|-----------------------|------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_iden<br>tifier | TEXT | IN                     | Yes          | Client authentication. The default value is <b>null</b> . Generally, you do not need to manually set this parameter.                                                                                                                                                                                                                                                             |
| attribute             | TEXT | IN                     | Yes          | Attribute to be cleared. The default value is <b>null</b> , indicating that all attributes of the specified context are cleared. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.<br><b>CAUTION</b><br>To ensure forward compatibility, if the parameter value is 'null', all attributes of the specified context are cleared. |

- DBE\_SESSION.SEARCH\_CONTEXT

Queries the value of an attribute in a specified namespace (context). The **DBE\_SESSION.SEARCH\_CONTEXT** function prototype is:

```
DBE_SESSION.SEARCH_CONTEXT (
 namespace text,
 attribute text
)returns text;
```

**Table 10-317** DBE\_SESSION.SEARCH\_CONTEXT API parameters

| Parameter     | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                      |
|---------------|------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------|
| namespa<br>ce | TEXT | IN                     | No           | Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.  |
| attribute     | TEXT | IN                     | No           | Attribute to be searched for. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated. |

## Example

```

DECLARE
 a text;
BEGIN
 DBE_SESSION.set_context('test', 'gaussdb', 'one'); --Set the gaussdb attribute in the test context to one.
 a := DBE_SESSION.search_context('test', 'gaussdb');
 DBE_OUTPUT.PRINT_LINE(a);
 DBE_SESSION.clear_context('test', 'test', 'gaussdb');
END;
/
-- The expected result is as follows:
one
ANONYMOUS BLOCK EXECUTE

```

### 10.11.2.10 DBE\_MATCH

#### Interface Description

[Table 10-318](#) provides all interfaces supported by the **DBE\_MATCH** package.

**Table 10-318** DBE\_MATCH

| Interface                                          | Description                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DBE_MATCH.EDIT_DISTANCE_SIMILARITY</a> | Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value <b>100</b> indicates that the two character strings are the same, and the value <b>0</b> indicates that the two character strings are different. |

- [DBE\\_MATCH.EDIT\\_DISTANCE\\_SIMILARITY](#)

Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different. The **DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY** function prototype is as follows:

```

DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
 str1 IN text,
 str2 IN text
)returns integer ;

```

**Table 10-319** DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY interface parameters

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| str1      | First character string. If the value is <b>null</b> , <b>0</b> is returned.  |
| str2      | Second character string. If the value is <b>null</b> , <b>0</b> is returned. |

## 10.11.2.11 DBE\_SCHEDULER

### APIs

The advanced package **DBE\_SCHEDULER** supports more flexible creation of scheduled jobs through scheduling and programming. For details about all the supported APIs, see [Table 10-320](#).

#### NOTICE

DBE\_SCHEDULER does not support scheduled jobs for synchronizing data between nodes. To create scheduled jobs for multiple nodes, use [DBE\\_TASK](#).

**Table 10-320** DBE\_SCHEDULER

| API                                                   | Description                            |
|-------------------------------------------------------|----------------------------------------|
| <a href="#">DBE_SCHEDULER.CREATE_JOB</a>              | Creates a scheduled job.               |
| <a href="#">DBE_SCHEDULER.DROP_JOB</a>                | Deletes a scheduled job.               |
| <a href="#">DBE_SCHEDULER.DROP_SINGLE_JOB</a>         | Deletes a single scheduled job.        |
| <a href="#">DBE_SCHEDULER.SET_ATTRIBUTE</a>           | Sets object attributes.                |
| <a href="#">DBE_SCHEDULER.RUN_JOB</a>                 | Executes a scheduled job.              |
| <a href="#">DBE_SCHEDULER.RUN_BACKEND_JOB</a>         | Runs a scheduled job in the backend.   |
| <a href="#">DBE_SCHEDULER.RUN_FOREGROUND_JOB</a>      | Runs a scheduled job in the frontend.  |
| <a href="#">DBE_SCHEDULER.STOP_JOB</a>                | Stops a scheduled job.                 |
| <a href="#">DBE_SCHEDULER.STOP_SINGLE_JOB</a>         | Stops a single scheduled job.          |
| <a href="#">DBE_SCHEDULER.GENERATE_JOB_NAME</a>       | Generates the name of a scheduled job. |
| <a href="#">DBE_SCHEDULER.CREATE_PROGRAM</a>          | Creates a program.                     |
| <a href="#">DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT</a> | Defines program parameters.            |

| API                                            | Description                                        |
|------------------------------------------------|----------------------------------------------------|
| <b>DBE_SCHEDULER.DROP_PROGRAM</b>              | Deletes a program.                                 |
| <b>DBE_SCHEDULER.DROP_SINGLE_PROGRAM</b>       | Deletes a single program.                          |
| <b>DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE</b>    | Sets the parameters of a scheduled job.            |
| <b>DBE_SCHEDULER.CREATE_SCHEDULE</b>           | Creates a schedule.                                |
| <b>DBE_SCHEDULER.DROP_SCHEDULE</b>             | Deletes a schedule.                                |
| <b>DBE_SCHEDULER.DROP_SINGLE_SCHEDULE</b>      | Deletes a single schedule.                         |
| <b>DBE_SCHEDULER.CREATE_JOB_CLASS</b>          | Creates the class of a scheduled job.              |
| <b>DBE_SCHEDULER.DROP_JOB_CLASS</b>            | Deletes the class of a scheduled job.              |
| <b>DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS</b>     | Deletes the class of a single scheduled job.       |
| <b>DBE_SCHEDULER.GRANT_USER_AUTHORIZATION</b>  | Grants special permissions to a user.              |
| <b>DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION</b> | Revokes special permissions from a user.           |
| <b>DBE_SCHEDULER.CREATE_CREDENTIAL</b>         | Creates a certificate.                             |
| <b>DBE_SCHEDULER.DROP_CREDENTIAL</b>           | Destroys a certificate.                            |
| <b>DBE_SCHEDULER.ENABLE</b>                    | Enables an object.                                 |
| <b>DBE_SCHEDULER.ENABLE_SINGLE</b>             | Enables a single object.                           |
| <b>DBE_SCHEDULER.DISABLE</b>                   | Disables an object.                                |
| <b>DBE_SCHEDULER.DISABLE_SINGLE</b>            | Disables a single object.                          |
| <b>DBE_SCHEDULER.EVAL_CALENDAR_STRING</b>      | Analyzes character strings in the Calendar format. |
| <b>DBE_SCHEDULER.EVALUATE_CALENDAR_STRING</b>  | Analyzes character strings in the Calendar format. |

- DBE\_SCHEDULER.CREATE\_JOB

Creates a scheduled job.

The prototypes of the DBE\_SCHEDULER.CREATE\_JOB function are as follows:

```
-- Scheduled jobs of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
repeat_interval TEXT DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created scheduled jobs of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
job_style TEXT DEFAULT 'REGULAR',
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created program and the scheduled job of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
repeat_interval TEXT DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
job_style TEXT DEFAULT 'REGULAR',
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)

-- Reference the created schedule and the scheduled job of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER DEFAULT 0,
job_class TEXT DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN DEFAULT FALSE,
auto_drop BOOLEAN DEFAULT TRUE,
comments TEXT DEFAULT NULL,
credential_name TEXT DEFAULT NULL,
destination_name TEXT DEFAULT NULL
)
```

 **NOTE**

The scheduled job created through **DBE\_SCHEDULER** does not conflict with the scheduled job in **DBE\_TASK**.

The scheduled job created by **DBE\_SCHEDULER** generates the corresponding **job\_id**. However, **job\_id** is meaningless.

**Table 10-321** DBE\_SCHEDULER.CREATE\_JOB API parameters

| Parameter           | Type                     | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | text                     | IN                     | No           | Name of a scheduled job.                                                                                                                                                                                                                                                                                   |
| job_type            | text                     | IN                     | No           | Inline program type of a scheduled job. The options are as follows: <ul style="list-style-type: none"> <li>• <b>'PLSQL_BLOCK'</b>: fast anonymous stored procedure.</li> <li>• <b>'STORED_PROCEDURE'</b>: stored procedure that is saved.</li> <li>• <b>'EXTERNAL_SCRIPT'</b>: external script.</li> </ul> |
| job_action          | text                     | IN                     | No           | Content executed by an inline program of a scheduled job.                                                                                                                                                                                                                                                  |
| number_of_arguments | integer                  | IN                     | No           | Number of inline program parameters of a scheduled job.                                                                                                                                                                                                                                                    |
| program_name        | text                     | IN                     | No           | Name of the program referenced by a scheduled job.                                                                                                                                                                                                                                                         |
| start_date          | timestamp with time zone | IN                     | Yes          | Inline scheduling start time of a scheduled job.                                                                                                                                                                                                                                                           |
| repeat_interval     | text                     | IN                     | Yes          | Inline scheduling period of a scheduled job.                                                                                                                                                                                                                                                               |
| end_date            | timestamp with time zone | IN                     | Yes          | Inline scheduling expiration time of a scheduled job.                                                                                                                                                                                                                                                      |

| Parameter        | Type    | Input/Output Parameter | Can Be Empty | Description                                                              |
|------------------|---------|------------------------|--------------|--------------------------------------------------------------------------|
| schedule_name    | text    | IN                     | No           | Name of the schedule referenced by a scheduled job.                      |
| job_class        | text    | IN                     | No           | Class name of a scheduled job.                                           |
| enabled          | boolean | IN                     | No           | Status of a scheduled job.                                               |
| auto_drop        | boolean | IN                     | No           | Automatic deletion of a scheduled job.                                   |
| comments         | text    | IN                     | Yes          | Comments.                                                                |
| job_style        | text    | IN                     | No           | Behavior pattern of a scheduled job. Only <b>'REGULAR'</b> is supported. |
| credential_name  | text    | IN                     | Yes          | Certificate name of a scheduled job.                                     |
| destination_name | text    | IN                     | Yes          | Target name of a scheduled job.                                          |

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'SELECT
pg_sleep(1);', 3, false, 'test');
create_program
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
create_schedule
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
create_job
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
```

```
drop_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)
```

### NOTICE

To create a scheduled job of the EXTERNAL\_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- DBE\_SCHEDULER.DROP\_JOB

Deletes a scheduled job.

The prototype of the DBE\_SCHEDULER.DROP\_JOB function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean default false,
defer boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

### NOTE

You can specify one or more jobs, or specify a job class in DBE\_SCHEDULER.DROP\_JOB to delete scheduled jobs.

**Table 10-322** DBE\_SCHEDULER.DROP\_JOB API parameters

| Parameter | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                  |
|-----------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | text    | IN                     | No           | Name or class of a scheduled job. You can specify one or more scheduled jobs. If you specify multiple scheduled jobs, separate them with commas (,).                                         |
| force     | boolean | IN                     | No           | Specifies whether to delete a scheduled job.<br><b>true:</b> The current scheduled job is stopped and then deleted.<br><b>false:</b> The scheduled job fails to be deleted if it is running. |

| Parameter        | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| defer            | boolean | IN                     | No           | Specifies whether to delete a scheduled job.<br><b>true</b> : A scheduled job can be deleted after it is complete.                                                                                                                                                                                                                                                                                 |
| commit_semantics | text    | IN                     | No           | Commit rules:<br><b>'STOP_ON_FIRST_ERROR'</b> : The deletion operation performed before the first error is reported is committed.<br><b>'TRANSACTIONAL'</b> : Transaction-level commit. The deletion operation performed before an error is reported will be rolled back.<br><b>'ABSORB_ERRORS'</b> : Attempt to bypass an error and commit the deletion operation that is performed successfully. |

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'SELECT
pg_sleep(1);', 3, false, 'test');
create_program
```

-----  
(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
create_schedule
```

-----  
(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
create_job
```

-----  
(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

-----  
(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_schedule
```

```

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)

```

### NOTICE

The **TRANSACTIONAL** option in **commit\_semantic** takes effect only when **force** is set to **false**.

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB**

Deletes a scheduled job.

The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_JOB** function is as follows:

```

DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean default false,
defer boolean default false
)

```

Example:

```

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'SELECT
pg_sleep(1);', 0, false, 'test');
create_program

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval "3 minute"',
'2121-07-20', 'DEFAULT_JOB_CLASS', false, false, 'test', 'style', NULL, NULL);
create_job

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job('job1', false, false);
drop_single_job

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)

```

- **DBE\_SCHEDULER.SET\_ATTRIBUTE**

Modifies the attributes of a scheduled job.

The prototypes of the **DBE\_SCHEDULER.SET\_ATTRIBUTE** function are as follows:

```

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value boolean
)

```

```

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value timestamp
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text default NULL
)

```

 **NOTE**

**name** specifies any object in **DBE\_SCHEDULER**.

**Table 10-323** DBE\_SCHEDULER.SET\_ATTRIBUTE API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description     |
|-----------|------|------------------------|--------------|-----------------|
| name      | text | IN                     | No           | Object name.    |
| attribute | text | IN                     | No           | Attribute name. |

| Parameter | Type                                                 | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value     | boolean/date/timestamp/timestamp with time zone/text | IN                     | No           | Attribute value. The options are as follows: <ul style="list-style-type: none"> <li>• Scheduled-job-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, job_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style.</li> <li>• Program-related: program_action, program_type, number_of_arguments, and comments.</li> <li>• Scheduling-related: start_date, repeat_interval, end_date, and comments.</li> </ul> |
| value2    | text                                                 | IN                     | Yes          | Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.                                                                                                                                                                                                                                                                                                                                                                                  |

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'SELECT
pg_sleep(1);', 3, false, 'test');
create_program
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
set_attribute
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'program_type', 'STORED_PROCEDURE');
set_attribute
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
```

-----

(1 row)

**NOTICE**

Do not use DBE\_SCHEDULER.SET\_ATTRIBUTE to leave the parameters empty. The object name cannot be changed using DBE\_SCHEDULER.SET\_ATTRIBUTE. Inline objects cannot be changed by DBE\_SCHEDULER.SET\_ATTRIBUTE.

- **DBE\_SCHEDULER.RUN\_JOB**

Executes a scheduled job.

The prototype of the DBE\_SCHEDULER.RUN\_JOB function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean default true
)
```

 **NOTE**

DBE\_SCHEDULER.RUN\_JOB is used to run scheduled jobs immediately. It is independent of the scheduling of scheduled jobs and can even run at the same time.

**Table 10-324** DBE\_SCHEDULER.RUN\_JOB API parameters

| Parameter           | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                        |
|---------------------|---------|------------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | text    | IN                     | No           | Name of a scheduled job. You can specify one or more scheduled jobs. If you specify multiple scheduled jobs, separate them with commas (,).                                                                                                                                                        |
| use_current_session | boolean | IN                     | No           | Specifies whether to run a scheduled job. <ul style="list-style-type: none"> <li>• <b>true:</b> Use the current session to check whether the scheduled job can run properly.</li> <li>• <b>false:</b> Start the scheduled job in the backend. The execution result is recorded in logs.</li> </ul> |

Example:

```
gaussdb=# SELECT db_scheduler.create_job('job1','PLSQL_BLOCK','BEGIN INSERT INTO test1
VALUES(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
```

```

create_job

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_job('job1', false);
run_job

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

(1 row)

```

### NOTICE

Currently, **use\_current\_session** applies only to scheduled jobs whose **job\_type** is set to **EXTERNAL\_SCRIPT**.

- **DBE\_SCHEDULER.RUN\_BACKEND\_JOB**

Runs a scheduled job in the backend.

The prototype of the DBE\_SCHEDULER.RUN\_BACKEND\_JOB function is as follows:

```

DBE_SCHEDULER.run_backend_job(
job_name text
)

```

Example:

```

gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','BEGIN INSERT INTO test1
VALUES(12); end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_backend_job('job1');
run_backend_job

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

(1 row)

```

- **DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB**

Executes a scheduled job in the current session.

Only external jobs can be executed.

Return value: text

The prototype of the DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB function is as follows:

```

DBE_SCHEDULER.run_foreground_job(
job_name text
)return text

```

Example:

```

gaussdb=# CREATE USER test1 IDENTIFIED BY '*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# SELECT DBE_SCHEDULER.create_credential('cre_1', 'test1', '*****');
create_credential

(1 row)

gaussdb=# SELECT DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'EXTERNAL_SCRIPT',
job_action=>'/usr/bin/pwd', enabled=>true, auto_drop=>false, credential_name => 'cre_1');
create_job

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_foreground_job('job1');
run_foreground_job

Host key verification failed.\r+
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
drop_credential

(1 row)

gaussdb=# DROP USER test1;
DROP ROLE

```

- **DBE\_SCHEDULER.STOP\_JOB**

Stops a scheduled job.

The prototype of the DBE\_SCHEDULER.STOP\_JOB function is as follows:

```

DBE_SCHEDULER.stop_job(
job_name text,
force boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)

```

**Table 10-325** DBE\_SCHEDULER.STOP\_JOB API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                          |
|-----------|------|------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | text | IN                     | No           | Name or class of a scheduled job. You can specify one or more scheduled jobs. If you specify multiple scheduled jobs, separate them with commas (,). |

| Parameter        | Type    | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                                                                                                                                                                                     |
|------------------|---------|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force            | boolean | IN                     | No           | Specifies whether to delete a scheduled job. <ul style="list-style-type: none"> <li>• <b>true</b>: The scheduler sends a termination signal to end the job thread immediately.</li> <li>• <b>false</b>: The scheduler attempts to use the interrupt signal to terminate the scheduled job thread.</li> </ul>                    |
| commit_semantics | text    | IN                     | No           | Commit rules: <ul style="list-style-type: none"> <li>• <b>'STOP_ON_FIRST_ERROR'</b>: The interrupt operation performed before the first error is reported is committed.</li> <li>• <b>'ABSORB_ERRORS'</b>: The system attempts to bypass an error and commit the interrupt operation that is performed successfully.</li> </ul> |

Example:

```
gaussdb=# SELECT db_scheduler.create_job('job1','PLSQL_BLOCK','BEGIN INSERT INTO test1
VALUES(12); end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.stop_job('job1', true, 'STOP_ON_FIRST_ERROR');
stop_job
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

-----

(1 row)

- **DBE\_SCHEDULER.STOP\_SINGLE\_JOB**

Stops a single scheduled job.

The prototype of the DBE\_SCHEDULER.STOP\_SINGLE\_JOB function is as follows:

```
DBE_SCHEDULER.stop_single_job(
job_name text,
```

```
force boolean default false
)
```

**Example:**

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','BEGIN INSERT INTO test1
VALUES(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job

```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.stop_single_job('job1', true);
stop_single_job

```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

```

(1 row)

- **DBE\_SCHEDULER.GENERATE\_JOB\_NAME**

Generates the name of a scheduled job.

The prototype of the DBE\_SCHEDULER.GENERATE\_JOB\_NAME function is as follows:

```
DBE_SCHEDULER.generate_job_name(
prefix text default 'JOB$_'
)return text
```

**Table 10-326** DBE\_SCHEDULER.GENERATE\_JOB\_NAME API parameters

| Parameter | Type | Input/Output Parameter | Can Be Empty | Description                                                                                                                                                     |
|-----------|------|------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prefix    | text | IN                     | No           | Prefix of the generated name. The default value is 'JOB\$_'. Scheduled jobs that are repeatedly executed are named as follows:<br>job\$_1, job\$_2, job\$_3 ... |

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
generate_job_name

```

JOB\$\_1  
(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
generate_job_name

```

```
JOB$_2
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
generate_job_name

job3
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
generate_job_name

job4
(1 row)
```

### NOTICE

When DBE\_SCHEDULER.GENERATE\_JOB\_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE\_SCHEDULER.CREATE\_PROGRAM

Creates a program.

The prototype of the DBE\_SCHEDULER.CREATE\_PROGRAM function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer default 0,
enabled boolean default false,
comments text default NULL
)
```

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'SELECT
pg_sleep(1);', 3, false, 'test');
create_program

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)
```

- DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT

Defines program parameters.

An API with the default value **default value** will not convert characters to lowercase letters by default. In this version, characters are case-sensitive.

The prototype of the DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
```

```

argument_position integer,
argument_name text default NULL,
argument_type text,
out_argument boolean default false
)

-- With a default value --
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text default NULL,
argument_type text,
default_value text,
out_argument boolean default false
)

```

**Example:**

```

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'SELECT
pg_sleep(1);', 2, false, 'test');
create_program

(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', false);
define_program_argument

(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', 'value1',
false);
define_program_argument

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)

```

- **DBE\_SCHEDULER.DROP\_PROGRAM**

Deletes a program.

The prototype of the DBE\_SCHEDULER.DROP\_PROGRAM function is as follows:

```

DBE_SCHEDULER.drop_program(
program_name text,
force boolean default false
)

```

**Example:**

```

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'SELECT
pg_sleep(1);', 2, false, 'test');
create_program

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

(1 row)

```

- **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM**

Deletes a single program.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM function is as follows:

```
DBE_SCHEDULER.drop_single_program(
program_name text,
force boolean default false
)
```

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'SELECT
pg_sleep(1);', 2, false, 'test');
create_program
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_single_program('program1', false);
drop_single_program
```

```

(1 row)
```

- DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE

Sets the parameters of a scheduled job. **argument\_value** can be left empty.

The prototype of the DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_position integer,
argument_value text
)
```

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_name text,
argument_value text
)
```

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','EXTERNAL_SCRIPT','BEGIN INSERT INTO test1
VALUES(12); end;',2,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.set_job_argument_value('job1', 1, 'value1');
set_job_argument_value
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

```

(1 row)
```

- DBE\_SCHEDULER.CREATE\_SCHEDULE

Creates a schedule.

The prototype of the DBE\_SCHEDULER.CREATE\_SCHEDULE function is as follows:

```
DBE_SCHEDULER.create_schedule(
schedule_name text,
```

```
start_date timestamp with time zone default NULL,
repeat_interval text,
end_date timestamp with time zone default NULL,
comments text default NULL
)
```

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
create_schedule
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
create_schedule
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
create_schedule
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_single_schedule
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
drop_single_schedule
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
drop_single_schedule
```

```

(1 row)
```

- **DBE\_SCHEDULER.DROP\_SCHEDULE**

Deletes a schedule.

The prototype of the DBE\_SCHEDULER.DROP\_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_schedule(
schedule_name text,
force boolean default false
)
```

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
create_schedule
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
create_schedule
```

```

(1 row)
```

```

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
create_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_single_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
drop_single_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
drop_single_schedule

(1 row)

```

- **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE**

Deletes a single schedule.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE function is as follows:

```

DBE_SCHEDULER.drop_single_schedule(
schedule_name text,
force boolean default false
)

```

Example:

```

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
create_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
create_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
create_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule1');
drop_single_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule2', false);
drop_single_schedule

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule3', true);

```

```
drop_single_schedule
```

```

(1 row)
```

- **DBE\_SCHEDULER.CREATE\_JOB\_CLASS**

Creates the class of a scheduled job.

The prototype of the DBE\_SCHEDULER.CREATE\_JOB\_CLASS function is as follows:

```
DBE_SCHEDULER.create_job_class(
job_class_name text,
resource_consumer_group text default NULL,
service text default NULL,
logging_level integer default 0,
log_history integer default NULL,
comments text default NULL
)
```

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
create_job_class
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
drop_job_class
```

```

(1 row)
```

- **DBE\_SCHEDULER.DROP\_JOB\_CLASS**

Deletes the class of a scheduled job.

The prototype of the DBE\_SCHEDULER.DROP\_JOB\_CLASS function is as follows:

```
DBE_SCHEDULER.drop_job_class(
job_class_name text,
force boolean default false
)
```

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
create_job_class
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
drop_job_class
```

```

(1 row)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS**

Deletes the class of a single scheduled job.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS function is as follows:

```
DBE_SCHEDULER.drop_single_job_class(
job_class_name text,
force boolean default false
)
```

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
create_job_class

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job_class('jc1', false);
drop_single_job_class

(1 row)
```

- **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION**

Grants the scheduled job permissions to the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION function is as follows:

```
DBE_SCHEDULER.grant_user_authorization(
username text,
privilege text
)
```

Example:

```
gaussdb=# CREATE USER user1 PASSWORD '1*s*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
grant_user_authorization

(1 row)
gaussdb=# DROP USER user1;
DROP ROLE
```

- **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION**

Revokes the scheduled job permissions from the database user. The user who calls this function must have the SYSADMIN permission.

The prototype of the DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(
username text,
privilege text
)
```

Example:

```
gaussdb=# CREATE USER user1 PASSWORD '1*s*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'CREATE JOB');
grant_user_authorization

(1 row)

gaussdb=# CALL DBE_SCHEDULER.revoke_user_authorization('user1', 'CREATE JOB');
revoke_user_authorization

(1 row)
gaussdb=# DROP USER user1;
DROP ROLE
```

- **DBE\_SCHEDULER.CREATE\_CREDENTIAL**

Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the DBE\_SCHEDULER.CREATE\_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.create_credential(
credential_name text,
username text,
password text default NULL,
database_role text default NULL,
windows_domain text default NULL,
comments text default NULL
)
```

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
create_credential

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
drop_credential

(1 row)
```

#### NOTICE

The **password** parameter of DBE\_SCHEDULER.CREATE\_CREDENTIAL must be set to **NULL** or '\*\*\*\*\*'. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- DBE\_SCHEDULER.DROP\_CREDENTIAL

Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission.

The prototype of the DBE\_SCHEDULER.DROP\_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.drop_credential(
credential_name text,
force boolean default false
)
```

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
create_credential

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
drop_credential

(1 row)
```

- DBE\_SCHEDULER.ENABLE

Enables an object.

The prototype of the DBE\_SCHEDULER.ENABLE function is as follows:

```
DBE_SCHEDULER.enable(
name text,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

**Example:**

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','BEGIN INSERT INTO test1
VALUES(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'INSERT INTO
tb_job_test(key) VALUES(null);', 0, false, '');
create_program
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.enable('job1');
enable
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.enable('program1', 'STOP_ON_FIRST_ERROR');
enable
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
```

```

(1 row)
```

- **DBE\_SCHEDULER.ENABLE\_SINGLE**

Enables a single object.

The prototype of the DBE\_SCHEDULER.ENABLE\_SINGLE function is as follows:

```
DBE_SCHEDULER.enable_single(
name text
)
```

**Example:**

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','BEGIN INSERT INTO test1
VALUES(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.enable_single('job1');
enable_single
```

```

(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

```

```

(1 row)

- **DBE\_SCHEDULER.DISABLE**

Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object.

The prototype of the DBE\_SCHEDULER.DISABLE function is as follows:

```
DBE_SCHEDULER.disable(
name text,
force boolean default false,
commit_semantics text default 'STOP_ON_FIRST_ERROR'
)
```

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','BEGIN INSERT INTO test1
VALUES(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job

```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'INSERT INTO
tb_job_test(key) VALUES(null);', 0, false, '');
create_program

```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.disable('job1');
disable

```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.disable('program1', false, 'STOP_ON_FIRST_ERROR');
disable

```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program

```

(1 row)

- **DBE\_SCHEDULER.DISABLE\_SINGLE**

Disables a single object.

The prototype of the DBE\_SCHEDULER.DISABLE\_SINGLE function is as follows:

```
DBE_SCHEDULER.disable_single(
name text,
force boolean default false
)
```

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','BEGIN INSERT INTO test1
VALUES(12); end;','0,null,null,null','DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job

```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable_single('job1', false);
disable_single

```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job

```

```
(1 row)
```

- **DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING**

Analyzes the scheduling job period.

Return type: timestamp with time zone

The prototype of the DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone
)return timestamp with time zone
```

Example:

```
gaussdb=# CALL DBE_SCHEDULER.eval_calendar_string('FREQ=DAILY; BYHOUR=6;', sysdate, sysdate);
eval_calendar_string

2023-09-15 06:47:24+08
(1 row)
```

- **DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING**

Analyzes the scheduling job period.

The prototype of the DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone,
OUT next_run_date timestamp with time zone
)return timestamp with time zone
```

Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE pr1(calendar_str text) as
DECLARE
start_date timestamp with time zone;
return_date_after timestamp with time zone;
next_run_date timestamp with time zone;
BEGIN
start_date := '2003-2-1 10:30:00.111111+8'::timestamp with time zone;
return_date_after := start_date;
DBE_SCHEDULER.evaluate_calendar_string(
calendar_str,
start_date, return_date_after, next_run_date);
DBE_OUTPUT.PRINT_LINE('next_run_date: ' || next_run_date);
return_date_after := next_run_date;
END;
/
CREATE PROCEDURE

gaussdb=# CALL pr1('FREQ=hourly;INTERVAL=2;BYHOUR=6,10;BYMINUTE=0;BYSECOND=0');
next_run_date: 2003-02-02 06:00:00+08
pr1

```

(1 row)

## 10.11.2.12 DBE\_APPLICATION\_INFO

### APIs

**Table 10-327** provides all APIs supported by the **DBE\_APPLICATION\_INFO** package. **DBE\_APPLICATION\_INFO** applies to the current session.

**Table 10-327** DBE\_APPLICATION\_INFO

| API                                                   | Description                |
|-------------------------------------------------------|----------------------------|
| <a href="#">DBE_APPLICATION_INFO.SET_CLIENT_INFO</a>  | Writes client information. |
| <a href="#">DBE_APPLICATION_INFO.READ_CLIENT_INFO</a> | Reads client information.  |

- [DBE\\_APPLICATION\\_INFO.SET\\_CLIENT\\_INFO](#)

Writes client information. The [DBE\\_APPLICATION\\_INFO.SET\\_CLIENT\\_INFO](#) function prototype is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(
 str text
)returns void;
```

**Table 10-328** DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO API parameters

| Parameter | Description                |
|-----------|----------------------------|
| str       | Writes client information. |

- [DBE\\_APPLICATION\\_INFO.READ\\_CLIENT\\_INFO](#)

The [DBE\\_APPLICATION\\_INFO.READ\\_CLIENT\\_INFO](#) function prototype is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(
 OUT client_info text);
```

**Table 10-329** DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO API parameters

| Parameter   | Description        |
|-------------|--------------------|
| client_info | Client information |

### 10.11.2.13 DBE\_XMLDOM

#### APIs

The advanced function package **DBE\_XMLDOM** is used to access XMLType objects and implement Document Object Model (DOM), which is an API used to access HTML and XML documents. For details about all types supported by the advanced function package **DBE\_XMLDOM**, see [Table 10-330](#). For details about all APIs supported by **DBE\_XMLDOM**, see [Table 10-331](#).

#### NOTE

When the **DBE\_XMLDOM** advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

**Table 10-330** DBE\_XMLDOM data types

| Type            | Description                         |
|-----------------|-------------------------------------|
| DOMATTR         | Implements the DOMAttributes API.   |
| DOMDOCUMENT     | Implements the DOMDocument API.     |
| DOMELEMENT      | Implements the DOMELEMENT API.      |
| DOMNAMEDNODEMAP | Implements the DOMNamedNodeMap API. |
| DOMNODELIST     | Implements the DOMNodeList API.     |
| DOMNODE         | Implements the DOMNode API.         |
| DOMTEXT         | Implements the DOMText API.         |

**Table 10-331** DBE\_XMLDOM parameters

| API                                       | Description                                                                               |
|-------------------------------------------|-------------------------------------------------------------------------------------------|
| <a href="#">DBE_XMLDOM.APPENDCHILD</a>    | Adds the newchild node to the end of the parent(n) node and returns the newly added node. |
| <a href="#">DBE_XMLDOM.CREATEELEMENT</a>  | Creates a DOMELEMENT object with the specified name.                                      |
| <a href="#">DBE_XMLDOM.CREATETEXTNODE</a> | Creates a DOMText node.                                                                   |
| <a href="#">DBE_XMLDOM.FREEDOCUMENT</a>   | Frees resources related to DOMDocument nodes.                                             |
| <a href="#">DBE_XMLDOM.FREEELEMENT</a>    | Frees resources related to DOMELEMENT nodes.                                              |
| <a href="#">DBE_XMLDOM.FREENODE</a>       | Frees resources related to DOMNode nodes.                                                 |

| API                                             | Description                                                         |
|-------------------------------------------------|---------------------------------------------------------------------|
| <a href="#">DBE_XMLDOM.FREENODELIST</a>         | Frees resources related to DOMNodeList nodes.                       |
| <a href="#">DBE_XMLDOM.GETATTRIBUTE</a>         | Returns the attribute values of a DOMELEMENT object by name.        |
| <a href="#">DBE_XMLDOM.GETATTRIBUTES</a>        | Returns the attribute values of a DOMNode node as a map.            |
| <a href="#">DBE_XMLDOM.GETCHILDNODES</a>        | Converts several subnodes under a node into a node list.            |
| <a href="#">DBE_XMLDOM.GETCHILDRENBYTAGNAME</a> | Returns the subnodes of a DOMELEMENT node by name.                  |
| <a href="#">DBE_XMLDOM.GETDOCUMENTELEMENT</a>   | Returns the first subnode of the specified document.                |
| <a href="#">DBE_XMLDOM.GETFIRSTCHILD</a>        | Returns the first subnode.                                          |
| <a href="#">DBE_XMLDOM.GETLASTCHILD</a>         | Returns the last subnode.                                           |
| <a href="#">DBE_XMLDOM.GETLENGTH</a>            | Obtains the number of subnodes under a specified node.              |
| <a href="#">DBE_XMLDOM.GETLOCALNAME</a>         | Returns the local name of a node.                                   |
| <a href="#">DBE_XMLDOM.GETNAMEDITEM</a>         | Returns the node specified by name.                                 |
| <a href="#">DBE_XMLDOM.GETNEXTSIBLING</a>       | Returns the next node of the specified node.                        |
| <a href="#">DBE_XMLDOM.GETNODENAME</a>          | Returns the name of a node.                                         |
| <a href="#">DBE_XMLDOM.GETNODETYPE</a>          | Returns the type of a node.                                         |
| <a href="#">DBE_XMLDOM.GETNODEVALUE</a>         | Obtains the value of a node, depending on its type.                 |
| <a href="#">DBE_XMLDOM.GETPARENTNODE</a>        | Returns the parent node of a node.                                  |
| <a href="#">DBE_XMLDOM.GETTAGNAME</a>           | Returns the tag name of the specified DOMELEMENT node.              |
| <a href="#">DBE_XMLDOM.HASCHILDNODES</a>        | Checks whether the DOMNode object has any subnode.                  |
| <a href="#">DBE_XMLDOM.IMPORTNODE</a>           | Copies a node and specifies the document to which the node belongs. |

| API                                      | Description                                                                                            |
|------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>DBE_XMLDOM.ISNULL</b>                 | Checks whether a node is null.                                                                         |
| <b>DBE_XMLDOM.ITEM</b>                   | Returns the item corresponding to the index parameter in the mapping.                                  |
| <b>DBE_XMLDOM.MAKEELEMENT</b>            | Converts a DOMNode object to the DOMELEMENT type.                                                      |
| <b>DBE_XMLDOM.MAKENODE</b>               | Forcibly converts a node to the DOMNode type.                                                          |
| <b>DBE_XMLDOM.NEWDOMDOCUMENT</b>         | Returns a new DOMDocument object.                                                                      |
| <b>DBE_XMLDOM.SETATTRIBUTE</b>           | Sets the value of the DOMELEMENT attribute by name.                                                    |
| <b>DBE_XMLDOM.SETCHARSET</b>             | Sets the character set for a DOMDocument object.                                                       |
| <b>DBE_XMLDOM.SETDOCTYPE</b>             | Sets the external DTD of a DOMDocument object.                                                         |
| <b>DBE_XMLDOM.SETNODEVALUE</b>           | Sets the value of a node in the DOMNode object.                                                        |
| <b>DBE_XMLDOM.WRITETOBUFFER</b>          | Writes an XML node to a specified buffer.                                                              |
| <b>DBE_XMLDOM.WRITETOCLOB</b>            | Writes an XML node to a specified CLOB.                                                                |
| <b>DBE_XMLDOM.WRITETOFILE</b>            | Writes an XML node to a specified file.                                                                |
| <b>DBE_XMLDOM.GETSESSIONTREECOUNT</b>    | Displays the number of DOM trees of all types in the current session.                                  |
| <b>DBE_XMLDOM.GETDOCTREEINFO</b>         | Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type. |
| <b>DBE_XMLDOM.GETDETAILEDDOCTREEINFO</b> | Displays the number of nodes of each type for a specific document variable.                            |

- **DBE\_XMLDOM.APPENDCHILD**

Adds the newchild node to the end of the parent(n) node and returns the newly added node. The prototype of the DBE\_XMLDOM.APPENDCHILD function is as follows:

```
DBE_XMLDOM.APPENDCHILD(
 n IN DOMNode,
 newchild IN DOMNode)
RETURN DOMNODE;
```

**Table 10-332** DBE\_XMLDOM.APPENDCHILD parameters

| Parameter | Description      |
|-----------|------------------|
| n         | Node to be added |
| newchild  | New node added   |

 **NOTE**

1. The error message "operation not support" is displayed for the APPEND ATTR node under the DOCUMENT node. Database ORA does not report an error in this scenario, but the mounting fails.
2. The error message "operation not support" is displayed for the APPEND ATTR node under the ATTR node. Database ORA does not report an error in this scenario, but the mounting fails.
3. When multiple child nodes of the ATTR type are added to a parent node, the child nodes with the same key value cannot exist under the same parent node.

**Example:**

-- Add a DOMNode node to a specified DOC tree and use DBE\_XMLDOM.HASCHILDNODES() to check whether the subnode is successfully added.

```

DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc1 DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 rootnode DBE_XMLDOM.DOMNode;
 child1 DBE_XMLDOM.DOMELEMENT;
 child2 DBE_XMLDOM.DOMELEMENT;
 attr DBE_XMLDOM.DOMAttr;
 text DBE_XMLDOM.DOMTEXT;
 node DBE_XMLDOM.DOMNode;
 child1_node DBE_XMLDOM.DOMNode;
 attr_node DBE_XMLDOM.DOMNode;
 parent DBE_XMLDOM.DOMNode;
 buf varchar2(1000);
BEGIN
 doc := DBE_XMLDOM.newDOMDocument();
 root := DBE_XMLDOM.createElement(doc, 'root');
 rootnode := DBE_xmlldom.makeNode(root);
 node := DBE_XMLDOM.appendChild(DBE_xmlldom.makeNode(doc), rootnode);
 child1 := DBE_XMLDOM.createElement(doc, 'child1');
 child1_node := DBE_XMLDOM.makeNode(child1);
 node := DBE_XMLDOM.appendChild(rootnode, child1_node);
 attr := DBE_XMLDOM.createAttribute(doc, 'abc');
 attr_node := DBE_XMLDOM.makeNode(attr);
 node := DBE_XMLDOM.appendChild(child1_node, attr_node);
 IF DBE_XMLDOM.HASCHILDNODES(child1_node) THEN
 DBE_OUTPUT.print_line('HAS CHILD NODES');
 ELSE
 DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
 END IF;
 parent := DBE_XMLDOM.GETPARENTNODE(attr_node);
 buf := DBE_XMLDOM.GETNODENAME(parent);
 DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.CREATEELEMENT**

Returns the DOMELEMENT object with the specified name. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```

DBE_XMLDOM.CREATEELEMENT(
 doc IN DOMDOCUMENT,

```

```
tagName IN VARCHAR2)
RETURN DOMELEMENT;
```

Returns the DOMELEMENT object with the specified name and namespace. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
doc IN DOMDOCUMENT,
tagName IN VARCHAR2,
ns IN VARCHAR2)
RETURN DOMELEMENT;
```

**Table 10-333** DBE\_XMLDOM.CREATEELEMENT parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| doc       | Specified DOMDocument object      |
| tagName   | Name of the new DOMELEMENT object |
| ns        | Namespace                         |

 **NOTE**

1. When the **tagName** parameter is set to null or an empty character string, the exception "NULL or invalid TagName argument specified" is thrown.
2. The default maximum length of **tagName** and **ns** is 32767. If the length exceeds 32767, an exception is thrown.

**Example:**

--1. Create a DOMELEMENT object with the specified name.

```
DECLARE
doc dbe_xmldom.domdocument;
attr DBE_XMLDOM.DOMATTR;
elem DBE_XMLDOM.DOMELEMENT;
ans DBE_XMLDOM.DOMATTR;
buf varchar2(1010);
BEGIN
doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
<computer size="ITX"><cpu>Ryzen 9 3950X</cpu>
<ram>32GBx2 DDR4 3200MHz</ram>
<motherboard>ROG X570i</motherboard>
<gpu>RTX2070 Super</gpu>
<ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
<hdd>12TB WD Digital</hdd>
<psu>CORSAIR SF750</psu>
<case>LIANLI TU150</case>
</computer>');
elem := dbe_xmldom.createelement(doc,'elem');
DBE_XMLDOM.WRITETOBUFFER(dbe_xmldom.makenode(elem), buf);
DBE_OUTPUT.print_line(buf);
END;
/
```

--2. Create a DOMELEMENT object with the specified name and namespace.

```
DECLARE
doc dbe_xmldom.domdocument;
attr DBE_XMLDOM.DOMATTR;
elem DBE_XMLDOM.DOMELEMENT;
ans DBE_XMLDOM.DOMNODE;
buf varchar2(1010);
list DBE_XMLDOM.DOMNODELIST;
node DBE_XMLDOM.DOMNODE;
BEGIN
```

```

doc := dbe_xmlDOM.newDOMdocument('<h:data xmlns:h="http://www.w3.org/TR/html4/">
 <h:da1 len="10">test namespace</h:da1><h:da1>bbbbbbbbbb</h:da1></h:data>');
elem := dbe_xmlDOM.createelement(doc,'elem','http://www.w3.org/TR/html5/');
ans := DBE_XMLDOM.APPENDCHILD(dbe_xmlDOM.makenode(doc), dbe_xmlDOM.makenode(elem));
DBE_XMLDOM.WRITETOBUFFER(doc, buf);
DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.CREATETEXTNODE**

Creates and returns a DOMText object. The prototype of the DBE\_XMLDOM.CREATETEXTNOD function is as follows:

```

DBE_XMLDOM.CREATETEXTNODE(
 doc IN DOMDocument,
 data IN VARCHAR2)
RETURN DOMTEXT;

```

**Table 10-334** DBE\_XMLDOM.CREATETEXTNODE parameters

| Parameter | Description                  |
|-----------|------------------------------|
| doc       | Specified DOMDocument object |
| data      | Content of the DOMText node  |

 **NOTE**

1. You can enter an empty string or null value for **data**.
  2. The default maximum length of **data** is 32767. If the length exceeds 32767, an exception is thrown.
- **DBE\_XMLDOM.FREEDOCUMENT**

Frees a DOMDocument node. The prototype of the DBE\_XMLDOM.FREEDOCUMENT function is as follows:

```

DBE_XMLDOM.FREEDOCUMENT(
 doc IN DOMDOCUMENT);

```

**Table 10-335** DBE\_XMLDOM.FREEDOCUMENT parameters

| Parameter | Description                |
|-----------|----------------------------|
| doc       | Specified DOMDocument node |

**Example:**

```

-- Free the entire DOC tree after the DOMNode node is added to the DOC tree.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem dbe_xmlDOM.domelement;
 doc_node dbe_xmlDOM.DOMNODE;
 root_elmt dbe_xmlDOM.DOMELEMENT;
 root_node dbe_xmlDOM.DOMNODE;
 value varchar(1000);
BEGIN
 doc := dbe_xmlDOM.newDOMdocument();
 doc_node := dbe_xmlDOM.MAKENODE(doc);
 root_elmt := dbe_xmlDOM.CREATEELEMENT(doc,'staff');
 root_node:=dbe_xmlDOM.APPENDCHILD(doc_node, dbe_xmlDOM.MAKENODE(root_elmt));

```

```
dbe_xmlDOM.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.FREEELEMENT

Frees a DOMELEMENT node. The prototype of the DBE\_XMLDOM.FREEELEMENT function is as follows:

```
DBE_XMLDOM.FREEELEMENT(
elem IN DOMELEMENT);
```

**Table 10-336** DBE\_XMLDOM.FREEELEMENT parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |

- DBE\_XMLDOM.FREENODE

Frees a DOMNode node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.FREENODE(
n IN DOMNODE);
```

**Table 10-337** DBE\_XMLDOM.FREENODE parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

 **NOTE**

1. After GaussDB performs the FREENODE operation, the freed node is not available again. After the database ORA performs the FREENODE operation, the freed node is available again and becomes another node.
  2. When other APIs call the freed DOMNode node, the calling is different from that in database ORA.
- DBE\_XMLDOM.FREENODELIST

Frees a DOMNodeList node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.GETLENGTH(
nl IN DOMNODELIST);
```

**Table 10-338** DBE\_XMLDOM.FREENODELIST parameters

| Parameter | Description                |
|-----------|----------------------------|
| nl        | Specified DOMNodeList node |

 **NOTE**

1. A DOMNodeList node will be completed freed by FREENODELIST.
  2. When other APIs call the freed DOMNodeList node, the calling is different from that in database ORA.
  3. The input parameter **freenodelist** cannot be empty.
- **DBE\_XMLDOM.GETATTRIBUTE**

Returns the attribute values of a DOMELEMENT object by name. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN VARCHAR2;
```

Returns the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN VARCHAR2;
```

**Table 10-339** DBE\_XMLDOM.GETATTRIBUTE parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |
| name      | Attribute name            |
| ns        | Namespace                 |

 **NOTE**

1. The **ns** parameter of the DBE\_XMLDOM.GETATTRIBUTE API does not support the asterisk (\*) parameter.
2. GaussDB does not support the namespace prefix as an attribute, and the value of the prefix cannot be queried through the DBE\_XMLDOM.GETATTRIBUTE API.

**Example:**

```
--1. Return the attribute values of a DOMELEMENT object by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar2(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
 DBE_XMLDOM.makeNode(elem));
 value := DBE_XMLDOM.getattribute(elem, 'len');
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
```

```

END;
/

--2. Return the attribute values of a DOMELEMENT object by name and namespace URI.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem dbe_xmlDOM.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);

BEGIN
 doc := dbe_xmlDOM.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
 DBE_XMLDOM.makeNode(elem));
 value := DBE_XMLDOM.getattribute(elem, 'len', 'www.huawei.com');
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

```

- **DBE\_XMLDOM.GETATTRIBUTES**

Returns the attribute values of a DOMNode node as a map. The prototype of the DBE\_XMLDOM.GETATTRIBUTES function is as follows:

```

DBE_XMLDOM.GETATTRIBUTES(
 n IN DOMNode)
RETURN DOMNAMEDNODEMAP;

```

**Table 10-340** DBE\_XMLDOM.GETATTRIBUTES parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

- **DBE\_XMLDOM.GETCHILDNODES**

Converts several subnodes under a node into a node list. The prototype of the DBE\_XMLDOM.GETCHILDNODES function is as follows:

```

DBE_XMLDOM.GETCHILDNODES(
 n IN DOMNode)
RETURN DOMNodeList;

```

**Table 10-341** DBE\_XMLDOM.GETCHILDNODES parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

- **DBE\_XMLDOM.GETCHILDRENBYTAGNAME**

Returns the subnodes of a DOMELEMENT node by name. The prototype of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```

DBE_XMLDOM.GETCHILDRENBYTAGNAME (
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN DOMNODELIST;

```

Returns the subnodes of a DOMELEMENT node by name and namespace. The prototype of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME function is as follows:

```
DBE_XMLDOM.GETCHILDRENBYTAGNAME (
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODELIST;
```

**Table 10-342** DBE\_XMLDOM.GETCHILDRENBYTAGNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |
| name      | Attribute name            |
| ns        | Namespace                 |

 **NOTE**

The **ns** parameter of the DBE\_XMLDOM.GETCHILDRENBYTAGNAME API does not support the asterisk (\*) parameter. To obtain all attributes of a node, use the DBE\_XMLDOM.GETCHILDNODES API.

**Example:**

```
--1. Return the subnodes of a DOMELEMENT node by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnodelist dbe_xmldom.domnodelist;
 node_elem dbe_xmldom.domelement;
 node dbe_xmldom.domnode;
 buffer varchar2(1010);
 value varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 <student>
 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
 </student>
 </students>');
 elem := dbe_xmldom.GETDOCUMENTELEMENT(doc);
 docnodelist := dbe_xmldom.GETCHILDRENBYTAGNAME(elem, 'student');
 node := dbe_xmldom.ITEM(docnodelist, 0);
 node_elem := dbe_xmldom.makeelement(node);
 value := DBE_XMLDOM.gettagname(node_elem);
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
```

- **DBE\_XMLDOM.GETDOCUMENTELEMENT**

Returns the first subnode of the specified document. The prototype of the DBE\_XMLDOM.GETDOCUMENTELEMENT function is as follows:

```
DBE_XMLDOM.GETDOCUMENTELEMENT(
 doc IN DOMDOCUMENT)
RETURN DOMELEMENT;
```

**Table 10-343** DBE\_XMLDOM.GETDOCUMENTELEMENT parameters

| Parameter | Description                |
|-----------|----------------------------|
| doc       | Specified DOMDocument node |

**Example:**

```
-- Obtain the first subnode in the DOC tree and output the node name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 doc_node dbe_xmldom.DOMNODE;
 root_elmt dbe_xmldom.DOMELEMENT;
 root_node dbe_xmldom.DOMNODE;
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument();
 doc_node := dbe_xmldom.MAKENODE(doc);
 root_elmt := dbe_xmldom.CREATEELEMENT(doc,'staff');
 root_node:=dbe_xmldom.APPENDCHILD(doc_node, dbe_xmldom.MAKENODE(root_elmt));
 elem := dbe_xmldom.GETDOCUMENTELEMENT(doc);
 value := DBE_XMLDOM.gettagname(elem);
 dbe_output.print_line(value);
END;
/
```

- **DBE\_XMLDOM.GETFIRSTCHILD**

Returns the first subnode of a node. The prototype of the DBE\_XMLDOM.GETFIRSTCHILD function is as follows:

```
DBE_XMLDOM.GETFIRSTCHILD(
 n IN DOMNODE)
RETURN DOMNODE;
```

**Table 10-344** DBE\_XMLDOM.GETFIRSTCHILD parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

```
-- Obtain the name and type of the first subnode after the DOC tree is converted to the DOMNode
type, and then obtain the name of the first subnode of the obtained first DOMNode node.
DECLARE
 doc dbe_xmldom.domdocument;
 doc_node dbe_xmldom.domnode;
 root_node dbe_xmldom.domnode;
 inside_node dbe_xmldom.domnode;
 node_name varchar2(1000);
 node_type integer;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student1>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student1>
 <student2>
```

```

 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
 </student2>
</students>');
doc_node := DBE_XMLDOM.MAKENODE(doc);
root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
node_name := DBE_XMLDOM.GETNODENAME(root_node);
node_type := DBE_XMLDOM.GETNODETYPE(root_node);
dbe_output.print_line(node_name);
dbe_output.print_line(node_type);
inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
node_name := DBE_XMLDOM.GETNODENAME(inside_node);
dbe_output.print_line(node_name);
END;
/

```

- **DBE\_XMLDOM.GETLASTCHILD**

Returns the last subnode of a node. The prototype of the DBE\_XMLDOM.GETLASTCHILD function is as follows:

```

DBE_XMLDOM.GETLASTCHILD(
 n IN DOMNODE)
RETURN DOMNODE;

```

**Table 10-345** DBE\_XMLDOM.GETLASTCHILD parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

-- Obtain the name and type of the last subnode after the DOC tree is converted to the DOMNode type, and then obtain the name of the last subnode of the obtained last DOMNode node.

```

DECLARE
 doc dbe_xmldom.domdocument;
 doc_node dbe_xmldom.domnode;
 root_node dbe_xmldom.domnode;
 inside_node dbe_xmldom.domnode;
 node_name varchar2(1000);
 node_type integer;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student1>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student1>
 <student2>
 <name>Bob</name><age>245</age><sex>woman</sex><abc>54321</abc>
 </student2>
 </students>');
 doc_node := DBE_XMLDOM.MAKENODE(doc);
 root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
 node_name := DBE_XMLDOM.GETNODENAME(root_node);
 node_type := DBE_XMLDOM.GETNODETYPE(root_node);
 dbe_output.print_line(node_name);
 dbe_output.print_line(node_type);
 inside_node := DBE_XMLDOM.GETLASTCHILD(root_node);
 node_name := DBE_XMLDOM.GETNODENAME(inside_node);
 dbe_output.print_line(node_name);
END;
/

```

- **DBE\_XMLDOM.GETLENGTH**

Returns the number of subnodes under a DOMNamedNodeMap node. The prototype of the DBE\_XMLDOM.GETLENGTH function is as follows:

```
DBE_XMLDOM.GETLENGTH(
 nnm IN DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Returns the number of subnodes under a DOMNodeList node. The prototype of the DBE\_XMLDOM.GETLENGTH function is as follows:

```
DBE_XMLDOM.GETLENGTH(
 nl IN DOMNODELIST)
RETURN NUMBER;
```

**Table 10-346** DBE\_XMLDOM.GETLENGTH parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| nnm       | Specified DOMNamedNodeMap node |
| nl        | Specified DOMNodeList node     |

**Example:**

--1. Declare a DOMNamedNodeMap parameter in a function.

```
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 buf varchar2(10000);
 len INTEGER;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
 <bookstore category="web" cover="paperback">
 <book category="cooking">
 <title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author>
 <year>2005</year>
 <price>30.00</price>
 </book>
 </bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(node);
 len := DBE_XMLDOM.GETLENGTH(map);
 DBE_OUTPUT.print_line(len);
END;
/
```

--2. Declare a NodeList parameter in a function.

```
DECLARE
 doc dbe_xmldom.domdocument;
 node dbe_xmldom.domnode;
 node1 dbe_xmldom.domnode;
 nodelist DBE_XMLDOM.DOMNODELIST;
 len INTEGER;
 buffer1 varchar2(1010);
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
 <students age="16" hight="176">
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 <student>
 <name>Jerry</name><age>519</age><sex>man</sex><abc>12345</abc>
 </student>
 </students>');
 node := dbe_xmldom.makenode(doc);
```

```
node := dbe_xmlDOM.GETFIRSTCHILD(node);
nodelist := DBE_XMLDOM.GETCHILDNODES(node);
len := DBE_XMLDOM.GETLENGTH(nodelist);
RAISE NOTICE 'len : %', len;
END;
/
```

- **DBE\_XMLDOM.GETLOCALNAME**

Returns the local name of the given DOMAttr node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 a IN DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the given DOMELEMENT node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

Returns the local name of the given DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
 n IN DOMNODE,
 data OUT VARCHAR2);
```

**Table 10-347** DBE\_XMLDOM.GETLOCALNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| a         | Specified DOMAttr node    |
| elem      | Specified DOMELEMENT node |
| n         | Specified DOMNode node    |
| data      | Returned local name       |

**Example:**

--2. Use the createElement function to generate a DOMELEMENT node and obtain its local name.

```
DECLARE
 doc DBE_xmlDOM.domdocument;
 elem DBE_xmlDOM.domelement;
 value varchar2(10000);
BEGIN
 doc := DBE_xmlDOM.newdomdocument();
 elem := DBE_XMLDOM.createELEMENT(doc, 'root');
 value := DBE_XMLDOM.getlocalname(elem);
 DBE_output.print_line('value: ');
 DBE_output.print_line(value);
END;
/
```

--3. Convert a DOMELEMENT to a DOMNode node and obtain its local name.

```
DECLARE
 doc DBE_xmlDOM.domdocument;
 elem DBE_xmlDOM.domelement;
 node DBE_xmlDOM.domnode;
 value varchar2(100);
 buf varchar2(100);
BEGIN
 doc := DBE_xmlDOM.newdomdocument();
```

```

elem := DBE_XMLDOM.createELEMENT(doc, 'root');
node := DBE_xmlDOM.makenode(elem);
DBE_XMLDOM.getlocalname(node, buf);
DBE_output.print_line('buf: ');
DBE_output.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.GETNAMEDITEM**

Returns the node specified by name. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```

DBE_XMLDOM.GETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 name IN VARCHAR2)
RETURN DOMNODE;

```

Returns the node specified by name and namespace. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```

DBE_XMLDOM.GETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODE;

```

**Table 10-348** DBE\_XMLDOM.GETNAMEDITEM parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| nnm       | Specified DOMNamedNodeMap object.    |
| name      | Name of the element to be retrieved. |
| ns        | Namespace.                           |

 **NOTE**

1. The values of **name** and **nnm** can be null, but they are required arguments.
2. The default maximum length of **name** and **ns** is 32767. If the length exceeds 32767, an error is reported.
3. The values of **name** and **ns** can be of the int type and contain more than 127 bits.

**Example:**

```

-- 1. Return the node specified by name.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 node2 DBE_XMLDOM.DOMNODE;
 buf varchar2(1000);
 buf2 varchar2(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(node);
 node2:= DBE_XMLDOM.GETNAMEDITEM(map,'category');

```

```

DBE_XMLDOM.writeToBuffer(node2, buf2);
dbe_output.print_line(buf2);
END;
/

-- 2. Return the node specified by name and namespace.
DECLARE
doc DBE_XMLDOM.DOMDocument;
root DBE_XMLDOM.DOMELEMENT;
elem DBE_XMLDOM.DOMELEMENT;
map DBE_XMLDOM.DOMNAMEDNODEMAP;
node DBE_XMLDOM.DOMNODE;
buf varchar2(1000);
buf2 varchar2(1000);
BEGIN
doc := dbe_xmldom.newdomdocument('<h:table xmlns:h="http://www.w3.org/TR/html4/">
<h:tr h:id="10"><h:td >Apples</h:td>
<h:td>Bananas</h:td></h:tr></h:table>');
root := DBE_XMLDOM.getDocumentElement(doc);
node := DBE_XMLDOM.MAKENODE(root);

node := DBE_XMLDOM.GETNAMEDITEM(map,'id','http://www.w3.org/TR/html4/');
DBE_XMLDOM.writeToBuffer(node, buf2);
dbe_output.print_line(buf2);
END;
/

```

- **DBE\_XMLDOM.GETNEXTSIBLING**

Returns the next node. The prototype of the DBE\_XMLDOM.GETNEXTSIBLING function is as follows:

```

DBE_XMLDOM.GETNEXTSIBLING(
n IN DOMNODE)
RETURN DOMNODE;

```

**Table 10-349** DBE\_XMLDOM.GETNEXTSIBLING parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

-- Obtain the first subnode after the DOC tree is converted into the DOMNode type, and obtain the name of the first subnode of the obtained first DOMNode node. Then, obtain the name of the next node through DBE\_XMLDOM.GETNEXTSIBLING.

```

DECLARE
doc dbe_xmldom.domdocument;
doc_node dbe_xmldom.domnode;
root_node dbe_xmldom.domnode;
inside_node dbe_xmldom.domnode;
node_name varchar2(1000);
node_type integer;
BEGIN
doc := dbe_xmldom.newdomdocument('<computer size="ITX">

root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
node_name := DBE_XMLDOM.GETNODENAME(root_node);
node_type := DBE_XMLDOM.GETNODETYPE(root_node);
dbe_output.print_line(node_name);
dbe_output.print_line(node_type);
inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);

```

```
node_name := DBE_XMLDOM.GETNODENAME(inside_node);
dbe_output.print_line(node_name);
inside_node := DBE_XMLDOM.GETNEXTSIBLING(inside_node);
node_name := DBE_XMLDOM.GETNODENAME(inside_node);
dbe_output.print_line(node_name);
END;
/
```

- **DBE\_XMLDOM.GETNODENAME**

Returns the name of a node. The prototype of the DBE\_XMLDOM.GETNODENAME function is as follows:

```
DBE_XMLDOM.GETNODENAME(
 n IN DOMNODE)
RETURN VARCHAR2;
```

**Table 10-350** DBE\_XMLDOM.GETNODENAME parameters

| Parameter | Description             |
|-----------|-------------------------|
| n         | Specified DOMNode node. |

**Example:**

```
-- Obtain the name of the specified DOMNode node from the DOC tree.
DECLARE
doc DBE_XMLDOM.DOMDocument;
root DBE_XMLDOM.DOMELEMENT;
root_node DBE_XMLDOM.DOMNode;
inside_node DBE_XMLDOM.DOMNode;
buf VARCHAR2(1000);
BEGIN
doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
<book category="cooking"><title lang="en">Everyday Italian</title>
<author>Giada De Laurentiis</author><year>2005</year>
<price>30.00</price></book></bookstore>');
root := DBE_XMLDOM.getDocumentElement(doc);
root_node := DBE_XMLDOM.MAKENODE(root);
inside_node := DBE_XMLDOM.GETFIRSTCHILD(root_node);
buf := DBE_XMLDOM.GETNODENAME(inside_node);
dbe_output.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.GETNODETYPE**

Returns the type of a node. The prototype of the DBE\_XMLDOM.GETNODETYPE function is as follows:

```
DBE_XMLDOM.GETNODETYPE(
 n IN DOMNODE)
RETURN NUMBER;
```

**Table 10-351** DBE\_XMLDOM.GETNODETYPE parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | Specified DOMNode node |

**Example:**

```
-- Obtain the type of the specified DOMNode node from the DOC tree.
DECLARE
doc DBE_XMLDOM.DOMDocument;
```

```

doc_node DBE_XMLDOM.DOMNode;
num number;
buf varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 doc_node := DBE_XMLDOM.makeNode(doc);
 num := DBE_XMLDOM.GETNODETYPE(doc_node);
 dbe_output.print_line(num);
 buf := DBE_XMLDOM.GETNODENAME(doc_node);
 dbe_output.print_line(buf);
END;
/

```

- DBE\_XMLDOM.GETNODEVALUE

Returns the value of a DOMNode node. The prototype of the DBE\_XMLDOM.GETNODEVALUE function is as follows:

```

DBE_XMLDOM.GETNODEVALUE(
 n IN DOMNODE)
RETURN VARCHAR2;

```

**Table 10-352** DBE\_XMLDOM.GETNODEVALUE parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Specified DOMNode object |

**Example:**

```

-- Convert a DOMText node to a DOMNode node and obtain the value of the node.
DECLARE
 buf VARCHAR2(1000);
 doc DBE_XMLDOM.DOMDocument;
 text DBE_XMLDOM.DOMText;
 elem2 DBE_XMLDOM.DOMEElement;
 node DBE_XMLDOM.DOMNode;
begin
 doc := DBE_XMLDOM.NEWDOMDOCUMENT();
 text := DBE_XMLDOM.createTextNode(doc, 'aaa');
 DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
 buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
 DBE_OUTPUT.print_line(buf);
end;
/

```

- DBE\_XMLDOM.GETPARENTNODE

Returns the parent node of the given DOMNode node. The prototype of the DBE\_XMLDOM.GETPARENTNODE function is as follows:

```

DBE_XMLDOM.GETPARENTNODE(
 n IN DOMNODE)
RETURN DOMNODE;

```

**Table 10-353** DBE\_XMLDOM.GETPARENTNODE parameters

| Parameter | Description               |
|-----------|---------------------------|
| n         | Specified DOMNode object. |

**Example:**

```
-- Add a node to the DOC tree and obtain the name of its parent node.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc1 DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 child1 DBE_XMLDOM.DOMELEMENT;
 child2 DBE_XMLDOM.DOMELEMENT;
 attr DBE_XMLDOM.DOMAttr;
 text DBE_XMLDOM.DOMTEXT;
 node DBE_XMLDOM.DOMNode;
 parent DBE_XMLDOM.DOMNode;
 buf varchar2(1000);
BEGIN
 doc := DBE_XMLDOM.newDOMDocument();
 root := DBE_XMLDOM.createElement(doc, 'root');
 node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc),DBE_xmldom.makeNode(root));
 child1 := DBE_XMLDOM.createElement(doc, 'child1');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
 child2 := DBE_XMLDOM.createElement(doc, 'child2');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
 parent := DBE_XMLDOM.GETPARENTNODE(DBE_XMLDOM.makeNode(child2));
 buf := DBE_XMLDOM.GETNODENAME(parent);
 DBE_OUTPUT.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.GETTAGNAME**

Returns the tag name of the specified DOMELEMENT node. The prototype of the DBE\_XMLDOM.GETTAGNAME function is as follows:

```
DBE_XMLDOM.GETTAGNAME(
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

**Table 10-354** DBE\_XMLDOM.GETTAGNAME parameters

| Parameter | Description               |
|-----------|---------------------------|
| elem      | Specified DOMELEMENT node |

**Example:**

```
-- Obtain the tag name of a DOMELEMENT node.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(DBE_XMLDOM.NEWDOMDOCUMENT(), 'root');
 value := DBE_XMLDOM.gettagname(elem);
 dbe_output.print_line('value: ');
 dbe_output.print_line(value);
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

- **DBE\_XMLDOM.HASCHILDNODES**

Checks whether the DOMNode object has any subnode. The prototype of the DBE\_XMLDOM.HASCHILDNODES function is as follows:

```
DBE_XMLDOM.HASCHILDNODES(
 n IN DOMNODE)
RETURN BOOLEAN;
```

**Table 10-355** DBE\_XMLDOM.HASCHILDNODES parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Specified DOMNode object |

**Example:**

```
-- Create a node named child1, mount it to the DOC tree, and add a node to child1. Then, check
whether the child1 node has any subnode.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc1 DBE_XMLDOM.DOMDocument;
 root DBE_XMLDOM.DOMELEMENT;
 child1 DBE_XMLDOM.DOMELEMENT;
 child2 DBE_XMLDOM.DOMELEMENT;
 attr DBE_XMLDOM.DOMAttr;
 text DBE_XMLDOM.DOMTEXT;
 node DBE_XMLDOM.DOMNODE;
 buf varchar2(1000);
BEGIN
 doc := DBE_XMLDOM.newDOMDocument();
 root := DBE_XMLDOM.createElement(doc, 'root');
 node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc),DBE_xmldom.makeNode(root));
 child1 := DBE_XMLDOM.createElement(doc, 'child1');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(root),
DBE_XMLDOM.makeNode(child1));
 child2 := DBE_XMLDOM.createElement(doc, 'child2');
 node := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(child1),
DBE_XMLDOM.makeNode(child2));
 IF DBE_XMLDOM.HASCHILDNODES(DBE_XMLDOM.makeNode(child1)) THEN
 DBE_OUTPUT.print_line('HAS CHILD NODES');
 ELSE
 DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
 END IF;
END;
```

- **DBE\_XMLDOM.IMPORTNODE**

Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown. The prototype of the DBE\_XMLDOM.IMPORTNODE function is as follows:

```
DBE_XMLDOM.IMPORTNODE(
 doc IN DOMDOCUMENT,
 importedNode IN DOMNODE,
 deep IN BOOLEAN)
RETURN DOMNODE;
```

**Table 10-356** DBE\_XMLDOM.IMPORTNODE parameters

| Parameter | Description                            |
|-----------|----------------------------------------|
| doc       | Document to which the node is mounted. |

| Parameter    | Description                                                                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| importedNode | Node to be imported.                                                                                                                                                                                                                          |
| deep         | Specifies whether to perform recursive import. <ul style="list-style-type: none"> <li>If the value is <b>TRUE</b>, the node and all its subnodes are imported.</li> <li>If the value is <b>FALSE</b>, the node itself is imported.</li> </ul> |

**Example:**

-- Obtain the **root2\_node** node in the **DOC2** tree, copy it, and mount it to the **DOC** tree.

```
DECLARE
 doc dbe_xmlDOM.domdocument;
 doc2 dbe_xmlDOM.domdocument;
 doc_node dbe_xmlDOM.domnode;
 doc2_node dbe_xmlDOM.domnode;
 root_node dbe_xmlDOM.domnode;
 root2_node dbe_xmlDOM.domnode;
 import_node dbe_xmlDOM.domnode;
 result_node dbe_xmlDOM.domnode;
 buffer varchar2(1010);
BEGIN
 doc := dbe_xmlDOM.newDOMdocument('<bookstore category="web" cover="paperback">
 <book category="cooking"><title lang="en">Everyday Italian</title>
 <author>Giada De Laurentiis</author><year>2005</year>
 <price>30.00</price></book></bookstore>');
 doc2 := dbe_xmlDOM.newDOMdocument('<case>LIANLI TU150</case>');
 doc_node := DBE_XMLDOM.MAKENODE(doc);
 doc2_node := DBE_XMLDOM.MAKENODE(doc2);
 root_node := DBE_XMLDOM.GETFIRSTCHILD(doc_node);
 root2_node := DBE_XMLDOM.GETFIRSTCHILD(doc2_node);
 DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
 dbe_output.print_line(buffer);
 import_node := DBE_XMLDOM.IMPORTNODE(doc, root2_node, TRUE);
 result_node := DBE_XMLDOM.APPENDCHILD(root_node, import_node);
 DBE_XMLDOM.WRITETOBUFFER(doc, buffer);
 dbe_output.print_line(buffer);
END;
/
```

- **DBE\_XMLDOM.ISNULL**

Checks whether the given DOMAttr node is null. If so, **TRUE** is returned. If not, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 a IN DOMATTR)
RETURN BOOLEAN;
```

Checks whether the given DOMDocument node is null. If so, **TRUE** is returned. If not, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 doc IN DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMELEMENT node is null. If so, **TRUE** is returned. If not, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 elem IN DOMELEMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMNamedNodeMap node is null. If so, **TRUE** is returned. If not, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 nnm IN DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks whether the given DOMNode node is null. If so, **TRUE** is returned. If not, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 n IN DOMNODE)
RETURN BOOLEAN;
```

Checks whether the given DOMNodeList node is null. If so, **TRUE** is returned. If not, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 nl IN DOMNODELIST)
RETURN BOOLEAN;
```

Checks whether the given DOMText node is null. If so, **TRUE** is returned. If not, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
 t IN DOMTEXT)
RETURN BOOLEAN;
```

**Table 10-357** DBE\_XMLDOM.ISNULL parameters

| Parameter | Description                     |
|-----------|---------------------------------|
| a         | Specified DOMAttr node.         |
| doc       | Specified DOMDocument node.     |
| elem      | Specified DOMELEMENT node.      |
| nnm       | Specified DOMNamedNodeMap node. |
| n         | Specified DOMNode node.         |
| nl        | Specified DOMNodeList node.     |
| t         | Specified DOMText node.         |

 **NOTE**

Due to the implementation difference of DBE\_XMLDOM.FREEDOCUMENT, an error is reported when the DBE\_XMLDOM.ISNULL API calls the freed DOMDocument node.

Example:

```
--2. Declare (but not initialize) a DOMELEMENT node and check whether the node is empty.
DECLARE
docelem DBE_XMLDOM.DOMELEMENT;
```

```
BEGIN
 if DBE_XMLDOM.ISNULL(docelem) then
 DBE_OUTPUT.print_line('null');
 else
 DBE_OUTPUT.print_line('not null');
 end if;
END;
/
```

- **DBE\_XMLDOM.ITEM**

Returns the element corresponding to the index in a list based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
 nl IN DOMNODELIST,
 index IN NUMBER)
RETURN DOMNODE;
```

Returns the element corresponding to the index in a map based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
 nnm IN DOMNAMEDNODEMAP,
 index IN NUMBER)
RETURN DOMNODE;
```

**Table 10-358** DBE\_XMLDOM.ITEM parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| nl        | Specified DOMNodeList object         |
| nnm       | Specified DOMNamedNodeMap object     |
| index     | Index of the element to be retrieved |

 **NOTE**

For improper input parameters such as Boolean and CLOB, the item function of the map type points to the value of the first index by default.

**Example:**

--1. Return the element corresponding to the index in a map based on the index.

```
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 elem DBE_XMLDOM.DOMELEMENT;
 map DBE_XMLDOM.DOMNAMEDNODEMAP;
 node DBE_XMLDOM.DOMNODE;
 node2 DBE_XMLDOM.DOMNODE;
 buf varchar2(1000);
BEGIN
 doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback"><book
category="cooking">
 <title lang="en">Everyday Italian</title><author>Giada De Laurentiis</author>
 <year>2005</year><price>30.00</price></book></bookstore>');
 elem := DBE_XMLDOM.GETDOCUMENTELEMENT(doc);
 node := DBE_XMLDOM.MAKENODE(elem);
 map := DBE_XMLDOM.GETATTRIBUTES(DBE_XMLDOM.getFirstChild(node));
 node2:= DBE_XMLDOM.item(map,0);
 DBE_XMLDOM.writeToBuffer(node2, buf);
 dbe_output.print_line(buf);
 dbe_xmldom.freedocument(doc);
 RAISE NOTICE '%', buf;
END;
```

```

/
--2. Return the element corresponding to the index in a list based on the index.
DECLARE
 doc dbe_xmlDOM.DOMDOCUMENT;
 node dbe_xmlDOM.DOMNODE;
 node1 dbe_xmlDOM.DOMNODE;
 nodelist DBE_XMLDOM.DOMNODELIST;
 len INTEGER;
 buffer1 VARCHAR2(1010);
BEGIN
 doc := dbe_xmlDOM.newDOMDOCUMENT('<bookstore category="web" cover="paperback"><book
category="cooking">
 <title lang="en">Everyday Italian</title><author>Giada De Laurentiis</author>
 <year>2005</year><price>30.00</price></book></bookstore>');
 node := dbe_xmlDOM.makeNode(doc);
 node := dbe_xmlDOM.GETFIRSTCHILD(node);
 node := dbe_xmlDOM.GETFIRSTCHILD(node);
 nodelist := DBE_XMLDOM.GETCHILDNODES(node);
 len := DBE_XMLDOM.GETLENGTH(nodelist);
 RAISE NOTICE 'len : %', len;
 node1 := DBE_XMLDOM.ITEM(nodelist, 0);
 IF DBE_XMLDOM.ISNULL(node1) THEN
 dbe_output.print_line('IS NULL');
 ELSE
 dbe_output.print_line('NOT NULL');
 END IF;
 dbe_xmlDOM.writetobuffer(node1, buffer1);
 dbe_output.print_line('buffer1: ');
 dbe_output.print_line(buffer1);
END;
/

```

- **DBE\_XMLDOM.MAKEELEMENT**

Returns the DOMElement object after conversion. The prototype of the DBE\_XMLDOM.MAKEELEMENT function is as follows:

```

DBE_XMLDOM.MAKEELEMENT(
 n IN DOMNODE)
RETURN DOMELEMENT;

```

**Table 10-359** DBE\_XMLDOM.MAKEELEMENT parameters

Parameter	Description
n	Specified DOMNode object

**Example:**

-- Forcibly convert the DOMNode node converted from the DOMElement type back to the DOMElement type.

```

DECLARE
 buf VARCHAR2(1000);
 doc DBE_XMLDOM.DOMDOCUMENT;
 elem DBE_XMLDOM.DOMELEMENT;
 elem2 DBE_XMLDOM.DOMELEMENT;
 node DBE_XMLDOM.DOMNODE;
BEGIN
 doc := DBE_XMLDOM.NEWDOMDOCUMENT();
 elem := DBE_XMLDOM.createElement(doc, 'aaa');
 node := DBE_XMLDOM.makeNode(elem);
 elem2 := DBE_XMLDOM.makeElement(node);
 buf := DBE_XMLDOM.GETNODENAME(DBE_XMLDOM.makeNode(elem2));
 DBE_OUTPUT.print_line(buf);
END;
/

```

- DBE\_XMLDOM.MAKENODE

Forcibly converts a specified DOMAttr node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 a IN DOMATTR)
RETURN DOMNODE;
```

Forcibly converts a specified DOMDocument node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 doc IN DOMDOCUMENT)
RETURN DOMNODE;
```

Forcibly converts a specified DOMELEMENT node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 elem IN DOMELEMENT)
RETURN DOMNODE;
```

Forcibly converts a specified DOMText node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(
 t IN DOMTEXT)
RETURN DOMNODE;
```

**Table 10-360** DBE\_XMLDOM.MAKENODE parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMELEMENT node
t	Specified DOMText node

 **NOTE**

Due to syntax restrictions, when DBE\_XMLDOM.MAKENODE is used as the return value of a function, it cannot be directly implemented by running the following command:

```
return DBE_XMLDOM.MAKENODE(doc);
```

You are advised to run the following command:

```
tmp_node := DBE_XMLDOM.MAKENODE(doc);
return tmp_node;
```

**Example:**

```
--4. Declare (but not initialize) a DOMText variable, and use it as the input parameter of MAKENODE.
DECLARE
text DBE_XMLDOM.DOMTEXT;
buf VARCHAR2(1000);
```

```

dom_node DBE_XMLDOM.DOMNODE;
BEGIN
 dom_node := DBE_XMLDOM.makeNode(text);
 buf := DBE_XMLDOM.GETNODENAME(dom_node);
 DBE_OUTPUT.print_line(buf);
END;
/

```

- **DBE\_XMLDOM.NEWDOMDOCUMENT**

Returns a new DOMDocument object. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;

```

Returns a new DOMDocument instance object created from the specified XMLType type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT(
 xmlDoc IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;

```

Returns a new DOMDocument instance object created from the specified CLOB type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT(
 cl IN CLOB)
RETURN DOMDOCUMENT;

```

**Table 10-361** DBE\_XMLDOM.NEWDOMDOCUMENT parameters

Parameter	Description
xmlDoc	Specified XMLType type
cl	Specified CLOB type

 **NOTE**

- The size of the input parameter must be less than 1 GB.
- Currently, external DTD parsing is not supported.
- The document created by NEWDOMDOCUMENT uses the UTF-8 character set by default.
- Each document parsed from the same XMLType instance is independent, and the modification of the document does not affect the XMLType.
- For details about the differences between our database ORAnd database ORA, see [DBE\\_XMLPARSER.PARSECLOB](#).

**Example:**

```

--1. Return a new DOMDocument object.
DECLARE
 doc dbe_xmlDOM.domdocument;
 buffer varchar2(1010);
BEGIN
 doc := dbe_xmlDOM.newdomdocument();
 dbe_xmlDOM.setdoctype(doc, 'note', 'sysid', 'pubid');
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
 dbe_xmlDOM.freedocument(doc);
END;
/

```

```
--2. Return a new DOMDocument instance object created from the specified CLOB type.
DECLARE
 doc dbexml.domdocument;
 buffer varchar2(1010);
BEGIN
 doc := dbexml.newdomdocument('<?xml version="1.0"?>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don't forget me this weekend!</body></note>');
 dbexml.writetobuffer(doc, buffer);
 db_output.print_line('buffer: ');
 db_output.print_line(buffer);
 dbexml.freedocument(doc);
END;
/

--3. Return a new DOMDocument instance object created from the specified XMLType type.
DECLARE
 doc dbexml.domdocument;
 xt xmltype;
 buffer varchar2(1010);
BEGIN
 xt := xmltype('<h:data xmlns:h="http://www.w3.org/TR/html4/">
 <h:da1 len="10">test namespace</h:da1>
 <h:da1>bbbbbbbbbb</h:da1>
 </h:data>');
 doc := dbexml.newdomdocument(xt);
 dbexml.writetobuffer(doc, buffer);
 db_output.print_line('buffer: ');
 db_output.print_line(buffer);
 dbexml.freedocument(doc);
END;
/
```

- **DBE\_XMLDOM.SETATTRIBUTE**

Sets the value of the DOMELEMENT attribute by name. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```
DBE_XMLDOM.SETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 value IN VARCHAR2);
```

Sets the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```
DBE_XMLDOM.SETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 value IN VARCHAR2,
 ns IN VARCHAR2);
```

**Table 10-362** DBE\_XMLDOM.SETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMELEMENT node
name	Attribute name
value	Attribute value
ns	Namespace

 **NOTE**

Multiple attributes can be added through the DBE\_XMLDOM.SETATTRIBUTE API. The attribute name cannot be null, and attributes with the same name cannot exist in the same DOMELEMENT node. If you want to add attributes with the same name, you should explicitly set a namespace for each attribute with the same name, but you are advised not to perform such operations. If an attribute exists in a namespace, the specified namespace must be displayed when you modify the attribute. Otherwise, the attribute with the same name is added.

**Example:**

```
--1. Set the value of the DOMELEMENT attribute by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

--2. Set the attribute values of a DOMELEMENT object by name and namespace URI.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
begin
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/

--3. Change the values of the DOMELEMENT attributes by name.
DECLARE
 doc dbe_xmldom.domdocument;
 elem dbe_xmldom.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
BEGIN
 doc := dbe_xmldom.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm');
 DBE_XMLDOM.setattribute(elem, 'len', '55cm');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmldom.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

```
--4. Change the values of the DOMElement attributes by name and namespace URI.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem dbe_xmlDOM.domelement;
 docnode DBE_XMLDOM.DOMNode;
 buffer varchar2(1010);
 value varchar(1000);
begin
 doc := dbe_xmlDOM.newDOMDocument();
 elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
 DBE_XMLDOM.setattribute(elem, 'len', '50cm', 'www.huawei.com');
 DBE_XMLDOM.setattribute(elem, 'len', '55cm', 'www.huawei.com');
 docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
END;
/
```

- DBE\_XMLDOM.SETCHARSET

Sets the character set for a DOMDocument object. The prototype of the DBE\_XMLDOM.SETCHARSET function is as follows:

```
DBE_XMLDOM.SETCHARSET(
 doc IN DOMDocument,
 charset IN VARCHAR2);
```

**Table 10-363** DBE\_XMLDOM.SETCHARSET parameters

Parameter	Description
doc	Specified DOMDocument node
charset	Character set

 **NOTE**

- The value of **charset** contains a maximum of 60 bytes.
- Currently, the following character sets are supported: UTF-8, UTF-16, UCS-4, UCS-2, ISO-8859-1, ISO-8859-2, ISO-8859-3, ISO-8859-4, ISO-8859-5, ISO-8859-6, ISO-8859-7, ISO-8859-8, ISO-8859-9, ISO-2022-JP, Shift\_JIS, EUC-JP and ASCII. If you enter other character sets, an error is reported or garbled characters may be displayed.

**Example:**

```
-- Set the UTF-16 character set for the DOC tree and print the DOC tree to the buffer.
DECLARE
 doc dbe_xmlDOM.domdocument;
 buffer varchar2(1010);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don"t forget me this weekend!</body></note>');
 dbe_xmlDOM.setcharset(doc, 'utf-16');
 dbe_xmlDOM.writetobuffer(doc, buffer);
 dbe_output.print_line('buffer: ');
 dbe_output.print_line(buffer);
 dbe_xmlDOM.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.SETDOCTYPE

Sets the external DTD of a DOMDocument object. The prototype of the DBE\_XMLDOM.SETDOCTYPE function is as follows:

```
DBE_XMLDOM.SETDOCTYPE(
doc IN DOMDocument,
name IN VARCHAR2,
sysid IN VARCHAR2,
pubid IN VARCHAR2);
```

**Table 10-364** DBE\_XMLDOM.SETDOCTYPE parameters

Parameter	Description
doc	Specified DOMDocument node
name	Name of the DOCTYPE to be initialized
sysid	ID of the system whose DOCTYPE needs to be initialized
pubid	Public ID of the DOCTYPE to be initialized

 **NOTE**

The total length of **name**, **sysid**, and **pubid** cannot exceed 32500 bytes.

**Example:**

-- After the initial system ID, public ID, and name are set for the external DTD of the DOMDocument, the DOC tree modified each time is output to the buffer.

```
DECLARE
doc dbe_xmldom.domdocument;
buffer varchar2(1010);
begin
doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don''t forget me this weekend!</body></note>');
dbe_xmldom.setdoctype(doc, 'note', 'sysid', 'pubid');
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_output.print_line('-----');
dbe_xmldom.setdoctype(doc, 'note', NULL, '');
dbe_xmldom.setdoctype(doc, 'note', NULL, '');
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_xmldom.freedocument(doc);
END;
```

- DBE\_XMLDOM.SETNODEVALUE

Sets the value of a node in the DOMNode object. The prototype of the DBE\_XMLDOM.SETNODEVALUE function is as follows:

```
DBE_XMLDOM.SETNODEVALUE(
n IN DOMNODE,
nodeValue IN VARCHAR2);
```

**Table 10-365** DBE\_XMLDOM.SETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object
nodeValue	String to be set in the DOMNode object

 **NOTE**

1. You can enter an empty string or null value for **nodeValue**, but the node value will not be changed.
2. Currently, **nodeValue** does not support the escape character '&'. If the character string contains the escape character, the node value will be cleared.
3. The default maximum length of **nodeValue** is restricted by the VARCHAR2 type and is 32767 bytes. If the length exceeds 32767 bytes, an exception is thrown.

**Example:**

-- After setting a node value different from the initial value for the DOMNode node that is converted from DOMText, obtain and output the node value.

```
DECLARE
 buf VARCHAR2(1000);
 doc DBE_XMLDOM.DOMDocument;
 text DBE_XMLDOM.DOMText;
 elem2 DBE_XMLDOM.DOMELEMENT;
 node DBE_XMLDOM.DOMNode;
BEGIN
 doc := DBE_XMLDOM.NEWDOMDOCUMENT();
 text := DBE_XMLDOM.createTextNode(doc, 'aaa');
 DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
 buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
 DBE_OUTPUT.print_line(buf);
END;
/
```

- **DBE\_XMLDOM.WRITETOBUFFER**

Writes an XML node to a specified buffer using the database character set.

The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
 doc IN DOMDOCUMENT,
 buffer INOUT VARCHAR2);
```

Writes an XML document to a specified buffer using the database character set. The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
 n IN DOMNODE,
 buffer INOUT VARCHAR2);
```

**Table 10-366** DBE\_XMLDOM.WRITETOBUFFER parameters

Parameter	Description
doc	Specified DOMDocument node
buffer	Buffer for the write operation
n	Specified DOMNode node

 **NOTE**

- The buffer to which the writetobuffer function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

**Example:**

```
--1. Enter a parameter of the DOMNode type.
DECLARE
 doc dbe_xmlDOM.domdocument;
 elem DBE_XMLDOM.DOMELEMENT;
 buf varchar2(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument();
 elem := dbe_xmlDOM.createelement(doc,'elem');
 DBE_XMLDOM.WRITETOBUFFER(dbe_xmlDOM.makenode(elem), buf);
 DBE_OUTPUT.print_line(buf);
END;
/

--2. Enter a parameter of the DOMDocument type.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 buf VARCHAR2(1000);
BEGIN
 doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
 <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don''t forget me this weekend!</body></note>');
 DBE_XMLDOM.WRITETOBUFFER(doc, buf);
 DBE_OUTPUT.print_line('doc: ');
 DBE_OUTPUT.print_line(buf);
 DBE_XMLDOM.FREEDOCUMENT(doc);
END;
/
```

- **DBE\_XMLDOM.WRITETOCLOB**

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 cl INOUT CLOB);
```

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 cl INOUT CLOB);
```

**Table 10-367** DBE\_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
cl	CLOB to be written
n	Specified DOMNode node

 NOTE

- The **doc** parameter is an input parameter. The CLOB to which the writetoclob function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

## Example:

--1. Enter a parameter of the DOMNode type.

```
DECLARE
 CL CLOB;
 N DBE_XMLDOM.DOMNODE;
BEGIN
 DBE_XMLDOM.WRITETOCLOB(N, CL);
 DBE_OUTPUT.PRINT_LINE(CL);
END;
/
```

--2. Enter a parameter of the DOMDocument type.

```
DECLARE
 doc dbe_xmldom.domdocument;
 mclob clob;
BEGIN
 doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
 <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
 <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
 <note><to>test</to><from>Jani</from><heading>Reminder</heading>
 <body>Don't forget me this weekend!</body></note>');
 dbe_xmldom.writetoclob(doc, mclob);
 dbe_output.print_line('mclob: ');
 dbe_output.print_line(mclob);
 dbe_xmldom.freedocument(doc);
END;
/
```

- DBE\_XMLDOM.WRITETOFILE

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 fileName IN VARCHAR2);
```

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 fileName IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set.

The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 fileName IN VARCHAR2,
 charset IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set.

The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 fileName IN VARCHAR2,
 charset IN VARCHAR2);
```

**Table 10-368** DBE\_XMLDOM.WRITETOFILE parameters

Parameter	Description
doc	Specified DOMDocument node
fileName	File to be written
n	Specified DOMNode node
charset	Specified character set

**NOTE**

- The **doc** parameter is an input parameter. The value of **filename** can contain a maximum of 255 bytes, and the value of **charset** can contain a maximum of 60 bytes. For details about the character sets supported by **charset**, see the [DBE\\_XMLDOM.SETCHARSET](#) API.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- If `newdomdocument()` is used to create a document without parameters, no error is reported when **charset** is not specified. The UTF-8 character set is used by default.
- The **filename** must be in the path created in **pg\_directory**. The backslash (\) in the filename will be converted to a slash (/). Only one slash (/) is allowed. The file name must be in the **pg\_directory\_name/file\_name.xml** format. The output file must be in the XML format.
- When the GUC parameter **safe\_data\_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe\_data\_path**.
- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory. For details about how to create a directory, see [CREATE DIRECTORY](#).

**Example:**

-- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory.

create directory dir as '/tmp';

--1. Write an XML node to a specified file using the database character set.

```
DECLARE
 FPATH VARCHAR2(1000);
 DOC DBE_XMLDOM.DOMDOCUMENT;
BEGIN
 DOC := DBE_XMLDOM.NEWDOMDOCUMENT('<ROOT>
 <A ATTR1="A_VALUE">
 <ACHILD>ACHILD TXT</ACHILD>

 B TXT
 <C/>
 </ROOT>');
 FPATH := 'dir/simplexml.xml';
 DBE_XMLDOM.WRITETOFILE(DOC, FPATH);
END;
/
```

--2. Write an XML document to a specified file using the specified character set.

```
DECLARE
 SRC VARCHAR(1000);
 FPATH VARCHAR2(1000);
 DOC DBE_XMLDOM.DOMDOCUMENT;
 ELE DBE_XMLDOM.DOMELEMENT;
```

```

BEGIN
 FPATH := 'dir/simplexml.xml';
 SRC := '<ROOT>
 <A ATTR1="A_VALUE">
 <ACHILD>ACHILD TXT</ACHILD>

 B TXT
 </C/>
</ROOT>';
 DOC := DBE_XMLDOM.NEWDOMDOCUMENT(SRC);
 ELE := DBE_XMLDOM.GETDOCUMENTELEMENT(DOC);
 DBE_XMLDOM.WRITETOFILE(DBE_XMLDOM.MAKENODE(ELE), FPATH, 'ASCII');
 DBE_XMLDOM.FREEDOCUMENT(DOC);
END;
/
drop directory dir;

```

- **DBE\_XMLDOM.GETSESSIONTREENUM**

Queries the number of DOM trees of all types in the current session. The prototype of the DBE\_XMLDOM.GETSESSIONTREENUM function is as follows:

```

DBE_XMLDOM.GETSESSIONTREENUM()
RETURN INTEGER;

```

 **NOTE**

For DOM trees that have used FREEElement and FREENode, this function still counts them.

**Example:**

-- Create three documents and obtain the number of DOM trees in the current session.

```

DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc2 DBE_XMLDOM.DOMDocument;
 doc3 DBE_XMLDOM.DOMDocument;

 buffer varchar2(1010);
BEGIN
 -- Create three documents.
 doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
 <elem1 attr="attrtest">
 <elem2>Im text</elem2>
 <elem3>Im text too</elem3>
 </elem1>
 <elem4>Text</elem4>
</root>
');
 doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">
 <cpu>Ryzen 9 3950X</cpu>
 <ram>32GBx2 DDR4 3200MHz</ram>
 <motherboard>ROG X570i</motherboard>
 <gpu>RTX2070 Super</gpu>
 <ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
 <hdd>12TB WD Digital</hdd>
 <psu>CORSAIR SF750</psu>
 <case>LIANLI TU150</case>
</computer>
');
 doc3 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<bookstore>
 <book genre="autobiography" publicationdate="1981" ISBN="1-861003-11-0">
 <title>The Autobiography of Benjamin Franklin</title>
 <author>
 <first-name>Benjamin</first-name>
 <last-name>Franklin</last-name>
 </author>
 <price>8.99</price>
 </book>

```

```

<book genre="novel" publicationdate="1967" ISBN="0-201-63361-2">

 <price>9.99</price>
</book>
</bookstore>
');

-- Print IDs.
DBE_OUTPUT.PRINT_LINE(doc.id);
DBE_OUTPUT.PRINT_LINE(doc2.id);
DBE_OUTPUT.PRINT_LINE(doc3.id);
-- Call functions and print them.
DBE_OUTPUT.PRINT_LINE(DBE_XMLDOM.GETSESSIONTREENUM());
-- Release the documents.
DBE_XMLDOM.FREEDOCUMENT(doc);
DBE_XMLDOM.FREEDOCUMENT(doc2);
DBE_XMLDOM.FREEDOCUMENT(doc3);
END;
/

```

- **DBE\_XMLDOM.GETDOCTREESINFO**

Queries the DOM tree information of the document type in the current session, such as the memory usage. The prototype of the DBE\_XMLDOM.GETDOCTREESINFO function is as follows:

```

DBE_XMLDOM.GETDOCTREESINFO()
RETURN VARCHAR2;

```

#### NOTE

This function collects statistics only on DOM tree nodes of the document type.

#### Example:

```

-- Create three documents and obtain the information about the document tree in the current session.
DECLARE
 doc DBE_XMLDOM.DOMDocument;
 doc2 DBE_XMLDOM.DOMDocument;
 doc3 DBE_XMLDOM.DOMDocument;

 buffer varchar2(1010);
BEGIN
 -- Create three documents.
 doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
 <elem1 attr="attrtest">
 <elem2>Im text</elem2>
 <elem3>Im text too</elem3>
 </elem1>
 <elem4>Text</elem4>
</root>
');
 doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">
 <cpu>Ryzen 9 3950X</cpu>
 <ram>32GBx2 DDR4 3200MHz</ram>
 <motherboard>ROG X570i</motherboard>
 <gpu>RTX2070 Super</gpu>
 <ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
 <hdd>12TB WD Digital</hdd>

```

```

<psu>CORSAIR SF750</psu>
<case>LIANLI TU150</case>
</computer>
');
doc3 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<bookstore>
 <book genre="autobiography" publicationdate="1981" ISBN="1-861003-11-0">

');

-- Print IDs.
DBE_OUTPUT.PRINT_LINE(doc.id);
DBE_OUTPUT.PRINT_LINE(doc2.id);
DBE_OUTPUT.PRINT_LINE(doc3.id);
-- Call functions and print them.
DBE_OUTPUT.PRINT_LINE(DBE_XMLDOM.GETDOCTREESINFO());
-- Release the documents.
DBE_XMLDOM.FREEDOCUMENT(doc);
DBE_XMLDOM.FREEDOCUMENT(doc2);
DBE_XMLDOM.FREEDOCUMENT(doc3);
END;
/

```

- DBE\_XMLDOM.GETDETAILDOCTREEINFO

Queries the number of subnodes of each type in the transferred document. The prototype of the DBE\_XMLDOM.GETDETAILDOCTREEINFO function is as follows:

```

DBE_XMLDOM.GETDETAILDOCTREEINFO(
 doc IN DOMDOCUMENT
)
RETURN VARCHAR2;

```

**Table 10-369** DBE\_XMLDOM.GETDETAILDOCTREEINFO parameters

Parameter	Description
doc	Specified DOMDocument node

 **NOTE**

This function collects statistics only on DOM tree nodes of the document type.

**Example:**

```
-- Create three documents and use this function to obtain the number of nodes of each type in each document.
DECLARE
doc DBE_XMLDOM.DOMDocument;
doc2 DBE_XMLDOM.DOMDocument;
doc3 DBE_XMLDOM.DOMDocument;

buffer varchar2(1010);
BEGIN
-- Create three documents.
doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<root>
 <elem1 attr="attrtest">
 <elem2>Im text</elem2>
 <elem3>Im text too</elem3>
 </elem1>
 <elem4>Text</elem4>
</root>
');
doc2 := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>
<computer size="ITX" price="19999">
 <cpu>Ryzen 9 3950X</cpu>
 <ram>32GBx2 DDR4 3200MHz</ram>
 <motherboard>ROG X570i</motherboard>
 <gpu>RTX2070 Super</gpu>
 <ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>

/

```

### 10.11.2.14 DBE\_XMLPARSER

#### API Description

The DBE\_XMLPARSER API is used to deserialize XML character strings and convert the character strings that store XML documents to document nodes. [Table 10-370](#) lists all APIs supported by the DBE\_XMLPARSER advanced package.

The XMLParser data type can be used to store XMLParser data. The maximum number of XMLParser data records that can be stored is 16777215. The XMLPARSER data type can parse and create the DOMDocument node according to the input character string. The advanced package also provides the corresponding set and get APIs to perform operations on the constraint attributes of the parsing process.

#### NOTE

When the DBE\_XMLPARSER advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

The DBE\_XMLPARSER advanced package supports only the O-compatible mode.

**Table 10-370** DBE\_XMLPARSER parameters

API	Description
<a href="#">DBE_XMLPARSER.FREEPARSER</a>	Frees a parser.
<a href="#">DBE_XMLPARSER.GETDOCUMENT</a>	Obtains the parsed document node.
<a href="#">DBE_XMLPARSER.GETVALIDATIONMODE</a>	Obtains the validation attribute.
<a href="#">DBE_XMLPARSER.NEWPARSER</a>	Creates a parser instance.
<a href="#">DBE_XMLPARSER.PARSEBUFFER</a>	Parses the VARCHAR string.
<a href="#">DBE_XMLPARSER.PARSECLOB</a>	Parses the CLOB string.
<a href="#">DBE_XMLPARSER.SETVALIDATIONMODE</a>	Sets the validation attribute.

- [DBE\\_XMLPARSER.FREEPARSER](#)  
Frees a given parser object.  
The stored procedure prototype of [DBE\\_XMLPARSER.FREEPARSER](#) is as follows:

```
DBE_XMLPARSER.FREEPARSER (
 p IN parser);
```

**Table 10-371** DBE\_XMLPARSER.FREEPARSER parameters

Parameter	Description
p	Parser object

**Example:**

```
-- Create a parser and then release it.
DECLARE
 l_parser dbe_xmlparser.parser;
BEGIN
 l_parser := dbe_xmlparser.newparser();
-- Directly release the l_parser instance.
 dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- **DBE\_XMLPARSER.GETDOCUMENT**

Returns the root node of the DOM tree document constructed by the parser. This function can be called only after the document is parsed.

The prototype of the DBE\_XMLPARSER.GETDOCUMENT function is as follows:

```
DBE_XMLPARSER.GETDOCUMENT (
 p IN parser)
RETURN DOMDocument;
```

**Table 10-372** DBE\_XMLPARSER.GETDOCUMENT parameters

Parameter	Description
p	Parser object

 **NOTE**

- If the GETDOCUMENT function has no input parameter, an error is reported.
- If the **parser** parameter of the GETDOCUMENT function is null, **NULL** is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, **NULL** is returned.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
 buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
 buffer2 varchar2;
```

```

BEGIN
L_parser := dbe_xmlparser.newparser();
dbe_xmlparser.PARSEBUFFER(L_parser, buffer);
L_doc := dbe_xmlparser.getdocument(L_parser);
-- The L_parser parses the character string and obtains the DOMDocument node through
GETDOCUMENT.
dbe_xmldom.writetobuffer(L_doc, buffer2);
RAISE NOTICE '%', buffer2;
-- Print the content in L_doc.
dbe_xmlparser.freeparser(L_parser);
dbe_xmldom.freedocument(L_doc);
END;
/

```

**Execution result:**

```

NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>

```

- **DBE\_XMLPARSER.GETVALIDATIONMODE**

Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the DBE\_XMLPARSER.GETVALIDATIONMODE function is as follows:

```

DBE_XMLPARSER.GETVALIDATIONMODE (
p IN parser)
RETURN BOOLEAN;

```

**Table 10-373** DBE\_XMLPARSER.GETVALIDATIONMODE parameters

Parameter	Description
p	Parser object

**Example:**

```

-- Create a parser and use GETVALIDATIONMODE to check whether the parser validation mode is
enabled.
DECLARE
L_parser dbe_xmlparser.parser;
BEGIN
L_parser := dbe_xmlparser.newparser();
if (dbe_xmlparser.GETVALIDATIONMODE(L_parser) = true) then
RAISE NOTICE 'validation';
else
RAISE NOTICE 'no validation';
end if;
dbe_xmlparser.freeparser(L_parser);
END;
/

```

**Execution result:**

```

NOTICE: validation

```

- **DBE\_XMLPARSER.NEWPARSER**

Creates a parser object and returns a new parser instance.

The prototype of the DBE\_XMLPARSER.NEWPARSER function is as follows:

```
DBE_XMLPARSER.NEWPARSER
RETURN Parser;
```

**Example:**

```
-- Create a parser to parse character strings and then free the parser.
DECLARE
-- Create a parser.
l_parser dbe_xmlparser.parser;
l_doc dbe_xmldom.domdocument;
buffer varchar2(1000) :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
buffer2 varchar2(1000);
BEGIN
l_parser := dbe_xmlparser.newparser();
-- Parse the document and create a new DOM document.
dbe_xmlparser.PARSEBUFFER(l_parser, buffer);

dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- **DBE\_XMLPARSER.PARSEBUFFER**

Parses XML documents stored in strings.

The stored procedure prototype of DBE\_XMLPARSER.PARSEBUFFER is as follows:

```
DBE_XMLPARSER.PARSEBUFFER (
p IN parser,
doc IN VARCHAR2);
```

**Table 10-374** DBE\_XMLPARSER.PARSEBUFFER parameters

Parameter	Description
p	Parser object
doc	A string that stores XML documents

 NOTE

- The maximum length of a character string that can be parsed by the PARSEBUFFER function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;**; are parsed and translated into ' and ". However, predefined entities in ORA database are not translated into characters.

## Example:

```
-- Create a parser to parse character strings and print the obtained document.
```

```
DECLARE
 l_parser dbexmlparser.parser;
 l_doc dbexmlDOM.domdocument;
 buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
 buffer2 varchar2;
BEGIN
 l_parser := dbexmlparser.newparser();
 dbexmlparser.PARSEBUFFER(l_parser, buffer);
 l_doc := dbexmlparser.getdocument(l_parser);

 dbexmlDOM.writetobuffer(l_doc, buffer2);
 RAISE NOTICE '%', buffer2;

 dbexmlparser.freeparser(l_parser);
 dbexmlDOM.freedocument(l_doc);
END;
/
```

## Execution result:

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- **DBE\_XMLPARSER.PARSECLOB**

Parses XML documents stored in a CLOB.

The stored procedure prototype of DBE\_XMLPARSER.PARSECLOB is as follows:

```
DBE_XMLPARSER.PARSECLOB (
 p IN parser,
 doc IN CLOB);
```

**Table 10-375** DBE\_XMLPARSER.PARSECLOB parameters

Parameter	Description
p	Parser object
doc	A CLOB that stores XML documents

 **NOTE**

- PARSECLOB cannot parse CLOBs larger than 1 GB.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in ORA database are not translated into characters.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
L_clob clob :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>';
-- Create a parser.
L_parser dbe_xmlparser.parser;
L_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
BEGIN
L_parser := dbe_xmlparser.newparser();
-- Parse the document and create a new DOM document.
dbe_xmlparser.parseclob(L_parser, L_clob);
L_doc := dbe_xmlparser.getdocument(L_parser);
dbe_xmldom.writetobuffer(L_doc, buffer);
RAISE NOTICE '%',buffer;

dbe_xmlparser.freeparser(L_parser);
dbe_xmldom.freedocument(L_doc);

END;
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
```

```
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>
```

- DBE\_XMLPARSER.SETVALIDATIONMODE

Sets the parsing validation mode of a specified parser.

The stored procedure prototype of DBE\_XMLPARSER.SETVALIDATIONMODE is as follows:

```
DBE_XMLPARSER.SETVALIDATIONMODE(
 p IN parser)
yes IN BOOLEAN);
```

**Table 10-376** DBE\_XMLPARSER.SETVALIDATIONMODE parameters

Parameter	Description
p	Parser object
yes	Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE</b>: DTD validation is enabled.</li> <li>• <b>FALSE</b>: DTD validation is disabled.</li> </ul>

 **NOTE**

- If the input parameter **yes** of the SETVALIDATIONMODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

**Example 1:**

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- If setValidationMode is set to false, the string can be parsed. If setValidationMode is set to true,
an error is reported during parsing.
DECLARE
 l_clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
 l_parser dbe_xmlparser.parser;
 l_doc dbe_xmldom.domdocument;
 buffer varchar2(1000);
BEGIN
 l_parser := dbe_xmlparser.newparser();
 -- Set it to false for parsing.
 dbe_xmlparser.setValidationMode(l_parser, false);
 dbe_xmlparser.parseclob(l_parser, l_clob);
 l_doc := dbe_xmlparser.getdocument(l_parser);
 dbe_xmldom.writetobuffer(l_doc, buffer);
 RAISE NOTICE '%', buffer;
 dbe_xmlparser.freeparser(l_parser);
```

```
 dbe_xmldom.freedocument(L_doc);
END;
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE note [
<!ELEMENT note (to , from , heading , body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
>]
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>
```

**Example 2:**

```
-- Parse a parser. The XML character string to be parsed does not match the DTD format.
-- An error is reported during parsing after setValidationMode is set to true.
DECLARE
 L_clob clob :=
 '<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
>]
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
 L_parser dbe_xmlparser.parser;
 L_doc dbe_xmldom.domdocument;
 buffer varchar2(1000);
BEGIN
 L_parser := dbe_xmlparser.newparser();
 -- Set it to true for parsing.
 --The XML character string does not match the DTD format. An error is expected.
 dbe_xmlparser.setValidationMode(L_parser, true);
 dbe_xmlparser.parseclob(L_parser, L_clob);
 L_doc := dbe_xmlparser.getdocument(L_parser);
 dbe_xmldom.writetobuffer(L_doc, buffer);
 dbe_xmlparser.freeparser(L_parser);
 dbe_xmldom.freedocument(L_doc);
END;
/
```

**Execution result:**

```
An error is reported during xmlparser parsing.
ERROR: invalid XML document
```

## 10.12 Retry Management

Retry is a process in which the database executes a SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. The database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE retry_basic (IN x INT)
AS
BEGIN
 INSERT INTO t1 (a) VALUES (x);
 INSERT INTO t1 (a) VALUES (x+1);
END;
/
gaussdb=# CALL retry_basic(1);
```

## 10.13 Debugging

### Syntax

RAISE has the following five syntax formats:

Figure 10-34 raise\_format::=

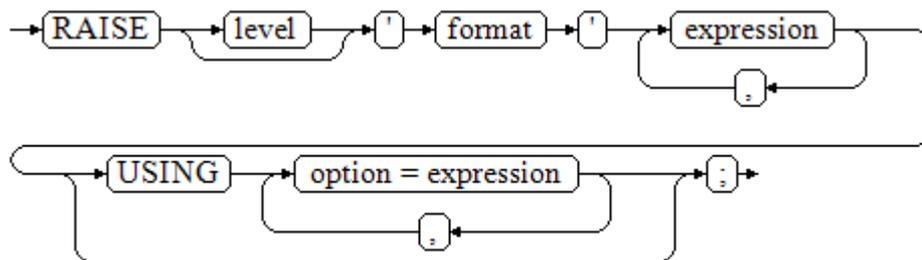

Figure 10-35 raise\_condition::=

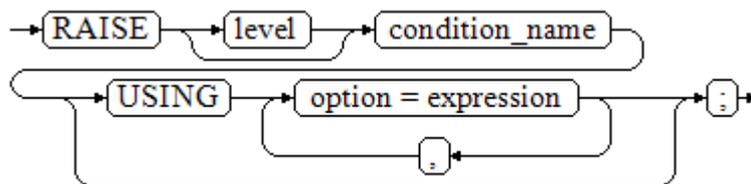

Figure 10-36 raise\_sqlstate::=

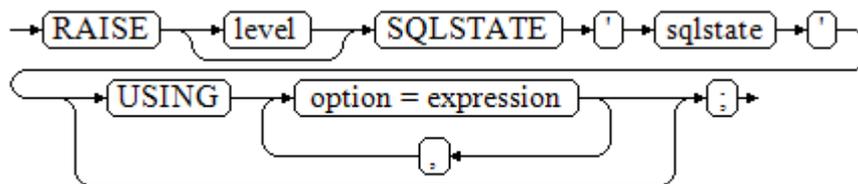

Figure 10-37 raise\_option::=

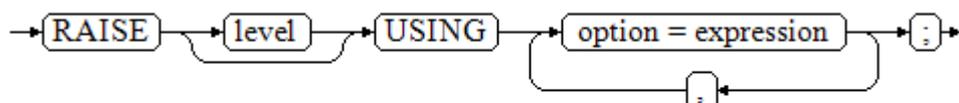

Figure 10-38 raise::=

**Parameter description:**

- The **level** option is used to specify the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The GUC parameters **log\_min\_messages** and **client\_min\_messages** control whether the error messages of specific levels are reported to the client and are written to the server log.
- **format**: specifies the error message text to be reported, a format string. The format string can be appended with an expression for insertion to the message text. In a format string, **%** is replaced by the parameter value attached to format and **%%** is used to print **%**. For example:  
--v\_job\_id replaces % in the string.  

```
RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;
```
- **option = expression**: inserts additional information to an error report. The **keyword** option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE**: specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL**: specifies detailed information of an error.
  - **HINT**: prints hint information.
  - **ERRCODE**: designates an error code (SQLSTATE) to a report. A condition name or a five-character SQLSTATE error code can be used.
- **condition\_name**: specifies the condition name corresponding to the error code.
- **sqlstate**: specifies the error code.

If neither a condition name nor an SQLSTATE is specified in the **RAISE EXCEPTION** command, the **RAISE EXCEPTION (P0001)** is used by default. If no message text is specified, the condition name or SQLSTATE is used as the message text by default.

**NOTICE**

- If the SQLSTATE specifies an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII uppercase rather than **00000**. Do not use an error code ended with three zeros because such error codes are category codes and can be captured by the whole category.
- In O-compatible mode, SQLCODE is equivalent to SQLSTATE.

 NOTE

The syntax described in [Figure 10-38](#) does not append any parameter. This form is used only for the **EXCEPTION** statement in a **BEGIN** block so that the error can be re-processed.

## Examples

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result
ERROR: Noexistence ID --> 300011
HINT: Please check your user ID
```

Two methods are available for setting SQLSTATE:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result
ERROR: Duplicate user ID: 300011
SQLSTATE: 23505
```

If the main parameter is a condition name or SQLSTATE, the following applies:

```
RAISE division_by_zero;
```

```
RAISE SQLSTATE '22012';
```

For example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
BEGIN
IF dividend=0 THEN
RAISE division_by_zero;
RETURN;
ELSE
res := div/dividend;
RAISE INFO 'division result: %', res;
RETURN;
END IF;
END;
/

call division(3,0);

-- Execution result
ERROR: division_by_zero
```

Alternatively:

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

# 11 Autonomous Transaction

An autonomous transaction is an independent transaction that is started during the execution of a primary transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. In addition, an autonomous transaction is not affected by the primary transaction.

Autonomous transactions are defined in stored procedures, functions, and anonymous blocks, and are declared using the **PRAGMA AUTONOMOUS\_TRANSACTION** keyword.

## 11.1 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. The following is an example.

```
-- Create a table.
gaussdb=# create table t2(a int, b int);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# insert into t2 values(1,2);
INSERT 0 1
gaussdb=# select * from t2;
 a | b
---+---
 1 | 2
(1 row)

-- Create a stored procedure that contains an autonomous transaction.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_4(a int, b int) AS
DECLARE
 num3 int := a;
 num4 int := b;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t2 values(num3, num4);
 db_output.print_line('just use call.');
```

```
-- Create a common stored procedure that calls an autonomous transaction stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_5(a int, b int) AS
DECLARE
BEGIN
 dbe_output.print_line('just no use call. ');
 insert into t2 values(666, 666);
 autonomous_4(a,b);
 rollback;
END;
/
CREATE PROCEDURE
-- Call a common stored procedure.
gaussdb=# select autonomous_5(11,22);
just no use call.
just use call.
autonomous_5

(1 row)
-- View the table result.
gaussdb=# select * from t2 order by a;
 a | b
----+----
 1 | 2
 11 | 22
(2 rows)
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.2 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an anonymous block. The following is an example.

```
gaussdb=# create table t1(a int ,b text);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# START TRANSACTION;
START TRANSACTION
gaussdb=# DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 dbe_output.print_line('just use call. ');
 insert into t1 values(1,'you are so cute,will commit!');
END;
/
just use call.
ANONYMOUS BLOCK EXECUTE
gaussdb=# insert into t1 values(1,'you will rollback!');
INSERT 0 1
gaussdb=# rollback;
ROLLBACK

gaussdb=# select * from t1;
 a | b
```

```
-----+-----
1 | you are so cute,will commit!
(1 row)
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.3 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. The following is an example.

```
gaussdb=# create table t4(a int, b int, c text);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# CREATE OR REPLACE function autonomous_32(a int ,b int ,c text) RETURN int AS
DECLARE
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 insert into t4 values(a, b, c);
 return 1;
END;
/

gaussdb=# CREATE OR REPLACE function autonomous_33(num1 int) RETURN int AS
DECLARE
 num3 int := 220;
 tmp int;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
 num3 := num3/num1;
 return num3;
EXCEPTION
 WHEN division_by_zero THEN
 select autonomous_32(num3, num1, sqlerrm) into tmp;
 return 0;
END;
/
CREATE FUNCTION

gaussdb=# select autonomous_33(0);
autonomous_33
-----+-----
0
(1 row)

gaussdb=# select * from t4;
a | b | c
-----+-----
220 | 0 | division by zero
(1 row)
```

## 11.4 Restrictions

### CAUTION

- When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max\_concurrent\_autonomous\_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 10000, and the default value is **10**.
- When **max\_concurrent\_autonomous\_transactions** is set to **0**, autonomous transactions cannot be executed.
- After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.
- Theoretically, the upper limit of autonomous transactions is 10000. Actually, the upper limit is a dynamic value. For details, see the description of the GUC parameter **max\_concurrent\_autonomous\_transactions**.
- Autonomous transactions are affected by the communication buffer. The size of the information returned to the client is limited by the length of the communication buffer. If the size exceeds the length of the communication buffer, an error is reported.
- During the execution of an autonomous transaction, the primary transaction adds a lock to the autonomous transaction. If this lock remains due to an exception, the residual lock needs to be cleared by **gs\_clean**. The clearing period is controlled by the GUC parameter **gs\_clean\_timeout**, and the default value is 60 seconds. The lock of an autonomous transaction is not affected by lock timeout. The lock timeout interval is 2,147,483 seconds. If the execution time of an autonomous transaction exceeds this interval, an error is reported, indicating that the lock times out.
- For an autonomous transaction, the connection timeout interval is 5s and the number of connection attempts is 5. Signals are not responded to immediately during connection establishment. Signals are checked before each connection attempt. Timeout errors may occur in high concurrency, high CPU usage, high memory usage, and thread pool scale-out scenarios.

- A trigger function does not support autonomous transactions.

```
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 int, id2 int, id3 int);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'id1' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
```

```
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
INSERT INTO test_trigger_des_tbl VALUES(new.id1, new.id2, new.id3);
RETURN new;END$$ LANGUAGE plpgsql;
ERROR: Triggers do not support autonomous transactions
DETAIL: N/A
```

```
gaussdb=# DROP TABLE test_trigger_des_tbl;
DROP TABLE
```

- Autonomous transactions cannot be called by non-top-layer anonymous blocks (but can only be called by top-layer autonomous transactions, including stored procedures, functions, and anonymous blocks).

```
gaussdb=# CREATE TABLE t1(a INT ,b TEXT);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
```

```
gaussdb=# DECLARE
--PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
DBE_OUTPUT.PRINT_LINE('JUST USE CALL.');
```

```
INSERT INTO t1 VALUES(1,'CAN YOU ROLLBACK!');
END;
INSERT INTO t1 VALUES(2,'I WILL ROLLBACK!');
ROLLBACK;
END;
/
JUST USE CALL.
ANONYMOUS BLOCK EXECUTE
```

```
gaussdb=# SELECT * FROM t1;
a | b
----+----
(0 rows)
```

```
gaussdb=# DROP TABLE t1;
DROP TABLE
```

- Autonomous transactions do not support **ref\_cursor** parameter transfer.

```
gaussdb=# create table sections(section_ID int);
gaussdb=# insert into sections values(1);
```

```
gaussdb=# CREATE OR REPLACE function proc_sys_ref()
return SYS_REFCURSOR
```

```
IS
declare
PRAGMA AUTONOMOUS_TRANSACTION;
C1 SYS_REFCURSOR;
BEGIN
OPEN C1 FOR SELECT section_ID FROM sections ORDER BY section_ID;
return C1;
END;
```

```
/
ERROR: Autonomous function do not support ref cursor as return types or out, inout arguments.
DETAIL: N/A
```

```
gaussdb=# CREATE OR REPLACE function proc_sys_ref(OUT C2 SYS_REFCURSOR, OUT a int)
return SYS_REFCURSOR
```

```
IS

# 12 System Catalogs and System Views

---

## 12.1 Overview of System Catalogs and System Views

System catalogs store structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query the system catalogs and internal database status.

System catalogs and views are visible to either system administrators or all users. Some system catalogs and views have marked the need of administrator permissions, so they are accessible only to administrators.

You can delete and re-create system catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

---

### NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
  - Do not add, delete, or modify system catalogs because doing so will result in exceptions or even cluster unavailability.
  - System catalogs and views do not support foreign key-related columns.
  - For details about column types in system catalogs and system views, see [Data Type](#).
- 

## 12.2 System Catalogs

## 12.2.1 GS\_AUDITING\_POLICY

**GS\_AUDITING\_POLICY** records the main information about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-1** GS\_AUDITING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	The latest timestamp when a policy is created or modified
polenabled	boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled.</li><li>• <b>f</b> (false): disabled.</li></ul>

## 12.2.2 GS\_AUDITING\_POLICY\_ACCESS

**GS\_AUDITING\_POLICY\_ACCESS** records the DML database operations about the unified audit. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-2** GS\_AUDITING\_POLICY\_ACCESS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
accesstype	name	DML database operation type, for example, <b>SELECT</b> , <b>INSERT</b> , and <b>DELETE</b> .
labelname	name	Specifies the resource label name, which corresponds to the <b>polname</b> column in the <a href="#">GS_AUDITING_POLICY</a> system catalog.

Name	Type	Description
policyoid	oid	OID of the audit policy, which corresponds to the OID in the <a href="#">12.2.1 GS_AUDITING_POLICY</a> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

### 12.2.3 GS\_AUDITING\_POLICY\_FILTERS

**GS\_AUDITING\_POLICY\_FILTERS** records the filtering policies about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-3** GS\_AUDITING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
labelname	name	Name. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of the audit policy, corresponding to the OID in the system catalog in <a href="#">GS_AUDITING_POLICY</a> .
modifydate	timestamp without time zone	Latest creation or modification timestamp.
logicaloperator	text	Logical character string of a filter criterion.

### 12.2.4 GS\_AUDITING\_POLICY\_PRIVILEGES

**GS\_AUDITING\_POLICY\_PRIVILEGES** records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-4** GS\_AUDITING\_POLICY\_PRIV columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
privilege_type	name	DDL database operation type, for example, <b>CREATE</b> , <b>ALTER</b> , and <b>DROP</b> .
labelname	name	Resource label name, which corresponds to the <b>polname</b> column in the <a href="#">12.2.1 GS_AUDITING_POLICY</a> system catalog.
policyoid	oid	Corresponds to OIDs in the <a href="#">12.2.1 GS_AUDITING_POLICY</a> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

## 12.2.5 GS\_ASP

GS\_ASP displays the persistent ACTIVE SESSION PROFILE samples. This system catalog can be queried only in the system library.

**Table 12-5** GS\_ASP columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks. <ul style="list-style-type: none"><li>● <b>t (true)</b>: yes.</li><li>● <b>f (false)</b>: no.</li></ul>
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Specified event name.

Name	Type	Description
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of the application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID indicates a CN from which the unique SQL statement is obtained. The <b>cn_id</b> is in the key of the unique query.
unique_query	text	Standardized unique SQL text string
locktag	text	Information of a lock that the session waits for. It can be parsed using <b>locktag_decode</b> .
lockmode	text	Mode of a lock that the session waits for. <ul style="list-style-type: none"><li>● <b>LW_EXCLUSIVE</b>: exclusive lock.</li><li>● <b>LW_SHARED</b>: shared lock.</li><li>● <b>LW_WAIT_UNTIL_FREE</b>: waits for the <b>LW_EXCLUSIVE</b> to be available.</li></ul>

Name	Type	Description
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The options are as follows: <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction. However, no statement is being executed in the transaction.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>

## 12.2.6 GS\_CLIENT\_GLOBAL\_KEYS

**GS\_CLIENT\_GLOBAL\_KEYS** records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

**Table 12-6** GS\_CLIENT\_GLOBAL\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_name	name	CMK name
key_namespace	oid	A namespace OID that contains this CMK

Name	Type	Description
key_owner	oid	CMK owner
key_acl	aclitem[]	Access permissions that this key should have on creation
create_date	timestamp without time zone	Time when a key is created

## 12.2.7 GS\_CLIENT\_GLOBAL\_KEYS\_ARGS

**GS\_CLIENT\_GLOBAL\_KEYS\_ARGS** records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-7** GS\_CLIENT\_GLOBAL\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_id	oid	CMK OID
function_name	name	The value is <b>encryption</b> .
key	name	CMK metadata name
value	bytea	Value of the CMK metadata name

## 12.2.8 GS\_COLUMN\_KEYS

**GS\_COLUMN\_KEYS** records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

**Table 12-8** GS\_COLUMN\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_name	name	CEK name
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK
global_key_id	oid	A foreign key, which is the CMK OID.

Name	Type	Description
key_namespace	oid	A namespace OID that contains this CEK
key_owner	oid	CEK owner
create_date	timestamp without time zone	Time when a CEK is created
key_acl	aclitem[]	Access permissions that this CEK should have on creation

## 12.2.9 GS\_COLUMN\_KEYS\_ARGS

**GS\_COLUMN\_KEYS\_ARGS** records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-9** GS\_COLUMN\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_id	oid	CEK OID
function_name	name	The value is <b>encryption</b> .
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

## 12.2.10 GS\_DATABASE\_LINK

**GS\_DATABASE\_LINK** stores database link information, mainly recording detailed information about database links. Only sysadmin can read this system catalog. Currently, the database link function is not supported.

**Table 12-10** GS\_DATABASE\_LINK columns

Name	Type	Description
oid	oid	Unique ID of the current database link object (hidden attribute, which must be specified).
dlname	name	Name of the current database link.
downer	oid	ID of the owner of the current database link. If the owner is <b>public</b> , the value is <b>0</b> .

Name	Type	Description
dlfdw	oid	OID of the foreign-data wrapper of the current database link.
dlcreator	oid	ID of the creator of the current database link.
options	text[]	Current database link connection information in the format of "keyword=value".
useroptions	text[]	User information used by the current database link to connect to the remote end, in the format of "keyword=value".
dlacl	aclitem[]	Current database link access permission.

## 12.2.11 GS\_DB\_PRIVILEGE

**GS\_DB\_PRIVILEGE** records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-11** GS\_DB\_PRIVILEGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roleid	oid	User ID
privilege_type	text	ANY permission of a user. For details about the value, see <a href="#">Table 7-166</a> .
admin_option	boolean	Whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted <ul style="list-style-type: none"> <li>• t: yes</li> <li>• f: no</li> </ul>

## 12.2.12 GS\_DEPENDENCIES

**GS\_DEPENDENCIES** records object dependency information and has a one-to-many relationship with [12.2.13 GS\\_DEPENDENCIES\\_OBJ](#).

**Table 12-12** GS\_DEPENDENCIES columns

Name	Type	Description
schemaname	name	Name of a namespace
refobjpos	integer	Position of the referenced object <ul style="list-style-type: none"> <li>• 1: type</li> <li>• 2: package header</li> <li>• 4: function header</li> <li>• 8: function body</li> <li>• 16: package body</li> <li>• 32: view</li> </ul>
refobjoid	oid	OID of the referenced object
objectname	text	Name of the dependent object

### 12.2.13 GS\_DEPENDENCIES\_OBJ

GS\_DEPENDENCIES\_OBJ records the detailed information about the referenced object.

**Table 12-13** GS\_DEPENDENCIES\_OBJ columns

Name	Type	Description
schemaname	name	Name of a namespace.
type	integer	Type of the referenced object. <ul style="list-style-type: none"> <li>• 1: unknown type</li> <li>• 2: variable</li> <li>• 3: type</li> <li>• 4: function</li> <li>• 5: view</li> <li>• 6: function header</li> </ul>
name	text	Name of the referenced object.
objnode	pg_node_tree	Detailed information about the referenced object.

### 12.2.14 GS\_ENCRYPTED\_COLUMNS

GS\_ENCRYPTED\_COLUMNS records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

**Table 12-14** GS\_ENCRYPTED\_COLUMNS columns

Name	Type	Description
rel_id	oid	Table OID
column_name	name	Name of an encrypted column.
column_key_id	oid	A foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be <b>2(DETERMINISTIC)</b> or <b>1(RANDOMIZED)</b> .
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the values, see the oid columns in the <a href="#">PG_TYPE</a> system catalog.
data_type_original_mod	integer	Modifiers of the original data type of the encrypted column. For details about the values, see the atttypmod columns in the <a href="#">PG_ATTRIBUTE</a> system catalog.
create_date	timestamp without time zone	Time when an encrypted column is created

## 12.2.15 GS\_ENCRYPTED\_PROC

**GS\_ENCRYPTED\_PROC** provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

**Table 12-15** GS\_ENCRYPTED\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
func_id	oid	OID of the function, corresponding to the OID row identifier in the <a href="#">12.2.81 PG_PROC</a> system catalog.
prorettype_orig	integer	Original data type of the return value.
last_change	timestamp without time zone	Last modification time of the encrypted function

Name	Type	Description
proargcachedcol	oidvector	OID of the encrypted column corresponding to the <b>INPUT</b> parameter of the function, corresponding to the OID row identifier in the <a href="#">12.2.14 GS_ENCRYPTED_COLUMNS</a> system catalog.
proallargtypes_orig	oid[]	Original data type of all function parameters.

## 12.2.16 GS\_GLOBAL\_CONFIG

**GS\_GLOBAL\_CONFIG** records the parameter values specified by users during cluster initialization. In addition, it also stores weak passwords set by users. Initial database users can write, modify, and delete parameters in system catalogs by using **ALTER** and **DROP**. Only the initial user, system administrator, and security administrator can access this system catalog. Other users do not have such permission.

**Table 12-16** GS\_GLOBAL\_CONFIG columns

Name	Type	Description
name	name	Specifies the preset parameter name, weak password name, or parameter required by users during cluster initialization.
value	text	Specifies the preset parameter value, weak password value, or parameter value required by users during cluster initialization.

## 12.2.17 GS\_JOB\_ATTRIBUTE

**GS\_JOB\_ATTRIBUTE** records attributes of DBE\_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules. Common users do not have the permission to access the newly installed database cluster.

**Table 12-17** GS\_JOB\_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized user names.

Name	Type	Description
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

## 12.2.18 GS\_JOB\_ARGUMENT

GS\_JOB\_ARGUMENT provides the parameter attributes of DBE\_SCHEDULER scheduled tasks and programs.

**Table 12-18** GS\_JOB\_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
argument_position	integer	Location of a parameter of a scheduled task or program.
argument_type	name	Parameter type of a scheduled task or program.
job_name	text	Name of a scheduled task or program.
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

## 12.2.19 GS\_MASKING\_POLICY

GS\_MASKING\_POLICY records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-19** GS\_MASKING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique.
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified.
polenabled	boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled</li><li>• <b>f</b> (false): disabled</li></ul>

## 12.2.20 GS\_MASKING\_POLICY\_ACTIONS

**GS\_MASKING\_POLICY\_ACTIONS** records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-20** GS\_MASKING\_POLICY\_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
actiontype	name	Name of a masking function used by a masking policy
actparams	name	Parameter information transferred to a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> .
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

## 12.2.21 GS\_MASKING\_POLICY\_FILTERS

**GS\_MASKING\_POLICY\_FILTERS** records the user filtering criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-21** GS\_MASKING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
filterlabelname	name	Filtering range. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> .
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified.
logicaloperator	text	Polish notation of the filter criteria.

## 12.2.22 GS\_MATVIEW

**GS\_MATVIEW** provides information about each materialized view in the database.

**Table 12-22** GS\_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
mapid	oid	OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a full materialized view does not correspond to a map table, the value of this column is <b>0</b> .

Name	Type	Description
ivm	boolean	Type of a materialized view. The value <b>t</b> indicates an incremental materialized view, and the value <b>f</b> indicates a full materialized view.
needrefresh	boolean	Reserved column.
refresh_time	timestamp without time zone	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for incremental materialized views on DNs. In other cases, the value is null.

### 12.2.23 GS\_MATVIEW\_DEPENDENCY

**GS\_MATVIEW\_DEPENDENCY** provides association information about each incremental materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the full materialized view. Therefore, no record is written into the Mlog table.

**Table 12-23** GS\_MATVIEW\_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
relid	oid	OID of a base table of a materialized view.
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	integer	Reserved column.

### 12.2.24 GS\_MODEL\_WAREHOUSE

**GS\_MODEL\_WAREHOUSE** stores AI engine training models, including the models and detailed description of the training process.

**Table 12-24** GS\_MODEL\_WAREHOUSE columns

Name	Data Type	Description
oid	oid	Hidden column
modelname	name	Unique constraint
modelowner	oid	OID of a model owner
createtime	timestamp without time zone	Time when a model is created
processedtuples	integer	Number of tuples involved in training
discardedtuples	integer	Number of unqualified tuples not involved in training
preprocesstime	real	Data preprocessing time
exectime	real	Training duration
iterations	integer	Iteration round
outputtype	oid	OID of the output data type
modeltype	text	AI operator type
query	text	Query statement executed to create a model
modeldata	bytea	Stored binary model information
weight	real[]	Currently, this column applies only to GD operator models.
hyperparametersnames	text[]	Involved hyperparameter name
hyperparametersvalues	text[]	Hyperparameter value
hyperparametersoids	oid[]	OID of the data type corresponding to a hyperparameter
coefnames	text[]	Model parameter
coefvalues	text[]	Value of a model parameter
coefoids	oid[]	OID of the data type corresponding to a model parameter

Name	Data Type	Description
trainingscoresname	text[]	Method used to measure model performance
trainingscoresvalue	real[]	Value used to measure model performance
modeldescribe	text[]	Model description

## 12.2.25 GS\_OPT\_MODEL

**GS\_OPT\_MODEL** is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

### NOTE

In the distributed scenario, this system catalog is provided, but the AI capabilities are unavailable.

## 12.2.26 GS\_PLAN\_TRACE

**GS\_PLAN\_TRACE** is used to store plan traces. It records details about the plan generation process of DML statements. Only users with the sysadmin permission can use this system catalog. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

**Table 12-25** GS\_PLAN\_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request.
query	text	SQL statement of the current request. The value of this field cannot exceed the value of <b>track_activity_query_size</b> .
unique_sql_id	bigint	Unique ID of the SQL statement of the current request.
plan	text	Query plan text corresponding to the current request SQL statement. The value of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.
owner	oid	OID of the user who initiates the current SQL request.

Name	Type	Description
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created).

## 12.2.27 GS\_POLICY\_LABEL

GS\_POLICY\_LABEL records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only a system administrator or security policy administrator can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

**Table 12-26** GS\_POLICY\_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
labelname	name	Specifies the resource label name.
labeltype	name	Resource tag type. Currently, the value is <b>RESOURCE</b> .
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs.
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.
fqdnstype	name	Type of the identified database resource, for example, schema, table, column, or view.

## 12.2.28 GS\_RECYCLEBIN

GS\_RECYCLEBIN describes details about objects in the recycle bin of the flashback feature.

**Table 12-27** GS\_RECYCLEBIN columns

Name	Type	Description
oid	oid	System column
rcybaseid	oid	Base table object ID, which references <b>gs_recyclebin.oid</b>
rcydbid	oid	OID of the database to which the current object belongs
rcyrelid	oid	OID of the current object
rcyname	name	Name of the object in the recycle bin. The format is BIN\$ <i>unique_id</i> \$ <i>oid</i> \$. <i>unique_id</i> indicates the unique identifier with a maximum of 16 characters, and <i>oid</i> indicates the OID.
rcyoriginname	name	Original object name
rcyoperation	char	Operation type. The options are as follows: <ul style="list-style-type: none"> <li>● <b>d</b>: drop</li> <li>● <b>t</b>: truncate</li> </ul>
rcytype	integer	Object type. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0</b>: table</li> <li>● <b>1</b>: index</li> <li>● <b>2</b>: TOAST table</li> <li>● <b>3</b>: TOAST index</li> <li>● <b>4</b>: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types.</li> <li>● <b>5</b>: partition</li> <li>● <b>6</b>: global index.</li> <li>● <b>7</b>: materialized view.</li> </ul>
rcyrecyclecsn	bigint	CSN when an object is dropped or truncated
rcyrecycletime	timestamp with time zone	Time when an object is dropped or truncated
rcycreatecsn	bigint	CSN when an object is created
rcychangecsn	bigint	SCN when an object definition is modified
rcynamespace	oid	OID of the namespace that contains this relationship
rcyowner	oid	Owner of the relationship

Name	Type	Description
rcytablespace	oid	Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file.
rcyrelfilenode	oid	File name of the recycle bin object on a disk, or <b>0</b> if none, which is used to restore the physical file when the TRUNCATE object is restored.
rcycanrestore	Boolean	Specifies whether flashback can be performed separately.
rcycanpurge	Boolean	Specifies whether the purge operation can be performed independently.
rcyfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcyfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.

## 12.2.29 GS\_SQL\_PATCH

**GS\_SQL\_PATCH** records the status information about SQL\_PATCH on the current node.

**Table 12-28** GS\_SQL\_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Global unique query ID
owner	oid	ID of the user who creates the patch.
enable	boolean	Specifies whether the patch takes effect.
status	"char"	Patch status (reserved column).
abort	boolean	Specifies whether the patch is an abort hint.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved column).

Name	Type	Description
patched_query	text	Patched statement (reserved column).
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.
parent_unique_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which the patch takes effect. The value of this parameter is <b>0</b> for statements outside a stored procedure. For statements inside the stored procedure, and the value of this parameter is the globally unique ID of the statement that invokes the stored procedure.

### 12.2.30 GS\_TXN\_SNAPSHOT

**GS\_TXN\_SNAPSHOT** is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN corresponding to the timestamp in the range.

**Table 12-29** GS\_TXN\_SNAPSHOT columns

Name	Type	Description
snptime	timestamp with time zone	Snapshot time
snpxmin	bigint	Minimum snapshot ID
snpcsn	bigint	Snapshot CSN
snpsnapshot	text	Serialized snapshot text

### 12.2.31 GS\_UID

**GS\_UID** records the unique identification meta information of the **hasuids** attribute table in the database.

**Table 12-30** GS\_UID columns

Name	Type	Description
relid	oid	OID of a table

Name	Type	Description
uid_backup	bigint	Largest unique identifier that can be assigned to a table

## 12.2.32 GS\_WORKLOAD\_RULE

The GS\_WORKLOAD\_RULE system catalog records information about SQL concurrency control rules. There is no permission restriction on this system catalog. All users can query this system catalog.

**Table 12-31** GS\_WORKLOAD\_RULE columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID, which is automatically generated by the system.
rule_name	name	Name of the concurrency control rule, which is used for search. The name may not be unique and can be <b>NULL</b> .
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is <b>NULL</b> , the concurrency control rules take effect for all databases.
max_workload	bigint	Maximum number of concurrent rule settings.
is_valid	boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to <b>false</b> .
start_time	timestamp with time zone	Start time of the concurrency control rules. The value <b>NULL</b> indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value <b>NULL</b> indicates that the rules are always effective.
rule_type	text	Concurrency control rule type. Currently, only "sqlid", "select", "insert", "update", "delete", "merge", and "resource" are supported. Other values are invalid.
option_val	text[]	Parameter values of concurrency control rules, including SQL ID, keyword list, and resource restriction.  For details, see the description of the <a href="#">gs_add_workload_rule</a> API.

Name	Type	Description
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

## 12.2.33 PG\_AGGREGATE

PG\_AGGREGATE records information about aggregate functions. Each entry in PG\_AGGREGATE is an extension of an entry in PG\_PROC. The PG\_PROC entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

**Table 12-32** PG\_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	<a href="#">PG_PROC.proname</a>	<a href="#">PG_PROC</a> proname of the aggregate function
aggtransfn	regproc	<a href="#">PG_PROC.proname</a>	Transition function
aggcollectfn	regproc	<a href="#">PG_PROC.proname</a>	Collect function
aggfinalfn	regproc	<a href="#">PG_PROC.proname</a>	Final function ( <b>0</b> if none)
aggstortop	oid	<a href="#">PG_OPERATOR.oid</a>	Associated sort operator ( <b>0</b> if none)
aggtranstype	oid	<a href="#">PG_TYPE.oid</a>	Data type of the aggregate function's internal transition (state) data  The possible values and their meanings are defined by the types in <a href="#">pg_type.h</a> . The main two types are polymorphic (isPolymorphicType) and non-polymorphic.
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.

Name	Type	Reference	Description
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: <ul style="list-style-type: none"> <li>• <b>n</b>: normal aggregate</li> <li>• <b>o</b>: ordered set aggregate</li> </ul>
aggnumdirect args	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is <b>0</b> .

## 12.2.34 PG\_AM

PG\_AM records information about index access methods. There is one row for each index access method supported by the system.

**Table 12-33** PG\_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amname	name	-	Name of the access method.
amstrategies	smallint	-	Number of operator strategies for the access method ( <b>0</b> if the access method does not have a fixed set of operator strategies).
amsupport	smallint	-	Number of support routines for the access method.

Name	Type	Reference	Description
amcanorder	boolean	-	Specifies whether the access method supports ordered scans sorted by the indexed column's value. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amcanorderbyop	boolean	-	Specifies whether the access method supports ordered scans sorted by the result of an operator on the indexed column. <b>t</b> (true): supported. <b>f</b> (false): not supported.
amcanbackward	boolean	-	Specifies whether the access method supports backward scanning. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amcanunique	boolean	-	Specifies whether the access method supports unique indexes. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amcanmulticol	boolean	-	Specifies whether the access method supports multi-column indexes. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amoptionalkey	boolean	-	Specifies whether the access method supports scanning without any constraint for the first index column. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amsearcharray	boolean	-	Specifies whether the access method supports <b>ScalarArrayOpExpr</b> searches. <b>t</b> (true): supported. <b>f</b> (false): not supported.

Name	Type	Reference	Description
amsearchnulls	boolean	-	Specifies whether the access method supports <b>IS NULL/NOT NULL</b> searches. <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amstorage	boolean	-	Specifies whether the index storage data type can differ from the column data type. <ul style="list-style-type: none"> <li>• <b>t</b> (true): same.</li> <li>• <b>f</b> (false): different.</li> </ul>
amclusterable	boolean	-	Specifies whether an index of this type can be clustered on. <ul style="list-style-type: none"> <li>• <b>t</b> (true): allowed.</li> <li>• <b>f</b> (false): not allowed.</li> </ul>
ampredlocks	boolean	-	Specifies whether an index of this type manages fine-grained predicate locks. <ul style="list-style-type: none"> <li>• <b>t</b> (true): allowed.</li> <li>• <b>f</b> (false): not allowed.</li> </ul>
amkeytype	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of data stored in index ( <b>0</b> if it is not a fixed type)
aminsert	regproc	<b>prname</b> in <b>PG_PROC</b>	"Insert this tuple" function
ambeginscan	regproc	<b>prname</b> in <b>PG_PROC</b>	"Prepare for index scan" function
amgettupl	regproc	<b>prname</b> in <b>PG_PROC</b>	"Next valid tuple" function ( <b>0</b> if none)
amgetbitmap	regproc	<b>prname</b> in <b>PG_PROC</b>	"Fetch all valid tuples" function ( <b>0</b> if none)
amrescan	regproc	<b>prname</b> in <b>PG_PROC</b>	"(Re)start index scan" function
amendscan	regproc	<b>prname</b> in <b>PG_PROC</b>	"Clean up after index scan" function
ammarkpos	regproc	<b>prname</b> in <b>PG_PROC</b>	"Mark current scan position" function
amrestrpos	regproc	<b>prname</b> in <b>PG_PROC</b>	"Restore marked scan position" function
ammerge	regproc	<b>prname</b> in <b>PG_PROC</b>	"Merge multiple indexes" function

Name	Type	Reference	Description
ambuild	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	"Build new index" function
ambuilde mpty	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	"Build empty index" function
ambulkdel ete	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Bulk-delete function
amvacuum cleanup	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Post-VACUUM cleanup function
amcanretu rn	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to check whether the index supports index-only scans ( <b>0</b> if none)
amcostesti mate	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to estimate cost of an index scan
amoptions	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function to parse and validate <b>reloptions</b> for an index

## 12.2.35 PG\_AMOP

PG\_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

**Table 12-34** PG\_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
amopfamily	oid	<a href="#">PG_OPFAMILY</a> .oid	Operator family of this entry.
amoplefttype	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	Left-hand input data type of the operator For details about the possible values and their descriptions, see <a href="#">7.3 Data Type</a> .

Name	Type	Reference	Description
amoprighthtype	oid	oid in <a href="#">PG_TYPE</a>	Right-hand input data type of the operator For details about the possible values and their descriptions, see <a href="#">7.3 Data Type</a> .
amopstrategy	smallint	-	Number of operator strategies.
amoppurpose	"char"	-	Purpose of the operator. <ul style="list-style-type: none"> <li>• s: search</li> <li>• o: order</li> </ul>
amopopr	oid	<a href="#">PG_OPERATOR</a> .oid	OID of the operator.
amopmethod	oid	<a href="#">PG_AM</a> .oid	Operator family of the index access method.
amopsortfamily	oid	<a href="#">PG_OPFAMILY</a> .oid	The B-tree operator family according to which this entry sorts for an ordering operator ( <b>0</b> for a search operator).

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed\_column operator constant**. Obviously, such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed\_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of **ORDER BY** are specified by the **amopsortfamily** column, which must reference the B-tree operator family for the operator's result type.

## 12.2.36 PG\_AMPROC

**PG\_AMPROC** records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

**Table 12-35** PG\_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)

Name	Type	Reference	Description
amprocfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	Operator family of this entry
amproclefttype	oid	<a href="#">PG_TYPE.oid</a>	Left-hand input data type of the associated operator For details about common data types, see <a href="#">Data Type</a> .
amprocrighttype	oid	<a href="#">PG_TYPE.oid</a>	Right-hand input data type of the associated operator For details about common data types, see <a href="#">Data Type</a> .
amprocnum	smallint	-	Support procedure number
amproc	regproc	<a href="#">PG_PROC.proname</a>	OID of the procedure

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

## 12.2.37 PG\_APP\_WORKLOADGROUP\_MAPPING

**PG\_APP\_WORKLOADGROUP\_MAPPING** provides load mapping group information in the database.

**Table 12-36** PG\_APP\_WORKLOADGROUP\_MAPPING columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
appname	name	Application name
workload_gpname	name	Mapped workload group name

## 12.2.38 PG\_ATTRDEF

**PG\_ATTRDEF** records default values of columns.

**Table 12-37** PG\_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
adrelid	oid	Table to which a column belongs
adnum	smallint	Number of columns
adbin	pg_node_tree	Internal representation of the default value of the column
adsrc	text	Internal representation of the human-readable default value
adgencol	"char"	Specifies whether a column is a generated column. The value <b>s</b> indicates that the column is a generated column, and the value '\0' indicates that the column is a common column. The default value is '\0'.

## 12.2.39 PG\_ATTRIBUTE

PG\_ATTRIBUTE records information about table columns.

**Table 12-38** PG\_ATTRIBUTE columns

Name	Type	Description
attrelid	oid	Table to which a column belongs.
attname	name	Column name.
atttypid	oid	Column type.
attstattarget	integer	Level of details of statistics collected for this column by <b>ANALYZE</b> . <ul style="list-style-type: none"><li>• The value <b>0</b> indicates that no statistics should be collected.</li><li>• A negative value indicates that the system default statistic object is used.</li><li>• The exact meaning of positive values is data type-dependent.</li></ul> For scalar data types, <b>attstattarget</b> is both the target number of "most common values" to collect, and the target number of histogram bins to create.
attlen	smallint	Copy of typlen in <a href="#">12.2.105 PG_TYPE</a> of the column type.

Name	Type	Description
attnum	smallint	Number of the column
attdims	integer	Number of dimensions if the column is an array ( <b>0</b> in other cases)
attcacheoff	integer	This column is always <b>-1</b> on disk. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.
atttypmod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need ATTTYPMOD.
attbyval	boolean	Copy of typbyval in <a href="#">12.2.105 PG_TYPE</a> of the column type.
attstorage	"char"	Copy of typstorage in <a href="#">12.2.105 PG_TYPE</a> of the column type.
attalign	"char"	Copy of typalign in <a href="#">12.2.105 PG_TYPE</a> of the column type.
attnotnull	boolean	A NOT NULL constraint. It is possible to change this column to enable or disable the constraint.
atthasdef	boolean	This column has a default value, in which case there will be a corresponding entry in <a href="#">12.2.45 PG_ATTRDEF</a> that actually defines the value.
attisdropped	boolean	Indicates that this column has been deleted and is no longer valid. A deleted column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.
attislocal	boolean	Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.

Name	Type	Description
attcmpr mode	tinyint	Compressed modes for a specific column. The compressed mode includes: <ul style="list-style-type: none"> <li>• <b>0</b>: not compressed (<b>ATT_CMPR_NOCOMPRESS</b>)</li> <li>• <b>1</b>: DELTA compression algorithm (<b>ATT_CMPR_DELTA</b>)</li> <li>• <b>2</b>: dictionary compression algorithm (<b>ATT_CMPR_DICTIONARY</b>)</li> <li>• <b>3</b>: prefix compression algorithm (<b>ATT_CMPR_PREFIX</b>)</li> <li>• <b>4</b>: digital string compression algorithm (<b>ATT_CMPR_NUMSTR</b>)</li> </ul>
attinhcount	integer	Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.
attcollation	oid	Defined collation of a column.
attacl	aclitem[]	Permissions for column-level access.
attoptions	text[]	Column attribute. Currently, the following attributes are supported: <ul style="list-style-type: none"> <li>• <b>n_distinct</b>: number of <b>distinct</b> values of a column (excluding subtables).</li> <li>• <b>n_distinct_inherited</b>: number of <b>distinct</b> values of a column (including subtables).</li> </ul>
attfdwoptions	text[]	Column attribute of a foreign table. Currently, <b>dist_fdw</b> , <b>file_fdw</b> , and <b>log_fdw</b> do not use foreign table column attributes.
attinitdefval	bytea	<b>attinitdefval</b> stores the default value expression. <b>ADD COLUMN</b> in the row-store table must use this column.
attkvtype	tinyint	Specifies a key value type for a column. Types include: <ul style="list-style-type: none"> <li><b>0</b>: default value (<b>ATT_KV_UNDEFINED</b>)</li> <li><b>1</b>: dimension (<b>ATT_KV_TAG</b>)</li> <li><b>2</b>: indicator (<b>ATT_KV_FIELD</b>)</li> <li><b>3</b>: time column (<b>ATT_KV_TIMETAG</b>)</li> <li><b>4</b>: hidden distribution key (<b>ATT_KV_HIDETAG</b>)</li> </ul>

## 12.2.40 PG\_AUTHID

**PG\_AUTHID** records information about database authentication identifiers (roles). The concept of users is contained in that of roles. A user is actually a role whose

**rolcanlogin** has been set. Any role, whether its **rolcanlogin** is set or not, can use other roles as members.

For a cluster, only one **PG\_AUTHID** exists, which is not available for every database. This system catalog is accessible only to system administrators.

**Table 12-39** PG\_AUTHID columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
rolname	name	Name of a role
rolsuper	boolean	Whether the role is the initial system administrator with the highest permission <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolinherit	boolean	Whether the role automatically inherits permissions of roles of which it is a member <ul style="list-style-type: none"> <li>• <b>t</b> (true): automatically inherited</li> <li>• <b>f</b> (false): not automatically inherited</li> </ul>
rolcreatorole	boolean	Whether the role can create more roles <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcreatedb	boolean	Whether the role can create databases <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcatupdate	boolean	Whether the role can directly update system catalogs Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. It is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcanlogin	boolean	Whether the role can log in (whether this role can be given as the initial session authorization identifier) <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Description
rolreplication	boolean	Specifies whether the role has the replication permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolauditadmin	boolean	Specifies whether the role has the audit administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolsystemadmin	boolean	Specifies whether the role has the system administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolconnlimit	integer	Maximum number of concurrent connections that this role can make (valid for roles that can log in) The value <b>-1</b> indicates there is no limit.
rolpassword	text	Password (possibly encrypted) (null if no password)
rolvalidbegin	timestamp with time zone	Account validity start time ( <b>NULL</b> if no start time)
rolvaliduntil	timestamp with time zone	Password expiry time ( <b>NULL</b> if no expiration)
rolrespool	name	Resource pool that a user can use
roluseft	boolean	Whether the role can perform operations on foreign tables <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolparentid	oid	OID of a group user to which the user belongs
roltabspace	text	Maximum size of a user data table
rolkind	"char"	Type of a user. <ul style="list-style-type: none"> <li>• <b>p</b>: permanent user</li> <li>• <b>n</b>: common user</li> </ul>
roltemp space	text	Maximum size of a user's temporary table, in KB.
rolspill space	text	Maximum size of data that can be written to disks when a user executes a job, in KB.

Name	Type	Description
rolexpdata	text	Query rules that can be set by users (reserved)
rolmonitoradmin	boolean	Specifies whether the role has the monitor administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
roloperatoradmin	boolean	Specifies whether the role has the O&M administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolpolicyadmin	boolean	Specifies whether the role has the security policy administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

## 12.2.41 PG\_AUTH\_HISTORY

PG\_AUTH\_HISTORY records the authentication history of a role. This system catalog is accessible only to system administrators.

**Table 12-40** PG\_AUTH\_HISTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of a role.
passwordtime	timestamp with time zone	Time of password creation and change.
rolpassword	text	Ciphertext of the role password. The encryption mode is determined by the GUC parameter <b>password_encryption_type</b> .

## 12.2.42 PG\_AUTH\_MEMBERS

PG\_AUTH\_MEMBERS records the membership between roles.

**Table 12-41** PG\_AUTH\_MEMBERS columns

Name	Type	Description
roleid	oid	ID of a role that has a member.
member	oid	ID of a role that is a member of ROLEID.
grantor	oid	ID of a role that grants this membership.
admin_option	boolean	Specifies whether a member can grant membership in ROLEID to others. The value can be <b>true</b> (yes) and <b>false</b> (no).

## 12.2.43 PG\_CAST

PG\_CAST records the conversion relationship between data types.

**Table 12-42** PG\_CAST columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
castsource	oid	OID of the source data type
casttarget	oid	OID of the target data type
castfunc	oid	OID of the conversion function ( <b>0</b> if no conversion function is required)
castcontext	"char"	Conversion mode between the source and target data types. <ul style="list-style-type: none"> <li>• <b>e</b>: Only explicit conversion can be performed (using the CAST or :: syntax).</li> <li>• <b>i</b>: Implicit conversion can be performed.</li> <li>• <b>a</b>: Both explicit and implicit conversion can be performed between data types.</li> </ul>
castmethod	"char"	Conversion method. <ul style="list-style-type: none"> <li>• <b>f</b>: Conversion is performed using the specified function in the <b>castfunc</b> column.</li> <li>• <b>b</b>: Binary forcible conversion rather than the specified function in the <b>castfunc</b> column is performed between data types.</li> </ul>

## 12.2.44 PG\_CLASS

PG\_CLASS records database objects and their relationship.

**Table 12-43** PG\_CLASS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Name of an object, such as a table, index, or view.
relnamespace	oid	OID of the namespace that contains the relationship.
reltype	oid	Data type that corresponds to the table's row type. The index is 0 because the index does not have <b>PG_TYPE</b> records.
relowner	oid	Owner of the relationship.
relam	oid	Access method used, such as B-tree, if the row is an index.
relfilenode	oid	Name of the on-disk file of this relationship ( <b>0</b> if such file does not exist).
reltablespace	oid	Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file.
relpages	double precision	Size of the on-disk representation of the table in pages (of size BLCKSZ). This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by <b>VACUUM</b> , <b>ANALYZE</b> , and a few DDL statements such as <b>CREATE INDEX</b> .
reltoastrelid	oid	OID of the TOAST table associated with the table ( <b>0</b> if no TOAST table exists). The TOAST table stores large columns "offline" in a secondary table.
reltoastidxid	oid	OID of the index for a TOAST table ( <b>0</b> for a table other than a TOAST table).

Name	Type	Description
relhasindex	boolean	Its value is <b>true</b> if this column is a table and has (or recently had) at least one index. It is set by CREATE INDEX but is not immediately cleared by DROP INDEX. If the VACUUM process detects that a table has no index, it clears the <b>relhasindex</b> column and sets the value to <b>false</b> .
relisshared	boolean	Its value is <b>true</b> if the table is shared across all databases in the entire cluster. Otherwise, the value is <b>false</b> . Only certain system catalogs (such as PG_DATABASE) are shared.
relpersistence	"char"	<ul style="list-style-type: none"> <li>● <b>p</b>: permanent table.</li> <li>● <b>u</b>: non-log table.</li> <li>● <b>t</b>: temporary table.</li> <li>● <b>g</b>: global temporary table.</li> </ul>
relkind	"char"	<ul style="list-style-type: none"> <li>● <b>r</b>: ordinary table.</li> <li>● <b>i</b>: index.</li> <li>● <b>G</b>: global secondary index.</li> <li>● <b>s</b>: sequence.</li> <li>● <b>v</b>: view.</li> <li>● <b>t</b>: TOAST table.</li> <li>● <b>f</b>: foreign table.</li> <li>● <b>m</b>: materialized view.</li> <li>● <b>e</b>: STREAM object.</li> <li>● <b>o</b>: CONTVIEW object.</li> </ul>
relnatts	smallint	Number of user columns in the relationship (excluding system columns). <a href="#">12.2.46 PG_ATTRIBUTE</a> has the same number of rows as the user columns.
relchecks	smallint	Number of check constraints in the table. For details, see the system catalog <a href="#">12.2.53 PG_CONSTRAINT</a> .
relhasoids	boolean	Its value is <b>true</b> if an OID is generated for each row of the relationship. Otherwise, the value is <b>false</b> .
relhaspkey	boolean	Its value is <b>true</b> if the table has (or once had) a primary key. Otherwise, the value is <b>false</b> .
relhasrules	boolean	Its value is <b>true</b> if the table has rules. For details, see the system catalog <a href="#">12.2.87 PG_REWRITE</a> .
relhastriggers	boolean	The value is <b>true</b> if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog <a href="#">12.2.99 PG_TRIGGER</a> .

Name	Type	Description
relhassubclass	boolean	Its value is <b>true</b> if the table has (or once had) any inheritance child table. Otherwise, the value is <b>false</b> .
relcmprs	tinyint	Specifies whether the compression feature is enabled for the table. Note that only batch insertion triggers compression, so ordinary CRUD does not trigger compression. <ul style="list-style-type: none"> <li>• <b>0</b>: Tables that do not support compression (primarily system catalogs, on which the compression attribute cannot be modified).</li> <li>• <b>1</b>: The compression feature of the table data is NOCOMPRESS or has no specified keyword.</li> <li>• <b>2</b>: The compression feature of the table data is COMPRESS.</li> </ul>
relhasclusterkey	boolean	Specifies whether the local cluster storage is used. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
relrowmovement	boolean	Specifies whether row migration is allowed when the partitioned table is updated. <ul style="list-style-type: none"> <li>• <b>true</b>: Row migration is allowed.</li> <li>• <b>false</b>: Row migration is not allowed.</li> </ul>
parttype	"char"	Specifies whether the table or index has the property of a partitioned table. <ul style="list-style-type: none"> <li>• <b>p</b>: The table or index has the property of a partitioned table.</li> <li>• <b>n</b>: The table or index does not have the property of a partitioned table.</li> </ul>
relfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.  To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.

Name	Type	Description
relacl	aclitem[]	<p>Access permissions. For details about the ACLItem type, see <a href="#">ACLItem</a>.</p> <p>The command output of the query is as follows:  <i>user1=privs/user2</i> indicates that the permission granted by user 2 to user 1 is <b>privs</b>.  <i>=privs/user3</i> indicates that the permission granted to the <b>public</b> role by user 3 is <b>privs</b>.</p> <p>In the preceding command, user 1, user 2, and user 3 are the existing users or roles in the database, and <b>privs</b> indicates the permissions supported by the database. For details on permission descriptions, see <a href="#">Table 12-44</a>.</p>
reloptions	text[]	Table or index access method, using character strings in the format of <i>keyword=value</i> .
relreplident	"char"	<p>Identifier of a decoding column in logical decoding.</p> <ul style="list-style-type: none"> <li>• <b>d</b>: default (primary key, if any).</li> <li>• <b>n</b>: none.</li> <li>• <b>f</b>: all columns.</li> <li>• <b>i</b>: The indisreplident of the index is specified or the default index is used.</li> </ul>
relfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.
relbucket	oid	Specifies whether the current catalog contains hash bucket shards. A valid OID points to the specific shard information recorded in the <b>PG_HASHBUCKET</b> catalog. <b>NULL</b> indicates that hash bucket shards are not included.
relbucketkey	int2vector	Hash partition column information. <b>NULL</b> indicates that the column information is not included.
relminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the table. This column is used to track whether the table needs to be vacuumed in order to prevent multi-transaction IDs wraparound or to allow <b>pg_clog</b> to be shrunk. The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.

**Table 12-44** Description of permissions

Parameter	Parameters
r	SELECT (read)
w	UPDATE (write)
a	INSERT (insert)
d	DELETE
D	TRUNCATE
x	REFERENCES
t	TRIGGER
X	EXECUTE
U	USAGE
C	CREATE
c	CONNECT
T	TEMPORARY
A	ALTER
P	DROP
m	COMMENT
i	INDEX
v	VACUUM
*	Authorization options for preceding permissions

## 12.2.45 PG\_COLLATION

PG\_COLLATION describes available collations, which are essentially mappings from an SQL name to OS local categories.

**Table 12-45** PG\_COLLATION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
collname	name	-	Collation name (unique per namespace and encoding)

Name	Type	Reference	Description
collnamespace	oid	oid in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains this collation
collowner	oid	oid in <a href="#">PG_AUTHID</a>	Owner of the collation
collencoding	integer	-	Encoding in which the collation is applicable, or <b>-1</b> if it works for any encoding. It is compatible with PostgreSQL.
collcollate	name	-	<b>LC_COLLATE</b> for this collation object
collctype	name	-	<b>LC_CTYPE</b> for this collation object
collpadattr	text	-	Collation padding attribute. <ul style="list-style-type: none"> <li>• <b>NULL</b>: not applicable.</li> <li>• <b>NO PAD</b>: no padding.</li> <li>• <b>PAD SPACE</b>: blank spaces padded at the end.</li> </ul>
collisdef	boolean	-	Determines whether the collation is the default collation of the character set.

## 12.2.46 PG\_CONSTRAINT

PG\_CONSTRAINT records check, primary key, unique, and foreign key constraints on tables.

**Table 12-46** PG\_CONSTRAINT columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of the namespace that contains the constraint.

Name	Type	Description
contype	"char"	<ul style="list-style-type: none"> <li>• <b>c</b>: check constraint</li> <li>• <b>p</b>: primary key constraint</li> <li>• <b>u</b>: unique constraint</li> <li>• <b>t</b>: trigger constraint</li> <li>• <b>x</b>: mutual exclusion constraint</li> <li>• <b>f</b>: foreign key constraint</li> <li>• <b>s</b>: clustering constraint</li> <li>• <b>i</b>: invalid constraint</li> </ul>
condeferrable	boolean	Specifies whether the constraint is deferrable. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
condeferred	boolean	Specifies whether the constraint can be deferrable by default. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
convalidated	boolean	Specifies whether the constraint is valid. Currently, it can be set to <b>false</b> only for foreign key and check constraints. <ul style="list-style-type: none"> <li>• <b>true</b>: valid</li> <li>• <b>false</b>: invalid</li> </ul>
conrelid	oid	Table containing this constraint ( <b>0</b> if it is not a table constraint).
contypid	oid	Domain containing this constraint ( <b>0</b> if it is not a domain constraint).
conindid	oid	ID of the index associated with the constraint.
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is <b>0</b> .
confupdtype	"char"	Foreign key update action code. <ul style="list-style-type: none"> <li>• <b>a</b>: no action</li> <li>• <b>r</b>: restriction</li> <li>• <b>c</b>: cascading</li> <li>• <b>n</b>: The parameter is set to null.</li> <li>• <b>d</b>: The default value is used.</li> </ul>

Name	Type	Description
confdeltype	"char"	Foreign key deletion action code. <ul style="list-style-type: none"> <li>• <b>a</b>: no action.</li> <li>• <b>r</b>: restriction.</li> <li>• <b>c</b>: cascading.</li> <li>• <b>n</b>: The parameter is set to null.</li> <li>• <b>d</b>: The default value is used.</li> </ul>
confmatchtype	"char"	Foreign key match type. <ul style="list-style-type: none"> <li>• <b>f</b>: full match</li> <li>• <b>p</b>: partial match</li> <li>• <b>u</b>: unspecified (The NULL value can be matched if <b>f</b> is specified.)</li> </ul>
conislocal	boolean	Specifies whether the constraint is defined locally for the relation. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not <b>0</b> , the constraint cannot be deleted or renamed.
connoinherit	boolean	Specifies whether the constraint can be inherited. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
consoft	boolean	Specifies whether the column indicates an informational constraint. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
conopt	boolean	Specifies whether you can use the informational constraint to optimize the execution plan. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
confpeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.

Name	Type	Description
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key.
conexclp	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
conbin	pg_node_tree	Internal representation of the expression if this column is a check constraint.
consrc	text	Readable representation of the expression if this column is a check constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of <b>INDEX</b> .

#### NOTICE

- **consrc** is not updated when referenced objects change and does not track new column names. You are advised to use `pg_get_constraintdef()` to extract the definition of a check constraint.
- **relchecks** of [12.2.51 PG\\_CLASS](#) must agree with the number of check-constraint entries found in the table for each relationship.

## 12.2.47 PG\_CONVERSION

**PG\_CONVERSION** describes encoding conversion information.

**Table 12-47** PG\_CONVERSION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
conname	name	-	Conversion name (unique within a namespace)
connamespace	oid	OID in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains this conversion
conowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the conversion
conforencoding	integer	-	Source encoding ID
contoencoding	integer	-	Destination encoding ID

Name	Type	Reference	Description
conproc	regproc	<b>prname</b> in <b>PG_PROC</b>	Conversion procedure
condefault	boolean	-	If this is the default conversion, the value is <b>true</b> . Otherwise, the value is <b>false</b> .

## 12.2.48 PG\_DATABASE

PG\_DATABASE records information about available databases.

**Table 12-48** PG\_DATABASE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
datname	name	Database name.
datdba	oid	Owner of the database, usually the user who created it.
encoding	integer	Character encoding for the database.
datcollate	name	Sequence used by the database.
datctype	name	Character type used by the database.
datistemplate	boolean	Specifies whether the database can be used as a template database. <ul style="list-style-type: none"> <li>• <b>true</b>: allowed.</li> <li>• <b>false</b>: not allowed.</li> </ul>
datallowconn	boolean	This column is used to protect the <b>template0</b> database from being altered. <ul style="list-style-type: none"> <li>• <b>true</b>: Users can connect to the database.</li> <li>• <b>false</b>: No user can connect to the database.</li> </ul>
datconnlimit	integer	Maximum number of concurrent connections allowed on this database. The value <b>-1</b> indicates no limit.
datlastsysoid	oid	Last system OID in the database.

Name	Type	Description
datfrozenxid	xid32	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is discarded in the current version. To ensure forward compatibility, this column is reserved. The <b>datfrozenxid64</b> column is added to record the information.
dattablespace	oid	Default tablespace of the database.
datcompatibility	name	Database compatibility mode. Currently, four compatible modes are supported: PG, ORA, MYSQL, and TD.
datacl	aclitem[]	Access permission.
datfrozenxid64	xid	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.
datminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction IDs wraparound or to allow PG_CLOG to be shrunk. It is the minimum value of <b>relminmxid</b> in <a href="#">12.2.51 PG_CLASS</a> of all tables in the database.
dattimezone	name	Database time zone. The default is PRC.

## 12.2.49 PG\_DB\_ROLE\_SETTING

**PG\_DB\_ROLE\_SETTING** records the default values of configuration items bound to each role and data when the database is running.

**Table 12-49** PG\_DB\_ROLE\_SETTING columns

Name	Type	Description
setdatabase	oid	Database corresponding to the configuration items ( <b>0</b> if no database is specified).
setrole	oid	Role corresponding to the configuration items ( <b>0</b> if no role is specified).
setconfig	text[]	Default value of runtime configuration items. Contact an administrator to configure it.

## 12.2.50 PG\_DEFAULT\_ACL

PG\_DEFAULT\_ACL records initial permissions assigned to newly created objects.

**Table 12-50** PG\_DEFAULT\_ACL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
defaclrole	oid	ID of the role associated with the permission.
defaclnamespace	oid	Namespace associated with the permission ( <b>0</b> if no ID).
defaclobjtype	"char"	Object type of the permission. <ul style="list-style-type: none"> <li>• <b>r</b>: table or view</li> <li>• <b>S</b>: sequence</li> <li>• <b>f</b>: function</li> <li>• <b>T</b>: type</li> <li>• <b>K</b>: client master key</li> <li>• <b>k</b>: column encryption key</li> </ul>
defaclacl	aclitem[]	Access permissions that this type of object should have on creation.

## 12.2.51 PG\_DEPEND

PG\_DEPEND records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also [PG\\_SHDEPEND](#), which performs a similar function for dependencies involving objects that are shared across a database cluster.

**Table 12-51** PG\_DEPEND columns

Name	Type	Reference	Description
classid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where a dependent object resides
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column ( <b>objid</b> and <b>classid</b> refer to the table itself); <b>0</b> for all other object types

Name	Type	Reference	Description
refclassid	oid	oid in <a href="#">PG_CLASS</a>	OID of the system catalog where a referenced object resides
refobjid	oid	Any OID column	OID of the referenced object
refobjsubid	integer	-	Column number for a table column ( <b>refobjid</b> and <b>refclassid</b> refer to the table itself); <b>0</b> for all other object types
deptype	"char"	-	A code defining the specific semantics of this dependency

In all cases, a PG\_DEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- **DEPENDENCY\_NORMAL** (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying **CASCADE**, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- **DEPENDENCY\_AUTO** (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of RESTRICT or CASCADE mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- **DEPENDENCY\_INTERNAL** (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A DROP of the dependent object will be disallowed outright (We'll tell the user to issue a DROP against the referenced object, instead). A DROP of the referenced object will be propagated through to drop the dependent object whether CASCADE is specified or not. Example: A trigger created to enforce a foreign-key constraint is made internally dependent on the constraint's [PG\\_CONSTRAINT](#) entry.
- **DEPENDENCY\_EXTENSION** (e): The dependent object is a member of the extension of the referenced object. The dependent object can be dropped only via DROP EXTENSION on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify GS\_DUMP.

---

**NOTICE**

The extended function is for internal use only. You are advised not to use it.

- **DEPENDENCY\_PIN** (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

## 12.2.52 PG\_DESCRIPTION

**PG\_DESCRIPTION** records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of **PG\_DESCRIPTION**.

See also **PG\_SHDESCRIPTION**, which provides a similar function for descriptions involving objects that are shared across a database cluster.

**Table 12-52** PG\_DESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to
classoid	oid	<a href="#">PG_CLASS</a> .oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a comment on a table column ( <b>objoid</b> and <b>classoid</b> refer to the table itself); <b>0</b> for all other object types
description	text	-	Arbitrary text that serves as the description of the object

## 12.2.53 PG\_DIRECTORY

**PG\_DIRECTORY** stores directory objects added by users. You can execute the **CREATE DIRECTORY** statement to add records to this system catalog. When **enable\_access\_server\_directory** is set to **off**, only the initial user can create directory objects. When **enable\_access\_server\_directory** is set to **on**, users with the SYSADMIN permission and users inheriting the built-in role permission **gs\_role\_directory\_create** can create directory objects. Common users can access this system catalog only after being authorized.

**Table 12-53** PG\_DIRECTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
dirname	name	Name of a directory object
owner	oid	Owner of a directory object
dirpath	text	Directory path.
diracl	aclitem[]	Access permissions.

## 12.2.54 PG\_ENUM

PG\_ENUM contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in PG\_ENUM.

**Table 12-54** PG\_ENUM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
enumtypeid	oid	<b>oid</b> in <b>PG_TYPE</b>	OID of <b>12.2.105 PG_TYPE</b> owning this enumerated value.
enumsortorder	real	-	Sort position of this enumerated value within its enumerated type.
enumlabel	name	-	Textual label for this enumerated value.

The OIDs for **PG\_ENUM** rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to *n*. However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

## 12.2.55 PG\_EXTENSION

PG\_EXTENSION records information about the installed extensions. By default, GaussDB provides the following extensions: PLPGSQL, DIST\_FDW, FILE\_FDW, LOG\_FDW, GC\_FDW, DBLINK\_FDW, ROACH\_API, STREAMING, TSDB, DIMSEARCH, GSREDISTRIBUTE, SECURITY\_PLUGIN, GSSTAT\_PLUGIN, PKG\_DBE\_RAW, PKG\_DBE\_OUTPUT, PKG\_DBE\_UTILITY, and PKG\_DBE\_XML. This system catalog is for internal use only. You are advised not to use it.

### NOTE

DIMSEARCH is no longer supported in the current version due to specification changes. Do not use it.

**Table 12-55** PG\_EXTENSION

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
extname	name	Extension name
extowner	oid	Owner of the extension
extnamespace	oid	Namespace containing the extension's exported objects
extrelocatable	boolean	Whether the extension can be relocated to another namespace. <b>true</b> : yes; <b>false</b> : no.
extversion	text	Version number of the extension
extconfig	oid[]	Configuration information about the extension
extcondition	text[]	Filter conditions for the extension's configuration information

## 12.2.56 PG\_FOREIGN\_DATA\_WRAPPER

**PG\_FOREIGN\_DATA\_WRAPPER** records foreign-data wrapper definitions. A foreign-data wrapper is the mechanism by which external data, residing on foreign servers, is accessed.

**Table 12-56** PG\_FOREIGN\_DATA\_WRAPPER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
fdwname	name	-	Name of a foreign-data wrapper
fdwowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the foreign-data wrapper
fdwhandler	oid	<a href="#">PG_PROC.oid</a>	References a handler function that is responsible for supplying execution routines for the foreign-data wrapper ( <b>0</b> if no handler is provided)

Name	Type	Reference	Description
fdwvalidator	oid	<a href="#">PG_PROC.oid</a>	References a validator function that is responsible for checking the validity of the options given to the foreign-data wrapper, as well as options for foreign servers and user mappings using the foreign-data wrapper. (0 if no handler is provided)
fdwacl	aclitem[]	-	Access permissions
fdwoptions	text[]	-	Foreign-data wrapper specific option, expressed in a string in the format of keyword=value

## 12.2.57 PG\_FOREIGN\_SERVER

**PG\_FOREIGN\_SERVER** records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign-data wrappers.

**Table 12-57** PG\_FOREIGN\_SERVER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
srvname	name	-	Name of a foreign server
srvowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the foreign server
srvfdw	oid	<a href="#">PG_FOREIGN_DATA_WRAPPER.oid</a>	OID of the foreign-data wrapper on this foreign server
srvtype	text	-	Type of the server (optional)
srvversion	text	-	Version of the server (optional)
srvacl	aclitem[]	-	Access permissions
srvoptions	text[]	-	Option used for foreign servers, expressed in a string in the format of keyword=value

## 12.2.58 PG\_HASHBUCKET

**PG\_HASHBUCKET** records hash bucket information.

**Table 12-58** PG\_HASHBUCKET columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
bucketid	oid	Hash value calculated for a bucket vector. The hash value can be used to accelerate the search for a bucket vector.
bucketcnt	integer	Number of shards.
bucketmapsize	integer	Total number of shards on all DNs.
bucketref	integer	Reserved column with <b>1</b> as its default value
bucketvector	oidvector_extend	Records all bucket IDs contained in the bucket information in this row. A unique index is created in this column. Tables with the same bucket ID share the <b>PG_HASHBUCKET</b> data in the same row.

## 12.2.59 PG\_INDEX

**PG\_INDEX** records part of index information. The rest is mostly recorded in **PG\_CLASS**.

**Table 12-59** PG\_INDEX columns

Name	Type	Description
indexrelid	oid	OID of the <a href="#">12.2.51 PG_CLASS</a> entry for the index
indrelid	oid	OID of the <a href="#">12.2.51 PG_CLASS</a> entry for the table that uses the index
indnatts	smallint	Number of columns in the index
indisunique	Boolean	Specifies whether the index is unique. <ul style="list-style-type: none"><li>● <b>true</b>: The index is unique.</li><li>● <b>false</b>: The index is not unique.</li></ul>

Name	Type	Description
indisprimary	Boolean	Specifies whether the index is the primary key of the table. <ul style="list-style-type: none"> <li>● <b>true</b>: The index is the primary key of the table. <b>indisunique</b> should always be <b>true</b> when the value of this column is <b>true</b>.</li> <li>● <b>false</b>: The index is not the primary key of the table.</li> </ul>
indisexclusion	Boolean	Specifies whether the index supports exclusive constraints. <ul style="list-style-type: none"> <li>● <b>true</b>: The index supports exclusive constraints.</li> <li>● <b>false</b>: The index does not support exclusive constraints.</li> </ul>
indimmediate	Boolean	Specifies whether to check the uniqueness of data to be inserted. <ul style="list-style-type: none"> <li>● <b>true</b>: The uniqueness check is performed immediately when data is inserted.</li> <li>● <b>false</b>: The uniqueness check is not performed when data is inserted.</li> </ul>
indisclustered	Boolean	Specifies whether the table is clustered on the index. <ul style="list-style-type: none"> <li>● <b>true</b>: The table is clustered on the index.</li> <li>● <b>false</b>: The table is not clustered on the index.</li> </ul>
indisusable	Boolean	Specifies whether the index is available for insert and select operations. <ul style="list-style-type: none"> <li>● <b>true</b>: The index is available for insert and select operations.</li> <li>● <b>false</b>: The index is unavailable for insert and select operations.</li> </ul>
indisvalid	Boolean	<ul style="list-style-type: none"> <li>● <b>true</b>: The index can be used for query.</li> <li>● <b>false</b>: The index is possibly incomplete and must still be modified by INSERT or UPDATE operations, but it cannot be securely used for queries. If it is a unique index, the uniqueness property is also not <b>true</b>.</li> </ul>
indcheckxmin	Boolean	<ul style="list-style-type: none"> <li>● <b>true</b>: Queries must not use the index until the xmin of this row in PG_INDEX is lower than their <b>TransactionXmin</b>, because the table may contain broken HOT chains with incompatible rows that they can see.</li> <li>● <b>false</b>: Indexes can be used for query.</li> </ul>

Name	Type	Description
indisready	Boolean	<ul style="list-style-type: none"><li>• <b>true</b>: The index is available for inserting data.</li><li>• <b>false</b>: The index is ignored when data is inserted or modified.</li></ul>
indkey	int2vector	This is an array of <b>indnatts</b> values indicating that this index creates table columns. For example, a value of <b>1 3</b> indicates that the first and the third columns make up the index key. The value <b>0</b> in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference.
indcollation	oidvector	OID of the collation corresponding to each index column. For details, see <a href="#">PG_COLLATION</a> .
indclass	oidvector	For each column in the index key, this contains the OID of the operator class to use. See <a href="#">PG_OPCLASS</a> for details.
indoption	int2vector	Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.
indexprs	pg_node_tree	Expression trees (in nodeToString() representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in indkey. The value is null if all index attributes are simple references.
indpred	pg_node_tree	Expression tree (in nodeToString() representation) for partial index predicate. If the index is not a partial index, this column is an empty string.
indisreplident	Boolean	Specifies whether the column of this index is a decoded column of logical decoding. <ul style="list-style-type: none"><li>• <b>true</b>: The column of this index is a decoded column of logical decoding.</li><li>• <b>false</b>: The column of this index is not a decoded column of logical decoding.</li></ul>
indnkeyatts	smallint	Total number of columns in the index. The columns that exceed the value of <b>indnatts</b> are not involved in the index query.

## 12.2.60 PG\_INHERITS

**PG\_INHERITS** records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

**Table 12-60** PG\_INHERITS columns

Name	Type	Reference	Description
inhrelid	oid	<a href="#">PG_CLASS.oid</a>	OID of a child table
inhparent	oid	<a href="#">PG_CLASS.oid</a>	OID of a parent table
inhseqno	integer	-	If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1.

## 12.2.61 PG\_JOB

PG\_JOB records detailed information about jobs created by users. Dedicated threads poll the system catalog PG\_JOB and trigger jobs based on scheduled job execution time, and update job status in PG\_JOB. This system catalog belongs to the Shared Relation category. All job records are visible to all databases. Common users can access this system catalog only after being authorized.

**Table 12-61** PG\_JOB columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	bigint	Job ID, which is the primary key and is unique (with a unique index).
current_postgres_pid	bigint	If the current job has been executed, the thread ID of this job is recorded. The default value is <b>-1</b> , indicating that the job has not yet been executed.
log_user	name	Username of the creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database in which the job will be executed.
node_name	name	CN on which the job will be executed.

Name	Type	Description
job_status	"char"	<p>Execution status of the current task. The default value is 's'. The options are as follows:</p> <ul style="list-style-type: none"> <li>• 'r': running</li> <li>• 's': successfully finished</li> <li>• 'f': job failed</li> <li>• 'd': disable</li> </ul> <p>If a job fails to be executed for 16 consecutive times, <b>job_status</b> is automatically set to 'd', and no more attempt will be made on this job.</p> <p>Note: When you disable a scheduled task (by setting <b>job_queue_processes</b> to 0), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled task function is enabled (<b>job_queue_processes</b> is not 0), the system updates the value of this column based on the real-time job status.</p>
start_date	timestamp without time zone	Start time of the first job execution, accurate to millisecond
next_run_date	timestamp without time zone	Time when a scheduled task is executed next time. The time is accurate to milliseconds.
failure_count	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
interval	text	Job execution interval.
last_start_date	timestamp without time zone	Start time of the last job execution, accurate to millisecond.
last_end_date	timestamp without time zone	End time of the last job execution, accurate to millisecond.
last_suc_date	timestamp without time zone	Start time of the last successful job execution, accurate to millisecond.
this_run_date	timestamp without time zone	Start time of the ongoing job execution, accurate to millisecond.
nspname	name	Name of the schema used for job execution.
job_name	text	Name of the DBE_SCHEDULER scheduled task.

Name	Type	Description
end_date	timestamp without time zone	Expiration time of the DBE_SCHEDULER scheduled task, accurate to millisecond.
enable	Boolean	The DBE_SCHEDULER scheduled task enabling status. The options are as follows: <ul style="list-style-type: none"><li>• <b>true</b>: enabled</li><li>• <b>false</b>: disabled</li></ul>
failure_message	text	Error information about the latest task execution.

## 12.2.62 PG\_JOB\_PROC

PG\_JOB\_PROC records the content of each job in [12.2.69 PG\\_JOB](#), including the PL/SQL code blocks and anonymous blocks. Storing such information in the system catalog PG\_JOB and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed. Common users can access this system catalog only after being authorized.

**Table 12-62** PG\_JOB\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	integer	Foreign key, which is associated with job_id in the system catalog <a href="#">12.2.69 PG_JOB</a> .
what	text	Job content, which is the program content in the DBE_SCHEDULER scheduled task.
job_name	text	Name of the DBE_SCHEDULER scheduled task or program.

## 12.2.63 PG\_LANGUAGE

PG\_LANGUAGE registers programming languages. You can use them and APIs to write functions or stored procedures.

**Table 12-63** PG\_LANGUAGE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
lanname	name	-	Language name.
lanowner	oid	<b>oid</b> in <b>PG_AUTHID</b>	Owner of the language.
lanispl	boolean	-	<ul style="list-style-type: none"><li>• <b>true</b>: user-defined language.</li><li>• <b>false</b>: internal language, for example, SQL.</li></ul> Currently, gs_dump still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.
lanpltrusted	boolean	-	<ul style="list-style-type: none"><li>• <b>true</b>: The language is trusted, which means that it is believed not to grant access to anything outside the normal SQL execution environment.</li><li>• <b>false</b>: The language is untrusted. Only the initial user can create functions in untrusted languages.</li></ul>
lanplcallfoid	oid	<b>oid</b> in <b>PG_PROC</b>	For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.
laninline	oid	<b>oid</b> in <b>PG_PROC</b>	This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is <b>0</b> if inline blocks are not supported.
lanvalidator	oid	<b>oid</b> in <b>PG_PROC</b>	This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is <b>0</b> if no validator is provided.
lanacl	aclitem[]	-	Access permission.

## 12.2.64 PG\_LARGEOBJECT

PG\_LARGEOBJECT records data making up large objects. A large object is identified by an OID assigned when it is created. Each large object is broken into segments or "pages" small enough to be conveniently stored as rows in PG\_LARGEOBJECT. The amount of data per page is defined to be LOBLKSIZE.

This system catalog is accessible only to system administrators.

**Table 12-64** PG\_LARGEOBJECT columns

Name	Type	Reference	Description
loid	oid	oid in <a href="#">PG_LARGEOBJECT_METADATA</a>	Identifier of the large object that includes this page
pageno	integer	-	Page number of this page within its large object (counting from zero).
data	bytea	-	Data stored in the large object. This will never be more than <b>LOBLKSIZE</b> bytes and might be less.

Each row of PG\_LARGEOBJECT holds data for one page of a large object, beginning at byte offset (**pageno \* LOBLKSIZE**) within the object. The implementation allows sparse storage: pages might be missing, and might be shorter than **LOBLKSIZE** bytes even if they are not the last page of the object. Missing regions within a large object read as zeroes.

## 12.2.65 PG\_LARGEOBJECT\_METADATA

PG\_LARGEOBJECT\_METADATA records metadata associated with large objects. The actual large object data is stored in PG\_LARGEOBJECT.

**Table 12-65** PG\_LARGEOBJECT\_METADATA columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lomowner	oid	<a href="#">PG_AUTHID</a> .oid	Owner of the large object
lomacl	aclitem[]	-	Access permissions

## 12.2.66 PG\_NAMESPACE

PG\_NAMESPACE records namespaces, that is, schema-related information. If the database object isolation attribute is enabled, users can view only the schema information that they have the permission to access.

**Table 12-66** PG\_NAMESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
nspname	name	Name of a namespace
nspowner	oid	Owner of the namespace
nsptimeline	bigint	Timeline when the namespace is created on the DN. This column is for internal use and valid only on the DN.
nspacl	aclitem[]	Access permission. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> .
in_redistribution	"char"	Specifies whether the content is in the redistribution state.
nspcollation	oid	Default collation of the namespace (a value may exist only when <b>sql_compatibility</b> is set to 'MYSQL').

## 12.2.67 PG\_OBJECT

PG\_OBJECT records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

**Table 12-67** PG\_OBJECT columns

Name	Type	Description
object_oid	oid	Object identifier.
object_type	"char"	Object type. <ul style="list-style-type: none"><li>● <b>r</b>: ordinary table</li><li>● <b>i</b>: index</li><li>● <b>s</b>: sequence</li><li>● <b>v</b>: view</li><li>● <b>p</b>: stored procedure and function</li><li>● <b>S</b>: package header</li><li>● <b>B</b>: package body</li></ul>

Name	Type	Description
creator	oid	Object owner.
ctime	timestamp with time zone	Creation time of an object.
mtime	timestamp with time zone	Last modification time of an object. The modification operations include <b>ALTER</b> , <b>GRANT</b> , and <b>REVOKE</b> .
createcsn	bigint	CSN when an object is created.
changeocsn	bigint	CSN when DDL operations are performed on a table or an index.
valid	Boolean	Validity of an object. <b>t</b> indicates valid, and <b>f</b> indicates invalid.

**NOTICE**

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG\_OBJECT** does not contain these object records.
- A database upgraded to this version cannot record objects created before the upgrade. **PG\_OBJECT** does not contain these object records.
- When the preceding two types of objects are modified again, the modification time (**mtime**) is recorded. Because the creation time of the objects cannot be obtained, **ctime** is empty.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changeocsn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createocsn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createocsn** and **changeocsn** record the transaction commit sequence number of the transaction to which the current operation belongs.
- If the statement for creating an object has an undefined object, or the referenced object is modified or deleted, the object to be created will be invalid.

## 12.2.68 PG\_OPCLASS

**PG\_OPCLASS** defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type.

The set of operators from the family that are actually usable with the indexed column are whichever ones accept the column's data type as their left-hand input.

**Table 12-68** PG\_OPCLASS columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
opcmethod	oid	OID in <a href="#">PG_AM</a>	Index access method operator class served by an operator class
opcname	name	-	Name of the operator class
opcnamespace	oid	OID in <a href="#">PG_NAMESPACE</a>	Namespace of the operator class
opcowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the operator class
opcfamily	oid	OID in <a href="#">PG_OPFAMILY</a>	Operator family containing the operator class
opcintype	oid	OID in <a href="#">PG_TYPE</a>	Data type that the operator class indexes
opcdefault	boolean	-	The value is <b>true</b> if this operator class is the default for <b>opcintype</b> .
opckeytype	oid	OID in <a href="#">PG_TYPE</a>	Type of data stored in index, or zero if same as <b>opcintype</b>

An operator class's **opcmethod** must match the **opfmetho**d of its containing operator family.

## 12.2.69 PG\_OPERATOR

PG\_OPERATOR records information about operators.

**Table 12-69** PG\_OPERATOR columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
oprname	name	-	Name of an operator
oprnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains the operator.
oprowner	oid	<b>oid</b> in <a href="#">PG_AUTHID</a>	Owner of the operator.

Name	Type	Reference	Description
oprkind	"char"	-	<ul style="list-style-type: none"><li>• <b>b</b>: infix (both sides)</li><li>• <b>l</b>: prefix (left side)</li><li>• <b>r</b>: suffix (right side)</li></ul>
oprcanmerge	boolean	-	Whether the operator supports merge joins <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
oprcanhash	boolean	-	Whether the operator supports hash joins <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
oprleft	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the left operand.
oprright	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the right operand.
oprresult	oid	<b>oid</b> in <b>PG_TYPE</b>	Type of the result.
oprcom	oid	<b>oid</b> in <b>PG_OPERATOR</b>	<ul style="list-style-type: none"><li>• If it exists, the value is the exchange character of this operator.</li><li>• If it does not exist, the value is <b>0</b>.</li></ul>
oprnegate	oid	<b>oid</b> in <b>PG_OPERATOR</b>	<ul style="list-style-type: none"><li>• If it exists, the value is the inverter of this operator.</li><li>• If it does not exist, the value is <b>0</b>.</li></ul>
oprcode	regproc	<b>prname</b> in <b>PG_PROC</b>	Function that implements the operator.
oprrest	regproc	<b>prname</b> in <b>PG_PROC</b>	Restriction selectivity estimation function for the operator.
oprjoin	regproc	<b>prname</b> in <b>PG_PROC</b>	Join selectivity estimation function for the operator.

## 12.2.70 PG\_OPFAMILY

**PG\_OPFAMILY** defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is specified by the access method. The operator family allows cross-data-type

operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

**Table 12-70** PG\_OPFAMILY columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
opfmethod	oid	<a href="#">PG_AM.oid</a>	Index access method used by an operator family
opfname	name	-	Name of the operator family
opfnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	Namespace of the operator family
opfowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the operator family

The majority of the information defining an operator family is not in its **PG\_OPFAMILY** row, but in the associated rows in [PG\\_AMOP](#), [PG\\_AMPROC](#), and [PG\\_OPCLASS](#).

## 12.2.71 PG\_PARTITION

PG\_PARTITION records all partitioned tables, table partitions, and index partitions in the database. Partitioned index information is not stored in the system catalog PG\_PARTITION. The partitioned table does not have actual physical files. Therefore, pg\_partition does not record information such as **relfilenode**, **relpages**, **reltuples**, **reltoastrelid**, and **reltoastidxid**.

**Table 12-71** PG\_PARTITION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Names of the partitioned tables, table partitions, TOAST tables on table partitions, and index partitions.
parttype	"char"	Object type. <ul style="list-style-type: none"> <li>● <b>r</b>: partitioned table</li> <li>● <b>p</b>: table partition</li> <li>● <b>x</b>: index partition</li> </ul>

Name	Type	Description
parentid	oid	OID of the partitioned table in PG_CLASS when the object is a partitioned table or table partition. OID of the partitioned index when the object is an index partition.
rangenum	integer	Reserved column.
intervalnum	integer	Reserved column.
partstrategy	"char"	Partition policy of the partitioned table. <ul style="list-style-type: none"> <li>• 'r': range partition</li> <li>• 'l': list partition</li> <li>• 'h': hash partition</li> </ul>
relfilenode	oid	Physical storage locations of the table partition, index partition, and TOAST table on the table partition.
reltablespace	oid	OID of the tablespace containing the table partition, index partition, and TOAST table on the table partition.
relpages	double precision	Statistics: numbers of data pages of the table partition and index partition.
reltuples	double precision	Statistics: numbers of tuples of the table partition and index partition.
relallvisible	integer	Statistics: number of visible data pages of the table partition and index partition.
reltoastrelid	oid	OID of the TOAST table corresponding to the table partition.
reltoastidxid	oid	OID of the TOAST table index corresponding to the table partition.
indextblid	oid	OID of the table partition corresponding to the index partition.
indisusable	boolean	Specifies whether the index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
relfrozenxid	xid32	Frozen transaction ID. To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.

Name	Type	Description
intspnum	integer	Number of tablespaces that the interval partition belongs to.
partkey	int2vector	Column number of the partition key.
intervaltablespace	oidvector	Tablespace that the interval partition belongs to. Interval partitions fall in the tablespaces in the round-robin manner.
interval	text[]	Interval value of the interval partition.
boundaries	text[]	Upper boundary of the range partition and interval partition.
transit	text[]	Transit of the interval partition.
reloptions	text[]	Storage property of a partition used for collecting online scale-out information. Same as <b>pg_class.reloptions</b> , it is expressed in a string in the format of keyword=value.
relfrozenxid64	xid	Frozen transaction ID.
relminmxid	xid	Frozen multi-transaction ID.
partitionno	integer	Used for maintaining the partition map of a partitioned table. <ul style="list-style-type: none"><li>• If the object is a partition, this field indicates the partition ID, which starts from 1 in ascending order.</li><li>• If the object is a partitioned table, this field indicates the maximum partition ID and a negative value is used for special meaning. The value increases with the DDL syntax of some partitions.</li><li>• If the object is of other types, this field is null and has no meaning.</li></ul> <b>partitionno</b> is a permanent auto-increment column, which can be reset or reclaimed by using the syntax ALTER TABLE t_name RESET PARTITION or VACUUM FULL.
subpartitionno	integer	Reserved column.

## 12.2.72 PG\_PLTEMPLATE

**PG\_PLTEMPLATE** records template information for procedural languages.

**Table 12-72** PG\_PLTEMPLATE columns

Name	Type	Description
tmplname	name	Name of the language for which this template is used
tmpltrusted	boolean	The value is <b>true</b> if the language is considered trusted. Otherwise, the value is <b>false</b> .
tmpldbcreate	boolean	The value is <b>true</b> if the language is created by the owner of the database. Otherwise, the value is <b>false</b> .
tmplhandler	text	Name of the call handler function
tmplinline	text	Name of the anonymous block handler ( <b>NULL</b> if no name of the block handler exists)
tmplvalidator	text	Name of the verification function ( <b>NULL</b> if no verification function is available)
tmpllibrary	text	Path of the shared library that implements languages
tmplacl	aclitem[]	Access permissions for template (not yet used)

## 12.2.73 PG\_PROC

PG\_PROC records information about functions or procedures.

**Table 12-73** PG\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
proname	name	Function name.
pronamespace	oid	OID of the namespace that contains the function.
proowner	oid	Owner of the function.
prolang	oid	Implementation language or call API of the function.
procost	real	Estimated execution cost.
prorows	real	Estimated number of rows that are influenced.

Name	Type	Description
provariadic	oid	Data type of parameter element.
protransform	regproc	Simplified call method for the function.
proisagg	Boolean	Specifies whether the function is an aggregate function. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
proiswindow	Boolean	Specifies whether the function is a window function. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
prosecdef	Boolean	Specifies whether the function is a security definer (or a setuid function). <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
proleakproof	Boolean	Specifies whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. <ul style="list-style-type: none"> <li>• <b>t</b> (true): There is no side effect.</li> <li>• <b>f</b> (false): There are side effects.</li> </ul>
proisstrict	Boolean	<ul style="list-style-type: none"> <li>• <b>t</b> (true): When this function is used, the function does not call the function and returns null if the input parameter is null.</li> <li>• <b>f</b> (false): When this function is used, it is called even if the input parameter is null. Therefore, this function must process null input.</li> </ul>
proretset	Boolean	Specifies whether the return value of the function is a set (that is, multiple values of the specified data type). <ul style="list-style-type: none"> <li>• <b>true</b>: The return value of the function is a set.</li> <li>• <b>false</b>: The return value of the function is not a set.</li> </ul>

Name	Type	Description
provolatile	"char"	Specifies whether the function's result depends only on its input parameters, or is affected by outside factors. <ul style="list-style-type: none"> <li>• <b>i</b>: immutable functions, which always deliver the same result for the same inputs.</li> <li>• <b>s</b>: stable functions, whose results (for fixed inputs) do not change within a scan.</li> <li>• <b>v</b>: volatile functions, whose results may change at any time. Use <b>v</b> also for functions with side-effects, so that the engine cannot get optimized if volatile functions are called.</li> </ul>
pronargs	smallint	Number of parameters.
pronargdefaults	smallint	Number of parameters that have default values.
prorettype	oid	Data type of return values.
proargtypes	oidvector	Array that stores the data types of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (API) of the function.
proallargtypes	oid[]	Array that contains the data types of function parameters. This array includes all parameter types (including <b>OUT</b> and <b>INOUT</b> parameters); however, if all the parameters are <b>IN</b> parameters, this column is null. Note that array indexing is 1-based, whereas for historical reasons, <b>proargtypes</b> is indexed from 0.
proargmodes	"char"[]	Array with the modes of the function parameters, encoded as follows: <ul style="list-style-type: none"> <li>• <b>i</b> indicates the IN parameter.</li> <li>• <b>o</b> indicates the OUT parameter.</li> <li>• <b>b</b> indicates the INOUT parameter.</li> <li>• <b>v</b> indicates the VARIADIC parameter.</li> </ul> If all the parameters are <b>IN</b> parameters, this column is null. Note that indexes correspond to positions of <b>proallargtypes</b> , not <b>proargtypes</b> .
proargnames	text[]	Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that indexes correspond to positions of <b>proallargtypes</b> , not <b>proargtypes</b> .

Name	Type	Description
proargdefaults	pg_node_tree	Expression tree of the default value. This is the list of <b>pronargdefaults</b> elements.
prosrc	text	A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a connection symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.
probin	text	Additional information about how to call the function. Again, the interpretation is language-specific.
proconfig	text[]	Function's local settings for run-time configuration variables.
proacl	aclitem[]	Access permission. For details, see <b>GRANT</b> and <b>REVOKE</b> .
prodefaultargpos	int2vector	Position of the input parameter of a function with a default value.
fencedmode	Boolean	Execution mode of a function, indicating whether the function is executed in fence or not fence mode. <ul style="list-style-type: none"> <li>● <b>true</b>: fence mode. In this mode, the function is executed in the fork process.</li> <li>● <b>false</b>: not fence mode.</li> </ul>
proshippable	Boolean	Specifies whether the function can be pushed down to DN for execution. The default value is <b>false</b> . <ul style="list-style-type: none"> <li>● Functions of the <b>IMMUTABLE</b> type can always be pushed down to DN.</li> <li>● Functions of the <b>STABLE</b> or <b>VOLATILE</b> type can be pushed down to DN only if their attribute is <b>SHIPPABLE</b>.</li> </ul>
propackage	Boolean	Specifies whether the function supports overloading. The default value is <b>false</b> . <ul style="list-style-type: none"> <li>● <b>t</b> (true): supported.</li> <li>● <b>f</b> (false): not supported.</li> </ul>
prokind	"char"	Specifies whether the object is a function or a stored procedure. <ul style="list-style-type: none"> <li>● <b>'f'</b>: The object is a function.</li> <li>● <b>'p'</b>: The object is a stored procedure.</li> </ul>

Name	Type	Description
proargsrc	text	Describes the parameter input strings of functions or stored procedures that are compatible with ORA syntax, including parameter comments. The default value is <b>NULL</b> .
proargtypesext	oidvector_ _extend	Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (API) of the function.
prodefaultargpo- sext	int2vector_ _extend	Position of the input parameter with a default value when the function has a large number of parameters.
allargtypes	oidvector	Array for storing the data types of stored procedure parameters, including all parameters (input parameters, output parameters, and <b>INOUT</b> parameters) of the stored procedure.
allargtypesext	oidvector_ _extend	Array for storing the data types of stored procedure parameters when the number of function parameters is greater than 666. The array contains all parameters (including input parameters, output parameters, and <b>INOUT</b> parameters).

 **NOTE**

When a function is created, data is inserted into the PG\_PROC catalog to update the index. When there are a large number of input and output parameters, the index length may exceed one-third of the page length. As a result, the error "Index row size xxx exceeds maximum xxx for index 'pg\_proc\_proname\_all\_args\_nsp\_index'" may be reported as expected. You can reduce the number of parameters to avoid this error.

## 12.2.74 PG\_RANGE

PG\_RANGE records information about range types, except for records of types in [PG\\_TYPE](#).

**Table 12-74** PG\_RANGE columns

Name	Type	Reference	Description
rngtypeid	oid	<b>oid</b> in <a href="#">PG_TYPE</a>	OID of the range type
rngcollation	oid	<b>oid</b> in <a href="#">PG_COLLATION</a>	OID of the collation used for range comparisons ( <b>0</b> if none)

Name	Type	Reference	Description
rngsubopc	oid	oid in <a href="#">PG_OPCLASS</a>	OID of the subtype's operator class used for range comparisons
rngcanonical	regproc	proname in <a href="#">PG_PROC</a>	Name of the function to convert a range value into canonical form ( <b>0</b> if none)
rngsubdiff	regproc	proname in <a href="#">PG_PROC</a>	Name of the function used to calculate the difference between two elements in a range. The return value of the function is of the double-precision type. If the function does not exist, the value of <b>rngsubdiff</b> is <b>0</b> .

**rngsubopc** determines the sort ordering used by the range type. **rngcanonical** is used when the element type is discrete.

## 12.2.75 PG\_REPLICATION\_ORIGIN

PG\_REPLICATION\_ORIGIN contains all created replication sources and is shared among all databases in a cluster. Each cluster has only one copy of PG\_REPLICATION\_ORIGIN, not one copy per database instance.

**Table 12-75** PG\_REPLICATION\_ORIGIN columns

Name	Type	Description
roident	oid	Unique replication source identifier within a cluster.
roname	text	External user-defined replication source name.

## 12.2.76 PG\_RESOURCE\_POOL

PG\_RESOURCE\_POOL provides information about database resource pools.

**Table 12-76** PG\_RESOURCE\_POOL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

Name	Type	Description
respool_name	name	Name of a resource pool.
mem_percent	integer	Percentage of the memory configuration.
cpu_affinity	bigint	Value of cores bound to the CPU.
control_group	name	Name of the Cgroup where the resource pool is located.
max_dop	integer	Maximum degree of concurrency. This column is used for scaling and indicates the scanning concurrency during data redistribution.
memory_limit	name	Maximum memory of the resource pool.
parentid	oid	OID of the parent resource pool.
io_limits	integer	Upper limit of IOPS. It is counted by 10 thousands per second.
io_priority	name	I/O priority set for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.
max_worker	integer	Concurrency in a table during data redistribution. This column is used only for scaling.
max_connections	integer	Maximum number of connections that can be used by a resource pool.

## 12.2.77 PG\_REWRITE

PG\_REWRITE records rewrite rules defined for tables and views.

**Table 12-77** PG\_REWRITE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rulename	name	Name of a rule.
ev_class	oid	Name of the table that uses the rule.
ev_attr	smallint	Column to which this rule applies (always <b>0</b> to indicate the entire table).

Name	Type	Description
ev_type	"char"	Event type for the rule. <ul style="list-style-type: none"> <li>• 1: SELECT</li> <li>• 2: UPDATE</li> <li>• 3: INSERT</li> <li>• 4: DELETE</li> </ul>
ev_enabled	"char"	Controls the mode in which the rule is triggered. <ul style="list-style-type: none"> <li>• <b>O</b>: The rule is triggered in origin and local modes.</li> <li>• <b>D</b>: The rule is disabled.</li> <li>• <b>R</b>: The rule is triggered in replica mode.</li> <li>• <b>A</b>: The rule is always triggered.</li> </ul>
is_instead	Boolean	The value is <b>true</b> if the rule is of the <b>INSTEAD</b> type. Otherwise, the value is <b>false</b> .
ev_qual	pg_node_tree	Expression tree (in the form of a <code>nodeToString()</code> representation) for the rule's qualifying condition
ev_action	pg_node_tree	Query tree (in the form of a <code>nodeToString()</code> representation) for the rule's action

## 12.2.78 PG\_RLSPOLICY

PG\_RLSPOLICY records row-level security policies.

**Table 12-78** PG\_RLSPOLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Name of an access control policy.
polrelid	oid	OID of the table object on which the row-level security policy takes effect.
polcmd	"char"	SQL operations affected by the row-level security policy.
polpermissive	Boolean	Attribute of the row-level security policy. <ul style="list-style-type: none"> <li>• <b>t</b>: OR condition concatenation of expressions.</li> <li>• <b>f</b>: AND condition concatenation of expressions.</li> </ul>

Name	Type	Description
polroles	oid[]	OID list of users affected by the row-level access control policy. If this parameter is not specified, all users are affected.
polqual	pg_node_tree	Expression of a row-level security policy.

## 12.2.79 PG\_SECLABEL

**PG\_SECLABEL** records security labels on database objects.

See also [PG\\_SHSECLABEL](#), which provides a similar function for security labels of database objects that are shared across a database cluster.

**Table 12-79** PG\_SECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	<a href="#">PG_CLASS</a> .oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a security label on a table column
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

## 12.2.80 PG\_SET

**PG\_SET** records metadata defined by the SET data type. Currently, this function is not supported in distributed mode.

## 12.2.81 PG\_SHDEPEND

**PG\_SHDEPEND** records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also [PG\\_DEPEND](#), which provides a similar function for dependencies involving objects within a single database.

**PG\_SHDEPEND** is shared among all databases of cluster. That is, there is only one **PG\_SHDEPEND** for each cluster, not for each database.

**Table 12-80** PG\_SHDEPEND columns

Name	Type	Reference	Description
dbid	oid	<b>oid</b> in <a href="#">PG_DATABASE</a>	OID of the database the dependent object is in, or zero for a shared object.
classid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where a dependent object resides.
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column ( <b>objid</b> and <b>classid</b> refer to the table itself); <b>0</b> for all other object types
refclassid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog the referenced object is in (must be a shared catalog).
refobjid	oid	Any OID column	OID of the referenced object
deptype	"char"	-	Code segment defining the specific semantics of this dependency relationship. See the following for details.

In all cases, a PG\_SHDEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- SHARED\_DEPENDENCY\_OWNER (o)  
The referenced object (which must be a role) is the owner of the dependent object.
- SHARED\_DEPENDENCY\_ACL (a)  
The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. SHARED\_DEPENDENCY\_ACL does not add a record to the owner of the object because the owner will have a SHARED\_DEPENDENCY\_OWNER record.
- SHARED\_DEPENDENCY\_PIN (p)  
This type of record indicates that the system itself depends on the depended object. Therefore, such an object cannot be deleted. Entries of this type are created only by initdb. The columns for the dependent object contain zeroes.
- SHARED\_DEPENDENCY\_DBPRIV(d)  
The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the [12.2.11 GS\\_DB\\_PRIVILEGE](#) system catalog).

## 12.2.82 PG\_SHDESCRIPTION

PG\_SHDESCRIPTION records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with the `\d` command.

See also PG\_DESCRIPTION, which provides a similar function for descriptions involving objects within a single database.

PG\_SHDESCRIPTION is shared among all databases of cluster. That is, there is only one PG\_SHDESCRIPTION for each cluster, not for each database.

**Table 12-81** PG\_SHDESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the described object.
classoid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where the object appears.
description	text	-	Description of the object.

## 12.2.83 PG\_SHSECLABEL

PG\_SHSECLABEL records security labels on shared database objects. Security labels can be manipulated with the **SECURITY LABEL** command.

For an easier way to view security labels, see [PG\\_SECLABELS](#).

See also [PG\\_SECLABEL](#), which provides a similar function for security labels involving objects within a single database.

Unlike most system catalogs, **PG\_SHSECLABEL** is shared across all databases of a cluster. There is only one copy of **PG\_SHSECLABEL** per cluster, not one per database.

**Table 12-82** PG\_SHSECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	<a href="#">PG_CLASS.oid</a>	OID of the system catalog where the object appears
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

## 12.2.84 PG\_STATISTIC

PG\_STATISTIC records statistics about tables and index columns in a database. By default, only system administrators can access the system catalog. Common users can access the system catalog only after being authorized.

**Table 12-83** PG\_STATISTIC columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. <ul style="list-style-type: none"><li>• A value greater than 0 is the actual number of distinct values.</li><li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li><li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li></ul>
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stanumbers N	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.

Name	Type	Description
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadndistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
staextinfo	text	Information about extension statistics. This is reserved.

**NOTICE**

PG\_STATISTIC stores sensitive information about statistical objects, such as MCVs. System administrators and authorized users can access the PG\_STATISTIC system catalog to query the sensitive information about the statistical objects.

## 12.2.85 PG\_STATISTIC\_EXT

PG\_STATISTIC\_EXT displays extended statistics of tables in a database, such as statistics of multiple columns. Statistics of expressions will be supported later. You can specify the extended statistics to be collected. This system catalog is accessible only to system administrators.

**Table 12-84** PG\_STATISTIC\_EXT columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	char	Type of an object. 'c' indicates a table, and 'p' indicates a partition.

Name	Type	Description
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadndistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stakey	int2vector	Array of a column ID.
stanumbers N	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.

Name	Type	Description
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.
stasource	char	Source of extended statistics: <ul style="list-style-type: none"> <li>'a': indicates automatic creation. For details, see the GUC parameter <b>auto_statistic_ext_columns</b>.</li> <li>'m': indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).</li> </ul>
stastatus	char	Status of extended statistics: <ul style="list-style-type: none"> <li>'a': active and available.</li> <li>'d': disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.</li> </ul>

#### NOTICE

PG\_STATISTIC\_EXT stores sensitive information about statistical objects, such as MCVs. System administrators and authorized users can access the PG\_STATISTIC\_EXT system catalog to query the sensitive information about the statistical objects.

## 12.2.86 PG\_SYNONYM

PG\_SYNONYM records the mapping between synonym object names and other database object names.

**Table 12-85** PG\_SYNONYM columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
synname	name	Synonym name.

Name	Type	Description
synnamespace	oid	OID of the namespace that contains the synonym.
synowner	oid	Owner of the synonym, usually the OID of the user who created it.
synobjschema	name	Schema name specified by the associated object.
synobjname	name	Name of the associated object.
syndblinkname	name	Database link name.

## 12.2.87 PG\_TABLESPACE

**PG\_TABLESPACE** records tablespace information.

**Table 12-86** PG\_TABLESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
spcname	name	Tablespace name
spcowner	oid	Owner of the tablespace, usually the user who created it
spcacl	aclitem[]	Access permissions. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> .
spcoptions	text[]	Options of the tablespace
spcmaxsize	text	Maximum size of the available disk space, in bytes
relative	boolean	Whether the storage path specified by the tablespace is a relative path <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes.</li><li>• <b>f (false)</b>: no.</li></ul>

## 12.2.88 PG\_TRIGGER

**PG\_TRIGGER** records trigger information.

**Table 12-87** PG\_TRIGGER columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
tgrelid	oid	OID of the table where the trigger is located.
tgname	name	Trigger name.
tgfoid	oid	Function to be invoked by a trigger.
tgtype	smallint	Trigger type.
tgenabled	"char"	<b>O</b> : The trigger is triggered in origin or local mode. <b>D</b> : The trigger is disabled. <b>R</b> : The trigger is triggered in replica mode. <b>A</b> : The trigger is always triggered.
tgisinternal	Boolean	Internal trigger ID. If the value is <b>true</b> , it indicates an internal trigger.
tgconstrrelid	oid	Table referenced by the integrity constraint.
tgconstrindid	oid	Index of the integrity constraint.
tgconstraint	oid	OID of the constraint trigger in PG_CONSTRAINT.
tgdeferrable	Boolean	Whether the constraint trigger is of the DEFERRABLE type <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes.</li><li>• <b>f (false)</b>: no.</li></ul>
tginitdeferred	Boolean	Specifies whether the trigger is of the INITIALLY DEFERRED type. <ul style="list-style-type: none"><li>• <b>t (true)</b>: yes</li><li>• <b>f (false)</b>: no</li></ul>
tgargs	smallint	Number of input parameters of the trigger function.
tgattr	int2vector	Column ID specified by the trigger. If no column is specified, an empty array is used.
tgargs	bytea	Parameter transferred to the trigger.
tgqual	pg_node_tree	WHEN condition of the trigger ( <b>NULL</b> if the WHEN condition does not exist).
tgowner	oid	Trigger owner.

## 12.2.89 PG\_TS\_CONFIG

**PG\_TS\_CONFIG** contains entries representing text search configurations. A configuration specifies a particular text search parser and a list of dictionaries to use for each of the parser's output token types.

The parser is shown in the **PG\_TS\_CONFIG** entry, but the token-to-dictionary mapping is defined by subsidiary entries in **PG\_TS\_CONFIG\_MAP**.

**Table 12-88** PG\_TS\_CONFIG columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
cfgname	name	-	Text search configuration name
cfgnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the configuration
cfgowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the configuration
cfgparser	oid	<a href="#">PG_TS_PARSER.oid</a>	OID of the text search parser for this configuration
cfoptions	text[]	-	Configuration options

## 12.2.90 PG\_TS\_CONFIG\_MAP

**PG\_TS\_CONFIG\_MAP** contains entries showing which text search dictionaries should be consulted, and in what order, for each output token type of each text search configuration's parser.

**Table 12-89** PG\_TS\_CONFIG\_MAP columns

Name	Type	Reference	Description
mapcfg	oid	<a href="#">PG_TS_CONFIG.oid</a>	OID of the <a href="#">PG_TS_CONFIG</a> entry owning this map entry
maptokentype	integer	-	Token type generated by the configuration's parser
mapseqno	integer	-	Sequence number of a token type when the values of <b>mapcfg</b> or <b>maptokentype</b> are the same.
mapdict	oid	<a href="#">PG_TS_DICT.oid</a>	OID of the text search dictionary to consult

## 12.2.91 PG\_TS\_DICT

**PG\_TS\_DICT** contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinitoption**, whose format and meaning vary depending on the template.

**Table 12-90** PG\_TS\_DICT columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
dictname	name	-	Text search dictionary name
dictnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the dictionary
dictowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the dictionary
dicttemplate	oid	<a href="#">PG_TS_TEMPLATE.oid</a>	OID of the text search template for the dictionary
dictinitoption	text	-	Initialization option string for the template

## 12.2.92 PG\_TS\_PARSER

**PG\_TS\_PARSER** contains entries defining text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. Since a parser must be implemented by C-language-level functions, creation of new parsers is restricted to database superusers.

**Table 12-91** PG\_TS\_PARSER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
prsname	name	-	Text search parser name
prsnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the parser

Name	Type	Reference	Description
prsstart	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's startup function
prstoken	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's next-token function
prsend	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's shutdown function
prsheadline	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's headline function
prsllextype	regproc	<a href="#">PG_PROC.proname</a>	Name of the parser's lextype function

### 12.2.93 PG\_TS\_TEMPLATE

**PG\_TS\_TEMPLATE** contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

**Table 12-92** PG\_TS\_TEMPLATE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
tmplname	name	-	Text search template name
tmplnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	OID of the namespace that contains the template
tmplinit	regproc	<a href="#">PG_PROC.proname</a>	Name of the template's initialization function
tmpllexize	regproc	<a href="#">PG_PROC.proname</a>	Name of the template's lexize function

### 12.2.94 PG\_TYPE

**PG\_TYPE** stores information about data types.

**Table 12-93** PG\_TYPE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
typname	name	Data type name
typnamespace	oid	OID of the namespace that contains the type.
typowner	oid	Owner of the type.
typplen	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. <ul style="list-style-type: none"> <li>• <b>-1</b>: a "varlena" type (one that has a length word).</li> <li>• <b>-2</b>: a null-terminated C string.</li> </ul>
typbyval	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: A value of this type is transferred by value internally.</li> <li>• <b>false</b>: A value of this type is transferred by reference internally.</li> </ul> <p>If <b>typplen</b> of this type is not <b>1, 2, 4, or 8</b>, you are advised to transfer a reference value for <b>typbyval</b>. You can also transfer a value for <b>typbyval</b>. Variable-length types are usually passed by reference or by value.</p>
typtype	"char"	<ul style="list-style-type: none"> <li>• <b>b</b>: basic type.</li> <li>• <b>d</b>: domain type.</li> <li>• <b>p</b>: pseudo type.</li> <li>• <b>r</b>: range type.</li> <li>• <b>e</b>: enumeration type.</li> <li>• <b>u</b>: undefined type.</li> <li>• <b>o</b>: set type.</li> </ul> <p>For details, see <b>typrelid</b> and <b>typbasetype</b>.</p>
typcategory	"char"	Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.
typispreferred	Boolean	<p><b>true</b>: Data is converted when it complies with the conversion rule specified by <b>typcategory</b>.</p> <ul style="list-style-type: none"> <li>• <b>false</b>: Data is not converted.</li> </ul>
typisdefined	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: The type has been defined.</li> <li>• <b>false</b>: The placeholder of an undefined type is used. In this case, there is no reliable information except the name, namespace, and OID of the type.</li> </ul>

Name	Type	Description
typdelim	"char"	Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.
typrelid	oid	<b>0</b> .
typelem	oid	If <b>typelem</b> is not <b>0</b> , it identifies another row in PG_TYPE. The current type can be described as an array yielding values of type <b>typelem</b> . A "true" array type has a variable length ( <b>typlen</b> = <b>-1</b> ), but some fixed-length types ( <b>typlen</b> > <b>0</b> ) also have non-zero <b>typelem</b> , for example <b>name</b> and <b>point</b> . If a fixed-length type has a <b>typelem</b> , its internal representation must be a number of values of the <b>typelem</b> data type with no other data. Variable-length array types have a header defined by the array subroutines.
typarray	oid	If the value is not <b>0</b> , the corresponding type record is available in PG_TYPE.
typinput	regproc	Input conversion function (text format).
typoutput	regproc	Output conversion function (text format).
typreceive	regproc	Input conversion function (binary format); <b>0</b> for non-input conversion function.
typsend	regproc	Output conversion function (binary format); <b>0</b> for non-output conversion function.
typmodin	regproc	Input type modifier function; <b>0</b> if none.
typmodout	regproc	Output type modifier function; <b>0</b> if none.
typanalyze	regproc	Custom ANALYZE function; <b>0</b> if the standard function is used.

Name	Type	Description
typalign	"char"	<p>Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>c</b>: char alignment, that is, no alignment required</li> <li>• <b>s</b>: short alignment (2 bytes on most machines)</li> <li>• <b>i</b>: integer alignment (4 bytes on most machines)</li> <li>• <b>d</b>: double alignment (8 bytes on many machines, but by no means all)</li> </ul> <p><b>NOTICE</b> For types used in system catalogs, the size and alignment defined in PG_TYPE must agree with the way that the compiler lays out the column in a structure representing a table row.</p>
typstorage	"char"	<p><b>typstorage</b> tells for varlena types (those with <b>typlen = -1</b>) if the type is prepared for toasting and what the default strategy for attributes of this type should be. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>p</b>: Values are always stored plain.</li> <li>• <b>e</b>: Value can be stored in a secondary relationship (if the relation has one, see <b>reltoastrelid</b> in <a href="#">12.2.51 PG_CLASS</a>).</li> <li>• <b>m</b>: Values can be stored compressed inline.</li> <li>• <b>x</b>: Values can be stored compressed inline or stored in secondary storage.</li> </ul> <p><b>NOTICE</b> <b>m</b> domains can also be moved out to secondary storage, but only as a last resort (<b>e</b> and <b>x</b> domains are moved first).</p>
typnotnull	Boolean	Specifies whether the type has a NOT NULL constraint. Currently, it is used for domains only.
typbasetype	oid	If this is a domain (see <b>typtype</b> ), then <b>typbasetype</b> identifies the type that this one is based on. The value is <b>0</b> if this type is not a derived type.
tytypmod	integer	<ul style="list-style-type: none"> <li>• Records the <b>tytypmod</b> to be applied to domains' base types by domains (the value is <b>-1</b> if the base type does not use <b>typmod</b>). This is <b>-1</b> if this type is not a domain.</li> </ul>
typndims	integer	If a field is an array, <b>typndims</b> is the number of array dimensions. This is <b>0</b> for types other than domains over array types.

Name	Type	Description
typcollation	oid	Sorting rule of a specified type. For details about the values, see the <a href="#">PG_COLLATION</a> system catalog. (0 if sequencing is not supported.)
typdefaultbin	pg_node_tree	nodeToString() representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.
typdefault	text	The value is <b>NULL</b> if a type has no associated default value. If <b>typdefaultbin</b> is not set to <b>NULL</b> , <b>typdefault</b> must contain a default expression represented by <b>typdefaultbin</b> . If <b>typdefaultbin</b> is <b>NULL</b> and <b>typdefault</b> is not, then <b>typdefault</b> is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.
typacl	aclitem[]	Access permission.
typelemmod	integer	This column has been deprecated.

## 12.2.95 PG\_USER\_MAPPING

**PG\_USER\_MAPPING** records mappings from local users to remote.

This system catalog is accessible only to system administrators. Common users can query the [PG\\_USER\\_MAPPINGS](#) view.

**Table 12-94** PG\_USER\_MAPPING columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
umuser	oid	<a href="#">PG_AUTHID.oid</a>	OID of the local role being mapped (0 if the user mapping is public)
umserver	oid	<a href="#">PG_FOREIGN_SERVER.oid</a>	OID of the foreign server that contains the mapping
umoptions	text[]	-	User mapping specific options, expressed in a string in the format of keyword=value

## 12.2.96 PG\_USER\_STATUS

PG\_USER\_STATUS records the states of users who access the database. This system catalog is accessible only to users with the system administrator permission.

**Table 12-95** PG\_USER\_STATUS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roid	oid	ID of a role.
failcount	integer	Number of failed attempts.
locktime	timestamp with time zone	By default, the creation date of the role is displayed. If the role is locked by the administrator or the role is locked because the number of login failures exceeds the threshold, the date when the role is locked is displayed.
rolstatus	smallint	Role state. <ul style="list-style-type: none"> <li>• <b>0</b>: normal</li> <li>• <b>1</b>: The role is locked for a specific period of time because the failed login attempts exceed the threshold.</li> <li>• <b>2</b>: The role is locked by the administrator.</li> </ul>
permspace	bigint	Size of the permanent table storage space used by a role.
tempspace	bigint	Size of the temporary table storage space used by a role.
password expired	smallint	Specifies whether a password is valid. <ul style="list-style-type: none"> <li>• <b>0</b>: The password is valid.</li> <li>• <b>1</b>: The password is invalid.</li> </ul>

## 12.2.97 PGXC\_CLASS

PGXC\_CLASS records replicated or distributed information for each table.

**Table 12-96** PGXC\_CLASS columns

Name	Type	Description
pcrelid	oid	OID of the table.
pclocatortype	"char"	Locator type. <ul style="list-style-type: none"> <li>• <b>H</b>: Hash</li> <li>• <b>G</b>: Range</li> <li>• <b>L</b>: List</li> <li>• <b>M</b>: Modulo</li> <li>• <b>N</b>: Round Robin</li> <li>• <b>R</b>: Replication</li> </ul>
pchashalgorithm	smallint	Distributed tuple using the hash algorithm.
pchashbuckets	smallint	Value of a harsh container.
pgroup	name	Node group name.
redistributed	"char"	Indicates that a table has been redistributed.
redis_order	integer	Redistribution sequence. Tables whose values are <b>0</b> will not be redistributed in this round of redistribution.
pcattnum	int2vector	Column number used as a distributed key.
nodeoids	oidvector_extend	List of distributed table node OIDs.
options	text	Extension status information. This is a reserved column in the system.

## 12.2.98 PGXC\_GROUP

PGXC\_GROUP records information about storage node groups.

**Table 12-97** PGXC\_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
group_name	name	Name of a node group.

Name	Type	Description
in_redistributi on	"char"	Specifies whether redistribution is required. Valid value: <ul style="list-style-type: none"> <li>• <b>n</b>: The node group is not redistributed.</li> <li>• <b>y</b>: The source node group is in redistribution.</li> <li>• <b>t</b>: The destination node group is in redistribution.</li> </ul>
group_membe rs	oidvector_ext end	Node OID list of the node group.
group_buckets	text	Distributed data bucket group.
is_installation	Boolean	Specifies whether to install a sub-cluster. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
group_acl	aclitem[]	Access permission.
group_kind	"char"	Node group type. The options are as follows: <ul style="list-style-type: none"> <li>• <b>i</b>: installation node group</li> <li>• <b>n</b>: node group in a common cluster</li> <li>• <b>e</b>: elastic cluster</li> </ul>
group_parent	oid	For a child node group, this field indicates the OID of the parent node group. For a parent node group, this field is left blank.

## 12.2.99 PGXC\_NODE

PGXC\_NODE records information about cluster nodes.

### NOTICE

- PGXC\_NODE stores information about database instance nodes. The PGXC\_NODE system catalog has specific meanings only on CNs and its data is valid and correct.
- In the result of querying the PGXC\_NODE system catalog on a DN, only the **node\_id** column is meaningful. Other columns are meaningless and invalid.

**Table 12-98** PGXC\_NODE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

Name	Type	Description
node_name	name	Node name.
node_type	"char"	Node type. <ul style="list-style-type: none"><li>● <b>C</b>: CN.</li><li>● <b>D</b>: DN.</li><li>● <b>S</b>: standby DN.</li></ul>
node_port	integer	Port ID of the node.
node_host	name	Host name or IP address of a node. (If a virtual IP address is configured, its value is a virtual IP address.)
node_port1	integer	Port number of a replication node.
node_host1	name	Host name or IP address of a replication node. (If a virtual IP address is configured, its value is a virtual IP address.)
hostis_primary	Boolean	Specifies whether a primary/standby switchover occurs on the current node. <ul style="list-style-type: none"><li>● <b>t</b> (true): yes</li><li>● <b>f</b> (false): no</li></ul>
nodeis_primary	Boolean	Specifies whether the current node is preferred to execute non-query operations in the <b>replication</b> table. <ul style="list-style-type: none"><li>● <b>t</b> (true): yes</li><li>● <b>f</b> (false): no</li></ul>
nodeis_preferred	Boolean	Specifies whether the current node is preferred to execute queries in the <b>replication</b> table. <ul style="list-style-type: none"><li>● <b>t</b> (true): yes</li><li>● <b>f</b> (false): no</li></ul>
node_id	integer	Node ID. The value is obtain by calculating the value of <b>node_name</b> using the hash function.
sctp_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)
control_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the control channel.
sctp_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)

Name	Type	Description
control_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the control channel.
nodeis_central	Boolean	Specifies whether the current node is a central control node. It is used only for CNs and is invalid for DNs. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
nodeis_active	Boolean	Specifies whether the current node is normal. It is used to mark whether the CN is removed and is invalid for DNs. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

## 12.2.100 PGXC\_REDISTB

**PGXC\_REDISTB** is created during scale-out for each database to record the redistribution status of user tables. It will be deleted after scale-out. Only users with the **connect** permission can view the information.

**Table 12-99**

Name	Type	Description
relname	name	Name of a user table.
nspname	name	Name of the tablespace that contains the table.
pcrelid	oid	OID of a table.
plocator type	character	Locator type. H: hash M: Modulo N: Round Robin R: Replicate
pchashalgorithm	smallint	Distributed tuple using the hash algorithm.
pchashbuckets	smallint	Value of a harsh container.
pgroup	name	Node group to which a table belongs.

Name	Type	Description
redistribut ed	character	Catalog status. <b>i</b> : Table is being redistributed. <b>y</b> : Table redistribution is complete. <b>n</b> : Table has not been redistributed. <b>d</b> : The redistribution is complete, but the temporary table has not been deleted.
redis_orde r	interger	Table redistribution sequence. The default value is <b>1024</b> . The value <b>0</b> indicates that the table is not redistributed. A smaller value indicates that the table is redistributed first.
pcattnum	int2vector	Column number used as a distribution key.
nodeoids	oidvector_e xtend	Node ID of the node group where the table is located.
internal_m ask	integer	Whether reloption contains internal information. Values are as follows: <b>0X0</b> : The internal mask is disabled. <b>0X8000</b> : The internal mask is enabled. <b>0X01</b> : The insert operation is not allowed in this table. <b>0X02</b> : The delete operation is not allowed in this table. <b>0X04</b> : The alter operation is not allowed in this table. <b>0X08</b> : The select operation is not allowed in this table. <b>0X0100</b> : The update operation is not allowed in this table.
table_size	bigint	Size of a table, in bytes.

## 12.2.101 PGXC\_SLICE

PGXC\_SLICE is a system catalog created for recording range distribution and list distribution details. Currently, range interval cannot be used to automatically scale out shards. It is reserved in the system catalog.

**Table 12-100** PGXC\_SLICE columns

Name	Type	Description
relname	name	Table name or shard name, which is distinguished by <b>type</b> .

Name	Type	Description
type	"char"	<ul style="list-style-type: none"> <li>'t': <b>relname</b> is the table name.</li> <li>'s': <b>relname</b> is the shard name.</li> </ul>
strategy	"char"	<ul style="list-style-type: none"> <li>'r': range distributed table.</li> <li>'l': list distributed table.</li> </ul> This value will be extended for subsequent interval shards.
relid	oid	OID of the distributed table to which the tuple belongs.
referenc eoid	oid	OID of the referenced distributed table, which is used for slice reference table creation syntax.
sindex	integer	Position of the current boundary in a shard when the table is a list distributed table.
interval	text[]	Reserved column.
transitb oundary	text[]	Reserved column.
transitn o	integer	Reserved column.
nodeoid	oid	When <b>relname</b> is set to a shard name, <b>nodeoid</b> indicates the OID of the DN where the shard data is stored.
boundar ies	text[]	When <b>relname</b> is set to a shard name, this parameter indicates the boundary value of the shard.
specifie d	boolean	Check whether the DN corresponding to the current segment is explicitly specified in the DDL.
sliceord er	integer	User-defined shard sequence.

## 12.2.102 PLAN\_TABLE\_DATA

**PLAN\_TABLE\_DATA** stores plan information collected by **EXPLAIN PLAN**. Different from the **PLAN\_TABLE** view, the system catalog **PLAN\_TABLE\_DATA** stores **EXPLAIN PLAN** information collected by all sessions and users.

**Table 12-101** PLAN\_TABLE\_DATA columns

Name	Type	Description
session_id	text	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by <b>NOT NULL</b> .

Name	Type	Description
user_id	oid	User who inserts the data. Values are constrained by <b>NOT NULL</b> .
statement_id	character varying(30)	Query tag specified by a user
plan_id	bigint	Query plan ID. The ID is automatically generated in the plan generation phase and is used by kernel engineers for debugging.
id	integer	Node ID in a plan
operation	character varying(30)	Operation description
options	character varying(255)	Operation action
object_name	name	Name of an operated object. It is defined by users.
object_type	character varying(30)	Object type
object_owner	name	Schema to which an object belongs. It is defined by users.
projection	character varying(4000)	Returned column information
cost	double precision	Execution cost estimated by the optimizer for an operator
cardinality	double precision	Number of rows estimated by the optimizer for an operator

 **NOTE**

- **PLAN\_TABLE\_DATA** records data of all users and sessions on the current node. Only administrators can access all the data. Common users can view their own data in the **PLAN\_TABLE** view.
- Data of inactive (exited) sessions is cleaned from **PLAN\_TABLE\_DATA** by **gs\_clean** after being stored in this system catalog for a certain period of time (5 minutes by default). You can also manually run **gs\_clean -C** to delete inactive session data from the table.
- Data is automatically inserted into **PLAN\_TABLE\_DATA** after **EXPLAIN PLAN** is executed. Therefore, do not manually insert data into or update data in **PLAN\_TABLE\_DATA**. Otherwise, data in **PLAN\_TABLE\_DATA** may be disordered. When you need to delete data from a table, it is recommended that you use the **PLAN\_TABLE** view.
- Information in the **statement\_id**, **object\_name**, **object\_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.

## 12.2.103 STATEMENT\_HISTORY

Displays information about statements executed on the current node. To query this system catalog, you must have the SYSADMIN permission. The result can be queried only in the system database but cannot be queried in the user database.

The constraints on the query of this system catalog are as follows:

- Data must be queried in the Postgres database. No data exists in other databases.
- This system catalog is controlled by **track\_stmt\_stat\_level**. The default value is **OFF,L0**, where the first part controls full SQL statements, and the second part controls slow SQL statements. For details about the record level of each field, see the following table. To ensure system performance, you are advised to use the SET statement to change the value of this parameter so that the parameter takes effect only for the current session.
- For slow SQL statements, if the value of **track\_stmt\_stat\_level** is not **OFF** and the SQL execution time exceeds the value of **log\_min\_duration\_statement**, the SQL statement is recorded as a slow SQL statement.

### NOTE

In the current version, the keyword FOR UPDATE cannot be identified or normalized. For example, **SELECT \* FROM table;** and **SELECT \* FROM table FOR UPDATE WAIT N;** are normalized into the same normalized SQL statement and displayed in the **query** column. SQL statements containing the keyword FOR UPDATE can be distinguished by the **query\_plan** column. The execution plan contains **lockRows**.

**Table 12-102** STATEMENT\_HISTORY columns

Name	Type	Description	Record Level
db_name	name	Database name.	L0
schema_name	name	Schema name.	L0
origin_node	integer	Node name.	L0
user_name	name	Username.	L0
application_name	text	Name of the application that sends a request.	L0
client_addr	text	IP address of the client that sends a request.	L0
client_port	integer	Port number of the client that sends a request.	L0
unique_query_id	bigint	ID of the normalized SQL statement.	L0

Name	Type	Description	Record Level
debug_query_id	bigint	ID of the unique SQL statement. Some statements are not unique. For example, the value of <b>debug_query_id</b> in the Parse packet, DCL statements, and TCL statements is <b>0</b> .	L0
query	text	Normalized SQL (available only on CNs). When <b>track_stmt_parameter</b> is enabled, complete SQL statements are displayed.	L0
start_time	timestamp with time zone	Time when a statement starts.	L0
finish_time	timestamp with time zone	Time when a statement ends.	L0
slow_sql_threshold	bigint	Standard for slow SQL statement execution.	L0
transaction_id	bigint	Transaction ID.	L0
thread_id	bigint	ID of an execution thread.	L0
session_id	bigint	Session ID of a user.	L0
n_soft_parse	bigint	Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries are not counted in the value of <b>n_calls</b> .	L0
n_hard_parse	bigint	Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries are not counted in the value of <b>n_calls</b> .	L0
query_plan	text	Statement execution plan. For <b>query_plan</b> of Slow SQL, if <b>execution_time</b> is greater than <b>slow_sql_threshold</b> , <b>query_plan</b> may be empty in scenarios such as deadlock.	L0
n_returned_rows	bigint	Number of rows in the result set returned by the <b>SELECT</b> statement.	L0

Name	Type	Description	Record Level
n_tuples_fetched	bigint	Number of rows randomly scanned.	L0
n_tuples_returned	bigint	Number of rows sequentially scanned.	L0
n_tuples_inserted	bigint	Number of rows inserted.	L0
n_tuples_updated	bigint	Number of rows updated.	L0
n_tuples_deleted	bigint	Number of rows deleted.	L0
n_blocks_fetched	bigint	Number of buffer block access times.	L0
n_blocks_hit	bigint	Number of buffer block hits.	L0
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).	L0
cpu_time	bigint	CPU time (unit: $\mu$ s).	L0
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).	L0
parse_time	bigint	SQL parsing time (unit: $\mu$ s).	L0
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).	L0
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).	L0
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).	L0
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s).	L0
data_io_time	bigint	I/O time (unit: $\mu$ s).	L0

Name	Type	Description	Record Level
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with the client, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <b>{"time":xxx, "n_calls":xxx, "size":xxx}</b> .	L0
net_rcv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with the client, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <b>{"time":xxx, "n_calls":xxx, "size":xxx}</b> .	L0
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <b>{"time":xxx, "n_calls":xxx, "size":xxx}</b> .	L0

Name	Type	Description	Record Level
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <code>{"time":xxx, "n_calls":xxx, "size":xxx}</code> .	L0
lock_count	bigint	Number of locks.	L0
lock_time	bigint	Time required for locking.	L1
lock_wait_count	bigint	Number of lock waits.	L0
lock_wait_time	bigint	Time required for lock waiting.	L1
lock_max_count	bigint	Maximum number of locks.	L0
lwlock_count	bigint	Number of lightweight locks (reserved).	L0
lwlock_wait_count	bigint	Number of lightweight lock waits.	L0
lwlock_time	bigint	Time required for lightweight locking (reserved).	L1
lwlock_wait_time	bigint	Time required for lightweight lock waiting.	L1

Name	Type	Description	Record Level
details	bytea	<p>List of wait events and statement lock events.</p> <p>When the value of <b>track_stmt_stat_level</b> is greater than or equal to <b>L0</b>, the list of wait events starts to be recorded. It displays statistics about wait events on the current node. For details about key events in the kernel, see <a href="#">Table 12-331</a>, <a href="#">Table 12-332</a>, <a href="#">Table 12-333</a>, and <a href="#">Table 12-334</a>. You can also view the list of all events in the system in the <code>wait_event_info</code> view. For details about the impact of each transaction lock on services, see <a href="#">LOCK</a>.</p> <p>When the value of <b>track_stmt_stat_level</b> is <b>L2</b>, the list of statement lock events is recorded. The list records events in chronological order. The number of records is affected by the value of the <b>track_stmt_details_size</b> parameter.</p> <p>This field is in binary format and needs to be read by using the parsing function <code>pg_catalog.statement_detail_decode</code>. For details, see <a href="#">Table 7-94</a>.</p> <p>Events include:</p> <ul style="list-style-type: none"> <li>● Start locking.</li> <li>● Complete locking.</li> <li>● Start lock waiting.</li> <li>● Complete lock waiting.</li> <li>● Start unlocking.</li> <li>● Complete unlocking.</li> <li>● Start lightweight lock waiting.</li> <li>● Complete lightweight lock waiting.</li> </ul>	L0/L2
is_slow_sql	Boolean	<p>Specifies whether the SQL statement is a slow SQL statement.</p> <ul style="list-style-type: none"> <li>● <b>t</b> (true): yes.</li> <li>● <b>f</b> (false): no</li> </ul>	L0
trace_id	text	Driver-specific trace ID, which is associated with an application request.	L0

Name	Type	Description	Record Level
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement.	L0
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that calls the stored procedure. For statements outside the stored procedure, the value is <b>0</b> .	L0

## 12.2.104 STREAMING\_STREAM

**STREAMING\_STREAM** records the metadata of all STREAM objects.

**Table 12-103** STREAMING\_STREAM column

Name	Type	Description
relid	oid	STREAM object ID.
queries	bytea	Bitmap mapping of the CONTVIEW corresponding to the STREAM.

## 12.2.105 STREAMING\_CONT\_QUERY

**STREAMING\_CONT\_QUERY** records the metadata of all CONTVIEW objects.

**Table 12-104** STREAMING\_CONT\_QUERY columns

Name	Type	Description
id	integer	Unique identifier of the CONTVIEW object.
type	"char"	CONTVIEW type. <ul style="list-style-type: none"> <li>'r' indicates that the CONTVIEW is based on the row-store model.</li> </ul>
relid	oid	CONTVIEW object ID.
defrelid	oid	ID of the continuous computing rule view corresponding to CONTVIEW.

Name	Type	Description
active	Boolean	Specifies whether the CONTVIEW is in the continuous computing state. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
streamrelid	oid	ID of STREAM corresponding to CONTVIEW.
matrelid	oid	ID of the materialized table corresponding to CONTVIEW.
lookupidxid	oid	ID of GROUP LOOK UP INDEX corresponding to CONTVIEW. This column is for internal use and is available only in row-store tables.
step_factor	smallint	CONTVIEW step mode. The main values are <b>0</b> (no overlapping window) and <b>1</b> (sliding window, with one step).
ttn	integer	Value of <b>ttn_interval</b> set by CONTVIEW.
ttn_attno	smallint	Number of a time column corresponding to the TTL function set by CONTVIEW.
dictrelid	oid	ID of the dictionary table corresponding to CONTVIEW.
grpnum	smallint	Number of dimension columns in the CONTVIEW continuous computing rule. This column is for internal use.
grpidx	int2vector	Index of the dimension column in TARGET LIST in the CONTVIEW continuous computing rule. This column is for internal use.

## 12.3 System Views

### 12.3.1 ADM\_ARGUMENTS

ADM\_ARGUMENTS displays parameter information of all stored procedures or functions. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-105** ADM\_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.

Name	Type	Description
object_name	character varying(128)	Name of a function or stored procedure.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	<i>n</i> th overloaded function of the name.
subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
argument_name	character varying(128)	Parameter name.
position	numeric	Position of the parameter in the parameter list. The value is <b>0</b> for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value is fixed at <b>0</b> because only one line is displayed for each parameter.
data_type	character varying(64)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value. <ul style="list-style-type: none"> <li>• <b>Y</b>: yes.</li> <li>• <b>N</b>: no.</li> </ul>
default_value	text	Not supported. Its value is <b>NULL</b> .
default_length	numeric	Not supported. Its value is <b>NULL</b> .
in_out	character varying(9)	Input and output attributes of a parameter: <ul style="list-style-type: none"> <li>• <b>IN</b>: input parameter.</li> <li>• <b>OUT</b>: output parameter.</li> <li>• <b>IN_OUT</b>: input and output parameters.</li> <li>• <b>VARIADIC</b>: VARIADIC parameter.</li> </ul>
data_length	numeric	Not supported. Its value is <b>NULL</b> .
data_precision	numeric	Not supported. Its value is <b>NULL</b> .
data_scale	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
radix	numeric	Radix of a number, which is <b>10</b> when the data type is smallint, integer, bigint, numeric, or float, and is <b>NULL</b> for other data types.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
type_owner	character varying(128)	Owner of a data type.
type_name	character varying(128)	Parameter type name.
type_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_link	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_object_type	character varying(7)	Types of types of the <b>type_owner</b> , <b>type_name</b> , and <b>type_subname</b> columns: <ul style="list-style-type: none"><li>• <b>TABLE</b>: The parameter is of the table type.</li><li>• <b>VIEW</b>: The parameter is of the view type.</li><li>• Set this column to <b>NULL</b> for other types.</li></ul>
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.2 ADM\_AUDIT\_OBJECT

ADM\_AUDIT\_OBJECT displays the audit trail records of all objects in the database. This view exists in both PG\_CATALOG and SYS schemas. By default, only the system administrator can access this view. Common users can access the view only after being authorized. The **action\_name** column of GaussDB is different from that of the ORA database in terms of the audit actions. The type of the

**transactionid** column is the same as that in the ORA database. In GaussDB, the **sql\_text** column is the parsed SQL statement, which is not completely the same as the executed SQL statement.

**Table 12-106** ADM\_AUDIT\_OBJECT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action_name	character varying(28)	Action name corresponding to the numeric code in the <b>ACTION</b> column in DBA_AUDIT_TRAIL
new_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_numeric	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .
transactionid	text	Identifier of the transaction that accesses or modifies an object.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	Ncharacter varying(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	Ncharacter varying(2000)	SQL text of the query.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.3 ADM\_AUDIT\_SESSION

ADM\_AUDIT\_SESSION displays all audit trail records concerning CONNECT and DISCONNECT. The audit information of GaussDB is mainly obtained through the pg\_query\_audit function. This view exists in both PG\_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute can view audit information. The **action\_name** column of GaussDB is inconsistent with the audit action of database ORA, and the **transactionid** column is consistent with the type of **transactionid** data in database ORA.

**Table 12-107** ADM\_AUDIT\_SESSION columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(128)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created (user login date and time of the entry created by the audit session)
action_name	character varying(28)	Action name corresponding to the numeric code in the <b>ACTION</b> column in DBA_AUDIT_TRAIL.
logoff_time	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
logoff_lread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_pread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_lwrite	numeric	Not supported. Its value is <b>NULL</b> .
logoff_dlock	character varying(40)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC)
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_numeric	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .

### 12.3.4 ADM\_AUDIT\_STATEMENT

ADM\_AUDIT\_STATEMENT displays all grant and revoke audit trail entries. The audit information of GaussDB is mainly obtained through the pg\_query\_audit function. This view exists in both PG\_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute can view audit information. The **action\_name** column of GaussDB is different from that of the ORA database in terms of the audit actions. The type of the **transactionid** column is the same as that in the ORA database. In GaussDB, the **sql\_text** column is the parsed SQL statement, which is not completely the same as the executed SQL statement.

**Table 12-108** ADM\_AUDIT\_STATEMENT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported. Its value is <b>NULL</b> .
action_name	character varying(28)	Action type corresponding to the code in the action column.
new_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
obj_privilege	character varying(32)	Not supported. Its value is <b>NULL</b> .
sys_privilege	character varying(40)	Not supported. Its value is <b>NULL</b> .
admin_option	character varying(1)	Not supported. Its value is <b>NULL</b> .
grantee	character varying(128)	Not supported. Its value is <b>NULL</b> .
audit_option	character varying(40)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
logoff_time	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
logoff_lread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_pread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_lwrite	numeric	Not supported. Its value is <b>NULL</b> .
logoff_dlock	character varying(40)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_number	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .
transactionid	text	Identifier of the transaction that accesses or modifies an object.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	nvarchar2(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	nvarchar2	SQL text of the query.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
dbid	numeric	Not supported. Its value is <b>NULL</b> .
rls_info	clob	Not supported. Its value is <b>NULL</b> .
current_user	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.5 ADM\_AUDIT\_TRAIL

ADM\_AUDIT\_TRAIL displays all standard audit trail entries. The audit information of GaussDB is mainly obtained through the `pg_query_audit` function. This view exists in both `PG_CATALOG` and `SYS` schemas. Only users with the `AUDITADMIN` attribute can view audit information. The **action\_name** column of GaussDB is different from that of the ORA database in terms of the audit actions. The type of the **transactionid** column is the same as that in the ORA database. In GaussDB, the **sql\_text** column is the parsed SQL statement, which is not completely the same as the executed SQL statement.

---

**⚠ CAUTION**

In a distributed system, the `pg_query_audit` function can only be used to query the audit information of the current node.

---

**Table 12-109** ADM\_AUDIT\_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	timestamp(0) without time zone	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported. Its value is <b>NULL</b> .
action_name	character varying(28)	Action type corresponding to the code in the action column.
new_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
obj_privilege	character varying(32)	Not supported. Its value is <b>NULL</b> .
sys_privilege	character varying(40)	Not supported. Its value is <b>NULL</b> .
admin_option	character varying(1)	Not supported. Its value is <b>NULL</b> .
grantee	character varying(128)	Not supported. Its value is <b>NULL</b> .
audit_option	character varying(40)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
logoff_time	timestamp(0) without time zone	Not supported. Its value is <b>NULL</b> .
logoff_lread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_pread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_lwrite	numeric	Not supported. Its value is <b>NULL</b> .
logoff_dlock	character varying(40)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_session_id	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_number	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .
transactionid	text	Identifier of the transaction that accesses or modifies an object.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	nvarchar2(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	nvarchar2	SQL text of the query.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
dbid	numeric	Not supported. Its value is <b>NULL</b> .
rls_info	clob	Not supported. Its value is <b>NULL</b> .
current_user	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.6 ADM\_COL\_COMMENTS

ADM\_COL\_COMMENTS displays information about table column comments in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-110** ADM\_COL\_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. Its value is <b>0</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.7 ADM\_COL\_PRIVS

ADM\_COL\_PRIVS displays permission granting information about all columns. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-111** ADM\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"><li>• <b>YES</b>: The privileges are granted.</li><li>• <b>NO</b>: The privileges are not granted.</li></ul>

Name	Type	Description
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.8 ADM\_COLL\_TYPES

ADM\_COLL\_TYPES displays information about all collection types. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-112** ADM\_COLL\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a cluster.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a set.
upper_bound	numeric	Not supported. Its value is <b>NULL</b> .
elem_type_mod	character varying(7)	Not supported. Its value is <b>NULL</b> .
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Its value is <b>NULL</b> .
precision	numeric	Not supported. Its value is <b>NULL</b> .
scale	numeric	Not supported. Its value is <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Its value is <b>NULL</b> .
nulls_stored	character varying(3)	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Its value is <b>NULL</b> .

## 12.3.9 ADM\_CONS\_COLUMNS

ADM\_CONS\_COLUMNS displays information about constraint columns in database tables. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-113** ADM\_CONS\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
position	smallint	Position of a column in a table.

## 12.3.10 ADM\_CONSTRAINTS

ADM\_CONSTRAINTS displays information about table constraints in database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-114** ADM\_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. <ul style="list-style-type: none"><li>● <b>c</b>: check constraint.</li><li>● <b>f</b>: foreign key constraint.</li><li>● <b>p</b>: primary key constraint.</li><li>● <b>u</b>: unique constraint.</li></ul>
table_name	character varying(64)	Name of a constraint-related table.

Name	Type	Description
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of the constraint-related index (only for the unique constraint and primary key constraint).
status	character varying(8)	Constraint status.
generated	character varying(14)	Not supported. Its value is <b>NULL</b> .
search_condition	text	Not supported. Its value is <b>NULL</b> .
search_condition_v c	character varying(4000)	Not supported. Its value is <b>NULL</b> .
r_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
r_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
delete_rule	character varying(9)	Not supported. Its value is <b>NULL</b> .
con_deferrable	character varying(14)	Not supported. Its value is <b>NULL</b> .
deferred	character varying(9)	Not supported. Its value is <b>NULL</b> .
validated	character varying(13)	Not supported. Its value is <b>NULL</b> .
bad	character varying(3)	Not supported. Its value is <b>NULL</b> .
rely	character varying(4)	Not supported. Its value is <b>NULL</b> .
last_change	date	Not supported. Its value is <b>NULL</b> .
invalid	character varying(7)	Not supported. Its value is <b>NULL</b> .
view_related	character varying(14)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .

### 12.3.11 ADM\_DATA\_FILES

ADM\_DATA\_FILES displays the description of database files. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-115** ADM\_DATA\_FILES columns

Name	Type	Description
tablespace_name	name	Name of the tablespace to which a file belongs.
bytes	double precision	Length of the file in bytes.

## 12.3.12 ADM\_DEPENDENCIES

ADM\_DEPENDENCIES displays the dependency relationships between types, tables, views, stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-116** ADM\_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
dependency_type	character varying(4)	Not supported. Its value is <b>NULL</b> .

## 12.3.13 ADM\_DIRECTORIES

ADM\_DIRECTORIES displays all directory objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-117** ADM\_DIRECTORIES columns

Name	Type	Description
owner	oid	Directory owner.
directory_name	name	Directory name.
directory_path	text	OS path name of a directory.
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .

## 12.3.14 ADM\_HIST\_SNAPSHOT

ADM\_HIST\_SNAPSHOT records the WDR snapshot data stored in the current system. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas. This view can be accessed only when the GUC parameter **enable\_wdr\_snapshot** is set to **on**. To access the PG\_CATALOG.ADM\_HIST\_SNAPSHOT and SYS.ADM\_HIST\_SNAPSHOT views, you must have the permission to access the **snapshot schema**, **snapshot**, and **tables\_snap\_timestamp** tables.

**Table 12-118** ADM\_HIST\_SNAPSHOT columns

Name	Type	Description
snap_id	bigint	Unique snapshot ID.
dbid	oid	Database ID of the snapshot.
instance_number	oid	Not supported. The value is the same as that of DBID.
startup_time	timestamp(3) without time zone	Instance start time.
begin_interval_time	timestamp without time zone	Start time of the snapshot interval (the end time of the last snapshot).
end_interval_time	timestamp without time zone	End time of the snapshot interval, that is, the actual time when the snapshot is taken (the end time of this snapshot).
flush_elapsed	interval	Amount of time to perform the snapshot.
snap_level	numeric	Not supported. Its value is <b>NULL</b> .
error_count	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
snap_flag	numeric	Not supported. Its value is <b>NULL</b> .
snap_timezone	interval day to second(0)	Time offset between the snapshot time zone and the coordinated universal time (UTC).
begin_interval_time_tz	timestamp with time zone	Start time of the snapshot interval with the time zone (end time of the last snapshot).
end_interval_time_tz	timestamp with time zone	End time of the snapshot interval, that is, the actual time when the snapshot is taken (the end time of this snapshot), with the time zone.
con_id	numeric	Not supported. Its value is <b>0</b> .

### 12.3.15 ADM\_HIST\_SQL\_PLAN

ADM\_HIST\_SQL\_PLAN displays plan information collected by the current user by running the EXPLAIN PLAN statement. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-119** ADM\_HIST\_SQL\_PLAN columns

Name	Type	Description
dbid	text	Database ID.
sql_id	character varying(30)	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by <b>NOT NULL</b> .
id	integer	Number assigned to each step in the execution plan.
plan_hash_value	bigint	Query ID.
operation	character varying(30)	Operation description.
options	character varying(255)	Operation option.
object_name	name	Name of an operated object. It is defined by users.
object_node	character varying(128)	Not supported. Its value is <b>NULL</b> .
object#	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
object_owner	name	Object number of a table or an index.
object_alias	character varying(261)	Not supported. Its value is <b>NULL</b> .
object_type	character varying(30)	Object type.
optimizer	character varying(20)	Not supported. Its value is <b>NULL</b> .
parent_id	numeric	Not supported. Its value is <b>NULL</b> .
depth	numeric	Not supported. Its value is <b>NULL</b> .
position	numeric	Not supported. Its value is <b>NULL</b> .
search_columns	numeric	Not supported. Its value is <b>NULL</b> .
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Cardinality estimated by the optimizer for an operator to access table records.
bytes	numeric	Not supported. Its value is <b>NULL</b> .
other_tag	character varying(35)	Not supported. Its value is <b>NULL</b> .
partition_start	character varying(64)	Not supported. Its value is <b>NULL</b> .
partition_stop	character varying(64)	Not supported. Its value is <b>NULL</b> .
partition_id	numeric	Not supported. Its value is <b>NULL</b> .
other	character varying(4000)	Not supported. Its value is <b>NULL</b> .
distribution	character varying(20)	Not supported. Its value is <b>NULL</b> .
cpu_cost	numeric	Not supported. Its value is <b>NULL</b> .
io_cost	numeric	Not supported. Its value is <b>NULL</b> .
temp_space	numeric	Not supported. Its value is <b>NULL</b> .
access_predicates	character varying(4000)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
filter_predicates	character varying(4000)	Not supported. Its value is <b>NULL</b> .
projection	character varying(4000)	Returned column information.
time	numeric	Not supported. Its value is <b>NULL</b> .
qblock_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
remarks	character varying(4000)	Not supported. Its value is <b>NULL</b> .
timestamp	date	Not supported. Its value is <b>NULL</b> .
other_xml	clob	Not supported. Its value is <b>NULL</b> .
con_dbid	text	Database ID of a container, which is currently set to a value the same as that of <b>dbid</b> .
con_id	numeric	Container ID. Containers are not supported. Its value is <b>0</b> .

## 12.3.16 ADM\_HIST\_SQLSTAT

ADM\_HIST\_SQLSTAT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable\_wdr\_snapshot** is set to **on**), users can view the data in this view.

**Table 12-120** ADM\_HIST\_SQLSTAT columns

Name	Type	Description
instance_number	integer	Instance ID of a snapshot.
sql_id	bigint	Query ID.
plan_hash_value	integer	ID of the normalized SQL statement.
module	integer	Name of the module that is executing when the SQL statement is first parsed.

Name	Type	Description
elapsed_time_delta	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time_delta	bigint	Time consumed on the CPU (unit: $\mu$ s).
executions_delta	bigint	Increment in the number of executions that have occurred on this object since it was brought into the cache.
iowait_delta	bigint	I/O time (unit: $\mu$ s).
apwait_delta	integer	Delta value of the application wait time.
rows_processed_delta	bigint	Number of rows in the result set returned by the SELECT statement.
snap_id	bigint	Unique snapshot ID.
parsing_schema_name	character varying	Not supported. Its value is <b>NULL</b> .
disk_reads_delta	bigint	Not supported. Its value is <b>NULL</b> .
buffer_reads_delta	bigint	Not supported. Its value is <b>NULL</b> .
clwait_delta	bigint	Not supported. Its value is <b>NULL</b> .

### 12.3.17 ADM\_HIST\_SQLTEXT

ADM\_HIST\_SQLTEXT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable\_wdr\_snapshot** is set to **on**), users can view the data in this view.

**Table 12-121** ADM\_HIST\_SQLTEXT columns

Name	Type	Description
dbid	integer	Database ID.
sql_id	bigint	Query ID.
sql_text	clob	Text corresponding to the query.
command_type	integer	Not supported. Its value is <b>0</b> .

Name	Type	Description
con_dbid	integer	Database ID of a container, which is currently set to a value the same as that of <b>dbid</b> .
con_id	integer	Container ID. Containers are not supported. Its value is <b>0</b> .

## 12.3.18 ADM\_IND\_COLUMNS

ADM\_IND\_COLUMNS displays information about index columns in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-122** ADM\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of the column in the index.
column_length	numeric	Length of the column. For the variable-length type, its value is <b>NULL</b> .
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying	Specifies whether columns are sorted in descending ( <b>DESC</b> ) or ascending ( <b>ASC</b> ) order.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.19 ADM\_IND\_EXPRESSIONS

ADM\_IND\_EXPRESSIONS displays information about expression indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-123** ADM\_IND\_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of the column in the index.

## 12.3.20 ADM\_IND\_PARTITIONS

ADM\_IND\_PARTITIONS displays the partition information about local indexes of level-1 partitioned table in the database. Each local index partition of level-1 index partitioned table in the database (if any) has a row of records in ADM\_IND\_PARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-124** ADM\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.

Name	Type	Description
high_value	text	Upper limit of the partition corresponding to the index partition. <ul style="list-style-type: none"><li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li><li>• For list partitioning, the value list of each partition is displayed.</li><li>• For hash partitioning, the number of each partition is displayed.</li></ul>
index_partition_usable	Boolean	Specifies whether the index partition is available. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is <b>0</b> .
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.

Name	Type	Description
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the <b>analyze</b> command to collect statistics.
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.21 ADM\_IND\_SUBPARTITIONS

ADM\_IND\_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table in the database (excluding global indexes on partitioned tables). Each local index partition of level-2 index partitioned table in the database (if any) has a row of records in ADM\_IND\_SUBPARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Currently, all columns in this table are set to **NULL**.

**Table 12-125** ADM\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
index_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
high_value	text	Not supported. Its value is <b>NULL</b> .
high_value_length	numeric	Not supported. Its value is <b>NULL</b> .
partition_position	numeric	Not supported. Its value is <b>NULL</b> .
subpartition_position	numeric	Not supported. Its value is <b>NULL</b> .
status	character varying(8)	Not supported. Its value is <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Not supported. Its value is <b>NULL</b> .
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .

## 12.3.22 ADM\_INDEXES

ADM\_INDEXES displays all indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-126** ADM\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of the table corresponding to the index.
uniqueness	text	Specifies whether the index is a unique index. <ul style="list-style-type: none"><li>• <b>UNIQUE</b>: unique index.</li><li>• <b>NONUNIQUE</b>: non-unique index.</li></ul>

Name	Type	Description
partitioned	character(3)	<p>Specifies whether the index has the property of partitioned tables.</p> <ul style="list-style-type: none"> <li>• <b>Yes:</b> The index has the property of a partitioned table.</li> <li>• <b>No:</b> The index does not have the property of a partitioned table.</li> </ul>
generated	character varying(1)	<p>Specifies whether the index name is generated by the system.</p> <ul style="list-style-type: none"> <li>• <b>y:</b> The index name is generated by the system.</li> <li>• <b>n:</b> The index name is not generated by the system.</li> </ul>
index_type	character varying(27)	<p>Index type.</p> <ul style="list-style-type: none"> <li>• <b>NORMAL:</b> Index attributes are simple references, and the expression tree is empty.</li> <li>• <b>FUNCTION-BASED NORMAL:</b> Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of an index object.
table_type	character(11)	<p>Type of the index object.</p> <ul style="list-style-type: none"> <li>• <b>TABLE:</b> The index object is of the table type.</li> </ul>
tablespace_name	character varying(30)	Name of a tablespace that contains the index.

Name	Type	Description
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Not supported. Its value is <b>NULL</b> .
domidx_management	character varying(14)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.23 ADM\_OBJECTS

ADM\_OBJECTS displays all database objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-127** ADM\_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object type. For example, table, schema, and index.
namespace	oid	Namespace containing the object.
temporary	character(1)	Specifies whether the object is a temporary object.
status	character varying(7)	Object status. <ul style="list-style-type: none"><li>• <b>valid</b></li><li>• <b>invalid</b></li></ul>
subobject_name	name	Subobject name of the object.
generated	character(1)	Specifies whether the object name is generated by the system.
created	timestamp with time zone	Time when the object was created.
last_ddl_time	timestamp with time zone	Last time when the object was modified.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is <b>NULL</b> .
timestamp	character varying(19)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sharing	character varying(18)	Not supported. Its value is <b>NULL</b> .
editionable	character varying(1)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
application	character varying(1)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
created_appid	numeric	Not supported. Its value is <b>NULL</b> .
modified_appid	numeric	Not supported. Its value is <b>NULL</b> .
created_vsnid	numeric	Not supported. Its value is <b>NULL</b> .
modified_vsnid	numeric	Not supported. Its value is <b>NULL</b> .

**NOTICE**

For details about the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

## 12.3.24 ADM\_PART\_COL\_STATISTICS

ADM\_PART\_COL\_STATISTICS displays the column statistics and histogram information about all table partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-128** ADM\_PART\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.

Name	Type	Description
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(63)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.25 ADM\_PART\_INDEXES

**ADM\_PART\_INDEXES** displays information about all partitioned table indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-129** ADM\_PART\_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of the partitioned table index
index_owner	character varying(64)	Name of the owner of a partitioned table index
index_name	character varying(64)	Name of the partitioned table index
partition_count	bigint	Number of index partitions of the partitioned table index
partitioning_key_count	integer	Number of partition keys of the partitioned table
partitioning_type	text	Partition policy of the partitioned table <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
schema	character varying(64)	Name of the schema to which the partitioned table index belongs
table_name	character varying(64)	Name of the partitioned table to which the partitioned table index belongs

## 12.3.26 ADM\_PART\_TABLES

ADM\_PART\_TABLES displays information about all partitioned tables in the database. By default, only system administrators can access this view. Common users can access the view only after being authorized. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-130** ADM\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of the partitioned table.

Name	Type	Description
partitioning_type	text	Partitioning policy of the partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of the partitioned table.
partitioning_key_count	integer	Number of partition keys of the partitioned table.
def_tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Schema of the partitioned table.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. The distributed system does not support level-2 partitions. Set this parameter to <b>NONE</b> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
status	character varying(8)	Not supported. Its value is <b>valid</b> .
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Its value is <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.

Name	Type	Description
def_initial_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_size	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_freelists	numeric	Not supported. Its value is <b>NULL</b> .
def_freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
def_logging	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_compression	character varying(8)	Default compression mode used when a partition is added. Value range: <ul style="list-style-type: none"> <li>• <b>NONE</b></li> <li>• <b>ENABLED</b></li> <li>• <b>DISABLED</b></li> </ul>
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <b>NOTE</b> For available compression modes and compression levels, see <a href="#">WITH ( { storage_paramet...</a>
def_buffer_pool	character varying(7)	Not supported. Its value is <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Its value is <b>NO</b> .

Name	Type	Description
interval_subpartition	character varying(1000)	Not supported. Its value is <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Its value is <b>NO</b> .
is_nested	character varying(3)	Not supported. Its value is <b>NO</b> .
def_segment_creation	character varying(4)	Currently, the segment-page mode is not supported. When the segment-page mode is enabled, the value is <b>YES</b> .
def_indexing	character varying(3)	Not supported. Its value is <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NONE</b> .
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Its value is <b>NO</b> .
def_cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .

### 12.3.27 ADM\_PROCEDURES

ADM\_PROCEDURES displays information about all stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-131** ADM\_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, or trigger.
object_name	character varying(64)	Name of a stored procedure, function, or trigger.
procedure_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
object_id	oid	OID of a stored procedure, function, or trigger.
subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
overload	character varying(40)	<i>n</i> th overloaded function of the name.
object_type	character varying(13)	Object type name.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: <ul style="list-style-type: none"><li>• <b>YES</b></li><li>• <b>NO</b></li></ul>
pipelined	character varying(3)	Not supported. Its value is <b>NO</b> .
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. Its value is <b>NO</b> .
interface	character varying(3)	Not supported. Its value is <b>NO</b> .
deterministic	character varying(3)	Not supported. Its value is <b>NO</b> .

Name	Type	Description
authid	character varying(12)	Specifies whether to use the creator permission or caller permission: <ul style="list-style-type: none"><li>• <b>DEFINER</b>: The creator permission is used.</li><li>• <b>CURRENT_USER</b>: The caller permission is used.</li></ul> This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .
polymorphic	character varying(5)	Not supported. Its value is <b>NULL</b> .
argument_number	smallint	Number of input parameters in a stored procedure.

### 12.3.28 ADM\_ROLE\_PRIVS

ADM\_ROLE\_PRIVS displays information about roles granted to all users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-132** ADM\_ROLE\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"><li>• <b>YES</b></li><li>• <b>NO</b></li></ul>
delegate_option	character varying(3)	Not supported. Its value is <b>NULL</b> .
default_role	character varying(3)	Not supported. Its value is <b>NULL</b> .
os_granted	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.29 ADM\_ROLES

ADM\_ROLES displays information about database roles. This view is accessible only to system administrators. This view exists in both PG\_CATALOG and SYS schemas.

Table 12-133 ADM\_ROLES columns

Name	Type	Description
role	character varying(128)	Role name.
role_id	oid	Role ID.
authentication_type	text	Role authentication mechanism. <ul style="list-style-type: none"> <li>• <b>password</b>: Password authentication is required.</li> <li>• <b>null</b>: Authentication is not required.</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .
implicit	character varying(3)	Not supported. Its value is <b>NULL</b> .
external_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .

### 12.3.30 ADM\_SCHEDULER\_JOB\_ARGS

ADM\_SCHEDULER\_JOB\_ARG displays parameters related to all jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-134** ADM\_SCHEDULER\_JOB\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be a user-defined data type.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

### 12.3.31 ADM\_SCHEDULER\_JOBS

ADM\_SCHEDULER\_JOBS displays information about all DBE\_SCHEDULER scheduled jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-135** ADM\_SCHEDULER\_JOBS columns

Name	Type	Description
owner	name	Owner of a scheduled job.
job_name	text	Name of a scheduled job.
job_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
job_style	text	Style of a scheduled job, which is specified during creation. Its value can only be " <b>REGULAR</b> ". If this parameter is not specified, the value is <b>NULL</b> .
job_creator	name	Creator of a scheduled job.

Name	Type	Description
client_id	character varying(65)	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(33)	Not supported. Its value is <b>NULL</b> .
program_owner	character varying(4000)	Owner of a program referenced by a scheduled job.
program_name	text	Name of the program referenced by a scheduled job.
job_type	character varying(16)	Inline program type of a scheduled job. The options are as follows: <ul style="list-style-type: none"> <li>• <b>PLSQL_BLOCK</b>: anonymous block of a stored procedure.</li> <li>• <b>STORED_PROCEDURE</b>: stored procedure that is saved.</li> <li>• <b>EXTERNAL_SCRIPT</b>: external script.</li> </ul>
job_action	text	Program content of a scheduled job.
number_of_arguments	text	Number of parameters of a scheduled job.
schedule_owner	character varying(4000)	Not supported. Its value is <b>NULL</b> .
schedule_name	text	Name of the schedule referenced by a scheduled job.
schedule_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
start_date	timestamp without time zone	Start time of a scheduled job.
repeat_interval	text	Period of a scheduled job.
event_queue_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
event_queue_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
event_queue_agent	character varying(523)	Not supported. Its value is <b>NULL</b> .
event_condition	character varying(4000)	Not supported. Its value is <b>NULL</b> .
event_rule	character varying(261)	Not supported. Its value is <b>NULL</b> .
file_watcher_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .
file_watcher_name	character varying(261)	Not supported. Its value is <b>NULL</b> .
end_date	timestamp without time zone	End time of a scheduled job.
job_class	text	Name of the scheduled job class to which a scheduled job belongs.
enabled	Boolean	Status of a scheduled job.
auto_drop	text	Status of the automatic deletion function of a scheduled job.
restart_on_recovery	character varying(5)	Not supported. Its value is <b>NULL</b> .
restart_on_failure	character varying(5)	Not supported. Its value is <b>NULL</b> .
state	"char"	Status of a scheduled job.
job_priority	numeric	Not supported. Its value is <b>NULL</b> .
run_count	numeric	Not supported. Its value is <b>NULL</b> .
uptime_run_count	numeric	Not supported. Its value is <b>NULL</b> .
max_runs	numeric	Not supported. Its value is <b>NULL</b> .
failure_count	smallint	Number of scheduled job failures.
uptime_failure_count	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
max_failures	numeric	Maximum number of failures allowed before the status of a scheduled job is marked as broken.
retry_count	numeric	Not supported. Its value is <b>NULL</b> .
last_start_date	timestamp without time zone	Last time when a scheduled job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduled job.
next_run_date	timestamp without time zone	Next execution time of a scheduled job.
schedule_limit	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
max_run_duration	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
logging_level	character varying(11)	Not supported. Its value is <b>NULL</b> .
store_output	character varying(5)	Specifies whether to store the output information of all scheduled jobs.
stop_on_window_close	character varying(5)	Not supported. Its value is <b>NULL</b> .
instance_stickiness	character varying(5)	Not supported. Its value is <b>NULL</b> .
raise_events	character varying(4000)	Not supported. Its value is <b>NULL</b> .
system	character varying(5)	Not supported. Its value is <b>NULL</b> .
job_weight	numeric	Not supported. Its value is <b>NULL</b> .
nls_env	character varying(4000)	Not supported. Its value is <b>NULL</b> .
source	character varying(128)	Not supported. Its value is <b>NULL</b> .
number_of_destinations	numeric	Not supported. Its value is <b>NULL</b> .
destination_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
destination	text	Target name of a scheduled job.
credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
credential_name	text	Certificate name of a scheduled job.
instance_id	oid	OID of the current database
deferred_drop	character varying(5)	Not supported. Its value is <b>NULL</b> .
allow_runs_in_restricted_mode	character varying(5)	Not supported. Its value is <b>NULL</b> .
comments	text	Comments of a scheduled job.
flags	numeric	Not supported. Its value is <b>NULL</b> .
restartable	character varying(5)	Not supported. Its value is <b>NULL</b> .
has_constraints	character varying(5)	Not supported. Its value is <b>NULL</b> .
connect_credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
connect_credential_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
fail_on_script_error	character varying(5)	Not supported. Its value is <b>NULL</b> .

### 12.3.32 ADM\_SCHEDULER\_PROGRAM\_ARGS

ADM\_SCHEDULER\_PROGRAM\_ARG displays parameters related to all programs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-136** ADM\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.

Name	Type	Description
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be a user-defined data type.
metadata_attribute	character varying(19)	Not supported. Its value is <b>NULL</b> .
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

### 12.3.33 ADM\_SCHEDULER\_PROGRAMS

ADM\_SCHEDULER\_PROGRAMS displays information about all programs that can be scheduled in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-137** ADM\_SCHEDULER\_PROGRAMS columns

Name	Type	Description
owner	name	Owner of a scheduler program
program_name	text	Name of a scheduler program

Name	Type	Description
program_type	character varying(16)	Type of the scheduler. The options are as follows: <ul style="list-style-type: none"> <li>• <b>PLSQL_BLOCK</b>: anonymous block of a stored procedure.</li> <li>• <b>STORED_PROCEDURE</b>: stored procedure that is saved.</li> <li>• <b>EXTERNAL_SCRIPT</b>: external script.</li> </ul>
program_action	text	Action performed by a scheduler program
number_of_arguments	numeric	Number of scheduler program parameters
enabled	character varying(5)	Specifies whether a scheduler program is enabled.
comments	text	Comments of a scheduler program
detached	character varying(5)	Not supported. Its value is <b>NULL</b> .
schedule_limit	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
priority	numeric	Not supported. Its value is <b>NULL</b> .
weight	numeric	Not supported. Its value is <b>NULL</b> .
max_runs	numeric	Not supported. Its value is <b>NULL</b> .
max_failures	numeric	Not supported. Its value is <b>NULL</b> .
max_run_duration	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
has_constraints	character varying(5)	Not supported. Its value is <b>NULL</b> .
nls_env	character varying(4000)	Not supported. Its value is <b>NULL</b> .

## 12.3.34 ADM\_SCHEDULER\_RUNNING\_JOBS

ADM\_SCHEDULER\_RUNNING\_JOBS displays information about all DBE\_SCHEDULER jobs that are being executed in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-138** ADM\_SCHEDULER\_RUNNING\_JOBS columns

Name	Type	Description
owner	character varying(128)	Owner of a scheduled job.
job_name	character varying(128)	Name of a scheduled job.
job_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
job_style	character varying(17)	Style of a scheduled job, which is specified during creation. Its value can only be " <b>REGULAR</b> ". If this parameter is not specified, the value is <b>NULL</b> .
detached	character varying(5)	Not supported. Its value is <b>NULL</b> .
session_id	numeric	ID of the session that executes a scheduled job.
slave_process_id	numeric	Not supported. Its value is <b>NULL</b> .
slave_os_process_id	character varying(12)	ID of the process that executes a scheduled job.
running_instance	numeric	Not supported. Its value is <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Its value is <b>NULL</b> .
elapsed_time	interval day to second(2)	Execution duration of a scheduled job.
cpu_used	interval day to second(2)	Not supported. Its value is <b>NULL</b> .
destination_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
destination	character varying(261)	Target name of a scheduled job.
credential_name	character varying(128)	Credential name of a scheduled job.
credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
log_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.35 ADM\_SEGMENTS

ADM\_SEGMENTS displays the storage space allocated to all segments in the database. It exists in both the PG\_CATALOG and SYS schemas. Only the system administrator can access this view. The information cannot be obtained from the system catalog. The view is empty.

**Table 12-139** ADM\_SEGMENTS columns

Name	Type	Description
owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
segment_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
segment_type	character varying(18)	Not supported. Its value is <b>NULL</b> .
segment_subtype	character varying(10)	Not supported. Its value is <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Its value is <b>NULL</b> .
header_file	numeric	Not supported. Its value is <b>NULL</b> .
header_block	numeric	Not supported. Its value is <b>NULL</b> .
bytes	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
extents	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
retention	character varying(7)	Not supported. Its value is <b>NULL</b> .
minretention	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
relative_fno	numeric	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .

### 12.3.36 ADM\_SEQUENCES

ADM\_SEQUENCES displays information about all sequences in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-140** ADM\_SEQUENCES columns

Name	Type	Description
sequence_owner	character varying(64)	Owner of a sequence.
sequence_name	character varying(64)	Name of the sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.
increment_by	int16	Increment of the sequence.
last_number	int16	Value of the previous sequence.
cache_size	int16	Size of the sequence disk cache.
cycle_flag	character(1)	Specifies whether the sequence is a cyclic sequence. The value can be <b>Y</b> or <b>N</b> . <ul style="list-style-type: none"><li>• <b>Y</b>: It is a cyclic sequence.</li><li>• <b>N</b>: It is not a cyclic sequence.</li></ul>

### 12.3.37 ADM\_SOURCE

ADM\_SOURCE displays the definition information about all stored procedures, functions, and triggers in the database. By default, only the system administrator

can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-141** ADM\_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. The value can be <b>function, procedure, or trigger</b> .
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.38 ADM\_SUBPART\_KEY\_COLUMNS

ADM\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

**Table 12-142** ADM\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
name	character varying(128)	Not supported. Its value is <b>NULL</b> .
object_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
column_position	numeric	Not supported. Its value is <b>NULL</b> .
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.39 ADM\_SYNONYMS

ADM\_SYNONYMS displays all synonyms in the database. This view is accessible only to system administrators. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-143** ADM\_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym.
schema_name	text	Name of the schema to which the synonym belongs.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

### 12.3.40 ADM\_SYS\_PRIVS

ADM\_SYS\_PRIVS displays information about system permissions granted to users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-144** ADM\_SYS\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
privilege	character varying(40)	System permission System permissions include rolsuper, rolinherit, rolcreatorole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.41 ADM\_TAB\_COLS

ADM\_TAB\_COLS displays information about table and view columns. Each column of each table and view in the database has a row of data in ADM\_TAB\_COLS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas. The number of rows displayed in this view is the same as that in the ADM\_TAB\_COLUMNS view. Only columns are different.

**Table 12-145** ADM\_TAB\_COLS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(128)	Name of the table or view.
column_name	character varying(128)	Column name.
data_type	character varying(128)	Data type of a column, which can be a user-defined data type.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	numeric	Length of the column, in bytes.
data_precision	numeric	Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types.
data_scale	numeric	Number of decimal places. This column is valid for the numeric data type and <b>0</b> for other data types.
nullable	character varying(1)	Specifies whether a column can be empty ( <b>n</b> for a primary key constraint or NOT NULL constraint).
column_id	numeric	Sequence number of the column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.

Name	Type	Description
global_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in characters) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Its value is <b>YES</b> .
hidden_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
virtual_column	character varying	Specifies whether a column is a virtual column (a generated column). <b>YES</b> <b>NO</b>
segment_column_id	numeric	Not supported. Its value is <b>NULL</b> .
internal_column_id	numeric	Internal sequence number of a column. The value is the same as that of <b>COLUMN_ID</b> .
histogram	character varying(15)	Histogram type: <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
qualified_col_name	character varying(64)	Qualified column name, which is the same as <b>COLUMN_NAME</b> .

Name	Type	Description
user_generated	character varying(3)	Not supported. Its value is <b>YES</b> .
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.42 ADM\_TAB\_COL\_STATISTICS

ADM\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from ADM\_TAB\_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-146** ADM\_TAB\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.

Name	Type	Description
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	<ul style="list-style-type: none"> <li>If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li> <li>If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <b>1/NUM_DISTINCT</b>.</li> </ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. After the database is restarted, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. <ul style="list-style-type: none"> <li><b>NONE</b>: no histogram.</li> <li><b>FREQUENCY</b>: frequency histogram.</li> <li><b>EQUI-WIDTH</b>: equal-width histogram.</li> </ul>
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is <b>SHARED</b> (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.43 ADM\_TAB\_COLUMNS

ADM\_TAB\_COLUMNS displays information about the columns of tables and views. Each column of each table and view in the database has a row of data in ADM\_TAB\_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-147** ADM\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of the column.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of the column, in bytes.
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and <b>0</b> for other data types.
nullable	bpchar	Specifies whether a column can be empty ( <b>n</b> for a primary key constraint or NOT NULL constraint). <ul style="list-style-type: none"><li>• <b>y</b>: yes.</li><li>• <b>n</b>: no.</li></ul>
column_id	integer	Sequence number of the column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes. This column is left blank if no default value left.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.

Name	Type	Description
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in characters) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Its value is <b>YES</b> .
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.44 ADM\_TAB\_COMMENTS

ADM\_TAB\_COMMENTS displays comments about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-148** ADM\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of the table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

## 12.3.45 ADM\_TAB\_HISTOGRAMS

ADM\_TAB\_HISTOGRAMS displays the histogram information about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-149** ADM\_TAB\_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Its value is <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Its value is <b>NULL</b> .
endpoint_repeat_count	numeric	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. Its value is <b>SHARED</b> .

## 12.3.46 ADM\_TAB\_PARTITIONS

ADM\_TAB\_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

**Table 12-150** ADM\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.

Name	Type	Description
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
subpartition_count	numeric	Not supported. Its value is <b>NULL</b> .
high_value_length	integer	Length of the binding value expression in a partition.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to the table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .

Name	Type	Description
segment_created	character varying(4)	Specifies whether a partitioned table has segments created or has not been created.
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.47 ADM\_TAB\_PRIVS

ADM\_TAB\_PRIVS displays authorization information about all objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-151** ADM\_TAB\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
owner	character varying(128)	Object owner.

Name	Type	Description
table_name	character varying(128)	Name of an object. Object types include tables, packages, indexes, and sequences.
grantor	character varying(128)	Name of the user who grants the permission.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the <b>GRANT</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
type	character varying(24)	Object types, including NODE GROUP, COLUMN_ENCRYPTION_KEY, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, and TABLESPACE.
hierarchy	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.48 ADM\_TAB\_STATISTICS

ADM\_TAB\_STATISTICS displays optimizer statistics for all tables in the database. This view exists in both PG\_CATALOG and SYS schemas. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

**Table 12-152** ADM\_TAB\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
partition_position	numeric	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_position	numeric	Not supported. Its value is <b>NULL</b> .
object_type	character varying(12)	Object type. <ul style="list-style-type: none"> <li>• <b>TABLE</b></li> <li>• <b>PARTITION</b></li> <li>• <b>SUBPARTITION</b></li> </ul>
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_cached_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_cache_hit_ratio	numeric	Not supported. Its value is <b>NULL</b> .
im_imcu_count	numeric	Not supported. Its value is <b>NULL</b> .
im_block_count	numeric	Not supported. Its value is <b>NULL</b> .
im_stat_update_time	timestamp(9) without time zone	Not supported. Its value is <b>NULL</b> .
scan_rate	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
stattype_locked	character varying(5)	Not supported. Its value is <b>NULL</b> .
stale_stats	character varying(7)	Not supported. Its value is <b>NULL</b> .
notes	character varying(25)	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. The default value is <b>SHARED</b> .

### 12.3.49 ADM\_TAB\_STATS\_HISTORY

ADM\_TAB\_STATS\_HISTORY provides historical statistics about all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-153** ADM\_TAB\_STATS\_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

### 12.3.50 ADM\_TABLES

ADM\_TABLES displays all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-154** ADM\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. <ul style="list-style-type: none"> <li>• <b>YES</b>: It is deleted.</li> <li>• <b>NO</b>: It is not deleted.</li> </ul>
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. <ul style="list-style-type: none"> <li>• <b>VALID</b>: The current table is valid.</li> <li>• <b>UNUSABLE</b>: The current table is unavailable.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. <ul style="list-style-type: none"> <li>• <b>Y</b>: The table is a temporary table.</li> <li>• <b>N</b>: The table is not a temporary table.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.

Name	Type	Description
partitioned	character varying(3)	Specifies whether a table is a partitioned table. <ul style="list-style-type: none"> <li>● <b>YES:</b> The table is a partitioned table.</li> <li>● <b>NO:</b> The table is not a partitioned table.</li> </ul>
last_analyzed	timestamp with time zone	Last time when the table was analyzed.
row_movement	character varying(8)	Specifies whether to allow partition row movement. <ul style="list-style-type: none"> <li>● <b>ENABLED:</b> The partition row movement is allowed.</li> <li>● <b>DISABLED:</b> The partition row movement is not allowed.</li> </ul>
compression	character varying(8)	Specifies whether to enable a table compression. <ul style="list-style-type: none"> <li>● <b>ENABLED:</b> A table compression is enabled.</li> <li>● <b>DISABLED:</b> A table compression is disabled.</li> </ul>
duration	character varying(15)	Time elapsed when a temporary table is processed. <ul style="list-style-type: none"> <li>● <b>NULL:</b> The table is not a temporary table.</li> <li>● <b>sys\$session:</b> The table is a temporary session table.</li> <li>● <b>sys\$transaction:</b> The table is a temporary transaction table.</li> </ul>

Name	Type	Description
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. <ul style="list-style-type: none"> <li>• <b>ENABLED</b>: Logical replication is enabled.</li> <li>• <b>DISABLED</b>: Logical replication is disabled.</li> </ul>
external	character varying(3)	Specifies whether the table is a foreign table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table is a foreign table.</li> <li>• <b>NO</b>: The table is not a foreign table.</li> </ul>
logging	character varying(3)	Specifies whether changes to a table are logged. <ul style="list-style-type: none"> <li>• <b>YES</b>: Changes to the table are logged.</li> <li>• <b>NO</b>: Changes to the table are not logged.</li> </ul>
default_collation	character varying(100)	Default collation of a table. <ul style="list-style-type: none"> <li>• default</li> </ul>
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. <ul style="list-style-type: none"> <li>• <b>ENABLED</b>: The table lock is enabled.</li> <li>• <b>DISABLED</b>: The table lock is disabled.</li> </ul>
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.

Name	Type	Description
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. <ul style="list-style-type: none"> <li>● <b>ENABLED:</b> The corrupted block is skipped.</li> <li>● <b>DISABLED:</b> The corrupted block is not skipped.</li> </ul>
has_identity	character varying(3)	Specifies whether a table has an identifier column. <ul style="list-style-type: none"> <li>● <b>YES:</b> There is an identifier column.</li> <li>● <b>NO:</b> There is no identifier column.</li> </ul>
segment_created	character varying(3)	Specifies whether a table segment has been created. <ul style="list-style-type: none"> <li>● <b>YES:</b> The table segment has been created.</li> <li>● <b>NO:</b> The table segment is not created.</li> </ul>
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. <ul style="list-style-type: none"> <li>● <b>YES:</b> The modification of the table is monitored.</li> <li>● <b>NO:</b> The modification of the table is not monitored.</li> </ul>
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .
result_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
clustering	character varying(3)	Not supported. Its value is <b>NULL</b> .
activity_tracking	character varying(23)	Not supported. Its value is <b>NULL</b> .
dml_timestamp	character varying(25)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
hybrid	character varying(3)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
container_map_object	character varying(3)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_link_dml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
object_id_type	character varying(16)	Not supported. Its value is <b>NULL</b> .
table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

### 12.3.51 ADM\_TABLESPACES

ADM\_TABLESPACES displays information about available tablespaces. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas. The logical structure features of GaussDB are different from those of the ORA database.

**Table 12-155** ADM\_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name
block_size	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
min_extlen	numeric	Not supported. Its value is <b>NULL</b> .
contents	character varying(9)	Not supported. Its value is <b>NULL</b> .
status	character varying(9)	Not supported The default value is <b>ONLINE</b> .
logging	character varying(9)	Not supported. Its value is <b>NULL</b> .
force_logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
extent_management	character varying(10)	Not supported. Its value is <b>NULL</b> .
allocation_type	character varying(9)	Not supported. Its value is <b>NULL</b> .
plugged_in	character varying(3)	Not supported. Its value is <b>NULL</b> .
segment_space_management	character varying(6)	Not supported. Its value is <b>NULL</b> .
def_tab_compression	character varying(8)	Not supported. Its value is <b>NULL</b> .
retention	character varying(11)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
bigfile	character varying(3)	Not supported. Its value is <b>NULL</b> .
predicate_evaluation	character varying(7)	Not supported. Its value is <b>NULL</b> .
encrypted	character varying(3)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
shared	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_index_compression	character varying(8)	Not supported. Its value is <b>NULL</b> .
index_compress_for	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_cellmemory	character varying(14)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
lost_write_protect	character varying(7)	Not supported. Its value is <b>NULL</b> .
chunk_tablespace	character varying(1)	Not supported. Its value is <b>NULL</b> .

## 12.3.52 ADM\_TRIGGERS

ADM\_TRIGGERS displays information about triggers in the database. By default, only the system administrator can access this view. Common users can access the

view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-156** ADM\_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Trigger types: <b>before statement, before each row, after statement, after each row, and instead of.</b>
triggering_event	character varying	Events that trigger a trigger: <b>update, insert, delete, and truncate.</b>
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Basic object type of a trigger, which can be <b>table</b> or <b>view</b> .
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
referencing_name	character varying(422)	Not supported. Its value is <b>referencing new as new old as old</b> .
when_clause	character varying(4000)	Content of the WHEN clause. <b>trigger_body</b> can be executed only when the value is <b>true</b> .
status	character varying(64)	<ul style="list-style-type: none"><li>● <b>O</b>: The trigger is enabled in origin or local mode.</li><li>● <b>D</b>: The trigger is disabled.</li><li>● <b>R</b>: The trigger is enabled in replica mode.</li><li>● <b>A</b>: The trigger is always enabled.</li></ul>
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports <b>call</b> .
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
before_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
before_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
after_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
after_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
instead_of_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
fire_once	character varying(3)	Not supported. Its value is <b>NULL</b> .
apply_server_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.53 ADM\_TYPES

ADM\_TYPES describes all object types in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-157** ADM\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Its value is <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
instantiable	character varying(3)	Not supported. Its value is <b>NULL</b> .
persistable	character varying(3)	Not supported. Its value is <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
local_attributes	numeric	Not supported. Its value is <b>NULL</b> .
local_methods	numeric	Not supported. Its value is <b>NULL</b> .
typeid	raw	Not supported. Its value is <b>NULL</b> .

## 12.3.54 ADM\_TYPE\_ATTRS

ADM\_TYPE\_ATTRS displays the attributes of the current database object type. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-158** ADM\_TYPE\_ATTRS columns

Name	Type	Description
owner	oid	Owner of the type.
type_name	name	Data type name.
attr_name	name	Column name.
attr_type_mod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need ATTTYPMOD.
attr_type_owner	oid	Owner of an attribute of this type.
attr_type_name	name	Data type attribute name. Currently, this column records the type name after conversion.

Name	Type	Description
length	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. <ul style="list-style-type: none"> <li>• The value <b>-1</b> indicates a "varlena" type (one that has a length word).</li> <li>• The value <b>-2</b> indicates a NULL-terminated C string.</li> </ul>
precision	integer	Precision of the numeric type.
scale	integer	Range of the numeric type.
character_set_name	character(1)	Character set name of an attribute ( <b>c</b> or <b>n</b> ). <ul style="list-style-type: none"> <li>• <b>c</b>: CHAR_CS.</li> <li>• <b>n</b>: NCHAR_CS.</li> </ul>
attr_no	smallint	Attribute number
inherited	character(1)	Specifies whether the attribute is inherited from the super type ( <b>Y</b> or <b>N</b> )
attr_length	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). The raw type is not recorded due to kernel implementation.

### 12.3.55 ADM\_USERS

ADM\_USERS displays information about all database users. This view is accessible only to system administrators. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-159** ADM\_USERS columns

Name	Type	Description
username	character varying(128)	Username.
user_id	oid	User ID.

Name	Type	Description
account_status	character varying(32)	Account status. <ul style="list-style-type: none"> <li>● <b>null</b>: The account is the initial system administrator with the highest permission.</li> <li>● <b>0</b>: normal.</li> <li>● <b>1</b>: The account is locked for a specific period of time because the number of failed login attempts exceeds the threshold.</li> <li>● <b>2</b>: The account is locked by the administrator.</li> </ul>
lock_date	timestamp with time zone	By default, the creation date of the account is displayed. If the account is locked by the administrator or the account is locked because the number of login failures exceeds the threshold, the date when the account is locked is displayed. The value is <b>null</b> for the initial system administrator.
expiry_date	timestamp with time zone	Account expiration date.
default_tablespace	character varying(4000)	Default tablespace for storing data.
temporary_tablespace	character varying(4000)	Name of the default tablespace or tablespace group of a temporary table.
local_temp_tablespace	character varying(30)	Not supported. The default value is <b>NULL</b> .
created	timestamp with time zone	Date when a user is created.
profile	character varying(128)	Not supported. The default value is <b>NULL</b> .
initial_rsrc_consumer_group	character varying(128)	Not supported. The default value is <b>NULL</b> .
external_name	character varying(4000)	Not supported. The default value is <b>NULL</b> .
password_versions	character varying(12)	Encryption mode of the account password. The value can be <b>MD5</b> , <b>SHA256</b> , or <b>SM3</b> .

Name	Type	Description
editions_enabled	character varying(1)	Not supported. The default value is <b>NULL</b> .
authentication_type	text	Indicates the authentication mechanism of the user.
proxy_only_connect	character varying(1)	Not supported. The default value is <b>NULL</b> .
common	character varying(3)	Not supported. The default value is <b>NULL</b> .
last_login	timestamp with time zone	Last login.
oracle_maintained	character varying(1)	Not supported. The default value is <b>NULL</b> .
inherited	character varying(3)	Not supported. The default value is <b>NULL</b> .
default_collation	character varying(100)	Default collation of the user schema.
implicit	character varying(3)	Not supported. The default value is <b>NULL</b> .
all_shard	character varying(3)	Not supported. The default value is <b>NULL</b> .
password_change_date	timestamp with time zone	Date when the user password was set last time.

### 12.3.56 ADM\_VIEWS

ADM\_VIEWS displays views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-160** ADM\_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of a view.
view_name	character varying(64)	View name.
text	text	Text in the view.
text_length	integer	Text length of the view.

Name	Type	Description
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.
type_text_length	numeric	Not supported. Its value is <b>NULL</b> .
type_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
oid_text_length	numeric	Not supported. Its value is <b>NULL</b> .
oid_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
view_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
view_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
superview_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
editioning_view	character varying(1)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(1)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(1)	Not supported. Its value is <b>NULL</b> .
bequeath	character varying(12)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .
default_collation	character varying(100)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
pdb_local_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.57 COMM\_CLIENT\_INFO

COMM\_CLIENT\_INFO displays information about active client connections of a single node (You can query this view on a DN to view the information about the connection between the CN and DN). By default, only the users with system administrator permission can access this view.

**Table 12-161** COMM\_CLIENT\_INFO columns

Name	Type	Description
node_name	text	Name of the current DN, for example, dn_6001_6002_6003.
app	text	Query a view on a DN. The app displays the client connected to the current DN, such as the coordinator (CN), GTM, or DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
socket	integer	<b>socket fd</b> is displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.
logic_id	integer	Displayed if the connection is a logical connection.

### 12.3.58 DB\_ALL\_TABLES

DB\_ALL\_TABLES displays tables or views accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-162** DB\_ALL\_TABLES columns

Name	Type	Description
owner	name	Owner of a table or view.
table_name	name	Name of the table or view.
tablespace_name	name	Tablespace where the table or view is located.

## 12.3.59 DB\_ARGUMENTS

DB\_ARGUMENTS displays parameter information about stored procedures and functions accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas. This view is accessible to all users and displays all information accessible to the current user.

**Table 12-163** DB\_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	<i>n</i> th overloaded function of the name.
subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
argument_name	character varying(128)	Parameter name.
position	numeric	Position of the parameter in the parameter list. The value is <b>0</b> for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value is fixed at <b>0</b> because only one line is displayed for each parameter.
data_type	character varying(64)	Data type of a parameter.

Name	Type	Description
defaulted	character varying(1)	Specifies whether a parameter has a default value. <ul style="list-style-type: none"> <li>• <b>Y</b>: yes.</li> <li>• <b>N</b>: no.</li> </ul>
default_value	text	Not supported. Its value is <b>NULL</b> .
default_length	numeric	Not supported. Its value is <b>NULL</b> .
in_out	character varying(9)	Input and output attributes of a parameter: <ul style="list-style-type: none"> <li>• <b>IN</b>: input parameter.</li> <li>• <b>OUT</b>: output parameter.</li> <li>• <b>IN_OUT</b>: input and output parameters.</li> <li>• <b>VARIADIC</b>: VARIADIC parameter.</li> </ul>
data_length	numeric	Not supported. Its value is <b>NULL</b> .
data_precision	numeric	Not supported. Its value is <b>NULL</b> .
data_scale	numeric	Not supported. Its value is <b>NULL</b> .
radix	numeric	Radix of a number. Set it to <b>10</b> for the smallint, integer, bigint, numeric, or float type, and to <b>NULL</b> for other data types.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
type_owner	character varying(128)	Owner of a data type.
type_name	character varying(128)	Parameter type name.
type_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_link	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_object_type	character varying(7)	Types of types of the <b>type_owner</b> , <b>type_name</b> , and <b>type_subname</b> columns: <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The parameter is of the table type.</li> <li>• <b>VIEW</b>: The parameter is of the view type.</li> <li>• Set this column to <b>NULL</b> for other types.</li> </ul>

Name	Type	Description
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.60 DB\_COL\_COMMENTS

DB\_COL\_COMMENTS displays comment information about table columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-164** DB\_COL\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.61 DB\_COL\_PRIVS

DB\_COL\_PRIVS displays the following granting information:

- Column permission granting information when the current user is the object owner, grantor, or grantee.
- Column permission granting information when the enabled role or PUBLIC role is the grantee.

By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-165** DB\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.62 DB\_COLL\_TYPES

DB\_COLL\_TYPES displays information about collection types that can be accessed by the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-166** DB\_COLL\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a cluster.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a set.
upper_bound	numeric	Not supported. Its value is <b>NULL</b> .
elem_type_mod	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Its value is <b>NULL</b> .
precision	numeric	Not supported. Its value is <b>NULL</b> .
scale	numeric	Not supported. Its value is <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Its value is <b>NULL</b> .
nulls_stored	character varying(3)	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Its value is <b>NULL</b> .

### 12.3.63 DB\_CONSTRAINTS

DB\_CONSTRAINTS displays information about constraints accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-167** DB\_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. <ul style="list-style-type: none"> <li>● <b>c</b>: check constraint.</li> <li>● <b>f</b>: foreign key constraint.</li> <li>● <b>p</b>: primary key constraint.</li> <li>● <b>u</b>: unique constraint.</li> </ul>
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of the constraint-related index (only for the unique constraint and primary key constraint).

## 12.3.64 DB\_CONS\_COLUMNS

DB\_CONS\_COLUMNS displays information about constraint columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-168** DB\_CONS\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
position	smallint	Position of a column in a table.

## 12.3.65 DB\_DEPENDENCIES

DB\_DEPENDENCIES displays the dependency relationship between types, tables, views, stored procedures, functions, and triggers accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-169** DB\_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
dependency_type	character varying(4)	Not supported. Its value is <b>NULL</b> .

## 12.3.66 DB\_IND\_COLUMNS

**DB\_IND\_COLUMNS** displays all index columns accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-170** DB\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_owner	character varying(64)	Table owner
table_name	character varying(64)	Table name
column_name	name	Column name
column_position	smallint	Position of the column in the index
column_length	numeric	Column length
char_length	numeric	Length of a column (character type).
descend	character varying	Indicates the sorting mode of a column. The value can be <b>DESC</b> or <b>ASC</b> .
collated_column_id	numeric	Provides the internal serial number of the language sorting columns.

## 12.3.67 DB\_IND\_EXPRESSIONS

**DB\_IND\_EXPRESSIONS** displays information about expression indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-171** DB\_IND\_EXPRESSIONS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.

Name	Type	Description
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of the column in the index.

### 12.3.68 DB\_IND\_PARTITIONS

DB\_IND\_PARTITIONS displays partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-172** DB\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>

Name	Type	Description
index_partition_usable	Boolean	Specifies whether the index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is <b>0</b> .
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the <b>analyze</b> command to collect statistics.
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.69 DB\_IND\_SUBPARTITIONS

DB\_IND\_SUBPARTITIONS displays partition information about local indexes of level-2 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Currently, all columns in this table are set to **NULL**.

**Table 1** DB\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
index_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
high_value	text	Not supported. Its value is <b>NULL</b> .
high_value_length	numeric	Not supported. Its value is <b>NULL</b> .
partition_position	numeric	Not supported. Its value is <b>NULL</b> .
subpartition_position	numeric	Not supported. Its value is <b>NULL</b> .
status	character varying(8)	Not supported. Its value is <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Not supported. Its value is <b>NULL</b> .
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .

## 12.3.70 DB\_INDEXES

DB\_INDEXES displays information about indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-173** DB\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of the table corresponding to the index.
uniqueness	text	Specifies whether the index is a unique index. <ul style="list-style-type: none"> <li>• <b>UNIQUE</b>: unique index.</li> <li>• <b>NONUNIQUE</b>: non-unique index.</li> </ul>
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. <ul style="list-style-type: none"> <li>• <b>Yes</b>: The index has the property of a partitioned table.</li> <li>• <b>No</b>: The index does not have the property of a partitioned table.</li> </ul>

Name	Type	Description
generated	character varying(1)	Specifies whether the index name is generated by the system. <ul style="list-style-type: none"> <li>• <b>y</b>: The index name is generated by the system.</li> <li>• <b>n</b>: The index name is not generated by the system.</li> </ul>
index_type	character varying(27)	Index type. <ul style="list-style-type: none"> <li>• <b>NORMAL</b>: Index attributes are simple references, and the expression tree is empty.</li> <li>• <b>FUNCTION-BASED NORMAL</b>: Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of an index object.
table_type	character(11)	Type of the index object. <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The index object is of the table type.</li> </ul>
tablespace_name	character varying(30)	Name of a tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Not supported. Its value is <b>NULL</b> .
domidx_management	character varying(14)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.71 DB\_OBJECTS

DB\_OBJECTS displays all database objects accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-174** DB\_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Object type.
namespace	oid	ID of the namespace where the object resides.

Name	Type	Description
temporary	character(1)	Specifies whether the object is a temporary object.
status	character varying(7)	Object status.
subobject_name	name	Subobject name of the object.
generated	character(1)	Specifies whether the object name is generated by the system.
created	timestamp with time zone	Time when the object was created.
last_ddl_time	timestamp with time zone	Last time when the object was modified.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is <b>NULL</b> .
timestamp	character varying(19)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
sharing	character varying(18)	Not supported. Its value is <b>NULL</b> .
editionable	character varying(1)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
application	character varying(1)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
created_appid	numeric	Not supported. Its value is <b>NULL</b> .
modified_appid	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
created_vsnid	numeric	Not supported. Its value is <b>NULL</b> .
modified_vsnid	numeric	Not supported. Its value is <b>NULL</b> .

**NOTICE**

For details about the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

## 12.3.72 DB\_PART\_COL\_STATISTICS

DB\_PART\_COL\_STATISTICS displays column statistics and histogram information about table partitions accessible to the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-175** DB\_PART\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(63)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.73 DB\_PART\_KEY\_COLUMNS

DB\_PART\_KEY\_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-176** DB\_PART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a partitioned table or index.
name	character varying(128)	Name of a partitioned table or index.
object_type	character varying(128)	Valid values are <b>table</b> and <b>index</b> . If the partition is a partitioned table, the value is <b>table</b> . If the partition is a partitioned index, the value is <b>index</b> .
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.74 DB\_PART\_TABLES

DB\_PART\_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-177** DB\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of the partitioned table.
partitioning_type	text	Partitioning policy of the partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of the partitioned table.
partitioning_key_count	integer	Number of partition keys of the partitioned table.
def_tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Schema of the partitioned table.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. The distributed system does not support level-2 partitions. Set this parameter to <b>NONE</b> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
status	character varying(8)	Not supported. Its value is <b>valid</b> .

Name	Type	Description
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Its value is <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_size	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_freelists	numeric	Not supported. Its value is <b>NULL</b> .
def_freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
def_logging	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_compression	character varying(8)	Default compression mode used when a partition is added. Value range: <ul style="list-style-type: none"><li>• NONE - Not specified</li><li>• ENABLED</li><li>• DISABLED</li></ul>
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <b>NOTE</b> For available compression modes and compression levels, see <a href="#">WITH ( { storage_paramet...</a>
def_buffer_pool	character varying(7)	Not supported. Its value is <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
def_cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Its value is <b>NO</b> .
interval_subpartition	character varying(1000)	Not supported. Its value is <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Its value is <b>NO</b> .
is_nested	character varying(3)	Not supported. Its value is <b>NO</b> .
def_segment_creation	character varying(4)	Currently, the segment-page mode is not supported. When the segment-page mode is enabled, the value is <b>YES</b> .
def_indexing	character varying(3)	Not supported. Its value is <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NONE</b> .
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Its value is <b>NO</b> .
def_cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .

## 12.3.75 DB\_PROCEDURES

DB\_PROCEDURES displays information about all stored procedures or functions accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-178** DB\_PROCEDURES columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.

## 12.3.76 DB\_SCHEDULER\_JOB\_ARGS

DB\_SCHEDULER\_JOB\_ARG displays the parameters related to the tasks accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-179** DB\_SCHEDULER\_JOB\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be a user-defined data type.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

## 12.3.77 DB\_SCHEDULER\_PROGRAM\_ARGS

DB\_SCHEDULER\_PROGRAM\_ARG displays the parameters related to the programs accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-180** DB\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be a user-defined data type.
metadata_attribute	character varying(19)	Not supported. Its value is <b>NULL</b> .
default_value	character varying(4000)	Default parameter value.
anydata_default_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

## 12.3.78 DB\_SEQUENCES

DB\_SEQUENCES displays all sequences accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-181** DB\_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of the sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.

Name	Type	Description
last_number	int16	Value of the previous sequence.
cache_size	int16	Size of the sequence disk cache.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether the sequence is a cyclic sequence. The value can be <b>Y</b> or <b>N</b> . <ul style="list-style-type: none"> <li>• <b>Y</b>: It is a cyclic sequence.</li> <li>• <b>N</b>: It is not a cyclic sequence.</li> </ul>
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. Not supported. Its value is <b>NULL</b> .
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. Not supported. Its value is <b>NULL</b> .
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported. Its value is <b>NULL</b> .
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported. Its value is <b>NULL</b> .
session_flag	character varying(1)	Specifies whether a sequence is a private session. Not supported. Its value is <b>NULL</b> .
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. Not supported. Its value is <b>NULL</b> .

## 12.3.79 DB\_SOURCE

DB\_SOURCE displays the definition information about stored procedures, functions, and triggers accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-182** DB\_SOURCE columns

Name	Type	Description
owner	name	Object owner.

Name	Type	Description
name	name	Object name.
type	name	Object type. The value can be <b>function</b> , <b>procedure</b> , or <b>trigger</b> .
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.80 DB\_SUBPART\_KEY\_COLUMNS

DB\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schema. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

**Table 12-183** DB\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
name	character varying(128)	Not supported. Its value is <b>NULL</b> .
object_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
column_position	numeric	Not supported. Its value is <b>NULL</b> .
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.81 DB\_SYNONYMS

DB\_SYNONYMS displays all synonyms accessible to the current user.

**Table 12-184** DB\_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym.
schema_name	text	Name of the schema to which the synonym belongs.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.82 DB\_TAB\_COL\_STATISTICS

DB\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from DB\_TAB\_COLUMNS. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-185** DB\_TAB\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.

Name	Type	Description
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	<ul style="list-style-type: none"> <li>If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li> <li>If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <b>1/NUM_DISTINCT</b>.</li> </ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	<p>Specifies whether the histogram exists and the type of the histogram if it exists.</p> <ul style="list-style-type: none"> <li><b>NONE</b>: no histogram.</li> <li><b>FREQUENCY</b>: frequency histogram.</li> <li><b>EQUI-WIDTH</b>: equal-width histogram.</li> </ul>

Name	Type	Description
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.83 DB\_TAB\_COLUMNS

DB\_TAB\_COLUMNS displays description information about columns of tables and views accessible to the current user. This view exists in both PG\_CATALOG and SYS schema. This view is accessible to all users and displays all information accessible to the current user.

**Table 12-186** DB\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of the column.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of the column, in bytes.
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and <b>0</b> for other data types.
nullable	bpchar	Specifies whether a column can be empty ( <b>n</b> for a primary key constraint or NOT NULL constraint).

Name	Type	Description
column_id	integer	Sequence number of the column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in characters) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Its value is <b>YES</b> .

Name	Type	Description
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.84 DB\_TAB\_COMMENTS

DB\_TAB\_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-187** DB\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a table or view.
table_name	character varying(128)	Name of the table or view.
table_type	character varying(11)	Object type.
comments	text	Comments.
origin_con_id	numeric	Not supported. Its value is <b>0</b> .

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the table belongs.

### 12.3.85 DB\_TAB\_HISTOGRAMS

DB\_TAB\_HISTOGRAMS displays histogram statistics about the tables or views accessible to the current user, that is, the distribution of data in each column of the table. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-188** DB\_TAB\_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Its value is <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Its value is <b>NULL</b> .
endpoint_repeat_count	numeric	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. Its value is <b>SHARED</b> .

### 12.3.86 DB\_TAB\_PARTITIONS

DB\_TAB\_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

**Table 12-189** DB\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
subpartition_count	numeric	Not supported. Its value is <b>NULL</b> .
high_value_length	integer	Length of the binding value expression in a partition.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to the table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(4)	Specifies whether a partitioned table has segments created or has not been created.
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.87 DB\_TAB\_STATS\_HISTORY

DB\_TAB\_STATS\_HISTORY records the tables, partitions, or subpartitions involved in table statistics and the time when table statistics are collected. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-190** DB\_TAB\_STATS\_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

## 12.3.88 DB\_TAB\_SUBPARTITIONS

DB\_TAB\_SUBPARTITIONS displays information about level-2 partitioned tables accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

**Table 12-191** DB\_TAB\_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
high_value	text	Not supported. Its value is <b>NULL</b> .
high_value_length	numeric	Not supported. Its value is <b>NULL</b> .
partition_position	numeric	Not supported. Its value is <b>NULL</b> .
subpartition_position	numeric	Not supported. Its value is <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
compression	character varying(8)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(3)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.89 DB\_TABLES

DB\_TABLES displays all tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-192** DB\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
num_rows	numeric	Estimated number of rows in the table.

Name	Type	Description
status	character varying(8)	Specifies whether the current table is valid. <ul style="list-style-type: none"> <li>• <b>VALID</b>: The current table is valid.</li> <li>• <b>UNUSABLE</b>: The current table is unavailable.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. <ul style="list-style-type: none"> <li>• <b>Y</b>: The table is a temporary table.</li> <li>• <b>N</b>: The table is not a temporary table.</li> </ul>
dropped	character varying	Specifies whether the current table is deleted. <ul style="list-style-type: none"> <li>• <b>YES</b>: It is deleted.</li> <li>• <b>NO</b>: It is not deleted.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table is a partitioned table.</li> <li>• <b>NO</b>: The table is not a partitioned table.</li> </ul>
last_analyzed	timestamp with time zone	Last time when the table was analyzed.

Name	Type	Description
row_movement	character varying(8)	Specifies whether to allow partition row movement. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: The partition row movement is allowed.</li> <li>● <b>DISABLED</b>: The partition row movement is not allowed.</li> </ul>
compression	character varying(8)	Specifies whether to enable a table compression. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: A table compression is enabled.</li> <li>● <b>DISABLED</b>: A table compression is disabled.</li> </ul>
duration	character varying(15)	Time elapsed when a temporary table is processed. <ul style="list-style-type: none"> <li>● <b>NULL</b>: The table is not a temporary table.</li> <li>● <b>sys\$session</b>: The table is a temporary session table.</li> <li>● <b>sys\$transaction</b>: The table is a temporary transaction table.</li> </ul>
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: Logical replication is enabled.</li> <li>● <b>DISABLED</b>: Logical replication is disabled.</li> </ul>
external	character varying(3)	Specifies whether the table is a foreign table. <ul style="list-style-type: none"> <li>● <b>YES</b>: The table is a foreign table.</li> <li>● <b>NO</b>: The table is not a foreign table.</li> </ul>
logging	character varying(3)	Specifies whether changes to a table are logged. <ul style="list-style-type: none"> <li>● <b>YES</b>: Changes to the table are logged.</li> <li>● <b>NO</b>: Changes to the table are not logged.</li> </ul>

Name	Type	Description
default_collation	character varying(100)	Default collation of a table. <ul style="list-style-type: none"> <li>• default</li> </ul>
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. <ul style="list-style-type: none"> <li>• <b>ENABLED</b>: The table lock is enabled.</li> <li>• <b>DISABLED</b>: The table lock is disabled.</li> </ul>
nested	character varying(3)	Specifies whether a table is a nested table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table is a nested table.</li> <li>• <b>NO</b>: The table is not a nested table.</li> </ul>
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. <ul style="list-style-type: none"> <li>• <b>ENABLED</b>: The corrupted block is skipped.</li> <li>• <b>DISABLED</b>: The corrupted block is not skipped.</li> </ul>
has_identity	character varying(3)	Specifies whether a table has an identifier column. <ul style="list-style-type: none"> <li>• <b>YES</b>: There is an identifier column.</li> <li>• <b>NO</b>: There is no identifier column.</li> </ul>
segment_created	character varying(3)	Specifies whether a table segment has been created. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table segment has been created.</li> <li>• <b>NO</b>: The table segment is not created.</li> </ul>

Name	Type	Description
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The modification of the table is monitored.</li> <li>• <b>NO</b>: The modification of the table is not monitored.</li> </ul>
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .
result_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
clustering	character varying(3)	Not supported. Its value is <b>NULL</b> .
activity_tracking	character varying(23)	Not supported. Its value is <b>NULL</b> .
dml_timestamp	character varying(25)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
hybrid	character varying(3)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
container_map_object	character varying(3)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_link_dml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
object_id_type	character varying(16)	Not supported. Its value is <b>NULL</b> .
table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

## 12.3.90 DB\_TRIGGERS

DB\_TRIGGERS displays information about triggers accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-193** DB\_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name.
table_owner	character varying(64)	Role name.
table_name	character varying(64)	Relational table name.
status	character varying(64)	<ul style="list-style-type: none"> <li>• <b>O</b>: The trigger is enabled in origin or local mode.</li> <li>• <b>D</b>: The trigger is disabled.</li> <li>• <b>R</b>: The trigger is enabled in replica mode.</li> <li>• <b>A</b>: The trigger is always enabled.</li> </ul>

## 12.3.91 DB\_TYPES

DB\_TYPES displays all object types accessible to the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-194** DB\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.

Name	Type	Description
methods	numeric	Not supported. Its value is <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is incomplete.
final	character varying(3)	Not supported. Its value is <b>NULL</b> .
instantiable	character varying(3)	Not supported. Its value is <b>NULL</b> .
persistable	character varying(3)	Not supported. Its value is <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
local_attributes	numeric	Not supported. Its value is <b>NULL</b> .
local_methods	numeric	Not supported. Its value is <b>NULL</b> .
typeid	raw	Not supported. Its value is <b>NULL</b> .

### 12.3.92 DB\_USERS

DB\_USERS displays all users of the database visible to the current user. However, it does not describe the users. By default, only the system administrator can access this view. This view exists in both PG\_CATALOG and SYS schema.

Table 12-195 DB\_USERS columns

Name	Type	Description
user_id	oid	OID of a user.
username	name	Username.

### 12.3.93 DB\_VIEWS

DB\_VIEWS displays the description about all views accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-196** DB\_VIEWS columns

Name	Type	Description
owner	name	Owner of a view.
view_name	name	View name.
text	text	Text in the view.
text_length	integer	Text length of the view.
TEXT_VC	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.
type_text_length	numeric	Not supported. Its value is <b>NULL</b> .
type_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
oid_text_length	numeric	Not supported. Its value is <b>NULL</b> .
oid_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
view_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
view_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
superview_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
editioning_view	character varying(1)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(1)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(1)	Not supported. Its value is <b>NULL</b> .
bequeath	character varying(12)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
default_collation	character varying(100)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
pdb_local_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.94 DICT

DICT displays the description of data dictionary tables and system views in the database. This view exists in both PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-197** DICT columns

Name	Type	Description
table_name	character varying(128)	Object name.
comments	character varying(4000)	Comment on an object.

### 12.3.95 DICTIONARY

DICTIONARY displays the description of data dictionary tables and system views in the database. This view exists in both PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-198** DICTIONARY columns

Name	Type	Description
table_name	character varying(128)	Object name.
comments	character varying(4000)	Comment on an object.

## 12.3.96 DV\_SESSIONS

DV\_SESSIONS displays information about all active backend threads. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

**Table 12-199** DV\_SESSIONS columns

Name	Type	Description
sid	bigint	OID of the active backend thread of the current session.
serial#	integer	Sequence number of the active backend thread, which is <b>0</b> in GaussDB.
user#	oid	OID of the user logged in to the backend thread. The OID is <b>0</b> if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend thread. <b>username</b> is null if the backend thread is a global auxiliary thread. <b>application_name</b> can be identified by associating with pg_stat_get_activity(). Example: SELECT s.*,a.application_name FROM DV_SESSIONS AS s LEFT JOIN pg_stat_get_activity(NULL) AS a ON s.sid=a.sessionid;

## 12.3.97 DV\_SESSION\_LONGOPS

DV\_SESSION\_LONGOPS displays the progress of ongoing operations. The view can be accessed only after being authorized.

**Table 12-200** DV\_SESSION\_LONGOPS columns

Name	Type	Description
sid	bigint	OID of the running backend process.

Name	Type	Description
serial#	integer	Sequence number of the running backend process, which is 0 in GaussDB.
sofar	integer	Completed workload, which is null in GaussDB.
totalwork	integer	Total workload, which is null in GaussDB.

## 12.3.98 GET\_GLOBAL\_PREPARED\_XACTS

GET\_GLOBAL\_PREPARED\_XACTS displays prepared transactions on all nodes globally.

**Table 12-201** GET\_GLOBAL\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	XID of a prepared transaction.
gid	text	GID of the prepared transaction.
prepared	timestamp with time zone	Prepared time of the prepared transaction.
owner	name	Owner of the prepared transaction.
database	name	Database to which the prepared transaction belongs.
node_name	text	Name of the node where the prepared transaction resides.

## 12.3.99 GLOBAL\_BAD\_BLOCK\_INFO

GLOBAL\_BAD\_BLOCK\_INFO is executed on the CN to collect statistics on damaged data pages of all instances. The queried result displays basic information about damaged pages. The execution result on the DN is empty. Based on the information, you can use the page detection and repair function in [Data Damage Detection and Repair Functions](#) to perform further repair operations. By default, only initial users, users with the sysadmin permission, users with the O&M administrator permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted with permissions.

**Table 12-202** GLOBAL\_BAD\_BLOCK\_INFO columns

Name	Type	Description
node_name	text	Information about the node where the current damaged page is located.
spc_node	oid	ID of the tablespace corresponding to the current damaged page.
db_node	oid	ID of the database corresponding to the current damaged page.
rel_node	oid	Relfilenode of the relation corresponding to the current damaged page.
bucket_node	integer	Bucket node of the current damaged page. It is set to <b>-1</b> for a segment-page table. Other values are reserved and not supported.
block_num	oid	Page number of the current damaged page.
fork_num	integer	File forknum of the current damaged page.
file_path	text	Relative path of the current damaged page.
check_time	timestamp with time zone	Time when an error is detected on the current damaged page.
repair_time	timestamp with time zone	Time when the current damaged page is repaired.

### 12.3.100 GLOBAL\_CLEAR\_BAD\_BLOCK\_INFO

GLOBAL\_CLEAR\_BAD\_BLOCK\_INFO is executed on the CN to clear information about repaired pages in all instances. The execution result on DNs is empty. By default, only initial users, users with the sysadmin permission, users with the O&M administrator permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted with permissions.

**Table 12-203** GLOBAL\_BAD\_BLOCK\_INFO columns

Name	Type	Description
node_name	text	Information about the node for clearing repaired pages.
result	Boolean	Execution result of clearing repaired pages of the current instance

## 12.3.101 GLOBAL\_COMM\_CLIENT\_INFO

GLOBAL\_COMM\_CLIENT\_INFO queries information about active client connections of global nodes in a cluster. By default, only the system administrator has the permission to access this system view.

**Table 12-204** GLOBAL\_COMM\_CLIENT\_INFO columns

Name	Type	Description
node_name	text	Current node name.
app	text	App
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
socket	integer	Displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.
logic_id	integer	Displayed if the connection is a logical connection.

## 12.3.102 GLOBAL\_SQL\_PATCH

GLOBAL\_SQL\_PATCH displays information about all SQL patches. This view is available only in the PG\_CATALOG schema.

**Table 12-205** GLOBAL\_SQL\_PATCH columns

Name	Type	Description
node_name	text	Name of the node where the SQL PATCH is located.
patch_name	name	Name of the SQL PATCH.
unique_sql_id	bigint	Global unique query ID.
owner	oid	ID of the user created using the SQL PATCH.
enable	Boolean	Specifies whether the SQL patch takes effect.
status	"char"	SQL patch status (reserved column).

Name	Type	Description
abort	Boolean	Specifies whether a hint is discarded.
hint_string	text	Hint text.
description	text	SQL patch description.
parent_unique_sql_id	bigint	<p>Globally unique ID of the outer statement of the SQL statement for which SQL patch takes effect.</p> <ul style="list-style-type: none"> <li>• Its value is <b>0</b> for statements outside the stored procedure.</li> <li>• For a statement within a stored procedure, the value is the globally unique ID of the statement that calls the stored procedure.</li> </ul>

### 12.3.103 GLOBAL\_STAT\_HOTKEYS\_INFO

GLOBAL\_STAT\_HOTKEYS\_INFO is used to query the statistics of hotspot keys in the entire cluster. The query results are sorted by **count** in descending order.

**Table 12-206** GLOBAL\_STAT\_HOTKEYS\_INFO columns

Name	Type	Description
database_name	text	Name of the database where the hot key is located.
schema_name	text	Name of the mode where the hotspot key is located.
table_name	text	Name of the table where the hotspot key is located.
key_value	text	Value of the hotspot key.
hash_value	bigint	Hash value of the hotspot key in the database. If the table is a list or range distributed table, the value of this column is <b>0</b> .
count	numeric	Frequency of accessing the hotspot key.

## 12.3.104 GLOBAL\_WAL\_SENDER\_STATUS

GLOBAL\_WAL\_SENDER\_STATUS displays the redo log transfer and replay status of the primary DN in the current cluster. This view can be viewed only by the users with monitor admin and sysadmin permission.

**Table 12-207** GLOBAL\_WAL\_SENDER\_STATUS column

Name	Type	Description
nodename	text	Name of the primary node.
source_ip	text	IP address of the primary node.
source_port	integer	Port of the primary node.
dest_ip	text	IP address of the standby node.
dest_port	integer	Port of the standby node.
sender_pid	integer	PID of the sending thread.
local_role	text	Type of the primary node. <ul style="list-style-type: none"> <li>• <b>UNKNOWN_MODE</b>: The status is unknown.</li> <li>• <b>NORMAL_MODE</b>: single-host node.</li> <li>• <b>PRIMARY_MODE</b>: primary node.</li> <li>• <b>STANDBY_MODE</b>: standby node.</li> <li>• <b>CASCADE_STANDBY_MODE</b>: cascaded standby node.</li> <li>• <b>PENDING_MODE</b>: The node is in the arbitration phase.</li> <li>• <b>RECOVERY_MODE</b>: The node is in the restoration phase.</li> <li>• <b>STANDBY_CLUSTER_MODE</b>: standby cluster node.</li> <li>• <b>MAIN_STANDBY_MODE</b>: main standby cluster node.</li> </ul> <p><b>NOTE</b> The expected values of the primary node type are <b>NORMAL_MODE</b>, <b>PRIMARY_MODE</b>, <b>PENDING_MODE</b>, and <b>RECOVERY_MODE</b>. If other node types are displayed, contact Huawei technical support.</p>

Name	Type	Description
peer_role	text	<p>Type of the standby node.</p> <ul style="list-style-type: none"> <li>● <b>UNKNOWN_MODE</b>: The status is unknown.</li> <li>● <b>NORMAL_MODE</b>: single-host node.</li> <li>● <b>PRIMARY_MODE</b>: primary node.</li> <li>● <b>STANDBY_MODE</b>: standby node.</li> <li>● <b>CASCADE_STANDBY_MODE</b>: cascaded standby node.</li> <li>● <b>PENDING_MODE</b>: The node is in the arbitration phase.</li> <li>● <b>RECOVERY_MODE</b>: The node is in the restoration phase.</li> <li>● <b>STANDBY_CLUSTER_MODE</b>: standby cluster node.</li> <li>● <b>MAIN_STANDBY_MODE</b>: main standby cluster node.</li> </ul> <p><b>NOTE</b> The expected values of the standby node type are <b>NORMAL_MODE</b>, <b>STANDBY_MODE</b>, <b>CASCADE_STANDBY_MODE</b>, <b>PENDING_MODE</b>, <b>RECOVERY_MODE</b>, <b>STANDBY_CLUSTER_MODE</b>, and <b>MAIN_STANDBY_MODE</b>. If other node types are displayed, contact Huawei technical support.</p>

Name	Type	Description
peer_state	text	<p>Status of the standby node.</p> <ul style="list-style-type: none"> <li>• <b>UNKNOWN_STATE</b>: The node status is unknown.</li> <li>• <b>NORMAL_STATE</b>: The node is started properly.</li> <li>• <b>NEEDREPAIR_STATE</b>: The current node needs to be repaired.</li> <li>• <b>STARTING_STATE</b>: The node is being started.</li> <li>• <b>WAITING_STATE</b>: The node is waiting to be upgraded.</li> <li>• <b>DEMOTING_STATE</b>: The node is being downgraded.</li> <li>• <b>PROMOTING_STATE</b>: The standby node is being upgraded to the primary node.</li> <li>• <b>BUILDING_STATE</b>: The standby node fails to be started and needs to be rebuilt.</li> <li>• <b>CATCHUP_STATE</b>: The standby node is catching up with the primary node.</li> <li>• <b>COREDUMP_STATE</b>: The node breaks down.</li> </ul>
state	text	<p>WAL sender status.</p> <ul style="list-style-type: none"> <li>• <b>WALSNDSTATE_STARTUP</b>: startup state.</li> <li>• <b>WALSNDSTATE_BACKUP</b>: backup state.</li> <li>• <b>WALSNDSTATE_CATCHUP</b>: catch-up state.</li> <li>• <b>WALSNDSTATE_STREAMING</b>: streaming replication state.</li> </ul>
sender_sent_location	text	Sending position of the primary node.
sender_write_location	text	Writing position of the primary node.
sender_flush_location	text	Flushing position of the primary node.
sender_replay_location	text	Redo position of the primary node.
receiver_received_location	text	Receiving position of the standby node.
receiver_write_location	text	Writing position of the standby node.

Name	Type	Description
receiver_flush_location	text	Flushing location of the standby node.
receiver_replay_location	text	Redo location of the standby node.

## 12.3.105 GS\_ALL\_CONTROL\_GROUP\_INFO

GS\_ALL\_CONTROL\_GROUP\_INFO displays all Cgroup information in a database.

**Table 12-208** GS\_ALL\_CONTROL\_GROUP\_INFO columns

Name	Type	Description
name	text	Name of a Cgroup.
type	text	Type of the Cgroup. <ul style="list-style-type: none"> <li>● <b>GROUP_NONE</b>: no group.</li> <li>● <b>GROUP_TOP</b>: top group.</li> <li>● <b>GROUP_CLASS</b>: class Cgroup, which does not control any thread.</li> <li>● <b>GROUP_BAKWD</b>: backend thread Cgroup.</li> <li>● <b>GROUP_DEFWD</b>: default Cgroup, which controls only the query threads at this level.</li> <li>● <b>GROUP_TSWD</b>: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.</li> </ul>
gid	bigint	Cgroup ID.
classgid	bigint	ID of the class Cgroup where a workload Cgroup belongs.
class	text	Class Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	<b>Workload</b> Cgroup level.
cpucores	text	Information about the CPU cores used by a Cgroup.

## 12.3.106 GS\_ALL\_PREPARED\_STATEMENTS

GS\_ALL\_PREPARED\_STATEMENTS displays information about prepared statements that are available in all sessions. Only the system administrator can access this view.

**Table 12-209** GS\_ALL\_PREPARED\_STATEMENTS columns

Name	Type	Description
pid	bigint	Backend thread ID. <b>NOTE</b> In thread pool mode, <b>pid</b> indicates the ID of the thread bound to the current session. When a session is executed on different threads, <b>pid</b> changes accordingly. In thread pool mode, statements are associated with <b>sessionid</b> but not <b>pid</b> . You are advised to use <b>sessionid</b> for join query.
sessionid	bigint	Current session ID.
global_sessionid	text	Global session ID.
name	text	Identifier of a prepared statement.
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement committed by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of <b>regtype</b> . The OID corresponding to an element of this array can be obtained by converting the <b>regtype</b> value to an OID value.
from_sql	Boolean	<ul style="list-style-type: none"><li>Its value is <b>true</b> if the prepared statement was created through the PREPARE statement</li><li>Its value is <b>false</b> if the statement was prepared through the frontend/backend protocol</li></ul>

## 12.3.107 GS\_AUDITING

GS\_AUDITING displays all audit information about database-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-210** GS\_AUDITING columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value can be 'access' or 'privilege'. <ul style="list-style-type: none"> <li>● <b>access</b>: DML operations are audited.</li> <li>● <b>privilege</b>: DDL operations are audited.</li> </ul>
polenabled	Boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"> <li>● <b>t</b> (true): enabled.</li> <li>● <b>f</b> (false): disabled.</li> </ul>
access_type	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.
priv_object	text	Describes the path of the database asset.
filter_name	text	Logical character string of a filter criterion.

## 12.3.108 GS\_AUDITING\_ACCESS

GS\_AUDITING\_ACCESS displays all audit information about database DML-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-211** GS\_AUDITING\_ACCESS columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value 'access' indicates that DML operations are audited.
polenabled	Boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"> <li>● <b>t</b> (true): enabled.</li> <li>● <b>f</b> (false): disabled.</li> </ul>

Name	Type	Description
access_type	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.
access_object	text	Describes the path of the database asset.
filter_name	text	Logical character string of a filter criterion.

### 12.3.109 GS\_AUDITING\_PRIVILEGE

GS\_AUDITING\_PRIVILEGE displays all audit information about database DDL-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-212** GS\_AUDITING\_PRIVILEGE columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value ' <b>privilege</b> ' indicates that DDL operations are audited.
polenabled	Boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled.</li><li>• <b>f</b> (false): disabled.</li></ul>
access_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.
priv_object	text	Full domain name of a database object.
filter_name	text	Logical character string of a filter criterion.

### 12.3.110 GS\_CLUSTER\_RESOURCE\_INFO

GS\_CLUSTER\_RESOURCE\_INFO displays all DNs resource summaries. This view can be queried only when **enable\_dynamic\_workload** is set to **on** and the view cannot be executed on DNs. Only the user with sysadmin permission can query this view.

**Table 12-213** GS\_CLUSTER\_RESOURCE\_INFO columns

Name	Type	Description
min_mem_util	integer	Minimum memory usage of a DN
max_mem_util	integer	Maximum memory usage of the DN
min_cpu_util	integer	Minimum CPU usage of the DN
max_cpu_util	integer	Maximum CPU usage of the DN
min_io_util	integer	Minimum I/O usage of the DN
max_io_util	integer	Maximum I/O usage of the DN
used_mem_rate	integer	Maximum physical memory usage

### 12.3.111 GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO

GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO queries DFX information, such as threads, sessions, and socket, for connecting the extended IP addresses of the current DN. For details about the application scenarios, see

•[gs\\_comm\\_listen\\_address\\_ext\\_info](#).

**Table 12-214** GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
app	text	Client connected to the DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID of the current thread.
socket	integer	Socket FD of the current physical connection.
remote_ip	text	Peer IP address of the current connection.
remote_port	text	Peer port of the current connection.
local_ip	text	Local IP address of the current connection.
local_port	text	Local port of the current connection.

## 12.3.112 GS\_DB\_LINKS

GS\_DB\_LINKS displays information about database links. You can view information about database links of your own and at the PUBLIC level.

**Table 12-215** GS\_DB\_LINKS columns

Name	Type	Description
dblinkid	oid	OID of the current database link.
dlname	name	Name of the current database link.
downer	oid	ID of the owner of the current database link. If the owner is <b>public</b> , the value is <b>0</b> .
downername	name	Name of the owner of the current database link.
options	text[ ]	Connection information of the current database link. The value is a character string in the "keyword=value" format.
useroptions	text	User information used by the remote end of the current database link.
heterogeneous	text	Not supported. Its value is <b>NULL</b> .
protocol	text	Not supported. Its value is <b>NULL</b> .
opencursors	text	Not supported. Its value is <b>NULL</b> .
intransaction	Boolean	Determines whether the current database link exists in a transaction.
updatesent	Boolean	Determines whether the current database link uses statements for updating data.

## 12.3.113 GS\_DB\_PRIVILEGES

GS\_DB\_PRIVILEGES displays the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-216** GS\_DB\_PRIVILEGES columns

Name	Type	Description
rolename	name	Username
privilege_type	text	ANY permission of a user. For details about the value, see <a href="#">Table 7-166</a> .

Name	Type	Description
admin_option	text	Whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted <ul style="list-style-type: none"> <li>• <b>yes</b></li> <li>• <b>no</b></li> </ul>

### 12.3.114 GS\_GET\_CONTROL\_GROUP\_INFO

GS\_GET\_CONTROL\_GROUP\_INFO displays information about all Cgroups. Only the user with sysadmin permission can query this view.

Table 12-217 GS\_GET\_CONTROL\_GROUP\_INFO columns

Name	Type	Description
group_name	text	Name of a Cgroup.
group_type	text	Type of the Cgroup. <ul style="list-style-type: none"> <li>• <b>GROUP_NONE</b>: no group.</li> <li>• <b>GROUP_TOP</b>: top group.</li> <li>• <b>GROUP_CLASS</b>: class Cgroup, which does not control any thread.</li> <li>• <b>GROUP_BAKWD</b>: backend thread Cgroup.</li> <li>• <b>GROUP_DEFWD</b>: default Cgroup, which controls only the query threads at this level.</li> <li>• <b>GROUP_TSWD</b>: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.</li> </ul>
gid	bigint	Cgroup ID.
classgid	bigint	ID of the class Cgroup where a workload Cgroup belongs.
class	text	Class Cgroup.
group_workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.

Name	Type	Description
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucoros	text	Information about the CPU cores used by a Cgroup.
nodegroup	text	Node group name.
group_kind	text	Node group type. The value must be <b>i</b> , <b>n</b> , <b>v</b> , or <b>e</b> . <ul style="list-style-type: none"><li>• <b>i</b>: installation node group.</li><li>• <b>n</b>: node group in a common cluster.</li><li>• <b>e</b>: elastic cluster.</li></ul>

### 12.3.115 GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO

GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO queries the extended IP address configured for the current DN instance. For details about the application scenarios, see [gs\\_get\\_listen\\_address\\_ext\\_info\(\)](#).

**Table 12-218** GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO columns

Name	Type	Description
node_name	text	DN name.
host	text	Listening IP address of a DN.
port	text	Listening port of a DN.
ext_listen_ip	text	Extended IP address configured for a DN.

### 12.3.116 GS\_GLOBAL\_ARCHIVE\_STATUS

GS\_GLOBAL\_ARCHIVE\_STATUS describes the archiving progress of CNs and all shards, including the shard name (**node\_name**), archiving location (**restart\_lsn**), name of the primary or standby node (**archive\_node**), and current log location (**current\_xlog\_location**). To query this view, you need to enable the archiving function of the database and query the view from the CN node. The monitor admin and sysadmin permissions are required.

**Table 12-219** GS\_GLOBAL\_ARCHIVE\_STATUS columns

Name	Type	Description
node_name	text	Shard name.
restart_lsn	text	Archiving location.
archive_node	text	Name of the primary or standby node where archiving is performed.
current_xlog_location	text	Current log position.

### 12.3.117 GS\_GSC\_MEMORY\_DETAIL

GS\_GSC\_MEMORY\_DETAIL displays the global SysCache memory usage of the current process on the current node. The data is displayed only when Global SysCache is enabled.

Note that the query is separated by the database memory context. Therefore, some memory statistics are missing. The memory context corresponding to the missing memory statistics is **GlobalSysDBCACHE**.

**Table 12-220** GS\_GSC\_MEMORY\_DETAIL columns

Name	Type	Description
db_id	text	Database ID.
totalsize	numeric	Total size of the shared memory, in bytes.
freesize	numeric	Remaining size of the shared memory, in bytes.
usedsize	numeric	Used size of the shared memory, in bytes.

### 12.3.118 GS\_LABELS

GS\_LABELS displays all configured resource labels. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-221** GS\_LABELS columns

Name	Type	Description
labelname	name	Resource label name.
labeltype	name	Resource label type This parameter corresponds to the <b>labeltype</b> column in the <a href="#">GS_POLICY_LABEL</a> system catalog.

Name	Type	Description
fqdtype	name	Database resource type. For example, table, schema, and index.
schemaname	name	Name of the schema to which the database resource belongs.
fqdnname	name	Database resource name.
columnname	name	Name of the database resource column. If the marked database resource is not a column, this parameter is left blank.

### 12.3.119 GS\_LSC\_MEMORY\_DETAIL

GS\_LSC\_MEMORY\_DETAIL displays the memory usage of the local system cache of all threads based on the MemoryContext node. The data is displayed only when Global SysCache is enabled.

**Table 12-222** GS\_LSC\_MEMORY\_DETAIL columns

Name	Type	Description
threadid	text	Thread start time and ID (string: <i>timestamp.sessionid</i> ).
tid	bigint	Thread ID.
thrdtype	text	Thread type. It can be any thread type in the system, such as postgresql and wlmmonitor.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Total size of used memory in the memory context, in bytes.

### 12.3.120 GS\_MASKING

GS\_MASKING displays all configured dynamic masking policies. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-223** GS\_MASKING columns

Name	Type	Description
polname	name	Name of the masking policy
polenabed	Boolean	Specifies whether to enable the masking policy.
maskaction	name	Masking function
labelname	name	Name of the label to which the masking function applies.
masking_object	text	Masking database resource object
filter_name	text	Logical expression of a filter criterion

### 12.3.121 GS\_MATVIEWS

**GS\_MATVIEWS** provides information about each materialized view in the database.

**Table 12-224** GS\_MATVIEWS columns

Name	Type	Reference	Description
schemaname	name	<a href="#">PG_NAMESPACE</a> .nspname	Name of the schema of a materialized view.
matviewname	name	<a href="#">PG_CLASS</a> .relname	Name of a materialized view.
matviewowner	name	<a href="#">PG_AUTHID</a> .Erolname	Owner of a materialized view.
tablespace	name	<a href="#">PG_TABLESPACE</a> .spcname	Tablespace name of a materialized view. If the default tablespace of the database is used, the value is null.
hasindexes	boolean	-	This column is true if a materialized view has (or has recently had) any indexes.
definition	text	-	Definition of a materialized view (a reconstructed SELECT query).

### 12.3.122 GS\_MY\_PLAN\_TRACE

**GS\_MY\_PLAN\_TRACE** is a view of the **GS\_PLAN\_TRACE** system catalog. This view displays the plan traces of the current user. The plan trace feature is not supported

in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

**Table 12-225** GS\_MY\_PLAN\_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request
query	text	SQL statement of the current request. The value of this column cannot exceed the value of <b>track_activity_query_size</b> .
unique_sql_id	bigint	Unique ID of the SQL statement of the current request
plan	text	Query plan text corresponding to the SQL statement of the current request. The size of this column cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this column cannot exceed 300 MB.
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created)

### 12.3.123 GS\_SESSION\_ALL\_SETTINGS

GS\_SESSION\_ALL\_SETTINGS displays the full GUC parameter settings of all sessions on the local node. Only users with the sysadmin or monadmin permissions can query this view.

**Table 12-226** GS\_SESSION\_ALL\_SETTINGS columns

Name	Type	Description
sessionid	bigint	Session ID.
pid	bigint	Backend thread ID.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of a parameter.

### 12.3.124 GS\_SQL\_COUNT

GS\_SQL\_COUNT displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) on the current node of the database.

- When a common user queries the GS\_SQL\_COUNT view, statistics about the current node of the user are displayed. When an administrator queries the GS\_SQL\_COUNT view, statistics about the current node of all users are displayed.
- When the cluster or node is restarted, the statistics are cleared and will be measured again.
- The system counts when a node receives a query, including a query inside the cluster. For example, when a CN receives a query and distributes multiple queries to DNs, the queries are counted accordingly on the DNs.

**Table 12-227** GS\_SQL\_COUNT columns

Name	Type	Description
node_name	name	Node name.
user_name	name	Username.
select_count	bigint	Statistical result of the SELECT statement.
update_count	bigint	Statistical result of the UPDATE statement.
insert_count	bigint	Statistical result of the INSERT statement.
delete_count	bigint	Statistical result of the DELETE statement.
mergeinto_count	bigint	Statistical result of the MERGE INTO statement.
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.
total_select_elapse	bigint	Total response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: $\mu$ s).

Name	Type	Description
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: $\mu$ s).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: $\mu$ s).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: $\mu$ s).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: $\mu$ s).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: $\mu$ s).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: $\mu$ s).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: $\mu$ s).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: $\mu$ s).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: $\mu$ s).

### 12.3.125 GS\_STAT\_ALL\_PARTITIONS

GS\_STAT\_ALL\_PARTITIONS contains information about each partition in all partitioned tables in the current database. Each partition occupies one row, showing the access statistics of the partition. The information can be queried by using the `gs_stat_get_all_partitions_stats()` function.

**Table 12-228** GS\_STAT\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Schema name of a table where the partition is located.
relname	name	Name of the table where the partition is located.
partition_name	name	Name of the level-1 partition to which the partition belongs.

Name	Type	Description
sub_partition_name	name	Name of the level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set it to <b>NULL</b> .
seq_scan	bigint	Number of sequential scans initiated by the partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by the partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of dead rows
last_vacuum	timestamp with time zone	Time when the partition was last cleared.
last_autovacuum	timestamp with time zone	Time when the partition was last cleared by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Time when the partition was last analyzed.
last_autoanalyze	timestamp with time zone	Time when the partition was last analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the partition is cleared.
autovacuum_count	bigint	Number of times that the partition is cleared by the autovacuum daemon thread.
analyze_count	bigint	Number of times that the partition is analyzed.
autoanalyze_count	bigint	Number of times that the partition is analyzed by the autovacuum daemon thread.

## 12.3.126 GS\_STAT\_XACT\_ALL\_PARTITIONS

GS\_STAT\_XACT\_ALL\_PARTITIONS displays the transaction status about all partitions of partitioned tables in a namespace. The information can be queried by using the `gs_stat_get_xact_all_partitions_stats()` function.

**Table 12-229** GS\_STAT\_XACT\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Schema name of the partition.
relname	name	Name of the table where the partition is located.
partition_name	name	Name of the level-1 partition to which the partition belongs.
sub_partition_name	name	Name of the level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set it to <b>NULL</b> .
seq_scan	bigint	Number of sequential scans initiated by the partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by the partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).

## 12.3.127 GS\_STATIO\_ALL\_PARTITIONS

GS\_STATIO\_ALL\_PARTITIONS contains I/O statistics about each partition in a partitioned table of the current database. The information can be queried by using the `gs_statio_get_all_partitions_stats()` function.

**Table 12-230** GS\_STATIO\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.

Name	Type	Description
schemaname	name	Name of the schema that the partition is in.
relname	name	Name of the table where the partition is located.
partition_name	name	Name of the level-1 partition to which the partition belongs.
sub_partition_name	name	Name of the level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set it to <b>NULL</b> .
heap_blks_read	bigint	Number of disk blocks read from the partition.
heap_blks_hit	bigint	Number of cache hits in the partition.
idx_blks_read	bigint	Number of disk blocks read from all indexes on the partition.
idx_blks_hit	bigint	Number of cache hits of all indexes in a partition.
toast_blks_read	bigint	Number of disk blocks read from the partition's TOAST table partition (if any).
toast_blks_hit	bigint	Number of buffer hits in the partition's TOAST table partition (if any).
tidx_blks_read	bigint	Number of disk blocks read from the partition's TOAST table partitioned indexes (if any).
tidx_blks_hit	bigint	Number of buffer hits in the partition's TOAST table partitioned indexes (if any).

### 12.3.128 GS\_WORKLOAD\_RULE\_STAT

GS\_WORKLOAD\_RULE\_STAT displays information about SQL concurrency control rules. Only the sysadmin user can access the system view.

**Table 12-231** GS\_WORKLOAD\_RULE\_STAT columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID.
rule_name	name	Name of a concurrency control rule, which is used to search for the concurrency control rule.

Name	Type	Description
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is <b>NULL</b> , the concurrency control rules take effect for all databases.
rule_type	text	Concurrency control rule type. Currently, only " <b>sqlid</b> ", " <b>select</b> ", " <b>insert</b> ", " <b>update</b> ", " <b>delete</b> ", " <b>merge</b> ", and " <b>resource</b> " are supported. Other values are invalid.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value <b>NULL</b> indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value <b>NULL</b> indicates that the rules are always effective.
max_workload	bigint	Maximum number of concurrent rule settings.
option_val	text[]	Parameter values of a concurrency control rule, including SQL ID, keyword list, and resource restriction.  For details, see the description of the <a href="#">gs_add_workload_rule</a> API.
is_valid	Boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to <b>false</b> .
validate_count	bigint	Number of SQL statements intercepted by the concurrency control rule.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

## 12.3.129 GV\_INSTANCE

GV\_INSTANCE displays information about the current database instance. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-232** GV\_INSTANCE columns

Name	Type	Description
inst_id	oid	OID of the current database.
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Not supported. Its value is <b>NULL</b> .
version	character varying(17)	Not supported. Its value is <b>NULL</b> .
version_legacy	character varying(17)	Not supported. Its value is <b>NULL</b> .
version_full	character varying(17)	Not supported. Its value is <b>NULL</b> .
startup_time	date	Not supported. Its value is <b>NULL</b> .
status	character varying(12)	Not supported. Its value is <b>NULL</b> .
parallel	character varying(3)	Not supported. Its value is <b>NULL</b> .
thread#	numeric	Not supported. Its value is <b>NULL</b> .
archiver	character varying(7)	Not supported. Its value is <b>NULL</b> .
log_switch_wait	character varying(15)	Not supported. Its value is <b>NULL</b> .
logins	character varying(10)	Not supported. Its value is <b>NULL</b> .
shutdown_pending	character varying(3)	Not supported. Its value is <b>NULL</b> .
database_status	character varying(17)	Not supported. Its value is <b>NULL</b> .
instance_role	character varying(18)	Not supported. Its value is <b>NULL</b> .
active_state	character varying(9)	Not supported. Its value is <b>NULL</b> .
blocked	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
con_id	numeric	Not supported. Its value is <b>NULL</b> .
instance_mode	character varying(11)	Not supported. Its value is <b>NULL</b> .
edition	character varying(7)	Not supported. Its value is <b>NULL</b> .
family	character varying(80)	Not supported. Its value is <b>NULL</b> .
database_type	character varying(15)	Not supported. Its value is <b>NULL</b> .

### 12.3.130 GV\_SESSION

GV\_SESSION describes information about all current sessions. Only administrators can access this view. Common users can access this view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-233** GV\_SESSION columns

Name	Type	Description
inst_id	numeric	Not supported. Its value is <b>NULL</b> .
saddr	raw	Not supported. Its value is <b>NULL</b> .
sid	bigint	Session ID.
serial#	integer	Sequence number of the active backend thread, which is <b>0</b> in GaussDB.
audsid	numeric	Not supported. Its value is <b>NULL</b> .
paddr	raw	Not supported. Its value is <b>NULL</b> .
schema#	numeric	Not supported. Its value is <b>NULL</b> .
schemaname	name	Name of the user logged in to the backend.
user#	oid	OID of the user who has logged in to the backend thread. Its value is <b>0</b> if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend thread. <b>username</b> is null if the backend thread is a global auxiliary thread.
command	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
ownerid	numeric	Not supported. Its value is <b>NULL</b> .
taddr	character varying(16)	Not supported. Its value is <b>NULL</b> .
lockwait	character varying(16)	Not supported. Its value is <b>NULL</b> .
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
sql_id	bigint	ID of a query.
client_info	text	Client information.
event	text	Queuing status of a statement. Its value can be: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>
sql_exec_start	timestamp with time zone	Time when the currently active query was started, or if <b>state</b> is not <b>active</b> , when the last query was started.
program	text	Name of the application connected to the backend.
status	text	Overall status of this backend. Its value can be: <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>
server	character varying(9)	Not supported. Its value is <b>NULL</b> .
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session.

Name	Type	Description
process	character varying(24)	Process ID of the current session.
logon_time	date	Login time of the current session.
last_call_et	integer	Duration when the status of the current session changes last time.
osuser	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(30)	Not supported. Its value is <b>NULL</b> .
type	character varying(10)	Not supported. Its value is <b>NULL</b> .
sql_address	raw	Not supported. Its value is <b>NULL</b> .
sql_hash_value	numeric	Not supported. Its value is <b>NULL</b> .
sql_child_number	numeric	Not supported. Its value is <b>NULL</b> .
sql_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_address	raw	Not supported. Its value is <b>NULL</b> .
prev_hash_value	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_id	character varying(13)	Not supported. Its value is <b>NULL</b> .
prev_child_number	numeric	Not supported. Its value is <b>NULL</b> .
prev_exec_start	date	Not supported. Its value is <b>NULL</b> .
prev_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_object_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_object_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
module	character varying(64)	Not supported. Its value is <b>NULL</b> .
module_hash	numeric	Not supported. Its value is <b>NULL</b> .
action	character varying(64)	Not supported. Its value is <b>NULL</b> .
action_hash	numeric	Not supported. Its value is <b>NULL</b> .
fixed_table_sequence	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_object#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_file#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_block#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_row#	numeric	Not supported. Its value is <b>NULL</b> .
top_level_call#	numeric	Not supported. Its value is <b>NULL</b> .
pdml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
failover_type	character varying(13)	Not supported. Its value is <b>NULL</b> .
failover_method	character varying(10)	Not supported. Its value is <b>NULL</b> .
failed_over	character varying(3)	Not supported. Its value is <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Its value is <b>NULL</b> .
pddl_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
pq_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
current_queue_duration	numeric	Not supported. Its value is <b>NULL</b> .
client_identifier	character varying(64)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
final_blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
seq#	numeric	Not supported. Its value is <b>NULL</b> .
event#	numeric	Not supported. Its value is <b>NULL</b> .
p1text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p1	numeric	Not supported. Its value is <b>NULL</b> .
p1raw	raw	Not supported. Its value is <b>NULL</b> .
p2text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p2	numeric	Not supported. Its value is <b>NULL</b> .
p2raw	raw	Not supported. Its value is <b>NULL</b> .
p3text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p3	numeric	Not supported. Its value is <b>NULL</b> .
p3raw	raw	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .
wait_class	character varying(64)	Not supported. Its value is <b>NULL</b> .
wait_time	numeric	Not supported. Its value is <b>NULL</b> .
seconds_in_wait	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
state	character varying(19)	Not supported. Its value is <b>NULL</b> .
wait_time_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_remaining_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_since_last_wait_micro	numeric	Not supported. Its value is <b>NULL</b> .
service_name	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_trace	character varying(8)	Not supported. Its value is <b>NULL</b> .
sql_trace_waits	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_binds	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_plan_stats	character varying(10)	Not supported. Its value is <b>NULL</b> .
session_editon_id	numeric	Not supported. Its value is <b>NULL</b> .
creator_addr	raw	Not supported. Its value is <b>NULL</b> .
creator_serial#	numeric	Not supported. Its value is <b>NULL</b> .
ecid	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_translation_profile_id	numeric	Not supported. Its value is <b>NULL</b> .
pga_tunable_mem	numeric	Not supported. Its value is <b>NULL</b> .
shard_ddl_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .
external_name	character varying(1024)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
plsql_debugger_connected	character varying(5)	Not supported. Its value is <b>NULL</b> .

### 12.3.131 MPP\_TABLES

MPP\_TABLES displays information about tables in PGXC\_CLASS.

**Table 12-234** MPP\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Table name.
tableowner	name	Table owner.
tablespace	name	Tablespace containing the table.
pgroup	name	Node group name.
nodeoids	oidvector_extend	List of distributed table node OIDs.

### 12.3.132 MY\_COL\_COMMENTS

MY\_COL\_COMMENTS displays column comments of the table accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-235** MY\_COL\_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. Its value is <b>0</b> .

Name	Type	Description
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.133 MY\_COL\_PRIVS

MY\_COL\_PRIVS displays the column permission granting information of the current user as the object owner, grantor, or grantee. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-236** MY\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.134 MY\_COLL\_TYPES

MY\_COLL\_TYPES displays information about types of collections created by the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-237** MY\_COLL\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a cluster.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a set.
upper_bound	numeric	Not supported. Its value is <b>NULL</b> .
elem_type_mod	character varying(7)	Not supported. Its value is <b>NULL</b> .
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Its value is <b>NULL</b> .
precision	numeric	Not supported. Its value is <b>NULL</b> .
scale	numeric	Not supported. Its value is <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Its value is <b>NULL</b> .
nulls_stored	character varying(3)	Not supported. Its value is <b>NULL</b> .
char_used	character varying(1)	Not supported. Its value is <b>NULL</b> .

### 12.3.135 MY\_CONS\_COLUMNS

MY\_CONS\_COLUMNS displays information about primary key constraint columns in tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-238** MY\_CONS\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
table_name	character varying(64)	Name of a constraint-related table.

Name	Type	Description
column_name	character varying(64)	Name of a constraint-related column.
constraint_name	character varying(64)	Constraint name.
position	smallint	Position of a column in a table.

## 12.3.136 MY\_CONSTRAINTS

MY\_CONSTRAINTS displays table constraint information accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-239** MY\_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	vcharacter varying(64)	Constraint name.
constraint_type	text	Constraint type. <ul style="list-style-type: none"><li>● <b>c</b>: check constraint.</li><li>● <b>f</b>: foreign key constraint.</li><li>● <b>p</b>: primary key constraint.</li><li>● <b>u</b>: unique constraint.</li></ul>
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of the constraint-related index (only for the unique constraint and primary key constraint).

## 12.3.137 MY\_DEPENDENCIES

MY\_DEPENDENCIES displays the dependencies between objects that are accessible to the current user. This view exists in both the PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-240** MY\_DEPENDENCIES columns

Name	Type	Description
name	character varying(128)	Object name.
type	character varying(18)	Object type.
referenced_owner	character varying(128)	Owner of the referenced object.
referenced_name	character varying(128)	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Name of the link to the parent object (if remote).
dependency_type	character varying(4)	Specifies whether the dependency is an REF dependency.

### 12.3.138 MY\_IND\_COLUMNS

MY\_IND\_COLUMNS displays column information about all indexes accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-241** MY\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of the column in the index.
column_length	numeric	Length of the column. For the variable-length type, its value is <b>NULL</b> .
char_length	numeric	Maximum length of a column, in bytes.

Name	Type	Description
descend	character varying	Specifies whether columns are sorted in descending ( <b>DESC</b> ) or ascending ( <b>ASC</b> ) order.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.139 MY\_IND\_EXPRESSIONS

MY\_IND\_EXPRESSIONS displays information about function-based expression indexes accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-242** MY\_IND\_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of the column in the index.

### 12.3.140 MY\_IND\_PARTITIONS

MY\_IND\_PARTITIONS displays the partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-243** MY\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.

Name	Type	Description
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. <ul style="list-style-type: none"> <li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>• For list partitioning, the value list of each partition is displayed.</li> <li>• For hash partitioning, the number of each partition is displayed.</li> </ul>
index_partition_usable	Boolean	Specifies whether the index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .

Name	Type	Description
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is <b>0</b> .
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether the index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the <b>analyze</b> command to collect statistics.
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.141 MY\_IND\_SUBPARTITIONS

MY\_IND\_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table owned by the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema. The distributed system does not support level-2 partitions. Currently, all columns in this table are set to **NULL**.

Table 12-244 MY\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
index_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
high_value	text	Not supported. Its value is <b>NULL</b> .
high_value_length	numeric	Not supported. Its value is <b>NULL</b> .
partition_position	numeric	Not supported. Its value is <b>NULL</b> .
subpartition_position	numeric	Not supported. Its value is <b>NULL</b> .
status	character varying(8)	Not supported. Its value is <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .

## 12.3.142 MY\_INDEXES

MY\_INDEXES displays index information about the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-245** MY\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_name	character varying(64)	Name of the table corresponding to the index.
uniqueness	text	Specifies whether the index is a unique index. <ul style="list-style-type: none"><li>• <b>UNIQUE</b>: unique index.</li><li>• <b>NONUNIQUE</b>: non-unique index.</li></ul>
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. <ul style="list-style-type: none"><li>• <b>Yes</b>: The index has the property of a partitioned table.</li><li>• <b>No</b>: The index does not have the property of a partitioned table.</li></ul>
generated	character varying(1)	Specifies whether the index name is generated by the system. <ul style="list-style-type: none"><li>• <b>y</b>: The index name is generated by the system.</li><li>• <b>n</b>: The index name is not generated by the system.</li></ul>

Name	Type	Description
index_type	character varying(27)	Index type. <ul style="list-style-type: none"> <li>• <b>NORMAL</b>: Index attributes are simple references, and the expression tree is empty.</li> <li>• <b>FUNCTION-BASED NORMAL</b>: Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of an index object.
table_type	character(11)	Type of the index object. <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The index object is of the table type.</li> </ul>
tablespace_name	character varying(30)	Name of a tablespace that contains the index.
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Not supported. Its value is <b>NULL</b> .
domidx_management	character varying(14)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.143 MY\_JOBS

MY\_JOBS displays details about the scheduled jobs owned by the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-246** MY\_JOBS columns

Name	Type	Description
job	bigint	Job ID.
log_user	name	Username of a job creator.
priv_user	name	Username of a job executor.
dbname	name	Name of the database where the job is created.
schema_user	name	Default schema name of a scheduled job.
start_date	timestamp without time zone	Time when a job starts to be executed for the first time.
start_suc	text	Start time of the first successful job execution.
last_date	timestamp without time zone	Start time of the last job execution.
last_suc	text	Start time of the last successful job execution.

Name	Type	Description
last_sec	text	Start time of the last successful job execution. Compatibility is supported.
this_date	timestamp without time zone	Start time of an ongoing job execution.
this_suc	text	Start time of an ongoing job execution.
this_sec	text	Start time of an ongoing job execution. Compatibility is supported.
next_date	timestamp without time zone	Schedule time of the next job execution.
next_suc	text	Schedule time of the next job execution.
next_sec	text	Schedule time of the next job execution. Compatibility is supported.
total_time	numeric	Latest execution duration of a job.
broken	text	If the value of the <b>status</b> column is 'd', the value is 'y'. Otherwise, the value is 'n'.
status	"char"	Status of the current job. The value can be 'r', 's', 'f', or 'd'. The default value is 'r'. <ul style="list-style-type: none"><li>● r: running</li><li>● s: successful execution</li><li>● f: failed execution</li><li>● d: canceling an execution</li></ul>
interval	text	Time expression used to calculate the next time the job will be executed. If this parameter is set to <b>null</b> , the job will be executed once only.
failures	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
what	text	Executable job.

Name	Type	Description
nls_env	character varying(4000)	Not supported. Its value is <b>NULL</b> .
misc_env	raw	Not supported. Its value is <b>NULL</b> .
instance	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.144 MY\_OBJECTS

MY\_OBJECTS displays database objects accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-247** MY\_OBJECTS columns

Name	Type	Description
object_name	name	Object name.
object_id	oid	Object OID.
object_type	name	Type of the object ( <b>TABLE</b> , <b>INDEX</b> , <b>SEQUENCE</b> , <b>VIEW</b> , or <b>GLOBAL SECONDARY INDEX</b> ).
namespace	oid	Namespace that the object belongs to.
temporary	character(1)	Specifies whether the object is a temporary object.
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether the object name is generated by the system.
created	timestamp with time zone	Time when the object was created.
last_ddl_time	timestamp with time zone	Last time when the object was modified.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is <b>NULL</b> .
timestamp	character varying(19)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
sharing	character varying(18)	Not supported. Its value is <b>NULL</b> .
editionable	character varying(1)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
application	character varying(1)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
created_appid	numeric	Not supported. Its value is <b>NULL</b> .
modified_appid	numeric	Not supported. Its value is <b>NULL</b> .
created_vsnid	numeric	Not supported. Its value is <b>NULL</b> .
modified_vsnid	numeric	Not supported. Its value is <b>NULL</b> .

**NOTICE**

For details about the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

### 12.3.145 MY\_PART\_COL\_STATISTICS

MY\_PART\_COL\_STATISTICS displays column statistics and histogram information about table partitions owned by the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-248** MY\_PART\_COL\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.

Name	Type	Description
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Its value is <b>NULL</b> .
low_value	raw	Not supported. Its value is <b>NULL</b> .
high_value	raw	Not supported. Its value is <b>NULL</b> .
density	numeric	Not supported. Its value is <b>NULL</b> .
num_nulls	numeric	Not supported. Its value is <b>NULL</b> .
num_buckets	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(63)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Not supported. Its value is <b>NULL</b> .
histogram	character varying(15)	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.146 MY\_PART\_INDEXES

**MY\_PART\_INDEXES** displays information about partitioned table indexes accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-249** MY\_PART\_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of the partitioned table index
index_owner	character varying(64)	Name of the owner of a partitioned table index
index_name	character varying(64)	Name of the partitioned table index
partition_count	bigint	Number of index partitions of the partitioned table index
partitioning_key_count	integer	Number of partition keys of the partitioned table
partitioning_type	text	Partition policy of the partitioned table <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
schema	character varying(64)	Schema of the partitioned table index
table_name	character varying(64)	Name of the partitioned table to which the partitioned table index belongs

### 12.3.147 MY\_PART\_KEY\_COLUMNS

MY\_PART\_KEY\_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-250** MY\_PART\_KEY\_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a partitioned table or index.
object_type	character varying(128)	Valid values are <b>table</b> and <b>index</b> . If the partition is a partitioned table, the value is <b>table</b> . If the partition is a partitioned index, the value is <b>index</b> .

Name	Type	Description
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.148 MY\_PART\_TABLES

MY\_PART\_TABLES displays information about partitioned tables accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-251** MY\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of the partitioned table.
partitioning_type	text	Partitioning policy of the partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of the partitioned table.
partitioning_key_count	integer	Number of partition keys of the partitioned table.
def_tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Schema of the partitioned table.
subpartitioning_type	text	Partitioning policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. The distributed system does not support level-2 partitions. Set this parameter to <b>NONE</b> .

Name	Type	Description
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
status	character varying(8)	Not supported. Its value is <b>valid</b> .
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Its value is <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_extents	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_max_size	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Its value is <b>NULL</b> .
def_freelists	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
def_freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
def_logging	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_compression	character varying(8)	Default compression mode used when a partition is added. Value range: <ul style="list-style-type: none"> <li>• NONE</li> <li>• ENABLED</li> <li>• DISABLED</li> </ul>
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <b>NOTE</b> For available compression modes and compression levels, see <a href="#">WITH ( { storage_paramet...</a>
def_buffer_pool	character varying(7)	Not supported. Its value is <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
def_cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Its value is <b>NO</b> .
interval_subpartition	character varying(1000)	Not supported. Its value is <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Its value is <b>NO</b> .
is_nested	character varying(3)	Not supported. Its value is <b>NO</b> .
def_segment_creation	character varying(4)	Currently, the segment-page mode is not supported. When the segment-page mode is enabled, the value is <b>YES</b> .
def_indexing	character varying(3)	Not supported. Its value is <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NONE</b> .

Name	Type	Description
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Its value is <b>NO</b> .
def_cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .

## 12.3.149 MY\_PROCEDURES

MY\_PROCEDURES displays information about stored procedures, functions, or triggers owned by the current user. This view exists in both PG\_CATALOG and SYS schema. This view can be accessed by all users. Only the information about the current user can be viewed.

**Table 12-252** MY\_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, or trigger.
object_name	character varying(64)	Name of a stored procedure, function, or trigger.
procedure_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
object_id	oid	OID of a stored procedure, function, or trigger.
subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
overload	character varying(40)	$n$ th overloaded function of the name.

Name	Type	Description
object_type	character varying(13)	Object type name.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: <ul style="list-style-type: none"><li>• <b>YES</b></li><li>• <b>NO</b></li></ul>
pipelined	character varying(3)	Not supported. Its value is <b>NO</b> .
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. Its value is <b>NO</b> .
interface	character varying(3)	Not supported. Its value is <b>NO</b> .
deterministic	character varying(3)	Not supported. Its value is <b>NO</b> .
authid	character varying(12)	Specifies whether to use the creator permission or caller permission: <ul style="list-style-type: none"><li>• <b>DEFINER</b>: The creator permission is used.</li><li>• <b>CURRENT_USER</b>: The caller permission is used.</li></ul> This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .
polymorphic	character varying(5)	Not supported. Its value is <b>NULL</b> .
argument_number	smallint	Number of input parameters in a stored procedure.

### 12.3.150 MY\_ROLE\_PRIVS

MY\_ROLE\_PRIVS displays permission information about roles (including the public role) granted to the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-253 MY\_ROLE\_PRIVS columns**

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
delegate_option	character varying(3)	Not supported. Its value is <b>NULL</b> .
default_role	character varying(3)	Not supported. Its value is <b>NULL</b> .
os_granted	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.151 MY\_SCHEDULER\_JOB\_ARGS

MY\_SCHEDULER\_JOB\_ARG displays the parameters related to the jobs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-254 MY\_SCHEDULER\_JOB\_ARGS columns**

Name	Type	Description
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of the parameter.

Name	Type	Description
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

### 12.3.152 MY\_SCHEDULER\_PROGRAM\_ARGS

MY\_SCHEDULER\_PROGRAM\_ARG displays the parameters related to the programs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-255** MY\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of the parameter.
metadata_attribute	character varying(19)	Not supported. Its value is <b>NULL</b> .
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Its value is <b>NULL</b> .

### 12.3.153 MY\_SEQUENCES

MY\_SEQUENCES displays the sequence information about the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-256** MY\_SEQUENCES columns

Name	Type	Description
sequence_owner	character varying(64)	Owner of a sequence.
sequence_name	character varying(64)	Name of the sequence.
min_value	int16	Minimum value of the sequence.
max_value	int16	Maximum value of the sequence.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether the sequence is a cyclic sequence. The value can be <b>Y</b> or <b>N</b> . <ul style="list-style-type: none"><li>• <b>Y</b>: It is a cyclic sequence.</li><li>• <b>N</b>: It is not a cyclic sequence.</li></ul>
last_number	int16	Value of the previous sequence.
cache_size	int16	Size of the sequence disk cache.
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. This parameter is not supported. Set it to <b>NULL</b> .
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. This parameter is not supported. Set it to <b>NULL</b> .
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported. Its value is <b>NULL</b> .
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported. Its value is <b>NULL</b> .
session_flag	character varying(1)	Specifies whether a sequence is a private session. This parameter is not supported. Its value is <b>NULL</b> .

Name	Type	Description
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. Not supported. Its value is <b>NULL</b> .

### 12.3.154 MY\_SOURCE

MY\_SOURCE displays the definition information about stored procedures, functions, and triggers accessible to the current user. This view exists in both PG\_CATALOG and SYS schema.

Table 12-257 MY\_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. The value can be <b>function</b> , <b>procedure</b> , or <b>trigger</b> .
line	numeric	Number of the source line.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.155 MY\_SUBPART\_KEY\_COLUMNS

MY\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

Table 12-258 MY\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
name	character varying(128)	Not supported. Its value is <b>NULL</b> .
object_type	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
column_position	numeric	Not supported. Its value is <b>NULL</b> .
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.156 MY\_SYNONYMS

MY\_SYNONYMS displays synonyms in the current schema. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-259** MY\_SYNONYMS columns

Name	Type	Description
schema_name	text	Name of the schema to which the synonym belongs.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , its associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. Its value is <b>NULL</b> .

Name	Type	Description
origin_con_id	character varying(256)	Not supported. Its value is <b>0</b> .

### 12.3.157 MY\_SYS\_PRIVS

MY\_SYS\_PRIVS displays information about system permissions granted to the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-260** MY\_SYS\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
privilege	character varying(40)	System permission
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"><li>• <b>YES</b></li><li>• <b>NO</b></li></ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.158 MY\_TAB\_COL\_STATISTICS

MY\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from MY\_TAB\_COLUMNS. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-261** MY\_TAB\_COL\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.

Name	Type	Description
high_value	raw	High value in a column.
density	numeric	<ul style="list-style-type: none"> <li>If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span less than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li> <li>If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <b>1/NUM_DISTINCT</b>.</li> </ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	<p>Specifies whether the histogram exists and the type of the histogram if it exists.</p> <ul style="list-style-type: none"> <li><b>NONE</b>: no histogram.</li> <li><b>FREQUENCY</b>: frequency histogram.</li> <li><b>EQUI-WIDTH</b>: equal-width histogram.</li> </ul>
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is <b>SHARED</b> (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

## 12.3.159 MY\_TAB\_COLUMNS

MY\_TAB\_COLUMNS displays the columns of the tables and views owned by the current user. This view exists in both PG\_CATALOG and SYS schema. All users can access this view. Only the information about the user is displayed.

**Table 12-262** MY\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of the column.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of the column, in bytes.
data_precision	integer	Precision of a data type. This column is valid for the numeric data type and <b>NULL</b> for other data types.
data_scale	integer	Number of decimal places. This column is valid for the numeric data type and <b>0</b> for other data types.
nullable	bpchar	Specifies whether a column can be empty ( <b>n</b> for a primary key constraint or NOT NULL constraint).
column_id	integer	Sequence number of the column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.

Name	Type	Description
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Length of a column, in characters. This parameter is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Its value is <b>YES</b> .
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. <ul style="list-style-type: none"><li>• <b>NONE</b>: no histogram.</li><li>• <b>FREQUENCY</b>: frequency histogram.</li><li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li></ul>

Name	Type	Description
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.160 MY\_TAB\_COMMENTS

MY\_TAB\_COMMENTS displays comments on all tables and views owned by the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-263** MY\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of the table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

## 12.3.161 MY\_TAB\_HISTOGRAMS

MY\_TAB\_HISTOGRAMS displays histogram information about the tables or views owned by the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Its value is <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Its value is <b>NULL</b> .
endpoint_repeat_count	numeric	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. Its value is <b>SHARED</b> .

## 12.3.162 MY\_TAB\_PARTITIONS

MY\_TAB\_PARTITIONS displays information about level-1 table partitions accessible to the current user (including level-2 partitioned tables). Each level-1 table partition of a partitioned table accessible to the current user has one record in MY\_TAB\_PARTITIONS. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

**Table 12-264** MY\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.

Name	Type	Description
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of the partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
subpartition_count	numeric	Not supported. Its value is <b>NULL</b> .
high_value_length	integer	Length of the binding value expression in a partition.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to the table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .

Name	Type	Description
segment_created	character varying(4)	Specifies whether a partitioned table has segments created or has not been created.
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.163 MY\_TAB\_STATISTICS

MY\_TAB\_STATISTICS displays statistics about tables owned by the current user in the database. This view exists in both PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-265** MY\_TAB\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
partition_position	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_position	numeric	Not supported. Its value is <b>NULL</b> .
object_type	character varying(12)	Object type. <ul style="list-style-type: none"><li>• TABLE</li><li>• PARTITION</li><li>• SUBPARTITION</li></ul>
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_cached_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_cache_hit_ratio	numeric	Not supported. Its value is <b>NULL</b> .
im_imcu_count	numeric	Not supported. Its value is <b>NULL</b> .
im_block_count	numeric	Not supported. Its value is <b>NULL</b> .
im_stat_update_time	timestamp(9) without time zone	Not supported. Its value is <b>NULL</b> .
scan_rate	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
stattype_locked	character varying(5)	Not supported. Its value is <b>NULL</b> .
stale_stats	character varying(7)	Not supported. Its value is <b>NULL</b> .
notes	character varying(25)	Not supported. Its value is <b>NULL</b> .
scope	character varying(7)	Not supported. The default value is <b>SHARED</b> .

### 12.3.164 MY\_TAB\_STATS\_HISTORY

MY\_TAB\_STATS\_HISTORY provides the table statistics history of the tables owned by the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-266** MY\_TAB\_STATS\_HISTORY columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

### 12.3.165 MY\_TABLES

MY\_TABLES displays information about the tables owned by the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-267** MY\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.

Name	Type	Description
dropped	character varying	Specifies whether the current record is deleted. <ul style="list-style-type: none"> <li>• <b>yes</b>: deleted.</li> <li>• <b>no</b>: not deleted.</li> </ul>
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current record is valid. <ul style="list-style-type: none"> <li>• <b>valid</b>: valid.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. <ul style="list-style-type: none"> <li>• <b>y</b>: The table is a temporary table.</li> <li>• <b>n</b>: The table is not a temporary table.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement.
compression	character varying(8)	Specifies whether to enable a table compression.
duration	character varying(15)	Time elapsed when a temporary table is processed.
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table.

Name	Type	Description
external	character varying(3)	Specifies whether the table is a foreign table.
logging	character varying(3)	Specifies whether changes to a table are logged.
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock.
nested	character varying(3)	Specifies whether a table is a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning.
has_identity	character varying(3)	Specifies whether a table has an identifier column.
segment_created	character varying(3)	Specifies whether a table segment has been created.
monitoring	character varying(3)	Specifies whether to monitor the modification of a table.
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelists_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .
result_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
clustering	character varying(3)	Not supported. Its value is <b>NULL</b> .
activity_tracking	character varying(23)	Not supported. Its value is <b>NULL</b> .
dml_timestamp	character varying(25)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
hybrid	character varying(3)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
container_map_object	character varying(3)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_link_dml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
object_id_type	character varying(16)	Not supported. Its value is <b>NULL</b> .
table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

### 12.3.166 MY\_TABLESPACES

MY\_TABLESPACES displays the description of tablespaces that store objects owned by users. By default, it is accessible to all users. This view exists in both

PG\_CATALOG and SYS schema. The logical structure features of GaussDB are different from those of the ORA database.

**Table 12-268** MY\_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name
block_size	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
min_extlen	numeric	Not supported. Its value is <b>NULL</b> .
contents	character varying(9)	Not supported. Its value is <b>NULL</b> .
status	character varying(9)	Tablespace status. The default value is <b>ONLINE</b> .
logging	character varying(9)	Not supported. Its value is <b>NULL</b> .
force_logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
extent_management	character varying(10)	Not supported. Its value is <b>NULL</b> .
allocation_type	character varying(9)	Not supported. Its value is <b>NULL</b> .
segment_space_management	character varying(6)	Not supported. Its value is <b>NULL</b> .
def_tab_compression	character varying(8)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
retention	character varying(11)	Not supported. Its value is <b>NULL</b> .
bigfile	character varying(3)	Not supported. Its value is <b>NULL</b> .
predicate_evaluation	character varying(7)	Not supported. Its value is <b>NULL</b> .
encrypted	character varying(3)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
def_inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
shared	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_index_compression	character varying(8)	Not supported. Its value is <b>NULL</b> .
index_compress_for	character varying(13)	Not supported. Its value is <b>NULL</b> .
def_cellmemory	character varying(14)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
lost_write_protect	character varying(7)	Not supported. Its value is <b>NULL</b> .
chunk_tablespace	character varying(1)	Not supported. Its value is <b>NULL</b> .

## 12.3.167 MY\_TRIGGERS

MY\_TRIGGERS displays information about the triggers owned by the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-269** MY\_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Trigger types: <b>before statement</b> , <b>before each row</b> , <b>after statement</b> , <b>after each row</b> , and <b>instead of</b> .
triggering_event	character varying	Event that triggers a trigger: <b>update</b> , <b>insert</b> , <b>delete</b> , or <b>truncate</b> .
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Basic object type of a trigger, which can be <b>table</b> or <b>view</b> .
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
referencing_name	character varying(422)	Not supported. Its value is <b>referencing new as new old as old</b> .
when_clause	character varying(4000)	Content of <b>when</b> . <b>TRUE</b> must be evaluated as <b>TRIGGER_BODY</b> to execute.
status	character varying(64)	<ul style="list-style-type: none"><li>● <b>O</b>: The trigger is enabled in origin or local mode.</li><li>● <b>D</b>: The trigger is disabled.</li><li>● <b>R</b>: The trigger is enabled in replica mode.</li><li>● <b>A</b>: The trigger is always enabled.</li></ul>
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports <b>call</b> .
trigger_body	text	Statement executed when a trigger is triggered.

Name	Type	Description
crossedition	character varying(7)	Not supported. Its value is <b>NULL</b> .
before_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
before_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
after_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
after_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
instead_of_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
fire_once	character varying(3)	Not supported. Its value is <b>NULL</b> .
apply_server_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.168 MY\_TYPE\_ATTRS

MY\_TYPE\_ATTRS displays all types of attributes owned by the current user in the database. This view exists in both PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-270** MY\_TYPE\_ATTRS columns

Name	Type	Description
type_name	character varying(128)	Data type name.
attr_name	character varying(128)	Attribute name.
attr_type_mod	character varying(7)	Type modifier of an attribute: <ul style="list-style-type: none"><li>• REF</li><li>• POINT</li></ul>
attr_type_owner	character varying(128)	Owner of an attribute type.
attr_type_name	character varying(128)	Name of an attribute type.
length	numeric	Length of the CHAR attribute, or the maximum length of the VARCHAR and character varying attribute
precision	numeric	Decimal precision of a number or DECIMAL attribute, or binary precision of a FLOAT attribute.

Name	Type	Description
scale	numeric	Decimal places for a numeric or DECIMAL attribute.
character_set_name	character varying(44)	Character set name of an attribute ( <b>Char_CS</b> or <b>NCHAR_CS</b> ).
attr_no	numeric	Syntax order number or location (not used as an ID number) of an attribute specified in the type specification or CREATE TYPE statement.
inherited	character varying(3)	Specifies whether an attribute is inherited from a supertype. <ul style="list-style-type: none"><li>• <b>YES</b>: It is inherited from a supertype.</li><li>• <b>NO</b>: It is not inherited from a supertype.</li></ul>

## 12.3.169 MY\_TYPES

MY\_TYPES describes all object types owned by the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-271** MY\_TYPES columns

Name	Type	Description
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Its value is <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is incomplete.
final	character varying(3)	Not supported. Its value is <b>NULL</b> .
instantiable	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
persistable	character varying(3)	Not supported. Its value is <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
local_attributes	numeric	Not supported. Its value is <b>NULL</b> .
local_methods	numeric	Not supported. Its value is <b>NULL</b> .
typeid	raw	Not supported. Its value is <b>NULL</b> .

### 12.3.170 MY\_VIEWS

MY\_VIEWS displays information about all views of the current user. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-272** MY\_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of a view.
view_name	character varying(64)	View name.
text	text	Text in the view.
text_length	integer	Text length of the view.
TEXT_VC	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.
type_text_length	numeric	Not supported. Its value is <b>NULL</b> .
type_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
oid_text_length	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
oid_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
view_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
view_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
superview_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
editioning_view	character varying(1)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(1)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(1)	Not supported. Its value is <b>NULL</b> .
bequeath	character varying(12)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .
default_collation	character varying(100)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
pdb_local_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.171 NLS\_DATABASE\_PARAMETERS

NLS\_DATABASE\_PARAMETERS lists the permanent NLS parameters of the database server. This view exists in both PG\_CATALOG and SYS schema. It is

accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in this view may be obviously different from those in the ORA database.

**Table 12-273** NLS\_DATABASE\_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name.
value	character varying(64)	Parameter value.

### 12.3.172 NLS\_INSTANCE\_PARAMETERS

NLS\_INSTANCE\_PARAMETERS lists the permanent NLS parameters of the database client. This view exists in both PG\_CATALOG and SYS schema. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in this view may be obviously different from those in the ORA database.

**Table 12-274** NLS\_INSTANCE\_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name.
value	character varying(64)	Parameter value.

### 12.3.173 PG\_AVAILABLE\_EXTENSION\_VERSIONS

PG\_AVAILABLE\_EXTENSION\_VERSIONS displays extension versions of certain database features. This view is for internal use only. You are advised not to use it.

**Table 12-275** PG\_AVAILABLE\_EXTENSION\_VERSIONS columns

Name	Type	Description
name	name	Extension name.
version	text	Version name.
installed	Boolean	Specifies whether this extension version is installed. Otherwise, the value is <b>false</b> .
superuser	Boolean	Specifies whether only system administrators are allowed to install the extension. Otherwise, the value is <b>false</b> .

Name	Type	Description
relocatable	Boolean	Specifies whether the extension can be relocated to another schema. Otherwise, the value is <b>false</b> .
schema	name	Name of the schema that the extension must be installed into ( <b>NULL</b> if the extension is partially or fully relocatable).
requires	name[]	Names of prerequisite extensions ( <b>NULL</b> if none)
comment	text	Comment from the extension's control file.

## 12.3.174 PG\_AVAILABLE\_EXTENSIONS

PG\_AVAILABLE\_EXTENSIONS displays the extension information about certain database features. This view is for internal use only. You are advised not to use it.

Table 12-276 PG\_AVAILABLE\_EXTENSIONS columns

Name	Type	Description
name	name	Extension name.
default_version	text	Name of the default version ( <b>NULL</b> if none is specified).
installed_version	text	Currently installed version of the extension ( <b>NULL</b> if no version is installed).
comment	text	Comment from the extension's control file.

## 12.3.175 PG\_COMM\_DELAY

PG\_COMM\_DELAY displays the communication library delay status for a single DN.

Table 12-277 PG\_COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Name of the peer node
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection

Name	Type	Description
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond

### 12.3.176 PG\_COMM\_RECV\_STREAM

**PG\_COMM\_RECV\_STREAM** displays the receiving stream status of all the communication libraries for a single DN.

**Table 12-278** PG\_COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream <ul style="list-style-type: none"> <li>• <b>UNKNOWN</b>: The logical connection status is unknown.</li> <li>• <b>READY</b>: The logical connection is ready.</li> <li>• <b>RUN</b>: The logical connection sends packets normally.</li> <li>• <b>HOLD</b>: The logical connection is waiting to send packets.</li> <li>• <b>CLOSED</b>: The logical connection is closed.</li> <li>• <b>TO_CLOSED</b>: The logical connection will be closed.</li> </ul>
query_id	bigint	<b>debug_query_id</b> corresponding to the stream

Name	Type	Description
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received from the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average receiving rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
buff_use	bigint	Current size of the data cache of the stream, in byte

### 12.3.177 PG\_COMM\_SEND\_STREAM

**PG\_COMM\_SEND\_STREAM** displays the sending stream status of all the communication libraries for a single DN.

**Table 12-279** PG\_COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream

Name	Type	Description
state	text	Status of the stream <ul style="list-style-type: none"><li>• <b>UNKNOWN</b>: The logical connection status is unknown.</li><li>• <b>READY</b>: The logical connection is ready.</li><li>• <b>RUN</b>: The logical connection sends packets normally.</li><li>• <b>HOLD</b>: The logical connection is waiting to send packets.</li><li>• <b>CLOSED</b>: The logical connection is closed.</li><li>• <b>TO_CLOSED</b>: The logical connection will be closed.</li></ul>
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
rcv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average sending rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms

## 12.3.178 PG\_COMM\_STATUS

**PG\_COMM\_STATUS** displays the communication library status for a single DN.

**Table 12-280** PG\_COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name
rxpck_rate	integer	Receiving rate of the communication library on the node, in byte/s

Name	Type	Description
txpck_rate	integer	Sending rate of the communication library on the node, in byte/s
rxkbyte_rate	bigint	Receiving rate of the communication library on the node, in kbyte/s
txkbyte_rate	bigint	Sending rate of the communication library on the node, in kbyte/s
buffer	bigint	Size of the buffer of the Cmailbox
memkbyte_libcomm	bigint	Communication memory size of the <b>libcomm</b> process, in bytes
memkbyte_libpq	bigint	Communication memory size of the <b>libpq</b> process, in bytes
used_pm	integer	Real-time usage of the <b>postmaster</b> thread
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads
stream	integer	Total number of used logical connections.

### 12.3.179 PG\_CONTROL\_GROUP\_CONFIG

PG\_CONTROL\_GROUP\_CONFIG displays Cgroup configuration information in the system. Only the user with sysadmin permission can query this view.

**Table 12-281** PG\_CONTROL\_GROUP\_CONFIG columns

Name	Type	Description
pg_control_group_config	text	Configuration information of the Cgroup

### 12.3.180 PG\_CURSORS

PG\_CURSORS displays cursors that are currently available.

**Table 12-282** PG\_CURSORS columns

Name	Type	Description
name	text	Cursor name.
statement	text	Query statement when the cursor is declared to change.
is_holdable	Boolean	Specifies whether the cursor is holdable (that is, whether the cursor can be accessed after the transaction that declared the cursor has committed). If it is, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
is_binary	Boolean	Specifies whether the cursor is declared BINARY. If it is, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
is_scrollable	Boolean	Specifies whether the cursor is scrollable (it allows rows to be retrieved in a nonsequential manner). If it is, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
creation_time	timestamp with time zone	Timestamp at which the cursor is declared.

## 12.3.181 PG\_EXT\_STATS

PG\_EXT\_STATS displays extended statistics stored in [PG\\_STATISTIC\\_EXT](#). The extension statistics means multiple columns of statistics.

**Table 12-283** PG\_EXT\_STATS columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <a href="#">PG_NAMESPACE</a>	Name of the schema that contains a table.
tablename	name	<b>relname</b> in <a href="#">PG_CLASS</a>	Table name.
attname	int2vector	<b>stakey</b> in <a href="#">PG_STATISTIC_EXT</a>	Columns to be combined for collecting statistics
inherited	Boolean	-	Table inheritance is not supported currently. The value of this column is <b>false</b> .
null_frac	real	-	Percentage of column combinations that are null to all records.

Name	Type	Reference	Description
avg_width	integer	-	Average width of column combinations, in bytes.
n_distinct	real	-	<ul style="list-style-type: none"> <li>Estimated number of distinct values in a column combination if the value is greater than 0.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, -1 indicates that the number of distinct values is the same as the number of rows for a column combination.               <ol style="list-style-type: none"> <li>The negated form is used when <b>ANALYZE</b> believes that the number of distinct values is likely to increase as the table grows.</li> <li>The positive form is used when the column seems to have a fixed number of possible values.</li> </ol> </li> <li>The number of distinct values is unknown if the value is 0.</li> </ul>
n_dndistinct	real	-	<p>Number of not-null distinct values in the <b>dn1</b> column combination.</p> <ul style="list-style-type: none"> <li>Exact number of distinct values if the value is greater than 0.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, if a value in a column combination appears twice in average, <b>n_dndistinct</b> equals -0.5.</li> <li>The number of distinct values is unknown if the value is 0.</li> </ul>

Name	Type	Reference	Description
most_common_vals	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be <b>NULL</b> . None of the most common values in the column is <b>NULL</b> .
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of <b>most_common_vals</b> is <b>NULL</b> , the value of this column is <b>NULL</b> .
most_common_vals_null	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be <b>NULL</b> . At least one of the common values in the column is <b>NULL</b> .
most_common_freqs_null	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of <b>most_common_vals_null</b> is <b>NULL</b> , the value of this column is <b>NULL</b> .
histogram_bounds	anyarray	-	Boundary value list of the histogram.

### 12.3.182 PG\_GET\_INVALID\_BACKENDS

The PG\_GET\_INVALID\_BACKENDS view displays information about current standby DN backend threads connected to the CN. Only system administrators and monitor administrators can access this view.

**Table 12-284** PG\_GET\_INVALID\_BACKENDS columns

Name	Type	Description
pid	bigint	Thread ID
node_name	text	Node information connected to the backend thread
dbname	name	Name of the connected database
backend_start	timestamp with time zone	Backend thread startup time
query	text	Query statement executed by the backend thread

### 12.3.183 PG\_GET\_SENDERS\_CATCHUP\_TIME

PG\_GET\_SENDERS\_CATCHUP\_TIME displays catchup information of the currently active primary/standby instance sender thread on the DN.

**Table 12-285** PG\_GET\_SENDERS\_CATCHUP\_TIME columns

Name	Type	Description
pid	bigint	Current sender thread ID.
lwpid	integer	Current sender lwpid.
local_role	text	Local role.
peer_role	text	Peer role.
state	text	Current sender's replication status <ul style="list-style-type: none"> <li>• <b>Startup</b>: startup state.</li> <li>• <b>Backup</b>: backup state.</li> <li>• <b>Catchup</b>: catch-up state, which indicates that the standby node is catching up with the primary node.</li> <li>• <b>Streaming</b>: streaming replication state. When the standby node catches up with the primary node, the replication remains in this state.</li> </ul>
type	text	Current sender type <ul style="list-style-type: none"> <li>• <b>Wal</b>: type that logs are written in advance.</li> <li>• <b>Data</b>: data type.</li> </ul>

Name	Type	Description
catchup_start	timestamp with time zone	Startup time of a catchup task.
catchup_end	timestamp with time zone	End time of the catchup task.

## 12.3.184 PG\_GROUP

PG\_GROUP displays the database role authentication and the relationship between group members.

**Table 12-286** PG\_GROUP columns

Name	Type	Description
groname	name	Group name
grosysid	oid	Group ID
grolist	oid[]	Array containing the IDs of all roles in the group.

## 12.3.185 PG\_INDEXES

PG\_INDEXES displays information about each index in the database.

**Table 12-287** PG\_INDEXES columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <b>PG_NAMESPACE</b>	Name of the schema that contains tables and indexes.
tablename	name	<b>relname</b> in <b>PG_CLASS</b>	Name of the table where the index is located.
indexname	name	<b>relname</b> in <b>PG_CLASS</b>	Index name
tablespace	name	<b>nspname</b> in <b>PG_TABLESPACE</b>	Name of the tablespace that contains the index.

Name	Type	Reference	Description
indexdef	text	-	Index definition (a reconstructed <b>CREATE INDEX</b> command).

## 12.3.186 PG\_LOCKS

PG\_LOCKS displays information about locks held by open transactions.

**Table 12-288** PG\_LOCKS columns

Name	Type	Reference	Description
locktype	text	-	Type of the locked object. The value can be <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b> .
database	oid	<b>oid</b> in <b>PG_DATABASE</b>	OID of the database in which the locked target exists. <ul style="list-style-type: none"> <li>The OID is <b>0</b> if the target is a shared object.</li> <li>The OID is <b>NULL</b> if the locked object is a transaction.</li> </ul>
relation	oid	<b>oid</b> in <b>PG_CLASS</b>	OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.
page	integer	-	Page number targeted by the lock within the relationship ( <b>NULL</b> if the object is not a relation page or row page).
tuple	smallint	-	Row number targeted by the lock within the page ( <b>NULL</b> if the object is not a row).
bucket	integer	-	Hash bucket ID.
virtualxid	text	-	ID of the virtual transaction. The value is <b>NULL</b> if the object is not a virtual transaction.
transactionid	xid	-	ID of the transaction. The value is <b>NULL</b> if the object is not a transaction.

Name	Type	Reference	Description
classid	oid	<b>oid</b> in <b>PG_CLASS</b>	OID of the system catalog that contains the object ( <b>NULL</b> if the object is not a general database object).
objid	oid	-	OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.
objsubid	smallint	-	Column number for a column in the table ( <b>0</b> if the target is of other object type and <b>NULL</b> if the target is not a general database object).
virtualtrans action	text	-	Virtual ID of the virtual transaction holding or awaiting this lock.
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock ( <b>NULL</b> if the lock is held by a prepared transaction).
sessionid	bigint	-	ID of the session that holds or waits for the lock.
mode	text	-	Lock mode held or desired by this thread.
granted	Boolean	-	<ul style="list-style-type: none"><li>The value is <b>TRUE</b> if the lock is a held lock.</li><li>The value is <b>FALSE</b> if the lock is an awaited lock.</li></ul>
fastpath	Boolean	-	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.
locktag	text	-	Lock information that the session waits for. It can be parsed using the locktag_decode() function.
global_sessionid	text	-	Global session ID.

### 12.3.187 PG\_NODE\_ENV

PG\_NODE\_ENV displays the environment variable information of the current node. This view can be viewed only by the users with monitor admin and sysadmin permission.

**Table 12-289** PG\_NODE\_ENV columns

Name	Type	Description
node_name	text	Current node name.
host	text	Host name of the node.
process	integer	Number of the node process.
port	integer	Port ID of the node.
installpath	text	Installation directory of the node.
datapath	text	Data directory of the node.
log_directory	text	Log directory of the node.

## 12.3.188 PG\_OS\_THREADS

**PG\_OS\_THREADS** provides status information about all the threads under the current node.

**Table 12-290** PG\_OS\_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	PID of the thread running under the current node process
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID

## 12.3.189 PG\_POOLER\_STATUS

**PG\_POOLER\_STATUS** queries the cache connection status in the pooler. This view can only query on the CN, and displays the connection cache information about the pooler module.

**Table 12-291** PG\_POOLER\_STATUS columns

Name	Type	Description
database	text	Database name.

Name	Type	Description
user_name	text	Username.
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected.
node_name	name	Name of the node connected.
in_use	Boolean	Specifies whether the connection is currently used. <ul style="list-style-type: none"><li>• <b>t</b> (true): The connection is in use.</li><li>• <b>f</b> (false): The connection is not in use.</li></ul>
node_port	integer	Port number of the connected instance node.
fdsock	bigint	Peer socket.
remote_pid	bigint	Peer thread ID.
session_params	text	GUC session parameter delivered by the connection.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

## 12.3.190 PG\_PREPARED\_STATEMENTS

PG\_PREPARED\_STATEMENTS displays information about all prepared statements that are available in the current session.

**Table 12-292** PG\_PREPARED\_STATEMENTS columns

Name	Type	Description
name	text	Identifier of a prepared statement.

Name	Type	Description
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement committed by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of <b>regtype</b> . The OID corresponding to an element of this array can be obtained by converting the <b>regtype</b> value to an OID value.
from_sql	Boolean	<ul style="list-style-type: none"> <li>Its value is <b>true</b> if the prepared statement was created through the PREPARE statement</li> <li>Its value is <b>false</b> if the statement was prepared through the frontend/backend protocol</li> </ul>

### 12.3.191 PG\_PREPARED\_XACTS

PG\_PREPARED\_XACTS displays information about transactions that are currently prepared for two-phase commit.

**Table 12-293** PG\_PREPARED\_XACTS columns

Name	Type	Reference	Description
transaction	xid	-	Numeric identifier of the prepared transaction.
gid	text	-	Global identifier of the prepared transaction.
prepared	timestamp with time zone	-	Time at which the transaction is prepared for commit
owner	name	<a href="#">PG_AUTHID</a> .rolname	Name of the user who executes the transaction.
database	name	<a href="#">PG_DATABASE</a> .datname	Name of the database that executes the transaction.

## 12.3.192 PG\_REPLICATION\_SLOTS

PG\_REPLICATION\_SLOTS displays replication slot information.

**Table 12-294** PG\_REPLICATION\_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. <ul style="list-style-type: none"><li>• <b>physical</b>: physical replication slot.</li><li>• <b>logical</b>: logical replication slot.</li></ul>
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	Boolean	Determines whether the replication slot is activated. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	Boolean	Reserved parameter.
confirmed_flush	text	Dedicated logical replication slot. The client confirms the location of the received log.
confirmed_csn	xid	Dedicated logical replication slot. The client confirms the CSN corresponding to the last transaction in the received log.

Example:

```
-- Perform query on the DN.
gaussdb=# SELECT * FROM pg_replication_slots;
slot_name | plugin | slot_type | datoid | database | active | xmin | catalog_xmin | restart_lsn |
dummy_standby | confirmed_flush | confirmed_csn
```

Name	Type	Description
polycmd	text	SQL operations affected by the row-level security policy.
policyqual	text	Expression of a row-level security policy.

## 12.3.194 PG\_ROLES

PG\_ROLES displays information about database roles. Initialization users and users with the sysadmin or createrole attribute can view information about all roles. Other users can view only their own information.

**Table 12-296** PG\_ROLES columns

Name	Type	Reference	Description
rolname	name	N/A	Role name.
rolsuper	Boolean	N/A	Specifies whether a role is the initial system administrator with the highest permissions. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolinherit	Boolean	N/A	Specifies whether the role inherits the permissions for this type of roles. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolcreaterole	Boolean	N/A	Specifies whether the role can create other roles. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolcreatedb	Boolean	N/A	Specifies whether the role can create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolcatupdate	Boolean	N/A	Specifies whether the role can update system catalogs directly. Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. This permission is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

Name	Type	Reference	Description
rolcanlogin	Boolean	N/A	Specifies whether the role can log in to the database. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolreplication	Boolean	N/A	Specifies whether the role can be replicated. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolauditadmin	Boolean	N/A	Specifies whether the role is an audit administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolsystemadmin	Boolean	N/A	Specifies whether the role is a system administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolconnlimit	integer	N/A	Maximum number of concurrent connections that this role can initiate if this role can log in. The value <b>-1</b> indicates no limit.
rolpassword	text	N/A	Encrypted user password. The value is displayed as <b>*****</b> .
rolvalidbegin	timestamp with time zone	N/A	Start time for account validity ( <b>NULL</b> if start time is not specified).
rolvaliduntil	timestamp with time zone	N/A	End time for account validity ( <b>NULL</b> if end time is not specified).
rolrespool	name	N/A	Resource pool that a user can use
rolparentid	oid	<a href="#">PG_AUTHID.rolparentid</a>	OID of a group user to which the user belongs
roltabspace	text	N/A	Storage space of the user permanent table, in KB.
rolconfig	text[]	<a href="#">PG_DB_ROLE_SETTING.setconfig</a>	Default value of runtime configuration items.
oid	oid	<b>oid</b> in <a href="#">PG_AUTHID</a>	Role ID

Name	Type	Reference	Description
roluseft	Boolean	<a href="#">PG_AUTHID.roluseft</a>	Specifies whether the role can perform operations on foreign tables <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolkind	"char"	N/A	Role type <ul style="list-style-type: none"> <li>• <b>n</b>: common user, that is, non-permanent user</li> <li>• <b>p</b>: permanent user.</li> </ul>
roltemp space	text	N/A	Storage space of the user temporary table, in KB.
rolspill space	text	N/A	Operator disk spill space of the user, in KB.
rolmonitor administrator	Boolean	N/A	Specifies whether the role is a monitor administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
roloperator administrator	Boolean	N/A	Specifies whether the role is an O&M administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolpolicy administrator	Boolean	N/A	Specifies whether the role is a security policy administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

## 12.3.195 PG\_RULES

PG\_RULES is used to query useful information about rewriting rules.

**Table 12-297** PG\_RULES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Name of the table to which the rule applies.
rulename	name	Name of a rule.

Name	Type	Description
definition	text	Rule definition (reconstructed by the CREATE statement).

## 12.3.196 PG\_RUNNING\_XACTS

PG\_RUNNING\_XACTS displays information about running transactions on the current node.

**Table 12-298** PG\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status. <ul style="list-style-type: none"><li>• <b>3</b>: prepared.</li><li>• <b>0</b>: starting.</li></ul>
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is lazy vacuum. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the prepared state; otherwise, the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Minimum CSN of a local active transaction.

## 12.3.197 PG\_SECLABELS

PG\_SECLABELS provides information about security labels.

**Table 12-299** PG\_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to.
classoid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where the object to which the security label belongs is located.
objsubid	integer	-	Column number for the security label on a table column ( <b>objoid</b> and <b>classoid</b> refer to the table itself). The value is <b>0</b> for all other object types.
objtype	text	-	Type of the object to which the label belongs, in text format. Example: <ul style="list-style-type: none"> <li>• <b>table</b>: table type.</li> <li>• <b>column</b>: column type.</li> </ul>
objnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace for the object, if applicable; otherwise, <b>NULL</b> .
objname	text	-	Name of the object to which the label belongs, in text format.
provider	text	<b>provider</b> in <a href="#">PG_SECLABEL</a>	Provider of the label.
label	text	<b>label</b> in <a href="#">PG_SECLABEL</a>	Security label name.

## 12.3.198 PG\_SETTINGS

PG\_SETTINGS displays information about parameters of the running database.

**Table 12-300** PG\_SETTINGS columns

Name	Type	Description
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Unit of the parameter.
category	text	Logical group of the parameter.

Name	Type	Description
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>siguhp</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b> .
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b> .
source	text	Method of assigning the parameter value.
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number of the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

### 12.3.199 PG\_SHADOW

PG\_SHADOW displays the attributes of all roles marked with rolcanlogin in [PG\\_AUTHID](#). Only the system administrator can access this system view.

The information in this view is basically the same as that of the view in [PG\\_USER](#). The difference is that passwords are sensitive and displayed as **\*\*\*\*\*** in the latter.

**Table 12-301** PG\_SHADOW columns

Name	Type	Reference	Description
username	name	<b>rolname</b> in <b>PG_AUTHID</b>	Username.
usesysid	oid	<b>oid</b> in <b>PG_AUTHID</b>	ID of this user.
usecreatedb	Boolean	-	Specifies whether a user has the permissions to create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usesuper	Boolean	-	Specifies whether the user is a system administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usecatupd	Boolean	-	Specifies whether the user can update a view. Even the system administrator cannot do this unless this column is <b>true</b> . <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
userepl	Boolean	-	Specifies whether the user has the permissions to duplicate data streams. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
passwd	text	<b>rolpassword</b> in <b>PG_AUTHID</b>	Password ciphertext ( <b>NULL</b> if there is no password).
valbegin	timestamp with time zone	-	Start time for account validity ( <b>NULL</b> if start time is not specified).
valuntil	timestamp with time zone	-	End time for account validity ( <b>NULL</b> if end time is not specified).
respool	name	-	Resource pool where the user is in.
parent	oid	-	Parent user OID.
spacelimit	text	-	Storage space of the permanent table, in KB.

Name	Type	Reference	Description
useconfig	text[]	<b>setconfig</b> in <b>PG_DB_ROLE_SETTING</b>	Default value of runtime configuration items.
tempspacelimit	text	-	Storage space of the temporary table, in KB.
spillspacelimit	text	-	Operator disk spill space, in KB.
usemonitoradmin	Boolean	-	Specifies whether the user is a monitor administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
useoperatoradmin	Boolean	-	Specifies whether the user is an O&M administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usepolicyadmin	Boolean	-	Specifies whether the user is a security policy administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

## 12.3.200 PG\_SHARED\_MEMORY\_DETAIL

PG\_SHARED\_MEMORY\_DETAIL displays usage information about all the shared memory contexts.

**Table 12-302** PG\_SHARED\_MEMORY\_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory, in bytes.
freesize	bigint	Remaining size of the shared memory, in bytes.
usedsize	bigint	Used size of the shared memory, in bytes.

## 12.3.201 PG\_STAT\_ACTIVITY

PG\_STAT\_ACTIVITY shows information about the current user's queries. The columns save information about the last query.

**Table 12-303** PG\_STAT\_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
username	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is <b>null</b> , it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend ( <b>-1</b> if a Unix socket is used).
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started ( <b>null</b> if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.

Name	Type	Description
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> . For a stored procedure or function, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when <b>state</b> was last modified.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is <b>true</b> . Otherwise, the value is <b>false</b> .
enqueue	text	Queuing status of a statement. Its value can be: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>

Name	Type	Description
state	text	<p>Overall status of this backend. Its value can be:</p> <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle</b>: The backend is waiting for a new client command.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Common users can view their own session status only. The state information of other accounts is empty. For example, after user <b>judy</b> is connected to the database, the state information of user <b>joe</b> and the initial user <b>omm</b> in <code>pg_stat_activity</code> is empty.</p> <pre>SELECT datname, username, usesysid, state,pid FROM pg_stat_activity;  datname   username   usesysid   state    pid -----+-----+-----+-----+-----  testdb   omm        10               139968752121616  testdb   omm        10               139968903116560  db_tpcds   judy      16398     active   139968391403280  testdb   omm        10               139968643069712  testdb   omm        10               139968680818448  testdb   joe       16390            139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.

Name	Type	Description
query	text	Latest query at the backend. If <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter <b>connection_info</b> .
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Amount of Xlogs currently used by a transaction, in bytes.

## 12.3.202 PG\_STAT\_ALL\_INDEXES

PG\_STAT\_ALL\_INDEXES is used to query statistics about accesses to a specific index by querying each index row in the current database.

Indexes can be used via either simple index scans or bitmap index scans. In a bitmap scan the output of several indexes can be combined via AND or OR rules, so it is difficult to associate individual heap row fetches with specific indexes when a bitmap scan is used. Therefore, each bitmap scan increments the **pg\_stat\_all\_indexes.idx\_tup\_read** count(s) for the index(es) it uses, and it increments the **pg\_stat\_all\_tables.idx\_tup\_fetch** count for the table, but it does not affect **pg\_stat\_all\_indexes.idx\_tup\_fetch**.

**Table 12-304** PG\_STAT\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.

Name	Type	Description
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 12.3.203 PG\_STAT\_ALL\_TABLES

PG\_STAT\_ALL\_TABLES is used to query one row for each table in the current database (including TOAST tables), showing statistics about a specific table.

**Table 12-305** PG\_STAT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when the table was cleared.
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table is cleared.
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon.
last_data_changed	timestamp with time zone	Last time when the data in the table changes (modifications that cause data changes on tables (insert/update/delete/truncate) and partitioned or subpartitioned tables (exchange/truncate/drop)). Data in this column is recorded only in the local database primary node.

### 12.3.204 PG\_STAT\_BAD\_BLOCK

PG\_STAT\_BAD\_BLOCK displays statistics about page verification failures after a node is started.

**Table 12-306** PG\_STAT\_BAD\_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	OID of a database.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	File object ID.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	File type. The values are as follows: <b>0</b> : main data file. <b>1</b> : FSM file. <b>2</b> : VM file. <b>3</b> : BCM file.
error_count	integer	Number of verification failures.
first_time	timestamp with time zone	Time of the first verification failure.
last_time	timestamp with time zone	Time of the latest verification failure.

### 12.3.205 PG\_STAT\_BGWRITER

PG\_STAT\_BGWRITER displays statistics about the activity of the background writer process.

**Table 12-307** PG\_STAT\_BGWRITER columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of checkpoints that have been performed actively.
checkpoint_write_time	double precision	Total time spent in the checkpoint processing portion when writing files to disk, in milliseconds.

Name	Type	Description
checkpoint_sync_time	double precision	Total time spent in the checkpoint processing portion when synchronizing files to disk, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written by checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer process.
maxwritten_clean	bigint	Number of times that cleanup scanning stops because the background writer process writes too many buffers.
buffers_backend	bigint	Number of buffers written directly by the backend.
buffers_backend_fsync	bigint	Number of times that the backend calls fsync (usually, even if the backend executes these write actions, the background writer process processes them again).
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time when these statistics were last reset.

## 12.3.206 PG\_STAT\_DATABASE

PG\_STAT\_DATABASE displays statistics about each database in the cluster.

**Table 12-308** PG\_STAT\_DATABASE columns

Name	Type	Description
datid	oid	OID of a database
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database. This is the only column in the view that returns the status value. Other columns return the accumulated value since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed.

Name	Type	Description
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of times that disk blocks have been found in the buffer cache and therefore the disk blocks do not need to be read (only those found in the buffer cache are counted, excluding those found in the file system cache of the OS).
tup_returned	bigint	Number of rows returned by queries in this database
tup_fetched	bigint	Number of rows fetched by queries in this database
tup_inserted	bigint	Number of rows inserted by queries in this database
tup_updated	bigint	Number of rows updated by queries in this database
tup_deleted	bigint	Number of rows deleted by queries in this database
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby node). For details, see <a href="#">PG_STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of all temporary files created by queries in this database, regardless of why the temporary files are created (such as sorting or hashing) or how the <b>log_temp_files</b> parameter is set.
temp_bytes	bigint	Total amount of data written to all temporary files by queries in this database, regardless of why the temporary files are created or how the <b>log_temp_files</b> parameter is set.
deadlocks	bigint	Number of deadlocks detected in the database.
blk_read_time	double precision	Time spent in reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).

Name	Type	Description
stats_reset	timestamp with time zone	Time when the status statistics are reset.

## 12.3.207 PG\_STAT\_DATABASE\_CONFLICTS

PG\_STAT\_DATABASE\_CONFLICTS displays statistics about database conflicts.

**Table 12-309** PG\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datid	oid	ID of a database
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

## 12.3.208 PG\_STAT\_REPLICATION

PG\_STAT\_REPLICATION displays information about the log synchronization thread, such as the locations where the sender sends logs and where the receiver receives logs.

**Table 12-310** PG\_STAT\_REPLICATION columns

Name	Type	Description
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
username	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.

Name	Type	Description
backend_start	timestamp with time zone	Start time of the program.
state	text	Status of the log synchronization thread: <ul style="list-style-type: none"> <li>● <b>startup</b>: The thread is being started.</li> <li>● <b>catchup</b>: The thread is establishing a connection between the standby node and the primary node.</li> <li>● <b>streaming</b>: The thread has established a connection between the standby node and the primary node and is replicating data streams.</li> <li>● <b>backup</b>: The thread is sending a backup.</li> <li>● <b>stopping</b>: The thread is being stopped.</li> </ul>
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receive end flushes logs.
receiver_replay_location	text	Location where the receive end replays logs.
sync_priority	integer	Priority of synchronous duplication ( <b>0</b> indicates asynchronization).

Name	Type	Description
sync_state	text	<p>Synchronization state:</p> <ul style="list-style-type: none"> <li>• <b>async</b>: asynchronous replication.</li> <li>• <b>sync</b>: synchronous replication.</li> <li>• <b>potential</b>: The standby node is asynchronous currently, but if a current synchronization node fails, the standby node becomes synchronous.</li> <li>• <b>quorum</b>: switches between the synchronous and asynchronous states to ensure that there are more than a certain number of synchronous standby nodes. Generally, the number of synchronous standby nodes is <math>(n+1)/2-1</math>, where <math>n</math> indicates the total number of copies. Whether the standby node is synchronous depends on whether logs are received first. For details, see the description of the <b>synchronous_standby_names</b> parameter.</li> </ul>

### 12.3.209 PG\_STAT\_SYS\_INDEXES

PG\_STAT\_SYS\_INDEXES displays index status information about all the system catalogs in pg\_catalog and information\_schema.

**Table 12-311** PG\_STAT\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 12.3.210 PG\_STAT\_SYS\_TABLES

PG\_STAT\_SYS\_TABLES displays statistics about the system catalogs of all the namespaces in pg\_catalog and information\_schema.

**Table 12-312** PG\_STAT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting VACUUM FULL).
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon.
last_data_changed	timestamp with time zone	Last modification time of the table data.

### 12.3.211 PG\_STAT\_USER\_FUNCTIONS

**PG\_STAT\_USER\_FUNCTIONS** shows user-defined function status information in the namespace. (The language of the function is non-internal language.)

**Table 12-313** PG\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function

Name	Type	Description
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

### 12.3.212 PG\_STAT\_USER\_INDEXES

PG\_STAT\_USER\_INDEXES displays information about the index status of user-defined ordinary tables and TOAST tables.

**Table 12-314** PG\_STAT\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that the index is in.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 12.3.213 PG\_STAT\_USER\_TABLES

PG\_STAT\_USER\_TABLES displays status information about user-defined ordinary tables and TOAST tables in the namespaces.

**Table 12-315** PG\_STAT\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ).

Name	Type	Description
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon.
last_data_change_d	timestamp with time zone	Last modification time of the table data.

### 12.3.214 PG\_STAT\_XACT\_ALL\_TABLES

**PG\_STAT\_XACT\_ALL\_TABLES** displays transaction status information about all ordinary tables and TOAST tables in the namespaces.

**Table 12-316** PG\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

### 12.3.215 PG\_STAT\_XACT\_SYS\_TABLES

**PG\_STAT\_XACT\_SYS\_TABLES** displays transaction status information of the system catalog in the namespace.

**Table 12-317** PG\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

## 12.3.216 PG\_STAT\_XACT\_USER\_FUNCTIONS

**PG\_STAT\_XACT\_USER\_FUNCTIONS** contains statistics on the execution of each function.

**Table 12-318** PG\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times that the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

## 12.3.217 PG\_STAT\_XACT\_USER\_TABLES

**PG\_STAT\_XACT\_USER\_TABLES** displays transaction status information of the user table in the namespace.

**Table 12-319** PG\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

## 12.3.218 PG\_STATS

**PG\_STATS** displays single-column statistics stored in the `pg_statistic` table. The GUC parameter **autovacuum\_naptime** specifies the interval for updating statistics recorded in the view.

**Table 12-320** PG\_STATS columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <b>PG_NAMESPACE</b>	Name of the schema that contains a table.
tablename	name	<b>PG_CLASS</b> .relname	Table name.
attname	name	<b>PG_ATTRIBUTE</b> .attname	Field name.
inherited	Boolean	-	Table inheritance is not supported currently. The value of this column is <b>false</b> .

Name	Type	Reference	Description
null_frac	real	-	Percentage of column entries that are null.
avg_width	integer	-	Average width in bytes of column's entries.
n_distinct	real	-	<ul style="list-style-type: none"> <li>Estimated number of distinct values in the column if the value is greater than 0.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, -1 indicates that the number of distinct values is the same as the number of rows for a column combination.               <ol style="list-style-type: none"> <li>The negated form is used when <b>ANALYZE</b> believes that the number of distinct values is likely to increase as the table grows.</li> <li>The positive form is used when the column seems to have a fixed number of possible values.</li> </ol> </li> <li>The number of distinct values is unknown if the value is 0.</li> </ul>
n_dndistinct	real	-	<p>Number of not-null distinct values in the <b>dn1</b> column.</p> <ul style="list-style-type: none"> <li>Exact number of distinct values if the value is greater than 0.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, if the value of a column appears twice in average, set <b>n_dndistinct</b> to -0.5.</li> <li>The number of distinct values is unknown if the value is 0.</li> </ul>

Name	Type	Reference	Description
most_common_vals	anyarray	-	List of the most common values in a column. If this column does not have the most common value, the value is <b>NULL</b> .
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. ( <b>NULL</b> if <b>most_common_vals</b> is <b>NULL</b> )
histogram_bounds	anyarray	-	Frequency histogram consisting of values excluding null values and MCVs. If a value appears in the value of <b>most_common_vals</b> , it does not appear in the histogram. If the column data type does not have the < operator or the list specified by <b>most_common_vals</b> contains all values of the column, the histogram information of the column is <b>NULL</b> .
correlation	real	-	Correlation between the physical row sequence and logical row sequence of a column value. The value ranges from -1 to +1. When the value is close to -1 or +1, the index scan overhead is less than that when the value is close to 0 because random access to the disk is reduced. This column is <b>NULL</b> if the column data type does not have a < operator.
most_common_elems	anyarray	-	A list of non-null element values most often appearing.
most_common_elem_freqs	real[]	-	List that records the frequency of the most commonly used non-null elements.
elem_count_histogram	real[]	-	A histogram of the counts of distinct non-null element values.

### 12.3.219 PG\_STATIO\_ALL\_INDEXES

PG\_STATIO\_ALL\_INDEXES is used to query information about one row for each index in the current database, showing statistics about I/O on that specific index.

**Table 12-321** PG\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of this index.
schemaname	name	Name of the schema that this index is in.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from this index.
idx_blks_hit	bigint	Number of cache hits in this index.

### 12.3.220 PG\_STATIO\_ALL\_SEQUENCES

PG\_STATIO\_ALL\_SEQUENCES displays the I/O statistics of each sequence in the current database.

**Table 12-322** PG\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of a sequence.
schemaname	name	Name of the schema that this sequence is in.
relname	name	Name of this sequence.
blks_read	bigint	Number of disk blocks read from this sequence.
blks_hit	bigint	Number of cache hits in this sequence.

### 12.3.221 PG\_STATIO\_ALL\_TABLES

PG\_STATIO\_ALL\_TABLES is used to query I/O statistics of each table (including TOAST tables) in the current database.

**Table 12-323** PG\_STATIO\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that this table is in.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from this table.
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from all indexes in this table.
idx_blks_hit	bigint	Number of cache hits of all indexes in this table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

### 12.3.222 PG\_STATIO\_SYS\_INDEXES

PG\_STATIO\_SYS\_INDEXES displays I/O status information about all system catalog indexes in the namespaces.

**Table 12-324** PG\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for an index.
indexrelid	oid	OID of this index.
schemaname	name	Name of the schema that this index is in.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from this index.
idx_blks_hit	bigint	Number of cache hits in this index.

### 12.3.223 PG\_STATIO\_SYS\_SEQUENCES

PG\_STATIO\_SYS\_SEQUENCES displays I/O status information about all the sequences in the namespaces.

**Table 12-325** PG\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of a sequence.
schemaname	name	Name of the schema that this sequence is in.
relname	name	Name of this sequence.
blks_read	bigint	Number of disk blocks read from this sequence.
blks_hit	bigint	Number of cache hits in this sequence.

### 12.3.224 PG\_STATIO\_SYS\_TABLES

PG\_STATIO\_SYS\_TABLES shows I/O status information about all the system catalogs in the namespaces.

**Table 12-326** PG\_STATIO\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that this table is in.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from this table.
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from all indexes in this table.
idx_blks_hit	bigint	Number of cache hits of all indexes in this table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

### 12.3.225 PG\_STATIO\_USER\_INDEXES

PG\_STATIO\_USER\_INDEXES displays I/O status information about all the user relationship table indexes in the namespaces.

**Table 12-327** PG\_STATIO\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of this index.
schemaname	name	Name of the schema that this index is in.
relname	name	Name of the table for this index.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from this index.
idx_blks_hit	bigint	Number of cache hits in this index.

### 12.3.226 PG\_STATIO\_USER\_SEQUENCES

PG\_STATIO\_USER\_SEQUENCES shows I/O status information about all the user relationship table sequences in the namespaces.

**Table 12-328** PG\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of a sequence.
schemaname	name	Name of the schema that this sequence is in.
relname	name	Name of this sequence.

Name	Type	Description
blks_read	bigint	Number of disk blocks read from this sequence.
blks_hit	bigint	Number of cache hits in this sequence.

### 12.3.227 PG\_STATIO\_USER\_TABLES

PG\_STATIO\_USER\_TABLES displays I/O status information about all the user relationship tables in the namespaces.

**Table 12-329** PG\_STATIO\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that this table is in.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from this table.
heap_blks_hit	bigint	Number of cache hits in this table.
idx_blks_read	bigint	Number of disk blocks read from all indexes in this table.
idx_blks_hit	bigint	Number of cache hits of all indexes in this table.
toast_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table of this table.
toast_blks_hit	bigint	Number of cache hits (if any) in the TOAST table of this table.
tidx_blks_read	bigint	Number of disk blocks (if any) read from the TOAST table indexes of this table.
tidx_blks_hit	bigint	Number of cache hits (if any) in the TOAST table indexes of this table.

### 12.3.228 PG\_THREAD\_WAIT\_STATUS

PG\_THREAD\_WAIT\_STATUS allows you to test the blocking status about the backend thread and auxiliary thread of the current instance.

**Table 12-330** PG\_THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Current session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent session ID.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table 12-331</a> .
wait_event	text	If <b>wait_status</b> is set to <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, and I/O information, respectively. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting to obtain.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.
block_session_id	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_session_id	text	Global session ID.

The waiting states in the **wait\_status** column are as follows:

**Table 12-331** Waiting state list

Value	Description
none	Waiting for no event.
acquire lock	Waiting for locking until the locking succeeds or times out.

Value	Description
acquire lwlock	Waiting for a lightweight lock.
wait io	Waiting for I/O completion.
wait cmd	Waiting for reading network communication packets to complete.
wait pooler get conn	Waiting for pooler to obtain connections.
wait pooler abort conn	Waiting for pooler to terminate connections.
wait pooler clean conn	Waiting for pooler to clear connections.
pooler create conn: [nodename], total N	Waiting for the pooler to set up a connection. The connection is being established with the node specified by <i>nodename</i> , and there are <i>N</i> connections waiting to be set up.
get conn	Obtaining the connection to other nodes.
set cmd: [nodename]	Waiting for running the <b>SET</b> , <b>RESET</b> , <b>TRANSACTION BLOCK LEVEL PARA SET</b> , or <b>SESSION LEVEL PARA SET</b> statement on the connection. The statement is being executed on the node specified by <i>nodename</i> .
cancel query	Canceling the SQL statement that is being executed through the connection.
stop query	Stopping the query that is being executed through the connection.
wait node: [nodename](plevel), total N, [phase]	Waiting for receiving data from a connected node. The thread is waiting for data from the <i>plevel</i> thread of the node specified by <i>nodename</i> . The data of <i>N</i> connections is waiting to be returned. If <i>phase</i> is included, the possible phases are as follows: <ul style="list-style-type: none"> <li>● <b>begin</b>: The transaction is being started.</li> <li>● <b>commit</b>: The transaction is being committed.</li> <li>● <b>rollback</b>: The transaction is being rolled back.</li> </ul>
wait transaction sync: xid	Waiting for synchronizing the transaction specified by <i>xid</i> .
wait wal sync	Waiting for the completion of WAL of synchronization from the specified LSN to the standby instance.

Value	Description
wait data sync	Waiting for the completion of data page synchronization to the standby instance.
wait data sync queue	Waiting for putting the data pages that are in the row-store into the synchronization queue.
flush data: [nodename](plevel), [phase]	Waiting for sending data to the plevel thread of the node specified by <i>nodename</i> . If <i>phase</i> is included, the possible phase is <b>wait quota</b> , indicating that the current communication flow is waiting for the quota value.  A quota indicates the size of data that can be received by the network channel. <b>wait quota</b> indicates that the sender (data producer) waits for the receiver (data consumer) to send the quota information of the current connection.
stream get conn: [nodename], total N	Waiting for connecting to the consumer object of the node specified by <i>nodename</i> when the stream flow is initialized. There are <i>N</i> consumers waiting to be connected.
wait producer ready: [nodename] (plevel), total N	Waiting for each producer to be ready when the stream flow is initialized. The thread is waiting for the procedure of the plevel thread on the <i>nodename</i> node to be ready. There are <i>N</i> producers waiting to be ready.
synchronize quit	Waits for the threads in the stream thread group to exit when the stream plan ends.
nodegroup destroy	Waiting for destroying the stream node group when the stream plan ends.
wait active statement	Waiting for job execution under resource and load control.
gtm connect	Waiting for connecting to GTM.
gtm get gxid	Waiting for obtaining XIDs from GTM.
gtm get snapshot	Waiting for obtaining transaction snapshots from GTM.
gtm begin trans	Waiting for GTM to start a transaction.
gtm commit trans	Waiting for GTM to commit a transaction.
gtm rollback trans	Waiting for GTM to roll back a transaction.

Value	Description
gtm start prepare trans	Waiting for GTM to start the prepare phase of a two-phase transaction.
gtm prepare trans	Waiting for GTM to complete the prepare phase of a two-phase transaction.
gtm open sequence	Waiting for GTM to open a sequence.
gtm close sequence	Waiting for GTM to close a sequence.
gtm create sequence	Waiting for GTM to create a sequence.
gtm alter sequence	Waiting for GTM to modify a sequence.
gtm get sequence val	Waiting for obtaining the next value of a sequence from GTM.
gtm set sequence val	Waiting for GTM to set a sequence value.
gtm drop sequence	Waiting for GTM to delete a sequence.
gtm rename sequence	Waiting for GTM to rename a sequence.
analyze: [relname], [phase]	Executing ANALYZE for the <i>relname</i> table. If <i>phase</i> is included, the possible phase is <b>autovacuum</b> , indicating that the database automatically enables the AutoVacuum thread to execute <b>ANALYZE</b> .
vacuum: [relname], [phase]	Executing VACUUM for the <i>relname</i> table. If <i>phase</i> is included, the possible phase is <b>autovacuum</b> , indicating that the database automatically enables the AutoVacuum thread to execute <b>VACUUM</b> .
vacuum full: [relname]	Executing VACUUM FULL for the <i>relname</i> table.
create index	An index is being created.
HashJoin - [ build hash   write file ]	The <b>HashJoin</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming. <ul style="list-style-type: none"><li>• <b>build hash</b>: The <b>HashJoin</b> operator is creating a hash table.</li><li>• <b>write file</b>: The <b>HashJoin</b> operator is writing data to disks.</li></ul>

Value	Description
HashAgg - [ build hash   write file ]	The <b>HashAgg</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming. <ul style="list-style-type: none"> <li>● <b>build hash</b>: The <b>HashAgg</b> operator is creating a hash table.</li> <li>● <b>write file</b>: The <b>HashAgg</b> operator is writing data to disks.</li> </ul>
HashSetop - [build hash   write file ]	The <b>HashSetop</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming. <ul style="list-style-type: none"> <li>● <b>build hash</b>: The <b>HashSetop</b> operator is creating a hash table.</li> <li>● <b>write file</b>: The <b>HashSetop</b> operator is writing data to disks.</li> </ul>
Sort   Sort - [fetch tuple   write file]	The <b>Sort</b> operator is used for sorting. <b>fetch tuple</b> indicates that the <b>Sort</b> operator is obtaining tuples, and <b>write file</b> indicates that the <b>Sort</b> operator is writing data to disks.
Material   Material - write file	The <b>Material</b> operator is being executed. <b>write file</b> indicates that the <b>Material</b> operator is writing data to disks.
standby read recovery conflict	The read-only mode of the standby node conflicts with the log replay mode.
standby get snapshot	The standby node obtains the snapshot in read-only mode.
prune table	Waiting for a heap table to clear historical deleted data.
prune index	Waiting for an index to clear historical deleted data.
vacuum gpi	Waiting for a GPI to clear historical deleted data.
gtm reset xmin	Waiting for GTM to reset the minimum transaction ID.
gtm get xmin	Waiting for obtaining the minimum transaction ID from GTM.
gtm get csn	Waiting for obtaining the CSN from GTM.
gtm start prepare trans	Waiting for the GTM to start a two-phase transaction.
gtm rename sequence	Waiting for GTM to rename a sequence.

Value	Description
wait reserve td	Waiting for an Ustore transaction slot allocation.
wait td rollback	Waiting for an Ustore transaction slot to roll back transactions.
wait available td	Waiting for an available transaction slot for Ustore.
wait transaction rollback	Waiting for a transaction to roll back.
gtm set disaster cluster	Waiting for setting the DR cluster information on the GTM.
gtm get disaster cluster	Waiting for obtaining the DR cluster information from the GTM.
gtm del disaster cluster	Waiting for deleting the DR cluster information from the GTM.
gtm set consistency point	Waiting for setting the barrier in GTM.
wait sync bgworkers	Waiting for an index worker thread created in parallel to complete local scanning and sorting.
security audit write pipe	Waiting for an audit log to be written to the pipe.
wait unpack stream plan	Waiting for parsing stream plan on the DN.
wait fetch undo record	Waiting for reading the target undo record.
wait heap hot search buffer	Waiting for reading the Astore tuple that meets the snapshot requirements through the hot link.
wait exclusive lwlock	The starvation prevention mechanism is triggered. A new lightweight lock request waits for the previously blocked lightweight lock to be obtained.

If **wait\_status** is **acquire lwlock**, **acquire lock**, or **wait io**, there is an event performing I/O operations or waiting for obtaining the corresponding lightweight lock or transaction lock.

The following table describes the corresponding wait events when **wait\_status** is **acquire lwlock**. If **wait\_event** is **extension**, the lightweight lock is dynamically allocated and is not monitored.

**Table 12-332** List of wait events corresponding to lightweight locks

wait_event	Description
ShmemIndexLock	Used to protect the primary index table, a hash table, in shared memory.
OidGenLock	Used to prevent different threads from generating the same OID.
XidGenLock	Used to prevent two transactions from obtaining the same XID.
ProcArrayLock	Used to prevent concurrent access to or concurrent modification on the ProcArray shared array.
SInvalReadLock	Used to prevent concurrent execution with invalid message deletion.
SInvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion.
WALInsertLock	Used to prevent concurrent execution with WAL insertion.
WALWriteLock	Used to prevent concurrent write from a WAL buffer to a disk.
ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the <b>pg_control</b> file.
CheckpointLock	Used to prevent multi-checkpoint concurrent execution.
CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the subtransaction control data structure.
MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode.
MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on <b>pg_multixact/offset</b> .
MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on <b>pg_multixact/members</b> .
RelCacheInitLock	Used to add a lock before any operations are performed on the <b>init</b> file when messages are invalid.

<b>wait_event</b>	<b>Description</b>
CheckpointCommLock	Used to send file flush requests to a checkpoint. The request structure needs to be inserted to a request queue in serial mode.
TwoPhaseStateLock	Used to prevent concurrent access to or modification on two-phase information sharing arrays.
TablespaceCreateLock	Used to check whether a tablespace already exists.
BtreeVacuumLock	Used to prevent VACUUM from clearing pages that are being used by B-tree indexes.
AlterPortLock	Used to protect the CN's operation of changing the registered port number.
AutovacuumLock	Used to access the autovacuum worker array in serial mode.
AutovacuumScheduleLock	Used to distribute tables requiring VACUUM in serial mode.
AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution.
SyncScanLock	Used to determine the start position of a relfilenode during heap scanning.
NodeTableLock	Used to protect a shared structure that stores CN and DN node information.
PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool.
RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated.
Async Ctl	Used to protect asynchronization buffers.
AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status.
AsyncQueueLock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue.
SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.

<b>wait_event</b>	<b>Description</b>
SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
SerializablePredicateLockList-Lock	Used to protect a linked list of serializable transactions that have locks.
OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts.
FileStatLock	Used to protect a data structure that stores statistics file information.
SyncRepLock	Used to protect Xlog synchronization information during primary/standby replication.
DataSyncRepLock	Used to protect data page synchronization information during primary/standby replication.
MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out.
ExtensionConnectorLibLock	Used to add a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.
SearchServerLibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
LsnXlogChkFileLock	Used to serially update the Xlog flush points for primary and standby nodes recorded in a specific structure.
GTMHostInfoLock	Used to prevent concurrent access to or concurrent modification on GTM host information.
ReplicationSlotAllocation-Lock	Used to add a lock when a primary node allocates streaming replication slots during primary/standby replication.
ReplicationSlotControlLock	Used to prevent concurrent update of streaming replication slot status during primary/standby replication.
ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table.
OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path.

<b>wait_event</b>	<b>Description</b>
JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled job where MPP is compatible with Oracle Database.
OBSRuntimeLock	Used to obtain environment variables, for example, <i>GAUSSHOME</i> .
CriticalCacheBuildLock	Used to load caches from a shared or local cache initialization file.
WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios.
BufMappingLock	Used to protect operations on a shared-buffer mapping table.
LockMgrLock	Used to protect a common lock structure.
PredicateLockMgrLock	Used to protect a lock structure that has serializable transactions.
OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.
OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.
SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
CacheSlotMappingLock	Used to protect global CU cache information.
BarrierLock	Used to ensure that only one thread is creating a barrier at a time.
GPCCommitLock	Used to protect the addition of the global plan cache hash table.
GPCClearLock	Used to protect the clearing of the global plan cache hash table.
GPCTimelineLock	Used to protect the timeline check of the global plan cache hash table.
GPCMappingLock	Used to manage the global plan cache.

<b>wait_event</b>	<b>Description</b>
GPCPrepareMappingLock	Used to manage the global plan cache.
GPRCMappingLock	Used to manage the access and modification operations of the global cache hash table of autonomous transactions.
BufFreelistLock	Used to ensure the atomicity of free list operations in the shared buffer.
AddinShmemInitLock	Used to protect the initialization of the shared memory object.
wait active statement	Waiting for job execution under resource and load control.
wait memory	Waiting for obtaining the memory.
DnUsedSpaceHashLock	Used to update space usage information corresponding to a session.
InstanceRealTLock	Used to protect the update of the hash table that stores shared instance statistics.
IOStatLock	Used to concurrently maintain the hash table of resource management I/O statistics.
PldebugLock	Used to debug stored procedures and perform concurrent maintenance operations.
StartBlockMappingLock	Used by globalstat to obtain information such as startblockarray from pgstat.
GlobalSeqLock	Used to manage global sequence numbers.
MatviewSeqnoLock	Used to manage the cache of materialized views.
DataFileIdCacheLock	Used to manage the concurrent access and storage of hash table that stores data file descriptor in the shared memory.
GTMHostInfoLock	Used to protect the concurrent access and storage of shared GTM host information.
TwoPhaseStatePartLock	Used to protect the status information of two-phase transactions (in each partition).
WALBufMappingLock	Used to protect the mapping between WAL buffer page and LSN offset.
UndoZoneLock	Used to protect the concurrent access and storage of undo zone.
RollbackReqHashLock	Used to protect the concurrent access and storage of hash table that stores the rollback request in the shared memory.

<b>wait_event</b>	<b>Description</b>
UHeapStatLock	Used to protect the concurrent access and storage of Ustore statistics.
WALWritePaxosLock	Used to protect the concurrent sequence of WALs written to the paxos replication component.
SyncPaxosLock	Used to protect the concurrent access and storage of paxos synchronization queue.
BackgroundWorkerLock	Used to protect the concurrent sequence of background workers.
HadrSwitchoverLock	Used to protect the concurrent sequence of DR switchover.
HashUidLock	Used to protect the concurrent sequence of UID allocation.
ParallelDecodeLock	Used to protect the concurrent sequence of parallel decoding.
XLogMaxCSNLock	Used to protect the maximum volume of CSNs that can be restored locally in DR mode.
DisasterCacheLock	Used to protect the concurrent access and storage of DR cache information in the shared memory.
MaxCSNArrayLock	Used to protect the restoration progress of standby node CSNs in each shard in the shared memory.
RepairBadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.
DropArchiveSlotLock	Used to protect the concurrent sequence of deleting the archive slot.
ProcXactMappingLock	Used to protect the concurrent access and storage of the hash table that stores the mapping information between transaction IDs and threads.
UndoPerZoneLock	Used to protect the concurrent access and storage of each information in undo zone.
UndoSpaceLock	Used to protect the concurrent access and storage of undo space.
SnapshotBlockLock	Used to control the concurrent sequence of snapshot-based backup and disk flushing.

<b>wait_event</b>	<b>Description</b>
DWSingleFlushFirstLock	Used to control the concurrent sequence of segment-pages and single-page doublewrite files.
RestartPointQueueLock	Used to control the concurrent access and storage of restart point arrays on the standby node.
UnlinkRelHashTblLock	Used to protect the concurrent access and storage of the hash table that restores files to be deleted.
UnlinkRelForkHashTblLock	Used to protect the concurrent access and storage of the hash table that restores the fork files to be deleted.
WALFlushWait	Used to protect the concurrent sequence of log flushing.
WALConsensusWait	Used to protect the transaction commit or log replay which is performed only when the logs are consistent.
WALBufferInitWait	Used to protect the initialization and disk flushing sequence of WAL pages in the shared memory.
WALInitSegment	Used to protect the initialization sequence of WAL segment files.
PgwrSyncQueueLock	Used to protect the concurrent access and storage of file queues to be flushed to disks.
BarrierHashTblLock	Used to protect the concurrent access and storage of barrier tables in the shared memory.
PageRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired pages.
FileRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired files.
BadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.
BufferIOLock	Used to protect the concurrent I/O for loading or evicting a single page in the shared buffer.
BufferContentLock	Used to protect the concurrent read and write operations on a single page in the shared buffer.

<b>wait_event</b>	<b>Description</b>
CUSlotListLock	Used to protect the concurrent access and storage of the slot linked list in the shared CU.
DataCacheLock	Used to protect the concurrent access and storage of the read-only cache in the shared CU.
MetaCacheLock	Used to protect the concurrent access and storage of the meta cache in the shared CU.
CBMParseXlogLock	Used to control the concurrent access and storage of CBM files.
CLogBufMappingLock	Used to control the concurrent access and storage of mapping in the shared clog page.
CLOG Ctl	Used to control the concurrent access and storage of each clog partition.
CSNBufMappingLock	Used to control the concurrent access and storage of mapping in the shared csnolog page.
CSNLOG Ctl	Used to control the concurrent access and storage of each csnolog partition.
DelayDDLLock	Used to control the concurrent sequence of DDL and delay backup function of the deletion.
DoubleWriteLock	Used to control the concurrent sequence of double write module.
DfsConnectorCacheLock	Used to control the concurrent access and storage of dfs connection cache.
DfsUserLoginLock	Used to control the concurrent sequence of dfs user login.
DfsSpaceCacheLock	Used to control the concurrent sequence of dfs space management cache.
PGPROCLock	Used to protect the concurrent access and storage of global shared thread array.
RelfilenodeReuseLock	Used to control the concurrent sequence of file name reuse.
ReplicationSlotLock	Used to protect the concurrent access and storage of logical replication slot.
LogicalReplicationSlotPersistentDataLock	Used to control the concurrent access and storage of logical replication slot persistence.
RowPageReplicationLock	Used to control the concurrent sequence of row-store page replication.
MultiXactOffset Ctl	Used to protect the concurrent access and storage of multixact offset document.

<b>wait_event</b>	<b>Description</b>
MultiXactMember Ctl	Used to protect the concurrent access and storage of multixact member document.
OldSerXid SLRU Ctl	Used to protect the concurrent access and storage of oldser transaction ID cache.
FullBuildXlogCopyStartPtr-Lock	Used to control the concurrent access and storage of the start point of full build request.
RcvWriteLock	Used to control the concurrent sequence of WAL receiver writer.
XlogRemoveSegLock	Used to control the concurrent access and storage of latest deleted WAL document.
CsnMinLock	Used to control the concurrent access and storage of CSN MIN
HypoIndexLock	Used to create, delete and reset the virtual index by the lightweight lock.
XGBoostLibLock	Used by DB4AI to call the XGBoost library.
InstrUserLockId	Used to protect the concurrent modification of the hash table that stores user login and logout records.
GsStackLock	Used to ensure that the gs_stack function is not concurrently called.
InstrStmtTrackCtlLock	Used to protect the concurrent access and storage of the hash table when full SQL statements are dynamically enabled.
CaptureViewFileHashLock	Used to protect the concurrent access and storage of the hash table when capturing the performance view.
UniqueSqlEvictLock	Used to protect the concurrent access and storage of the hash table when the unique SQL reclamation is enabled.
ASPMappingLock	Used to manage the concurrent access and storage of the ASP hash table.
AuditIndexFileLock	Used to protect concurrent read and write of index files in the audit log.
SQLAdvisorLock	Used to manage the concurrent access and storage of recommended hash tables in distribution key management.
LWTRANCHE_ACCOUNT_TABLE	Used to control the concurrent read and write of the hash table that stores the account locking status.

The following table describes the corresponding wait events when **wait\_status** is **wait io**.

**Table 12-333** List of wait events corresponding to I/Os

<b>wait_event</b>	<b>Description</b>
BufFileRead	Reads data from a temporary file to a specified buffer.
BufFileWrite	Writes the content of a specified buffer to a temporary file.
ControlFileRead	Reads the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileSync	Flushes the <b>pg_control</b> file to a disk, mainly during database initialization.
ControlFileSyncUpdate	Flushes the <b>pg_control</b> file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileWrite	Writes the <b>pg_control</b> file, mainly during database initialization.
ControlFileWriteUpdate	Updates the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
CopyFileRead	Reads a file during file copying.
CopyFileWrite	Writes a file during file copying.
DataFileExtend	Writes a file during file name extension.
DataFileFlush	Flushes a table data file to a disk.
DataFileImmediateSync	Flushes a table data file to a disk immediately.
DataFilePrefetch	Reads a table data file asynchronously.
DataFileRead	Reads a table data file synchronously.
DataFileSync	Flushes table data file modifications to a disk.
DataFileTruncate	Truncates a table data file.
DataFileWrite	Writes a table data file.
LockFileAddToDataDirRead	Reads the <b>postmaster.pid</b> file.
LockFileAddToDataDirSync	Flushes the <b>postmaster.pid</b> file to a disk.

<b>wait_event</b>	<b>Description</b>
LockFileAddToDataDirWrite	Writes PID information into the <b>postmaster.pid</b> file.
LockFileCreateRead	Read the LockFile file <b>%s.lock</b> .
LockFileCreateSync	Flushes the LockFile file <b>%s.lock</b> to a disk.
LockFileCreateWRITE	Writes PID information into the LockFile file <b>%s.lock</b> .
NgroupDestoryLock	Adds a lock to the concurrent modification of the Node Group hash table.
NGroupMappingLock	Adds a lock to the concurrent modification of a single bucket that protects the NodeGroup hash table.
RelationMapRead	Reads the mapping file between system catalogs and storage locations.
RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
ReplicationSlotRead	Reads a streaming replication slot file during a restart.
ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk during a restart.
ReplicationSlotSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.
ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.
SLRUFlushSync	Flushes the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files to a disk, mainly during checkpoint execution and database shutdown.
SLRURead	Reads the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files.
SLRUSync	Writes dirty pages into the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files, and flushes the files to a disk, mainly during checkpoint execution and database shutdown.
SLRUWrite	Writes the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files.
TimelineHistoryRead	Reads the timeline history file during database startup.

<b>wait_event</b>	<b>Description</b>
TimelineHistorySync	Flushes the <b>timelinehistory</b> file to a disk during database startup.
TimelineHistoryWrite	Writes to the timeline history file during database startup.
TwophaseFileRead	Reads the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
TwophaseFileSync	Flushes the <b>pg_twophase</b> file to a disk, mainly during two-phase transaction commit and restoration.
TwophaseFileWrite	Writes the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WALCopyRead	Reads operation generated when an existing WAL file is read for replication after archiving and restoration.
WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WALCopyWrite	Writes operation generated when an existing WAL file is read for replication after archiving and restoration.
WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WALInitWrite	Initializes a newly created WAL file to <b>0</b> during log reclaiming or writing.
WALRead	Reads data from Xlogs during redo operations on two-phase files.
WALSyncMethodAssign	Flushes all open WAL files to a disk.
WALWrite	Writes a WAL file.
DoubleWriteFileRead	Waits for reading the doublewrite file.
DoubleWriteFileSync	Waits for flushing the doublewrite file to the disk.
DoubleWriteFileWrite	Waits for writing the doublewrite file.
PredoProcessPending	Waits for the replay of the remaining records processing in parallel.

<b>wait_event</b>	<b>Description</b>
PredoApply	Waits for the replay of the application in parallel.
DisableConnectFileRead	Waits for reading the lock segment file.
DisableConnectFileSync	Waits for flushing lock segment files to the disk.
DisableConnectFileWrite	Waits for writing the lock segment file
BufHashTableSearch	Used to search the hash table in the shared buffer (page eviction may be triggered).
buffer_strategy_get	Used to obtain pages from strategy buffer (page eviction may be triggered).
UndoFileExtend	Used to extend an undo file.
UndoFilePrefetch	Used to prefetch an undo file.
UndoFileRead	Used to read an undo file.
UndoFileWrite	Used to write an undo file.
UndoFileSync	Flushes an undo file to a disk.
UndoFileUnlink	Deletes an undo file.
UndoMetaSync	Flushes an undo metadata file to a disk.
WALBufferAccess	Accesses WAL buffer. (To ensure performance, only the number of access times is counted in the kernel code, and the access duration is not counted.)
WALBufferFull	Writes WAL files when the WAL buffer is full.
DWSingleFlushGetPos	Searches for an available location for a single-page doublewrite file.
DWSingleFlushWrite	Flushes a single-page doublewrite file to a disk.
MPFL_INIT	Initiates max_page_flush_lsn.
MPFL_READ	Reads max_page_flush_lsn.
MPFL_WRITE	Writes max_page_flush_lsn.
OBSList	Traverses an OBS directory.
OBSRead	Reads an OBS object.
OBSWrite	Writes an OBS object.
LOGCTRL_SLEEP	Waits for the standby node to catch up with logs.
ShareStorageWalRead	Reads log files from the shared disk.

wait_event	Description
ShareStorageWalWrite	Writes log files to the shared disk.
ShareStorageCtlInfoRead	Reads control information from the shared disk.
ShareStorageCtlInfoWrite	Writes control information to the shared disk.

The following table describes the corresponding wait events when **wait\_status** is **acquire lock**.

**Table 12-334** List of wait events corresponding to transaction locks

wait_event	Description
relation	Adds a lock to a table.
extend	Adds a lock to a table being scaled out.
partition	Adds a lock to a partitioned table.
partition_seq	Adds a lock to a partition of a partitioned table.
page	Adds a lock to a table page.
tuple	Adds a lock to a tuple on a page.
transactionid	Adds a lock to a transaction ID.
virtualxid	Adds a lock to a virtual transaction ID.
object	Adds a lock to an object.
userlock	Adds a lock to a user.
advisory	Adds an advisory lock.
filenode	Locks a file name.
subtransactionid	Adds a lock to a sub-transaction ID.
tuple_uid	Used to add a lock to the UID hidden column in the tuple header.

### 12.3.229 PG\_TABLES

PG\_TABLES is used to query useful information about each table in the database.

**Table 12-335** PG\_TABLES columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <a href="#">PG_NAMESPACE</a>	Name of the schema that contains a table.
tablename	name	<b>relname</b> in <a href="#">PG_CLASS</a>	Table name.
tableowner	name	<b>pg_get_userbyid(relowner)</b> in <a href="#">PG_CLASS</a>	Table owner.
tablespace	name	<b>spcname</b> in <a href="#">PG_TABLESPACE</a>	Tablespace that contains the table (default value: <b>NULL</b> ).
hasindexes	Boolean	<b>relhasindex</b> in <a href="#">PG_CLASS</a>	Specifies whether the table has (or recently had) an index. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
hasrules	Boolean	<b>relhasruls</b> in <a href="#">PG_CLASS</a>	Specifies whether the table has rules. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
hastriggers	Boolean	<b>RELHASTRIGGERS</b> in <a href="#">PG_CLASS</a>	Specifies whether the table has triggers. If it does, the value is <b>TRUE</b> . Otherwise, the value is <b>FALSE</b> .
tablecreator	name	<b>pg_get_userbyid(creator)</b> in <a href="#">PG_OBJECT</a>	Table owner.
created	timestamp with time zone	<b>ctime</b> in <a href="#">PG_OBJECT</a>	Time when the table is created.
last_ddl_time	timestamp with time zone	<b>mtime</b> in <a href="#">PG_OBJECT</a>	Time when the last DDL operation is performed on the table.

### 12.3.230 PG\_TDE\_INFO

PG\_TDE\_INFO displays encryption information of the entire cluster.

**Table 12-336** PG\_TDE\_INFO columns

Name	Type	Description
is_encrypt	Boolean	Specifies whether the cluster is an encryption cluster. <ul style="list-style-type: none"> <li>• <b>f</b>: non-encryption cluster.</li> <li>• <b>t</b>: encryption cluster.</li> </ul>
g_tde_algo	text	Encryption algorithm. <ul style="list-style-type: none"> <li>• SM4-CTR-128</li> <li>• AES-CTR-128</li> </ul>
remain	text	Reserved column.

### 12.3.231 PG\_TIMEZONE\_ABBREVS

PG\_TIMEZONE\_ABBREVS displays information about all available time zones.

**Table 12-337** PG\_TIMEZONE\_ABBREVS columns

Name	Type	Description
abbrev	text	Abbreviation of the time zone name.
utc_offset	interval	Offset from UTC.
is_dst	Boolean	Specifies whether the DST is being used. If the DST is being used, the value is <b>TRUE</b> ; otherwise, the value is <b>FALSE</b> .

### 12.3.232 PG\_TIMEZONE\_NAMES

PG\_TIMEZONE\_NAMES displays all time zone names that can be recognized by SET TIMEZONE, along with their abbreviations, UTC offsets, and daylight saving time (DST) statuses.

**Table 12-338** PG\_TIMEZONE\_NAMES columns

Name	Type	Description
name	text	Name of the time zone.
abbrev	text	Abbreviation of the time zone name.
utc_offset	interval	Offset from UTC.

Name	Type	Description
is_dst	Boolean	Specifies whether the DST is being used. If the DST is being used, the value is <b>TRUE</b> ; otherwise, the value is <b>FALSE</b> .

### 12.3.233 PG\_TOTAL\_MEMORY\_DETAIL

**PG\_TOTAL\_MEMORY\_DETAIL** displays memory usage of a node in the database.

**Table 12-339** PG\_TOTAL\_MEMORY\_DETAIL columns

Name	Type	Description
nodename	text	Node name
memorytype	text	Memory name
memorybytes	integer	Size of the used memory, in MB

### 12.3.234 PG\_TOTAL\_USER\_RESOURCE\_INFO

**PG\_TOTAL\_USER\_RESOURCE\_INFO** displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**. I/O monitoring items are valid only when **enable\_logical\_io\_statistics** is set to **on**.

**Table 12-340** PG\_TOTAL\_USER\_RESOURCE\_INFO columns

Name	Type	Description
username	name	Username.
used_memory	integer	Used memory, in MB.
total_memory	integer	Available memory, in MB. The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use. CPU usage data is collected only in complex jobs, and the value is the CPU usage of the related Cgroup.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node.
used_space	bigint	Used permanent table storage space, in KB.

Name	Type	Description
total_space	bigint	Available permanent table storage space, in KB (-1 if the storage space is not limited).
used_temp_space	bigint	Used temporary space, in KB.
total_temp_space	bigint	Total available temporary space, in KB (-1 if the temporary space is not limited).
used_spill_space	bigint	Size of the used operator-level data flushing space, in KB.
total_spill_space	bigint	Total size of the available operator-level data flushing space, in KB (-1 if the space is not limited).
read_kbytes	bigint	CN: total bytes read by the user's complex jobs on all DNs in the last 5 seconds, in KB. DN: total bytes read by the user's complex jobs from the instance startup time to the current time, in KB.
write_kbytes	bigint	CN: total bytes written by the user's complex jobs on all DNs in the last 5 seconds, in KB. DN: total bytes written by the user's complex jobs from the instance startup time to the current time, in KB.
read_counts	bigint	CN: total number of read times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of read times of the user's complex jobs from the instance startup time to the current time
write_counts	bigint	CN: total number of write times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of write times of the user's complex jobs from the instance startup time to the current time
read_speed	double precision	CN: average read rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s. DN: average read rate of the user's complex jobs on the DN in the last 5 seconds, in KB/s.
write_speed	double precision	CN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s. DN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s.

### 12.3.235 PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID

PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**.

**Table 12-341** PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID columns

Name	Type	Description
userid	oid	User ID.
used_memory	integer	Used memory, in MB.
total_memory	integer	Available memory, in MB. The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node.
used_space	bigint	Used storage space, in KB.
total_space	bigint	Available storage space, in KB (-1 if the space is not limited).
used_temp_space	bigint	Used temporary space, in KB.
total_temp_space	bigint	Total available temporary space, in KB (-1 if the temporary space is not limited).
used_spill_space	bigint	Used disk space for spilling, in KB.
total_spill_space	bigint	Total available disk space for spilling, in KB (-1 if the space is not limited).
read_kbytes	bigint	Volume of data read from the disk, in KB.
write_kbytes	bigint	Volume of data written to the disk, in KB.
read_counts	bigint	Number of disk read times.
write_counts	bigint	Number of disk write times.
read_speed	double precision	Disk read rate, in B/ms.
write_speed	double precision	Disk write rate, in B/ms.

## 12.3.236 PG\_USER

PG\_USER displays information about database users. By default, only the initial user and users with the sysadmin attribute can view the information. Other users can view the information only after being granted with permissions.

**Table 12-342** PG\_USER columns

Name	Type	Description
username	name	Username.
usesysid	oid	ID of this user.
usecreatedb	Boolean	Specifies whether a user has the permissions to create databases. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
usesuper	Boolean	Specifies whether the user is the initial system administrator with the highest permissions. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
usecatupd	Boolean	Specifies whether the user can directly update system catalogs. Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. This permission is unavailable for other users. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
userepl	Boolean	Specifies whether the user has the permissions to duplicate data streams. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
passwd	text	Encrypted user password. The value is displayed as <b>*****</b> .
valbegin	timestamp with time zone	Start time for account validity ( <b>NULL</b> if start time is not specified).
valuntil	timestamp with time zone	End time for account validity ( <b>NULL</b> if end time is not specified).
respool	name	Resource pool where the user is in.
parent	oid	Parent user OID.

Name	Type	Description
spacelimit	text	Storage space of the permanent table, in KB.
useconfig	text[]	Default value of runtime configuration items.
tempspacelimit	text	Storage space of the temporary table, in KB.
spillspacelimit	text	Operator disk spill space, in KB.
usemonitoradmin	Boolean	Specifies whether the user is a monitor administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
useoperatoradmin	Boolean	Specifies whether the user is an O&M administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usepolicyadmin	Boolean	Specifies whether the user is a security policy administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

### 12.3.237 PG\_USER\_MAPPINGS

PG\_USER\_MAPPINGS displays user mapping information. All users can view the report.

**Table 12-343** PG\_USER\_MAPPINGS columns

Name	Type	Reference	Description
umid	oid	<a href="#">PG_USER_MAPPING.oid</a>	OID of the user mapping.
srvid	oid	<a href="#">PG_FOREIGN_SERVER.oid</a>	OID of the foreign server that contains the mapping.
srvname	name	<a href="#">PG_FOREIGN_SERVER.srvname</a>	Name of the foreign server.
umuser	oid	<a href="#">PG_AUTHID.oid</a>	OID of the local role being mapped ( <b>0</b> if the user mapping is public)
username	name	-	Name of the local user to be mapped.

Name	Type	Reference	Description
umoptions	text[]	-	User mapping specific options. If the current user is the owner of the foreign server, it is a string in the format of "keyword=value". Otherwise, it is <b>null</b> .

### 12.3.238 PG\_VARIABLE\_INFO

PG\_VARIABLE\_INFO records information about transaction IDs and OIDs of the current node in a cluster.

**Table 12-344** PG\_VARIABLE\_INFO columns

Name	Type	Description
node_name	text	Node name.
next_oid	oid	OID generated next time on the node.
next_xid	xid	Transaction ID generated next time on the node.
oldest_xid	xid	Oldest transaction ID on the node.
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum.
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node.
last_extend_cs n_logpage	xid	Number of the last extended CSNlog page.
start_extend_cs n_logpage	xid	Number of the page from which CSNlog extending starts.
next_commit_s eqno	xid	CSN generated next time on the node.
latest_complet ed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback.
startup_max_xi d	xid	Last transaction ID before the node is powered off.

### 12.3.239 PG\_VIEWS

PG\_VIEWS displays useful information about each view in the database.

**Table 12-345** PG\_VIEWS columns

Name	Type	Reference	Description
schemaname	name	nspname in <a href="#">PG_NAMESPACE</a>	Schema name of a view.
viewname	name	relname in <a href="#">PG_CLASS</a>	View name.
viewowner	name	Erolname in <a href="#">PG_AUTHID</a>	Owner of the view.
definition	text	-	Definition of the view.

### 12.3.240 PGXC\_COMM\_DELAY

**PGXC\_COMM\_DELAY** displays the communication library delay status of all DNs. Only system admin and monitor admin can view the status.

**Table 12-346** PGXC\_COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Peer node name
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond

### 12.3.241 PGXC\_COMM\_RECV\_STREAM

**PGXC\_COMM\_RECV\_STREAM** displays the receiving stream status of the communication libraries for all the DNs.

**Table 12-347** PGXC\_COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name

Name	Type	Description
local_tid	bigint	ID of the thread using this stream
remote_name	text	Peer node name
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream <ul style="list-style-type: none"><li>● <b>UNKNOWN</b>: The logical connection status is unknown.</li><li>● <b>READY</b>: The logical connection is ready.</li><li>● <b>RUN</b>: The logical connection sends packets normally.</li><li>● <b>HOLD</b>: The logical connection is waiting to send packets.</li><li>● <b>CLOSED</b>: The logical connection is closed.</li><li>● <b>TO_CLOSED</b>: The logical connection will be closed.</li></ul>
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received from the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average receiving rate of the stream, in byte/s
quota	bigint	Current communication quota value of the stream, in byte
buff_usize	bigint	Current size of the data cache of the stream, in byte

## 12.3.242 PGXC\_COMM\_SEND\_STREAM

**PGXC\_COMM\_SEND\_STREAM** displays the sending stream status of the communication libraries for all the DNs.

**Table 12-348** PGXC\_COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Peer node name
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Status of the stream The options are as follows: <ul style="list-style-type: none"><li>● <b>UNKNOWN</b>: The connection status is unknown.</li><li>● <b>READY</b>: The connection is ready.</li><li>● <b>RUN</b>: The connection sends packets normally.</li><li>● <b>HOLD</b>: The connection is waiting to send packets.</li><li>● <b>CLOSED</b>: The connection is closed.</li><li>● <b>TO_CLOSED</b>: The connection will be closed.</li></ul>
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream, in byte
time	bigint	Current lifecycle service duration of the stream, in ms
speed	bigint	Average sending rate of the stream, in byte/s

Name	Type	Description
quota	bigint	Current communication quota value of the stream, in byte
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms

### 12.3.243 PGXC\_COMM\_STATUS

**PGXC\_COMM\_STATUS** displays the communication library status for all the DNs.

**Table 12-349** PGXC\_COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name
rxpck_rate	integer	Receiving rate of the communication library on the node, in byte/s
txpck_rate	integer	Sending rate of the communication library on the node, in byte/s
rxkbyte_rate	bigint	Receiving rate of the communication library on the node, in kbyte/s
txkbyte_rate	bigint	Sending rate of the communication library on the node, in kbyte/s
buffer	bigint	Size of the buffer of the Cmailbox
memkbyte_libcomm	bigint	Communication memory size of the <b>libcomm</b> process, in bytes
memkbyte_libpq	bigint	Communication memory size of the <b>libpq</b> process, in bytes
used_pm	integer	Real-time usage of the postmaster thread
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads
stream	integer	Total number of used logical connections.

## 12.3.244 PGXC\_GET\_STAT\_ALL\_TABLES

PGXC\_GET\_STAT\_ALL\_TABLES displays information about INSERTION, UPDATE, and DELETION operations on tables and the dirty page rate of tables. Before running **VACUUM FULL** to a system catalog with a high dirty page rate, ensure that no user is performing operations on it. This view is a new feature of GaussDB, and will not collect statistics on insertion, update, and deletion operations in earlier versions. You are advised to run **VACUUM FULL** to tables (excluding system catalogs) whose dirty page rate exceeds 30% or run it based on service scenarios. Only users with the system admin or monitor admin permission can view the information.

**Table 12-350** PGXC\_GET\_STAT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID
relname	name	Table name.
schemaname	name	Name of the schema that contains a table.
n_tup_ins	numeric	Number of inserted tuples
n_tup_upd	numeric	Number of updated tuples
n_tup_del	numeric	Number of deleted tuples
n_live_tup	numeric	Number of live tuples
n_dead_tup	numeric	Number of dead tuples
dirty_page_rate	numeric(5,2)	Dirty page rate (%) of a table

## 12.3.245 PGXC\_GET\_TABLE\_SKEWNESS

PGXC\_GET\_TABLE\_SKEWNESS displays the data skew on tables in the current database. Only the system administrator has the permission to access.

**Table 12-351** PGXC\_GET\_TABLE\_SKEWNESS columns

Name	Type	Description
schemaname	name	Schema name of a table
tablename	name	Table name.
totalsize	numeric	Total size of the table, in bytes
avgsz	numeric(1000,0)	Average table size (total table size divided by the number of DN), which is the ideal size of tables distributed on each DN

Name	Type	Description
maxratio	numeric(4,3)	Ratio of the maximum table size on a single DN to the total table size
minratio	numeric(4,3)	Ratio of the minimum table size on a single DN to the total table size
skewsize	bigint	Table skew rate (the maximum table size on a single DN minus the minimum table size on a single DN)
skewratio	numeric(4,3)	Table skew rate (skew size divided by total table size)
skewstddev	numeric(1000,0)	Standard deviation of table distribution (For two tables of the same size, a larger deviation indicates a more severe skew.)

### 12.3.246 PGXC\_NODE\_ENV

PGXC\_NODE\_ENV displays environmental variables of all nodes in a cluster. This view can be viewed only by the users with monitor admin and sysadmin permission.

**Table 12-352** PGXC\_NODE\_ENV columns

Name	Type	Description
node_name1	text	Name of a node in a cluster.
host1	text	Host names of the nodes in the cluster.
process1	integer	Process IDs of the nodes in the cluster.
port1	integer	Port numbers of the nodes in the cluster.
installpath1	text	Installation directory of the nodes in the cluster.
datapath1	text	Data directory of the nodes in the cluster.
log_directory1	text	Log directory of the nodes in the cluster.

### 12.3.247 PGXC\_OS\_THREADS

PGXC\_OS\_THREADS displays thread status information under all normal nodes in the current cluster. Only system administrators and monitor administrators can access this view.

**Table 12-353** PGXC\_OS\_THREADS columns

Name	Type	Description
node_name	text	Names of the normal nodes in the cluster.
pid	bigint	IDs of running threads among the normal node processes in the current cluster.
lwpid	integer	ID of the lightweight thread corresponding to <b>pid</b> .
thread_name	text	Name of the thread corresponding to <b>pid</b> .
creation_time	timestamp with time zone	Creation time of the thread corresponding to <b>pid</b> .

### 12.3.248 PGXC\_PREPARED\_XACTS

PGXC\_PREPARED\_XACTS displays two-phase transactions in the prepared phase. Only users with the system admin or monitor admin permission can view the information.

**Table 12-354** PGXC\_PREPARED\_XACTS columns

Name	Type	Description
pgxc_prepared_xact	text	Displays the two-phase transaction in the prepared phase.

### 12.3.249 PGXC\_RUNNING\_XACTS

PGXC\_RUNNING\_XACTS displays information about running transactions on each node in the cluster. The content is the same as that displayed by PG\_RUNNING\_XACTS. Only users with the system admin or monitor admin permission can view the information.

**Table 12-355** PGXC\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.

Name	Type	Description
state	tinyint	Transaction status. <ul style="list-style-type: none"><li>• <b>3</b>: prepared.</li><li>• <b>0</b>: starting.</li></ul>
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is lazy vacuum. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
timeline	bigint	Number of database restarts.
prepare_xid	xid	Transaction ID in the <b>prepared</b> state. If the status is not <b>prepared</b> , the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Minimum CSN of a local active transaction.

## 12.3.250 PGXC\_SQL\_COUNT

**PGXC\_SQL\_COUNT** displays node-level and user-level statistical results for the **SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO** statements in real time, identifies query types with heavy load, and measures the capability of a cluster or node to perform a specific type of query. For example, you can calculate QPS based on the quantities of the five types of SQL statements at certain time points. **USER1 SELECT** is counted as **X1** at T1 and as **X2** at T2. The **SELECT** QPS of the user can be calculated as follows:  $(X2 - X1)/(T2 - T1)$ . In this way, the system can draw cluster-user-level QPS curve graphs and determine cluster throughput, tracing changes in the service load of each user. If there are drastic changes, the system can locate the specific statement type (such as **SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**). You can also observe QPS curves to determine the time points when problems occur and then locate the problems using other tools. The curves provide a basis for optimizing cluster performance and locating problems. This view can be viewed only by the users with monitor admin and sysadmin permission. The query can be performed only on the CN. The **execute direct on (dn)'select \* from PGXC\_SQL\_COUNT'**; statement is not supported.

Columns in the **PGXC\_SQL\_COUNT** view are the same as those in the **GS\_SQL\_COUNT** view. For details, see [Table 12-227](#).

### NOTE

If a **MERGE INTO** statement can be pushed down and a DN receives it, the statement will be counted on the DN and the value of the **mergeinto\_count** column will be incremented by 1. If pushdown is not allowed, the DN will receive an **UPDATE** or **INSERT** statement. In this case, the **update\_count** or **insert\_count** column will be incremented by 1.

## 12.3.251 PGXC\_STAT\_ACTIVITY

PGXC\_STAT\_ACTIVITY displays information about the current user's queries on all CNs in the current cluster. Only SYSADMIN and MONADMIN can query the view.

**Table 12-356** PGXC\_STAT\_ACTIVITY columns

Name	Type	Description
coorname	text	Name of a CN in the current cluster.
datid	oid	OID of the database that the user session connects to in the backend.
datname	text	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
username	text	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is <b>null</b> , either the client is connected via a Unix socket on the server machine or this is an internal process such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current transaction was started ( <b>null</b> if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.

Name	Type	Description
query_start	timestamp with time zone	Time when the currently active query was started, or if <b>state</b> is not <b>active</b> , when the last query was started.
state_change	timestamp with time zone	Time when <b>state</b> was last modified.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is <b>true</b> . Otherwise, the value is <b>false</b> . If a lock is being waited for on a DN, determine the DN based on the <b>wait_status</b> column in the PG_THREAD_WAIT_STATUS view and query the <b>waiting</b> column in PG_STAT_ACTIVITY on the DN to check whether a lock wait occurs.
enqueue	text	Queuing status of a statement. Its value can be: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>

Name	Type	Description
state	text	<p>Overall status of this backend. Its value can be:</p> <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Only system administrators can view the session status of their accounts. The state information of other accounts is empty. For example, after user <b>judy</b> is connected to the database, the state information of user <b>joe</b> and the initial user <b>omm</b> in <code>pgxc_stat_activity</code> is empty.</p> <pre>SELECT datname, username, usesysid, state,pid FROM pgxc_stat_activity;  datname   username   usesysid   state   pid -----+-----+-----+-----+----- +-----+ testdb   omm   10      139968752121616 testdb   omm   10      139968903116560 db_tpcds   judy   16398   active    139968391403280 testdb   omm   10      139968643069712 testdb   omm   10      139968680818448 testdb   joe   16390      139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.

Name	Type	Description
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter <b>connection_info</b> .
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Amount of Xlogs currently used by a transaction, in bytes.

### 12.3.252 PGXC\_STAT\_BAD\_BLOCK

PGXC\_STAT\_BAD\_BLOCK displays statistics about page verification failures after all nodes in a cluster are started. This view can be viewed only by the monitor admin and sysadmin users.

**Table 12-357** PGXC\_STAT\_BAD\_BLOCK columns

Name	Type	Description
nodename	text	Node name
databaseid	integer	Database OID
tablespaceid	integer	Tablespace OID
relfilenode	integer	File object ID
forknum	integer	File type
error_count	integer	Number of verification failures
first_time	timestamp with time zone	Time of the first verification failure
last_time	timestamp with time zone	Time of the latest verification failure

## 12.3.253 PGXC\_THREAD\_WAIT\_STATUS

PGXC\_THREAD\_WAIT\_STATUS displays all the call layer hierarchy relationship between threads of the SQL statements on all the nodes in a cluster, and the waiting status of the block for each thread, so that you can easily locate the causes of process response failures and similar phenomena.

The definitions of PGXC\_THREAD\_WAIT\_STATUS and PG\_THREAD\_WAIT\_STATUS are the same, because the essence of PGXC\_THREAD\_WAIT\_STATUS is the query summary of PG\_THREAD\_WAIT\_STATUS on each node in the cluster.

**Table 12-358** PGXC\_THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent session ID.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Detailed information about the waiting status of the current thread.
wait_event	text	Event that the current thread is waiting for. For details, see <a href="#">Table 12-331</a> .
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

Example:

If you run a statement on coordinator1 and no response is returned after a long period of time, establish another connection to coordinator1 to check the thread status on it.

```

gaussdb=# SELECT * FROM pg_thread_wait_status WHERE query_id > 0;
-[RECORD 1]-----+-----
node_name | cn_5001
db_name | tpcc_row
thread_name | PostgreSQL JDBC Driver
query_id | 72620544050065400

```

### 12.3.254 PGXC\_TOTAL\_MEMORY\_DETAIL

PGXC\_TOTAL\_MEMORY\_DETAIL displays memory usage in the cluster. The query can be performed only on the CN. The **execute direct on (dn)'select \* from PGXC\_TOTAL\_MEMORY\_DETAIL'**; statement is not supported. Only users with the sysadmin and monitor admin permissions can query this view.

**Table 12-359** PGXC\_TOTAL\_MEMORY\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	Memory name. <ul style="list-style-type: none"> <li>• <b>max_process_memory</b>: memory occupied by a GaussDB cluster instance.</li> <li>• <b>process_used_memory</b>: memory occupied by a GaussDB process.</li> <li>• <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>• <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>• <b>dynamic_peak_memory</b>: dynamic memory peak.</li> <li>• <b>dynamic_used_shrctx</b>: maximum dynamic shared memory context.</li> <li>• <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>• <b>max_shared_memory</b>: maximum shared memory.</li> <li>• <b>shared_used_memory</b>: used shared memory.</li> <li>• <b>max_sctpcomm_memory</b>: maximum memory allowed for the communications library.</li> <li>• <b>sctpcomm_used_memory</b>: memory used by the communications library.</li> <li>• <b>sctpcomm_peak_memory</b>: memory peak of the communications library.</li> <li>• <b>other_used_memory</b>: other used memory.</li> </ul>
memorybytes	integer	Size of the used memory (unit: MB).

### 12.3.255 PGXC\_VARIABLE\_INFO

**PGXC\_VARIABLE\_INFO** records information about transaction IDs and OIDs of all nodes in a cluster. This view can be viewed only by the monitor admin and sysadmin users. The query can be performed only on the CN. The **execute direct on (dn)'select \* from PGXC\_VARIABLE\_INFO'**; statement is not supported.

**Table 12-360** PGXC\_VARIABLE\_INFO columns

Name	Type	Description
node_name	text	Node name

Name	Type	Description
next_oid	oid	OID generated next time for the node
next_xid	xid	Transaction ID generated next time for the node
oldest_xid	xid	Oldest transaction ID on the node
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node
last_extend_csn_logpage	xid	Number of the last extended cslog page
start_extend_csn_logpage	xid	Number of the page from which cslog extending starts
next_commit_seqno	xid	CSN generated next time for the node
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback
startup_max_xid	xid	Last transaction ID before the node is powered off

## 12.3.256 PLAN\_TABLE

PLAN\_TABLE displays plan information collected by **EXPLAIN PLAN**. Plan information is in a session-level lifecycle. After a session exits, the data will be deleted. Data is isolated between sessions and between users. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-361** PLAN\_TABLE columns

Name	Type	Description
statement_id	character varying(30)	Query tag specified by a user.
plan_id	bigint	Query ID.
id	integer	ID of each operator in a generated plan.
operation	character varying(30)	Operation description of an operator in a plan.
options	character varying(255)	Operation option.

Name	Type	Description
object_name	name	Object name corresponding to the operation, which is not the object alias used in the query. The object name is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.
remarks	character varying(4000)	Not supported. Its value is <b>NULL</b> .
timestamp	date	Not supported. Its value is <b>NULL</b> .
object_node	character varying(128)	Not supported. Its value is <b>NULL</b> .
object_alias	character varying(261)	Not supported. Its value is <b>NULL</b> .
object_instance	numeric	Not supported. Its value is <b>NULL</b> .
optimizer	character varying(255)	Not supported. Its value is <b>NULL</b> .
search_columns	numeric	Not supported. Its value is <b>NULL</b> .
parent_id	numeric	Not supported. Its value is <b>NULL</b> .
depth	numeric	Not supported. Its value is <b>NULL</b> .
position	numeric	Not supported. Its value is <b>NULL</b> .
bytes	numeric	Not supported. Its value is <b>NULL</b> .
other_tag	character varying(255)	Not supported. Its value is <b>NULL</b> .
partition_start	character varying(255)	Not supported. Its value is <b>NULL</b> .
partition_stop	character varying(255)	Not supported. Its value is <b>NULL</b> .
partition_id	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
other	character varying	Not supported. Its value is <b>NULL</b> .
other_xml	clob	Not supported. Its value is <b>NULL</b> .
distribution	character varying(20)	Not supported. Its value is <b>NULL</b> .
cpu_cost	numeric	Not supported. Its value is <b>NULL</b> .
io_cost	numeric	Not supported. Its value is <b>NULL</b> .
temp_space	numeric	Not supported. Its value is <b>NULL</b> .
access_predicates	character varying(4000)	Not supported. Its value is <b>NULL</b> .
filter_predicates	character varying(4000)	Not supported. Its value is <b>NULL</b> .
time	numeric	Not supported. Its value is <b>NULL</b> .
qblock_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

#### NOTE

- A valid **object\_type** value consists of a relkind type defined in **PG\_CLASS** (**TABLE**, **INDEX**, **SEQUENCE**, **VIEW**, or **TOASTVALUE TOAST**) and the rtekind type used in the plan (**SUBQUERY**, **JOIN**, **FUNCTION**, **VALUES**, **CTE**, or **REMOTE\_QUERY**).
- For RangeTableEntry (RTE), **object\_owner** is the object description used in the plan. Non-user-defined objects do not have **object\_owner**.
- Information in the **statement\_id**, **object\_name**, **object\_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.
- **PLAN\_TABLE** supports only **SELECT** and **DELETE** and does not support other DML operations.

## 12.3.257 PV\_FILE\_STAT

**PV\_FILE\_STAT** records statistics about data file I/O to indicate I/O performance and detect performance problems such as abnormal I/O operations.

**Table 12-362** PV\_FILE\_STAT columns

Name	Type	Description
filenum	oid	File ID
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files

Name	Type	Description
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading, in microseconds
writetim	bigint	Total duration of writing, in microseconds
avgiotim	bigint	Average duration of reading and writing, in microseconds
lstiotim	bigint	Duration of the last file reading, in microseconds
miniotim	bigint	Minimum duration of reading and writing, in microseconds
maxiowtm	bigint	Maximum duration of reading and writing, in microseconds

## 12.3.258 PV\_INSTANCE\_TIME

PV\_INSTANCE\_TIME records time consumption information of the current node. The time consumption information is classified into the following types:

- DB\_TIME: effective time spent by jobs in multi-core scenarios.
- CPU\_TIME: CPU time spent.
- EXECUTION\_TIME: time spent within executors.
- PARSE\_TIME: time spent on parsing SQL statements.
- PLAN\_TIME: time spent on generating plans.
- REWRITE\_TIME: time spent on rewriting SQL statements.
- PL\_EXECUTION\_TIME: execution time of the PL/SQL stored procedure
- PL\_COMPILATION\_TIME: compilation time of the PL/SQL stored procedure
- NET\_SEND\_TIME: time spent on the network.
- DATA\_IO\_TIME: I/O time spent.

**Table 12-363** PV\_INSTANCE\_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID.
stat_name	text	Type name.

Name	Type	Description
value	bigint	Time value, in $\mu$ s.

### 12.3.259 PV\_OS\_RUN\_INFO

PV\_OS\_RUN\_INFO displays the running status of the OS.

Table 12-364 PV\_OS\_RUN\_INFO columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

### 12.3.260 PV\_REDO\_STAT

PV\_REDO\_STAT displays the log replay of session threads.

Table 12-365 PV\_REDO\_STAT columns

Name	Type	Description
phywrts	bigint	Number of times that data is written during log replay.
phyblkwrt	bigint	Number of data blocks written during log replay.
writetim	bigint	Total time required for writing data during log replay.
avgiotim	bigint	Average time required for writing data during log replay.
lstiotim	bigint	Time consumed by the last data write operation during log replay.
miniotim	bigint	Minimum time consumed by a single data write operation during log replay.
maxiowtm	bigint	Maximum time consumed by a single data write operation during log replay.

## 12.3.261 PV\_SESSION\_MEMORY

PV\_SESSION\_MEMORY collects statistics about memory usage at the session level, including all the memory allocated to gaussdb and Stream threads on DNs for jobs currently executed by users.

**Table 12-366** PV\_SESSION\_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed jobs before they enter the executor, in MB.
used_mem	integer	Memory allocated to the currently executed jobs, in MB.
peak_mem	integer	Peak memory allocated to the currently executed jobs, in MB.

## 12.3.262 PV\_SESSION\_MEMORY\_CONTEXT

PV\_SESSION\_MEMORY\_CONTEXT displays the memory usage of all sessions based on the MemoryContext node. This view is valid only when **enable\_thread\_pool** is set to **on**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

**Table 12-367** PV\_SESSION\_MEMORY\_CONTEXT columns

Name	Type	Description
sessid	text	Session start time+session ID (string: <i>timestamp.sessionid</i> ).
threadid	bigint	ID of the thread bound to a session (-1 if no thread is bound).
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.

Name	Type	Description
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

---

**⚠ CAUTION**

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

---

### 12.3.263 PV\_SESSION\_MEMORY\_DETAIL

PV\_SESSION\_MEMORY\_DETAIL displays the memory usage of sessions based on the MemoryContext node. When **enable\_thread\_pool** is set to **on**, this view contains memory usage of all threads and sessions.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

You can run the **SELECT \* FROM pv\_session\_memctx\_detail (threadid,');** statement to record information about all memory contexts of a thread into the *threadid\_timestamp.log* file in the *\$GAUSSLOG/pg\_log/\${node\_name}/dumppmem* directory. *threadid* can be obtained from **sessid** in the following table.

**Table 12-368** PV\_SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
sessid	text	<ol style="list-style-type: none"> <li>1. When the thread pool is disabled (<b>enable_thread_pool</b> is set to <b>off</b>), this column indicates the thread start time +session ID (string: <i>timestamp.sessionid</i>).</li> <li>2. When the thread pool is enabled (<b>enable_thread_pool</b> is set to <b>on</b>): If the memory context is at the thread level, this column indicates the thread start time + thread ID (string: <i>timestamp.threadid</i>). If the memory context is at the session level, the column indicates the thread start time +session ID (string: <i>timestamp.sessionid</i>).</li> </ol>
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

 CAUTION

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

### 12.3.264 PV\_SESSION\_STAT

PV\_SESSION\_STAT collects statistics about session states based on session threads or the AutoVacuum thread.

**Table 12-369** PV\_SESSION\_STAT columns

Name	Type	Description
sessid	text	Thread ID and start time.

Name	Type	Description
statid	integer	Statistics ID.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Value of the statistics session.

### 12.3.265 PV\_SESSION\_TIME

PV\_SESSION\_TIME displays the running time of session threads and time consumed in each execution phase.

**Table 12-370** PV\_SESSION\_TIME columns

Name	Type	Description
sessid	text	Thread ID and start time.
stat_id	integer	Statistics ID.
stat_name	text	Name of the session type. <ul style="list-style-type: none"> <li>DB_TIME: effective time spent by jobs in multi-core scenarios.</li> <li>CPU_TIME: CPU time spent.</li> <li>EXECUTION_TIME: time spent within executors.</li> <li>PARSE_TIME: time spent on parsing SQL statements.</li> <li>PLAN_TIME: time spent on generating plans.</li> <li>REWRITE_TIME: time spent on rewriting SQL statements.</li> <li>PL_EXECUTION_TIME: execution time of the PL/pgSQL stored procedure.</li> <li>PL_COMPILATION_TIME: compilation time of the PL/pgSQL stored procedure.</li> <li>NET_SEND_TIME: time spent on the network.</li> <li>DATA_IO_TIME: I/O time spent.</li> </ul>
value	bigint	Session value.

### 12.3.266 PV\_THREAD\_MEMORY\_CONTEXT

PV\_THREAD\_MEMORY\_CONTEXT displays the memory usage of all threads based on the MemoryContext node. This view is equivalent to the PV\_SESSION\_MEMORY\_DETAIL view when **enable\_thread\_pool** is set to **off**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

**Table 12-371** PV\_THREAD\_MEMORY\_CONTEXT columns

Name	Type	Description
threadid	text	Thread start time and ID (string: <i>timestamp.sessionid</i> ).
tid	bigint	Thread ID.
thrdtype	text	Thread type. It can be any thread type in the system, such as wlmmonitor.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

## 12.3.267 PV\_TOTAL\_MEMORY\_DETAIL

PV\_TOTAL\_MEMORY\_DETAIL displays statistics about memory usage of the current database node in the unit of MB.

**Table 12-372** PV\_TOTAL\_MEMORY\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	Memory type. The value must be one of the following: <ul style="list-style-type: none"> <li>● <b>max_process_memory</b>: memory occupied by a GaussDB cluster instance.</li> <li>● <b>process_used_memory</b>: memory occupied by a GaussDB process.</li> <li>● <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>● <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>● <b>dynamic_peak_memory</b>: dynamic memory peak.</li> <li>● <b>dynamic_used_shrctx</b>: maximum dynamic shared memory context.</li> <li>● <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>● <b>max_backend_memory</b>: maximum memory that can be used when the HA port is used to execute services.</li> <li>● <b>backend_used_memory</b>: memory that has been used when the HA port is used to execute services.</li> <li>● <b>max_shared_memory</b>: maximum shared memory.</li> <li>● <b>shared_used_memory</b>: used shared memory.</li> <li>● <b>max_sctpcomm_memory</b>: maximum memory allowed for the communications library.</li> <li>● <b>sctpcomm_used_memory</b>: memory used by the communications library.</li> <li>● <b>sctpcomm_peak_memory</b>: memory peak of the communications library.</li> <li>● <b>other_used_memory</b>: other used memory.</li> </ul>
memorybytes	integer	Size of allocated memory-typed memory.

### 12.3.268 ROLE\_ROLE\_PRIVS

ROLE\_ROLE\_PRIVS displays roles granted to other roles and provides only information about the roles that the user has access to. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-373** ROLE\_ROLE\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.269 ROLE\_SYS\_PRIVS

ROLE\_SYS\_PRIVS displays information about system privileges granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-374** ROLE\_SYS\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
privilege	character varying(40)	System permission granted to a role.  System permissions include rolsuper, rolinherit, rolcreatorole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.270 ROLE\_TAB\_PRIVS

ROLE\_TAB\_PRIVS displays information about object permissions granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-375** ROLE\_TAB\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Name of an object. Object types include tables, packages, indexes, and sequences.
column_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the <b>GRANT</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.271 SYS\_DUMMY

SYS\_DUMMY is automatically created by the database based on the data dictionary. It has only one text column in only one row for storing expression calculation results. This view is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-376** SYS\_DUMMY columns

Name	Type	Description
dummy	text	Expression calculation result

## 12.3.272 V\_INSTANCE

V\_INSTANCE displays instance information in current database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-377** V\_INSTANCE columns

Name	Type	Description
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Host name.
version	character varying(17)	Not supported. Its value is <b>NULL</b> .
version_legacy	character varying(17)	Not supported. Its value is <b>NULL</b> .
version_full	character varying(17)	Not supported. Its value is <b>NULL</b> .
startup_time	date	Not supported. Its value is <b>NULL</b> .
status	character varying(12)	Not supported. Its value is <b>NULL</b> .
parallel	character varying(3)	Not supported. Its value is <b>NULL</b> .
thread#	numeric	Not supported. Its value is <b>NULL</b> .
archiver	character varying(7)	Not supported. Its value is <b>NULL</b> .
log_switch_wait	character varying(15)	Not supported. Its value is <b>NULL</b> .
logins	character varying(10)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
shutdown_pending	character varying(3)	Not supported. Its value is <b>NULL</b> .
database_status	character varying(17)	Not supported. Its value is <b>NULL</b> .
instance_role	character varying(18)	Not supported. Its value is <b>NULL</b> .
active_state	character varying(9)	Not supported. Its value is <b>NULL</b> .
blocked	character varying(3)	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .
instance_mode	character varying(11)	Not supported. Its value is <b>NULL</b> .
edition	character varying(7)	Not supported. Its value is <b>NULL</b> .
family	character varying(80)	Not supported. Its value is <b>NULL</b> .
database_type	character varying(15)	Not supported. Its value is <b>NULL</b> .

## 12.3.273 V\_MYSTAT

V\_MYSTAT displays statistics about all sessions in the database. Only the system administrator can access this view. Common users can access this view only after being authorized. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-378** V\_MYSTAT columns

Name	Type	Description
sid	numeric	Current session ID.
statistic#	numeric	Not supported. Its value is <b>NULL</b> .
value	numeric	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.274 V\_SESSION

V\_SESSION displays information about all current sessions. Only administrators can access this view. Common users can access this view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

Table 12-379 V\_SESSION columns

Name	Type	Description
saddr	raw	Not supported. Its value is <b>NULL</b> .
sid	bigint	Session ID.
serial#	integer	Sequence number of the active backend thread, which is <b>0</b> in GaussDB.
audsid	numeric	Not supported. Its value is <b>NULL</b> .
paddr	raw	Not supported. Its value is <b>NULL</b> .
schema#	numeric	Not supported. Its value is <b>NULL</b> .
schemaname	name	Name of the user logged in to the backend.
user#	oid	OID of the user logged in to the backend thread. Its value is <b>0</b> if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend thread. <b>username</b> is null if the backend thread is a global auxiliary thread.
command	numeric	Not supported. Its value is <b>NULL</b> .
ownerid	numeric	Not supported. Its value is <b>NULL</b> .
taddr	character varying(16)	Not supported. Its value is <b>NULL</b> .
lockwait	character varying(16)	Not supported. Its value is <b>NULL</b> .
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
sql_id	bigint	ID of a query.
client_info	text	Client information.
event	text	Queuing status of a statement. Its value can be: <ul style="list-style-type: none"><li>• <b>waiting in queue</b>: The statement is in the queue.</li><li>• <b>Empty</b>: The statement is running.</li></ul>

Name	Type	Description
sql_exec_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> .
program	text	Name of the application connected to the backend.
status	text	Overall status of this backend. Its value can be: <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle</b>: The backend is waiting for a new client command.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>
server	character varying(9)	Not supported. Its value is <b>NULL</b> .
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session.
process	character varying(24)	Process ID of the current session.
logon_time	date	Login time of the current session.
last_call_et	integer	Duration when the status of the current session changes last time.
osuser	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(30)	Not supported. Its value is <b>NULL</b> .
type	character varying(10)	Not supported. Its value is <b>NULL</b> .
sql_address	raw	Not supported. Its value is <b>NULL</b> .
sql_hash_value	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sql_child_number	numeric	Not supported. Its value is <b>NULL</b> .
sql_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_addr	raw	Not supported. Its value is <b>NULL</b> .
prev_hash_value	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_id	character varying(13)	Not supported. Its value is <b>NULL</b> .
prev_child_number	numeric	Not supported. Its value is <b>NULL</b> .
prev_exec_start	date	Not supported. Its value is <b>NULL</b> .
prev_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_object_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_object_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
module	character varying(64)	Not supported. Its value is <b>NULL</b> .
module_hash	numeric	Not supported. Its value is <b>NULL</b> .
action	character varying(64)	Not supported. Its value is <b>NULL</b> .
action_hash	numeric	Not supported. Its value is <b>NULL</b> .
fixed_table_sequence	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_obj#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_file#	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
row_wait_block#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_row#	numeric	Not supported. Its value is <b>NULL</b> .
top_level_call#	numeric	Not supported. Its value is <b>NULL</b> .
pdml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
failover_type	character varying(13)	Not supported. Its value is <b>NULL</b> .
failover_method	character varying(10)	Not supported. Its value is <b>NULL</b> .
failed_over	character varying(3)	Not supported. Its value is <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Its value is <b>NULL</b> .
pddl_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
pq_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
current_queue_duration	numeric	Not supported. Its value is <b>NULL</b> .
client_identifier	character varying(64)	Not supported. Its value is <b>NULL</b> .
blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
final_blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
seq#	numeric	Not supported. Its value is <b>NULL</b> .
event#	numeric	Not supported. Its value is <b>NULL</b> .
p1text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p1	numeric	Not supported. Its value is <b>NULL</b> .
p1raw	raw	Not supported. Its value is <b>NULL</b> .
p2text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p2	numeric	Not supported. Its value is <b>NULL</b> .
p2raw	raw	Not supported. Its value is <b>NULL</b> .
p3text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p3	numeric	Not supported. Its value is <b>NULL</b> .
p3raw	raw	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .
wait_class	character varying(64)	Not supported. Its value is <b>NULL</b> .
wait_time	numeric	Not supported. Its value is <b>NULL</b> .
seconds_in_wait	numeric	Not supported. Its value is <b>NULL</b> .
state	character varying(19)	Not supported. Its value is <b>NULL</b> .
wait_time_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_remaining_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_since_last_wait_micro	numeric	Not supported. Its value is <b>NULL</b> .
service_name	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_trace	character varying(8)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sql_trace_waits	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_binids	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_plan_stats	character varying(10)	Not supported. Its value is <b>NULL</b> .
session_edition_id	numeric	Not supported. Its value is <b>NULL</b> .
creator_addr	raw	Not supported. Its value is <b>NULL</b> .
creator_serial#	numeric	Not supported. Its value is <b>NULL</b> .
ecid	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_translation_profile_id	numeric	Not supported. Its value is <b>NULL</b> .
pga_tunable_mem	numeric	Not supported. Its value is <b>NULL</b> .
shard_ddl_statuses	character varying(8)	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .
external_name	character varying(1024)	Not supported. Its value is <b>NULL</b> .
plsql_debugger_connected	character varying(5)	Not supported. Its value is <b>NULL</b> .

### 12.3.275 V\$NLS\_PARAMETERS

V\$NLS\_PARAMETERS displays the National Language Support (NLS) parameters and parameter values configured for the database. This view exists in both the PG\_CATALOG and SYS schema and all users can access this view.

**Table 12-380** V\$NLS\_PARAMETERS columns

Name	Type	Description
parameter	character varying(64)	NLS parameter name.

Name	Type	Description
value	character varying(64)	NLS parameter value.
con_id	numeric	Not supported. Its value is <b>0</b> .

## 12.3.276 V\$SESSION\_WAIT

V\$SESSION\_WAIT displays the current wait event or the last wait event of each session of each user. By default, only system administrators can access this view. Common users can access the view only after being authorized. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-381** V\$SESSION\_WAIT columns

Name	Type	Description
sid	numeric	Session ID, which is mapped to the <b>V\$SESSION.SID</b> column.
seq#	numeric	Not supported. Its value is <b>NULL</b> .
event	character varying(64 )	If the session is waiting, the resource or event that is waiting for is displayed. If the session is not waiting, the resource or event that is waiting for the last time is displayed.
p1text	character varying(64 )	Not supported. Its value is <b>NULL</b> .
p1	numeric	Not supported. Its value is <b>NULL</b> .
p1raw	raw	Not supported. Its value is <b>NULL</b> .
p2text	character varying(64 )	Not supported. Its value is <b>NULL</b> .
p2	numeric	Not supported. Its value is <b>NULL</b> .
p2raw	raw	Not supported. Its value is <b>NULL</b> .
p3text	character varying(64 )	Not supported. Its value is <b>NULL</b> .
p3	numeric	Not supported. Its value is <b>NULL</b> .
p3raw	raw	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
wait_class	character varying(64)	Name of a wait event type
wait_time	numeric	<p>If the session is waiting, the value is <b>0</b>. If the session is not waiting, the options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>&gt;0</b>: duration of the last wait (unit: centisecond).</li> <li>• <b>-1</b>: The duration of the last wait is less than a centisecond.</li> <li>• <b>-2</b>: The <b>TIMED_STATISTICS</b> parameter is set to <b>false</b>.</li> </ul> <p>This column has been deprecated and replaced by <b>WAIT_TIME_MICRO</b> and <b>STATE</b>.</p>
second_in_wait	numeric	<p>If the session is waiting, the value is the amount of time to wait. If the session is not waiting, the value is the amount of time since the last wait started.</p> <p>This column has been deprecated and replaced by the <b>WAIT_TIME_MICRO</b> and <b>TIME_SINCE_LAST_WAIT_MICRO</b> columns.</p>
state	character varying(64)	<p>Waiting state. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>WAITING</b>: The session is waiting.</li> <li>• <b>WAITED UNKNOWN TIME</b>: The duration of the last wait is unknown. This value is used when <b>TIMED_STATISTICS</b> is set to <b>false</b>.</li> <li>• <b>WAITED SHORT TIME</b>: The duration of the last wait is less than a centisecond.</li> <li>• <b>WAITED KNOWN TIME</b>: duration of the last wait specified in the <b>WAIT_TIME</b> column.</li> </ul>
wait_time_micro	numeric	Wait time, in microseconds. If the session is waiting, the value is the time spent in the current wait. If the session is not waiting, the value is the time spent for the last wait.
time_remaining_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_since_last_wait_micro	numeric	Time elapsed since the last wait ended, in microseconds. If the session is waiting, the value is <b>0</b> .
con_id	numeric	Not supported. Its value is <b>0</b> .

## 12.3.277 V\$SYSSTAT

V\$SYSSTAT displays the resource usage of the entire database instance since the database instance is started. By default, only the initial user or monitor administrator can access the database. Other users can access the database only after being granted the MONADMIN permission. This view exists in both PG\_CATALOG and SYS schema. Contact an administrator to enable the memory resource management function in the Arm environment.

**Table 12-382** V\$SYSSTAT columns

Name	Type	Description
statistic#	numeric	Statistics ID.
name	character varying(64)	Statistical item name.
class	numeric	Not supported. Its value is <b>NULL</b> .
value	numeric	Statistical item value.
stat_id	numeric	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>0</b> .

## 12.3.278 V\$SYSTEM\_EVENT

V\$SYSTEM\_EVENT displays information about all the wait events (summary of each wait event since the instance is started). By default, only system administrators can access this view. Common users can access the view only after being authorized. This view exists in both the PG\_CATALOG and SYS schemas.

**Table 12-383** V\$SYSTEM\_EVENT columns

Name	Type	Description
event	character varying(64)	Wait event name
total_waits	numeric	Total number of wait events
total_timeouts	numeric	Total number of timeout events
time_waited	numeric	Total time (in centiseconds) of wait events
average_wait	numeric	Average time (in centiseconds) of wait events
time_waited_micro	numeric	Total time (in microseconds) of wait events

Name	Type	Description
total_waits_fg	numeric	Not supported. Its value is <b>NULL</b> .
total_timeouts_fg	numeric	Not supported. Its value is <b>NULL</b> .
time_waited_fg	numeric	Not supported. Its value is <b>NULL</b> .
average_wait_fg	numeric	Not supported. Its value is <b>NULL</b> .
time_waited_micro_fg	numeric	Not supported. Its value is <b>NULL</b> .
event_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .
wait_class	character varying(64)	Class name of a wait event
con_id	numeric	Not supported. Its value is <b>0</b> .

### 12.3.279 V\$VERSION

V\$VERSION displays the version number of the database. This view exists in the PG\_CATALOG and SYS schemas and all users can access this view.

**Table 12-384** V\$VERSION columns

Name	Type	Description
banner	character varying(80)	Component name and version number.
banner_full	character varying(160)	Database version and specific version number.
banner_legacy	character varying(80)	Database version.
con_id	numeric	Not supported. Its value is <b>0</b> .

# 13 Schemas

The following table describes the schemas supported in GaussDB.

 **NOTE**

Do not create service data of users in a schema that provides functional APIs, including but not limited to tables and functions (such as `dbe_*` and `pkg_*`).

**Table 13-1** Schemas supported in GaussDB

Schema	Description
dbe_perf	Diagnoses performance issues and is also the data source of WDR snapshots. After a database is installed, only the initial user and monitor administrator have permission to view views and functions in this schema by default.
snapshot	Manages data related to WDR snapshots. By default, the initial user or monitor administrator can access the data.
sqladvsior	Recommends distribution keys. For details, see <a href="#">Distribution Key Recommendation Functions</a> .
sys	Provides the system information view APIs.
pg_catalog	Maintains system catalog information, including system catalogs and all built-in data types, functions, and operators.
pg_toast	Stores large objects (for internal use).
public	Public schema, which is used to store public objects. If <b>search_path</b> is not specified and a schema with the same name exists, new tables (and other objects) are created in the schema by default. If no schema with the same name exists, new tables (and other objects) are automatically placed in this public schema.
dbe_raw	Advanced function package <code>dbe_raw</code> , which is used to convert raw data, obtain substrings, and calculate the length.

Schema	Description
dbe_session	Advanced function package dbe_session, which is used to set the value of a specified attribute and support user query and verification.
dbe_lob	Advanced function package dbe_lob, which is used to read, write, and copy large files (CLOB/BLOB).
dbe_match	Advanced function package dbe_match, which is used to compare character string similarity.
dbe_task	Advanced function package dbe_task, which is used to schedule job tasks, including committing tasks, canceling tasks, synchronizing task status, and updating task information, so that the database can periodically execute specific tasks.
dbe_sql	Advanced function package dbe_sql, which is used to execute dynamic SQL statements and construct query and other commands during application running.
dbe_file	Advanced function package dbe_file, which is used to read, copy, write, delete, and rename external database files.
dbe_output	Advanced function package dbe_output, which is used to print output information.
dbe_random	Advanced function package dbe_random, which is used to generate random seeds and random numbers.
dbe_application_info	Advanced function package dbe_application_info, which is used for recording client information.
dbe_utility	Advanced function package dbe_utility, which is used to call the debugging tool in a stored procedure, for example, to print error stacks.
dbe_scheduler	Advanced function package dbe_scheduler, which is used to create scheduled jobs and enable the database to periodically execute specified tasks through programs and schedules. You can also perform external database tasks by authorizing and providing certificates.
information_schema	Stores information about objects defined in the current database.
dbe_sql_util	SQL O&M function, including the O&M API of SQL patches.

**Table 13-2** Schemas disabled in GaussDB

Schema	Description
dbe_pldebugger	Debugs PL/SQL functions and stored procedures. Currently, this view is not supported. An error message "unsupported" is displayed when the API is called in this view.
db4ai	Manages data of different versions in AI training.
dbe_pldeveloper	Compiles and debugs user stored procedures.

## 13.1 Information Schema

An information schema named INFORMATION\_SCHEMA automatically exists in all databases. An information schema consists of a group of views that contain information about objects defined in the current database. The owner of this schema is the initial database user. However, all users have only the permission to use this schema and do not have the permission to create objects such as tables and functions.

Information schemas are compatible with PG, including constraint\_table\_usage, domain\_constraints, domain\_udt\_usage, domains, enabled\_roles, key\_column\_usage, parameters, referential\_constraints, applicable\_roles, administrable\_role\_authorizations, attributes, character\_sets, check\_constraint\_routine\_usage, check\_constraints, collations, collation\_character\_set\_applicability, column\_domain\_usage, column\_privileges, column\_udt\_usage, columns, constraint\_column\_usage, role\_column\_grants, routine\_privileges, role\_routine\_grants, routines, schemata, sequences, table\_constraints, table\_privileges, role\_table\_grants, tables, triggered\_update\_columns, triggers, udt\_privileges, role\_udt\_grants, usage\_privileges, role\_usage\_grants, user\_defined\_types, view\_column\_usage, view\_routine\_usage, view\_table\_usage, views, data\_type\_privileges, element\_types, column\_options, foreign\_data\_wrapper\_options, foreign\_data\_wrappers, foreign\_server\_options, foreign\_servers, foreign\_table\_options, foreign\_tables, user\_mapping\_options, user\_mappings, sql\_features, sql\_implementation\_info, sql\_languages, sql\_packages, sql\_parts, sql\_sizing, and sql\_sizing\_profiles.

The following sections display only the views that are not listed in the preceding description.

### 13.1.1 \_PG\_FOREIGN\_DATA\_WRAPPERS

**\_PG\_FOREIGN\_DATA\_WRAPPERS** displays information about a foreign-data wrapper. Only the sysadmin user has the permission to view this view.

**Table 13-3** \_PG\_FOREIGN\_DATA\_WRAPPERS columns

Name	Type	Description
------	------	-------------

oid	oid	OID of the foreign-data wrapper
fdwowner	oid	OID of the owner of the foreign-data wrapper
fdwoptions	text[]	Foreign-data wrapper specific option, expressed in a string in the format of <i>keyword=value</i>
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database)
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign-data wrapper
foreign_data_wrapper_language	information_schema.character_data	Programming language of the foreign-data wrapper

## 13.1.2 \_PG\_FOREIGN\_SERVERS

**\_PG\_FOREIGN\_SERVERS** displays information about a foreign server. Only the sysadmin user has the permission to view this view.

**Table 13-4** \_PG\_FOREIGN\_SERVERS columns

Name	Type	Description
oid	oid	OID of the foreign server
srvoptions	text[]	Foreign server specific options, expressed in a string in the format of <i>keyword=value</i>
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database)

foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper
foreign_server_type	information_schema.character_data	Type of the foreign server
foreign_server_version	information_schema.character_data	Version of the foreign server
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign server

### 13.1.3 \_PG\_FOREIGN\_TABLE\_COLUMNS

**\_PG\_FOREIGN\_TABLE\_COLUMNS** displays column information about a foreign table. Only the sysadmin user has the permission to view this view.

**Table 13-5** \_PG\_FOREIGN\_TABLE\_COLUMNS columns

Name	Type	Description
nspname	name	Schema name
relname	name	Table name
attname	name	Column name
attdwoptions	text[]	Attribute-level foreign data wrapper options, expressed in a string in the format of <i>keyword=value</i>

### 13.1.4 \_PG\_FOREIGN\_TABLES

**\_PG\_FOREIGN\_TABLES** stores information about all foreign tables defined in the current database, whereas displays information about foreign tables accessible to the current user. Only the sysadmin user has the permission to view this view.

**Table 13-6** \_PG\_FOREIGN\_TABLES columns

Name	Type	Description
foreign_table_catalog	information_schema.sql_identifier	Name of the database where the foreign table is located (always the current database)
foreign_table_schema	name	Name of the schema that the foreign table is in
foreign_table_name	name	Name of the foreign table

ftoptions	text[]	Foreign table options
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database)
foreign_server_name	information_schema.sql_identifier	Name of the foreign server
authorization_identifier	information_schema.sql_identifier	Role of the owner

### 13.1.5 \_PG\_USER\_MAPPINGS

Stores mappings from local users to remote users. Only the sysadmin user has the permission to view this view.

**Table 13-7** \_PG\_USER\_MAPPINGS columns

Name	Type	Description
oid	oid	OID of the mapping from the local user to a remote user.
umoptions	text[]	User mapping specific options, expressed in a string in the format of <i>keyword=value</i> .
umuser	oid	OID of the local user being mapped ( <b>0</b> if the user mapping is public).
authorization_identifier	information_schema.sql_identifier	Role of the local user.
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
srvowner	information_schema.sql_identifier	Owner of the foreign server.

### 13.1.6 INFORMATION\_SCHEMA\_CATALOG\_NAME

Displays the name of the current database.

**Table 13-8** INFORMATION\_SCHEMA\_CATALOG\_NAME columns

Name	Type	Description
catalog_name	information_schema.sql_identifier	Current database name.

## 13.2 DBE\_PERF Schema

In the **DBE\_PERF** schema, views are used to diagnose performance issues and are also the data source of WDR snapshots. After a database is installed, only the initial user and monitoring administrator have permission to view views and functions in the **DBE\_PERF** scheme by default. To ensure forward compatibility, the permission on the dbe\_perf schema has no change before and after an upgrade. In the current version, all users are not allowed to create operators in this schema. Existing operators are not affected. Organization views are divided based on multiple dimensions, such as OS, instance, and memory. These views comply with the following naming rules:

- A view starting with **GLOBAL\_** requests data from a CN/DN and returns the data without processing the data.
- A view starting with **SUMMARY\_** summarizes data in a cluster. In most cases, data from a CN/DN (sometimes only a CN) is processed, aggregated, and returned.
- A view that does not start with **GLOBAL\_** or **SUMMARY\_** is a local view and does not request data from any other CN/DN.

### 13.2.1 OS

#### 13.2.1.1 OS\_RUNTIME

**OS\_RUNTIME** displays the running status of the current OS.

**Table 13-9** OS\_RUNTIME columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

### 13.2.1.2 GLOBAL\_OS\_RUNTIME

**GLOBAL\_OS\_RUNTIME** records the OS running status information on all normal nodes in the cluster.

**Table 13-10** GLOBAL\_OS\_RUNTIME columns

Name	Type	Description
node_name	name	Node name
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

### 13.2.1.3 OS\_THREADS

**OS\_THREADS** provides status information about all threads on the current node.

**Table 13-11** OS\_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	ID of the thread running within the current node process
lwpid	integer	Lightweight thread ID corresponding to <b>pid</b>
thread_name	text	Name of the thread corresponding to <b>pid</b>
creation_time	timestamp with time zone	Creation time of the thread corresponding to <b>pid</b>

### 13.2.1.4 GLOBAL\_OS\_THREADS

**GLOBAL\_OS\_THREADS** records the thread status information on all normal nodes in the cluster.

**Table 13-12** GLOBAL\_OS\_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	ID of the thread running within the current node process
lwpid	integer	Lightweight thread ID corresponding to <b>pid</b>
thread_name	text	Name of the thread corresponding to <b>pid</b>
creation_time	timestamp with time zone	Creation time of the thread corresponding to <b>pid</b>

## 13.2.2 Instance

### 13.2.2.1 INSTANCE\_TIME

Records the time consumption information on the current node. The information is classified into the following types:

- DB\_TIME: effective time spent by jobs in multi-core scenarios.
- CPU\_TIME: CPU time cost.
- EXECUTION\_TIME: time spent in the executor.
- PARSE\_TIME: time spent on parsing SQL statements.
- PLAN\_TIME: time spent on generating plans.
- REWRITE\_TIME: time spent on rewriting SQL statements.
- PL\_EXECUTION\_TIME: execution time of the PL/SQL stored procedure.
- PL\_COMPILATION\_TIME: compilation time of the PL/SQL stored procedure.
- NET\_SEND\_TIME: time spent on the network.
- DATA\_IO\_TIME: I/O time spent.

**Table 13-13** INSTANCE\_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID.
stat_name	text	Type name.
value	bigint	Time value (unit: μs).

### 13.2.2.2 GLOBAL\_INSTANCE\_TIME

**GLOBAL\_INSTANCE\_TIME** records the time consumption information on all normal nodes in the cluster. For details about the time types, see the **INSTANCE\_TIME** view.

**Table 13-14** GLOBAL\_INSTANCE\_TIME columns

Name	Type	Description
node_name	name	Node name
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value (unit: $\mu$ s)

## 13.2.3 Memory

### 13.2.3.1 MEMORY\_NODE\_DETAIL

Displays memory usage of the current database node.

**Table 13-15** MEMORY\_NODE\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	Memory name. <ul style="list-style-type: none"> <li>● <b>max_process_memory</b>: maximum available memory of the database node.</li> <li>● <b>process_used_memory</b>: memory occupied by a process.</li> <li>● <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>● <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>● <b>dynamic_peak_memory</b>: dynamic memory peak.</li> <li>● <b>dynamic_used_shrctx</b>: context of the used dynamic shared memory.</li> <li>● <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>● <b>max_shared_memory</b>: maximum shared memory.</li> <li>● <b>shared_used_memory</b>: used shared memory.</li> <li>● <b>max_sctpcomm_memory</b>: maximum memory allowed for TCP proxy communications.</li> <li>● <b>sctpcomm_used_memory</b>: used memory for TCP proxy communications.</li> <li>● <b>sctpcomm_peak_memory</b>: memory peak of TCP proxy communications.</li> <li>● <b>other_used_memory</b>: other used memory.</li> <li>● <b>gpu_max_dynamic_memory</b>: maximum dynamic GPU memory.</li> <li>● <b>gpu_dynamic_used_memory</b>: used dynamic GPU memory.</li> <li>● <b>gpu_dynamic_peak_memory</b>: dynamic GPU memory peak.</li> <li>● <b>pooler_conn_memory</b>: memory allocated to the connection pool.</li> <li>● <b>pooler_freeconn_memory</b>: memory occupied by idle connections in the connection pool.</li> <li>● <b>storage_compress_memory</b>: memory used by the storage module for compression.</li> <li>● <b>udf_reserved_memory</b>: reserved memory for the UDF.</li> </ul>
memorybytes	integer	Size of the used memory (unit: MB).

### 13.2.3.2 GLOBAL\_MEMORY\_NODE\_DETAIL

Displays the memory usage on all normal nodes in the cluster.

**Table 13-16** GLOBAL\_MEMORY\_NODE\_DETAIL columns

Name	Type	Description
nodename	text	Node name.
memorytype	text	<p>Memory name.</p> <ul style="list-style-type: none"> <li>● <b>max_process_memory</b>: maximum available memory of the database node.</li> <li>● <b>process_used_memory</b>: memory occupied by a process.</li> <li>● <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>● <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>● <b>dynamic_peak_memory</b>: dynamic memory peak.</li> <li>● <b>dynamic_used_shrctx</b>: context of the used dynamic shared memory.</li> <li>● <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>● <b>max_shared_memory</b>: maximum shared memory.</li> <li>● <b>shared_used_memory</b>: used shared memory.</li> <li>● <b>max_sctpcomm_memory</b>: maximum memory allowed for TCP proxy communications.</li> <li>● <b>sctpcomm_used_memory</b>: used memory for TCP proxy communications.</li> <li>● <b>sctpcomm_peak_memory</b>: memory peak of TCP proxy communications.</li> <li>● <b>other_used_memory</b>: other used memory.</li> <li>● <b>gpu_max_dynamic_memory</b>: maximum dynamic GPU memory.</li> <li>● <b>gpu_dynamic_used_memory</b>: used dynamic GPU memory.</li> <li>● <b>gpu_dynamic_peak_memory</b>: dynamic GPU memory peak.</li> <li>● <b>pooler_conn_memory</b>: memory allocated to the connection pool.</li> <li>● <b>pooler_freeconn_memory</b>: memory occupied by idle connections in the connection pool.</li> <li>● <b>storage_compress_memory</b>: memory used by the storage module for compression.</li> <li>● <b>udf_reserved_memory</b>: reserved memory for the user-defined functions.</li> </ul>
memorybytes	integer	Size of the used memory (unit: MB).

### 13.2.3.3 MEMORY\_NODE\_NG\_DETAIL

**MEMORY\_NODE\_NG\_DETAIL** displays memory usage of a node group.

**Table 13-17** MEMORY\_NODE\_NG\_DETAIL columns

Name	Type	Description
ngname	text	Node group name
memorytype	text	Memory name <ul style="list-style-type: none"> <li>● <b>ng_total_memory</b>: total memory configured in the node group</li> <li>● <b>ng_used_memory</b>: used memory</li> <li>● <b>ng_estimate_memory</b>: memory used by the optimizer for evaluation</li> <li>● <b>ng_foreignrp_memsize</b>: memory configured in the foreign resource pool</li> <li>● <b>ng_foreignrp_usesize</b>: memory used by the foreign resource pool</li> <li>● <b>ng_foreignrp_peaksize</b>: peak memory used by the foreign resource pool</li> <li>● <b>ng_foreignrp_mempct</b>: percentage of the system memory configured in attributes of the foreign resource pool</li> <li>● <b>ng_foreignrp_estmsize</b>: memory used by the optimizer for job evaluation in the foreign resource pool</li> </ul>
memorybytes	integer	Size of the used memory (unit: MB)

### 13.2.3.4 SHARED\_MEMORY\_DETAIL

**SHARED\_MEMORY\_DETAIL** displays the usage information about shared memory contexts on the current node.

**Table 13-18** SHARED\_MEMORY\_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory (unit: byte)

Name	Type	Description
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

### 13.2.3.5 GLOBAL\_SHARED\_MEMORY\_DETAIL

**GLOBAL\_SHARED\_MEMORY\_DETAIL** displays the usage information about shared memory contexts on all normal nodes in the cluster.

**Table 13-19** GLOBAL\_SHARED\_MEMORY\_DETAIL columns

Name	Type	Description
node_name	name	Node name
contextname	text	Name of the memory context
level	smallint	Level of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory (unit: byte)
freesize	bigint	Remaining size of the shared memory (unit: byte)
usedsize	bigint	Used size of the shared memory (unit: byte)

### 13.2.3.6 TRACK\_MEMORY\_CONTEXT\_DETAIL

Queries the detailed memory application information about the memory context set by **DBE\_PERF.track\_memory\_context**. Only the initial user or a user with the monadmin permission can execute this view.

**Table 13-20** TRACK\_MEMORY\_CONTEXT\_DETAIL columns

Name	Type	Description
context_name	text	Name of the memory context.
file	text	File to which the memory application location belongs.

Name	Type	Description
line	integer	Line number of the memory application location.
size	bigint	Total size of memory that is applied for (unit: byte).

## 13.2.4 File

### 13.2.4.1 FILE\_IOSTAT

Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations.

**Table 13-21** FILE\_IOSTAT columns

Name	Type	Description
filenum	oid	File identifier
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading (unit: $\mu$ s)
writetim	bigint	Total duration of writing (unit: $\mu$ s)
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s)
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s)
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s)
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s)

### 13.2.4.2 SUMMARY\_FILE\_IOSTAT

Records the summary of statistics about data file I/Os of each node in the cluster to reflect performance issues such as exceptions in I/O operations.

The values of **phyrds**, **phywrts**, **phyblkrd**, **phyblkwrt**, **readtim** and **writetim** are summed up based on the data of each node. **avgiotim** is the average value (total duration/total times) of each node. **lstiotim** and **maxiowtm** are the maximum values of each node. **miniotim** is the minimum value of each node.

**Table 13-22** SUMMARY\_FILE\_IOSTAT columns

Name	Type	Description
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	numeric	Number of times of reading physical files.
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.
readtim	numeric	Total duration of reading (unit: $\mu$ s).
writetim	numeric	Total duration of writing (unit: $\mu$ s).
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s).
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s).
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s).

### 13.2.4.3 GLOBAL\_FILE\_IOSTAT

Displays statistics about data file I/Os on all nodes in the cluster.

**Table 13-23** GLOBAL\_FILE\_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
readtim	bigint	Total duration of reading (unit: $\mu$ s).
writetim	bigint	Total duration of writing (unit: $\mu$ s).
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s).
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s).
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s).

#### 13.2.4.4 FILE\_REDO\_IOSTAT

Records statistics about redo logs (WALs) on the current node.

**Table 13-24** FILE\_REDO\_IOSTAT columns

Name	Type	Description
phywrts	bigint	Number of times writing into the WAL buffer.
phyblkwrt	bigint	Number of blocks written into the WAL buffer.
writetim	bigint	Duration of writing into Xlog files (unit: $\mu$ s).

Name	Type	Description
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). The value is <b>wrietim</b> divided by <b>phywrts</b> .
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s).

### 13.2.4.5 SUMMARY\_FILE\_REDO\_IOSTAT

Displays statistics about redo logs (WALs) on all nodes in the cluster. The values of the **phywrts**, **phyblkwrt**, and **wrietim** columns are accumulated based on the data of each node. The value of **avgiotim** is the average value of each node (summed up **wrietim** or **phywrts**). The values of **lstiotim** and **maxiowtm** are the maximum values of each node, and the value of **miniotim** is the minimum value of each node.

Table 13-25 SUMMARY\_FILE\_REDO\_IOSTAT columns

Name	Type	Description
phywrts	numeric	Number of times writing into the WAL buffer.
phyblkwrt	numeric	Number of blocks written into the WAL buffer.
wrietim	numeric	Duration of writing into Xlog files (unit: $\mu$ s).
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). The value is <b>wrietim</b> divided by <b>phywrts</b> .
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s).

### 13.2.4.6 GLOBAL\_FILE\_REDO\_IOSTAT

Displays statistics about redo logs (WALs) on nodes in the cluster.

**Table 13-26** GLOBAL\_FILE\_REDO\_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
phywrts	bigint	Number of times writing into the WAL buffer.
phyblkwrt	bigint	Number of blocks written into the WAL buffer.
writetim	bigint	Duration of writing into Xlog files (unit: $\mu$ s).
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). The value is <b>writetim</b> divided by <b>phywrts</b> .
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s).

### 13.2.4.7 LOCAL\_REL\_IOSTAT

Displays the accumulated I/O status of all data files on the current node.

**Table 13-27** LOCAL\_REL\_IOSTAT columns

Name	Type	Description
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

### 13.2.4.8 GLOBAL\_REL\_IOSTAT

Displays statistics about data file I/Os on all nodes.

**Table 13-28** GLOBAL\_REL\_IOSTAT columns

Name	Type	Description
node_name	name	Node name
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks

### 13.2.4.9 SUMMARY\_REL\_IOSTAT

Obtains the summary of data file I/O statistics of all nodes.

**Table 13-29** SUMMARY\_REL\_IOSTAT columns

Name	Type	Description
phyrds	numeric	Number of times of reading physical files.
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.

## 13.2.5 Object

### 13.2.5.1 STAT\_USER\_TABLES

Displays the status information about user-defined ordinary tables in all schemas on the current node.

**Table 13-30** STAT\_USER\_TABLES columns

Name	Type	Description
relid	oid	Table OID

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed

Name	Type	Description
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.2 SUMMARY\_STAT\_USER\_TABLES

Displays the sum of the status information about user-defined ordinary tables in all schemas of a cluster. It is used on the CN. The status information about user-defined common tables on each DN is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

**Table 13-31** SUMMARY\_STAT\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.

Name	Type	Description
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	numeric	Number of times this table has been manually analyzed
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.3 GLOBAL\_STAT\_USER\_TABLES

Displays the status of user-defined ordinary tables in all schemas on each node. It is used on CNs. The status information about user-defined ordinary tables on each DN is displayed but not summed up.

**Table 13-32** GLOBAL\_STAT\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.

Name	Type	Description
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of dead rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding VACUUM FULL).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding VACUUM FULL).
autovacuum_count	bigint	Number of times this table is vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times this table is manually analyzed.
autoanalyze_count	bigint	Number of times the table is analyzed by the autovacuum daemon thread.

### 13.2.5.4 STAT\_USER\_INDEXES

Displays the index status information about the user-defined ordinary tables on the current node.

**Table 13-33** STAT\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.

Name	Type	Description
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.5 SUMMARY\_STAT\_USER\_INDEXES

Displays the index status statistics of user-defined ordinary tables in all schemas of a cluster. It applies to CNs only and the index status information about user-defined ordinary tables on each CN is summed up.

**Table 13-34** SUMMARY\_STAT\_USER\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.6 GLOBAL\_STAT\_USER\_INDEXES

Displays the index status information about user-defined ordinary tables in all schemas on each node. The information is about CNs and DNs. It is used on CNs and information is not summed up.

**Table 13-35** GLOBAL\_STAT\_USER\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.7 STAT\_SYS\_TABLES

Displays status information about all the system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas on the current node.

**Table 13-36** STAT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted

Name	Type	Description
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.8 SUMMARY\_STAT\_SYS\_TABLES

Displays the status statistics of all system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas in the cluster. The statistics are used on CNs and include data on CNs and DN. The status information in the system catalog on each node is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

**Table 13-37** SUMMARY\_STAT\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon

Name	Type	Description
analyze_count	numeric	Number of times this table has been manually analyzed
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.9 GLOBAL\_STAT\_SYS\_TABLES

Displays the status information of all system catalogs in pg\_catalog, information\_schema, and pg\_toast modes on each node in the cluster. The statistics information includes that of CNs and DN. It is used on CNs and is not summed up.

**Table 13-38** GLOBAL\_STAT\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.10 STAT\_SYS\_INDEXES

Displays the index status information about all system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas on the current node.

**Table 13-39** STAT\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.

Name	Type	Description
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.11 SUMMARY\_STAT\_SYS\_INDEXES

Displays the index status statistics of all system catalogs in the `pg_catalog`, `information_schema`, and `pg_toast` schemas of all nodes in the cluster. It is used on CNs and the index status information of system catalogs on each node is summed up.

**Table 13-40** SUMMARY\_STAT\_SYS\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.12 GLOBAL\_STAT\_SYS\_INDEXES

Displays the index status information of all system catalogs in `pg_catalog`, `information_schema`, and `pg_toast` schemas on each node. The index status information is about CNs and DN. It is used on CNs and information is not summed up.

**Table 13-41** GLOBAL\_STAT\_SYS\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.13 STAT\_ALL\_TABLES

Displays the status of each table (including the TOAST table) on the current node of the database.

**Table 13-42** STAT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

Name	Type	Description
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.14 SUMMARY\_STAT\_ALL\_TABLES

Displays the sum of the status information of each table (including the TOAST table) in the cluster database. It is used on the CN. The status information in the table on each node is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

**Table 13-43** SUMMARY\_STAT\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	numeric	Number of sequential scans initiated on the table
seq_tup_read	numeric	Number of live rows fetched by sequential scans

Name	Type	Description
idx_scan	numeric	Number of index scans initiated on the table
idx_tup_fetch	numeric	Number of live rows fetched by index scans
n_tup_ins	numeric	Number of rows inserted
n_tup_upd	numeric	Number of rows updated
n_tup_del	numeric	Number of rows deleted
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon
analyze_count	numeric	Number of times this table has been manually analyzed
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.15 GLOBAL\_STAT\_ALL\_TABLES

Displays the status of each table (including the TOAST table) on each node. It is used on CNs and the status of each table on each node is not summed up.

**Table 13-44** GLOBAL\_STAT\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema where the table is located.
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which this table was manually analyzed
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table has been manually vacuumed (not counting <b>VACUUM FULL</b> )
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon

Name	Type	Description
analyze_count	bigint	Number of times this table has been manually analyzed
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.5.16 STAT\_ALL\_INDEXES

Displays the access information about each index on the current database node.

**Table 13-45** STAT\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.17 SUMMARY\_STAT\_ALL\_INDEXES

Displays the access statistics of each index on each database node in a cluster. It is used on CNs. The access statistics of each node index are summed up.

**Table 13-46** SUMMARY\_STAT\_ALL\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.

Name	Type	Description
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.18 GLOBAL\_STAT\_ALL\_INDEXES

Displays the access information about each index on each node of the database in the cluster. It is used on the CN. The status information of each index on each node is not summed up.

**Table 13-47** GLOBAL\_STAT\_ALL\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.5.19 STAT\_DATABASE

Displays the statistics of the current node in the database.

**Table 13-48** STAT\_DATABASE columns

Name	Type	Description
datid	oid	Database OID.

Name	Type	Description
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_committed	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent in reading data file blocks by backends in this database (unit: ms).

Name	Type	Description
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

### 13.2.5.20 SUMMARY\_STAT\_DATABASE

Displays the summary of the statistics on each database node in the cluster. It is used on CNs. The status information of each node in the database is summed up by database name. The timestamp column is not summed up and only the latest value of this column on all nodes is used.

**Table 13-49** SUMMARY\_STAT\_DATABASE columns

Name	Type	Description
datname	name	Database name.
numbackends	bigint	Number of backends currently connected to this database.
xact_commit	numeric	Number of transactions in this database that have been committed.
xact_rollback	numeric	Number of transactions in this database that have been rolled back.
blks_read	numeric	Number of disk blocks read in this database.
blks_hit	numeric	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	numeric	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	numeric	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.

Name	Type	Description
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	numeric	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	numeric	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent in reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

### 13.2.5.21 GLOBAL\_STAT\_DATABASE

Displays the statistics of each database node in the cluster. (It is used on CNs and the status statistics of each database are not summed up.)

**Table 13-50** GLOBAL\_STAT\_DATABASE columns

Name	Type	Description
node_name	name	Node name.
datid	oid	Database OID.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed.

Name	Type	Description
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the database buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent in reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).

Name	Type	Description
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

### 13.2.5.22 STAT\_DATABASE\_CONFLICTS

Displays statistics about the conflict status of the current database node.

**Table 13-51** STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID.
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

### 13.2.5.23 SUMMARY\_STAT\_DATABASE\_CONFLICTS

Displays the conflict status statistics of all database nodes in the cluster. It is used on CNs and the conflict status statistics of each node are summed up by database name.

**Table 13-52** SUMMARY\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

### 13.2.5.24 GLOBAL\_STAT\_DATABASE\_CONFLICTS

Displays statistics about the conflict status of each database node. It is used on CNs and the status information of each database node is not summed up.

**Table 13-53** GLOBAL\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
node_name	name	Node name.
datid	oid	Database ID.
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

### 13.2.5.25 STAT\_XACT\_ALL\_TABLES

Displays transaction status information about all ordinary tables and TOAST tables in all schemas on the current node.

**Table 13-54** STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetched	bigint	Number of live rows fetched by index scans.

Name	Type	Description
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

### 13.2.5.26 SUMMARY\_STAT\_XACT\_ALL\_TABLES

Displays the transaction status statistics of all ordinary tables and TOAST tables in schemas of all nodes in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name.

**Table 13-55** SUMMARY\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

### 13.2.5.27 GLOBAL\_STAT\_XACT\_ALL\_TABLES

Displays the transaction status information of all ordinary tables and TOAST tables in the schemas of each node. (It is used on CNs. The transaction status information of the same table name on different nodes is not summed up.)

**Table 13-56** GLOBAL\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

### 13.2.5.28 STAT\_XACT\_SYS\_TABLES

Displays transaction status information about the system catalogs in the schemas of the current node.

**Table 13-57** STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.

Name	Type	Description
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

### 13.2.5.29 SUMMARY\_STAT\_XACT\_SYS\_TABLES

Displays the transaction status statistics of system catalogs in schemas of all nodes in the cluster. It is used on a CN and the transaction status statistics of tables on each node are summed up by table name.

**Table 13-58** SUMMARY\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

### 13.2.5.30 GLOBAL\_STAT\_XACT\_SYS\_TABLES

Displays the transaction status information of the system catalogs in the schemas of each node. (It is used on CNs. The transaction status information of the same table on different nodes is not summed up.)

**Table 13-59** GLOBAL\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

### 13.2.5.31 STAT\_XACT\_USER\_TABLES

Displays transaction status information about the user tables in schemas on the current node.

**Table 13-60** STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.

Name	Type	Description
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose new index columns are not updated).

### 13.2.5.32 SUMMARY\_STAT\_XACT\_USER\_TABLES

Displays the transaction status statistics of user tables in schemas of all nodes in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name.

**Table 13-61** SUMMARY\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

### 13.2.5.33 GLOBAL\_STAT\_XACT\_USER\_TABLES

Displays the transaction status information of the user tables in the schemas of each node. (It is used on CNs. The transaction status information of the same table on different nodes is not summed up.)

**Table 13-62** GLOBAL\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows updated by HOT (that is, the number of rows whose index columns are not updated).

### 13.2.5.34 STAT\_XACT\_USER\_FUNCTIONS

Displays statistics about function executions in the current transaction on the current database node.

**Table 13-63** STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	Function ID.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.

Name	Type	Description
self_time	double precision	Time spent in this function, excluding other functions called by it.

### 13.2.5.35 SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS

Displays the summary of function execution statistics in the current transaction on each node in the cluster. (It is used on CNs.)

**Table 13-64** SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

### 13.2.5.36 GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS

Displays statistics about function execution in the current transaction on each node in the cluster. (It is used on CNs.)

**Table 13-65** GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	Function ID.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.

Name	Type	Description
self_time	double precision	Total time spent in this function, excluding other functions called by it

### 13.2.5.37 STAT\_BAD\_BLOCK

Displays information about table and index read failures on the current node.

**Table 13-66** STAT\_BAD\_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.5.38 SUMMARY\_STAT\_BAD\_BLOCK

Obtains the summary of information about table and index read failures on each node in the cluster. It is used on CNs. The statistics of different DNs is summed up. The value of **first\_time** is the statistics collection start time, and the value of **last\_time** is the statistics collection end time.

**Table 13-67** SUMMARY\_STAT\_BAD\_BLOCK columns

Name	Type	Description
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
forknum	bigint	Fork number.

Name	Type	Description
error_count	bigint	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.5.39 GLOBAL\_STAT\_BAD\_BLOCK

Obtains the information about table and index read failures on each node. It is used on CNs. The read failure information of DN is displayed only, but not summed up.

**Table 13-68** GLOBAL\_STAT\_BAD\_BLOCK columns

Name	Type	Description
node_name	text	Node name
databaseid	integer	OID of the database
tablespaceid	integer	OID of the tablespace
relfilenode	integer	File node of this relation
forknum	integer	Fork number
error_count	integer	Number of errors
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.5.40 STAT\_USER\_FUNCTIONS

Displays user-defined function status information in the schemas of the current node. (The language of the function is non-internal language.)

**Table 13-69** STAT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function.
schemaname	name	Schema name.
funcname	name	Rename the customized function.

Name	Type	Description
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

### 13.2.5.41 SUMMARY\_STAT\_USER\_FUNCTIONS

Displays the summary of statistics about user-defined functions on each node in the entire cluster. It is used on CNs and the status information of user-defined functions on each node is summed up by function name.

**Table 13-70** SUMMARY\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
schemaname	name	Schema name.
funcname	name	UDF name.
calls	numeric	Number of times that the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

### 13.2.5.42 GLOBAL\_STAT\_USER\_FUNCTIONS

Displays statistics about user-defined functions on each node in the entire cluster. (It is used on CNs. Status information about functions with the same name on different nodes is not summed up.)

**Table 13-71** GLOBAL\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	ID of the function.

Name	Type	Description
schemaname	name	Name of the schema where the function is located.
funcname	name	UDF name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

## 13.2.6 Workload

### 13.2.6.1 WORKLOAD\_SQL\_COUNT

Displays the distribution of SQL statements in workloads on the current node.

**Table 13-72** WORKLOAD\_SQL\_COUNT columns

Name	Type	Description
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.

### 13.2.6.2 SUMMARY\_WORKLOAD\_SQL\_COUNT

**SUMMARY\_WORKLOAD\_SQL\_COUNT** displays the distribution of SQL statements in workloads on each CN in the cluster.

**Table 13-73** SUMMARY\_WORKLOAD\_SQL\_COUNT columns

Name	Type	Description
node_name	name	Node name
workload	name	Workload name
select_count	bigint	Number of <b>SELECT</b> statements
update_count	bigint	Number of <b>UPDATE</b> statements
insert_count	bigint	Number of <b>INSERT</b> statements
delete_count	bigint	Number of <b>DELETE</b> statements
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements

### 13.2.6.3 WORKLOAD\_TRANSACTION

**WORKLOAD\_TRANSACTION** displays the information about transactions on the current node.

**Table 13-74** WORKLOAD\_TRANSACTION columns

Name	Type	Description
workload	name	Workload name
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	bigint	Number of background transactions committed

Name	Type	Description
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s)

### 13.2.6.4 SUMMARY\_WORKLOAD\_TRANSACTION

**SUMMARY\_WORKLOAD\_TRANSACTION** displays the information about transactions in the cluster.

**Table 13-75** SUMMARY\_WORKLOAD\_TRANSACTION columns

Name	Type	Description
workload	name	Workload name
commit_counter	numeric	Number of user transactions committed
rollback_counter	numeric	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	numeric	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	numeric	Number of background transactions committed
bg_rollback_counter	numeric	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)

Name	Type	Description
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	numeric	Total response time of background transactions (unit: $\mu$ s)

### 13.2.6.5 GLOBAL\_WORKLOAD\_TRANSACTION

**GLOBAL\_WORKLOAD\_TRANSACTION** displays the information about workloads on each node.

**Table 13-76** GLOBAL\_WORKLOAD\_TRANSACTION columns

Name	Type	Description
node_name	name	Node name
workload	name	Workload name
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s)

### 13.2.6.6 WORKLOAD\_SQL\_ELAPSE\_TIME

WORKLOAD\_SQL\_ELAPSE\_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics.

**Table 13-77** WORKLOAD\_SQL\_ELAPSE\_TIME columns

Name	Type	Description
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: $\mu$ s).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: $\mu$ s).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: $\mu$ s).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: $\mu$ s).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: $\mu$ s).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: $\mu$ s).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: $\mu$ s).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: $\mu$ s).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: $\mu$ s).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: $\mu$ s).

### 13.2.6.7 SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME

WORKLOAD\_SQL\_ELAPSE\_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics on all CNs.

**Table 13-78** SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: $\mu$ s).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: $\mu$ s).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: $\mu$ s).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: $\mu$ s).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: $\mu$ s).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: $\mu$ s).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: $\mu$ s).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: $\mu$ s).

Name	Type	Description
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: $\mu$ s).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: $\mu$ s).

### 13.2.6.8 USER\_TRANSACTION

**USER\_TRANSACTION** collects statistics about transactions executed by users. The monadmin user can view information about transactions executed by all users.

**Table 13-79** USER\_TRANSACTION columns

Name	Type	Description
username	name	Username
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s)

### 13.2.6.9 GLOBAL\_USER\_TRANSACTION

**GLOBAL\_USER\_TRANSACTION** collects statistics about transactions executed by all users.

**Table 13-80** GLOBAL\_USER\_TRANSACTION columns

Name	Type	Description
node_name	name	Node name
username	name	Username
commit_counter	bigint	Number of user transactions committed
rollback_counter	bigint	Number of user transactions rolled back
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s)
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s)
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s)
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s)
bg_commit_counter	bigint	Number of background transactions committed
bg_rollback_counter	bigint	Number of background transactions rolled back
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s)
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s)
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s)
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s)

## 13.2.7 Session and Thread

### 13.2.7.1 SESSION\_STAT

**SESSION\_STAT** collects statistics about session status on the current node based on session threads or the **AutoVacuum** thread.

**Table 13-81** SESSION\_STAT columns

Name	Type	Description
sessid	text	Thread start time and ID
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

### 13.2.7.2 GLOBAL\_SESSION\_STAT

**GLOBAL\_SESSION\_STAT** collects statistics about session status on each node based on session threads or the **AutoVacuum** thread.

**Table 13-82** GLOBAL\_SESSION\_STAT columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

### 13.2.7.3 SESSION\_TIME

**SESSION\_TIME** collects statistics about the running time of session threads and time consumed in each execution phase on the current node.

**Table 13-83** SESSION\_TIME columns

Name	Type	Description
sessid	text	Thread start time and ID
stat_id	integer	Statistics ID
stat_name	text	Session type
value	bigint	Session value

### 13.2.7.4 GLOBAL\_SESSION\_TIME

**GLOBAL\_SESSION\_TIME** collects statistics about the running time of session threads and time consumed in each execution phase on each node.

**Table 13-84** GLOBAL\_SESSION\_TIME columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
stat_id	integer	Statistics ID
stat_name	text	Session type
value	bigint	Session value

### 13.2.7.5 SESSION\_MEMORY

Collects statistics about memory usage at the session level in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users.

**Table 13-85** SESSION\_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

### 13.2.7.6 GLOBAL\_SESSION\_MEMORY

Collects statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users.

**Table 13-86** GLOBAL\_SESSION\_MEMORY columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.

Name	Type	Description
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

### 13.2.7.7 SESSION\_MEMORY\_DETAIL

**SESSION\_MEMORY\_DETAIL** collects statistics about thread memory usage by MemoryContext node.

**Table 13-87** SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
sessid	text	Thread start time and ID
sesstype	text	Thread name
contextname	text	Name of the memory context
level	smallint	Level of memory context importance
parent	text	Name of the parent memory context
totalsize	bigint	Size of the applied memory (unit: byte)
freesize	bigint	Size of the idle memory (unit: byte)
usedsize	bigint	Size of the used memory (unit: byte)

### 13.2.7.8 GLOBAL\_SESSION\_MEMORY\_DETAIL

**GLOBAL\_SESSION\_MEMORY\_DETAIL** collects statistics about thread memory usage on each node by MemoryContext node.

**Table 13-88** GLOBAL\_SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
node_name	name	Node name
sessid	text	Thread start time and ID
sesstype	text	Thread name
contextname	text	Name of the memory context
level	smallint	Level of memory context importance

Name	Type	Description
parent	text	Name of the parent memory context
totalsize	bigint	Size of the applied memory (unit: byte)
freesize	bigint	Size of the idle memory (unit: byte)
usedsize	bigint	Size of the used memory (unit: byte)

### 13.2.7.9 SESSION\_STAT\_ACTIVITY

Displays information about threads that are running on the current node.

**Table 13-89** SESSION\_STAT\_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
usesysid	oid	OID of the user logging in to the backend.
username	name	Name of the user logging in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used).
backend_start	timestampwith time zone	Time when this process was started, that is, when the client connected to the server.

Name	Type	Description
xact_start	timestampwith time zone	Time when the current transaction was started (null if no transactions are active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestampwith time zone	Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestampwith time zone	Time when the state was last changed.
waiting	boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is <b>true</b> .

Name	Type	Description
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.

### 13.2.7.10 GLOBAL\_SESSION\_STAT\_ACTIVITY

Displays information about threads that are running on each node in the cluster.

**Table 13-90** GLOBAL\_SESSION\_STAT\_ACTIVITY columns

Name	Type	Description
coorname	text	CN name.
datid	oid	OID of the database that the user session connects to in the backend.
datname	text	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
usesysid	oid	OID of the user logging in to the backend.
username	text	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is null, it indicates either the client is connected via a Unix socket on the server or this is an internal process, such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used).
backend_start	timestampwith time zone	Time when this process was started, that is, when the client connected to the server.

Name	Type	Description
xact_start	timestampwith time zone	Time when the current transaction was started ( <b>null</b> if no transactions are active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestampwith time zone	Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestampwith time zone	Time when the state was last changed.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is <b>true</b> . If a lock is being waited for on a DN, determine the DN based on the <b>wait_status</b> column in the PG_THREAD_WAIT_STATUS view and query the <b>waiting</b> column in PG_STAT_ACTIVITY on the DN to check whether a lock wait occurs.

Name	Type	Description
state	text	<p>Overall status of this backend. Its value can be:</p> <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but is not currently executing a query.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Common users can view their own session status only. The state information of other accounts is empty. For example, after the <b>judy</b> user is connected to the database, the state information of the <b>joe</b> user and the initial user <b>omm</b> in pg_stat_activity is empty.</p> <pre>gaussdb=# SELECT datname, username, usesysid,state,pid FROM pg_stat_activity; datname   username   usesysid   state   pid -----+-----+-----+-----+----- +-----+-----+-----+-----+----- testdb   omm   10     139968752121616 testdb   omm   10     139968903116560 db_tpcds   judy   16398   active   139968391403280 testdb   omm   10     139968643069712 testdb   omm   10     139968680818448 testdb   joe   16390     139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Text of this backend's latest query. If the value of <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.

Name	Type	Description
trace_id	text	Driver-specific trace ID, which is associated with an application request.

### 13.2.7.11 THREAD\_WAIT\_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on the current node. For detailed events, see [Table 13-175](#).

**Table 13-91** THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table 13-175</a> .
wait_event	text	If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.

Name	Type	Description
global_sessionid	text	Global session ID.

### 13.2.7.12 GLOBAL\_THREAD\_WAIT\_STATUS

In this view, you can check the blocking and waiting status of backend threads and auxiliary threads on all nodes. For details about the events, see [Table 13-175](#).

In GLOBAL\_THREAD\_WAIT\_STATUS, you can see all the call hierarchy relationships between threads of the SQL statements on all nodes in the cluster, and the blocking status for each thread. With this view, you can easily locate the causes of process hang and similar issues.

The definitions of GLOBAL\_THREAD\_WAIT\_STATUS and THREAD\_WAIT\_STATUS are the same, because the essence of the GLOBAL\_THREAD\_WAIT\_STATUS view is the query summary of the THREAD\_WAIT\_STATUS view on each node in the cluster.

**Table 13-92** GLOBAL\_THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table 13-175</a> .
wait_event	text	If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.

Name	Type	Description
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

### 13.2.7.13 LOCAL\_THREADPOOL\_STATUS

LOCAL\_THREADPOOL\_STATUS displays the status of worker threads and sessions in a thread pool. This view is valid only when **enable\_thread\_pool** is set to **on**.

**Table 13-93** LOCAL\_THREADPOOL\_STATUS columns

Name	Type	Description
node_name	text	Node name.
group_id	integer	ID of the thread pool group.
bind_numa_id	integer	NUMA ID to which the thread pool group is bound.
bind_cpu_number	integer	Information about the CPU to which the thread pool group is bound. If no CPUs are bound, the value is <b>NULL</b> .
listener	integer	Number of listener threads in the thread pool group.

Name	Type	Description
worker_info	text	Information about threads in the thread pool, including: <ul style="list-style-type: none"> <li>● <b>default</b>: Number of initial threads in the thread pool group</li> <li>● <b>new</b>: Number of new threads in the thread pool group</li> <li>● <b>expect</b>: Expected number of threads in the thread pool group</li> <li>● <b>actual</b>: Actual number of threads in the thread pool group</li> <li>● <b>idle</b>: Number of idle threads in the thread pool group</li> <li>● <b>pending</b>: Number of pending threads in the thread pool group</li> </ul>
session_info	text	Information about sessions in the thread pool, including: <ul style="list-style-type: none"> <li>● <b>total</b>: Total number of sessions in the thread pool group.</li> <li>● <b>waiting</b>: Number of sessions pending scheduling in the thread pool group.</li> <li>● <b>running</b>: Number of running sessions in the thread pool group.</li> <li>● <b>idle</b>: Number of idle sessions in the thread pool group.</li> </ul>
stream_info	text	Information about streams in the thread pool, including: <ul style="list-style-type: none"> <li>● <b>total</b>: total number of stream threads in the thread pool group.</li> <li>● <b>running</b>: number of running stream threads in the thread pool group.</li> <li>● <b>idle</b>: number of idle stream threads in the thread pool group.</li> </ul>

### 13.2.7.14 GLOBAL\_THREADPOOL\_STATUS

**GLOBAL\_THREADPOOL\_STATUS** displays the status of worker threads and sessions in thread pools on all nodes. Columns in this view are the same as those in [Table 13-93](#).

### 13.2.7.15 SESSION\_CPU\_RUNTIME

**SESSION\_CPU\_RUNTIME** displays information about CPU usage of ongoing complex jobs executed by the current user.

**Table 13-94** SESSION\_CPU\_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to.
username	name	Name of the user logged in to the backend.
pid	bigint	Backend thread ID.
start_time	timestamp with time zone	Time when the statement execution starts. For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure.
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms).
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms).
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms).
query	text	Statement being executed.
top_cpu_dn	text	Top <i>N</i> CPU usage.

### 13.2.7.16 SESSION\_MEMORY\_RUNTIME

SESSION\_MEMORY\_RUNTIME displays information about memory usage of ongoing complex jobs executed by the current user.

**Table 13-95** SESSION\_MEMORY\_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to.
username	name	Name of the user logged in to the backend.
pid	bigint	Backend thread ID.
start_time	timestamp with time zone	Time when the statement execution starts. For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure.

Name	Type	Description
min_peak_memory	integer	Minimum peak memory of the statement among all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory of the statement among all DNs (unit: MB).
spill_info	text	Statement spill information on all DNs. <ul style="list-style-type: none"> <li>• <b>None:</b> No data is spilled to disks on all DNs.</li> <li>• <b>All:</b> Data is spilled to disks on all DNs.</li> <li>• <b>[a:b]:</b> The statement has been spilled to disks on <i>a</i> of <i>b</i> DNs.</li> </ul>
query	text	Statement being executed.
top_mem_dn	text	Top N memory usage.

### 13.2.7.17 LOCAL\_ACTIVE\_SESSION

LOCAL\_ACTIVE\_SESSION displays samples in the **ACTIVE SESSION PROFILE** memory on the current node.

**Table 13-96** LOCAL\_ACTIVE\_SESSION columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Event name.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.

Name	Type	Description
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized text string of the unique SQL statement.
locktag	text	Information of a lock that the session waits for, which can be parsed using <b>locktag_decode</b> .
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.

Name	Type	Description
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be <b>active</b> , <b>idle in transaction</b> , <b>fastpath function call</b> , <b>idle in transaction (aborted)</b> , <b>disabled</b> , or <b>retrying</b> .

### 13.2.7.18 GLOBAL\_ACTIVE\_SESSION

GLOBAL\_ACTIVE\_SESSION displays a summary of samples in the **ACTIVE SESSION PROFILE** memory on all nodes.

**Table 13-97** GLOBAL\_ACTIVE\_SESSION columns

Name	Type	Description
node_name	text	Node name.
sampleid	bigint	Sample ID.
sample_time	timestamp without time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp without time zone	Start time of a session.
event	text	Event name.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.

Name	Type	Description
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized text string of the unique SQL statement.
locktag	text	Information of a lock that the session waits for, which can be parsed using <b>locktag_decode</b> .
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be <b>active</b> , <b>idle in transaction</b> , <b>fastpath function call</b> , <b>idle in transaction (aborted)</b> , <b>disabled</b> , or <b>retrying</b> .

## 13.2.8 Transaction

### 13.2.8.1 TRANSACTIONS\_RUNNING\_XACTS

Displays information about running transactions on the current node.

**Table 13-98** TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is lazy vacuum.
timeline	bigint	Number of database restarts.
prepare_xid	xid	Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Minimum CSN of a local active transaction.

### 13.2.8.2 SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS

Displays information about the running transactions on each CN in the cluster. The column content is the same as that of TRANSACTIONS\_RUNNING\_XACTS.

**Table 13-99** SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.

Name	Type	Description
vacuum	Boolean	Specifies whether the current transaction is lazy vacuum.
timeline	bigint	Number of database restarts.
prepare_xid	xid	Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Minimum CSN of a local active transaction.

### 13.2.8.3 GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS

Displays information about the running transactions on each node in the cluster.

**Table 13-100** GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is lazy vacuum.
timeline	bigint	Number of database restarts.
prepare_xid	xid	Transaction ID in the <b>prepared</b> state. If the state is not <b>prepared</b> , the value is <b>0</b> .
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Minimum CSN of a local active transaction.

### 13.2.8.4 TRANSACTIONS\_PREPARED\_XACTS

**TRANSACTIONS\_PREPARED\_XACTS** displays information about transactions that are currently prepared for two-phase commit.

**Table 13-101** TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

### 13.2.8.5 SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS

**SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS** displays information about the transactions that are ready for two-phase commit on each CN in the cluster.

**Table 13-102** SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

### 13.2.8.6 GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS

**GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS** displays information about the transactions that are currently prepared for two-phase commit on each node.

**Table 13-103** GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction
gid	text	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	Time at which the transaction is prepared for commit
owner	name	Name of the user that executes the transaction
database	name	Name of the database in which the transaction is executed

## 13.2.9 Query

### 13.2.9.1 STATEMENT

Obtains information about executed statements (normalized SQL statements) on the current node. You can view all statistics about normalized SQL statements received by the CN, whereas you can view only the statistics about normalized SQL statements executed on the current DN.

#### NOTE

- **unique\_sql\_id** generated by different **savepoint\_name** values is different. When a large number of **savepoint\_name** is used, the number of **unique\_sql\_id** values generated in the system increases rapidly. If the number of **unique\_sql\_id** values is greater than the number of **instr\_unique\_sql\_count** values, the newly generated **unique\_sql\_id** information is not counted.
- In the current version, the keyword FOR UPDATE cannot be identified or normalized. For example, **SELECT \* FROM table;** and **SELECT \* FROM table FOR UPDATE WAIT N;** are normalized into the same normalized SQL statement and displayed in the **query** column.

**Table 13-104** STATEMENT columns

Name	Type	Description
node_name	name	Node name.
node_id	integer	Node ID ( <b>node_id</b> in <b>pgxc_node</b> ).
user_name	name	Username.
user_id	oid	OID of the user.
unique_sql_id	bigint	ID of the normalized SQL statement.

Name	Type	Description
query	text	Normalized SQL statement. Note: The length is controlled by <b>track_activity_query_size</b> .
n_calls	bigint	Number of calls.
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: $\mu$ s).
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: $\mu$ s).
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: $\mu$ s).
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
n_soft_parse	bigint	Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .
n_hard_parse	bigint	Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time	bigint	CPU time (unit: $\mu$ s).
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).
parse_time	bigint	SQL parsing time (unit: $\mu$ s).
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).

Name	Type	Description
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s).
data_io_time	bigint	I/O time (unit: $\mu$ s).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <code>{"time":xxx, "n_calls":xxx, "size":xxx}</code>
net_rcv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <code>{"time":xxx, "n_calls":xxx, "size":xxx}</code>
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DN of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <code>{"time":xxx, "n_calls":xxx, "size":xxx}</code>

Name	Type	Description
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <code>{"time":xxx, "n_calls":xxx, "size":xxx}</code>
last_updated	timestamp with time zone	Last time when the statement was updated.
sort_count	bigint	Sorting count.
sort_time	bigint	Sorting duration (unit: $\mu$ s).
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB).
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting.
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB).
hash_count	bigint	Hashing count.
hash_time	bigint	Hashing duration (unit: $\mu$ s).
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB).
hash_spill_count	bigint	Number of file writes when data is flushed to disks during hashing.
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB).
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is <b>0</b> for a non-stored procedure substatement.

 **NOTE**

**n\_calls** indicates the actual number of calling times. For the FETCH statement in the stored procedure, the actual number of triggering times of the FETCH statement is the increase times of **n\_calls** of the statement actually executed by the cursor.

### 13.2.9.2 SUMMARY\_STATEMENT

Displays all information (including DNs) about executed statements (normalized SQL statements) on each CN.

 NOTE

In the current version, the keyword FOR UPDATE cannot be identified or normalized. For example, **SELECT \* FROM table;** and **SELECT \* FROM table FOR UPDATE WAIT N;** are normalized into the same normalized SQL statement and displayed in the **query** column.

**Table 13-105** SUMMARY\_STATEMENT columns

Name	Type	Description
node_name	name	Node name.
node_id	integer	Node ID ( <b>node_id</b> in <b>pgxc_node</b> ).
user_name	name	Username.
user_id	oid	OID of the user.
unique_sql_id	bigint	ID of the normalized SQL statement.
query	text	Normalized SQL statement. Note: The length is controlled by <b>track_activity_query_size</b> .
n_calls	bigint	Number of calls.
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: $\mu$ s).
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: $\mu$ s).
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: $\mu$ s).
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
n_soft_parse	bigint	Number of soft parsing times.

Name	Type	Description
n_hard_parse	bigint	Number of hard parsing times.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time	bigint	CPU time (unit: $\mu$ s).
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).
parse_time	bigint	SQL parsing time (unit: $\mu$ s).
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s).
data_io_time	bigint	I/O time (unit: $\mu$ s).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}
net_rcv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}

Name	Type	Description
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}
net_stream_rcv_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}
last_updated	timestamp with time zone	Last time when the statement was updated.
sort_count	bigint	Sorting count.
sort_time	bigint	Sorting duration (unit: $\mu$ s).
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB).
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting.
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB).
hash_count	bigint	Hashing count.
hash_time	bigint	Hashing duration (unit: $\mu$ s).
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB).
hash_spill_count	bigint	Number of file writes when data is flushed to disks during hashing.
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB).

Name	Type	Description
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is 0 for a non-stored procedure substatement.

### 13.2.9.3 STATEMENT\_COUNT

Displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) as well as DDL, DML, and DCL statements on the current node of the database.

#### NOTE

An administrator can query the STATEMENT\_COUNT view to view the statistics of all users on the current node. When the cluster or node is restarted, the statistics are cleared and the counting restarts. The system counts when a node receives a query, including a query inside the cluster. For example, when a CN receives a query and distributes multiple queries to DN, the queries are counted accordingly on the DNs.

**Table 13-106** STATEMENT\_COUNT columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
select_count	bigint	Statistical result of the <b>SELECT</b> statement
update_count	bigint	Statistical result of the <b>UPDATE</b> statement
insert_count	bigint	Statistical result of the <b>INSERT</b> statement
delete_count	bigint	Statistical result of the <b>DELETE</b> statement
mergeinto_count	bigint	Statistical result of the <b>MERGE INTO</b> statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements
total_select_elapse	bigint	Total response time of <b>SELECT</b> statements (unit: $\mu$ s)
avg_select_elapse	bigint	Average response time of <b>SELECT</b> statements (unit: $\mu$ s)
max_select_elapse	bigint	Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s)
min_select_elapse	bigint	Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s)

Name	Type	Description
total_update_elapse	bigint	Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)
avg_update_elapse	bigint	Average response time of <b>UPDATE</b> statements (unit: $\mu$ s)
max_update_elapse	bigint	Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
min_update_elapse	bigint	Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
total_insert_elapse	bigint	Total response time of <b>INSERT</b> statements (unit: $\mu$ s)
avg_insert_elapse	bigint	Average response time of <b>INSERT</b> statements (unit: $\mu$ s)
max_insert_elapse	bigint	Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s)
min_insert_elapse	bigint	Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s)
total_delete_elapse	bigint	Total response time of <b>DELETE</b> statements (unit: $\mu$ s)
avg_delete_elapse	bigint	Average response time of <b>DELETE</b> statements (unit: $\mu$ s)
max_delete_elapse	bigint	Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s)
min_delete_elapse	bigint	Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s)

#### 13.2.9.4 GLOBAL\_STATEMENT\_COUNT

**GLOBAL\_STATEMENT\_COUNT** displays statistics about four types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on each node of the database.

**Table 13-107** GLOBAL\_STATEMENT\_COUNT columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
select_count	bigint	Statistical result of the <b>SELECT</b> statement

Name	Type	Description
update_count	bigint	Statistical result of the <b>UPDATE</b> statement
insert_count	bigint	Statistical result of the <b>INSERT</b> statement
delete_count	bigint	Statistical result of the <b>DELETE</b> statement
mergeinto_count	bigint	Statistical result of the <b>MERGE INTO</b> statement
ddl_count	bigint	Number of DDL statements
dml_count	bigint	Number of DML statements
dcl_count	bigint	Number of DCL statements
total_select_elapse	bigint	Total response time of <b>SELECT</b> statements (unit: $\mu$ s)
avg_select_elapse	bigint	Average response time of <b>SELECT</b> statements (unit: $\mu$ s)
max_select_elapse	bigint	Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s)
min_select_elapse	bigint	Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s)
total_update_elapse	bigint	Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)
avg_update_elapse	bigint	Average response time of <b>UPDATE</b> statements (unit: $\mu$ s)
max_update_elapse	bigint	Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
min_update_elapse	bigint	Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
total_insert_elapse	bigint	Total response time of <b>INSERT</b> statements (unit: $\mu$ s)
avg_insert_elapse	bigint	Average response time of <b>INSERT</b> statements (unit: $\mu$ s)
max_insert_elapse	bigint	Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s)
min_insert_elapse	bigint	Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s)
total_delete_elapse	bigint	Total response time of <b>DELETE</b> statements (unit: $\mu$ s)
avg_delete_elapse	bigint	Average response time of <b>DELETE</b> statements (unit: $\mu$ s)

Name	Type	Description
max_delete_elapse	bigint	Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s)
min_delete_elapse	bigint	Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s)

### 13.2.9.5 SUMMARY\_STATEMENT\_COUNT

**SUMMARY\_STATEMENT\_COUNT** displays statistics about four types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on all nodes (CNs and DN) of the database.

**Table 13-108** SUMMARY\_STATEMENT\_COUNT columns

Name	Type	Description
user_name	text	Username
select_count	numeric	Statistical result of the <b>SELECT</b> statement
update_count	numeric	Statistical result of the <b>UPDATE</b> statement
insert_count	numeric	Statistical result of the <b>INSERT</b> statement
delete_count	numeric	Statistical result of the <b>DELETE</b> statement
mergeinto_count	numeric	Statistical result of the <b>MERGE INTO</b> statement
ddl_count	numeric	Number of DDL statements
dml_count	numeric	Number of DML statements
dcl_count	numeric	Number of DCL statements
total_select_elapse	numeric	Total response time of <b>SELECT</b> statements (unit: $\mu$ s)
avg_select_elapse	bigint	Average response time of <b>SELECT</b> statements (unit: $\mu$ s)
max_select_elapse	bigint	Maximum response time of <b>SELECT</b> statements (unit: $\mu$ s)
min_select_elapse	bigint	Minimum response time of <b>SELECT</b> statements (unit: $\mu$ s)
total_update_elapse	numeric	Total response time of <b>UPDATE</b> statements (unit: $\mu$ s)

Name	Type	Description
avg_update_elapsed	bigint	Average response time of <b>UPDATE</b> statements (unit: $\mu$ s)
max_update_elapsed	bigint	Maximum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
min_update_elapsed	bigint	Minimum response time of <b>UPDATE</b> statements (unit: $\mu$ s)
total_insert_elapsed	numeric	Total response time of <b>INSERT</b> statements (unit: $\mu$ s)
avg_insert_elapsed	bigint	Average response time of <b>INSERT</b> statements (unit: $\mu$ s)
max_insert_elapsed	bigint	Maximum response time of <b>INSERT</b> statements (unit: $\mu$ s)
min_insert_elapsed	bigint	Minimum response time of <b>INSERT</b> statements (unit: $\mu$ s)
total_delete_elapsed	numeric	Total response time of <b>DELETE</b> statements (unit: $\mu$ s)
avg_delete_elapsed	bigint	Average response time of <b>DELETE</b> statements (unit: $\mu$ s)
max_delete_elapsed	bigint	Maximum response time of <b>DELETE</b> statements (unit: $\mu$ s)
min_delete_elapsed	bigint	Minimum response time of <b>DELETE</b> statements (unit: $\mu$ s)

### 13.2.9.6 STATEMENT\_HISTORY

Displays information about statements executed on the current node. The result can be queried only in the system database but cannot be queried in the user database.

 **NOTE**

In the current version, the keyword FOR UPDATE cannot be identified or normalized. For example, **SELECT \* FROM table;** and **SELECT \* FROM table FOR UPDATE WAIT N;** are normalized into the same normalized SQL statement and displayed in the **query** column. SQL statements containing the keyword FOR UPDATE can be distinguished by the **query\_plan** column. The execution plan contains '**lockRows**'.

**Table 13-109** STATEMENT\_HISTORY columns

Name	Type	Description
dbname	name	Database name.

Name	Type	Description
schemaname	name	Schema name.
origin_node	integer	Node name.
user_name	name	Username.
application_name	text	Name of the application that sends a request.
client_addr	text	IP address of the client that sends a request.
client_port	integer	Port number of the client that sends a request.
unique_query_id	bigint	ID of the normalized SQL statement.
debug_query_id	bigint	ID of the unique SQL statement.
query	text	Normalized SQL (available only on CNs).
start_time	timestamp with time zone	Time when a statement starts.
finish_time	timestamp with time zone	Time when a statement ends.
slow_sql_threshold	bigint	Standard for slow SQL statement execution.
transaction_id	bigint	Transaction ID.
thread_id	bigint	ID of an execution thread.
session_id	bigint	Session ID of a user.
n_soft_parse	bigint	Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .
n_hard_parse	bigint	Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .
query_plan	text	Statement execution plan.
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.

Name	Type	Description
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time	bigint	CPU time (unit: $\mu$ s).
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).
parse_time	bigint	SQL parsing time (unit: $\mu$ s)
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s)
data_io_time	bigint	I/O time (unit: $\mu$ s).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <code>{"time":xxx, "n_calls":xxx, "size":xxx}</code>

Name	Type	Description
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <b>{"time":xxx, "n_calls":xxx, "size":xxx}</b>
net_stream_sen d_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <b>{"time":xxx, "n_calls":xxx, "size":xxx}</b>
net_stream_rec v_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <b>{"time":xxx, "n_calls":xxx, "size":xxx}</b>
lock_count	bigint	Number of locks.
lock_time	bigint	Time required for locking.
lock_wait_count	bigint	Number of lock waits.
lock_wait_time	bigint	Time required for lock waiting.
lock_max_count	bigint	Maximum number of locks.
lwlock_count	bigint	Number of lightweight locks (reserved).
lwlock_wait_co unt	bigint	Number of lightweight lock waits.

Name	Type	Description
lwlock_time	bigint	Time required for lightweight locking (reserved).
lwlock_wait_time	bigint	Time required for lightweight lock waiting.
details	bytea	<p>List of wait events and statement lock events.</p> <p>When the value of the record level is greater than or equal to L0, the list of wait events starts to be recorded. It displays statistics about wait events on the current node. For key events in the kernel, see <a href="#">Table 13-175</a>. Alternatively, view the list of all events in the system in the wait_event_info view. For details about the impact of each transaction lock on services, see <a href="#">LOCK</a>.</p> <p>When the value of <b>track_stmt_stat_level</b> is <b>L2</b>, the list of statement lock events is recorded. The list records events in chronological order. The number of records is affected by the value of the <b>track_stmt_details_size</b> parameter.</p> <p>This column is in binary format and needs to be read by using the parsing function pg_catalog.statement_detail_decode. For details, see <a href="#">Other Functions</a>.</p> <p>Events include:</p> <ul style="list-style-type: none"> <li>• Start locking.</li> <li>• Complete locking.</li> <li>• Start lock waiting.</li> <li>• Complete lock waiting.</li> <li>• Start unlocking.</li> <li>• Complete unlocking.</li> <li>• Start lightweight lock waiting.</li> <li>• Complete lightweight lock waiting.</li> </ul>
is_slow_sql	Boolean	Specifies whether the SQL statement is a slow SQL statement.
trace_id	text	Driver-specific trace ID, which is associated with an application request.

Name	Type	Description
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement. <b>NOTE</b> If the statement is executed in SQLBypass mode (you can run the explain command to view the plan), there is no slow SQL risk and the information in this field may be missing.
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that calls the stored procedure. For statements outside the stored procedure, the value is <b>0</b> .

## 13.2.10 Cache and I/O

### 13.2.10.1 STATIO\_USER\_TABLES

**STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in the namespace.

**Table 13-110** STATIO\_USER\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

### 13.2.10.2 SUMMARY\_STATIO\_USER\_TABLES

**SUMMARY\_STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in namespaces in the cluster.

**Table 13-111** SUMMARY\_STATIO\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	numeric	Number of disk blocks read from the table
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from indexes in the table
idx_blks_hit	numeric	Number of cache hits in indexes in the table
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table

### 13.2.10.3 GLOBAL\_STATIO\_USER\_TABLES

**GLOBAL\_STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in namespaces on each node.

**Table 13-112** GLOBAL\_STATIO\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

#### 13.2.10.4 STATIO\_USER\_INDEXES

**STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces on the current node.

**Table 13-113** STATIO\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name

Name	Type	Description
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 13.2.10.5 SUMMARY\_STATIO\_USER\_INDEXES

**SUMMARY\_STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces in the cluster.

**Table 13-114** SUMMARY\_STATIO\_USER\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.6 GLOBAL\_STATIO\_USER\_INDEXES

**GLOBAL\_STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces on each node.

**Table 13-115** GLOBAL\_STATIO\_USER\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index

Name	Type	Description
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.7 STATIO\_USER\_SEQUENCES

**STATIO\_USER\_SEQUENCE** displays I/O status information about all user relationship table sequences in namespaces on the current node.

**Table 13-116** STATIO\_USER\_SEQUENCE columns

Name	Type	Description
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.8 SUMMARY\_STATIO\_USER\_SEQUENCES

**SUMMARY\_STATIO\_USER\_SEQUENCES** displays I/O status information about all user relationship table sequences in namespaces in the cluster.

**Table 13-117** SUMMARY\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

### 13.2.10.9 GLOBAL\_STATIO\_USER\_SEQUENCES

**GLOBAL\_STATIO\_USER\_SEQUENCES** displays I/O status information about all user relationship table sequences in namespaces on each node.

**Table 13-118** GLOBAL\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.10 STATIO\_SYS\_TABLES

**STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in the current namespace.

**Table 13-119** STATIO\_SYS\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

### 13.2.10.11 SUMMARY\_STATIO\_SYS\_TABLES

**SUMMARY\_STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in namespaces in the cluster.

**Table 13-120** SUMMARY\_STATIO\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	numeric	Number of disk blocks read from the table
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from indexes in the table
idx_blks_hit	numeric	Number of cache hits in indexes in the table
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table

### 13.2.10.12 GLOBAL\_STATIO\_SYS\_TABLES

**GLOBAL\_STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in namespaces on each node.

**Table 13-121** GLOBAL\_STATIO\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table

Name	Type	Description
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

### 13.2.10.13 STATIO\_SYS\_INDEXES

**STATIO\_SYS\_INDEXES** displays the I/O status information about all system catalog indexes in the current namespace.

**Table 13-122** STATIO\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 13.2.10.14 SUMMARY\_STATIO\_SYS\_INDEXES

**SUMMARY\_STATIO\_SYS\_INDEXES** displays I/O status information about all system catalog indexes in namespaces in the cluster.

**Table 13-123** SUMMARY\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.15 GLOBAL\_STATIO\_SYS\_INDEXES

**GLOBAL\_STATIO\_SYS\_INDEXES** displays I/O status information about all system catalog indexes in namespaces on each node.

**Table 13-124** GLOBAL\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.16 STATIO\_SYS\_SEQUENCES

**STATIO\_SYS\_SEQUENCES** shows the I/O status information about all the system sequences in the current namespace.

**Table 13-125** STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.17 SUMMARY\_STATIO\_SYS\_SEQUENCES

**SUMMARY\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all system sequences in namespaces in the cluster.

**Table 13-126** SUMMARY\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

### 13.2.10.18 GLOBAL\_STATIO\_SYS\_SEQUENCES

**GLOBAL\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all system sequences in namespaces on each node.

**Table 13-127** GLOBAL\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.19 STATIO\_ALL\_TABLES

**STATIO\_ALL\_TABLES** contains I/O statistics about a row of each table (including TOAST tables) in databases.

**Table 13-128** STATIO\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

### 13.2.10.20 SUMMARY\_STATIO\_ALL\_TABLES

**SUMMARY\_STATIO\_ALL\_TABLES** contains I/O statistics about each table (including TOAST tables) in databases in the cluster.

**Table 13-129** SUMMARY\_STATIO\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	numeric	Number of disk blocks read from the table

Name	Type	Description
heap_blks_hit	numeric	Number of cache hits in the table
idx_blks_read	numeric	Number of disk blocks read from indexes in the table
idx_blks_hit	numeric	Number of cache hits in indexes in the table
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table

### 13.2.10.21 GLOBAL\_STATIO\_ALL\_TABLES

**GLOBAL\_STATIO\_ALL\_TABLES** contains I/O statistics about each table (including TOAST tables) in databases on each node.

**Table 13-130** GLOBAL\_STATIO\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from indexes in the table
idx_blks_hit	bigint	Number of cache hits in indexes in the table
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table

### 13.2.10.22 STATIO\_ALL\_INDEXES

**STATIO\_ALL\_INDEXES** contains one row for each index in the current database, showing I/O statistics about specific indexes.

**Table 13-131** STATIO\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 13.2.10.23 SUMMARY\_STATIO\_ALL\_INDEXES

**SUMMARY\_STATIO\_ALL\_INDEXES** contains I/O statistics about each index row in databases in the cluster.

**Table 13-132** SUMMARY\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index

Name	Type	Description
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.24 GLOBAL\_STATIO\_ALL\_INDEXES

**GLOBAL\_STATIO\_ALL\_INDEXES** contains I/O statistics about one row of each index in databases on each node.

**Table 13-133** GLOBAL\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the table that the index is created for
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table that the index is created for
indexrelname	name	Index name
idx_blks_read	numeric	Number of disk blocks read from the index
idx_blks_hit	numeric	Number of cache hits in the index

### 13.2.10.25 STATIO\_ALL\_SEQUENCES

**STATIO\_ALL\_SEQUENCES** contains one row for each sequence in the current database, showing I/O statistics about specific sequences.

**Table 13-134** STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

### 13.2.10.26 SUMMARY\_STATIO\_ALL\_SEQUENCES

**SUMMARY\_STATIO\_ALL\_SEQUENCES** contains I/O statistics about one row of each sequence in databases in the cluster.

**Table 13-135** SUMMARY\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	numeric	Number of disk blocks read from the sequence
blks_hit	numeric	Number of cache hits in the sequence

### 13.2.10.27 GLOBAL\_STATIO\_ALL\_SEQUENCES

**GLOBAL\_STATIO\_ALL\_SEQUENCES** contains I/O statistics about one row of each sequence in databases on each node.

**Table 13-136** GLOBAL\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name
relid	oid	OID of the sequence
schemaname	name	Name of the schema that the sequence is in
relname	name	Sequence name
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Number of cache hits in the sequence

## 13.2.11 Communication Library

### 13.2.11.1 COMM\_DELAY

**COMM\_DELAY** displays the TCP proxy communications library status for a single DN.

**Table 13-137** COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name

Name	Type	Description
remote_name	text	Name of the peer node
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: $\mu$ s) <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: $\mu$ s)
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: $\mu$ s)

### 13.2.11.2 GLOBAL\_COMM\_DELAY

**GLOBAL\_COMM\_DELAY** displays the TCP proxy communications library status for all the DNs.

**Table 13-138** GLOBAL\_COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name
remote_name	text	Name of the peer node
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: $\mu$ s) <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: $\mu$ s)
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: $\mu$ s)

### 13.2.11.3 COMM\_RECV\_STREAM

**COMM\_RECV\_STREAM** displays the receiving stream status of all TCP proxy communications libraries on a single DN.

**Table 13-139** COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Stream status
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received by the stream (unit: byte)
time	bigint	Current lifecycle service duration of the stream (unit: ms)
speed	bigint	Average receiving rate of the stream (unit: byte/s)
quota	bigint	Current communication quota value of the stream (unit: byte)
buff_usize	bigint	Current size of the data cache of the stream (unit: byte)

### 13.2.11.4 GLOBAL\_COMM\_RECV\_STREAM

**GLOBAL\_COMM\_RECV\_STREAM** displays the receiving stream status of all TCP proxy communications libraries on all the DNs.

**Table 13-140** GLOBAL\_COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Stream status
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
recv_bytes	bigint	Total data volume received by the stream (unit: byte)
time	bigint	Current lifecycle service duration of the stream (unit: ms)
speed	bigint	Average receiving rate of the stream (unit: byte/s)
quota	bigint	Current communication quota value of the stream (unit: byte)
buff_usize	bigint	Current size of the data cache of the stream (unit: byte)

### 13.2.11.5 COMM\_SEND\_STREAM

**COMM\_SEND\_STREAM** displays the sending stream status of all TCP proxy communications libraries on a single DN.

**Table 13-141** COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream

Name	Type	Description
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Stream status
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream (unit: byte)
time	bigint	Current lifecycle service duration of the stream (unit: ms)
speed	bigint	Average sending rate of the stream (unit: byte/s)
quota	bigint	Current communication quota value of the stream (unit: byte)
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms)

### 13.2.11.6 GLOBAL\_COMM\_SEND\_STREAM

**GLOBAL\_COMM\_SEND\_STREAM** displays the sending stream status of all TCP proxy communications libraries on all the DN's.

**Table 13-142** GLOBAL\_COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name
local_tid	bigint	ID of the thread using this stream
remote_name	text	Name of the peer node
remote_tid	bigint	Peer thread ID

Name	Type	Description
idx	integer	Peer DN ID in the local DN
sid	integer	Stream ID in the physical connection
tcp_sock	integer	TCP socket used in the stream
state	text	Stream status
query_id	bigint	<b>debug_query_id</b> corresponding to the stream
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream
send_bytes	bigint	Total data volume sent by the stream (unit: byte)
time	bigint	Current lifecycle service duration of the stream (unit: ms)
speed	bigint	Average sending rate of the stream (unit: byte/s)
quota	bigint	Current communication quota value of the stream (unit: byte)
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms)

### 13.2.11.7 COMM\_STATUS

**COMM\_STATUS** displays the TCP proxy communications library status on a single DN.

**Table 13-143** COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in Kbyte/s
txkbyte_rate	bigint	Sending rate of the communications library on the node, in Kbyte/s

Name	Type	Description
buffer	bigint	Size of the buffer of the Cmailbox
memkbyte_l ibcomm	bigint	Communication memory size of the <b>libcomm</b> process, in bytes
memkbyte_l ibpq	bigint	Communication memory size of the <b>libpq</b> process, in bytes
used_pm	integer	Real-time usage of the <b>postmaster</b> thread
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads
stream	integer	Total number of used logical connections.

### 13.2.11.8 GLOBAL\_COMM\_STATUS

**GLOBAL\_COMM\_STATUS** displays the TCP proxy communications library status on all the DNs.

**Table 13-144** GLOBAL\_COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in Kbyte/s
txkbyte_rate	bigint	Sending rate of the communications library on the node, in Kbyte/s
buffer	bigint	Size of the buffer of the Cmailbox
memkbyte_l ibcomm	bigint	Communication memory size of the <b>libcomm</b> process, in bytes
memkbyte_l ibpq	bigint	Communication memory size of the <b>libpq</b> process, in bytes

Name	Type	Description
used_pm	integer	Real-time usage of the <b>postmaster</b> thread
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads
stream	integer	Total number of used logical connections.

## 13.2.12 Utility

### 13.2.12.1 REPLICATION\_STAT

REPLICATION\_STAT describes information about log synchronization status, such as the locations where the sender sends logs and where the receiver receives logs.

**Table 13-145** REPLICATION\_STAT columns

Name	Type	Description
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
username	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.
backend_start	timestamp with time zone	Start time of the program.
state	text	Log replication state: <ul style="list-style-type: none"> <li>• Catch-up state</li> <li>• Consistent streaming state</li> </ul>
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.

Name	Type	Description
receiver_flush_location	text	Location where the receiver flushes logs.
receiver_replay_location	text	Location where the receiver replays logs.
sync_priority	integer	Priority of synchronous duplication. (0 indicates asynchronization.)
sync_state	text	Synchronization state: <ul style="list-style-type: none"> <li>Asynchronous replication</li> <li>Synchronous replication</li> <li>Potential synchronization</li> </ul>

### 13.2.12.2 GLOBAL\_REPLICATION\_STAT

GLOBAL\_REPLICATION\_STAT displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs.

**Table 13-146** GLOBAL\_REPLICATION\_STAT columns

Name	Type	Description
node_name	name	Node name.
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
username	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.
backend_start	timestamp with time zone	Start time of the program.
state	text	Log replication state: <ul style="list-style-type: none"> <li>Catch-up state</li> <li>Consistent streaming state</li> </ul>
sender_sent_location	text	Location where the sender sends logs.

Name	Type	Description
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receiver flushes logs.
receiver_replay_location	text	Location where the receiver replays logs.
sync_priority	integer	Priority of synchronous duplication. ( <b>0</b> indicates asynchronization.)
sync_state	text	Synchronization state: <ul style="list-style-type: none"> <li>Asynchronous replication</li> <li>Synchronous replication</li> <li>Potential synchronization</li> </ul>

### 13.2.12.3 REPLICATION\_SLOTS

**REPLICATION\_SLOTS** displays replication slot information.

**Table 13-147** REPLICATION\_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. <ul style="list-style-type: none"> <li><b>physical</b>: physical replication slot.</li> <li><b>logical</b>: logical replication slot.</li> </ul>
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. <ul style="list-style-type: none"> <li><b>t</b> (true): yes</li> <li><b>f</b> (false): no</li> </ul>
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.

Name	Type	Description
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.

### 13.2.12.4 GLOBAL\_REPLICATION\_SLOTS

**GLOBAL\_REPLICATION\_SLOTS** displays information about replicated slots on each node in the cluster.

**Table 13-148** GLOBAL\_REPLICATION\_SLOTS columns

Name	Type	Description
node_name	name	Node name.
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. <ul style="list-style-type: none"> <li>• <b>physical</b>: physical replication slot.</li> <li>• <b>logical</b>: logical replication slot.</li> </ul>
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
x_min	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.

Name	Type	Description
dummy_standby	boolean	Reserved parameter.

### 13.2.12.5 PARALLEL\_DECODE\_STATUS

**PARALLEL\_DECODE\_STATUS** displays parallel decoding information about replication slots on the current node. This view needs to be queried on a CN. No result is returned if you query the view on a DN.

**Table 13-149** PARALLEL\_DECODE\_STATUS columns

Name	Type	Description
slot_name	text	Specifies the replication slot name.
parallel_decode_number	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestampz	Specifies the time of the latest WAL decoded by the replication slot.

### 13.2.12.6 GLOBAL\_PARALLEL\_DECODE\_STATUS

**GLOBAL\_PARALLEL\_DECODE\_STATUS** displays parallel decoding information about replication slots on each primary DN in a cluster. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

**Table 13-150** GLOBAL\_PARALLEL\_DECODE\_STATUS columns

Name	Type	Description
node_name	name	Specifies the node name.
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestampz	Specifies the time of the latest WAL decoded by the replication slot.

### 13.2.12.7 PARALLEL\_DECODE\_THREAD\_INFO

**PARALLEL\_DECODE\_THREAD\_INFO** displays information about threads that perform parallel decoding on the current node. This view needs to be queried on a CN. No result is returned if you query the view on a DN.

**Table 13-151** PARALLEL\_DECODE\_THREAD\_INFO columns

Name	Type	Description
thread_id	bigint	Thread ID
slot_name	text	Replication slot name
thread_type	text	Thread type (sender, reader, or decoder)
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot

### 13.2.12.8 GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO

**GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO** displays information about threads that perform parallel decoding on each primary DN in a cluster. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

**Table 13-152** GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO columns

Name	Type	Description
node_name	name	Node name
thread_id	bigint	Thread ID
slot_name	text	Replication slot name
thread_type	text	Thread type (sender, reader, or decoder)
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot

### 13.2.12.9 BGWRITER\_STAT

**BGWRITER\_STAT** displays statistics about the background writer process's activities.

**Table 13-153** BGWRITER\_STAT columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed
checkpoints_req	bigint	Number of requested checkpoints that have been performed
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms)
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms)
buffers_checkpoint	bigint	Number of buffers written during checkpoints
buffers_clean	bigint	Number of buffers written by the background writer

Name	Type	Description
maxwritten_clean	bigint	Number of times the background writer stopped a cleaning scan because it had written too many buffers
buffers_backend	bigint	Number of buffers written directly by the backend
buffers_backend_fsync	bigint	Number of times the backend had to execute its own fsync call (normally the background writer handles those even when the backend does its own write)
buffers_alloc	bigint	Number of buffers allocated
stats_reset	timestamp with time zone	Time at which these statistics were last reset

### 13.2.12.10 GLOBAL\_BGWRITER\_STAT

**GLOBAL\_BGWRITER\_STAT** displays statistics about the background writer process's activities on each node.

**Table 13-154** GLOBAL\_BGWRITER\_STAT columns

Name	Type	Description
node_name	name	Node name
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed
checkpoints_req	bigint	Number of requested checkpoints that have been performed
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms)
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms)
buffers_checkpoint	bigint	Number of buffers written during checkpoints
buffers_clean	bigint	Number of buffers written by the background writer

Name	Type	Description
maxwritten_clean	bigint	Number of times the background writer stopped a cleaning scan because it had written too many buffers
buffers_backend	bigint	Number of buffers written directly by a backend
buffers_backend_fsync	bigint	Number of times the backend had to execute its own fsync call (normally the background writer handles those even when the backend does its own write)
buffers_alloc	bigint	Number of buffers allocated
stats_reset	timestamp with time zone	Time at which these statistics were last reset

### 13.2.12.11 POOLER\_STATUS

**POOLER\_STATUS** is used to query the cache connection status of the pooler module on the local CN.

**Table 13-155** POOLER\_STATUS columns

Name	Type	Description
database	text	Database name
user_name	text	Username
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected
node_name	name	Name of the node connected
in_use	boolean	Whether the connection is currently used. <ul style="list-style-type: none"><li>• <b>t</b> (true): The connection is in use.</li><li>• <b>f</b> (false): The connection is not in use.</li></ul>
node_port	integer	Port number of the node connected

Name	Type	Description
fdsock	bigint	Port file descriptor
remote_pid	bigint	Thread ID of the remote node connected
session_params	text	Session parameter
used_count	bigint	Number of reuse times of a connection
idx	bigint	Logical connection ID of the connected instance node
streamid	bigint	Stream ID corresponding to each logical connection

### 13.2.12.12 GLOBAL\_COMM\_CHECK\_CONNECTION\_STATUS

GLOBAL\_COMM\_CHECK\_CONNECTION\_STATUS displays the connection status of all CNs and all active nodes (CNs and primary DN). The permission control is inherited from the DBE\_PERF schema.

**Table 13-156** GLOBAL\_COMM\_CHECK\_CONNECTION\_STATUS columns

Name	Type	Description
node_name	name	Instance name.
remote_name	name	Name of the peer instance.
remote_host	text	IP address of the peer instance.
remote_port	bigint	Port number of the peer instance.
is_connected	Boolean	<p>Detects the network status between the current instance and the peer instance:</p> <ul style="list-style-type: none"> <li>• <b>t</b> (true): The network between instances is normal.</li> <li>• <b>f</b> (false): The network between instances is abnormal.</li> </ul>
no_error_occur	Boolean	<p>Pooler connection result between the current instance and the peer instance.</p> <ul style="list-style-type: none"> <li>• <b>t</b> (true) indicates that the pooler connection is normal.</li> <li>• <b>f</b> (false) indicates that the pooler connection is abnormal.</li> </ul>

### 13.2.12.13 GLOBAL\_CKPT\_STATUS

GLOBAL\_CKPT\_STATUS displays the information about checkpoints and flushing pages of all instances in the entire cluster.

**Table 13-157** GLOBAL\_CKPT\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
ckpt_redo_point	text	Checkpoint of the current instance.
ckpt_clog_flush_num	bigint	Number of Clog flushing pages from the startup time to the current time.
ckpt_csnlog_flush_num	bigint	Number of CSN log flushing pages from the startup time to the current time.
ckpt_multixact_flush_num	bigint	Number of MultiXact flushing pages from the startup time to the current time.
ckpt_predicate_flush_num	bigint	Number of predicate flushing pages from the startup time to the current time.
ckpt_twophase_flush_num	bigint	Number of two-phase flushing pages from the startup time to the current time.

### 13.2.12.14 GLOBAL\_DOUBLE\_WRITE\_STATUS

GLOBAL\_DOUBLE\_WRITE\_STATUS displays the information about doublewrite files of all instances in the entire cluster.

**Table 13-158** GLOBAL\_DOUBLE\_WRITE\_STATUS columns

Name	Type	Description
node_name	text	Instance name
curr_dwn	bigint	Sequence number of the doublewrite file
curr_start_page	bigint	Start page for restoring the doublewrite file
file_trunc_num	bigint	Number of times that the doublewrite file is reused
file_reset_num	bigint	Number of reset times after the doublewrite file is full
total_writes	bigint	Total number of I/Os of the doublewrite file

Name	Type	Description
low_threshold_writes	bigint	Number of I/Os for writing the doublewrite files with low efficiency (the number of I/O flushing pages at a time is less than 16.)
high_threshold_writes	bigint	Number of I/Os for writing the doublewrite files with high efficiency (the number of I/O flushing pages at a time is more than 421.)
total_pages	bigint	Total number of pages that are flushed to the doublewrite file area
low_threshold_pages	bigint	Number of pages that are flushed with low efficiency
high_threshold_pages	bigint	Number of pages that are flushed with high efficiency
file_id	bigint	ID of the current doublewrite file

### 13.2.12.15 GLOBAL\_PAGEWRITER\_STATUS

**GLOBAL\_PAGEWRITER\_STATUS** displays the information about checkpoints and flushing pages of all instances in the cluster.

**Table 13-159** GLOBAL\_PAGEWRITER\_STATUS columns

Name	Type	Description
node_name	text	Instance name
pgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed from the startup time to the current time
pgwr_last_flush_num	integer	Number of dirty pages flushed in the previous batch
remain_dirty_page_num	bigint	Estimated number of dirty pages that are not flushed
queue_head_page_rec_lsn	text	<b>recovery_lsn</b> of the first dirty page in the dirty page queue of the current instance
queue_rec_lsn	text	<b>recovery_lsn</b> of the dirty page queue of the current instance
current_xlog_important_lsn	text	The write position of Xlogs in the current instance
ckpt_redo_point	text	Checkpoint of the current instance

### 13.2.12.16 GLOBAL\_POOLER\_STATUS

**GLOBAL\_POOLER\_STATUS** is used to query the cache connection status of the pooler modules on all CNs.

**Table 13-160** GLOBAL\_POOLER\_STATUS columns

Name	Type	Description
source_node_name	name	Source node name
database	text	Database name
user_name	text	Username
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected
node_name	name	Name of the node connected
in_use	boolean	Whether the connection is currently used. <ul style="list-style-type: none"><li>• <b>t</b> (true): The connection is in use.</li><li>• <b>f</b> (false): The connection is not in use.</li></ul>
fdsock	bigint	Port file descriptor
remote_pid	bigint	Thread ID of the remote node connected
session_params	text	Session parameter

### 13.2.12.17 GLOBAL\_RECORD\_RESET\_TIME

**GLOBAL\_RECORD\_RESET\_TIME** is used to obtain statistics about the reset (restart, active/standby switchover, and database deletion) time of each node in the cluster.

**Table 13-161** GLOBAL\_RECORD\_RESET\_TIME columns

Name	Type	Description
node_name	text	Node name.
reset_time	timestamp with time zone	Time to be reset.

### 13.2.12.18 GLOBAL\_REDO\_STATUS

GLOBAL\_REDO\_STATUS displays the replaying of logs about instances in the entire cluster.

**Table 13-162** GLOBAL\_REDO\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
redo_start_ptr	bigint	Start point for replaying the instance logs.
redo_start_time	bigint	Start time (UTC) when the instance logs are replayed.
redo_done_time	bigint	End time (UTC) when the instance logs are replayed.
curr_time	bigint	Current time (UTC) of the instance.
min_recovery_point	bigint	Minimum barrier for the current instance log to provide services after the replay is complete.
read_ptr	bigint	Position for reading the instance logs.
last_replayed_read_ptr	bigint	Position for replaying the instance logs.
recovery_done_ptr	bigint	Replay position after the instance is started.
read_xlog_io_counter	bigint	Number of I/Os when the current instance reads and replays logs.
read_xlog_io_total_dur	bigint	Total I/O duration when the current instance reads and replays logs.
read_data_io_counter	bigint	Number of data page I/O reads during replay in the current instance log.
read_data_io_total_dur	bigint	Total I/O duration reads during replay in the current instance log.
write_data_io_counter	bigint	Number of data page I/O writes during replay in the current instance log.
write_data_io_total_dur	bigint	Total I/O duration writes during replay in the current instance log.
process_pending_counter	bigint	Number of synchronization times of log distribution threads during replay in the instance log.
process_pending_total_dur	bigint	Synchronization duration of log distribution threads during replay in the instance log.

Name	Type	Description
apply_counter	bigint	Number of synchronization times of replay threads during replay in the instance log.
apply_total_dur	bigint	Synchronization duration of replay threads during replay in the instance log.
speed	bigint	Log replay rate of the current instance. The value is updated every time when a 256-MB log is replayed. The unit is byte/s.  In a cluster environment, you are advised to run the <b>cm_ctl query -rv</b> command to obtain a more accurate replay speed of the standby node. For details about the <b>cm_ctl</b> command, see "Unified Cluster Management Tool" in <i>Tool Reference</i> .
local_max_ptr	bigint	Maximum number of replay logs received by the localhost after the instance is started.
primary_flush_ptr	bigint	Log point where the host flushes logs to a disk.
worker_info	text	Replay thread information of the instance. If parallel replay is not enabled, the value is <b>NULL</b> .

### 13.2.12.19 GLOBAL\_RECOVERY\_STATUS

GLOBAL\_RECOVERY\_STATUS displays log flow control information about the primary and standby nodes.

**Table 13-163** GLOBAL\_RECOVERY\_STATUS columns

Name	Type	Description
node_name	text	Node name (including the primary and standby nodes).
standby_node_name	text	Name of the standby node.
source_ip	text	IP address of the primary node.
source_port	integer	Port number of the primary node.
dest_ip	text	IP address of the standby node.
dest_port	integer	Port number of the standby node.
current_rto	bigint	Current log flow control time of the standby node (unit: s).

Name	Type	Description
target_rto	bigint	Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s).
current_sleep_time	bigint	Sleep time (in microseconds) required by the host to achieve the expected RTO.

### 13.2.12.20 CLASS\_VITAL\_INFO

CLASS\_VITAL\_INFO is used to check whether the OIDs of the same table or index are consistent for WDR snapshots.

**Table 13-164** CLASS\_VITAL\_INFO columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Schema name.
relname	name	Table name.
relkind	"char"	Object type. Its value can be: <ul style="list-style-type: none"> <li>• r: ordinary table.</li> <li>• t: TOAST table.</li> <li>• i: index.</li> </ul>

### 13.2.12.21 USER\_LOGIN

USER\_LOGIN records the number of user logins and logouts.

**Table 13-165** USER\_LOGIN columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
user_id	integer	User OID (Its value is the same as that of <b>oid</b> in <b>pg_authid</b> .)
login_counter	bigint	Number of logins
logout_counter	bigint	Number of logouts

### 13.2.12.22 SUMMARY\_USER\_LOGIN

**SUMMARY\_USER\_LOGIN** records information about user logins and logouts on all CNs.

**Table 13-166** SUMMARY\_USER\_LOGIN columns

Name	Type	Description
node_name	text	Node name
user_name	text	Username
user_id	integer	User OID (Its value is the same as that of <b>oid</b> in <b>pg_authid</b> .)
login_counter	bigint	Number of logins
logout_counter	bigint	Number of logouts

### 13.2.12.23 GLOBAL\_GET\_BGWRITER\_STATUS

**GLOBAL\_GET\_BGWRITER\_STATUS** displays the information about pages flushed by the bgwriter threads of all instances in the entire cluster, number of pages in the candidate buffer chain, and buffer eviction information.

**Table 13-167** GLOBAL\_GET\_BGWRITER\_STATUS columns

Name	Type	Description
node_name	text	Node name.
bgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed by the bgwriter thread from the startup time to the current time.
bgwr_last_flush_num	integer	Number of dirty pages flushed by the bgwriter thread in the previous batch.
candidate_slots	integer	Number of pages in the current candidate buffer chain.
get_buffer_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction.
get_buffer_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction.

### 13.2.12.24 GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS

**GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS** displays information about doublewrite files eliminated on a single page of all instances in the entire cluster. In the displayed

information, the information before the slash (/) indicates the page flushing status of the first version, and the information after the slash (/) indicates the page flushing status of the second version.

**Table 13-168** GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS columns

Name	Type	Description
node_name	text	Node name.
curr_dwn	text	Sequence number of the doublewrite file.
curr_start_page	text	Start position of the current doublewrite file.
total_writes	text	Total number of data write pages in the current doublewrite file.
file_trunc_num	text	Number of times that the doublewrite file is reused.
file_reset_num	text	Number of reset times after the doublewrite file is full.

### 13.2.12.25 GLOBAL\_CANDIDATE\_STATUS

GLOBAL\_CANDIDATE\_STATUS displays the number of candidate buffers and buffer eviction information of all instances in the database.

**Table 13-169** GLOBAL\_GET\_BGWRITER\_STATUS columns

Name	Type	Description
node_name	text	Node name.
candidate_slots	integer	Number of pages in the candidate buffer chain of the current normal buffer pool.
get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool.
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool.
seg_candidate_slots	integer	Number of pages in the candidate buffer chain of the current segment buffer pool.
seg_get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool.

Name	Type	Description
seg_get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool.

## 13.2.13 Lock

### 13.2.13.1 LOCKS

**LOCKS** displays information about locks held by each open transaction.

**Table 13-170** LOCKS columns

Name	Type	Description
locktype	text	Type of the locked object: <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b>
database	oid	OID of the database in which the locked object exists. <ul style="list-style-type: none"> <li>The OID is <b>0</b> if the object is a shared object.</li> <li>The OID is <b>NULL</b> if the object is a transaction ID.</li> </ul>
relation	oid	OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is <b>NULL</b> if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is <b>NULL</b> if the object is not a row.
bucket	integer	Hash bucket number
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.

Name	Type	Description
classid	oid	OID of the system catalog that contains the object. The value is <b>NULL</b> if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is <b>0</b> if the object is some other object type. The value is <b>NULL</b> if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.
sessionid	bigint	ID of the session holding or awaiting this lock The value is <b>NULL</b> if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread
granted	boolean	<ul style="list-style-type: none"><li>• The value is <b>TRUE</b> if the lock is a held lock.</li><li>• The value is <b>FALSE</b> if the lock is an awaited lock.</li></ul>
fastpath	boolean	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the <b>locktag_decode()</b> function.
global_sessionid	text	Global session ID

### 13.2.13.2 GLOBAL\_LOCKS

**GLOBAL\_LOCKS** displays information about locks held by open transactions on each node.

**Table 13-171** GLOBAL\_LOCKS columns

Name	Type	Description
node_name	name	Node name

Name	Type	Description
locktype	text	Type of the locked object: <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b>
database	oid	OID of the database in which the locked object exists. <ul style="list-style-type: none"> <li>The OID is <b>0</b> if the object is a shared object.</li> <li>The OID is <b>NULL</b> if the object is a transaction ID.</li> </ul>
relation	oid	OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is <b>NULL</b> if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is <b>NULL</b> if the object is not a row.
bucket	integer	Hash bucket ID
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is <b>NULL</b> if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is <b>0</b> if the object is some other object type. The value is <b>NULL</b> if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.

Name	Type	Description
sessionid	bigint	ID of the session holding or awaiting this lock The value is <b>NULL</b> if the lock is held by a prepared transaction.
global_sessionid	text	Global session ID
mode	text	Lock mode held or desired by this thread
granted	boolean	<ul style="list-style-type: none"><li>The value is <b>TRUE</b> if the lock is a held lock.</li><li>The value is <b>FALSE</b> if the lock is an awaited lock.</li></ul>
fastpath	boolean	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the <b>locktag_decode()</b> function.

## 13.2.14 Wait Event

### 13.2.14.1 WAIT\_EVENTS

**WAIT\_EVENTS** displays statistics about wait events on the current node. For key events in the kernel, see [Table 13-175](#). Alternatively, view the list of all events in the system in the **wait\_event\_info** view. For details about the impact of each transaction lock on services, see [LOCK](#).

**Table 13-172** WAIT\_EVENTS columns

Name	Type	Description
nodename	text	Node name
type	text	Event type
event	text	Event name
wait	bigint	Number of waiting times
failed_wait	bigint	Number of waiting failures
total_wait_time	bigint	Total waiting time (unit: $\mu$ s)
avg_wait_time	bigint	Average waiting time (unit: $\mu$ s)
max_wait_time	bigint	Maximum waiting time (unit: $\mu$ s)
min_wait_time	bigint	Minimum waiting time (unit: $\mu$ s)

Name	Type	Description
last_updated	timestamp with time zone	Last time when the event was updated

### 13.2.14.2 GLOBAL\_WAIT\_EVENTS

**GLOBAL\_WAIT\_EVENTS** displays statistics about wait events on each node.

**Table 13-173** GLOBAL\_WAIT\_EVENTS columns

Name	Type	Description
nodename	text	Node name
type	text	Event type
event	text	Event name
wait	bigint	Number of waiting times
failed_wait	bigint	Number of waiting failures
total_wait_time	bigint	Total waiting time (unit: $\mu$ s)
avg_wait_time	bigint	Average waiting time (unit: $\mu$ s)
max_wait_time	bigint	Maximum waiting time (unit: $\mu$ s)
min_wait_time	bigint	Minimum waiting time (unit: $\mu$ s)
last_updated	timestamp with time zone	Last time when the event was updated

### 13.2.14.3 WAIT\_EVENT\_INFO

**WAIT\_EVENT\_INFO** displays the details about wait events.

**Table 13-174** WAIT\_EVENT\_INFO columns

Name	Type	Description
module	text	Name of the module an event belongs to.
type	text	Event type.
event	text	Event name.

**Table 13-175** List of wait events

Module Category	Event Category	Event	Description
Lock	Wait event	acquire lock	Waits for locking until the locking succeeds or times out.
SharedMemory	LWLock event	ShmemIndex Lock	Protects the primary index table, a hash table, in shared memory.
Shared buffer	LWLock event	BufMappingLock	Protects operations on a shared-buffer mapping table.
Lmgr	LWLock event	LockMgrLock	Protects the information about a common lock structure.
LWLock	Wait event	acquire lwlock	Waits for a lightweight lock.
I/O	Wait event	wait io	Waits for I/O completion.
COMM	Wait event	wait cmd	Waits for reading network communication packets to complete.
COMM	Wait event	wait pooler get conn	Waits for pooler to obtain connections.
COMM	Wait event	wait pooler abort conn	Waits for pooler to terminate connections.
COMM	Wait event	wait pooler clean conn	Waits for pooler to clear connections.
COMM	Wait event	get conn	Obtains connections to other nodes.
COMM	Wait event	set cmd	Waits for running the <b>SET</b> , <b>RESET</b> , or <b>TRANSACTION BLOCK LEVEL</b> command on the connection.
COMM	Wait event	cancel query	Cancels the SQL statement that is being executed through a connection.
COMM	Wait event	stop query	Stops the query that is being executed through a connection.
COMM	Wait event	wait node	Waits for receiving data through the connection to a node.
COMM	Wait event	flush data	Waits for sending data to other nodes in the network.
COMM	Wait event	stream get conn	Waits for establishing connections to consumer nodes when the stream flow is initialized.

Module Category	Event Category	Event	Description
COMM	Wait event	wait producer ready	Waits for every producer to get ready when the stream flow is initialized.
Stream	Wait event	synchronize quit	Waits for the threads in the stream thread group to exit when the stream plan ends.
Stream	Wait event	wait stream group destroy	Waits for destroying the stream node group when the stream plan ends.
Transaction	Wait event	wait transaction sync	Waits for transaction synchronization.
Transaction	Wait event	wait data sync	Waits for the completion of data page synchronization to the standby node.
Transaction	Wait event	wait data sync queue	Waits for putting the data pages that are in the row-store into the synchronization queue.
Transaction	LWLock event	OidGenLock	Prevents different threads from generating the same OID.
Transaction	LWLock event	XidGenLock	Prevents two transactions from obtaining the same XID.
Transaction	LWLock event	ProcArrayLock	Prevents concurrent access to or concurrent modification on the ProcArray shared arrays.
Transaction	LWLock event	SubtransControlLock	Prevents concurrent access to or concurrent modification on the sub-transaction control data structure.
Transaction	LWLock event	MultiXactGenLock	Allocates a unique MultiXact ID in serial mode.
Transaction	LWLock event	TwoPhaseStateLock	Prevents concurrent access to or concurrent modification on two-phase information sharing arrays.
Transaction	LWLock event	SerializableXactHashLock	Prevents concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.
Transaction	LWLock event	SerializableFinishedListLock	Prevents concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
Transaction	LWLock event	SerializablePredicateListLock	Protects a linked list of serializable transactions that have locks.

Module Category	Event Category	Event	Description
Transaction	LWLock event	PredicateLock MgrLock	Protects the information about a lock structure that has serializable transactions.
Transaction	LWLock event	OldSerXid SLRU lwlock	Protects SLRU buffers of old transaction IDs.
Transaction	LWLock event	OldSerXidLock	Protects a structure that records serializable transactions that have conflicts.
Transaction	Lock event	transactionid	Adds a lock to a transaction ID.
Transaction	Lock event	virtualxid	Adds a lock to a virtual transaction ID.
Checkpoint	LWLock event	CheckpointLock	Prevents multi-checkpoint concurrent execution.
Checkpoint	LWLock event	CheckpointComLock	Sends file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
Analyze	LWLock event	AutoanalyzeLock	Obtains and releases resources related to a task that allows for autoanalyze execution.
Vacuum	LWLock event	BtreeVacuumLock	Prevents VACUUM from clearing pages that are being used by B-tree indexes.
Vacuum	LWLock event	AutovacuumLock	Accesses the autovacuum worker array in serial mode.
Vacuum	LWLock event	AutovacuumScheduleLock	Distributes tables requiring VACUUM in serial mode.
Autovacuum	LWLock event	AutovacuumLock	Protects the autovacuum shared memory structure.
Autovacuum	LWLock event	AutovacuumScheduleLock	Protects the information about autovacuum workers.
Autoanalyze	LWLock event	AutoanalyzeLock	Protects the <i>autoAnalyzeFreeProcess</i> variable and ensures that no more than 10 autoanalyze threads are running at the same time.
WAL	Wait event	wait wal sync	Waits for the completion of WAL synchronization from the specified LSN to the standby node.

Module Category	Event Category	Event	Description
WAL	I/O event	WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WAL	I/O event	WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WAL	I/O event	WALCopyRead	Reads operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WAL	I/O event	WALCopyWrite	Writes operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WAL	I/O event	WALInitWrite	Initializes a newly created WAL file to 0 during log reclaiming or writing.
WAL	I/O event	WALRead	Reads data from Xlogs during redo operations on two-phase files.
WAL	I/O event	WALSyncMethodAssign	Flushes all open WAL files to a disk.
WAL	I/O event	WALWrite	Writes a WAL file.
WAL	I/O event	LOGCTRL_SLEEP	Collects statistics on the number of stream control times and the sleep time of log stream control.
WAL	LWLock event	RcvWriteLock	Prevents concurrent call of WalDataRcvWrite.
WAL	LWLock event	WALBufMappingLock	An exclusive (X) lock needs to be added when the next page of an Xlog buffer is initialized.
WAL	LWLock event	WALInsertLock	Prevents multiple programs from writing data to the same Xlog buffer at the same time.
WAL	LWLock event	WALWriteLock	Prevents concurrent WAL write.
Relation	LWLock event	SInvalReadLock	Prevents concurrent execution with invalid message deletion.
Relation	LWLock event	SInvalWriteLock	Prevents concurrent execution with invalid message write and deletion.

Module Category	Event Category	Event	Description
Relation	LWLock event	RelCacheInitLock	Adds a lock before any operations are performed on the <b>init</b> file when messages are invalid.
Relation	LWLock event	TablespaceCreateLock	Checks whether a tablespace already exists.
Relation	LWLock event	RelfilenodeReuseLock	Prevents the link to a reused column attribute file from being canceled by mistake.
Relation	Lock event	relation	Adds a lock to a table.
Relation	Lock event	extend	Adds a lock to a table being scaled out.
Relation	Lock event	partition	Adds a lock to a partitioned table.
Relation	Lock event	partition_seq	Adds a lock to a partition of a partitioned table.
WLM	Wait event	wait active statement	Waits for active statements.
WLM	Wait event	wait memory	Waits for free memory.
DDL/DCL	Wait event	create index	Waits for the completion of index creation.
DDL/DCL	Wait event	analyze	Waits for analysis completion.
DDL/DCL	Wait event	vacuum	Waits for the completion of the VACUUM operation.
DDL/DCL	LWLock event	DelayDDLlock	Prevents concurrent DDL operations.
DDL/DCL	Wait event	vacuum full	Waits for the completion of the VACUUM FULL operation.
Executor	Wait event	Sort	Waits for the completion of tuple sorting.
Executor	Wait event	Sort - write file	Writes sorted data to a file temporarily since the memory is limited during merge sort.
Executor	Wait event	Material	Waits for tuple materialization.

Module Category	Event Category	Event	Description
Executor	Wait event	Material - write file	Waits for writing a materialized tuple to a file.
Executor	Wait event	HashJoin - build hash	Waits until a hash table is created when a hash join is executed.
Executor	Wait event	HashJoin - write file	Waits for writing the hash result of a tuple to a disk when a hash join is executed.
Executor	Wait event	HashAgg - build hash	Waits until a hash table is created when a hash aggregate is executed.
Executor	Wait event	HashAgg - write file	Waits for writing the hash result of a tuple to a disk when a hash aggregate is executed.
Executor	Wait event	HashSetop - build hash	Waits until a hash table is created when an OP operation is performed using the hash algorithm.
Executor	Wait event	HashSetop - write file	Waits for writing the hash result of a tuple to a disk when an OP operation is performed using the hash algorithm.
Executor	Wait event	wait sync consumer next step	Waits for the stream consumer to perform the next step.
Executor	Wait event	wait sync producer next step	Waits for the stream producer to perform the next step.
GTM	Wait event	gtm connect	Waits for connecting to GTM.
GTM	Wait event	gtm reset xmin	Waits for GTM to reset the minimum transaction ID.
GTM	Wait event	gtm get xmin	Waits for obtaining the minimum transaction ID from GTM.
GTM	Wait event	gtm get gxid	Waits for obtaining the global transaction ID from GTM during transaction startup.
GTM	Wait event	gtm get csn	Waits for obtaining the CSN from GTM during transaction startup.
GTM	Wait event	gtm get snapshot	Waits for obtaining snapshots from GTM during transaction startup.
GTM	Wait event	gtm begin trans	Waits for GTM to start a transaction.

Module Category	Event Category	Event	Description
GTM	Wait event	gtm commit trans	Waits for GTM to commit a transaction.
GTM	Wait event	gtm rollback trans	Waits for GTM to roll back transactions.
GTM	Wait event	gtm start prepare trans	Waits for GTM to complete the first phase during two-phase commit.
GTM	Wait event	gtm prepare trans	Waits for GTM to complete the second phase during two-phase commit.
GTM	Wait event	gtm open sequence	Waits for GTM to create a sequence.
GTM	Wait event	gtm close sequence	Waits for GTM to complete the ALTER SEQUENCE operation.
GTM	Wait event	gtm set sequence val	Waits for GTM to set a sequence value.
GTM	Wait event	gtm drop sequence	Waits for GTM to delete a sequence.
GTM	Wait event	gtm rename sequence	Waits for GTM to rename a sequence.
GTM	LWLock event	GTMHostInfo Lock	Protects GTM information.
Temp File	I/O event	BufFileRead	Reads data from a temporary file to a specified buffer.
Temp File	I/O event	BufFileWrite	Writes the content of a specified buffer to a temporary file.
Pg_control	I/O event	ControlFileRead	Reads the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileSync	Flushes the <b>pg_control</b> file to a disk, mainly during database initialization.
Pg_control	I/O event	ControlFileSyncUpdate	Flushes the <b>pg_control</b> file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileWrite	Writes the <b>pg_control</b> file, mainly during database initialization.

Module Category	Event Category	Event	Description
Pg_control	I/O event	ControlFileWriteUpdate	Updates the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	LWLock event	ControlFileLock	Prevents concurrent read/write or concurrent write/write on the <b>pg_control</b> file.
File operation	I/O event	CopyFileRead	Reads a file during file copying.
File operation	I/O event	CopyFileWrite	Writes a file during file copying.
File operation	I/O event	DataFileExtend	Writes a file during file name extension.
Table data file	I/O event	DataFileImmediateSync	Flushes a table data file to a disk immediately.
Table data file	I/O event	DataFilePrefetch	Reads a table data file asynchronously.
Table data file	I/O event	DataFileRead	Reads a table data file synchronously.
Table data file	I/O event	DataFileSync	Synchronizes a table data file to a disk.
Table data file	I/O event	DataFileTruncate	Truncates a table data file.
Table data file	I/O event	DataFileWrite	Writes a table data file.
Table data file	LWLock event	SyncScanLock	Determines the start position of a relfilenode during heap scanning.
Table data file	LWLock event	RelationMappingLock	Waits for the mapping file between system catalogs and storage locations to be updated.
metadata	LWLock event	MetaCacheSweepLock	Adds a lock when metadata is cyclically washed out.
postmaster.pid	I/O event	LockFileAddToDataDirRead	Reads the <b>postmaster.pid</b> file.
postmaster.pid	I/O event	LockFileAddToDataDirSync	Flushes the <b>postmaster.pid</b> file to a disk.

Module Category	Event Category	Event	Description
postmaster.pid	I/O event	LockFileAddT oDataDirWrit e	Writes PID information into the <b>postmaster.pid</b> file.
Pid File	I/O event	LockFileCreat eRead	Reads the LockFile file <b>%s.lock</b> .
Pid File	I/O event	LockFileCreat eSync	Flushes the LockFile file <b>%s.lock</b> to a disk.
Pid File	I/O event	LockFileCreat eWRITE	Writes PID information into the LockFile file <b>%s.lock</b> .
System catalog mapping file	I/O event	RelationMap Read	Reads the mapping file between system catalogs and storage locations.
System catalog mapping file	I/O event	RelationMap Sync	Flushes the mapping file between system catalogs and storage locations to a disk.
System catalog mapping file	I/O event	RelationMap Write	Writes the mapping file between system catalogs and storage locations.
Streaming replication	I/O event	ReplicationSl otRead	Reads a streaming replication slot file during a restart.
Streaming replication	I/O event	ReplicationSl otRestoreSyn c	Flushes a streaming replication slot file to a disk.
Streaming replication	I/O event	ReplicationSl otSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.
Streaming replication	I/O event	ReplicationSl otWrite	Writes a temporary streaming replication slot file during checkpoint execution.
Streaming replication	LWLock event	ReplicationSl otAllocationL ock	Allocates a replication slot.
Streaming replication	LWLock event	ReplicationSl otControlLoc k	Detects replication slot name conflicts and identifies replication slots that can be allocated.

Module Category	Event Category	Event	Description
Clog	I/O event	SLRUFlushSync	Flushes the <b>pg_clog</b> file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRURead	Reads the <b>pg_clog</b> file.
Clog	I/O event	SLRUSync	Writes dirty pages into the <b>pg_clog</b> file, and flushes the file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRUWrite	Writes the <b>pg_clog</b> file.
Clog	LWLock event	CLogControlLock	Prevents concurrent access to or concurrent modification on the Clog control data structure.
Clog	LWLock event	MultiXactOffsetControlLock	Prevents concurrent read/write or concurrent write/write on <b>pg_multixact/offset</b> .
Clog	LWLock event	MultiXactMemberControlLock	Prevents concurrent read/write or concurrent write/write on <b>pg_multixact/members</b> .
timelinehistory	I/O event	TimelineHistoryRead	Reads the <b>timelinehistory</b> file during database startup.
timelinehistory	I/O event	TimelineHistorySync	Flushes the <b>timelinehistory</b> file to a disk during database startup.
timelinehistory	I/O event	TimelineHistoryWrite	Writes the <b>timelinehistory</b> file.
pg_twophase	I/O event	TwophaseFileRead	Reads the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileSync	Flushes the <b>pg_twophase</b> file to a disk, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileWrite	Writes the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
Cluster	LWLock event	NodeTableLock	Protects a shared structure that stores CNs and DNs information.
Concurrency	LWLock event	PoolerLock	Prevents two threads from simultaneously obtaining the same connection from a connection pool.

Module Category	Event Category	Event	Description
Concurren- cy	LWLock event	AsyncCtlLock	Prevents concurrent access to or concurrent modification on the sharing notification status.
Concurren- cy	LWLock event	AsyncQueueL ock	Prevents concurrent access to or concurrent modification on the sharing notification queue.
Double write	I/O event	DoubleWriteF ileWrite	Writes pages to a doublewrite file during the doublewrite process.
Double write	I/O event	DoubleWriteF ileRead	Reads a doublewrite file during restoration for a halfwrite.
Statistics file	LWLock event	FileStatLock	Protects a data structure that stores statistics file information.
Master- slave replicatio n	LWLock event	SyncRepLock	Protects Xlog synchronization information during primary/standby replication.
Master- slave replicatio n	LWLock event	ReplicationSl otAllocationL ock	Adds a lock when a primary node allocates streaming replication slots during primary/standby replication.
Master- slave replicatio n	LWLock event	ReplicationSl otControlLoc k	Prevents concurrent update of streaming replication slot status during primary/standby replication.
Master- slave replicatio n	LWLock event	LsnXlogChkFil eLock	Serially updates the Xlog flush points for primary and standby nodes recorded in a specific structure.
Master- slave replicatio n	LWLock event	DataSyncRep Lock	Protects data page synchronization information during primary/standby replication.
Speed up the cluster	LWLock event	SearchServer LibLock	Adds a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
Resource manage	LWLock event	ResourcePool HashLock	Prevents concurrent access to or concurrent modification on a resource pool table, a hash table.

Module Category	Event Category	Event	Description
Resource manage	LWLock event	WorkloadStatHashLock	Prevents concurrent access to or concurrent modification on a hash table that contains SQL requests from the CN side.
Resource manage	LWLock event	WorkloadIoStatHashLock	Prevents concurrent access to or concurrent modification on a hash table that contains I/O information of the current DN.
Resource manage	LWLock event	WorkloadCGroupHashLock	Prevents concurrent access to or concurrent modification on a hash table that contains Cgroup information.
Resource manage	LWLock event	WorkloadRecordLock	Prevents concurrent access to or concurrent modification on a hash table that contains requests received by CNs during adaptive memory management.
Resource manage	LWLock event	WorkloadIOUtilLock	Protects a structure that records <b>iostat</b> and CPU load information.
Resource manage	LWLock event	WorkloadNodeGroupLock	Prevents concurrent access to or concurrent modification on a hash table that contains node group information in memory.
OBS	LWLock event	OBSGetPathLock	Prevents concurrent read/write or concurrent write/write on an OBS path.
OBS	LWLock event	OBSRuntimeLock	Obtains environment variables, for example, <i>GAUSSHOME</i> .
MPP is compatible with ORACLE scheduled task function	LWLock event	JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled job where MPP is compatible with Oracle Database.
Operator history information statistics	LWLock event	OperatorRealTLock	Prevents concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.

Module Category	Event Category	Event	Description
Operator history information statistics	LWLock event	OperatorHistLock	Prevents concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
query history information statistics	LWLock event	SessionRealTLock	Prevents concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.
query history information statistics	LWLock event	SessionHistLock	Prevents concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
query history information statistics	LWLock event	WaitCountHashLock	Protects a shared structure in user statement counting scenarios.
barrier	LWLock event	BarrierLock	Ensures that only one thread is creating a barrier at a time.
CSN	LWLock event	CSNBufMappingLock	Protects CSN pages.
instrumentation	LWLock event	UniqueSQLMappingLock	Protects a unique SQL hash table.
instrumentation	LWLock event	InstrUserLock	Protects InstrUserHTAB.
instrumentation	LWLock event	PercentileLock	Protects global percentile buffers.
instrumentation	LWLock event	InstrWorkloadLock	Protects a workload transaction hash table.
Pgproc	LWLock event	Pgproclwlock	Protects the PGPROC structure.
Async buffer	LWLock event	AsyncCtlLock	Protects asynchronization buffers.
MultiXact	LWLock event	MultiXactOffsetlwlock	Protects SLRU buffers of a MultiXact offset.
MultiXact	LWLock event	MultiXactMemberlwlock	Protects SLRU buffer of a MultiXact member.

Module Category	Event Category	Event	Description
CBM	LWLock event	CBMParseXlogLock	Protects the lock used when CBM parses Xlogs.
BadBlock	LWLock event	BadBlockStat HashLock	Protects the hash table <b>global_bad_block_stat</b> .
Page	Lock event	page	Adds a lock to a table page.
Tuple	Lock event	tuple	Adds a lock to a tuple on a page.
object	Lock event	object	Adds a lock to an object.
user	Lock event	userlock	Adds a lock to a user.
advisor	Lock event	advisory	Adds an advisory lock.
ODBC	LWLock event	ExtensionConnectorLibLock	Adds a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.
Undo	Wait event	wait fetch undo record	Waits for reading the target undo record.
Heap	Wait event	wait heap hot search buffer	Waits for reading the Astore tuple that meets the snapshot requirements through the hot link.
LWLock	Wait event	wait exclusive lwlock	The starvation prevention mechanism is triggered. A new lightweight lock request waits for the previously blocked lightweight lock to be obtained.

## 13.2.15 Configuration

### 13.2.15.1 CONFIG\_SETTINGS

**CONFIG\_SETTINGS** displays information about parameters of the running database.

**Table 13-176** CONFIG\_SETTINGS columns

Name	Type	Description
name	text	Parameter name

Name	Type	Description
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>sighup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b>
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b>
source	text	Method of assigning the parameter value
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

### 13.2.15.2 GLOBAL\_CONFIG\_SETTINGS

**GLOBAL\_CONFIG\_SETTINGS** displays information about parameters of running databases on each node.

**Table 13-177** GLOBAL\_CONFIG\_SETTINGS columns

Name	Type	Description
node_name	text	Node name
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>sighup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b>
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b>
source	text	Method of assigning the parameter value
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

## 13.2.16 Operator

### 13.2.16.1 OPERATOR\_HISTORY\_TABLE

OPERATOR\_HISTORY\_TABLE displays records about operators of completed jobs. Data is dumped from the kernel to this system view.

**Table 13-178** OPERATOR\_HISTORY\_TABLE columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DN's (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DN's (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DN's (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DN's when a spill occurs (unit: MB; default value: 0).
max_spill_size	integer	Maximum spilled data among all DN's when a spill occurs (unit: MB; default value: 0).
average_spill_size	integer	Average spilled data among all DN's when a spill occurs (unit: MB; default value: 0).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DN's (unit: ms).

Name	Type	Description
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"> <li>• Sort/SetOp/HashAgg/HashJoin spill</li> <li>• Spill file size large than 256MB</li> <li>• Broadcast size large than 100MB</li> <li>• Early spill</li> <li>• Spill times is greater than 3</li> <li>• Spill on memory adaptive</li> <li>• Hash table conflict</li> </ul>

### 13.2.16.2 OPERATOR\_HISTORY

OPERATOR\_HISTORY displays information about operators of the jobs that are executed by the current user on the current CN. Data in the kernel is cleared every 3 minutes.

### 13.2.16.3 OPERATOR\_RUNTIME

OPERATOR\_RUNTIME displays information about operators of the jobs that are being executed by the current user.

**Table 13-179** OPERATOR\_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator (unit: ms)

Name	Type	Description
status	text	Execution status of the current operator. Its value can be <b>finished</b> or <b>running</b> .
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> )
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> )
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> )
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms)
cpu_skew_percent	integer	Skew of the execution time among DNs

Name	Type	Description
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"><li>• Sort/SetOp/HashAgg/HashJoin spill</li><li>• Spill file size large than 256MB</li><li>• Broadcast size large than 100MB</li><li>• Early spill</li><li>• Spill times is greater than 3</li><li>• Spill on memory adaptive</li><li>• Hash table conflict</li></ul>

#### 13.2.16.4 GLOBAL\_OPERATOR\_HISTORY

**GLOBAL\_OPERATOR\_HISTORY** displays the records about operators after jobs are executed by the current user on all CNs.

**Table 13-180** GLOBAL\_OPERATOR\_HISTORY columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator (unit: ms)
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DN's (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on all DN's (unit: MB)

Name	Type	Description
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: 0)
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: 0)
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: 0)
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms)
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms)
cpu_skew_percent	integer	Skew of the execution time among DNs
warning	text	Warning. The following warnings are displayed: 1. Sort/SetOp/HashAgg/HashJoin spill 2. Spill file size large than 256MB 3. Broadcast size large than 100MB 4. Early spill 5. Spill times is greater than 3 6. Spill on memory adaptive 7. Hash table conflict

### 13.2.16.5 GLOBAL\_OPERATOR\_HISTORY\_TABLE

GLOBAL\_OPERATOR\_HISTORY\_TABLE displays the records about operators of completed jobs on all CNs. Data is dumped from the kernel to the system catalog GS\_WLM\_OPERATOR\_INFO.

### 13.2.16.6 GLOBAL\_OPERATOR\_RUNTIME

GLOBAL\_OPERATOR\_RUNTIME displays information about operators of the jobs that are being executed by the current user on all CNs.

**Table 13-181** GLOBAL\_OPERATOR\_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution
pid	bigint	Backend thread ID
plan_node_id	integer	Plan node ID of the execution plan of a query
plan_node_name	text	Name of the operator corresponding to the plan node ID
start_time	timestamp with time zone	Time when the operator starts to process the first data record
duration	bigint	Total execution time of the operator (unit: ms)
status	text	Execution status of the current operator. Its value can be <b>finished</b> or <b>running</b> .
query_dop	integer	DOP of the operator
estimated_rows	bigint	Number of rows estimated by the optimizer
tuple_processed	bigint	Number of elements returned by the operator
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB)
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB)
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB)
memory_skew_percent	integer	Memory usage skew of the operator among DNs
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> )
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> )
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> )
spill_skew_percent	integer	DN spill skew when a spill occurs
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms)
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms)

Name	Type	Description
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms)
cpu_skew_percent	integer	Skew of the execution time among DNs
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"><li>• Sort/SetOp/HashAgg/HashJoin spill</li><li>• Spill file size large than 256MB</li><li>• Broadcast size large than 100MB</li><li>• Early spill</li><li>• Spill times is greater than 3</li><li>• Spill on memory adaptive</li><li>• Hash table conflict</li></ul>

## 13.2.17 Workload Manager

### 13.2.17.1 WLM\_CGROUP\_CONFIG

**WLM\_CGROUP\_CONFIG** displays information about a Cgroup for a job that is being executed.

**Table 13-182** WLM\_CGROUP\_CONFIG columns

Name	Type	Description
cgoup_name	text	Cgroup name
priority	integer	Job priority.
usage_pencent	integer	Percentage of resources used by the Cgroup.
shares	bigint	CPU quota allocated to the Cgroup
cpuacct	bigint	Allocated CPU quota
cpuset	text	Allocated CPU cores
relpath	text	Relative path of the Cgroup
valid	text	Whether the Cgroup is valid

### 13.2.17.2 WLM\_CLUSTER\_RESOURCE\_RUNTIME

**WLM\_CLUSTER\_RESOURCE\_RUNTIME** displays a DN resource summary.

**Table 13-183** WLM\_CLUSTER\_RESOURCE\_RUNTIME columns

Name	Type	Description
min_mem_util	integer	Minimum memory usage of a DN
max_mem_util	integer	Maximum memory usage of a DN
min_cpu_util	integer	Minimum CPU usage of a DN
max_cpu_util	integer	Maximum CPU usage of a DN
min_io_util	integer	Minimum I/O usage of a DN
max_io_util	integer	Maximum I/O usage of a DN
used_mem_rate	integer	Maximum memory usage of a physical node

### 13.2.17.3 WLM\_CONTROLGROUP\_CONFIG

**WLM\_CONTROLGROUP\_CONFIG** displays information about all Cgroups in the current database.

**Table 13-184** WLM\_CONTROLGROUP\_CONFIG columns

Name	Type	Description
name	text	Cgroup name
type	text	Cgroup type
gid	bigint	Cgroup ID
classgid	bigint	ID of the Class Cgroup to which a Workload Cgroup belongs
class	text	Class Cgroup
workload	text	Workload Cgroup
shares	bigint	CPU quota allocated to a Cgroup
limits	bigint	Limit of CPUs allocated to a Cgroup
wdlevel	bigint	Workload Cgroup level
cpucores	text	Usage of CPU cores in a Cgroup

### 13.2.17.4 WLM\_RESOURCEPOOL\_RUNTIME

**WLM\_RESOURCEPOOL\_RUNTIME** displays statistics about a resource pool.

**Table 13-185** WLM\_RESOURCEPOOL\_RUNTIME columns

Name	Type	Description
rpoid	oid	OID of the resource pool
respool	name	Name of the resource pool
control_group	name	Cgroup associated with the resource pool
parentid	oid	OID of the parent resource pool
ref_count	integer	Number of jobs associated with the resource pool
active_points	integer	Number of used points in the resource pool
running_count	integer	Number of jobs running in the resource pool
waiting_count	integer	Number of jobs queuing in the resource pool
io_limits	integer	IOPS upper limit of the resource pool
io_priority	integer	I/O priority of the resource pool

### 13.2.17.5 WLM\_USER\_RESOURCE\_CONFIG

**WLM\_USER\_RESOURCE\_CONFIG** displays the resource configuration information of a user.

**Table 13-186** WLM\_USER\_RESOURCE\_CONFIG columns

Name	Type	Description
userid	oid	OID of the user
username	name	Username
sysadmin	boolean	Whether the user has the <b>sysadmin</b> permission
rpoid	oid	OID of the resource pool
respool	name	Name of the resource pool
parentid	oid	OID of the parent user
totalspace	bigint	Size of the occupied space
spacelimit	bigint	Upper limit of the space size
childcount	integer	Number of child users

Name	Type	Description
childlist	texto	Child user list

### 13.2.17.6 WLM\_USER\_RESOURCE\_RUNTIME

**WLM\_USER\_RESOURCE\_RUNTIME** displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**.

**Table 13-187** WLM\_USER\_RESOURCE\_RUNTIME columns

Name	Type	Description
username	name	Username
used_memory	integer	Size of the memory being used (unit: MB)
total_memory	integer	Available memory (unit: MB) The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	integer	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space (unit: KB)
total_space	bigint	Available storage space (unit: KB). The value <b>-1</b> indicates that the space is not limited.
used_temp_space	bigint	Used temporary space (reserved column; unit: KB)
total_temp_space	bigint	Available temporary space (reserved column; unit: KB). The value <b>-1</b> indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space for storing spilled data (reserved column; unit: KB)
total_spill_space	bigint	Available space for storing spilled data (reserved column; unit: KB). The value <b>-1</b> indicates that the maximum space for storing spilled data is not limited.

### 13.2.17.7 WLM\_WORKLOAD\_RUNTIME

WLM\_WORKLOAD\_RUNTIME displays the status of jobs being executed by the current user on the current CN.

**Table 13-188** WLM\_WORKLOAD\_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed.
thread_id	bigint	Backend thread ID.
processid	integer	PID of the backend thread.
time_stamp	bigint	Time when the statement execution starts.
username	name	Name of the user logged in to the backend.
memory	integer	Memory required by the statement.
active_points	integer	Number of resources consumed by the statement in the resource pool.
max_points	integer	Number of resources consumed by the statement in the resource pool.
priority	integer	Job priority.
resource_pool	text	Resource pool to which the job belongs.
status	text	Job execution status. Its value can be: <ul style="list-style-type: none"><li>● <b>pending</b>: blocked status</li><li>● <b>running</b>: running status</li><li>● <b>finished</b>: final status</li><li>● <b>aborted</b>: termination status</li><li>● <b>unknown</b>: unknown status</li></ul>
control_group	text	Cgroups used by the job
enqueue	text	Queue that the job is in. Its value can be: <ul style="list-style-type: none"><li>● <b>GLOBAL</b>: global queue</li><li>● <b>RESPOOL</b>: resource pool queue</li><li>● <b>ACTIVE</b>: not in a queue</li></ul>
query	text	Statement being executed.

### 13.2.17.8 GLOBAL\_WLM\_WORKLOAD\_RUNTIME

**GLOBAL\_WAL\_WORKLOAD\_RUNTIME** displays the status of jobs executed by the current user on CNs. This view is accessible only to users with system administrator permissions.

**Table 13-189** GLOBAL\_WAL\_WORKLOAD\_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed
thread_id	bigint	Backend thread ID.
processid	integer	LWP ID of the thread
time_stamp	bigint	Time when the statement starts to be executed.
username	name	Name of the user logged in to the backend.
memory	integer	Memory required by the statement
active_points	integer	Number of resources consumed by the statement in the resource pool
max_points	integer	Maximum number of resources in the resource pool
priority	integer	Job priority
resource_pool	text	Resource pool to which the job belongs
status	text	Job execution status. Its value can be: <ul style="list-style-type: none"> <li>● <b>pending</b>: blocked status</li> <li>● <b>running</b>: running status</li> <li>● <b>finished</b>: final status</li> <li>● <b>aborted</b>: termination status</li> <li>● <b>unknown</b>: unknown status</li> </ul>
control_group	name	Cgroups used by the job
enqueue	text	Queue that the job is in. Its value can be: <ul style="list-style-type: none"> <li>● <b>GLOBAL</b>: global queue</li> <li>● <b>RESPOOL</b>: resource pool queue</li> <li>● <b>ACTIVE</b>: not in a queue</li> </ul>
query	text	Statement being executed

### 13.2.17.9 LOCAL\_IO\_WAIT\_INFO

Returns the real-time statistics of I/O control on the current node.

**Table 13-190** LOCAL\_IO\_WAIT\_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	float	Number of read completions per second.
write_per_second	float	Number of write completions per second.
write_ratio	float	Ratio of the disk write I/Os to the total I/Os.
io_util	float	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is <b>0</b> , no I/O is under control.

### 13.2.17.10 GLOBAL\_IO\_WAIT\_INFO

Returns the real-time statistics of I/O control on all nodes.

**Table 13-191** GLOBAL\_IO\_WAIT\_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	float	Number of read completions per second.
write_per_second	float	Number of write completions per second.
write_ratio	float	Ratio of the disk write I/Os to the total I/Os.
io_util	float	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.

Name	Type	Description
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is <b>0</b> , no I/O is under control.

## 13.2.18 Global Plan Cache

Global plan cache (GPC) views are valid only when **enable\_global\_plancache** is set to **on**.

### 13.2.18.1 LOCAL\_PLANCACHE\_STATUS

**LOCAL\_PLANCACHE\_STATUS** displays the status of the GPC plan cache on the current node.

**Table 13-192** LOCAL\_PLANCACHE\_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the plan cache belongs to
query	text	Text of query statements
refcount	integer	Number of times that the plan cache is referenced
valid	bool	Whether the plan cache is valid
databaseid	oid	ID of the database that the plan cache belongs to
schema_name	text	Schema that the plan cache belongs to
params_num	integer	Number of parameters
func_id	oid	OID of the stored procedure where the plan cache is located. If the plancache does not belong to the stored procedure, the value is <b>0</b> .
stmt_id	integer	Sequence number of the statement plan in the stored procedure.

### 13.2.18.2 GLOBAL\_PLANCACHE\_STATUS

**GLOBAL\_PLANCACHE\_STATUS** displays the status of GPC plan caches on all nodes. For details about the columns, see [LOCAL\\_PLANCACHE\\_STATUS](#).

## 13.2.19 RTO & RPO

### 13.2.19.1 global\_rto\_status

Displays log flow control information about the primary and standby nodes (except the current node and DNs).

**Table 13-193** global\_rto\_status columns

Parameter	Type	Description
node_name	text	Node name (including the primary and standby nodes)
rto_info	text	Flow control information, including the current log flow control time (unit: second) of the standby server, the expected flow control time (unit: second) specified by the GUC parameter, and the primary server sleep time (unit: $\mu$ s) required to reach the expectation

### 13.2.19.2 global\_streaming\_hadr\_rto\_and\_rpo\_stat

global\_streaming\_hadr\_rto\_and\_rpo\_stat displays the log flow control information about the primary and standby clusters for streaming DR. (This view can be used only on the CN in the primary cluster and cannot obtain statistics from the DN or standby cluster.)

**Table 13-194** Parameters

Parameter	Type	Description
hadr_sender_node_name	text	Name of the primary cluster and the main standby node in the standby cluster.
hadr_receiver_node_name	text	Name of the main standby node in the standby cluster.
current_rto	int	Flow control information, that is, log RTO time of the current primary and standby clusters (unit: second).
target_rto	int	Flow control information, that is, RTO time between the target primary and standby clusters (unit: second).
current_rpo	int	Flow control information, that is, log RPO time of the current primary and standby clusters (unit: second).
target_rpo	int	Flow control information, that is, RPO time between the target primary and standby clusters (unit: second).

Parameter	Type	Description
rto_sleep_time	int	RTO flow control information, that is, expected sleep time (unit: $\mu$ s) required by WAL sender on the host to reach the specified RTO
rpo_sleep_time	int	RPO flow control information, that is, the expected sleep time (unit: $\mu$ s) required by xlogInsert on the host to reach the specified RPO.

## 13.2.20 AI Watchdog

### 13.2.20.1 ai\_watchdog\_monitor\_status

**Table 13-195** ai\_watchdog\_monitor\_status parameters

Parameter	Type	Description
metric_name	text	Metric names: <ul style="list-style-type: none"> <li>• <b>tps</b>: TPS.</li> <li>• <b>tps_hourly</b>: average TPS per hour.</li> <li>• <b>shared_used_mem</b>: the used shared memory (MB).</li> <li>• <b>dynamic_used_shrctx</b>: the used shared memory context (MB).</li> <li>• <b>other_used_mem</b>: other used memory (MB).</li> <li>• <b>process_used_mem</b>: the used resident memory (MB).</li> <li>• <b>dynamic_used_mem</b>: the used dynamic memory (MB).</li> <li>• <b>malloc_failures</b>: the number of memory allocation failures in each collection interval.</li> <li>• <b>D_state_rate</b>: percentage of threads in the D state.</li> <li>• <b>R_state_rate</b>: percentage of threads in the R state.</li> <li>• <b>S_state_rate</b>: ratio of threads in the S state.</li> <li>• <b>db_state</b>: database state (<b>68</b> indicates D, <b>82</b> indicates R, and <b>83</b> indicates S).</li> <li>• <b>cpu_usage</b>: CPU usage. The upper limit is 100.</li> <li>• <b>disk_io</b>: disk I/O delay between two collection intervals.</li> <li>• <b>network_io</b>: network I/O delay between two collection intervals.</li> <li>• <b>threadpool_usage</b>: thread pool usage.</li> <li>• <b>threadpool_hang_rate</b>: percentage of the thread pool group in the hang state.</li> </ul>
max_length	int	Collection queue length.
current_length	int	The number of currently collected samples.
collection_interval	int	Collection interval, in seconds.
latest_value	int	Value collected last time. If no value is collected, the value is <b>null</b> .
last_report	timestamp	The last collection time.

### 13.2.20.2 ai\_watchdog\_detection\_warnings

**Table 13-196** ai\_watchdog\_detection\_warnings parameters

Parameter	Type	Description
event	text	Event name.
cause	text	Event cause.
details	text	Event details.
time	timestamp	Reporting time.
need_to_handle	bool	Determines whether automatic processing is required.

### 13.2.20.3 ai\_watchdog\_parameters

Table 13-197 ai\_watchdog\_parameters parameters

Parameter	Type	Description
name	text	Parameter name. The options are as follows: <ul style="list-style-type: none"> <li>• <b>enable_ai_watchdog</b>: determines whether to enable this function.</li> <li>• <b>ai_watchdog_max_consuming_time_ms</b>: specifies the maximum duration.</li> <li>• <b>ai_watchdog_used_memory_kb</b>: specifies the memory used by this function.</li> <li>• <b>ai_watchdog_detection_times</b>: specifies the number of detection times.</li> <li>• <b>enable_self_healing</b>: determines whether self-healing can be performed after a problem is detected.</li> <li>• <b>oom_detected_times</b>: specifies the number of detected OOMs.</li> <li>• <b>hang_detected_times</b>: specifies the number of detected hang times.</li> <li>• <b>enable_oom_detection</b>: determines whether the OOM detection function is automatically enabled.</li> <li>• <b>in_wait_time</b>: determines whether the system is waiting.</li> <li>• <b>other_used_memory_has_risk</b>: determines whether other memory usage is risky.</li> <li>• <b>shared_used_mem_has_risk</b>: determines whether risks exist when the shared memory context is used.</li> <li>• <b>dynamic_used_shrctx_has_risk</b>: determines whether the dynamic memory usage is risky.</li> </ul>
value	text	Parameter value.

## 13.2.21 Discarded

### 13.2.21.1 Query

#### 13.2.21.1.1 GS\_SLOW\_QUERY\_INFO

**GS\_SLOW\_QUERY\_INFO** displays the slow query information that has been dumped on the current node. Data is dumped from the kernel to this system catalog. If the GUC parameter **enable\_resource\_record** is set to **on**, the system

imports the query information from the kernel to **GS\_WLM\_SESSION\_QUERY\_INFO\_ALL** every 3 minutes. This operation occupies storage space and affects performance. You can check **GS\_SLOW\_QUERY\_INFO** to view the slow query information that has been dumped. This view has been discarded in this version.

**Table 13-198** GS\_SLOW\_QUERY\_INFO columns

Name	Type	Description
dbname	text	Database name
schemaname	text	Schema name
nodename	text	Node name
username	text	Username
queryid	bigint	Normalization ID
query	text	Query statement
start_time	timestamp with time zone	Execution start time
finish_time	timestamp with time zone	Execution end time
duration	bigint	Execution duration (unit: ms)
query_plan	text	Plan information
n_returned_rows	bigint	Number of rows in the result set returned by the <b>SELECT</b> statement
n_tuples_fetched	bigint	Number of rows randomly scanned
n_tuples_returned	bigint	Number of rows sequentially scanned
n_tuples_inserted	bigint	Number of rows inserted
n_tuples_updated	bigint	Number of rows updated
n_tuples_deleted	bigint	Number of rows deleted
n_blocks_fetched	bigint	Number of cache loading times
n_blocks_hit	bigint	Cache hits
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s)

Name	Type	Description
cpu_time	bigint	CPU time (unit: $\mu$ s)
execution_time	bigint	Execution time in the executor (unit: $\mu$ s)
parse_time	bigint	SQL parsing time (unit: $\mu$ s)
plan_time	bigint	SQL plan generation time (unit: $\mu$ s)
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s)
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s)
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s)
net_send_time	bigint	Network time (unit: $\mu$ s)
data_io_time	bigint	I/O time (unit: $\mu$ s)

#### 13.2.21.1.2 GS\_SLOW\_QUERY\_HISTORY

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that is not dumped on the current node. For details, see [18.9.15 GS\\_SLOW\\_QUERY\\_INFO](#). This is discarded in the current version.

#### 13.2.21.1.3 GLOBAL\_SLOW\_QUERY\_HISTORY

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that is not dumped on all nodes. This view is discarded in this version. For details, see [18.9.15 GS\\_SLOW\\_QUERY\\_INFO](#).

#### 13.2.21.1.4 GLOBAL\_SLOW\_QUERY\_INFO

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that has been dumped on all nodes. This view is discarded in this version. For details, see [18.9.15 GS\\_SLOW\\_QUERY\\_INFO](#).

### 13.2.21.2 Global Plancache

#### 13.2.21.2.1 LOCAL\_PREPARE\_STATEMENT\_STATUS

**LOCAL\_PREPARE\_STATEMENT\_STATUS** displays the information about prepare statements corresponding to the GPC plan cache on the current node.

**Table 13-199** LOCAL\_PREPARE\_STATEMENT\_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the statement belongs to
cn_sess_id	bigint	Session ID of the CN that the statement is sent from
cn_node_id	integer	Node ID of the CN that the statement is sent from
cn_time_line	integer	Number of restart times of the CN that the statement is sent from
statement_name	text	Statement name
refcount	integer	Number of times that the corresponding plan cache is referenced
is_shared	bool	Whether the corresponding plan cache is shared
query	text	Corresponding query statement.

### 13.2.21.2 GLOBAL\_PREPARE\_STATEMENT\_STATUS

**GLOBAL\_PREPARE\_STATEMENT\_STATUS** displays the information about prepare statements corresponding to GPC plan caches on all nodes. For details about the columns, see [LOCAL\\_PREPARE\\_STATEMENT\\_STATUS](#).

## 13.3 DBE\_SQL\_UTIL Schema

The DBE\_SQL\_UTIL schema stores tools for managing SQL patches, including creating, deleting, enabling, and disabling SQL patches. Common users have only the USAGE permission and do not have the CREATE, ALTER, DROP, and COMMENT permissions.

For details about how to use the DBE\_SQL\_UTIL schema, see [Tuning with SQL PATCH](#).

### 13.3.1 DBE\_SQL\_UTIL.create\_hint\_sql\_patch

**create\_hint\_sql\_patch** creates hint SQL patches on the connected CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

#### NOTE

- SQL patches are not shared among CNs and need to be created on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.create\\_remote\\_hint\\_sql\\_patch](#) API to create a CN.

**Table 13-200** DBE\_SQL\_UTIL.create\_hint\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique query ID.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.3.2 DBE\_SQL\_UTIL.create\_abort\_sql\_patch

**create\_abort\_sql\_patch** creates abort SQL patches on the connected CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

 **NOTE**

- SQL patches are not shared among CNs and need to be created on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.create\\_remote\\_abort\\_sql\\_patch](#) API to create a CN.

**Table 13-201** DBE\_SQL\_UTIL.create\_abort\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique query ID.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.3.3 DBE\_SQL\_UTIL.drop\_sql\_patch

**drop\_sql\_patch** deletes SQL patches from the connected CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

 NOTE

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.drop\\_remote\\_sql\\_patch](#) API to delete a CN.

**Table 13-202** DBE\_SQL\_UTIL.drop\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.3.4 DBE\_SQL\_UTIL.enable\_sql\_patch

**enable\_sql\_patch** enables SQL patches on the connected CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

 NOTE

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.enable\\_remote\\_sql\\_patch](#) API to enable SQL patches.

**Table 13-203** DBE\_SQL\_UTIL.enable\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.3.5 DBE\_SQL\_UTIL.disable\_sql\_patch

**disable\_sql\_patch** disables SQL patches on the connected CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

 NOTE

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.disable\\_remote\\_sql\\_patch](#) API to disable SQL patches.

**Table 13-204** DBE\_SQL\_UTIL.disable\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.3.6 DBE\_SQL\_UTIL.show\_sql\_patch

**show\_sql\_patch** displays the SQL patch corresponding to a specified patch name and returns the running result.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-205** DBE\_SQL\_UTIL.show\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	OUT bigint	Global unique query ID.
enabled	OUT bool	Determines whether the patch takes effect.
abort	OUT bool	Determines whether the value is <b>AbortHint</b> .
hint_str	OUT text	Hint text.

### 13.3.7 DBE\_SQL\_UTIL.create\_hint\_sql\_patch

**create\_hint\_sql\_patch** creates hint SQL patches and returns whether the execution is successful. This function is an overloaded function of the original function. The value of **parent\_unique\_sql\_id** can be used to limit the effective range of the hint patch.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-206** DBE\_SQL\_UTIL.create\_hint\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique query ID.
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value <b>0</b> indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.3.8 DBE\_SQL\_UTIL.create\_abort\_sql\_patch

**create\_abort\_sql\_patch** creates abort SQL patches and returns whether the execution is successful. This function is an overloaded function of the original function. The value of **parent\_unique\_sql\_id** can be used to limit the effective range of the abort patch.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-207** DBE\_SQL\_UTIL.create\_abort\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique query ID.
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value <b>0</b> indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .

Parameter	Type	Description
result	OUT bool	Specifies whether this operation is successful.

### 13.3.9 DBE\_SQL\_UTIL.create\_remote\_hint\_sql\_patch

**create\_remote\_hint\_sql\_patch** creates hint SQL patches on a specified CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-208** DBE\_SQL\_UTIL.create\_remote\_hint\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique query ID.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.3.10 DBE\_SQL\_UTIL.create\_remote\_abort\_sql\_patch

**create\_abort\_sql\_patch** creates abort SQL patches and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-209** DBE\_SQL\_UTIL.create\_remote\_abort\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.

Parameter	Type	Description
unique_sql_id	IN bigint	Global unique query ID.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.3.11 DBE\_SQL\_UTIL.drop\_remote\_sql\_patch

**drop\_sql\_patch** deletes SQL patches from a specified CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-210** DBE\_SQL\_UTIL.drop\_remote\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.3.12 DBE\_SQL\_UTIL.enable\_remote\_sql\_patch

**enable\_remote\_sql\_patch** enables SQL patches on a specified CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-211** DBE\_SQL\_UTIL.enable\_remote\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.

Parameter	Type	Description
result	OUT bool	Specifies whether this operation is successful.

### 13.3.13 DBE\_SQL\_UTIL.disable\_remote\_sql\_patch

**disable\_remote\_sql\_patch** disables SQL patches on a specified CN and returns whether the execution is successful.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to invoke this interface.

**Table 13-212** DBE\_SQL\_UTIL.disable\_remote\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

# 14 Configuring Running Parameters

## 14.1 Viewing Parameters

GaussDB uses a set of default running parameters after it is installed. You can modify the GUC parameters to enable GaussDB to better fit your service scenarios and data volume.

### Procedure

**Step 1** Connect to the database.

**Step 2** View the parameter values in the database.

- Method 1: Run the **SHOW** command.
  - Run the following command to view the value of a certain parameter:  
`gaussdb=# SHOW server_version;`  
*server\_version* indicates the database version.
  - Run the following command to view values of all parameters:  
`gaussdb=# SHOW ALL;`
- Method 2: Query the **pg\_settings** view.
  - Run the following command to view the value of a certain parameter:  
`gaussdb=# SELECT * FROM pg_settings WHERE NAME='server_version';`
  - Run the following command to view values of all parameters:  
`gaussdb=# SELECT * FROM pg_settings;`

----End

### Example

Check the character encoding type of the client.

```
gaussdb=# SHOW client_encoding;
client_encoding

UTF8
(1 row)
```

## 14.2 Setting Parameters

You are advised to modify some parameters on the GaussDB console. If the parameters cannot be modified on the console, evaluate the risks and contact customer service.

### Background

GaussDB provides multiple methods to set GUC parameters for databases, users, or sessions.

- Parameter names are case-insensitive.
- The parameter values can be integers, floating points, strings, Boolean values, or enumerated values.
  - The Boolean values can be **on / off, true / false, yes / no**, or **1 / 0**, and are case-insensitive.
  - The enumerated value range is specified in the **enumvals** column of the system catalog **pg\_settings**.
- For parameters using units, specify their units during the setting. Otherwise, default units are used.
  - The default units are specified in the **unit** column of **pg\_settings**.
  - The unit of memory can be KB, MB, or GB.
  - The unit of time can be ms, s, min, h, or d.
- You can set parameters related to CNs and DNPs at a time, but cannot do the same to other parameters.

For details about the parameters, see [GUC Parameters](#).

### Setting GUC Parameters

GaussDB provides six types of GUC parameters. For details about parameter types and their setting methods, see [Table 14-1](#).

**Table 14-1** GUC parameter types

Parameter Type	Description	Setting Method
INTERNAL	Fixed parameter. It is set during database creation and cannot be modified. Users can only view the parameter by running the <b>SHOW</b> command or in the <b>pg_settings</b> view.	None
POSTMASTER	Database server parameter. It can be set when the database is started or in the configuration file.	Method 1 in <a href="#">Table 14-2</a> .

Parameter Type	Description	Setting Method
SIGHUP	Global database parameter. It can be set when the database is started or be modified later.	Method 1 or 2 in <a href="#">Table 14-2</a> .
BACKEND	Session connection parameter. It is specified during session connection creation and cannot be modified after that. The parameter setting becomes invalid when the session is disconnected. This is an internal parameter and not recommended for users to set it.	Method 1 or 2 in <a href="#">Table 14-2</a> . <b>NOTE</b> The parameter setting takes effect when the next session is created.
SUSET	Database administrator parameter. It can be set by common users when or after the database is started. It can also be set by database administrators using SQL statements.	Method 1 or 2 by a common user, or method 3 by a database administrator in <a href="#">Table 14-2</a> .
USERSET	Common user parameter. It can be set by any user at any time.	Method 1, 2, or 3 in <a href="#">Table 14-2</a> . <b>NOTE</b> When you set parameters of the USERSET type, the parameter value set using <b>ALTER DATABASE</b> takes precedence over that set using <b>gs_guc</b> . To make the parameter settings of <b>gs_guc</b> take effect, run the <b>alter database xxx reset xxx</b> command to reset the parameters.

You can set GUC parameters in GaussDB using the methods listed in [Table 14-2](#).

**Table 14-2** Methods for setting GUC parameters

No.	Setting Method
Method 1	<ol style="list-style-type: none"> <li>1. Log in to the management console.</li> <li>2. On the <b>Instances</b> page, click the name of the target instance to go to the <b>Basic Information</b> page.</li> <li>3. In the navigation pane on the left, click <b>Parameters</b>. On the displayed page, modify parameters. If the parameters cannot be modified on the console, evaluate the modification risks and contact customer service for modification.</li> <li>4. Reboot the instance to make the modifications take effect.</li> </ol> <p><b>NOTE</b> Rebooting instances will interrupt user operations. Plan a proper execution window before the reboot.</p>
Method 2	<ol style="list-style-type: none"> <li>1. Log in to the management console.</li> <li>2. On the <b>Instances</b> page, click the name of the target instance to go to the <b>Basic Information</b> page.</li> <li>3. In the navigation pane on the left, click <b>Parameters</b>. On the displayed page, modify parameters. If the parameters cannot be modified on the console, evaluate the modification risks and contact customer service for modification.</li> </ol>
Method 3	<p>Modify a session-level parameter.</p> <ul style="list-style-type: none"> <li>• Set a session-level parameter. <code>openGauss=# SET <i>paraname</i> TO <i>value</i>;</code></li> </ul> <p>Parameter value in the current session is changed. After you exit the session, the setting becomes invalid.</p>

 **CAUTION**

If you use method 1 or 2 to set a parameter that does not belong to the current environment, the database displays a message indicating that the parameter is not supported.

If the parameters cannot be modified using the preceding methods, evaluate the risks and contact customer service for modification.

## 14.3 GUC Parameters

### 14.3.1 GUC Parameter Usage

A database provides many operation parameters. Configurations of these parameters affect the behavior of the database system. Before modifying these parameters, learn the impact of these parameters on the database. Otherwise, unexpected results may occur.

You are advised to modify some parameters on the GaussDB console. If the parameters cannot be modified on the console, evaluate the risks and contact customer service.

## Precautions

- If the value range of a parameter is a string, the string should comply with the naming conventions of the path and file name in the OS running the target database.
- If the maximum value of a parameter is *INT\_MAX*, the maximum parameter value varies by OS. *INT\_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
- If the maximum value of a parameter is *DBL\_MAX*, the maximum parameter value varies by OS. *DBL\_MAX* indicates the maximum value of the FLOAT data type.

## 14.3.2 File Location

After a database has been installed, three configuration files (**postgresql.conf**, **pg\_hba.conf**, and **pg\_ident.conf**) are automatically generated and saved in the data directory. You can use the methods described in this section to change the names and save paths of these configuration files.

When changing the storage directory of a configuration file, set **data\_directory** in **postgresql.conf** to the actual data directory.

---

### NOTICE

If a configuration file is incorrectly modified, the database will be seriously affected. Do not modify the configuration files mentioned in this section after installation.

---

## data\_directory

**Parameter description:** Specifies the GaussDB **data** directory. Only the sysadmin user can access this parameter. You can set this parameter using one of the following methods:

- Set it when you install the GaussDB.
- This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

**Default value:** Specify this parameter during installation. If this parameter is not specified during installation, the database is not initialized by default.

## config\_file

**Parameter description:** Specifies the configuration file (**postgresql.conf**) of the primary server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

**Default value:** `postgresql.conf` (The absolute directory of this file may be displayed in the actual situation.)

## hba\_file

**Parameter description:** Specifies the configuration file (`pg_hba.conf`) for host-based authentication (HBA). This parameter can be specified only in the `postgresql.conf` file and can be accessed only by the `sysadmin` user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** `pg_hba.conf` (The absolute directory of this file may be displayed in the actual situation.)

## ident\_file

**Parameter description:** Specifies the name of the configuration file (`pg_ident.conf`) for client authentication. Only the `sysadmin` user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** `pg_ident.conf` (The absolute directory of this file may be displayed in the actual situation.)

## external\_pid\_file

**Parameter description:** Specifies the extra PID file that can be used by the server management program. Only the `sysadmin` user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

This parameter takes effect only after the database restarts.

---

**Value range:** a string

**Default value:** empty

## enable\_default\_cfunc\_libpath

**Parameter description:** Specifies GaussDB whether the `.so` file uses the default path when the C function is created.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on:** indicates that the .so file must be placed in the specified directory (\$libdir/proc\_srclib) when the C function is created.

**off:** indicates that the .so file can be stored in any accessible directory when the C function is created.

**Default value:** on

---

**NOTICE**

If this parameter is set to **off**, the .so file can be placed in any accessible directory or the .so file provided by the system can be used, which poses security risks. Therefore, you are not advised to set this parameter to **off**.

---

## 14.3.3 Connection and Authentication

### 14.3.3.1 Connection Settings

This section describes parameters related to client-server connection modes.

#### light\_comm

**Parameter description:** Specifies whether the server uses the lightweight communication mode.

This parameter specifies whether the server uses the communication mode based on lightweight locks and non-blocking sockets. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **TRUE / ON:** indicates that the lightweight communication mode is used.
- **FALSE / OFF:** indicates that the lightweight communication mode is not used.

**Default value:** FALSE / OFF

#### listen\_addresses

**Parameter description:** Specifies the TCP/IP address of the client for a server to listen on.

This parameter specifies the IP address used by the GaussDB server for listening, for example, IPv4. Multiple NICs may exist on the host and each NIC can be bound to multiple IP addresses. This parameter specifies the IP addresses to which GaussDB is bound. The client can use the IP address specified by this parameter to connect to GaussDB or send requests to GaussDB.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**

- Host name or IP address. Multiple values are separated with commas (,).
- Asterisk (\*) or **0.0.0.0**, indicating that all IP addresses will be listened on, which is not recommended due to potential security risks.
- If the parameter is not specified, the server does not listen on any IP address. In this case, only Unix domain sockets can be used for database connections.

**Default value:**

After the cluster is installed, configure different default values based on the IP addresses of different instances in the **public\_cloud.conf** file. The default value of CN is **listen\_addresses = 'localhost,IP address of the mgr.net NIC,IP address of the data.net NIC,IP address of the virtual.net NIC'**. The default value of DN is **listen\_addresses = 'IP address of the data.net NIC'**.

 **NOTE**

**localhost** indicates that only local loopback is allowed.

The **public\_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

## listen\_address\_ext

**Parameter description:** Specifies the extended TCP/IP address of the client for a server to listen on. This parameter specifies that the GaussDB server uses a specific IP address as the extended listening IP address.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an IPv4 address. Multiple IP addresses are not supported.

**Default value:** "localhost"

 **NOTE**

- The setting of the **listen\_address\_ext** parameter involves the network topology and configuration of the extended IP addresses of the entire cluster. Therefore, it must be set and reloaded by using the OM tool.
- **listen\_address\_ext** is a network channel used to extend specific IP addresses. If this parameter is set to \*, **0.0.0.0**, **localhost**, or **127.0.0.1**, the setting does not take effect. If required, you are advised to set these addresses in **listen\_addresses**.
- **listen\_address\_ext** is used to configure distributed DNs. It does not take effect if it is configured for CNs.

## local\_bind\_address

**Parameter description:** Specifies the host IP address bound to the current node for connecting to other nodes in the cluster.

This parameter is a POSTMASTER parameter.

 NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Default value:**

After the cluster is installed, configure different default values based on the IP addresses of different instances in the **public\_cloud.conf** file. The default value of CN/DN is **local\_bind\_address = 'IP address of the data.net NIC'**.

 NOTE

The **public\_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

## port

**Parameter description:** Specifies the TCP port listened on by the GaussDB.

 NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Value range:** an integer ranging from 1 to 65535.

 NOTE

- When setting the port number, ensure that the port number is not in use. When setting the port numbers of multiple instances, ensure that the port numbers do not conflict.
- Ports 1 to 1023 are reserved for the operating system. Do not use them.
- When the cluster is installed using the configuration file, pay attention to the ports reserved in the communication matrix in the configuration file. For example, the port specified by the value of **dataPortBase** plus 1 needs to be reserved for internal tools, and the port specified by the value of **dataPortBase** plus 6 needs to be reserved as the communication port of the flow engine message queue. (Due to specification changes, the current version no longer supports this feature. Do not use it.) Therefore, during cluster installation, the maximum value of **port** is **65532** for CNs, **65529** for DN, and **65534** for GTMs. Ensure that the port number does not conflict with each other.

**Default value:** **5432** (The actual value is specified in the configuration file during installation.)

## max\_connections

**Parameter description:** Specifies the maximum number of concurrent connections to the database. This parameter influences the concurrent processing capability of the cluster.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The minimum value is **10** (greater than **max\_wal\_senders**). The theoretical maximum value is **262143**. The actual maximum value is a dynamic value, which is calculated using the formula:  $262143$

– **job\_queue\_processes** – **autovacuum\_max\_workers** – **max\_inner\_tool\_connections** – **max\_concurrent\_autonomous\_transactions** – **AUXILIARY\_BACKENDS** – **AV\_LAUNCHER\_PROCS** – **min(max(newValue/4,64),1024)**. The values of **job\_queue\_processes**, **autovacuum\_max\_workers**, **max\_inner\_tool\_connections**, and **max\_concurrent\_autonomous\_transactions** depend on the settings of the corresponding GUC parameters. **AUXILIARY\_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV\_LAUNCHER\_PROCS** indicates the number of reserved autovacuum launcher threads, which is fixed to **2**. In **min(max(newValue/4,64),1024)**, **newValue** indicates the new value.

For different memory specifications, the value range of this parameter in different instances is as follows:

**Table 14-3** Value ranges of memory specifications for different instances in independent deployment mode

Memory Specifications	Value Range for CNs	Value Range for DNs
< 32 GB	[10,100]	[10,100]
[32 GB,64 GB)	[10,200]	[10,200]
[64 GB,128 GB)	[10,1000]	[10,2500]
[128 GB,256 GB)	[10,2000]	[10,6000]
[256 GB,480 GB)	[10,4000]	[10,12000]
≥ 480 GB	[10,8000]	[10,24000]

**Default value:**

- Independent deployment:  
 CN: **8000** (60-core CPU/480 GB memory); **4000** (32-core CPU/256 GB memory); **2000** (16-core CPU/128 GB memory); **1000** (8-core CPU/64 GB memory); **100** (4-core CPU/32 GB memory and 4-core CPU/16 GB memory)  
 DN: **24000** (60-core CPU/480 GB memory); **12000** (32-core CPU/256 GB memory); **6000** (16-core CPU/128 GB memory); **2500** (8-core CPU/64 GB memory); **100** (4-core CPU/32 GB memory and 4-core CPU/16 GB memory)

**Impact of incorrect configuration:**

If the value of **max\_connections** exceeds the maximum dynamic value, the node fails to be started and the following error message is displayed: "invalid value for parameter "max\_connections"". Alternatively, the memory fails to be allocated during the node startup and the following error message is displayed: "Cannot allocate memory."

If only the value of **max\_connections** is increased but the memory parameter is not adjusted in proportion based on the external egress specifications, when the service pressure is high, the memory may be insufficient, and the error message "memory is temporarily unavailable" is displayed.

 NOTE

- If the number of connections of the administrator exceeds the value of **max\_connections**, the administrator can still connect to the database after the connections are used up by common users. If the number of connections exceeds the value of **sysadmin\_reserved\_connections**, an error is reported. That is, the maximum number of connections of the administrator is equal to the value of *max\_connections* + *sysadmin\_reserved\_connections*.
- For common users, internal jobs use some connections. Therefore, the value of this parameter is slightly less than that of **max\_connections**. The value depends on the number of internal connections.
- After the thread pool is enabled, the maximum number of stream threads is determined by the value of **max\_connections**. If the number of stream threads reaches the upper limit, the error is reported: "Exceed stream thread pool limitation...". In this case, you can increase the value of **max\_connections** to increase the upper limit. This parameter is a POSTMASTER parameter. Therefore, you can estimate the number of stream threads based on service requirements. The formula is as follows: Total number of stream threads = Number of concurrent services x Number of stream threads consumed by each concurrently executed statement (which can be viewed in the execution plan).

## max\_inner\_tool\_connections

**Parameter description:** Specifies the maximum number of concurrent connections of a tool which is allowed to connect to the database. This parameter influences the concurrent connection capability of the GaussDB tool.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to *MIN* (which takes the smaller value between **262143** and *max\_connections*). For details about how to calculate the value of *max\_connections*, see the preceding description.

**Default value:** 50 If the default value is greater than the maximum value supported by the kernel (determined when the **gs\_initdb** command is executed), an error message is displayed.

**Setting suggestions:**

You are advised to use the default value for this parameter in the primary database node.

## sysadmin\_reserved\_connections

**Parameter description:** Specifies the minimum number of connections reserved for administrators. You are advised not to set this parameter to a large value. This parameter is used together with the *max\_connections* parameter. The maximum number of connections of the administrator is equal to the value of *max\_connections* + *sysadmin\_reserved\_connections*.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to *MIN(262143, max\_connections)* (the smaller value between **262143** and **max\_connections**). For details about how to calculate the value of **max\_connections**, see [max\\_connections](#).

**Default value:** 3

**Note:** When the thread pool function is enabled, if the thread pool is fully occupied, a processing bottleneck occurs. As a result, connections reserved by the administrator cannot be established. In this case, you can use `gsql` to establish connections through the port specified by the primary port number plus 1 and clear useless sessions.

## service\_reserved\_connections

**Parameter description:** Specifies the minimum number of connections reserved for background O&M users (with the persistence attribute). A large value is not recommended. This parameter is used together with **max\_connections**. The maximum number of connections of an O&M user can be calculated as follows: **max\_connections + service\_reserved\_connections**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 262143.

**Default value:** 10

**Note:** If this parameter is set to a small value, the O&M user (with the persistence attribute) cannot connect to the database and jobs cannot be executed when the number of connections reaches the maximum (**max\_connections**).

## extip\_reserved\_connections

**Parameter description:** Provides a reserved connection channel for common `gsql` service connections from the extended IP address specified by **listen\_address\_ext**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to  $MIN(262143, max\_connections)$  (the smaller value between **262143** and **max\_connections**). For details about how to calculate the value of **max\_connections**, see [max\\_connections](#).

**Default value:** 5

---

### CAUTION

This parameter is used for common `gsql` service connections only when **listen\_address\_ext** is set to a specific IP address for a distributed DN. This parameter specifies the maximum number of connections allowed after the maximum number of connections specified by **max\_connections** is reached.

---

## unix\_socket\_directory

**Parameter description:** Specifies the Unix domain socket directory that the GaussDB server listens to for connections from the client. Only the **sysadmin** user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

The parameter length limit varies by OS. In the Linux OS, the length of a socket path name (combination of a socket directory and a socket file name) cannot exceed 107 bytes, and the length of a directory cannot exceed 92 bytes. If the upper limit is exceeded, the error "Unix-domain socket path xxx is too long" will be reported and the process cannot be started properly. You can retrieve the **system\_call** log in the **cm\_agent** directory to locate configuration issues.

**Value range:** a string.

**Default value:** empty. The actual value is specified by **tmpMppdbPath** in the configuration file during installation.

## unix\_socket\_group

**Parameter description:** Specifies the group of the Unix domain socket (the user of a socket is the user that starts the server). This parameter can work with [unix\\_socket\\_permissions](#) to control socket access.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. If this parameter is set to an empty string, the default group of the current user is used.

**Default value:** an empty string

## unix\_socket\_permissions

**Parameter description:** Specifies access permissions for the Unix domain socket.

The Unix domain socket uses the usual permission set of the Unix file system. The value of this parameter should be a number (acceptable for the **chmod** and **umask** commands). If a user-defined octal format is used, the number must start with 0.

You are advised to set it to **0770** (only allowing access from users connecting to the database and users in the same group as them) or **0700** (only allowing access from users connecting to the database).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0000 to 0777

**Default value:** 0700

 **NOTE**

In the Linux OS, a document has one document attribute and nine permission attributes which consist of the read (r), write (w), and execute (x) permissions of the Owner, Group, and Others groups.

The r, w, and x permissions are represented by the following numbers:

r: 4

w: 2

x: 1

-: 0

The three attributes in a group are accumulative.

For example, **-rwxrwx---** indicates the following permissions:

owner = rwx = 4+2+1 = 7

group = rwx = 4+2+1 = 7

others = --- = 0+0+0 = 0

The permission of the file is 0770.

## application\_name

**Parameter description:** Specifies the client name used in the current connection request.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

When a standby node requests to replicate logs on the primary node, if this parameter is not an empty string, it is used as the name of the streaming replication slot of the standby node on the primary node. In this case, if the length of this parameter exceeds 61 bytes, only the first 61 bytes are used as the streaming replication slot name.

**Value range:** a string. The actual query result depends on the client used for queries or user configurations.

**Default value:** an empty string

## connection\_info

**Parameter description:** Specifies the database connection information, including the driver type, driver version, driver deployment path, and process owner.

This parameter is a USERSET parameter used for O&M. You are advised not to change the parameter value.

**Value range:** a string.

**Default value:** an empty string.

 NOTE

- An empty string indicates that the driver connected to the database does not support automatic setting of the **connection\_info** parameter or the parameter is not set by users in applications.
- The following is an example of the concatenated value of **connection\_info**:  

```
{"driver_name":"ODBC","driver_version": "(GaussDB 503.1.XXX build 290d125f) compiled at 2020-05-08 02:59:43 commit 2143 last mr 131 release","driver_path":"/usr/local/lib/psqlodbcw.so","os_user":"omm"}
```

By default, **driver\_name** and **driver\_version** are displayed. The display of **driver\_path** and **os\_user** is controlled by users. For details, see "Application Development Guide > Development Based on JDBC > Connecting to the Database" in *Developer Guide* and "Application Development Guide > Development Based on ODBC > Configuring a Data Source in the Linux OS" in *Developer Guide*.

## backend\_version

**Parameter description:** Specifies the version number of the synchronous connection between CNs or between a CN and a DN. This parameter involves the version number and cannot be set randomly.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100000.

### 14.3.3.2 Security and Authentication (postgresql.conf)

This section describes parameters about client-to-server authentication.

## authentication\_timeout

**Parameter description:** Specifies the longest duration to wait before the client authentication times out. If a client is not authenticated by the server within the period, the server automatically disconnects from the client so that the client does not occupy connection resources.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 600. The smallest unit is s.

**Default value:** 1min

## auth\_iteration\_count

**Parameter description:** Specifies the number of iterations during the generation of encryption information for authentication.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2048 to 134217728

**Default value:** 10000

---

**NOTICE**

If the number of iterations is too small, the password storage security is reduced. If the number of iterations is too large, the performance deteriorates in scenarios involving password encryption, such as authentication and user creation. Set the number of iterations based on actual hardware conditions. You are advised to retain the default value.

---

## session\_authorization

**Parameter description:** Specifies the user ID of the current session.

This is a USERSET parameter and can be set only by following the instructions provided in "SQL Reference > SQL Syntax > SET SESSION AUTHORIZATION" in *Developer Guide*.

**Value range:** a string

**Default value:** NULL

## session\_timeout

**Parameter description:** Specifies the longest duration allowed when no operations are performed on a client after it is connected to the server.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 86400. The smallest unit is s. **0** indicates that the timeout is disabled.

**Default value:** 1800

---

**NOTICE**

The gsql client of GaussDB has an automatic reconnection mechanism. For local connection of initialized users, the client reconnects to the server if the connection breaks after the timeout.

---

## ssl

**Parameter description:** Specifies whether SSL connections are enabled. Before setting this parameter, read [Using gsql to Connect to an Instance](#).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that SSL connections are enabled.
- **off** indicates that SSL connections are not enabled.

---

**NOTICE**

GaussDB supports SSL when a client connects to a CN. You are advised to enable SSL connections only on CNs. The default value is **off** on DN. Before setting this parameter to **on**, ensure that the [ssl\\_cert\\_file](#), [ssl\\_key\\_file](#), and [ssl\\_ca\\_file](#) parameters are correctly set. If SM series cryptographic algorithms are used, ensure that the [ssl\\_enc\\_cert\\_file](#) and [ssl\\_enc\\_key\\_file](#) parameters are correctly set. Incorrect settings may cause cluster startup failures.

---

**Default value:** **on** (for CNs) or **off** (for DN)

## comm\_ssl

**Parameter description:** Specifies whether to enable the SSL connection between primary DN. Before setting this parameter, read [Using gsql to Connect to an Instance](#).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the SSL connection is enabled between primary DN.
- **off** indicates that the SSL connection is disabled between primary DN.

---

**NOTICE**

- It is recommended that this parameter be enabled only on DN. The default value on CN is **off**.
  - To enable SSL connections, you also need to ensure that parameters such as [ssl\\_cert\\_file](#), [ssl\\_key\\_file](#), and [ssl\\_ca\\_file](#) are configured correctly. Incorrect configurations may cause startup failure of the cluster.
- 

**Default value:** **off**

## require\_ssl

**Parameter description:** Specifies whether the server requires SSL connections. This parameter is valid only when [ssl](#) is set to **on**. Before setting this parameter, read [Using gsql to Connect to an Instance](#).

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the server requires SSL connections.
- **off** indicates that the server does not require SSL connections.

---

**NOTICE**

GaussDB supports SSL when a client connects to a CN. It is recommended that the SSL connection be enabled only on CNs.

---

**Default value:** off

## ssl\_ciphers

**Parameter description:** Specifies the list of encryption algorithms supported by SSL. Only the sysadmin user can access the list.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. Separate multiple encryption algorithms by semicolons (;).

---

**NOTICE**

If **ssl\_ciphers** is set incorrectly, the cluster cannot be started properly.

---

**Default value:** ALL

## ssl\_renegotiation\_limit

**Parameter description:** Specifies the allowed traffic volume over an SSL-encrypted channel before the session key is renegotiated. The renegotiation mechanism reduces the probability that attackers use the password analysis method to crack the key based on a huge amount of data but causes big performance losses. The traffic indicates the sum of transmitted and received traffic. The SSL renegotiation mechanism has been disabled because of potential risks. This parameter is reserved for version compatibility and does not take effect.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is KB. **0** indicates that the renegotiation mechanism is disabled.

**Default value:** 0

## ssl\_cert\_file

**Parameter description:** Specifies the name of the file that contains the SSL server certificate. The relative path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** server.crt

## ssl\_key\_file

**Parameter description:** Specifies the name of the file that contains the SSL private key. The relative path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** server.key

## ssl\_enc\_cert\_file

**Parameter description:** Specifies the name of the SSL server certificate file that is encrypted using Chinese cryptographic algorithms. The path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** server\_enc.crt

## ssl\_enc\_key\_file

**Parameter description:** Specifies the name of the file that contains the SSL private key. The relative path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** server\_enc.key

## ssl\_ca\_file

**Parameter description:** Specifies the name of the root certificate that contains CA information. Its path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. If it is an empty string, no CA file is loaded and client certificate verification is not performed.

**Default value:** cacert.pem

## ssl\_crl\_file

**Parameter description:** Specifies the certificate revocation list (CRL). If a client certificate is in the list, the certificate is invalid. The path is relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that there is no CRL.

**Default value:** an empty string

## ssl\_cert\_notify\_time

**Parameter description:** Specifies the number of days prior to SSL server certificate expiration that a user will receive a reminder. When the SSL certificate is initialized during connection establishment, if the duration from the current time to the certificate expiration time is shorter than the specified value, an expiration notification is recorded in the log.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 7 to 180. The unit is day.

**Default value:** 90

## krb\_server\_keyfile

**Parameter description:** Specifies the location of the main configuration file of the Kerberos service. Only the **sysadmin** user can access the file.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** an empty string

## krb\_srvname

**Parameter description:** Specifies the Kerberos service name.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** postgres

## krb\_caseins\_users

**Parameter description:** Specifies whether the Kerberos username is case-sensitive.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the Kerberos username is case-insensitive.
- **off** indicates that the Kerberos username is case-sensitive.

**Default value:** off

## modify\_initial\_password

**Parameter description:** After GaussDB is installed, there is only one initial user account (whose UID is 10) in the database. When a user logs in to the database using this initial account for the first time, this parameter determines whether the password of the initial account needs to be modified.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If the initial user password is not specified during the installation, the initial user password is empty by default after the installation. Before performing other operations, you need to set the initial user password using the gsql client. This parameter no longer takes effect and is reserved only for compatibility with upgrade scenarios.

---

**Value range:** Boolean

- **on** indicates that the password of the initial account needs to be modified upon the first login.
- **off** indicates that the password of the initial account does not need to be modified.

**Default value:** off

## password\_policy

**Parameter description:** Specifies whether to check the password complexity when you run the **CREATE ROLE/USER** or **ALTER ROLE/USER** command to create or modify the GaussDB account.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

For security purposes, do not disable the password complexity policy.

---

**Value range:** 0 and 1

- **0** indicates that no password complexity policy is enabled.
- **1** indicates that the default password complexity policy is enabled.

**Default value:** 1

## password\_reuse\_time

**Parameter description:** Specifies whether to check the reuse interval of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

When you change the password, the system checks the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#).

- If the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of [password\\_reuse\\_time](#) is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of [password\\_reuse\\_max](#) is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are **0**, password reuse is not restricted.

---

**Value range:** a floating point number ranging from 0 to 3650. The unit is day.

- **0** indicates that the password reuse interval is not checked.
- A positive number indicates that a new password cannot be chosen from passwords in history that are newer than the specified number of days.

## password\_reuse\_max

**Parameter description:** Specifies whether to check the reuse times of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password. Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

When you change the password, the system checks the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#).

- If the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of [password\\_reuse\\_time](#) is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of [password\\_reuse\\_max](#) is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are **0**, password reuse is not restricted.

---

**Value range:** an integer ranging from 0 to 1000

- **0** indicates that the password reuse times are not checked.
- A positive number indicates that the new password cannot be the one whose reuse times exceed the specified number.

**Default value:** 0

## password\_lock\_time

**Parameter description:** Specifies the duration before a locked account is automatically unlocked.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

The locking and unlocking functions take effect only when the values of **password\_lock\_time** and **failed\_login\_attempts** are positive numbers.

---

**Value range:** a floating point number ranging from 0 to 365. The unit is day. The integer part indicates the number of days, and the decimal part can be converted into hours, minutes, and seconds. For example, **password\_lock\_time=1.5** indicates one day and 12 hours.

- **0** indicates that an account is not automatically locked if the password verification fails.
- A positive number indicates the duration after which a locked account is automatically unlocked.

**Default value:** 1

## failed\_login\_attempts

**Parameter description:** Specifies the maximum number of incorrect password attempts before an account is locked. The account will be automatically unlocked after the time specified by **password\_lock\_time**. Only the **sysadmin** user can access the account. The automatic account locking policy applies in scenarios such as login and password modification using the **ALTER USER** command.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

The locking and unlocking functions take effect only when the values of **failed\_login\_attempts** and **password\_lock\_time** are positive numbers.

---

**Value range:** an integer ranging from 0 to 1000

- **0** indicates that the automatic locking function does not take effect.
- A positive number indicates that an account is locked when the number of incorrect password attempts reaches the specified number.

**Default value:** 10

## password\_encryption\_type

**Parameter description:** Specifies the encryption type of a user password. Changing the value of this parameter does not change the password encryption type of existing users. The new encryption type is applied to passwords of new users or passwords modified after the parameter value is changed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0, 1, 2, or 3

- 0 indicates that passwords are encrypted with MD5.
- 1 indicates that passwords are encrypted with SHA-256 and MD5.
- 2 indicates that passwords are encrypted with SHA-256.
- 3 indicates that the passwords are encrypted in sm3 mode.

---

### NOTICE

The MD5 encryption algorithm is not recommended because it has lower security and poses security risks.

---

**Default value:** 2

## password\_min\_length

**Parameter description:** Specifies the minimum length of an account password. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. A password can contain 6 to 999 characters.

**Default value:** 8

## password\_max\_length

**Parameter description:** Specifies the maximum length of an account password. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. A password can contain 6 to 999 characters.

**Default value:** 32

## password\_min\_uppercase

**Parameter description:** Specifies the minimum number of uppercase letters that an account password must contain. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- A positive integer indicates the minimum number of uppercase letters required in a password when you create an account.

**Default value:** 0

## password\_min\_lowercase

**Parameter description:** Specifies the minimum number of lowercase letters that an account password must contain. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- A positive integer indicates the minimum number of lowercase letters required in a password when you create an account.

**Default value:** 0

## password\_min\_digital

**Parameter description:** Specifies the minimum number of digits that an account password must contain. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- A positive integer indicates the minimum number of digits required in a password when you create an account.

**Default value:** 0

## password\_min\_special

**Parameter description:** Specifies the minimum number of special characters that an account password must contain. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- A positive integer indicates the minimum number of special characters required in a password when you create an account.

**Default value:** 0

## password\_effect\_time

**Parameter description:** Specifies the validity period of an account password.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to 999. The unit is day.

- 0 indicates that the validity period restriction is disabled.
- A floating-point number from 1 to 999 indicates the number of days for which an account password is valid. When the password is about to expire or has expired, the system prompts the user to change the password.

**Default value:** 0

## password\_notify\_time

**Parameter description:** Specifies how many days in advance a user is notified before a password expires.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999. The unit is day.

- 0 indicates that the reminder is disabled.
- A positive integer indicates the number of days prior to password expiration that a user will receive a reminder.

**Default value:** 7

### 14.3.3.3 Communication Library Parameters

This section describes parameter settings and value ranges for communications libraries.

## tcp\_keepalives\_idle

**Parameter description:** Specifies the interval for transmitting keepalive signals on an OS that supports the **TCP\_KEEPIDLE** socket option. If no keepalive signal is transmitted, the connection is in idle mode.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- If the OS does not support **TCP\_KEEPIIDLE**, set this parameter to **0**.
  - The parameter is ignored on an OS where connections are established using the Unix domain socket.
- 

**Value range:** 0 to 3600. The unit is s.

**Default value:** 1min

### tcp\_keepalives\_interval

**Parameter description:** Specifies the response time before retransmission on an OS that supports the **TCP\_KEEPINTVL** socket option.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 180. The unit is s.

**Default value:** 30

---

**NOTICE**

- If the OS does not support **TCP\_KEEPINTVL**, set this parameter to **0**.
  - The parameter is ignored on an OS where connections are established using the Unix domain socket.
- 

### tcp\_keepalives\_count

**Parameter description:** Specifies the number of keepalive signals that can be waited before the GaussDB server is disconnected from the client on an OS that supports the **TCP\_KEEPCNT** socket option.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- If the OS does not support **TCP\_KEEPCNT**, set this parameter to **0**.
  - The parameter is ignored on an OS where connections are established using the Unix domain socket.
- 

**Value range:** 0 to 100. **0** indicates that the connection is immediately broken if GaussDB does not receive a keepalived signal from the client.

**Default value:** 20

### tcp\_user\_timeout

**Parameter description:** Specifies the maximum duration for which the transmitted data can remain in the unacknowledged state before the TCP

connection is forcibly closed when the GaussDB sends data on the OS that supports the TCP\_USER\_TIMEOUT socket option.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**NOTICE**

- If the OS does not support the TCP\_USER\_TIMEOUT option, the value of this parameter does not take effect. The default value is **0**.
- The parameter is ignored on an OS where connections are established using the Unix domain socket.

**Value Range:** 0 to 3600000. The unit is ms. The value **0** indicates that the value is set based on the OS.

**Default value:** 0

Note that the effective result of this parameter varies according to the OS kernel.

- For AArch64 EulerOS (Linux kernel version: 4.19), the timeout interval is the value of this parameter.
- For x86 Euler 2.5 (Linux kernel version: 3.10), the timeout interval is not the value of this parameter but the maximum value in different ranges. That is, the timeout interval is the maximum upper limit of the total Linux TCP retransmission duration to which the value of **tcp\_user\_timeout** belongs. For example, if **tcp\_user\_timeout** is set to **40000**, the total retransmission duration is 51 seconds.

**Table 14-4** Value of tcp\_user\_timeout for x86 Euler 2.5 (Linux kernel version: 3.10)

Number of Linux TCP Retransmission Times	Total Linux TCP Retransmission Duration Range (s)	Example of tcp_user_timeout (ms)	Actual Linux TCP Retransmission Duration (s)
1	(0.2,0.6]	400	0.6
2	(0.6,1.4]	1000	1.4
3	(1.4,3]	2000	3
4	(3,6.2]	4000	6.2
5	(6.2,12.6]	10000	12.6
6	(12.6,25.4]	20000	25.4
7	(25.4,51]	40000	51
8	(51,102.2]	80000	102.2

Number of Linux TCP Retransmission Times	Total Linux TCP Retransmission Duration Range (s)	Example of tcp_user_timeout (ms)	Actual Linux TCP Retransmission Duration (s)
9	(102.2,204.6]	150000	204.6
10	(204.6,324.6]	260000	324.6
11	(324.6,444.6]	400000	444.6

Note: The duration of each TCP retransmission increases exponentially with the number of retransmission times. When the duration of a TCP retransmission reaches 120 seconds, the duration of each subsequent retransmission does not change.

## comm\_tcp\_mode

**Parameter description:** Specifies whether the communications library uses the TCP or SCTP protocol to set up a data channel. The parameter setting takes effect after you restart the cluster. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

SCTP is no longer supported. This parameter is provided for compatibility, but its value is fixed at **on**.

---

**Value range:** Boolean. If this parameter is set to **on** for a CN, it connects to a DN using TCP. If this parameter is set to **on** for a DN, the DN communicates with each other using TCP.

**Default value:** on

## comm\_sctp\_port

**Parameter description:** Specifies the TCP or SCTP port used to listen on data packet channels by the TCP proxy communications library or SCTP communications library. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

This port number is automatically allocated during cluster deployment. Do not change the parameter. If the port number is incorrectly configured, the database communication fails.

---

**Value range:** an integer ranging from 0 to 65535

**Default value:** 25110 (The actual value is the specified value of the **port** GUC parameter plus 2.)

## comm\_control\_port

**Parameter description:** Specifies the TCP listening port used by the TCP proxy communications library or SCTP communications library. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

This port number is automatically allocated during cluster deployment. Do not change the parameter. If the port number is incorrectly configured, the database communication fails.

---

**Value range:** an integer ranging from 0 to 65535

**Default value:** 25111 (The actual value is the specified value of the **port** GUC parameter plus 3.)

## comm\_max\_datanode

**Parameter description:** Specifies the maximum number of DNs supported by the TCP proxy communications library.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 8192

**Default value:** maximum number of primary DNs supported by each node

**Recommended value:** 256

## comm\_max\_stream

**Parameter description:** Specifies the maximum number of concurrent data streams supported by the TCP proxy communications library. The value of this parameter must be greater than: Number of concurrent data streams x Number of operators in each stream x Square of smp.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 60000

**Default value:** 1024

---

**NOTICE**

- You are advised not to set this parameter to a large value because this will cause high memory usage (256 bytes x **comm\_max\_stream** x **comm\_max\_datanode**). If the number of concurrent data streams is large, the query is complex and the SMP is large, resulting in insufficient memory.
  - If the process memory is sufficient, you can properly increase the value of **comm\_max\_stream**.
- 

### comm\_max\_receiver

**Parameter description:** Specifies the maximum number of receiver threads for the TCP proxy communications library.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 50

**Default value:** 4

### comm\_quota\_size

**Parameter description:** Specifies the maximum size of packets that can be consecutively sent by the TCP proxy communications library. When you use a 1GE NIC, a small value ranging from 20 KB to 40 KB is recommended.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2048000. The default unit is KB.

**Default value:** 1 MB

### comm\_usable\_memory

**Parameter description:** Specifies the maximum memory available for buffering on the TCP proxy communications library on a DN.

---

**NOTICE**

This parameter must be set based on environment memory and the deployment method. If it is too large, an out-of-memory (OOM) exception may occur. If it is too small, the performance of the TCP proxy communications library or SCTP communications library may deteriorate. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

---

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 x 1024 to 1073741823. The default unit is KB.

**Default value:** 4000 MB

## comm\_memory\_pool

**Parameter description:** Specifies the size of the memory pool resources that can be used by the TCP proxy communications library on a DN.

---

### NOTICE

If the memory used by the communications library is small, set this parameter to a small value. Otherwise, set it to a large value.

---

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 x 1024 to 1073741823. The default unit is KB.

**Default value:** 2000 MB

## comm\_memory\_pool\_percent

**Parameter description:** Specifies the percentage of the memory pool resources that can be used by the TCP proxy communications library on a DN. This parameter is used to adaptively reserve memory used by the communications libraries.

---

### NOTICE

If the memory used by the communications library is small, set this parameter to a small value. Otherwise, set it to a large value.

---

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100

**Default value:** 0

## comm\_client\_bind

**Parameter description:** Specifies whether to bind the client of the communications library to a specified IP address when the client initiates a connection.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the client is bound to a specified IP address.
- **off** indicates that the client is not bound to any IP addresses.

---

**NOTICE**

If multiple IP addresses of a node in the cluster are on the same network segment, set this parameter to **on**. In this case, the client is bound to the IP address specified by **listen\_addresses**. The concurrency performance of the cluster depends on the number of random ports because a port can be used by only one client at a time.

---

**Default value:** off

## comm\_no\_delay

**Parameter description:** Specifies whether to use the **NO\_DELAY** attribute of a communications library connection.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

---

**NOTICE**

If packet loss occurs in the cluster because a large number of packets are received per second, set this parameter to **off** so that small packets are combined into large packets for transmission to reduce the total number of packets.

---

**Default value:** off

## comm\_debug\_mode

**Parameter description:** Specifies whether to enable the debug mode of the TCP proxy communications library, that is, whether to print logs about the communication layer.

---

**NOTICE**

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

---

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the debug logs of the communications library are printed.

- **off** indicates that the debug logs of the communications library are not printed.

**Default value:** off

## comm\_ackchk\_time

**Parameter description:** Specifies the duration after which the communications library server automatically triggers ACK when no data packet is received.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 20000. The unit is ms. **0:** disabled

**Default value:** 2000 (2s)

## comm\_timer\_mode

**Parameter description:** Specifies whether to enable the timer mode of the TCP proxy communications library, that is, whether to print timer logs in each phase of the communication layer.

---

### NOTICE

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

---

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the timer logs of the communications library are printed.
- **off** indicates that the timer logs of the communications library are not printed.

**Default value:** off

## comm\_stat\_mode

**Parameter description:** Specifies whether to enable the statistics mode of the TCP proxy communications library, that is, whether to print statistics about the communication layer.

---

### NOTICE

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

---

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics logs of the communications library are printed.
- **off** indicates that the statistics logs of the communications library are not printed.

**Default value:** off

## enable\_stateless\_pooler\_reuse

**Parameter description:** Specifies whether to enable the reuse of the pooler connection pool. After the parameter is enabled, existing idle TCP connections can be reused. The setting takes effect after the cluster is restarted.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that the pooler reuse mode is enabled.
- **off** or **false** indicates that the pooler reuse mode is disabled.

---

### NOTICE

This parameter should be set to a same value on CNs and DN. If this parameter is set to **off** for CNs and **on** for DN, the cluster communication fails. Set this parameter to the same value for CNs and DN. Restart the cluster for the setting to take effect.

---

**Default value:** on

## comm\_cn\_dn\_logic\_conn

**Parameter description:** Specifies whether logical connections are used between CNs and DN. The setting takes effect after the cluster is restarted.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that the connections between CNs and DN are logical, with the libcomm component in use.
- **off** or **false** indicates that the connections between CNs and DN are physical, with the libpq component in use.

---

### NOTICE

Logical connections between CNs and DN are no longer supported. This parameter is provided for compatibility, but its value is fixed at **off**.

---

**Default value:** off

## COMM\_IPC

**Parameter description:** Specifies whether to print the packet sending and receiving status of each communication node.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that the function of logging packet sending and receiving status data is enabled.
- **off** or **false** indicates that the function of logging packet sending and receiving status data is disabled.

---

### NOTICE

```
set logging_module='on(COMM_IPC)'; --Enabled
set logging_module='off(COMM_IPC)'; --Disabled
show logging_module; -- View the setting result.
```

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and set it to **off** after debugging.

---

**Default value:** off

---

### NOTICE

```
set logging_module='on(COMM_IPC)'; --Enabled
set logging_module='off(COMM_IPC)'; --Disabled
show logging_module; -- View the setting result.
```

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and set it to **off** after debugging.

---

**Default value:** off

## COMM\_PARAM

**Parameter description:** Specifies whether to print the **session** parameter settings during node communication.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that the function of logging the **session** parameter settings is enabled.

- **off** or **false** indicates that the function of logging the **session** parameter settings is disabled.

---

**NOTICE**

```
set logging_module='on(COMM_PARAM)'; --Enabled
set logging_module='off(COMM_PARAM)'; --Disabled
show logging_module; -- View the setting result.
```

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and set it to **off** after debugging.

---

**Default value:** off

## 14.3.4 Resource Consumption

### 14.3.4.1 Memory

This section describes memory parameters.

---

**NOTICE**

These parameters, except **local\_syscache\_threshold**, take effect only after the database restarts.

---

#### memorypool\_enable

**Parameter description:** Specifies whether to enable a memory pool.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the memory pool is enabled.
- **off** indicates that the memory pool is disabled.

**Default value:** off

#### memorypool\_size

**Parameter description:** Specifies the memory pool size.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 128 x 1024 to 1073741823. The unit is KB.

**Default value:** 512 MB

## enable\_memory\_limit

**Parameter description:** Specifies whether to enable the logical memory management module.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the logical memory management module is enabled.
- **off** indicates that the logical memory management module is disabled.

**Default value:** on

---

### CAUTION

- Fixed overhead exists, that is, **shared\_buffers** and metadata (about 200 MB). If **max\_process\_memory** minus the fixed overhead is less than 2 GB, GaussDB forcibly sets **enable\_memory\_limit** to **off**. Metadata is the memory used in GaussDB and is related to some concurrent parameters, such as **max\_connections**, **thread\_pool\_attr**, and **max\_prepared\_transactions**.
  - If this parameter is set to **off**, the memory used by the database is not limited. When a large number of concurrent or complex queries are performed, too much memory is used, which may cause OS OOM problems.
- 

## max\_process\_memory

**Parameter description:** Specifies the maximum physical memory of a database node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2097152 to 2147483647. The unit is KB.

**Default value:**

Independent deployment: 360 GB (60-core CPU/480 GB memory); 192 GB (32-core CPU/256 GB memory); 96 GB (16-core CPU/128 GB memory); 40 GB (8-core CPU/64 GB memory); 20 GB (4-core CPU/32 GB memory); 10 GB (4-core CPU/16 GB memory)

**Setting suggestions:**

On DNs, the value of this parameter is determined based on the physical system memory and the number of primary DNs deployed on a single node. Parameter value = (Physical memory - **vm.min\_free\_kbytes**) x 0.7/(n + Number of primary DNs). This parameter is used to prevent node OOM caused by memory usage increase, ensuring system reliability. **vm.min\_free\_kbytes** indicates the OS memory reserved for the kernel to receive and send data. Its value is at least 5% of the total memory. Therefore, the value of **max\_process\_memory** is: Physical memory x 0.665/(n + Number of primary DNs). When the number of nodes in the cluster is less than or equal to 256, n = 1. When the number of nodes in the

cluster is greater than 256 and less than or equal to 512,  $n = 2$ . When the number of nodes in the cluster is greater than 512,  $n = 3$ .

You can set this parameter on CNs to the same value as that on DN.

RAM is the maximum memory allocated to the cluster during cluster planning. It equals the physical memory of servers.

---

 **CAUTION**

If this parameter is set to a value greater than the physical memory of the server, the OS OOM problem may occur.

---

## local\_syscache\_threshold

**Parameter description:** Specifies the size of system catalog cache in a session.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

- If **enable\_global\_plancache** is enabled, **local\_syscache\_threshold** must be set to a value greater than or equal to 16 MB to ensure that GPC takes effect.
- If **enable\_global\_syscache** and **enable\_thread\_pool** are enabled, this parameter indicates the total cache size of the current thread and sessions bound to the current thread.

**Value range:** an integer ranging from  $1 \times 1024$  to  $512 \times 1024$ . The unit is KB.

**Default value:**

- Independent deployment: 16 MB

## enable\_memory\_context\_control

**Parameter description:** Enables the function of checking whether the number of memory contexts exceeds the specified limit. This parameter applies only to the DEBUG version.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of checking the number of memory contexts is enabled.
- **off** indicates that the function of checking the number of memory contexts is disabled.

**Default value:** off

## uncontrolled\_memory\_context

**Parameter description:** Specifies which memory context will not be checked when the **enable\_memory\_context\_control** parameter is enabled. This parameter applies only to the DEBUG version.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

During the query, the title meaning string "MemoryContext white list:" is added to the beginning of the parameter value.

**Value range:** a string.

**Default value:** empty.

## shared\_buffers

**Parameter description:** Specifies the size of shared memory used by GaussDB. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 16 to 1073741823. The unit is 8 KB.

The minimum value changes according to **BLCKSZ**.

**Default value:**

Independent deployment:

CN: 4 GB (60-core CPU/480 GB memory); 2 GB (32-core CPU/256 GB memory, 16-core CPU/128 GB memory); 1 GB (8-core CPU/64 GB memory); 512 MB (4-core CPU/32 GB memory) 256 MB (4-core CPU/16 GB memory)

DN: 140 GB (60-core CPU/480 GB memory); 76 GB (32-core CPU/256 GB memory); 40 GB (16-core CPU/128 GB memory); 16 GB (8-core CPU/64 GB memory); 8 GB (4-core CPU/32 GB memory); 4 GB (4-core CPU/16 GB memory)

**Setting suggestions:**

1. Set this parameter on DNs to a value greater than that on CNs because most queries in GaussDB are pushed down.
2. Set **shared\_buffers** to a value less than 40% of the memory.
3. If **shared\_buffers** is set to a larger value, increase the value of **checkpoint\_segments** because a longer period of time is required to write a large amount of new or changed data.
4. If the process fails to be restarted after the value of **shared\_buffers** is changed, perform either of the following operations based on the error information:
  - a. Adjust the **kernel.shmall**, **kernel.shmmax**, and **kernel.shmmin** OS parameters. For details, see "Preparing for Installation > Modifying OS Configuration > Configuring Other OS Parameters" in *Installation Guide*.
  - b. Run the **free -g** command to check whether the available memory and swap space of the OS are sufficient. If the memory is insufficient, manually stop other user programs that occupy much memory.
  - c. Do not set **shared\_buffers** to an excessively large or small value.

## segment\_buffers

**Parameter description:** This parameter is reserved and is not supported currently.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

## bulk\_write\_ring\_size

**Parameter description:** Specifies the size of a ring buffer used for parallel data import.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 16384 to 2147483647. The unit is KB.

**Default value:** 2 GB

**Setting suggestions:** Increase the value of this parameter on DNs if a huge amount of data will be imported.

## standby\_shared\_buffers\_fraction

**Parameter description:** Specifies the **shared\_buffers** proportion used on the server where a standby instance is deployed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a double-precision floating-point number ranging from 0.1 to 1.0

**Default value:** 1

## temp\_buffers

**Parameter description:** Specifies the maximum size of local temporary buffers used by a database session.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

This parameter can be modified only before the first use of temporary tables within each session. Subsequent attempts to change the value of this parameter will not take effect on that session.

A session allocates temporary buffers based on the value of **temp\_buffers**. If a large value is set in a session that does not require many temporary buffers, only the overhead of one buffer descriptor is added. If a buffer is used, additional 8192 bytes will be consumed for it.

**Value range:** an integer ranging from 100 to 1073741823. The unit is 8 KB.

**Default value:** 1 MB

## max\_prepared\_transactions

**Parameter description:** Specifies the maximum number of transactions that can stay in the **prepared** state simultaneously. Increasing the value of this parameter

causes GaussDB to request more System V shared memory than the default configuration allows.

When GaussDB is deployed as an HA system, set this parameter on standby servers to a value greater than or equal to that on primary servers. Otherwise, queries will fail on the standby servers.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 262143.

**Default value:**

- Independent deployment:  
1200 (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); 800 (16-core CPU/128 GB memory); 400 (8-core CPU/64 GB memory); 300 (4-core CPU/32 GB memory); 200 (4-core CPU/16 GB memory)

 **NOTE**

To avoid failures in the preparation step, the value of this parameter must be greater than the number of worker threads in `thread_pool_attr` in thread pool mode. In non-thread pool mode, the value of this parameter must be greater than or equal to the value of `max_connections`.

## work\_mem

**Parameter description:** Specifies the amount of memory to be used by internal sort operations and hash tables before they write data into temporary disk files. Sort operations are required for **ORDER BY**, **DISTINCT**, and merge joins. Hash tables are used in hash joins, hash-based aggregation, and hash-based processing of **IN** subqueries.

In a complex query, several sort or hash operations may run in parallel; each operation will be allowed to use as much memory as this parameter specifies. If the memory is insufficient, data will be written into temporary files. In addition, several running sessions could be performing such operations concurrently. Therefore, the total memory used may be many times the value of **work\_mem**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 64 to 2147483647. The unit is KB.

**Default value:**

- Independent deployment:  
128 MB (60-core CPU/480 GB memory, 32-core CPU/256 GB memory, and 16-core CPU/128 GB memory); 64 MB (8-core CPU/64 GB memory); 32 MB (4-core CPU/32 GB memory); 16 MB (4-core CPU/16 GB memory)

---

**NOTICE**

**Setting suggestions:**

If the physical memory specified by **work\_mem** is insufficient, additional operator calculation data will be written into temporary tables based on query characteristics and the degree of parallelism. This reduces performance by five to ten times, and prolongs the query response time from seconds to minutes.

- For complex serial queries, each query requires five to ten associated operations. Set **work\_mem** using the following formula: **work\_mem** = 50% of the memory/10.
  - For simple serial queries, each query requires two to five associated operations. Set **work\_mem** using the following formula: **work\_mem** = 50% of the memory/5.
  - For concurrent queries, set **work\_mem** using the following formula: **work\_mem** = **work\_mem** for serial queries/Number of concurrent SQL statements.
  - BitmapScan hash tables are also restricted by **work\_mem**, but will not be forcibly flushed to disks. In the case of complete lossify, every 1-MB memory occupied by the hash table corresponds to a 16 GB page of BitmapHeapScan. After the upper limit of **work\_mem** is reached, the memory increases linearly with the data access traffic based on this ratio.
- 

## query\_mem

**Parameter description:** Specifies the memory used by a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or an integer greater than 32 MB. The default unit is KB.

**Default value:** 0

---

**NOTICE**

- If the value of **query\_mem** is greater than 0, the optimizer adjusts the memory cost estimate to this value when generating an execution plan.
  - If the value is set to a negative value or a positive integer less than 32 MB, the default value 0 is used. In this case, the optimizer does not adjust the estimated query memory.
- 

## query\_max\_mem

**Parameter description:** Specifies the maximum memory that can be used by a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or an integer greater than 32 MB. The default unit is KB.

**Default value:** 0

---

**NOTICE**

- If the value of **query\_max\_mem** is greater than 0, an error is reported when the query memory usage exceeds the value.
  - If the value is set to a negative value or a positive integer less than 32 MB, the default value 0 is used. In this case, the optimizer does not limit the query memory.
- 

## **maintenance\_work\_mem**

**Parameter description:** Specifies the maximum amount of memory to be used by maintenance operations, such as **VACUUM** and **CREATE INDEX**. This parameter may affect the execution efficiency of **VACUUM**, **VACUUM FULL**, **CLUSTER**, and **CREATE INDEX**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1024 to 2147483647. The unit is KB.

**Default value:**

- Independent deployment:  
CN: 1 GB (60-core CPU/480 GB memory); 512 MB (32-core CPU/256 GB memory); 256 MB (16-core CPU/128 GB memory); 128 MB (8-core CPU/64 GB memory); 64 MB (4-core CPU/32 GB memory); 32 MB (4-core CPU/16 GB memory)  
DN: 2 GB (60-core CPU/480 GB memory); 1 GB (32-core CPU/256 GB memory); 512 MB (16-core CPU/128 GB memory); 256 MB (8-core CPU/64 GB memory); 128 MB (4-core CPU/32 GB memory); 64 MB (4-core CPU/16 GB memory)

---

**NOTICE**

**Setting suggestions:**

- The value of this parameter must be greater than that of **work\_mem** so that database dumps can be cleared or restored more quickly. In a database session, only one maintenance operation can be performed at a time. Maintenance is usually performed when there are not many running sessions.
  - When the **Automatic Vacuuming** process is running, up to **autovacuum\_max\_workers** times this memory may be allocated. In this case, set **maintenance\_work\_mem** to a value greater than or equal to that of **work\_mem**.
  - If a large amount of data is to be clustered, increase the value of this parameter in the session.
-

## max\_stack\_depth

**Parameter description:** Specifies the maximum safe depth of the GaussDB execution stack. The safety margin is required because the stack depth is not checked in every routine in the server, but only in key potentially-recursive routines, such as expression evaluation.

This parameter is a SUSE parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 to 2147483647. The unit is KB.

**Default value:**

- If the value of **ulimit -s** minus 640 KB is greater than or equal to 2 MB, the default value of this parameter is 2 MB.
- If the value of **ulimit -s** minus 640 KB is less than 2 MB, the default value of this parameter is the value of **ulimit -s** minus 640 KB.

---

### NOTICE

When setting this parameter, comply with the following principles:

- The database needs to reserve 640 KB stack depth. Therefore, the maximum value of this parameter is the actual stack size limit enforced by the OS kernel (as set by **ulimit -s**) minus 640 KB.
  - If the value of this parameter is greater than the value of **ulimit -s** minus 640 KB before the database is started, the database fails to be started. During database running, if the value of this parameter is greater than the value of **ulimit -s** minus 640 KB, this parameter does not take effect.
  - If the value of **ulimit -s** minus 640 KB is less than the minimum value of this parameter, the database fails to be started.
  - Setting this parameter to a value greater than the actual kernel limit means that a running recursive function may crash an individual backend process.
  - Since not all OSs provide this function, you are advised to set a specific value for this parameter.
  - The default value is 2 MB, which is relatively small and does not easily cause system breakdown.
- 

## bulk\_read\_ring\_size

**Parameter description:** Specifies the ring buffer size used for parallel data export.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 256 to 2147483647. The unit is KB.

**Default value:** 16 MB

## enable\_early\_free

**Parameter description:** Specifies whether the operator memory can be released in advance.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the operator memory can be released in advance.
- **off** indicates that the operator memory cannot be released in advance.

**Default value:** on

## memory\_trace\_level

**Parameter description:** Specifies the control level for recording memory allocation information after the dynamic memory usage exceeds 90% of the maximum dynamic memory. This parameter takes effect only when the GUC parameters **use\_workload\_manager** and **enable\_memory\_limit** are enabled. This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **none:** indicates that memory application information is not recorded.
- **level1:** After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following information is recorded and the recorded memory information is saved in the *\$GAUSSLOG/mem\_log* directory.
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
- **level2:** After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following information is recorded and the recorded memory information is saved in the *\$GAUSSLOG/mem\_log* directory.
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
  - Detailed information about all memory applications in each memory context, including the file where the allocated memory is located, line number, and size.

**Default value:** level1

#### NOTICE

- If this parameter is set to **level2**, the memory allocation details (file, line, and size) of each memory context are recorded, which greatly affects the performance. Therefore, exercise caution when setting this parameter.
- You can use the system function **gs\_get\_history\_memory\_detail(cstring)** to query the recorded memory snapshot information. For details about the function, see "SQL Reference > Functions and Operators > Statistics Functions" in *Developer Guide*.
- If the **use\_workload\_manager** parameter is disabled and the **bypass\_workload\_manager** parameter is enabled, this parameter also takes effect. The **bypass\_workload\_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The recorded memory context is obtained after all memory contexts of the same type with the same name are summarized.

## resilience\_memory\_reject\_percent

**Parameter description:** Specifies the dynamic memory usage percentage for escape from memory overload. This parameter takes effect only when the GUC parameters **use\_workload\_manager** and **enable\_memory\_limit** are enabled. This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

This parameter consists of **recover\_memory\_percent** and **overload\_memory\_percent**. The meanings of the two parts are as follows:

- **recover\_memory\_percent:** Percentage of the dynamic memory usage when the memory recovers from overload to the maximum dynamic memory. When the dynamic memory usage is less than the maximum dynamic memory multiplied by the value of this parameter, the overload escape function is disabled and new connections are allowed. The value ranges from 0 to 100. The value indicates a percentage.
- **overload\_memory\_percent:** Percentage of the dynamic memory usage to the maximum dynamic memory when the memory is overloaded. When the dynamic memory usage is greater than the maximum dynamic memory multiplied by the value of this parameter, the current memory is overloaded. In this case, the overload escape function is triggered to kill sessions and new connections are prohibited. The value ranges from 0 to 100. The value indicates a percentage.

**Default value:** '0,0', indicating that the escape from memory overload function is disabled.

#### Example:

```
resilience_memory_reject_percent = '70,90'
```

When the memory usage exceeds 90% of the upper limit, new connections are forbidden and stacked sessions are killed. When the memory usage is less than

70% of the upper limit, session killing is stopped and new connections are allowed.

---

#### NOTICE

- You can query the maximum dynamic memory and used dynamic memory in the **pv\_total\_memory\_detail** view. **max\_dynamic\_memory** indicates the maximum dynamic memory, and **dynamic\_used\_memory** indicates the used dynamic memory.
  - If this parameter is set to a small value, the escape from memory overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual memory usage.
  - If the **use\_workload\_manager** parameter is disabled and the **bypass\_workload\_manager** parameter is enabled, this parameter also takes effect. The **bypass\_workload\_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
  - The values of **recover\_memory\_percent** and **overload\_memory\_percent** can be **0** at the same time. In addition, the value of **recover\_memory\_percent** must be smaller than that of **overload\_memory\_percent**. Otherwise, the setting does not take effect.
- 

## resilience\_escape\_user\_permissions

**Parameter description:** Specifies the escape permission of users. You can set it for multiple users and separate users by commas (.). The value **sysadmin** indicates that jobs of user **sysadmin** can be canceled by the escape function. The value **monadmin** indicates that jobs of user **monadmin** can be canceled by the escape function. By default, this parameter is left blank, indicating that the escape function of the sysadmin and monadmin users is disabled. The value can only be **sysadmin**, **monadmin**, or an empty string. This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

Currently, this parameter supports only three values: **sysadmin**, **monadmin**, and "". The meanings of these values are as follows:

- **sysadmin:** Jobs of user **sysadmin** can be canceled by the escape function.
- **monadmin:** Jobs of user **monadmin** can be canceled by the escape function.
- **":** The escape function of the sysadmin and monadmin users is disabled.

**Default value:** "", indicating that the escape function of the sysadmin and monadmin users is disabled.

#### Example:

```
resilience_escape_user_permissions = 'sysadmin,monadmin'
```

The escape function is enabled for both the sysadmin and monadmin users.

---

**NOTICE**

- You can set this parameter to multiple values separated by commas (,), for example, **resilience\_escape\_user\_permissions = 'sysadmin,monadmin'**. You can also set this parameter to only one value, for example, **resilience\_escape\_user\_permissions = 'monadmin'**.
  - If this parameter is set for multiple times, the latest setting takes effect.
  - If this parameter is set to any value in the value range, common users support the escape function.
  - If a user has both the sysadmin and monadmin role permissions, the escape function of the user can be triggered only when **resilience\_escape\_user\_permissions** is set to **'sysadmin,monadmin'**.
- 

### 14.3.4.2 Disk Space

This section describes the disk space parameters, which are used to set limits on the disk space for storing temporary files.

#### sql\_use\_spacelimit

**Parameter description:** Specifies the space size for files to be flushed to disks when a single SQL statement is executed on a single DN. The managed space includes the space occupied by ordinary tables, temporary tables, and intermediate result sets to be flushed to disks. This parameter does not take effect for initial users.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB. -1 indicates no limit.

**Default value:** -1

#### temp\_file\_limit

**Parameter description:** Specifies the limit on the size of a temporary file spilled to disk in a session. The temporary file can be a sort or hash temporary file, or the storage file for a held cursor.

This is a session-level setting.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

This parameter does not apply to disk space used for temporary tables during the SQL query process.

---

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB. -1 indicates no limit.

**Default value:** -1

### 14.3.4.3 Kernel Resource Usage

This section describes kernel resource parameters. Whether these parameters take effect depends on OS settings.

#### **max\_files\_per\_process**

**Parameter description:** Specifies the maximum number of simultaneously open files allowed by each server process. If the kernel is enforcing a proper limit, setting this parameter is not required.

But on some platforms, especially on most BSD systems, the kernel allows independent processes to open far more files than the system can really support. If the message "Too many open files" is displayed, set this parameter to a smaller value. Generally, the system must meet this requirement: Number of file descriptors  $\geq$  Maximum number of concurrent statements  $\times$  Number of primary DNS of the current server  $\times$  **max\_files\_per\_process**  $\times$  3

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 25 to 2147483647

**Default value:** 1024

#### **shared\_preload\_libraries**

**Parameter description:** Specifies one or more shared libraries to be preloaded at server start. If multiple libraries are to be loaded, separate their names using commas (,). Only the **sysadmin** user can access this parameter. For example, **\$libdir/mylib** will cause **mylib.so** (or on some platforms, **mylib.sl**) to be preloaded before the loading of the standard library directory.

You can preinstall the GaussDB stored procedure library using the **\$libdir/plXXX** syntax as described in the preceding text. **XXX** can only be **pgsql**, **perl**, **tcl**, or **python**.

By preloading a shared library and initializing it as required, the library startup time is avoided when the library is first used. However, the time to start each new server process may increase, even if that process never uses the library. Therefore, set this parameter only for libraries that will be used in most sessions.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

- If a specified library is not found, the GaussDB service will fail to start.
  - Each GaussDB-supported library has a special mark that is checked to guarantee compatibility. Therefore, libraries that do not support GaussDB cannot be loaded in this way.
-

**Value range:** a string

**Default value:** `security_plugin`

#### 14.3.4.4 Cost-based Vacuum Delay

This feature allows administrators to reduce the I/O impact of the **VACUUM** and **ANALYZE** statements on concurrent database activities. It is often more important to prevent maintenance statements, such as **VACUUM** and **ANALYZE**, from affecting other database operations than to run them quickly. Cost-based vacuum delay provides a way for administrators to achieve this purpose.

---

#### NOTICE

Certain vacuum operations hold critical locks and should be complete as quickly as possible. In GaussDB, cost-based vacuum delays do not take effect during such operations. To avoid uselessly long delays in such cases, the actual delay is the larger of the two calculated values:

- $\text{vacuum\_cost\_delay} \times \text{accumulated\_balance} / \text{vacuum\_cost\_limit}$
  - $\text{vacuum\_cost\_delay} \times 4$
- 

### Background

During the execution of the **ANALYZE | ANALYSE** and **VACUUM** statements, the system maintains an internal counter that keeps track of the estimated cost of the various I/O operations that are performed. For details about **ANALYZE | ANALYSE** and **VACUUM**, see the corresponding sections in "SQL Reference > SQL Syntax" in *Developer Guide*. When the accumulated cost reaches a limit (specified by **vacuum\_cost\_limit**), the process performing the operation will sleep for a short period of time (specified by **vacuum\_cost\_delay**). Then, the counter resets and the operation continues.

By default, this feature is disabled. To enable this feature, set **vacuum\_cost\_delay** to a positive value.

### **vacuum\_cost\_delay**

**Parameter description:** Specifies the length of time that a process will sleep when **vacuum\_cost\_limit** has been exceeded.

On many systems, the effective resolution of the sleep length is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to the next higher multiple of 10.

This parameter is usually set to a small value, such as 10 or 20 milliseconds. Adjusting vacuum's resource consumption is best done by changing other vacuum cost parameters.

This parameter is a **USERSET** parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100. The unit is ms. A positive number enables cost-based vacuum delay and **0** disables cost-based vacuum delay.

**Default value:** 0

### **vacuum\_cost\_page\_hit**

**Parameter description:** Specifies the estimated cost for vacuuming a buffer found in the shared buffer. It represents the cost to lock the buffer pool, look up the shared hash table, and scan the content of the page.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 1

### **vacuum\_cost\_page\_miss**

**Parameter description:** Specifies the estimated cost for vacuuming a buffer read from the disk. It represents the cost to lock the buffer pool, look up the shared hash table, read the desired block from the disk, and scan the block.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 10

### **vacuum\_cost\_page\_dirty**

**Parameter description:** Specifies the estimated cost charged when vacuum modifies a block that was previously clean. It represents the extra cost required to update the dirty block out to the disk again.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 20

### **vacuum\_cost\_limit**

**Parameter description:** Specifies the cost limit. The vacuuming process will sleep if this limit is exceeded.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 10000

**Default value:** 1000

## **14.3.4.5 Background Writer**

This section describes background writer parameters. The background writer process is used to write dirty data (new or modified data) in shared buffers to

disks. This mechanism ensures that database processes seldom or never need to wait for a write action to occur when handling user queries.

It also mitigates performance deterioration caused by checkpoints because only a few of dirty pages need to be flushed to the disk when the checkpoints arrive. This mechanism, however, increases the overall net I/O load because while a repeatedly-dirtied page may otherwise be written only once per checkpoint interval, the background writer may write it several times as it is dirtied in the same interval. In most cases, continuous light loads are preferred, instead of periodic load peaks. The parameters discussed in this section can be set based on actual requirements.

## bgwriter\_delay

**Parameter description:** Specifies the interval at which the background writer writes dirty shared buffers. Each time, the backend write process initiates write operations for some dirty buffers. In full checkpoint mode, the **bgwriter\_lru\_maxpages** parameter is used to control the amount of data to be written each time, and the process is restarted after *bgwriter\_delay* ms hibernation. In incremental checkpoint mode, the number of target idle buffer pages is calculated based on the value of **candidate\_buf\_percent\_target**. If the number of idle buffer pages is insufficient, a batch of pages is flushed to disks every *bgwriter\_delay* ms. The number of flushed pages is calculated based on the target difference percentage. The maximum number of flushed pages is limited by **max\_io\_capacity**.

In many systems, the effective resolution of sleep delays is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to the next higher multiple of 10.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 10000. The unit is millisecond.

**Default value:** 2s

**Setting suggestion:** Reduce this value in slow data writing scenarios to reduce the checkpoint load.

## candidate\_buf\_percent\_target

**Parameter description:** Specifies the expected percentage of available buffers in the shared\_buffer memory buffer in the candidate buffer chain when the incremental checkpoint is enabled. If the number of available buffers in the current candidate chain is less than the target value, the bgwriter thread starts flushing dirty pages that meet the requirements.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a double-precision floating point number ranging from 0.1 to 0.85

**Default value:** 0.3

## bgwriter\_lru\_maxpages

**Parameter description:** Specifies the number of dirty buffers the background writer can write in each round.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000

### NOTE

When this parameter is set to **0**, the background writer is disabled. This setting does not affect checkpoints.

**Default value:** 100

## bgwriter\_lru\_multiplier

**Parameter description:** Specifies the coefficient used to estimate the number of dirty buffers the background writer can write in the next round.

The number of dirty buffers written in each round depends on the number of buffers used by server processes during recent rounds. The estimated number of buffers required in the next round is calculated using the following formula: Average number of recently used buffers x **bgwriter\_lru\_multiplier**. The background writer writes dirty buffers until sufficient, clean and reusable buffers are available. The number of buffers the background writer writes in each round is always less than or equal to the value of **bgwriter\_lru\_maxpages**.

Therefore, the value **1.0** of **bgwriter\_lru\_multiplier** represents a just-in-time policy of writing exactly the number of dirty buffers predicted to be required. Larger values provide some cushion against spikes in demand, whereas smaller values intentionally leave more writes to be done by server processes.

Smaller values of **bgwriter\_lru\_maxpages** and **bgwriter\_lru\_multiplier** reduce the extra I/O load caused by the background writer, but make it more likely that server processes will have to issue writes for themselves, delaying interactive queries.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to 10

**Default value:** 2

## pagewriter\_thread\_num

**Parameter description:** Specifies the number of threads for background page flushing after the incremental checkpoint is enabled. Dirty pages are flushed in sequence to disks, promoting recovery points.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 16

**Default value:** 4

## dirty\_page\_percent\_max

**Parameter description:** Specifies the percentage of dirty pages to **shared\_buffers** after the incremental checkpoint is enabled. When the value of this parameter is reached, the background page flush thread flushes dirty pages based on the maximum value of **max\_io\_capacity**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0.1 to 1

**Default value:** 0.9

## pagewriter\_sleep

**Parameter description:** Specifies the interval for the pagewriter thread to flush dirty pages to disks after the incremental checkpoint is enabled. When the ratio of dirty pages to **shared\_buffers** reaches **dirty\_page\_percent\_max**, the number of pages in each batch is calculated based on the value of **max\_io\_capacity**. In other cases, the number of pages in each batch decreases proportionally.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600000. The unit is ms.

**Default value:** 2000 ms (2s)

## max\_io\_capacity

**Parameter description:** Specifies the I/O upper limit per second for the backend write process to flush pages in batches. Set this parameter based on the service scenario and the disk I/O capability. If the RTO is short or the data volume is much larger than the shared memory and the service access data volume is random, the value of this parameter cannot be too small. A small value of **max\_io\_capacity** reduces the number of pages flushed by the backend write process. If a large number of pages are evicted due to service triggering, the services are affected.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 30720 to 10485760. The unit is KB.

**Default value:** 500 MB/s

## enable\_consider\_usecount

**Parameter description:** Specifies whether the backend thread considers the page popularity during page replacement. You are advised to enable this parameter in large-capacity scenarios.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on/true:** The page popularity is considered.
- **off/false:** The page popularity is not considered.

**Default value:** off

## dw\_file\_num

**Parameter description:** Specifies the number of doublewrite files to be written in batches. The value is related to **pagewriter\_thread\_num** and cannot be greater than **pagewriter\_thread\_num**. If the value is too large, it will be corrected to the value of **pagewriter\_thread\_num**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 16

**Default value:** 1

## dw\_file\_size

**Parameter description:** Specifies the size of each doublewrite file.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, in the range [32,256]

**Default value:** 256

### 14.3.4.6 Asynchronous I/O

## checkpoint\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the checkpointer thread. If the threshold is exceeded, the operating system is instructed to flush the pages cached in the operating system asynchronously. In GaussDB, the disk page size is 8 KB.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. For example, if the value is **32**, the checkpointer thread continuously writes 32 disk pages (that is,  $32 \times 8 = 256$  KB) before asynchronous flush.

**Default value:** 256 KB (32 pages)

## bgwriter\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the background writer thread. If the number of pages exceeds the threshold, the background writer thread instructs the operating system to asynchronously flush the pages cached in the operating system to disks. In GaussDB, the disk page size is 8 KB.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. For example, if the value is **64**, the background writer thread continuously writes 64 disk pages (that is,  $64 \times 8 = 512$  KB) before asynchronous flush.

**Default value:** 512 KB (64 pages)

## backend\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the backend thread. If the number of pages exceeds the threshold, the backend thread instructs the operating system to asynchronously flush the pages cached in the operating system to disks. In GaussDB, the disk page size is 8 KB.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. For example, if the value is **64**, the backend thread continuously writes 64 disk pages (that is,  $64 \times 8 = 512$  KB) before asynchronous flush.

**Default value:** 0

## 14.3.5 Parallel Data Import

GaussDB provides a parallel data import function that enables a large amount of data to be imported in a fast and efficient manner. This section describes parameters for importing data to GaussDB in parallel.

### raise\_errors\_if\_no\_files

**Parameter description:** Specifies whether to distinguish between the problems "the number of imported file records is empty" and "the imported file does not exist". If this parameter is set to **TRUE** and the problem "the imported file does not exist" occurs, GaussDB will report the error message "file does not exist".

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are distinguished when files are imported.
- **off** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are the same when files are imported.

**Default value:** off

### gds\_debug\_mod

**Parameter description:** Specifies whether to enable the debug function of Gauss Data Service (GDS). This parameter is used to better locate and analyze GDS

faults. After the debug function is enabled, types of packets received or sent by GDS, peer end of GDS during command interaction, and other interaction information about GDS are written into the logs of corresponding nodes in the cluster. In this way, the state switching on the GaussDB state machine and the current state are recorded. If this function is enabled, additional log I/O resources will be consumed, affecting log performance and validity. You are advised to enable this function only when locating GDS faults.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**

- **on** indicates that the GDS debug function is enabled.
- **off** indicates that the GDS debug function is disabled.

**Default value:** off

## safe\_data\_path

**Parameter description:** Specifies the path prefix restriction except for the initial user. Currently, the path prefix restriction applies to the COPY operation and advanced packages.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string of up to 4,096 characters

**Default value:** NULL

---

### CAUTION

- If a soft link file exists in the **safe\_data\_path** directory, the system processes the file based on the actual file path to which the soft link points. If the actual path is not in the **safe\_data\_path** directory, an error is reported.
  - If a hard link file exists in the **safe\_data\_path** directory, it can be used properly. For security purposes, exercise caution when using hard link files. Do not create hard link files that point to other directories in the **safe\_data\_path** directory. Ensure that the permission on the **safe\_data\_path** directory is minimized.
- 

## enable\_copy\_server\_files

**Parameter description:** Specifies whether to enable the permission to copy server files.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the permission to copy server files is enabled.
- **off** indicates that the permission to copy server files is disabled.

**Default value:** off

---

**NOTICE**

When the **enable\_copy\_server\_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable\_copy\_server\_files** parameter is enabled, users with the **SYSADMIN** permission or users who inherit the **gs\_role\_copy\_files** permission of the built-in role are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement.

---

## 14.3.6 Write Ahead Log

### 14.3.6.1 Settings

#### wal\_level

**Parameter description:** Specifies the level of information to be written to the WAL. The value cannot be empty or commented out.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- To enable WAL archiving and data streaming replication between primary and standby servers, set this parameter to **archive**, **hot\_standby**, or **logical**.
  - If this parameter is set to **archive** or **minimal**, **hot\_standby** must be set to **off**. In a distributed environment, **hot\_standby** cannot be set to **off**. Therefore, you are not advised to set this parameter to **archive** or **minimal**. Otherwise, the database cannot be started.
- 

**Value range:** enumerated values

- **minimal**  
Advantages: Certain bulk operations (including creating tables and indexes, executing cluster operations, and copying tables) are safely skipped in logging, which can make those operations much faster.  
Disadvantages: WALs contain only basic information required for recovery from a database server crash or an emergency shutdown. Data cannot be restored from archived WALs.
- **archive**  
Adds logging required for WAL archiving, supporting the database restoration from archives.
- **hot\_standby**
  - Further adds information required to run SQL queries on a standby server and takes effect after a server restart.
  - To enable read-only queries on a standby server, the **wal\_level** parameter must be set to **hot\_standby** on the primary server and the same value

must be set on the standby server. There are few measurable differences in performance between using **hot\_standby** and **archive** levels. However, feedback is welcome if any differences in their impacts on product performance are noticeable.

- **logical**

Only when this parameter is set to **logical**, logical logs can be parsed and the primary key information is recorded in Xlogs.

**Default value:** hot\_standby

## fsync

**Parameter description:** Specifies whether the GaussDB server uses the **fsync()** function (see [wal\\_sync\\_method](#)) to ensure that updates can be written to disks in a timely manner.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- Using the **fsync()** function ensures that the data can be recovered to a known state when an OS or a hardware crashes.
- Setting this parameter to **off** may result in unrecoverable data corruption in a system crash.

---

**Value range:** Boolean

- **on** indicates that the **fsync()** function is used.
- **off** indicates that the **fsync()** function is not used.

**Default value:** on

## synchronous\_commit

**Parameter description:** Specifies the synchronization mode of the current transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

Generally, logs generated by a transaction are synchronized in the following sequence:

1. The primary node writes the logs to the local memory.
2. The primary node writes the logs in the local memory to the local file system.
3. The primary node flushes the logs in the local file system to disks.
4. The primary node sends the logs to the standby node.
5. The standby node receives the logs and saves them to its local memory.
6. The standby node writes the logs in the local memory to the local file system.
7. The standby node flushes the logs in the local file system to disks.

8. The standby node replays the logs to complete the incremental update of data files.

**Value range:** enumerated values

- **on (true, yes, 1):** The primary node waits for the standby node to flush logs to disks before committing a transaction.
- **off (false, no, 0):** The primary node commits a transaction without waiting for the primary node to flush logs to disks. This mode is also called asynchronous commit.
- **local:** The primary node waits for the primary node to flush logs to disks before committing a transaction. This mode is also called local commit.
- **remote\_write:** The primary node waits for the standby node to write logs to the file system before committing a transaction. (The logs do not need to be flushed to disks.)
- **remote\_receive:** The primary node waits for the standby node to receive logs before committing a transaction. (The logs do not need to be written to the file system.)
- **remote\_apply:** The primary node waits for the standby node to complete log replay before committing a transaction.
- **true:** same as **on**.
- **false:** same as **off**.
- **yes:** same as **on**.
- **no:** same as **off**.
- **1:** same as **on**.
- **0:** same as **off**.
- **2:** same as **remote\_apply**.

**Default value:** on

## wal\_sync\_method

**Parameter description:** Specifies the method used for forcing WAL updates out to disk.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If **fsync** is set to **off**, the setting of this parameter does not take effect because WAL file updates will not be forced out to disk.

---

**Value range:** enumerated values

- **open\_datasync** indicates that WAL files are opened with the **O\_DSYNC** option.
- **fdatsync** indicates that **fdatsync()** is called at each commit. (SLES 10 and SLES 11 are supported.)

- **fsync\_writethrough** indicates that **fsync()** is called at each commit to force data in the buffer to be written to the disk.

 NOTE

**wal\_sync\_method** can be set to **fsync\_writethrough** on a Windows platform, but this setting has the same effect as setting the parameter to **fsync** on the Windows platform.

- **fsync** indicates that **fsync()** is called at each commit. (SLES 10 and SLES 11 are supported.)
- **open\_sync** indicates that the **open()** with the O\_SYNC option is used to write WAL files (SLES 10 and SLES 11 are supported).

 NOTE

Not all platforms support the preceding parameters.

**Default value:** **fdatasync**

## full\_page\_writes

**Parameter description:** Specifies whether the GaussDB server writes the entire content of each disk page to WALs during the first modification of that page after a checkpoint.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- This parameter is needed because a page write that is in process during an OS crash might be only partially completed, leading to an on-disk page that contains a mix of old and new data. The row-level change data normally stored in WALs will not be enough to completely restore such a page during post-crash recovery. Storing the full page image guarantees that the page can be correctly restored, but at the price of increasing the amount of data that must be written to WALs.
- Setting this parameter to **off** might lead to unrecoverable data corruption after a system failure. It might be safe to set this parameter to **off** if you have hardware (such as a battery-backed disk controller) or file-system software (such as ReiserFS 4) that reduces the risk of partial page writes to an acceptably low level.

---

**Value range:** Boolean

- **on** indicates that this feature is enabled.
- **off** indicates that this feature is disabled.

**Default value:** **on**

## wal\_log\_hints

**Parameter description:** Specifies whether to write an entire page to WALs during the first modification of that page after a checkpoint, even for non-critical modifications of so-called hint bits. You are advised not to modify the setting.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the entire page is written to WALs.
- **off** indicates that the entire page is not written to WALs.

**Default value:** on

## wal\_buffers

**Parameter description:** Specifies the number of **XLOG\_BLCKSZ** used for storing WAL data. The size of each **XLOG\_BLCKSZ** is 8 KB.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**  $-1$  to  $2^{18}$ . The minimum value is  $-1$  and the maximum value is 262144. The unit is 8 KB.

- If this parameter is set to  $-1$ , the value of **wal\_buffers** is automatically adjusted based on the value of **shared\_buffers**. The default value is 1/32 of **shared\_buffers**. If the value is less than 8, it will be forcibly set to **8**. If the value is greater than 2048, it will be forcibly set to **2048**.
- If this parameter is set to a value other than  $-1$  and smaller than **4**, the value **4** is forcibly used.
- Independent deployment: 1 GB (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); 512 MB (16-core CPU/128 GB memory); 256 MB (8-core CPU/64 GB memory); 128 MB (4-core CPU/32 GB memory); 64 MB (4-core CPU/16 GB memory)

**Setting suggestions:** The content of the WAL buffer is written to disks at every transaction commit. Therefore, setting an extremely large value is unlikely to bring a significant increase in system performance. However, setting this parameter to hundreds of megabytes can improve the disk write performance on a server to which a large number of transactions are committed at the same time. The default value meets user requirements in most cases.

## wal\_writer\_delay

**Parameter description:** Specifies the delay between activity rounds for the WAL writer.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

A longer delay might lead to insufficient WAL buffer and a shorter delay leads to continuously writing of the WALs, thereby increasing the load of disk I/O.

---

**Value range:** an integer ranging from 1 to 10000. The unit is millisecond.

**Default value:** 200 ms

## commit\_delay

**Parameter description:** Specifies the duration for committed data to be stored in the WAL buffer.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- When this parameter is set to a non-zero value, the committed transaction is stored in the WAL buffer instead of being written to the WAL immediately. Then the WAL writer process flushes the buffer out to disks periodically.
  - If system load is high, other transactions are probably ready to be committed within the delay. If no other transactions are ready to be committed, the delay is a waste of time.
- 

**Value range:** an integer ranging from 0 to 100000. The unit is microsecond. **0** indicates no delay.

**Default value:** 0

## commit\_siblings

**Parameter description:** Specifies a threshold on the number of concurrent open transactions. If the number of concurrent open transactions is greater than the value of this parameter, a transaction that initiates a commit request will wait for a period of time specified by [commit\\_delay](#). Otherwise, this transaction is written into WALs immediately.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000.

**Default value:** 5

## wal\_block\_size

**Parameter description:** Specifies the size of a WAL disk block.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer. The unit is byte.

**Default value:** 8192

## wal\_segment\_size

**Parameter description:** Specifies the size of a WAL segment file.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer. The unit is 8 KB.

**Default value:** 16 MB (2048 x 8 KB)

## force\_promote

**Parameter description:** Specifies whether to enable the forcible switchover function on the standby node.

When a cluster is faulty, the forcible switchover enables the cluster to recover services as soon as possible at the cost of losing some data. This is an escape method used when the cluster is unavailable. You are not advised to trigger this method frequently. You are not advised not to use this function if you are not clear about the impact of data loss on services.

To use this function, you need to enable it on the DN and CM Server and restart the cluster for the setting to take effect. For details about how to enable the forcible switchover function on the standby node, see "Emergency Handling > Performing a Forcible Primary/Standby Switchover" in *Troubleshooting*.

**Value range:** an integer. The value can be 0 (disabled) or 1 (enabled).

**Default value:** 0

## wal\_file\_init\_num

**Parameter description:** Specifies the number of Xlog segment files created by the WAL writer assistant thread at a time.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 1000000.

**Default value:** 10

## wal\_debug

**Parameter description:** Specifies whether to output WAL-related debugging information. This parameter is available only when **WAL\_DEBUG** is enabled during compilation.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** false

## walwriter\_cpu\_bind

**Parameter description:** Sets the number of CPU cores bound to the WAL writer thread.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from -1 to 2147483647

**Default value:** -1

## walwriter\_sleep\_threshold

**Parameter description:** Specifies the number of times that the idle Xlog is refreshed before the Xlog refresher enters sleep.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 50000.

**Default value:** 500

## wal\_flush\_timeout

**Parameter description:** Specifies the timeout interval for traversing **WalInsertStatusEntryTbl**. It is the maximum wait time for the adaptive Xlog disk flushing I/O to traverse **WalInsertStatusEntryTbl**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

---

### NOTICE

If the timeout interval is too long, the Xlog flushing frequency may decrease, reducing the Xlog processing performance.

---

**Value range:** an integer ranging from 0 to 90000000. The unit is microsecond.

**Default value:** 2us

## wal\_flush\_delay

**Parameter description:** Specifies the wait interval when an entry in the **WAL\_NOT\_COPIED** state is encountered during **WalInsertStatusEntryTbl** traversal.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 90000000. The unit is microsecond.

**Default value:** 1us

## 14.3.6.2 Checkpoints

### checkpoint\_segments

**Parameter description:** Specifies the minimum number of WAL segment files in the period specified by [checkpoint\\_timeout](#). The size of each log file is 16 MB.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483646

Increasing the value of this parameter speeds up the import of a large amount of data. Set this parameter based on [checkpoint\\_timeout](#) and [shared\\_buffers](#). This parameter affects the number of WAL segment files that can be reused. Generally, the maximum number of reused files in the [pg\\_xlog](#) folder is twice the number of [checkpoint\\_segments](#). The reused files are not deleted and are renamed to the WAL segment files which will be later used.

**Default value:** 1024

### checkpoint\_timeout

**Parameter description:** Specifies the maximum time between automatic WAL checkpoints.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 30 to 3600. The unit is second.

If the value of [checkpoint\\_segments](#) is increased, you need to increase the value of this parameter. The increase of these two parameters further requires the increase of [shared\\_buffers](#). Consider all these parameters during setting.

**Default value:** 15min

### checkpoint\_completion\_target

**Parameter description:** Specifies the target of checkpoint completion.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a double-precision floating point number ranging from 0.0 to 1.0

**Default value:** 0.5

#### NOTE

0.5 indicates that each checkpoint should be complete within 50% of the interval between checkpoints.

### checkpoint\_warning

**Parameter description:** Specifies a time in seconds. If the checkpoint interval is close to this time due to filling of checkpoint segment files, a message is sent to the server log to suggest an increase in the value of [checkpoint\\_segments](#).

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is s. **0** indicates that the warning is disabled.

**Default value:** 5min

**Recommended value:** 5min

## checkpoint\_wait\_timeout

**Parameter description:** Sets the longest time that the checkpoint waits for the checkpoint thread to start.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2 to 3600. The unit is s.

**Default value:** 1min

## enable\_incremental\_checkpoint

**Parameter description:** Specifies whether to enable incremental checkpoint.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## enable\_double\_write

**Parameter description:** Specifies whether to enable the doublewrite buffer. When the incremental checkpoint is enabled, the doublewrite buffer instead of **full\_page\_writes** is used to prevent partial page writes.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## incremental\_checkpoint\_timeout

**Parameter description:** Specifies the maximum interval between automatic WAL checkpoints when the incremental checkpoint is enabled.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 3600. The unit is second.

**Default value:** 1min

## enable\_xlog\_prune

**Parameter description:** Specifies whether the primary node reclaims logs if the size of Xlogs exceeds the value of **max\_size\_for\_xlog\_prune** when any standby node is disconnected.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the primary node reclaims logs when any standby node is disconnected.
- If this parameter is set to **off**, the primary node does not reclaim logs when any standby node is disconnected.

**Default value:** on

## max\_size\_for\_xlog\_prune

**Parameter description:** This parameter takes effect when **enable\_xlog\_prune** is enabled. The working mechanism is as follows:

1. If all standby nodes specified by the **replconninfo** series GUC parameters are connected to the primary node, this parameter does not take effect.
2. If any standby node specified by the **replconninfo** series GUC parameters is not connected to the primary node, this parameter takes effect. When the number of historical logs on the primary node is greater than the value of this parameter, the logs are forcibly recycled. Exception: In synchronous commit mode (that is, the value of **synchronous\_commit** is not **local** or **off**), if there are connected standby nodes, the primary node retains the logs that meet the minimum log receiving requirements on the majority of standby nodes. In this case, the number of reserved logs may exceed the value of **max\_size\_for\_xlog\_prune**.
3. If any standby node is being built, this parameter does not take effect. All logs of the primary node are retained to prevent build failures due to log recycling.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is KB.

**Default value:** 256 GB

## max\_redo\_log\_size

**Parameter description:** On standby DN, this specifies the maximum size of logs between the latest checkpoint and the current log playback location. On the primary DN, this specifies the maximum size of logs between the recovery point and the latest log location. You are advised not to set this parameter to a large value if the RTO is concerned.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 163840 to 2147483647. The unit is KB.

**Default value:** 1048576. The unit is KB.

### 14.3.6.3 Log Replay

#### recovery\_time\_target

**Parameter description:** Sets the value of **recovery\_time\_target** in seconds to enable the standby server to write and replay logs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that a standby node can write and replay logs within the period specified by the value, so that the standby node can quickly assume the primary role. If this parameter is set to a small value, the performance of the primary server is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 60

#### recovery\_max\_workers

**Parameter description:** Specifies the maximum number of concurrent replay threads.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 20.

**Default value:** 4

#### recovery\_parallelism

**Parameter description:** Specifies the actual number of replay threads. This parameter is read-only.

This parameter is a POSTMASTER parameter and is affected by **recovery\_max\_workers** and **recovery\_parse\_workers**. If any value is greater than 0, **recovery\_parallelism** will be recalculated.

**Value range:** an integer ranging from 1 to 2147483647.

**Default value:** 1

#### queue\_item\_size

**Parameter description:** Specifies the maximum length of the task queue of each redo replayer thread.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a value ranging from 1 to 65535.

**Default value:** 560

## recovery\_parse\_workers

**Parameter description:** Specifies the number of **ParseRedoRecord** threads for the ultimate RTO feature.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 16.

This parameter can be set to a value greater than 1 only when the ultimate RTO feature is enabled. In addition, it must be used together with **recovery\_redo\_workers**. If both **recovery\_parse\_workers** and **recovery\_max\_workers** are enabled, the ultimate RTO setting of **recovery\_parse\_workers** prevails and the concurrent replay function is disabled. In addition, to enable ultimate RTO, ensure that the value of [wal\\_receiver\\_buffer\\_size](#) is greater than or equal to 32 MB (64 MB is recommended).

**Default value:** 1

### NOTE

- After the database is upgraded from V500R001C00 to V500R001C10 or a later version, you are advised to set this parameter to **2** and restart the DN.
- After ultimate RTO is enabled, the standby node extra starts a number of threads (**recovery\_parse\_workers** × (**recovery\_redo\_workers** + 2) + 5), occupying more CPU, memory, and I/O resources. You need to select proper parameters. Otherwise, the standby node may fail to start due to insufficient resources.
- In this version and later, the ultimate RTO feature does not have flow control. Flow control is controlled by the [recovery\\_time\\_target](#) parameter.

## recovery\_redo\_workers

**Parameter description:** Specifies the number of **PageRedoWorker** threads corresponding to each **ParseRedoRecord** thread when the ultimate RTO feature is enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 8.

It must be used together with **recovery\_parse\_workers**. The setting of **recovery\_redo\_workers** takes effect only when **recovery\_parse\_workers** is set to a value greater than 1.

**Default value:** 1

### NOTE

After the database is upgraded from V500R001C00 to V500R001C10 or a later version, you are advised to set parameters based on the number of CPUs in the environment and restart the DN.

**Table 14-5** Parameter settings for different CPUs, memory sizes, and deployment models

No.	CPUs	Memory	Distributed Hybrid Deployment	recover_parse_workers	recover_redo_workers	Replayer Threads	Remarks
1	4	-	-	1	1	-	Not recommended
2	8	-	Yes	1	1	-	Not recommended
3	8	64	No	1	1	-	Not recommended
4	16	128	Yes	1	1	-	Not recommended
5	16	128	No	2	3	15	-
6	32	256	Yes	2	2	13	-
7	32	256	No	2	8	25	-
8	64	512	Yes	2	4	17	-
9	64	512	No	2	8	25	Set the parameter to the recommended value for larger specifications.
10	96	768	-	2	8	25	Set the parameter to the recommended value for larger specifications.

## enable\_page\_lsn\_check

**Parameter description:** Specifies whether to enable the data page LSN check. During replay, the current LSN of the data page is checked to see if it is the expected one.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## redo\_bind\_cpu\_attr

**Parameter description:** Specifies the core binding operation of the replayer thread. Only user **sysadmin** can access this parameter. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

The available configuration modes are as follows: 1. '**nobind**': The thread is not bound to a core. 2. '**nodebind: 1, 2**': Use the CPU cores in NUMA groups 1 and 2 to bind threads. 3. '**cpubind: 0-30**': Use the CPU cores 0 to 30 to bind threads. The value of this parameter is case-insensitive.

**Default value:** '**nobind**'

 **NOTE**

This parameter is used for core binding in the Arm environment. You are advised to bind all replay threads to the same NUMA group for better performance.

## 14.3.6.4 Archiving

### archive\_mode

**Parameter description:** Specifies whether to archive WALs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

When [wal\\_level](#) is set to **minimal**, the **archive\_mode** parameter is unavailable.

---

**Value range:** Boolean

- **on** indicates that the archiving is enabled.
- **off** indicates that the archiving is disabled.

**Default value:** **off**

### archive\_command

**Parameter description:** Specifies the command set by the administrator to archive WALs. You are advised to set the archive log path to an absolute path.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- If both **archive\_dest** and **archive\_command** are configured, WALs are preferentially saved to the directory specified by **archive\_dest**. The command configured by **archive\_command** does not take effect.
- Any **%p** in the string is replaced by the absolute path of the file to archive, and any **%f** is replaced by only the file name. (The relative path is relative to the data directory.) Use **%%** to embed an actual **%** character in the command.
- This command returns zero only if it succeeds. The command example is as follows:  

```
archive_command = 'cp --remove-destination %p /mnt/server/archivedir/%f'
```
- **--remove-destination** indicates that files will be overwritten during the archiving.
- If there are multiple archive commands, write them to the shell script file and set **archive\_command** to the command for executing the script. Example:  
-- Assume that multiple commands are as follows:  

```
test ! -f dir/%f && cp %p dir/%f
```

  
-- The content of the **test.sh** script is as follows:  

```
test ! -f dir/$2 && cp $1 dir/$2
```

  
-- The archive command is as follows:  

```
archive_command='sh dir/test.sh %p %f'
```

**Value range:** a string

**Default value:** (disabled)

## archive\_dest

**Parameter description:** Specifies the path set by the administrator to archive WALs. You are advised to set the archive log path to an absolute path.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- If both **archive\_dest** and **archive\_command** are configured, WALs are preferentially saved to the directory specified by **archive\_dest**. The command configured by **archive\_command** does not take effect.
- If the string is a relative path, it is relative to the data directory. Example:  

```
archive_dest = '/mnt/server/archivedir/'
```

**Value range:** a string

**Default value:** an empty string

## archive\_timeout

**Parameter description:** Specifies the archiving period.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- The server is forced to switch to a new WAL segment file when the period specified by this parameter has elapsed since the last file switch.
- Archived files that are closed early due to a forced switch are still of the same length as full files. Therefore, a very short **archive\_timeout** will bloat the archive storage. You are advised to set **archive\_timeout** to **60s**.

---

**Value range:** an integer ranging from 0 to 1073741823. The unit is second. The value **0** indicates that the function is disabled.

**Default value:** 0

## archive\_interval

**Parameter description:** Specifies the archiving interval.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- Log files are forcibly archived when the period specified by this parameter has elapsed.
- Archiving involves I/O operations. Therefore, frequent archiving is not allowed. In addition, the RPO cannot be set to a large value; otherwise, the PITR will be affected. You are advised to use the default value.

---

**Value range:** an integer ranging from 1 to 1000. The unit is second.

**Default value:** 1

## time\_to\_target\_rpo

**Parameter description:** Specifies the maximum *time\_to\_target\_rpo* seconds from the time when an exception occurs on the primary cluster to the time when data is archived to the OBS recovery point in dual-cluster remote DR mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

In dual-cluster remote DR mode, logs of the primary cluster are archived to OBS. **0** indicates that log flow control is disabled. 1 to 3600 indicates the maximum *time\_to\_target\_rpo* seconds from the time when an exception occurs on the primary cluster to the time when data is archived to the recovery point of OBS. This ensures that the maximum duration of data loss is within the allowed range when the primary cluster breaks down due to a disaster. If this parameter is set to a small value, the performance of the primary server is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 10

## 14.3.7 HA Replication

### 14.3.7.1 Sending Server

#### max\_wal\_senders

**Parameter description:** Specifies the maximum number of concurrent connections of transaction log sender processes. The value cannot be greater than or equal to that of [max\\_connections](#).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

[wal\\_level](#) must be set to **archive**, **hot\_standby**, or **logical** to allow connections from standby servers.

---

**Value range:** an integer ranging from 0 to 1024. The recommended value range is 8 to 100.

#### NOTE

This parameter can be set to 0 only when a single DN is used and there is no primary/standby instance.

#### **Default value:**

**Setting suggestions:** Each log replication connection between a standby server and a primary server occupies a WAL sender thread. Therefore, the value of this parameter must be greater than or equal to the number of DNs. Otherwise, the standby server cannot connect to the primary server. When logical replication is required, each log extraction thread occupies one WAL sender thread. If logical replication is required, set **max\_wal\_senders** to a value greater than the number of threads required by standby servers and logical replication extraction threads.

#### wal\_keep\_segments

**Parameter description:** Specifies the minimum number of transaction log files that can be retained in the **pg\_xlog** directory. The standby node obtains the logs from the primary node to perform streaming replication.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2 to *INT\_MAX*

**Default value:** 128

#### **Setting suggestions:**

- During WAL archiving or recovery from a checkpoint on the server, the system may retain more log files than the number specified by **wal\_keep\_segments**.

- If this parameter is set to an excessively small value, a transaction log may have been overwritten by a new transaction before requested by the standby server. As a result, the request fails and the connection between the primary and standby servers is terminated.
- If the HA system uses asynchronous transmission, increase the value of **wal\_keep\_segments** when data greater than 4 GB is continuously imported in COPY mode. Take T6000 board as an example. If the data to be imported reaches 50 GB, you are advised to set this parameter to **1000**. You can dynamically restore the setting of this parameter after data import is complete and the log synchronization is normal.

## wal\_sender\_timeout

**Parameter description:** Specifies the maximum duration that the sender waits for the receiver to receive transaction logs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the data volume on the primary node is huge, the value of this parameter must be increased for rebuilding. For example, if the data volume on the primary node reaches 500 GB, you are advised to set this parameter to 600 seconds.
- This parameter cannot be set to a value larger than the value of **wal\_receiver\_timeout** or the timeout parameter for database rebuilding.

---

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 6s

## max\_replication\_slots

**Parameter description:** Specifies the number of log replication slots in the primary server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1024. The recommended value range is 8 to 100.

**Default value:** 20

**Setting suggestions:**

#### NOTICE

When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to: Number of current physical replication slots + Number of backup slots + Number of required logical replication slots.

If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

Physical replication slots provide an automatic method to ensure that Xlog files are not removed from a primary DN before they are received by all the standby DNs, allowing high availability for the cluster. The number of physical replication slots required by the cluster is as follows: ratio of the number of standby DNs to the number of primary DNs in a group of DNs. For example, if the HA cluster has one primary DN and one standby DN, the number of physical replication slots required is 1. If the HA cluster has one primary DN and three standby DNs, the number of physical replication slots required is 3.

Backup slot records replication information during backup execution. Full backup and incremental backup correspond to two independent backup slots.

Plan the number of logical replication slots as follows:

- A logical replication slot can carry changes of only one database for decoding. If multiple databases are involved, create multiple logical replication slots.
- If logical replication is needed by multiple target databases, create multiple logical replication slots in the source database. Each logical replication slot corresponds to one logical replication link.

## max\_keep\_log\_seg

**Parameter description:** Stream control parameter. In logical replication, physical logs are parsed and converted into logical logs locally on the DN. When the number of physical log files that are not parsed is greater than the value of this parameter, stream control is triggered. The value **0** indicates that the stream control function is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## enable\_wal\_shipping\_compression

**Parameter description:** Specifies whether to enable cross-cluster log compression in streaming DR mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- This parameter applies only to a pair of WAL senders and WAL receivers for cross-cluster transmission in streaming DR and is configured in the primary cluster.

---

**Value range:** Boolean

- **true** indicates that cross-cluster log compression is enabled in streaming DR mode.
- **false** indicates that cross-cluster log compression is disabled in streaming DR mode.

**Default value:** false

## repl\_auth\_mode

**Parameter description:** Specifies the validation mode for the primary/standby replication and standby node rebuilding.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- If UUID validation is enabled on the primary node and a non-null repl\_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl\_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- It does not support the authentication between the primary and standby nodes across clusters, including the primary/standby Dorado and DR clusters.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

---

**Value range:** enumerated values

- **off:** indicates that UUID validation is disabled.

- **default:** indicates that UUID validation is disabled.
- **uuid:** indicates that UUID validation is enabled.

**Default value:** default

## repl\_uuid

**Parameter description:** Specifies the UUID used for primary/standby UUID validation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If UUID validation is enabled on the primary node and a non-null repl\_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl\_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- It does not support the authentication between the primary and standby nodes across clusters, including the primary/standby Dorado and DR clusters.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

---

**Value range:** a string of 0 to 63 case-insensitive letters and digits. It is converted to lowercase letters for storage. An empty string indicates that UUID validation is disabled.

**Default value:** empty

## replconninfo1

**Parameter description:** Specifies the information about the first node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the first node is configured.

**Default value:** the first connection information listened on by the DN.

**Example:**

```
replconninfo1 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost= 127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo2

**Parameter description:** Specifies the information about the second node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the second node is configured.

**Default value:** information about the second connection listened to by the DN.

**Example:**

```
replconninfo2 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost= 127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo3

**Parameter description:** Specifies the information about the third node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the third node is configured.

**Default value:** information about the third connection listened to by the DN.

**Example:**

```
replconninfo3 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost= 127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo4

**Parameter description:** Specifies the information about the fourth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fourth node is configured.

**Default value:** information about the fourth connection listened to by the DN.

**Example:**

```
replconninfo4 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost= 127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo5

**Parameter description:** Specifies the information about the fifth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string An empty string indicates that no information about the fifth node is configured.

**Default value:** information about the fifth connection listened to by the DN.

**Example:**

```
replconninfo5 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost= 127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo6

**Parameter description:** Specifies the information about the sixth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the sixth node is configured.

**Default value:** information about the sixth connection listened to by the DN.

**Example:**

```
replconninfo6 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost= 127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo7

**Parameter description:** Specifies the information about the seventh node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the seventh node is configured.

**Default value:** information about the seventh connection listened to by the DN.

**Example:**

```
replconninfo7 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost= 127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## enable\_time\_report

**Parameter description:** Specifies whether to record the time consumed by each redo log.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the time when a redo record is generated is recorded.
- **off** indicates that no record is generated.

**Default value:** off

## thread\_top\_level

**Parameter description:** Increases the priority of the WALWRITERAUXILIARY || WALWRITER || STARTUP ||WALRECEIVER || WAL\_NORMAL\_SENDER || PGSTAT threads to the highest.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the priority of the preceding threads is increased to the highest.
- **off** indicates that the priority of the preceding threads is not increased.

**Default value:** off

## wal\_flush\_size

**Parameter description:** Specifies the threshold for flushing entries in each WAL.

If this parameter is set to a large value for each entry, the flushing frequency is reduced, but the flushing delay increases.

The default value is **-1**, indicating that data is not evenly flushed and data is flushed as many as possible each time. If the parameter is set to a value greater than 0, data is evenly refreshed based on the threshold.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [-1,16777216]. The unit is byte.

**Default value:** -1

## page\_work\_queue\_size

**Parameter description:** Specifies the length of the blocking queue of each redo worker.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a value ranging from 1 to 100000.

**Default value:** 4096

### 14.3.7.2 Primary Server

#### synchronous\_standby\_names

**Parameter description:** Specifies a comma-separated list of names of potential standby servers that support synchronous replication.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### NOTICE

- The current synchronous standby server is on the top of the list. If the current synchronous standby server is disconnected, it will be replaced immediately with the next-highest-priority standby server. Name of the next-highest-priority standby server is added to the list.
- The standby server name can be specified by setting the environment variable **PGAPPNAME**.

**Value range:** a string. If this parameter is set to \*, the name of any standby server that provides synchronous replication is matched. The value can be configured in the following format:

- ANY *num\_sync* (*standby\_name* [, ...])
- [FIRST] *num\_sync* (*standby\_name* [, ...])
- *standby\_name* [, ...]

#### NOTE

- In the preceding command, *num\_sync* indicates the number of standby nodes that need to wait for responses from the transaction, *standby\_name* indicates the name of the standby node, and FIRST and ANY specify the policies for selecting standby nodes for synchronous replication from the listed servers.
- **ANY N (dn\_instanceld1, dn\_instanceld2,...)** indicates that any *N* host names in the brackets are selected as the name list of standby nodes for synchronous replication. For example, **ANY 1 (dn\_instanceld1, dn\_instanceld2)** indicates that any one of **dn\_instanceld1** and **dn\_instanceld2** is used as the standby node for synchronous replication.
- **FIRST N (dn\_instanceld1, dn\_instanceld2, ...)** indicates that the first *N* primary node names in the brackets are selected as the standby node name list for synchronous replication based on the priority. For example, **FIRST 1 (dn\_instanceld1, dn\_instanceld2)** indicates that **dn\_instanceld1** is selected as the standby node for synchronous replication.
- The meanings of **dn\_instanceld1, dn\_instanceld2, ...** are the same as those of **FIRST 1 (dn\_instanceld1, dn\_instanceld2, ...)**.

If you use the `gs_guc` tool to set this parameter, perform the following operations:

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY NODE 1(dn_instanceld1, dn_instanceld2)'"
```

or

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY 1(AZ1, AZ2)'";
```

**Default value:** \*

## most\_available\_sync

**Parameter description:** Specifies whether to block the primary server when the primary-standby synchronization fails.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the primary server is not blocked when the synchronization fails.
- **off** indicates that the primary server is blocked when the synchronization fails.

**Default value:** off

## enable\_stream\_replication

**Parameter description:** Specifies whether data and logs are synchronized between primary and standby servers, and between primary and secondary servers.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- This parameter is used for testing performance with standby DNs and without standby DNs. If this parameter is set to **off**, tests on abnormal scenarios, such as switchover and faults, cannot be performed to prevent inconsistency between the primary, standby, and secondary servers.
- This parameter is a controlled parameter, and you are advised not to set it to **off** in normal service scenarios.

---

**Value range:** Boolean

- **on** indicates that data and log synchronization is enabled.
- **off** indicates that data and log synchronization is disabled.

**Default value:** on

## enable\_mix\_replication

**Parameter description:** Specifies how WAL files and data are replicated between primary and standby servers, and between primary and secondary servers.

This parameter is an INTERNAL parameter. Its default value is **off** and cannot be modified.

---

**NOTICE**

This parameter cannot be modified in normal service scenarios. That is, the WAL file and data page mixed replication mode is disabled by default.

---

**Value range:** Boolean

- **on** indicates that the WAL file and data page mixed replication mode is enabled.
- **off** indicates that the WAL file and data page mixed replication mode is disabled.

**Default value:** off

### **vacuum\_defer\_cleanup\_age**

**Parameter description:** Specifies the number of transactions by which **VACUUM** will defer the cleanup of invalid row-store table records. That is, **VACUUM** and **VACUUM FULL** do not clean up deleted tuples immediately.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000. **0** means no delay.

**Default value:** 0

### **data\_replicate\_buffer\_size**

**Parameter description:** Specifies the amount of memory used by queues when the sender sends data pages to the receiver. The value of this parameter affects the buffer size used during the replication from the primary server to the standby server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 4096 to 1072693248. The unit is KB.

**Default value:** 128 MB (131072 KB)

### **walsender\_max\_send\_size**

**Parameter description:** Specifies the size of the WAL or Sender buffers on the primary server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 8 to 1048575. The unit is KB.

**Default value:** 8 MB (8192 KB)

## enable\_data\_replicate

**Parameter description:** Specifies how data is synchronized between primary and standby servers when the data is imported to a row-store table.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the primary and standby servers synchronize data using data pages when the data is imported to a row-store table. When **replication\_type** is set to **1**, this parameter cannot be set to **on**. If this parameter is set to **on** using the GUC tool, its value will be forcibly changed to **off**.
- **off** indicates that the primary and standby servers synchronize data using Xlogs when the data is imported to a row-store table.

**Default value:** off

## ha\_module\_debug

**Parameter description:** Specifies the replication status log of a specific data block during data replication.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the status of each data block is recorded in logs during data replication.
- **off** indicates that the status of each data block is not recorded in logs during data replication.

**Default value:** off

## enable\_incremental\_catchup

**Parameter description:** Specifies the data catchup mode between the primary and standby servers.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the standby server uses the incremental catchup mode. That is, the standby server scans local data files on the standby server to obtain the list of differential data files between the primary and standby servers and then performs catchup between the primary and standby servers.
- **off** indicates that the standby server uses the full catchup mode. That is, the standby server scans all local data files on the primary server to obtain the list of differential data files between the primary and standby servers and then performs catchup between the primary and standby servers.

**Default value:** on

## wait\_dummy\_time

**Parameter description:** Specifies the maximum duration for the primary server to wait for the standby servers to start and send the scanning lists when incremental data catchup is enabled in cluster.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is second.

**Default value:** 300

### NOTE

The unit can only be second.

## catchup2normal\_wait\_time

**Parameter description:** Specifies the maximum duration that the primary server is blocked during the data catchup on the standby server in the case of a single synchronous standby server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 10000. The unit is ms.

- The value **-1** indicates that the primary server is blocked until the data catchup on the standby server is complete.
- The value **0** indicates that the primary server is not blocked during the data catchup on the standby server.
- Other values indicate the maximum duration that the primary server is blocked during the data catchup on the standby server. For example, if this parameter is set to **5000**, the primary server is blocked until the data catchup on the standby server is complete in 5s.

**Default value:** -1

## sync\_config\_strategy

**Parameter description:** Specifies the policy for synchronizing configuration files between the primary node and standby node, and between the standby node and cascaded standby node.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **all\_node:** If this parameter is set to **all\_node** for the primary node, the primary node is allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **all\_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **all\_node** for a

cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.

- **only\_sync\_node**: If this parameter is set to **only\_sync\_node** for the primary node, the primary node is only allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **only\_sync\_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is not allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **only\_sync\_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.
- **none\_node**: If this parameter is set to **none\_node** for the primary node, the primary node is not allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **none\_node** for a standby node, the standby node is not allowed to send synchronization requests to its primary node, and the standby node is not allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **none\_node** for a cascaded standby node, the current cascaded standby node is not allowed to send synchronization requests to its standby node.

**Default value:** all\_node

**Note:** If this parameter is configured after an upgrade from a version earlier than 503.0.0 to 503.0.0, this parameter cannot be identified after a rollback. Do not set this parameter during the upgrade to 503.0.0.

## hadr\_recovery\_time\_target

**Parameter description:** Specifies whether the standby database instance completes log writing and replay in streaming DR mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is second.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that a standby node can write and replay logs within the period specified by **hadr\_recovery\_time\_target**. This ensures that the logs can be written and replayed within the period specified by **hadr\_recovery\_time\_target** and the standby database instance can be promoted to primary quickly. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 60 (financial edition (data computing))

## hadr\_recovery\_point\_target

**Parameter description:** Specifies the RPO time allowed for the standby database instance to flush logs to disks in streaming DR mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is second.

**0** indicates that log flow control is disabled. A value from 1 to 3600 indicates that the standby node can flush logs to disks within the period specified by **hadr\_recovery\_point\_target**. This ensures that the log difference between the primary and standby database instances is controlled within the period specified by **hadr\_recovery\_point\_target** during the switchover and the standby database instance can be promoted to primary. If this parameter is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 10 (financial edition (data computing))

## hadr\_super\_user\_record\_path

**Parameter description:** Specifies the path for storing encrypted files of the **hadr\_disaster** user in the standby cluster in streaming DR mode. This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Modification suggestion:** The value is automatically set by the streaming DR password transfer tool and does not need to be manually added.

**Value range:** a string

**Default value:** NULL

## check\_sync\_standby

**Parameter description:** Specifies whether to enable the standby node check function. After the **synchronous\_standby\_names** parameter is correctly configured in the primary/standby scenario, if the synchronous standby node is faulty, the write service on the primary node reports a write failure. This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** on or off

- **on** indicates that the standby node check is enabled.
- **off** indicates that the standby node check is disabled.

**Default value:** off

### NOTE

- This parameter cannot be synchronized in job work and autonomous transactions. Otherwise, the check may not take effect.
- If the standby node check is not configured for a specified user or session and the standby node is faulty when the forcible synchronization commit mode is enabled, the write operation on a table causes the query on the same table by another user or in another session to hang. In this case, you need to recover the standby node or manually terminate the hung client.
- The standby node check function cannot be enabled in scenarios (such as VACUUM ANALYZE and gs\_clean) where non-write operations trigger log writing. If the standby node does not meet the requirements for synchronizing configurations to the standby node, services will be hung in this scenario. In this case, you need to manually terminate the services.

### 14.3.7.3 Standby Server

#### hot\_standby

**Parameter description:** Specifies whether the standby server is allowed to accept connections and queries after it is restored to the minrecovery point.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

- If this parameter is set to **on**, [wal\\_level](#) must be set to **hot\_standby** or higher. Otherwise, the database startup fails.
- In a distributed system, **hot\_standby** cannot be set to **off**, because this setting can affect other features of the HA system.
- If the **hot\_standby** parameter was disabled and the **wal\_level** parameter was set to a value smaller than the value of **hot\_standby**, perform the following operations to ensure that the logs to be replayed on the standby node can be queried on the standby node before enabling the **hot\_standby** parameter again:
  1. Change the value of **wal\_level** of the primary and standby nodes to the value of **hot\_standby** or a higher value, and restart the instances for the change to take effect.
  2. Perform the checkpoint operation on the primary node and query the **pg\_stat\_get\_wal\_senders()** function to ensure that the value of **receiver\_replay\_location** of each standby node is the same as that of **sender\_flush\_location** of the primary node. Ensure that the value adjustment of **wal\_level** is synchronized to the standby nodes and takes effect, and the standby nodes do not need to replay low-level logs.
  3. Set the **hot\_standby** parameter of the primary and standby nodes to **on**, and restart the instances for the setting to take effect.

---

**Value range:** Boolean

- **on**: allowed.
- **off**: not allowed.

**Default value:** on

#### max\_standby\_archive\_delay

**Parameter description:** Specifies the wait period before queries on a standby server are canceled when the queries conflict with WAL processing and archiving in hot standby mode. In the current version, the setting does not take effect and is controlled by the **max\_standby\_streaming\_delay** parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

-1 indicates that the standby node waits until the conflicting queries are complete.

---

**Value range:** an integer ranging from -1 to 2147483647. The unit is ms.

**Default value:** 3s (3000 ms)

## max\_standby\_streaming\_delay

**Parameter description:** Specifies the wait period before queries on the standby node are canceled when the queries conflict with WAL data receiving through streaming replication in hot standby mode. If this parameter is set to a large value or the service load is heavy, an error may be reported for waiting for transaction replay and flushing to disks.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

-1 indicates that the standby node waits until the conflicting queries are complete.

---

**Value range:** an integer ranging from -1 to 2147483647. The unit is ms.

**Default value:** 3s (3000 ms)

## wal\_receiver\_status\_interval

**Parameter description:** Specifies the maximum interval for notifying the primary server of the WAL Receiver status.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

If this parameter is set to **0**, the standby server does not send information, such as the log receiving location, to the primary server. As a result, the transaction commit on the primary server may be blocked, and the switchover may fail. In normal service scenarios, you are advised not to set this parameter to **0**.

---

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 5s

## hot\_standby\_feedback

**Parameter description:** Specifies whether a standby server is allowed to send the result of a query performed on it to the primary server, preventing a query conflict.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the standby server is allowed to send the result of a query performed on it to the primary server.
- **off** indicates that the standby server is not allowed to send the result of a query performed on it to the primary server.

**Default value:** off

## wal\_receiver\_timeout

**Parameter description:** Specifies the maximum wait period for a standby server to receive data from the primary server.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 6s (6000 ms)

## wal\_receiver\_connect\_timeout

**Parameter description:** Specifies the timeout period for a standby server to connect to the primary server.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 2s

## wal\_receiver\_connect\_retries

**Parameter description:** Specifies the maximum attempts that a standby server connects to the primary server

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 1

## wal\_receiver\_buffer\_size

**Parameter description:** Specifies the memory buffer size for the standby and secondary nodes to store the received Xlog files.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 4096 to 1047552. The unit is KB.

**Default value:** 64 MB (65536 KB)

## primary\_slotname

**Parameter description:** Specifies the slot name of the primary server corresponding to a standby server. This parameter is used for the mechanisms to verify the primary-standby relationship and delete WALs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## enable\_redo\_atomic\_operation

**Parameter description:** Specifies whether to use atomic operations or spinlocks to update the LSN of the current thread when parallel playback is enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that atomic operations are used for update.
- **off** indicates that spinlocks are used for update.

**Default value:** on

## max\_standby\_base\_page\_size

**Parameter description:** Specifies the maximum storage space of base page files on the standby node after the ultimate RTO function is enabled.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a long integer ranging from 1048576 to 562949953421311. The unit is KB.

**Default value:** 268435456 (256 GB)

## max\_standby\_lsn\_info\_size

**Parameter description:** Specifies the maximum size of LSN info files on the standby node after the ultimate RTO function is enabled.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a long integer ranging from 1048576 to 562949953421311. The unit is KB.

**Default value:** 268435456 (256 GB)

## base\_page\_saved\_interval

**Parameter description:** Specifies the interval for generating base pages on the standby node after the ultimate RTO function is enabled. For the same page, a base page is generated each time the value of this parameter is replayed.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 5 to 2000.

**Default value:** 400

## standby\_force\_recycle\_ratio

**Parameter description:** Specifies the percentage of files read by the standby node to trigger forcible recycling after the ultimate RTO function is enabled. When the total size of base page files exceeds the value of **max\_standby\_base\_page\_size** x **standby\_force\_recycle\_ratio** or the total size of LSN info files exceeds the value of **max\_standby\_lsn\_info\_size** x **standby\_force\_recycle\_ratio**, forcible recycling is triggered and some queries are canceled. When the value of **standby\_force\_recycle\_ratio** is **0**, forcible recycling is not started, and the setting of **max\_standby\_base\_page\_size** and **max\_standby\_lsn\_info\_size** does not take effect.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a double-precision floating point number ranging from 0.0 to 1.0

**Default value:** 0.8

## standby\_recycle\_interval

**Parameter description:** Specifies the interval for the standby node to recycle read files after the ultimate RTO function is enabled. The thread for recycling read resources on the standby node attempts to clear read files on the standby node at the interval specified by this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 86400. The unit is s.

**Default value:** 10

## standby\_max\_query\_time

**Parameter description:** Specifies the maximum query time supported on the standby node after the ultimate RTO function is enabled. If the query time exceeds the value of this parameter, the query will be canceled. Note: The time when the query is canceled is affected by the interval parameter [standby\\_recycle\\_interval](#) of the recycling thread and the time when the snapshot is obtained. Therefore, the actual execution time of the query on the standby node must be greater than the value of this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 86400. The unit is s.

**Default value:** 600

### exrto\_standby\_read\_opt

**Parameter description:** Specifies whether to support read optimization of the standby node with ultimate RTO. This parameter is enabled by default. This parameter is not synchronized between the primary and standby nodes.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. **on** indicates that the optimization is enabled, and **off** indicates that the optimization is disabled.

**Default value:** on

## 14.3.8 Query Planning

This section describes the method configuration, cost constants, planning algorithm, and some configuration parameters for the optimizer.

### NOTE

- Two parameters are involved in the optimizer:
  - *INT\_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
  - *DBL\_MAX* indicates the maximum value of the FLOAT data type.
- In addition to customer services, global query planning parameters also affect database O&M and monitoring services, such as WDR generation, scale-out, redistribution, and data import and export.

### 14.3.8.1 Optimizer Method Configuration

These configuration parameters provide a crude method of influencing the query plans chosen by the query optimizer. If the default plan chosen by the optimizer for a particular query is not optimal, a temporary solution is to use one of these configuration parameters to force the optimizer to choose a different plan. Better ways include adjusting the optimizer cost constants, manually running **ANALYZE**, increasing the value of the **default\_statistics\_target** configuration parameter, and increasing the amount of the statistics collected in specific columns using **ALTER TABLE SET STATISTICS**.

### enable\_bitmapscan

**Parameter description:** Controls the query optimizer's use of bitmap-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## force\_bitmapand

**Parameter description:** Controls the query optimizer's use of BitmapAnd plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** off

## enable\_hashagg

**Parameter description:** Controls the query optimizer's use of Hash aggregation plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_hashjoin

**Parameter description:** Controls the query optimizer's use of Hash-join plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_indexscan

**Parameter description:** Controls the query optimizer's use of index-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_indexonlyscan

**Parameter description:** Controls the query optimizer's use of index-only-scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_gsiscan

**Parameter description:** Controls the query optimizer's use of the global secondary index scan plan type. In the current version, global secondary indexes cannot be used for table access by index row ID.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** used.
- **off:** not used.

**Default value:** off

## enable\_material

**Parameter description:** Controls the query optimizer's use of materialization. It is impossible to suppress materialization entirely, but setting this variable to **off** prevents the optimizer from inserting materialized nodes.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_mergejoin

**Parameter description:** Controls the query optimizer's use of merge-join plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_nestloop

**Parameter description:** Controls the query optimizer's use of nested-loop join plan types to fully scan internal tables. It is impossible to suppress nested-loop joins entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_index\_nestloop

**Parameter description:** Controls the query optimizer's use of the index nested-loop join plan types to scan the parameterized indexes of internal tables.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_seqscan

**Parameter description:** Controls the query optimizer's use of sequential scan plan types. It is impossible to suppress sequential scans entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_sort

**Parameter description:** Controls the query optimizer's use of sort methods. It is impossible to suppress explicit sorts entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_tidscan

**Parameter description:** Controls the query optimizer's use of Tuple ID (TID) scan plan types.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## enable\_kill\_query

**Parameter description:** In CASCADE mode, when a user is deleted, all the objects belonging to the user are deleted. This parameter specifies whether the queries of the objects belonging to the user can be unlocked when the user is deleted.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the unlocking is allowed.
- **off** indicates that the unlocking is not allowed.

**Default value:** off

## enable\_stream\_concurrent\_update

**Parameter description:** Controls the use of stream in concurrent updates. This parameter is restricted by the [enable\\_stream\\_operator](#) parameter. If concurrent

update conflicts occur, an error may be reported. This parameter can be used to control the conflict.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the optimizer can generate stream plans for the **UPDATE** statement.
- **off** indicates that the optimizer can generate only non-stream plans for the **UPDATE** statement.

**Default value:** on

## enable\_stream\_operator

**Parameter description:** Controls the query optimizer's use of stream. When this parameter is set to **off**, a large number of logs indicating that the stream plans cannot be pushed down are recorded. If you do not need these logs, you are advised to set both **enable\_unshipping\_log** and **enable\_stream\_operator** to **off**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:**

- Independent deployment: **off**

## enable\_stream\_recursive

**Parameter description:** Specifies whether to push **WITH RECURSIVE** join queries to DNs for processing.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that **WITH RECURSIVE** join queries will be pushed down to DNs.
- **off** indicates that **WITH RECURSIVE** join queries will not be pushed down.

**Default value:** on

## max\_recursive\_times

**Parameter description:** Specifies the maximum number of **WITH RECURSIVE** iterations.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 200

## enable\_vector\_engine

**Parameter description:** Controls the query optimizer's use of vectorized executor.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_broadcast

**Parameter description:** Controls the query optimizer's use of broadcast distribution method when it evaluates the cost of stream.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_change\_hjcost

**Parameter description:** Specifies whether the optimizer excludes internal table running costs when selecting the Hash Join cost path. If it is set to **on**, tables with a few records and high running costs are more possible to be selected.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## best\_agg\_plan

**Parameter description:** The query optimizer generates three plans for the aggregate operation under the stream:

1. hashagg+gather(redistribute)+hashagg
2. redistribute+hashagg(+gather)
3. hashagg+redistribute+hashagg(+gather)

This parameter is used to control the type of hashagg plans generated by the query optimizer.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3.

- **1** indicates that the first plan is forcibly generated.
- **2** indicates that the second plan is forcibly generated if the **group by** column can be redistributed. Otherwise, the first plan is generated.
- **3** indicates that the third plan is forcibly generated if the **group by** column can be redistributed. Otherwise, the first plan is generated.
- **0** indicates that the optimizer chooses an optimal plan based on the estimated costs of the three plans above.

**Default value:** 0

## agg\_redistribute\_enhancement

**Parameter description:** When the aggregate operation is performed, which contains multiple **group by** columns and none of them is the distribution key, a **group by** column will be selected for redistribution. This parameter specifies the policy of selecting a redistribution column.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the column that can be redistributed and evaluates the most distinct value is selected for redistribution.
- **off** indicates that the first column that can be redistributed is selected for redistribution.

**Default value:** off

## enable\_absolute\_tablespace

**Parameter description:** Controls whether the tablespace can use an absolute path.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that an absolute path can be used.
- **off** indicates that an absolute path cannot be used.

**Default value:** on

## enable\_valuepartition\_pruning

**Parameter description:** Specifies whether the DFS partitioned table is dynamically or statically optimized.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the DFS partitioned table is dynamically or statically optimized.
- **off** indicates that the DFS partitioned table is not dynamically or statically optimized.

**Default value:** on

## expected\_computing\_nodegroup

**Parameter description:** Specifies a compute node group or the way to choose such a group. The node group mechanism is now for internal use only. You do not need to set it.

During join or aggregation operations, a node group can be selected in four modes. In each mode, the specified candidate compute node groups are listed for the optimizer to select the most appropriate one for the current operator.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

- **optimal:** The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the node group that combines all DNs in the node groups on which the current user has the COMPUTE permission.
- **query:** The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the node group that combines all DNs in the node groups where base tables involved in the query are located.
- *Node group name* (when [enable\\_nodegroup\\_debug](#) is set to **off**): The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the specified node group.
- *Node group name* (when [enable\\_nodegroup\\_debug](#) is set to **on**): A specific node group is used as the compute node group.

**Default value:** query

## enable\_nodegroup\_debug

**Parameter description:** Specifies whether the optimizer assigns computing workloads to a specific node group when multiple node groups exist in an environment. The node group mechanism is now for internal use only. You do not need to set it.

This parameter takes effect only when [expected\\_computing\\_nodegroup](#) is set to a specific node group.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that computing workloads are assigned to the node group specified by **expected\_computing\_nodegroup**.
- **off** indicates no node group is specified for computing.

**Default value:** off

## enable\_default\_index\_deduplication

**Parameter description:** Specifies whether to deduplicate and compress tuples with duplicate key values for a B-tree index by default. The deduplication and compression functions do not take effect for primary key indexes and unique indexes. When there are a large number of indexes with duplicate key values, the deduplication and compression function can effectively reduce the space occupied by indexes. In scenarios where non-unique indexes are used and index key values are seldom repeated or unique, the deduplication and compression function slightly deteriorates the index insertion performance. If the WITH (**deduplication** set to **on/off**) syntax is used during index creation, the deduplication parameter is preferentially used to determine whether to use deduplication and compression for the index.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **off:** indicates that the deduplication and compression function is disabled for B-tree indexes. This is the default value.
- **on:** indicates that the deduplication and compression function is enabled for B-tree indexes.

**Default value:** off

## enable\_expr\_fusion

**Parameter description:** Specifies whether to enable the SRF, expression flattening, centralized Seq Scan projection cancellation, transition status of shared aggregate functions, and step number optimization features.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **off:** indicates that this function is disabled. This is the default value.
- **on:** indicates that the SRF, expression flattening, centralized Seq Scan projection cancellation, transition status of shared aggregate functions, and step number optimization features are enabled.

**Default value:** off

### NOTE

It is supported only in the scenario where **query\_dop** is set to 1.

## stream\_multiple

**Parameter description:** Specifies the weight used by the optimizer to calculate the final cost of stream operators.

The base stream cost is multiplied by this weight to obtain the final cost.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

This parameter is applicable only to Redistribute and Broadcast streams.

---

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 1

## qrw\_inlist2join\_optmode

**Parameter description:** Specifies whether to enable inlist-to-join (inlist2join) query rewriting.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

- **disable** indicates that the inlist2join query rewriting is disabled.
- **cost\_base** indicates that the cost-based inlist2join query rewriting is enabled.
- **rule\_base** indicates that the forcible rule-based inlist2join query rewriting is enabled.
- A positive integer indicates the threshold of inlist2join query rewriting. If the number of elements in the list is greater than the threshold, the rewriting is performed.

**Default value:** **cost\_base**

## skew\_option

**Parameter description:** Specifies whether an optimization policy is used.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **off** indicates that the policy is disabled.
- **normal** indicates that a radical policy is used. All possible skews are optimized.
- **lazy** indicates that a conservative policy is used. Uncertain skews are ignored.

**Default value:** **normal**

## enable\_dngather

**Parameter description:** Specifies whether to calculate stream plans that meet the threshold on a single DN to reduce the number of planned stream nodes.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## dngather\_min\_rows

**Parameter description:** Specifies the maximum number of rows that control **dngather**. Values less than or equal to this parameter value can be calculated on a single DN. The prerequisite is that **enable\_dngather** is enabled.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from -1 to *DBL\_MAX*

**Default value:** 500.0

## cost\_weight\_index

**Parameter description:** Specifies the cost weight of index\_scan.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 1e-10 to 1e+10.

**Default value:** 1

## default\_limit\_rows

**Parameter description:** Specifies the default estimated number of limit rows for generating genericplan. If this parameter is set to a positive value, the positive value is used as the estimated number of limit rows. If this parameter is set to a negative value, the negative value is converted to a percentage and used as default estimated value, that is, -5 indicates 5%.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from -100 to *DBL\_MAX*

**Default value:** -10

## enforce\_a\_behavior

**Parameter description:** Controls the rule matching modes of regular expressions.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the A matching rule is used.
- **off** indicates that the POSIX matching rule is used.

**Default value:** on

## enable\_force\_vector\_engine

**Parameter description:** Specifies whether to forcibly generate vectorized execution plans for a vectorized execution operator if the operator's child node is a non-vectorized operator. When this parameter is set to **on**, vectorized execution plans are forcibly generated.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that vectorized operators are forcibly generated.
- **off** indicates that the vectorized operator optimizer determines whether to perform vectorization.

**Default value:** off

## check\_implicit\_conversions

**Parameter description:** Specifies whether to check candidate index paths generated for index columns that have implicit type conversions in a query. For details about the application scenarios of this parameter, see "SQL Optimization > Checking the Implicit Conversion Performance" in *Developer Guide*.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a check will be performed for candidate index paths generated for index columns that have implicit type conversion in a query.
- **off** indicates that a check will not be performed.

**Default value:** off

---

### NOTICE

When this parameter is set to **on**, you need to set **enable\_fast\_query\_shipping** to **off** so that the mechanism for identifying implicit data type conversion of index columns can take effect.

---

## 14.3.8.2 Optimizer Cost Constants

This section describes the optimizer cost constants. The cost variables described here are measured on an arbitrary scale. Only their relative values matter,

therefore scaling them all up or down by the same factor will result in no change in the optimizer's choices. By default, these cost variables are based on the cost of sequential page fetches, that is, **seq\_page\_cost** is conventionally set to **1.0** and the other cost variables are set with reference to the parameter. However, you can use a different scale, such as actual execution time in milliseconds.

## seq\_page\_cost

**Parameter description:** Specifies the optimizer's estimated cost of a disk page fetch that is part of a series of sequential fetches.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 1

## random\_page\_cost

**Parameter description:** Specifies the optimizer's estimated cost of an out-of-sequence disk page fetch.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

Although the server allows you to set **random\_page\_cost** to a value less than that of **seq\_page\_cost**, it is not physically sensitive to do so. However, setting them equal makes sense if the database is entirely cached in RAM, because in that case there is no penalty for fetching pages out of sequence. Also, in a heavily-cached database you should lower both values relative to the CPU parameters, since the cost of fetching a page already in RAM is much smaller than it would normally be.

---

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 4

### NOTE

- This value can be overwritten for tables and indexes in a particular tablespace by setting the tablespace parameter of the same name.
- Reducing this value relative to **seq\_page\_cost** will cause the system to prefer index scans and raising it will make index scans relatively more expensive. You can increase or decrease both values together to change the disk I/O costs relative to CPU costs.

## cpu\_tuple\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each row during a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.01

## cpu\_index\_tuple\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each index entry during an index scan.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.005

## cpu\_operator\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each operator or function executed during a query.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0.0025

## effective\_cache\_size

**Parameter description:** Specifies the optimizer's assumption about the effective size of the disk cache that is available to a single query.

Set this parameter based on the following factors: the GaussDB's shared buffer space, the kernel's disk buffer space, and the estimated number of concurrent queries on different tables that share the available space.

This parameter does not affect the size of the shared memory allocated during actual GaussDB running. It is used only for estimation in the plan generation phase. The value is in the unit of disk page. Usually the size of each page is 8192 bytes.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is 8 KB.

**Default value:**

Independent deployment:

CN: **2 GB** (60-core CPU/480 GB memory); **1 GB** (32-core CPU/256 GB memory and 16-core CPU/128 GB memory); **512 MB** (8-core CPU/64 GB memory); **256 MB** (4-core CPU/32 GB memory); **128 MB** (4-core CPU/16 GB memory)

DN: **70 GB** (60-core CPU/480 GB memory); **38 GB** (32-core CPU/256 GB memory); **20 GB** (16-core CPU/128 GB memory); **8 GB** (8-core CPU/64 GB memory); **4 GB** (4-core CPU/32 GB memory); **2 GB** (4-core CPU/16 GB memory)

Setting suggestions:

A larger value indicates that the optimizer prefers index scanning, and a smaller value indicates that the optimizer prefers full table scanning. Generally, the value is half of the value of **shared\_buffers**. More radically, you can set the value to three-fourth of the value of **shared\_buffers**.

## allocate\_mem\_cost

**Parameter description:** Specifies the query optimizer's estimated cost of creating a hash table for memory space using hash join. This parameter is used for optimization when the hash join estimation is inaccurate.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to *DBL\_MAX*

**Default value:** 0

### 14.3.8.3 Genetic Query Optimizer

This section describes parameters related to genetic query optimizer. The genetic query optimizer (GEQO) is an algorithm that plans queries by using heuristic searching. This algorithm reduces planning time for complex queries and the costs of producing plans are sometimes inferior to those found by the normal exhaustive-search algorithm.

## geqo

**Parameter description:** Specifies whether to enable the genetic query optimization.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

It is best not to turn it off in execution. **geqo\_threshold** provides more subtle control of GEQO.

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

---

**Value range:** Boolean

- **on** indicates that the genetic query optimization is enabled.
- **off** indicates that the genetic query optimization is disabled.

**Default value:** on

## geqo\_threshold

**Parameter description:** Specifies the number of **FROM** items. Genetic query optimization is used to plan queries when the number of statements executed is greater than this value.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- For simpler queries it is best to use the regular, exhaustive-search planner, but for queries with many tables it is better to use GEQO to manage the queries.
  - A **FULL OUTER JOIN** construct counts as only one **FROM** item.
- 

**Value range:** an integer ranging from 2 to 2147483647

**Default value:** 12

## geqo\_effort

**Parameter description:** Controls the trade-off between planning time and query plan quality in GEQO.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

**geqo\_effort** does not do anything directly. This parameter is only used to compute the default values for the other variables that influence GEQO behavior. If you prefer, you can manually set the other parameters instead.

---

**Value range:** an integer ranging from 1 to 10

---

### NOTICE

Larger values increase the time spent in query planning, but also increase the probability that an efficient query plan is chosen.

---

**Default value:** 5

## geqo\_pool\_size

**Parameter description:** Controls the pool size used by GEQO, that is, the number of individuals in the genetic population.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

---

**NOTICE**

The value of this parameter must be at least **2**, and useful values are typically from **100** to **1000**. If this parameter is set to **0**, GaussDB selects a proper value based on **geqo\_effort** and the number of tables.

---

**Default value:** 0

## geqo\_generations

**Parameter description:** Specifies the number of iterations of the GEQO.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

---

**NOTICE**

The value of this parameter must be at least **1**, and useful values are typically from **100** to **1000**. If it is set to **0**, a suitable value is chosen based on **geqo\_pool\_size**.

---

**Default value:** 0

## geqo\_selection\_bias

**Parameter description:** Specifies the selection bias used by GEQO. The selection bias is the selective pressure within the population.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 1.5 to 2.0

**Default value:** 2

## geqo\_seed

**Parameter description:** Specifies the initial value of the random number generator used by GEQO to select random paths through the join order search space.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0.0 to 1.0

---

**NOTICE**

Varying the value changes the set of join paths explored, and may result in a better or worse best path being found.

---

**Default value:** 0

### 14.3.8.4 Other Optimizer Options

#### cost\_model\_version

**Parameter description:** Specifies the version of the optimizer cost model. It can be regarded as a protection parameter to disable the latest optimizer cost model and keep consistent with the plan of the earlier version. Changing the value of this parameter may change many SQL plans. Therefore, exercise caution when changing the value of this parameter.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0, 1, 2, or 3

- **0** indicates that the latest cost estimation model is used. The current version is equivalent to **3**.
- **1** indicates that the original cost estimation model is used.
- **2:** indicates that the enhanced COALESCE expression, hash join cost, and semi/anti join cost are used for estimation on the basis of **1**.
- **3:** indicates that the boundary correction estimator is used to estimate the NDV on the basis of **2**. The hint of indexscan can be applied to indexonlyscan.

**Default value:** 0

#### enable\_fast\_query\_shipping

**Parameter description:** Specifies whether to use the distributed framework for a query optimizer.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the distributed framework is not used. Execution plans are generated on CNs and DNs separately.
- **off** indicates that the distributed framework is used. Execution plans are generated on CNs and then sent to DN for execution.

**Default value:** on

#### enable\_trigger\_shipping

**Parameter description:** Specifies whether the trigger can be pushed to DN for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the trigger can be pushed to DN for execution.

- **off** indicates that the trigger cannot be pushed to DNs. It must be executed on CNs.

**Default value:** on

## enable\_remotejoin

**Parameter description:** Specifies whether JOIN operation plans can be delivered to DNs for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that JOIN operation plans can be delivered to DNs for execution.
- **off** indicates that JOIN operation plans cannot be delivered to DNs for execution.

**Default value:** on

## enable\_remotegroup

**Parameter description:** Specifies whether the execution plans of **GROUP BY** and **AGGREGATE** can be delivered to DNs for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the execution plans of **GROUP BY** and **AGGREGATE** can be delivered to DNs for execution.
- **off** indicates that the execution plans of **GROUP BY** and **AGGREGATE** cannot be delivered to DNs for execution.

**Default value:** on

## enable\_remotelimit

**Parameter description:** Specifies whether the execution plan specified in the LIMIT clause can be delivered to DNs for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the execution plan specified in the LIMIT clause can be pushed down to DNs for execution.
- **off** indicates that the execution plan specified in the LIMIT clause cannot be delivered to DNs for execution.

**Default value:** on

## enable\_remosort

**Parameter description:** Specifies whether the execution plan of the **ORDER BY** clause can be delivered to DNs for execution.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the execution plan of the **ORDER BY** clause can be delivered to DNs for execution.
- **off** indicates that the execution plan of the **ORDER BY** clause cannot be delivered to DNs for execution.

**Default value:** on

## enable\_csqual\_pushdown

**Parameter description:** Specifies whether to deliver filter criteria for a rough check during query.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a rough check is performed with filter criteria delivered during query.
- **off** indicates that a rough check is performed without filter criteria delivered during query.

**Default value:** on

## explain\_dna\_file

**Parameter description:** Sets [explain\\_perf\\_mode](#) to **run** to export object files in CSV format.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

The value of this parameter must be an absolute path plus a file name with the extension **.csv**.

---

**Value range:** a string

**Default value:** empty

## analysis\_options

**Parameter description:** Specifies whether to enable function options in the corresponding options to use the corresponding location functions, including data

verification and performance statistics. For details, see the options in the value range.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **HASH\_CONFLICT** indicates that the log file in the **pg\_log** directory of the DN process displays the hash table statistics, including the hash table size, hash chain length, and hash conflict information.
- **STREAM\_DATA\_CHECK** indicates that a CRC check is performed on data before and after network data transmission.

**Default value:** ALL,on(),off(HASH\_CONFLICT,STREAM\_DATA\_CHECK), which indicates that no location function is enabled.

## explain\_perf\_mode

**Parameter description:** Specifies the display format of the **explain** command.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** normal, pretty, summary, and run

- **normal** indicates that the default printing format is used.
- **pretty** indicates a new format improved by using GaussDB. The new format contains a plan node ID, directly and effectively analyzing performance.
- **summary** indicates that the analysis result on this information is printed in addition to the printed information specified by **pretty**.
- **run** indicates that the system exports the printed information specified by **summary** as a CSV file for further analysis.

**Default value:** pretty

### NOTE

The pretty mode supports only plans that contain stream operators and does not support plans that deliver statements to DNs. Therefore, the display format is affected by the **enable\_stream\_operator** parameter. When **enable\_stream\_operator** is set to **off**, the plan containing the stream operator cannot be generated.

## cost\_param

**Parameter description:** Controls use of different estimation methods in specific customer scenarios, allowing estimated values approximating to onsite values. This parameter can control various methods simultaneously by performing AND (&) on the bit of each method. A method is selected if the result value is not 0.

- When **cost\_param & 1** is set to a value other than 0, an improved mechanism is used for connecting the selection rate of non-equi-joins. This method is more accurate for estimating the selection rate of joins between two identical tables. At present, if **cost\_param & 1** is set to a value other than 0, the path is not used. That is, a better formula is selected for calculation.
- When **cost\_param & 2** is set to a value other than 0, the selection rate is estimated based on multiple filter criteria. The lowest selection rate among all

filter criteria, but not the product of the selection rates for two tables under a specific filter criterion, is used as the total selection rate. This method is more accurate when a close correlation exists between the columns to be filtered.

- When **cost\_param & 4** is not 0, the selected debugging model is not recommended when the stream node is evaluated.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## enable\_partitionwise

**Parameter description:** Specifies whether to select an intelligent algorithm for joining partition tables.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that an intelligent algorithm is selected.
- **off** indicates that an intelligent algorithm is not selected.

**Default value:** off

## enable\_fast\_numeric

**Parameter description:** Specifies whether to enable optimization for numeric data calculation. Calculation of numeric data is time-consuming. Numeric data is converted into int64- or int128-type data to improve numeric data calculation performance.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that optimization for numeric data calculation is enabled.
- **off** or **false** indicates that optimization for numeric data calculation is disabled.

**Default value:** on

## rewrite\_rule

**Parameter description:** Specifies the rewriting rule for enabled optional queries. Some query rewrite rules are optional. Enabling them cannot always improve the query efficiency. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter can control the combination of query rewriting rules, for example, there are multiple rewriting rules: rule1, rule2, rule3, and rule4. You can perform the following settings:

```
set rewrite_rule=rule1; -- Enable query rewriting rule rule1
set rewrite_rule=rule2, rule3; -- Enable the query rewriting rules rule2 and rule3
set rewrite_rule=none; -- Disable all optional query rewriting rules
```

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **none:** Does not use any optional query rewriting rules
- **Lazyagg:** Uses the Lazy Agg query rewriting rules for eliminating aggregation operations in subqueries
- **magicset:** The Magic Set query rewriting rules are used to associate subqueries which have aggregation operators with the main query in advance to reduce repeated scanning of sublinks.
- **partialpush:** Uses the Partial Push query rewriting rules. For statements that cannot be pushed down, push down some subqueries to DN for execution and the rest to CN for execution.
- **uniquecheck:** Uses the Unique Check query rewriting rules. Optimize the subquery statements in target columns without agg and check whether the number of returned rows is 1.
- **disablerep:** Uses the Disable Replicate query rewriting rules. The performance may deteriorate after a replication table is optimized. Therefore, after this rule is enabled, subqueries cannot be optimized.
- **intargetlist:** Uses the In Target List query rewriting rules (subquery optimization in the target column).
- **predpushnormal:** Uses the Predicate Push query rewriting rules. When predicate conditions are pushed down to subqueries, the BROADCAST operator may be added to support distributed execution.
- **predpushforce:** Uses the Predicate Push query rewriting rules. Push down predicate conditions to subqueries and use indexes as much as possible for acceleration.
- **predpush:** Selects the optimal plan based on the cost in **predpushnormal** and **predpushforce**.
- **disable\_pullup\_expr\_sublink:** The optimizer is not allowed to pull up sublinks of the expr\_sublink type. For details about sublink classification and pull-up principles, see "SQL Optimization > Typical SQL Optimization Methods > Optimizing Subqueries" in *Developer Guide*.
- **enable\_sublink\_pullup\_enhanced:** Enhanced sublink query rewriting rules are used, including unrelated sublink pull-up of the WHERE and HAVING clauses and WinMagic rewriting optimization.
- **disable\_pullup\_not\_in\_sublink:** The optimizer is not allowed to pull up sublinks related to NOT IN. For details about sublink classification and pull-up principles, see "SQL Optimization > Typical SQL Optimization Methods > Optimizing Subqueries" in *Developer Guide*.

**Default value:** magicset

## enable\_pbe\_optimization

**Parameter description:** Specifies whether the optimizer optimizes the query plan for statements executed in Parse Bind Execute (PBE) mode.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the optimizer optimizes the query plan for statements executed in PBE mode.
- **off** indicates that the optimizer does not optimize the execution.

**Default value:** on

## enable\_light\_proxy

**Parameter description:** Specifies whether the optimizer optimizes the execution of simple queries on CNs. This parameter does not take effect if the character set of the application side does not match that of the kernel side. You are advised to set the character set to UTF8 when creating a database.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the optimizer optimizes the execution of simple queries on CNs.
- **off** indicates that the optimizer does not optimize the execution.

**Default value:** on

## enable\_global\_plancache

**Parameter description:** Specifies whether to share the cache for the execution plans of statements in PBE queries and stored procedures. If this parameter is set to **on**, the memory usage of the CNs and DN in high concurrency scenarios can be reduced. In addition, the value of this parameter must be the same on the CN and DN. Otherwise, the packets sent from the CN to the DN do not match and an error is reported.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

When **enable\_global\_plancache** is enabled, the default value of **local\_syscache\_threshold** is greater than or equal to 16 MB to ensure that GPC takes effect. If the value of **local\_syscache\_threshold** is less than 16 MB, set it to 16 MB. If the value is greater than 16 MB, do not change it.

**Value range:** Boolean

- **on** indicates that cache sharing is enabled for the execution plans of statements in PBE queries and stored procedures.
- **off** indicates no sharing.

**Default value:** off

## gpc\_clean\_timeout

**Parameter description:** When **enable\_global\_plancache** is set to **on**, if a plan in the shared plan list is not used within the period specified by **gpc\_clean\_timeout**,

the plan will be deleted. This parameter is used to control the retention period of a shared plan that is not used.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 300 to 86400. The unit is s.

**Default value:** 1800, that is, 30 minutes

## enable\_gpc\_grayrelease\_mode

**Parameter description:** Specifies whether to enable GPC in a distributed cluster. The cluster needs to be restarted to enable GPC. If you want to enable GPC without restarting the cluster, use **enable\_gpc\_grayrelease\_mode**.

Operations in a distributed cluster:

To enable GPC:

1. Enable **enable\_gpc\_grayrelease\_mode** on all DNs.
2. Enable **enable\_gpc\_grayrelease\_mode** on all CNs.
3. Enable the GPC parameter which is a POSTMASTER parameter. You need to reload the parameter and then kill the node in polling mode for GPC on the restarted node to take effect.

To disable GPC:

1. Ensure that **enable\_gpc\_grayrelease\_mode** is set to **on**, reload and then disable the GPC parameter, and kill the node in polling mode for GPC on the restarted node to take effect.
2. Disable **enable\_gpc\_grayrelease\_mode** on all CNs.
3. Disable **enable\_gpc\_grayrelease\_mode** on all DNs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- on
- off

**Default value:** off

## enable\_opfusion

**Parameter description:** Specifies whether to optimize simple queries.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

## NOTICE

This parameter is used to optimize the query performance of DNs. You can set **max\_datanode\_for\_plan** to view the execution plan of a query DN. If the execution plan of the DN contains **[Bypass]**, the query can be optimized on the DN.

The restrictions on simple queries are as follows:

- Only indexscan and indexonlyscan are supported, and the filter criteria of all **WHERE** statements are on indexes.
- Only single tables can be added, deleted, modified, and queried. JOIN and USING operations are not supported.
- Only row-store tables are supported. Partitioned tables and tables with triggers are not supported.
- Information statistics features of active SQL statements and queries per second (QPS) are not supported.
- Tables that are being scaled out or in are not supported.
- System columns cannot be queried or modified.
- Only simple **SELECT** statements are supported. For example:  

```
SELECT c3 FROM t1 WHERE c1 = ? and c2 =10;
```

Only columns in the target table can be queried. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters. You can use **for update**.

- Only simple **INSERT** statements are supported. For example:  

```
INSERT INTO t1 VALUES (?,10,?);
```

Only one **VALUES** is supported. The type in **VALUES** can be a constant or a parameter. **RETURNING** is not supported.

- Only simple **DELETE** statements are supported. For example:  

```
DELETE FROM t1 WHERE c1 = ? and c2 = 10;
```

Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

- Only simple **UPDATE** statements are supported. For example:  

```
UPDATE t1 SET c3 = c3+? WHERE c1 = ? and c2 = 10;
```

The values modified in column **c3** can be constants, parameters, or a simple expression. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

**Value range:** Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

**Default value:** on

## enable\_partition\_opfusion

**Parameter description:** If this parameter is enabled when the enable\_opfusion parameter is enabled, the simple query of the partitioned table can be optimized to improve the SQL execution performance. If **enable\_global\_plancache** is set to **on**, this parameter does not take effect.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

**Default value:** off

## sql\_beta\_feature

**Parameter description:** Specifies the SQL engine's optional beta features to be enabled, including optimization of row count estimation and query equivalence estimation. These optional features provide optimization for specific scenarios, but performance deterioration may occur in some scenarios for which testing is not performed. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter determines the combination of the SQL engine's beta features, for example, feature1, feature2, feature3, and feature4. You can perform the following settings:

```
set sql_beta_feature=feature1; --Enable the beta feature 1 of the SQL engine.
set sql_beta_feature=feature2,feature3; --Enable the beta features 2 and 3 of the SQL engine.
set sql_beta_feature=none; --Disable all optional SQL engine beta features.
```

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **none:** None of the beta optimizer features are used.
- **sel\_semi\_poisson:** Uses poisson distribution to calibrate the equivalent semi-join and anti-join selection rates.
- **sel\_expr\_instr:** Uses the matching row count estimation method to provide more accurate estimation for **instr(col, 'const') > 0, = 0, = 1**.
- **param\_path\_gen:** Generates more possible parameterized paths.
- **rand\_cost\_opt:** Optimizes the random read cost of tables that have a small amount of data.
- **param\_path\_opt:** Uses the bloating ratio of the table to optimize the analysis information of indexes.
- **page\_est\_opt:** Optimizes the **relpages** estimation for the analysis information of table indexes.
- **no\_unique\_index\_first:** Disables optimization of the primary key index scanning path first.
- **join\_sel\_with\_cast\_func:** Supports type conversion functions when the number of join rows is estimated.
- **canonical\_pathkey:** The regularization pathkey is generated in advance (**pathkey**: a set of ordered key values of data).

 **WARNING**

After this parameter is enabled, the semantics of the output data of statements such as ORDER BY may be different from that of the standard ones in the case of outer join. Contact Huawei engineers to determine whether to enable this parameter.

- **index\_cost\_with\_leaf\_pages\_only**: specifies whether index leaf nodes are included when the index cost is estimated.
- **partition\_opfusion**: enables partitioned table optimization.
- **a\_style\_coerce**: enables the Decode type conversion rule to be compatible with O. For details, see the part related to case processing in ORA compatibility mode in "SQL Reference > Type Conversion > UNION, CASE, and Related Constructs" in *Developer Guide*.
- **plpgsql\_stream\_fetchall**: enables the function of obtaining all tuple results when the SQL statements which use streams are executed on the for loop or cursor in a stored procedure.
- **partition\_fdw\_on**: SQL statements can be created for Postgres foreign tables based on partitioned tables.
- **predpush\_same\_level**: enables the **predpush** hint to control parameterized paths at the same layer.
- **disable\_bitmap\_cost\_with\_lossy\_pages**: disables the computation of the cost of lossy pages in the bitmap path cost.
- **enable\_upsert\_execute\_gplan**: In the PBE scenario, if the UPDATE clause in the on duplicate key update statement contains parameters, set **enable\_upsert\_execute\_gplan** to allow execution through **gplan**.

**Default value:**

"sel\_semi\_poisson,sel\_expr\_instr,rand\_cost\_opt,param\_path\_opt,page\_est\_opt"

## table\_skewness\_warning\_threshold

**Parameter description:** Specifies the threshold for triggering a table skew alarm.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0 to 1

**Default value:** 1

## table\_skewness\_warning\_rows

**Parameter description:** Specifies the minimum number of rows for triggering a table skew alarm.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 100000

## enable\_global\_stats

**Parameter description:** Specifies the current statistics collection mode, which can be global statistics collection or single-node statistics collection. By default, the global statistics collection mode is used. If this parameter is disabled, the statistics of the first node in the cluster are collected by default. In this case, the quality of the generated query plan may be affected. However, the information collection performance is optimal. Therefore, exercise caution when disabling this parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates the global statistics mode.
- **off** or **false** indicates the single-DN statistics mode.

**Default value:** on

## default\_statistics\_target

**Parameter description:** Specifies the default statistics target for table columns without a column-specific target set via **ALTER TABLE SET STATISTICS**. If this parameter is set to a positive number, it indicates the number of samples of statistics information. If this parameter is set to a negative number, percentage is used to set the statistic target. The negative number converts to its corresponding percentage, for example, -5 means 5%.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -100 to 10000

---

### NOTICE

- A larger positive number than the default value increases the time required to do **ANALYZE**, but might improve the quality of the optimizer's estimates.
- Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
  1. Restore to the default statistics.
  2. Use hints to force the optimizer to use the optimal query plan. For details, see "SQL Optimization > Hint-based Tuning" in *Developer Guide*.
- If this GUC parameter is set to a negative value, the number of samples is greater than or equal to 2% of the total data volume, and the number of records in user tables is less than 1.6 million, the time taken by running **ANALYZE** will be longer than that when this parameter uses its default value.
- If this GUC parameter is set to a negative value, the autoanalyze function is disabled.

---

**Default value:** 100

## default\_gsi\_statistics\_target

**Parameter description:** Sets the default statistics target for global secondary indexes. If the parameter is set to a positive number, it indicates the number of samples of statistics information. If the parameter is set to a negative number, it indicates the percentage of statistics collected. The negative number converts to its corresponding percentage, for example, **-5** means 5%.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, in the range from -100 to 3000000.

**Default value:** 0

---

### NOTICE

- The default value **0** indicates that the default sampling rate is used for sampling.
  - Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
    1. Restore to the default statistics.
    2. Use hints to force the optimizer to use the optimal query plan. For details, see "SQL Optimization > Hint-based Tuning" in *Developer Guide*.
- 

## auto\_statistic\_ext\_columns

**Parameter description:** Collects statistics about multiple columns based on the first *K* columns of the composite index in the data table. This GUC parameter indicates *K*. For example, if a composite index is (a,b,c,d,e) and the GUC parameter is set to **3**, statistics about multiple columns are generated on columns (a,b) and (a,b,c). Multi-column statistics can make the optimizer estimate the cardinality more accurate when querying with combined conditions.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- The system catalog does not take effect.
- The statistics take effect only when the types of all columns support the comparison functions '=' and '<'.
- System pseudocolumns in indexes, such as **tableoid** and **ctid**, are not collected.
- By default, distinct values, MCVs without NULL, and MCVs with NULL are collected. If the AI-based cardinality estimation parameter **enable\_ai\_stats** is set to **on**, MCVs are not collected. Instead, models for AI-based cardinality estimation are collected.
- If the index for creating multi-column statistics is deleted and no other index contains the multi-column combination, the multi-column statistics will be deleted in the next ANALYZE operation.
- If the value of this parameter decreases, the new index generates multi-column statistics based on the value of this parameter. The generated multi-column statistics that exceed the value of this parameter will not be deleted.
- If you want to disable the multi-column statistics on a specific combination only, you can retain the value of this parameter and run the **ALTER TABLE tablename disable statistics ((column list))** DDL command to disable the statistics on multiple columns in a specific combination.

---

**Value range:** an integer ranging from 1 to 4 The value 1 indicates that statistics about multiple columns are not automatically collected.

**Default value:** 1

## constraint\_exclusion

**Parameter description:** Controls the query optimizer's use of table constraints to optimize queries.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **on, true, yes,** and **1** indicate that constraints for all tables are examined.
- **off, false, no,** and **0** indicate that no constraints are examined.
- **partition** indicates that only constraints for inheritance child tables and **UNION ALL** subqueries are examined.

---

**NOTICE**

When **constraint\_exclusion** is set to **on**, the optimizer compares query conditions with the table's **CHECK** constraints, and omits scanning tables for which the conditions contradict the constraints.

---

**Default value:** partition

 NOTE

Currently, **constraint\_exclusion** is enabled by default only for cases that are often used to implement table partitioning. Turning this feature on for all tables imposes extra planning on simple queries, and provides no benefit for simple queries. If you have no partitioned tables, set it to **off**.

## cursor\_tuple\_fraction

**Parameter description:** Specifies the optimizer's estimated fraction of a cursor's rows that are retrieved.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0.0 to 1.0

---

**NOTICE**

Smaller values of this setting bias the optimizer towards using **fast start** plans for cursors, which will retrieve the first few rows quickly while perhaps taking a long time to fetch all rows. Larger values put more emphasis on the total estimated time. At the maximum setting of **1.0**, cursors are planned exactly like regular queries, considering only the total estimated time and how soon the first rows might be delivered.

---

**Default value:** 0.1

## from\_collapse\_limit

**Parameter description:** Specifies whether the optimizer merges sub-queries into upper queries based on the resulting FROM list. The optimizer merges sub-queries into upper queries if the resulting FROM list would have no more than this many items.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

---

**NOTICE**

Smaller values reduce planning time but may lead to inferior execution plans.

---

**Default value:** 8

## join\_collapse\_limit

**Parameter description:** Specifies whether the optimizer rewrites **JOIN** constructs (except **FULL JOINS**) into lists of **FROM** items based on the number of the items in the result list.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

---

**NOTICE**

- Setting this parameter to **1** prevents join reordering. As a result, the join order specified in the query will be the actual order in which the relations are joined. The query optimizer does not always choose the optimal join order. Therefore, advanced users can temporarily set this variable to **1**, and then specify the join order they desire explicitly.
- Smaller values reduce planning time but lead to inferior execution plans.

---

**Default value:** 8

## plan\_mode\_seed

**Parameter description:** This is a commissioning parameter. Currently, it supports only **OPTIMIZE\_PLAN** and **RANDOM\_PLAN**. The value **0** (for **OPTIMIZE\_PLAN**) indicates the optimized plan using the dynamic planning algorithm. Other values are for **RANDOM\_PLAN**, which indicates that the plan is randomly generated. **-1** indicates that users do not specify the value of the seed identifier. In this case, the optimizer generates a random integer from **1** to **2147483647** and a random execution plan based on the generated integer. A GUC parameter value from **1** to **2147483647** is regarded as the seed identifier, based on which the optimizer generates a random execution plan.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

**Default value:** 0

---

**NOTICE**

- If this parameter is set to **RANDOM\_PLAN**, the optimizer generates a random execution plan that may not be the optimal one. Therefore, to guarantee the query performance, the default value **0** is recommended during upgrade, scale-out, scale-in, and O&M.
- If this parameter is not set to **0**, the specified plan hint will not be used.

## enable\_random\_datanode

**Parameter description:** Specifies whether the query of the replication table is conducted on a random DN. A complete replication table is stored on each each DN for random retrieval to release the pressure on nodes.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of querying the replication table on a random DN is enabled.
- **off** indicates that the function of querying the replication table on a random DN is disabled.

**Default value:** on

## hashagg\_table\_size

**Parameter description:** Specifies the hash table size during the execution of the HASH JOIN operation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1073741823

**Default value:** 0

## enable\_bloom\_filter

**Parameter description:** Specifies whether the BloomFilter optimization is used. This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the BloomFilter optimization can be used.
- **off** indicates that the BloomFilter optimization cannot be used.

**Default value:** on

## enable\_extrapolation\_stats

**Parameter description:** Specifies whether the extrapolation logic is used for data of DATE type based on historical statistics. The logic can increase the accuracy of estimation for tables whose statistics are not collected in time, but will possibly provide an overlarge estimation due to incorrect extrapolation. Enable the logic only in scenarios where the data of DATE type is periodically inserted. This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the extrapolation logic is used for data of DATE type based on historical statistics.
- **off** indicates that the extrapolation logic is not used for data of DATE type based on historical statistics.

**Default value:** off

## autoanalyze

**Parameter description:** Specifies whether to automatically collect statistics on tables that have no statistics when a plan is generated. **autoanalyze** cannot be

used for foreign or temporary tables. To collect statistics, manually perform the ANALYZE operation. If an exception occurs in the database during the execution of autoanalyze on a table, after the database is recovered, the system may still prompt you to collect the statistics of the table when you run the statement again. In this case, manually perform the ANALYZE operation on the table to synchronize statistics. This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the table statistics are automatically collected.
- **off** indicates that the table statistics are not automatically collected.

**Default value:** off

## query\_dop

**Parameter description:** Specifies the user-defined degree of parallelism (DOP). This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -64 to 64

A value ranging from 1 to 64 indicates that the fixed SMP is enabled and the system will use the specified DOP.

**0** indicates that the SMP adaptation is enabled, and the system will dynamically select the optimal DOP based on resource usage and plan characteristics.

A value ranging from -64 to -1 indicates that the SMP adaptation is enabled, and the system limits the DOP that can be adaptively selected.

### NOTE

- After enabling concurrent queries, ensure you have sufficient CPU, memory, network, and I/O resources to achieve the optimal performance.
- To prevent performance deterioration caused by an overly large value of **query\_dop**, the system calculates the maximum number of available CPU cores for a DN and uses the number as the upper limit for this parameter. If the value of **query\_dop** is greater than 4 and also the upper limit, the system resets **query\_dop** to the upper limit.

**Default value:** 1

## enable\_analyze\_check

**Parameter description:** Checks whether statistics were collected about tables whose **reltuples** and **relpages** are displayed as **0** in **pg\_class** during plan generation.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the tables will be checked.
- **off** indicates that the tables will not be checked.

**Default value:** off

## enable\_sonic\_hashagg

**Parameter description:** Specifies whether to use the hash aggregation operator designed for column-oriented hash tables when certain constraints are met.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the hash aggregation operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash aggregation operator designed for column-oriented hash tables is not used.

### NOTE

- If **enable\_sonic\_hashagg** is enabled and the Hash Agg operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the memory usage of the Hash Agg operator can be reduced. However, in scenarios where the performance is significantly improved based on code generation, the performance of the operator may deteriorate.
- If **enable\_sonic\_hashagg** is enabled and the hash agg operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Aggregation in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Aggregation. For details, see "SQL Optimization > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

**Default value:** on

## enable\_sonic\_hashjoin

**Parameter description:** Specifies whether to use the hash join operator designed for column-oriented hash tables when certain constraints are met.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the hash join operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash join operator designed for column-oriented hash tables is not used.

 NOTE

- Currently, the parameter can be used only for Inner Join.
- If **enable\_sonic\_hashjoin** is enabled, the memory usage of query using the Hash Inner operator can be reduced. However, in scenarios where the code generation technology can significantly improve performance, the performance of the operator may deteriorate.
- If **enable\_sonic\_hashjoin** is enabled and the hash join operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Join in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Join. For details, see "SQL Optimization > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

**Default value:** on

## enable\_sonic\_optspill

**Parameter description:** Specifies whether to optimize the number of files to be written to disks for the Hash Join operator designed for column-oriented hash tables. If this parameter is set to **on**, the number of files written to disks does not increase significantly when the Hash Join operator writes a large number of files to disks.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the optimization is enabled.
- **off** indicates that the optimization is disabled.

**Default value:** on

## plan\_cache\_mode

**Parameter description:** Specifies the policy for generating an execution plan in the **prepare** statement.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **auto** indicates that the **custom plan** or **generic plan** is selected by default.
- **force\_generic\_plan** indicates that the **generic plan** (soft parse) is forcibly used. The **generic plan** is a plan generated after you run a prepared statement. The plan policy binds parameters to the plan when you run the EXECUTE statement and execute the plan. The advantage of this plan is that repeated optimizer overheads can be avoided in each execution. The disadvantage is that the plan may not be optimal when data skew occurs for the bound parameters and may result in poor plan execution performance.
- **force\_custom\_plan** indicates that the **custom plan** (hard parse) is forcibly used. The **custom plan** is a plan generated after you run a prepared statement where parameters in the EXECUTE statement are embedded. The **custom plan** generates a plan based on specific parameters in the EXECUTE

statement. This plan generates a preferred plan based on specific parameters each time and has good execution performance. The disadvantage is that the plan needs to be regenerated before each execution, resulting in a large amount of repeated optimizer overhead.

 **NOTE**

This parameter is valid only for prepared statements. It is used when the parameterized field in a prepared statement has severe data skew.

**Default value:** auto

## enable\_router

**Parameter description:** Specifies whether to enable the manual node pushdown function.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the performance logs are output.
- **off** indicates that the performance logs are not output.

**Default value:** off

## router

**Parameter description:** Controls the detailed attributes of the router function. This parameter is valid only when **enable\_router** and **enable\_light\_proxy** are enabled. This parameter is used to calculate the DN where the given distribution key is located based on the hash distribution key of the table. After the router is set, the supported SQL statements are pushed down to the DN for execution. If the router is incorrectly configured, data may be saved to an incorrect DN, causing unpredictable problems. Therefore, be cautious when running this command.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

This parameter consists of two parts:

'**schema\_name.table\_name,"distribute\_keys"**'. The meanings are as follows:

- **schema\_name.table\_name:** indicates the schema name and table name. If schema\_name is not set, the default value current\_schema is used.
- **distribute\_keys:** Values of all distribution keys in the distribution table are separated by commas (.). The sequence of the values must be the same as that of the distribution keys in the table.

**Default value:** empty

## enable\_auto\_explain

**Parameter description:** Specifies whether to enable the function of automatically printing execution plans. This parameter is used to locate slow stored procedures or slow queries and is valid only for the currently connected CN.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value **on** indicates that the function is enabled, and the value **off** indicates that the function is disabled.

**Default value:** off

## auto\_explain\_level

**Parameter description:** Specifies the log level for automatically printing execution plans.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Enumeration type. The value can be **log** or **notice**. **log** indicates that the execution plan is printed in logs. **notice** indicates that the execution plan is printed in notification mode.

**Default value:** log

## auto\_explain\_log\_min\_duration

**Parameter description:** Specifies the minimum duration of execution plans that are automatically printed. Only execution plans whose duration is greater than the value of **auto\_explain\_log\_min\_duration** will be printed.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

- **0:** All executed plans are printed.
- **3000:** All execution plans will be printed if the execution of a statement takes more than 3000 ms.

**Default value:** 0

## max\_datanode\_for\_plan

**Parameter description:** Specifies the number of execution plans to be displayed on the DN when an FQS plan is generated. The number of plans that are displayed on the DN is determined by the smaller value between the number of DNs on the cluster and the value of this parameter.

For statements executed by PBE, only plans generated in kernel prepared precompilation mode can be displayed. Plans generated in JDBC precompilation mode cannot be displayed.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 8192

**Default value:** 0

## enable\_inner\_unique\_opt

**Parameter description:** Specifies that Inner Unique is optimized for nested loop join, hash join, and sort merge join. That is, the number of matching times is reduced when the attribute corresponding to the inner table in the join condition meets the uniqueness constraint.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** used.
- **off:** not used.

**Default value:** on

## enable\_indexscan\_optimization

**Parameter description:** Specifies whether to optimize B-tree index scanning (IndexScan and IndexOnlyScan) in the Astore engine.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** used.
- **off:** not used.

**Default value:** off

## session\_sequence\_cache

**Parameter description:** Specifies the **sequence** value applied for one-time interaction in the current session. The unused values are automatically discarded after the session ends. When using **sequence** to import data in batches, you can increase the value of this parameter to improve the insertion speed and high concurrency performance. When a single data record is inserted concurrently, set this parameter to **1** to reduce the sequence change. If you have high requirements on continuity, you need to specify the required cache when creating a sequence. If the value of this parameter is greater than that of cache, the value automatically becomes invalid.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 10

### NOTE

The default value is **10**. In high-concurrency scenarios, the performance of single and batch insertion is good.

## enable\_dynamic\_sample\_size

**Parameter description:** Specifies whether to dynamically adjust the number of sampled rows. For a large table with more than one million rows, the number of sampled rows is dynamically adjusted during statistics collection to improve statistics accuracy.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** indicates that this function is enabled.
- **off:** indicates that the function is disabled.

**Default value:** on

### NOTE

The function of dynamically adjusting the number of sampled rows supports only absolute sampling.

## 14.3.9 Error Reporting and Logging

### 14.3.9.1 Logging Destination

#### log\_destination

**Parameter description:** GaussDB supports several methods of logging server messages. Set this parameter to a list of desired log destinations separated by commas. (For example, log\_destination="stderr, csvlog")

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

The valid values are **stderr**, **csvlog**, and **syslog**.

- **stderr** indicates that logs are printed to the screen.
- **csvlog** indicates that logs are output in comma-separated value (CSV) format. The prerequisite for generating logs in CSV format is that **logging\_collector** must be set to **on**. For details, see [Using CSV Log Output](#).
- **syslog** indicates that logs are recorded using the syslog of the OS. GaussDB can record logs using syslog from **LOCAL0** to **LOCAL7**. For details, see [syslog facility](#). To record logs using syslog, add the following information to syslog daemon's configuration file:

```
local0.* /var/log/postgresql
```

**Default value:** stderr

#### logging\_collector

**Parameter description:** Specifies whether to enable the logger process to collect logs. This process captures log messages sent to **stderr** or **csvlog** and redirects them into log files.

This method is more effective than recording logs to syslog because some types of messages cannot be displayed in syslog output, such as messages indicating the loading failures of dynamic link libraries and error messages generated by scripts (for example, **archive\_command**).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

It is possible to log to **stderr** without using the logging collector and the log messages will go to where the server's **stderr** is directed. However, this method is only suitable for low log volumes due to difficulties in rotating log files.

---

**Value range:** Boolean

- **on** indicates that the log collection is enabled.
- **off** indicates that the log collection is disabled.

**Default value:** on

## log\_directory

**Parameter description:** Specifies the directory for storing log files when **logging\_collector** is set to **on**. The value can be an absolute path, or relative to the data directory. The **log\_directory** parameter can be dynamically modified using the **gs\_guc reload** command. Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- If this parameter is set to an invalid path, the cluster cannot be started.
  - If you modify the **log\_directory** parameter using the **gs\_guc reload** command, and the specified path is valid, the log files are output to this new path. If the specified path is invalid, the log files are output to the valid path set last time and the database operation is not affected. The invalid value is still written into the configuration file.
  - In the sandbox environment, the path cannot contain `/var/chroot`. For example, if the absolute path of log is `/var/chroot/var/lib/log/Ruby/pg_log/cn_log`, you only need to set the path to `/var/lib/log/Ruby/pg_log/cn_log`.
- 

**NOTE**

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## log\_filename

**Parameter description:** Specifies the names of generated log files when **logging\_collector** is set to **on**. The value is treated as a strftime pattern, so %-escapes can be used to specify time-varying file names. Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- You are advised to use %-escapes to specify the log file names for efficient management of log files.
- If **log\_destination** is set to **csvlog**, log files are output in CSV format with timestamped names, for example, **server\_log.1093827753.csv**.

---

**Value range:** a string

**Default value:** postgresql-%Y-%m-%d\_%H%M%S.log

## log\_file\_mode

**Parameter description:** Specifies the permissions of log files when **logging\_collector** is set to **on**. This parameter is invalid on Windows. The parameter value is usually a number in the format acceptable to the **chmod** and **umask** system calls.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- Before setting this parameter, set **log\_directory** to store the logs to a directory other than the data directory.
- Do not make the log files world-readable because they might contain sensitive data.

---

**Value range:** an octal integer ranging from 0000 to 0777 (that is, 0 to 511 in the decimal format)

### NOTE

- **0600** indicates that log files are readable and writable only to the server administrator.
- **0640** indicates that log files are readable and writable to members of the administrator's group.

**Default value:** 0600

## log\_truncate\_on\_rotation

**Parameter description:** Specifies the writing mode of the log files when **logging\_collector** is set to **on**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

A setting example is as follows:

Assume that you want logs to be kept for 7 days, a log file generated each day to be named **server\_log.Mon** on Monday, **server\_log.Tue** on Tuesday, and so forth, and this week's log files to be overwritten by next week's log files. Then you can set **log\_filename** to **server\_log.%a**, **log\_truncate\_on\_rotation** to **on**, and **log\_rotation\_age** to **1440** (indicating that the valid duration of the log file is 24 hours).

**Value range:** Boolean

- **on** indicates that GaussDB overwrites the existing log files of the same name on the server.
- **off** indicates that GaussDB appends the logging messages to the existing log files of the same name on the server.

**Default value:** **off**

## log\_rotation\_age

**Parameter description:** Specifies the interval for creating a log file when **logging\_collector** is set to **on**. If the duration from the time when the last log file was created to the current time is greater than the value of **log\_rotation\_age**, a new log file will be generated.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 35791394. The unit is min. **0** indicates that the time-based creation of new log files is disabled.

**Default value:** **1d** (1440 min)

## log\_rotation\_size

**Parameter description:** Specifies the maximum size of a server log file when **logging\_collector** is set to **on**. If the total size of messages in a log file exceeds the specified value, a log file will be generated.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2097151. The unit is KB.

**0** indicates that the capacity-based creation of new log files is disabled.

**Default value:** 20 MB

## syslog\_facility

**Parameter description:** Specifies the syslog facility to be used when **log\_destination** is set to **syslog**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, and **local7**.

**Default value:** local0

## syslog\_ident

**Parameter description:** Specifies the identifier of GaussDB messages in syslog logs when **log\_destination** is set to **syslog**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** postgres

## event\_source

**Parameter description:** Specifies the identifier of GaussDB messages in logs when **log\_destination** is set to **eventlog**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** PostgreSQL

## 14.3.9.2 Logging Time

### client\_min\_messages

**Parameter description:** Specifies which level of messages will be sent to the client. Each level covers all the levels following it. The lower the level is, the fewer messages are sent.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

A same value for **client\_min\_messages** and **log\_min\_messages** does not indicate the same level.

---

**Value range:** enumerated type. The valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal** and **panic**.

Among them, **debug** and **debug2** are equivalent. For details about the parameters, see [Table 14-6](#). If the configured level is higher than **error**, for example, **fatal** or **panic**, the system changes the level to **error** by default.

**Default value:** notice

## log\_min\_messages

**Parameter description:** Specifies which level of messages will be written into the server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

A same value for **client\_min\_messages** and **log\_min\_messages** does not indicate the same level.

---

**Value range:** enumerated type. The valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal** and **panic**. Among them, **debug** and **debug2** are equivalent. For details about the parameters, see [Table 14-6](#).

**Default value:** warning

## log\_min\_error\_statement

**Parameter description:** Controls which SQL statements that cause an error condition are recorded in the server log.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see [Table 14-6](#).

### NOTE

- The default is **error**, indicating that statements causing errors, log messages, fatal errors, or panics will be logged.
- **panic** indicates that SQL statements that cause an error condition will not be logged.

**Default value:** error

## log\_min\_duration\_statement

**Parameter description:** Specifies the threshold for logging the duration of a completed statement. If a statement runs for a duration greater than or equal to the specified value, its duration will be logged.

Setting this parameter can be helpful in tracking down unoptimized queries. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

When this option is used together with [log\\_statement](#), the text of statements that are logged because of [log\\_statement](#) will not be repeated in the duration log message. If you are not using [syslog](#), it is recommended that you log the process ID (PID) or session ID using [log\\_line\\_prefix](#) so that you can link the statement message to the later duration message.

---

**Value range:** an integer ranging from -1 to 2147483647. The unit is ms.

- If this parameter is set to **250**, all SQL statements that run for 250 ms or longer will be logged.
- **0** indicates that the execution durations of all the statements are logged.
- **-1** indicates that the duration logging is disabled.

**Default value:** 3s (that is, 3000 ms)

## backtrace\_min\_messages

**Parameter description:** Prints the function's stack information to the server's log file if the information generated is greater than or equal to the level specified by this parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

This parameter is used to locate problems on-site. Frequent stack printing will affect the system's overhead and stability. Therefore, set the value of this parameter to a rank other than **fatal** or **panic** during problem location.

---

**Value range:** enumerated values

Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see [Table 14-6](#).

**Default value:** panic

[Table 14-6](#) explains message severities used by GaussDB. If logging output is sent to syslog or eventlog, severity is translated in GaussDB as shown in the table.

**Table 14-6** Message severity levels

Severity	Description	System Log	Event Log
debug[1-5]	Provides detailed debug information.	DEBUG	INFORMATION
log	Reports information of interest to administrators, for example, checkpoint activity.	INFO	INFORMATION
info	Provides information implicitly requested by users, for example, output from <b>VACUUM VERBOSE</b> .	INFO	INFORMATION
notice	Provides information that might be helpful to users, for example, truncation of long identifiers and index created as part of the primary key.	NOTICE	INFORMATION
warning	Provides warnings of likely problems, for example, <b>COMMIT</b> outside a transaction block.	NOTICE	WARNING
error	Reports an error that causes a command to terminate.	WARNING	ERROR
fatal	Reports the reason that causes a session to terminate.	ERR	ERROR
panic	Reports an error that caused all database sessions to terminate.	CRIT	ERROR

### 14.3.9.3 Logging Content

#### debug\_print\_parse

**Parameter description:** Specifies whether to print parsing tree results.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

## debug\_print\_rewritten

**Parameter description:** Specifies whether to print query rewriting results.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

## debug\_print\_plan

**Parameter description:** Specifies whether to print the query execution plan to logs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

---

### NOTICE

- Debugging information about **debug\_print\_parse**, **debug\_print\_rewritten**, and **debug\_print\_plan** are printed only when the log level is set to **log** or higher. When these parameters are set to **on**, their debugging information will be recorded in server logs and will not be sent to client logs. You can change the log level by setting [client\\_min\\_messages](#) and [log\\_min\\_messages](#).
  - Do not invoke the **gs\_encrypt\_aes128** and **gs\_decrypt\_aes128** functions when **debug\_print\_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the **gs\_encrypt\_aes128** and **gs\_decrypt\_aes128** functions in the log files generated when **debug\_print\_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.
- 

## debug\_pretty\_print

**Parameter description:** Indents the logs produced by **debug\_print\_parse**, **debug\_print\_rewritten**, and **debug\_print\_plan**. The output format is more readable but much longer than that generated when this parameter is set to **off**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the indentation is enabled.
- **off** indicates that the indentation is disabled.

**Default value:** on

## log\_checkpoints

**Parameter description:** Specifies whether the statistics on checkpoints and restart points are recorded in the server logs. When this parameter is set to **on**, statistics on checkpoints and restart points are recorded in the log messages, including the number of buffers written and the time spent in writing them.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics on checkpoints and restart points are recorded in the server logs.
- **off** indicates that the statistics on checkpoints and restart points are not recorded in the server logs

**Default value:** off

## log\_connections

**Parameter description:** Specifies whether to record connection request information of the client.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

Some client programs, such as gsql, attempt to connect twice while determining if a password is required. In this case, duplicate "connection receive" messages do not necessarily indicate a problem.

---

**Value range:** Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

**Default value:** off

## log\_disconnections

**Parameter description:** Specifies whether to record disconnection request information of the client.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

**Default value:** off

## log\_duration

**Parameter description:** Specifies whether to record the duration of every completed SQL statement. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **off:** Compared with this option, [log\\_min\\_duration\\_statement](#) forcibly records the query text.
- If this parameter is set to **on** and [log\\_min\\_duration\\_statement](#) is set to a positive value, the duration of each completed statement is logged but the query text is included only for statements exceeding the threshold. This behavior can be used for gathering statistics in high-load situation.

**Default value:** off

## log\_error\_verbosity

**Parameter description:** Specifies the amount of detail written in the server log for each message that is logged.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **terse** indicates that the output excludes the DETAIL, HINT, QUERY, and CONTEXT error information.
- **verbose** indicates that the output includes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.
- **default** indicates that the output includes the DETAIL, HINT, QUERY, and CONTEXT error information, and excludes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.

**Default value:** default

## log\_hostname

**Parameter description:** By default, connection log messages only show the IP address of the connecting host. The host name can be recorded when this parameter is set to **on**. It may take some time to parse the host name. Therefore, the database performance may be affected.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the host name is simultaneously recorded.
- **off** indicates that the host name is not simultaneously recorded.

**Default value:** off

## log\_line\_prefix

**Parameter description:** Specifies the prefix format of each log information. A prefix is a printf-style string that is output at the beginning of each line of the log. The "escape sequences" which begin with % are replaced with status information as listed in [Table 14-7](#).

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Table 14-7** Escape characters

Escape Character	Effect
%a	Application name
%u	Username
%d	Database name
%r	Remote host name or IP address and remote port. If <b>log_hostname</b> is set to <b>off</b> , only the IP address and remote port are displayed.
%h	Remote host name or IP address. If <b>log_hostname</b> is set to <b>off</b> , only the IP address is displayed.
%p	Thread ID
%t	Timestamp without milliseconds (no time zone in the Windows OS)
%m	Timestamp with milliseconds
%n	Node from which an error is reported
%i	Command tag: type of command executed in the current session
%e	SQLSTATE error code
%c	Session ID: For details, see the note below the table.
%l	Number of the log line for each session, starting from 1
%s	Start time of a session
%v	Virtual transaction ID (backendID/ localXID)
%x	Transaction ID ( <b>0</b> indicates that no transaction ID is assigned)

Escape Character	Effect
%q	Produces no output. If the current thread is a backend thread, this escape sequence is ignored and subsequent escape sequences are processed. Otherwise, this escape sequence and subsequent escape sequences are all ignored.
%S	Session ID
%T	Trace ID
%%	The character %

 **NOTE**

The %c escape character prints a unique session ID consisting of two 4-byte hexadecimal numbers separated by a period (.). The numbers are the process startup time and the process ID. Therefore, %c can also be used as a space saving way of printing those items. For example, run the following query to generate the session ID from **pg\_stat\_activity**:

```
SELECT to_hex(EXTRACT(EPOCH FROM backend_start)::integer) || '.' ||
 to_hex(pid)
FROM pg_stat_activity;
```

- If you set a non-empty value for **log\_line\_prefix**, ensure that its last character is a space, to provide visual separation from the rest of the log line. A punctuation character can be used, too.
- Syslog generates its own timestamp and process ID information. Therefore, you do not need to include those escapes characters when you are logging in to syslog.

**Value range:** a string

**Default value:** '%m %n %u %d %h %p %S %x %a '

 **NOTE**

**%m %n %u %d %h %p %S %x %a** indicates the session start timestamp, error reporting node, username, database name, remote host name or IP address, thread ID, session ID, transaction ID, and application name.

## log\_lock\_waits

**Parameter description:** If the time for which a session waits to acquire a lock is longer than the value of **deadlock\_timeout**, this parameter specifies whether to record this message in the database. This is useful in determining if lock waits are causing poor performance.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the information is recorded.
- **off** indicates that the information is not recorded.

**Default value:** **off**

## log\_statement

**Parameter description:** Specifies which SQL statements are recorded. For clients using extended query protocols, logging occurs when an Execute message is received, and values of the Bind parameters are included (with any embedded single quotation marks doubled).

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

### NOTICE

- Statements that contain simple syntax errors are not logged even if **log\_statement** is set to **all**, because the log message is emitted only after basic parsing has been completed to determine the statement type. If an extended query protocol is used, statements that fail before the execution phase (during parse analysis or planning) are not logged, either. Set **log\_min\_error\_statement** to **ERROR** or lower to log such statements.
- If this parameter is set to a value other than **none**, the statement audit function is enabled. The database administrator can access server logs to view SQL execution records.

**Value range:** enumerated values

- **none** indicates that no statement is recorded.
- **ddl** indicates that all data definition statements, such as CREATE, ALTER, and DROP, are recorded.
- **mod** indicates that all DDL statements and data modification statements, such as INSERT, UPDATE, DELETE, TRUNCATE, and COPY FROM, are recorded.
- **all** indicates that all statements, including the PREPARE, EXECUTE, and EXPLAIN ANALYZE statements, are recorded.

**Default value:** none

## log\_temp\_files

**Parameter description:** Specifies whether to record the deletion information of temporary files. Temporary files can be created for sorting, hashing, and storing temporary querying results. If the recording is enabled, a log entry is generated for each temporary file when it is deleted.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB.

- A positive value indicates that the deletion information of temporary files whose size is larger than the specified value of **log\_temp\_files** is recorded.
- **0** indicates that the delete information of all temporary files is recorded.
- **-1** indicates that the delete information of any temporary files is not recorded.

**Default value:** -1

## log\_timezone

**Parameter description:** Specifies the time zone used for timestamps written in the server log. Different from **TimeZone**, this parameter takes effect for all sessions in the database.

This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

**Value range:** a string. You can query the PG\_TIMEZONE\_NAMES view to obtain the value. For details, see "System Catalogs and System Views > System Views > PG\_TIMEZONE\_NAMES" in *Developer Guide*.

**Default value:** Set this parameter based on the OS time zone.

### NOTE

The default value will be changed when **gs\_initdb** is used to set system environments.

## logging\_module

**Parameter description:** Specifies whether module logs are output on the server. This parameter is a session-level parameter, and you are advised not to use the **gs\_guc** tool to set it.

This parameter is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

**Value range:** a string

**Default value:** Logs of the LOCK module are generated on the server. Logs of other modules are not generated on the server, but can be viewed by running **SHOW logging\_module**.

```
ALL,on(LOCK),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GD
S,TBLSPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRIT
E,OPT_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,UD
F,COOP_ANALYZE,WLMCP,ACCELERATE,MOT,PLANHINT,PARQUET,PGSTAT,CARBONDATA,SNAPSHOT,XACT,H
ANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,WDR_SNAPS
HOT,WDR_REPORT,INCRE_CKPT,INCRE_BG_WRITER,DBL_WRT,RTO_RPO,HEARTBEAT,COMM_IPC,COMM_PAR
AM,TIMESERIES,SCHEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREAD_POOL,OPT_AI,WALRECEIVER,USTO
RE,UPAGE,UBTREE,UNDO,TIMECAPSULE,GEN_COL,DCF,DB4AI,PLDEBUGGER,ADVISOR,SEC,SEC_FE,SEC_LEGE
R,SEC_POLICY,SEC_SDD,SEC_TDE,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,NEST_COMPILE,RESOWN
ER,GSSSTACK,LOGICAL_DECODE,GPRC,DISASTER_READ,STANDBY_READ,REPSYNC,SQLPATCH,PARTITION,UBT
NEWPAGE,GPI,GS_DEPENDENCY,LWLOCK,GS)
```

---

### CAUTION

**CN\_RETRY** does not take effect in the current version.

---

**Setting method:** Run **SHOW logging\_module** to view which modules are controllable. For example, the query output result is as follows:

```
gaussdb=# show logging_module;
logging_module
```

```

ALL,on(LOCK),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GD
S,TBLSPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRIT
```

```
E,OPT_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,UD
F,COOP_ANALYZE,WLMCP,ACCELERATE,MOT,PLANHINT,PARQUET,PGSTAT,CARBONDATA,SNAPSHOT,XACT,H
ANDLE,CLOG,EC,REMOTE,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,WDR_SNAPSHOT,WDR_R

PI,GS_DEPENDENCY,LWLOCK,GS)
```

(1 row)

Controllable modules are identified by uppercase letters, and the special ID **ALL** is used for setting all module logs. You can control the output of module logs by setting **logging\_module** to **on** or **off**. Enable log output for SSL:

```
gaussdb=# set logging_module='on(SSL)';
SET
gaussdb=# show
logging_module;
 logging_module

ALL,on(SSL,LOCK),off(COMMAND,DFS,GUC,GS CLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,GD
S,TBLSPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRIT
E,OPT_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,UD
F,COOP_ANALYZE,WLMCP,ACCELERATE,MOT,PLANHINT,PARQUET,PGSTAT,CARBONDATA,SNAPSHOT,XACT,H
ANDLE,CLOG,EC,REMOTE,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,INSTR,WDR_SNAPSHOT,WDR_R
EPORT,INCRE_CKPT,INCRE_BG_WRITER,DBL_WRT,RTO_RPO,HEARTBEAT,COMM_IPC,COMM_PARAM,TIMESER
IES,SCHEMA,SEGMENT_PAGE,LIGHTPROXY,HOTKEY,THREAD_POOL,OPT_AI,WALRECEIVER,USTORE,UPAGE,U
BTREE,UNDO,TIMECAPSULE,GEN_COL,DCF,DB4AI,PLDEBUGGER,ADVISOR,SEC,SEC_FE,SEC_LEGER,SEC_POLIC
Y,SEC_SDD,SEC_TDE,COMM_PROXY,COMM_POOLER,VACUUM,JOB,SPI,NEST_COMPILE,RESOWNER,GSSTACK,
LOGICAL_DECODE,GPRC,DISASTER_READ,STANDBY_READ,REPSYNC,SQLPATCH,PARTITION,UBT_NEWPAGE,G
PI,GS_DEPENDENCY,LWLOCK,GS)
```

(1 row)

SSL log output is enabled.

The **ALL** identifier can be used to quickly enable or disable log output for all modules.

```
gaussdb=# set logging_module='off(ALL)';
SET
gaussdb=# show
logging_module;
 logging_module

ALL,on(),off(COMMAND,DFS,GUC,GS CLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBL
SPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT

(1 row)
```

**Dependency:** The value of this parameter depends on the settings of **log\_min\_level**.

## enable\_unshipping\_log

**Parameter description:** Specifies whether to log statements that are not pushed down. The logs help locate performance issues that may be caused by statements not pushed down. If **enable\_stream\_operator** is set to **off** and this parameter is set to **on**, a large number of logs indicating that plans cannot be pushed down are recorded. If you do not need these logs, you are advised to set both **enable\_unshipping\_log** and **enable\_stream\_operator** to **off**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that statements not pushed down are logged.
- **off** indicates that statements not pushed down are not logged.

**Default value:** **off**

## opfusion\_debug\_mode

**Parameter description:** Checks whether simple queries are optimized for debugging. If this parameter is set to **log**, you can view the specific reasons why queries are not optimized in the DN execution plans.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **off** indicates that reasons why queries are not optimized are not included.
- **log** indicates that reasons why queries are not optimized are included in the DN execution plan.

#### NOTICE

- You need to set **max\_datanode\_for\_plan** to view the DN execution plans.
- To view the reasons why queries are not optimized in the log, set **opfusion\_debug\_mode** to **log**, **log\_min\_messages** to **debug4**, and **logging\_module** to **on(OPFUSION)**. Note that a large number of log messages may be generated. Therefore, execute only a small number of jobs during debugging.

**Default value:** off

### enable\_debug\_vacuum

**Parameter description:** Specifies whether to allow output of some VACUUM-related logs for problem locating. This parameter is used only by developers. Common users are advised not to use it.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on/true** indicates that output of VACUUM-related logs is allowed.
- **off/false** indicates that output of VACUUM-related logs is disallowed.

**Default value:** off

### resource\_track\_log

**Parameter description:** Specifies the log level of self-diagnosis. Currently, this parameter takes effect only in multi-column statistics.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- **summary:** Brief diagnosis information is displayed.
- **detail:** Detailed diagnosis information is displayed.

Currently, the two parameter values differ only when there is an alarm about multi-column statistics not collected. If the parameter is set to **summary**, such an alarm will not be displayed. If it is set to **detail**, such an alarm will be displayed.

**Default value:** summary

#### 14.3.9.4 Using CSV Log Output

##### Prerequisites

- The **log\_destination** parameter is set to **csvlog**.
- The **logging\_collector** parameter is set to **on**.

## Definition of csvlog

Log lines are emitted in comma-separated values (CSV) format.

An example table definition for storing CSV-format log output is shown as follows:

```
CREATE TABLE postgres_log
(
log_time timestamp(3) with time zone,
node_name text,
user_name text,
database_name text,
process_id bigint,
connection_from text,
"session_id" text,
session_line_num bigint,
command_tag text,
session_start_time timestamp with time zone,
virtual_transaction_id text,
transaction_id bigint,
query_id bigint,
module text,
error_severity text,
sql_state_code text,
message text,
detail text,
hint text,
internal_query text,
internal_query_pos integer,
context text,
query text,
query_pos integer,
location text,
application_name text
);
```

For details, see [Table 14-8](#).

**Table 14-8** Meaning of each csvlog field

Field	Description	Field	Description
log_time	Timestamp in milliseconds	module	Log module
node_name	Node name	error_severity	ERRORSTATE code
user_name	Username	sql_state_code	SQLSTATE code
database_name	Database name	message	Error message
process_id	Process ID	detail	Detailed error message
connection_from	Port number of the client host	hint	Prompt message

Field	Description	Field	Description
session_id	Session ID	internal_query	Internal query (This field is used to query the information leading to errors if any.)
session_line_num	Number of lines in each session	internal_query_pos	Pointer for an internal query
command_tag	Command tag	context	Environment
session_start_time	Start time of a session	query	Character count at the position where errors occur
virtual_transaction_id	Regular transaction	query_pos	Pointer at the position where errors occur
transaction_id	Transaction ID	location	Position where errors occur in the GaussDB source code if <b>log_error_verbosity</b> is set to <b>verbose</b>
query_id	Query ID	application_name	Application name

Run the following command to import a log file to this table:  
`COPY postgres_log FROM '/opt/data/pg_log/logfile.csv' WITH csv;`

 **NOTE**

The log name (**logfile.csv**) here needs to be replaced with the name of a log generated.

## Simplifying Input

Simplify importing CSV log files by performing the following operations:

- Set **log\_filename** and **log\_rotation\_age** to provide a consistent, predictable naming solution for log files. By doing this, you can predict when an individual log file is complete and ready to be imported.
- Set **log\_rotation\_size** to **0** to disable size-based log rollback, as it makes the log file name difficult to predict.
- Set **log\_truncate\_on\_rotation** to **on** so that old log data cannot be mixed with the new one in the same file.

### 14.3.10 Alarm Detection

During the running of the cluster, error scenarios can be detected and informed to users in a timely manner. You can view the **system\_alarm** log written by the alarm in the `$GAUSSLOG/cm` or the `$GAUSSLOG/pg_log/gtm` directory.

## enable\_alarm

**Parameter description:** Specifies whether to enable the alarm detection thread to detect fault scenarios that may occur in the database.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the alarm detection thread is enabled.
- **off** indicates that the alarm detection thread is disabled.

**Default value:** on

### NOTE

This parameter takes effect only on CNs and DNPs.

## connection\_alarm\_rate

**Parameter description:** Specifies the ratio restriction on the maximum number of allowed parallel connections to the database. The maximum number of concurrent connections to the database is **max\_connections** x **connection\_alarm\_rate**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from 0.0 to 1.0

**Default value:** 0.9

## alarm\_report\_interval

**Parameter description:** specifies the interval at which an alarm is reported.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The unit is s.

**Default value:** 10

## alarm\_component

**Parameter description:** Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm\_report\_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log.

In this case, the value of **alarm\_component** is `/opt/huawei/snas/bin/snas_cm_cmd`.

- If `--alarm-type` in the `gs_preinstall` script is set to `1`, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** `/opt/huawei/snas/bin/snas_cm_cmd`

## 14.3.11 Statistics During the Database Running

### 14.3.11.1 Query and Index Statistics Collector

The query and index statistics collector is used to collect statistics during database running. The statistics include the times of inserting and updating a table and index, the number of disk blocks and tuples, and the time required for the last cleanup and analysis on each table. The statistics can be viewed by querying system view `pg_stats` and `pg_statistic`. The following parameters are used to set the statistics collection feature in the server scope.

#### **track\_activities**

**Parameter description:** Collects statistics about the commands that are being executed in session. For a stored procedure, if this parameter is enabled, you can view the PERFORM statement, stored procedure calling statement, SQL statement, and OPEN CURSOR statement that are being executed in the stored procedure in the `pg_stat_activity` view.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** **on**

#### **track\_counts**

**Parameter description:** Collects statistics about database activities.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

#### NOTE

When the database to be cleaned up is selected from the **AutoVacuum** automatic cleanup process, the database statistics are required. In this case, the default value is set to **on**.

**Default value:** **on**

## track\_io\_timing

**Parameter description:** Collects statistics about I/O timing in the database. The I/O timing statistics can be queried by using the **pg\_stat\_database** parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the collection function is enabled. In this case, the collector repeatedly queries the operating system at the current time. As a result, large number of costs may occur on some platforms. Therefore, the default value is set to **off**.
- **off** indicates that the statistics collection function is disabled.

**Default value:** off

## track\_functions

**Parameter description:** Collects statistics of the number and duration of function invocations.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

When the SQL functions are set to inline functions queried by the invoking, these SQL functions cannot be traced no matter these functions are set or not.

---

**Value range:** enumerated values

- **pl** indicates that only procedural language functions are traced.
- **none** indicates that the function tracing function is disabled.

**Default value:** none

## track\_activity\_query\_size

**Parameter description:** Specifies byte counts of the current running commands used to trace each active session.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 to 102400, in bytes

**Default value:** 1024

## update\_process\_title

**Parameter description:** Collects statistics updated with a process name each time the server receives a new SQL statement.

The process name can be viewed on Windows task manager by running the **ps** command.

This parameter is an INTERNAL parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** off

## stats\_temp\_directory

**Parameter description:** Specifies the directory for storing temporary statistics. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If a RAM-based file system directory is used, the actual I/O cost can be lowered and the performance can be improved.

---

**Value range:** a string

**Default value:** pg\_stat\_tmp

## track\_thread\_wait\_status\_interval

**Parameter description:** Specifies the interval of collecting the thread status information.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1440. The unit is min.

**Default value:** 30min

## enable\_save\_datachanged\_timestamp

**Parameter description:** Specifies whether to record the time when **INSERT**, **UPDATE**, **DELETE**, or **EXCHANGE/TRUNCATE/DROP PARTITION** is performed on table data.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the time when an operation is performed on table data will be recorded.

- **off** indicates that the time when an operation is performed on table data will not be recorded.

**Default value:** on

## plan\_collect\_thresh

**Parameter description:** Collects statistics about the plans that are being executed in each session.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

- **-1:** Plans that are being executed are not collected.
- **0:** Plans that are being executed are collected before plan execution.
- A value greater than **0** indicates that when the total number of tuples incrementally returned by all operators in a plan is greater than or equal to the value of this parameter, plans that are being executed are collected once.

**Default value:** 0

## track\_sql\_count

**Parameter description:** Collects statistics on the statements (**SELECT**, **INSERT**, **UPDATE**, **MERGE INTO**, and **DELETE**) that are being executed in a session.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 0.8% by enabling or disabling this parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the auditing function is disabled.

**Default value:** on

### NOTE

If **track\_sql\_count** is set to **off**, querying the **gs\_sql\_count** or **pgxc\_sql\_count** view returns 0.

### 14.3.11.2 Performance Statistics

During the running of the database, the lock access, disk I/O operation, and invalid message processing are involved. All these operations are the bottleneck of the database performance. The performance statistics provided by GaussDB can facilitate the performance fault location.

## Generating Performance Statistics Logs

**Parameter description:** For each query, the following four parameters record the performance statistics of corresponding modules in the server log:

- The **log\_parser\_stats** parameter records the performance statistics of a parser in the server log.
- The **log\_planner\_stats** parameter records the performance statistics of a query optimizer in the server log.
- The **log\_executor\_stats** parameter records the performance statistics of an executor in the server log.
- The **log\_statement\_stats** parameter records the performance statistics of the whole statement in the server log.

All these parameters can only provide assistant analysis for administrators, which are similar to the `getrusage()` of the Linux OS.

These parameters are SUSET parameters. Set them based on instructions provided in [Table 14-1](#).

---

### NOTICE

- The **log\_statement\_stats** records the total statement statistics whereas other parameters record statistics only about their corresponding modules.
- The **log\_statement\_stats** parameter cannot be enabled together with any parameter recording statistics about a module.

---

**Value range:** Boolean

- **on** indicates that performance statistics are recorded.
- **off** indicates that performance statistics are not recorded.

**Default value:** off

### 14.3.11.3 Hotspot Key Statistics

In the distributed architecture, if applications access a node in a short period of time, the resource usage of the node is too high, affecting the normal running of the database. GaussDB provides the function of quickly detecting hotspot keys to quickly determine whether there are hotspot keys and the distribution of hotspot keys.

#### enable\_hotkeys\_collection

**Parameter description:** Specifies whether to automatically collect statistics on the accessed key values in the database.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

 NOTE

If you set parameters using **gs\_guc** set, you need to restart the database for the GUC parameters to take effect. During the restart, hotspot key information is cleared.

When the GUC parameter is disabled, the query result of the hotspot key is empty and a message is displayed indicating that the GUC parameter is disabled. However, when the function is disabled, the hotspot key clearance API can still be used.

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the auditing function is disabled.

**Default value:** off

## 14.3.12 Automatic Vacuuming

The **autovacuum** process automatically runs the **VACUUM** and **ANALYZE** statements to recycle the record space marked as deleted and update statistics about the table.

### autovacuum

**Parameter description:** Specifies whether to start the **autovacuum** process in the database. Ensure that the **track\_counts** parameter is set to **on** before starting the **autovacuum** process.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

 NOTE

- Set the **autovacuum** parameter to **on** to automatically vacuum two-phase transactions after the system recovers from faults.
- If **autovacuum** is set to **on** and **autovacuum\_max\_workers** to **0**, the autovacuum process is enabled only when the system recovers from faults to clean up abnormal two-phase transactions.
- If **autovacuum** is set to **on** and **autovacuum\_max\_workers** to a value greater than **0**, the **autovacuum** process is started to clean up two-phase transactions and processes when the system recovers from faults.

**Value range:** Boolean

- **on** indicates that the **autovacuum** process is started.
- **off** indicates that the **autovacuum** process is not started.

**Default value:** on

### autovacuum\_mode

**Parameter description:** Specifies whether the autoanalyze or autovacuum function is enabled. This parameter is valid only when **autovacuum** is set to **on**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **analyze** indicates that only autoanalyze is performed.
- **vacuum** indicates that only autovacuum is performed.
- **mix** indicates that both autoanalyze and autovacuum are performed.
- **none** indicates that neither of them is performed.

**Default value:** mix

## autoanalyze\_timeout

**Parameter description:** Specifies the timeout period of autoanalyze. If the duration of autoanalyze on a table exceeds the value of **autoanalyze\_timeout**, the autoanalyze operation is automatically canceled.

The timeout check cannot be completely accurate. In principle, the statistics on each CN must be consistent. Therefore, the synchronization between CNs will not be interrupted even if the synchronization times out. As a result, the actual execution time may exceed the user-defined time.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483, in seconds. The value 0 indicates no timeout.

**Default value:** 5min (300s)

## autovacuum\_io\_limits

**Parameter description:** Specifies the upper limit of I/Os triggered by the autovacuum process per second.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 1073741823. -1 indicates that the default Cgroup is used.

**Default value:** -1

## log\_autovacuum\_min\_duration

**Parameter description:** Records each step performed by the autovacuum process to the server log when the execution time of the autovacuum process is greater than or equal to a certain value. This parameter helps track the autovacuum behavior.

For example, set the **log\_autovacuum\_min\_duration** parameter to **250ms** to record the information about the autovacuum commands running longer than or equal to 250 ms.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is ms.

- 0 indicates that all autovacuum actions are recorded in the log.

- **-1** indicates that all autovacuum actions are not recorded in the log.
- A value other than **-1** indicates that a message is recorded when an autovacuum action is skipped due to a lock conflict.

**Default value:** -1

## autovacuum\_max\_workers

**Parameter description:** Specifies the maximum number of autovacuum worker threads that can run at the same time. The upper limit of this parameter is related to the values of **max\_connections** and **job\_queue\_processes**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The minimum value is **0**, indicating that autovacuum is not enabled. The theoretical maximum value is **262143**, but the actual maximum value is a dynamic value calculated by the following formula:  $262143 - \text{Value of } \mathbf{max\_inner\_tool\_connections} - \text{Value of } \mathbf{max\_connections} - \text{Value of } \mathbf{max\_concurrent\_autonomous\_transactions} - \text{Value of } \mathbf{job\_queue\_processes} - \text{Number of auxiliary threads} - \text{Number of autovacuum launcher threads} - 1$ . The number of auxiliary threads and the number of autovacuum launcher threads are specified by two macros. Their default values are **20** and **2** respectively.

**Default value:** 3

## autovacuum\_naptime

**Parameter description:** Specifies the interval between activity rounds for the autovacuum process.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483. The unit is s.

**Default value:** 10min (600s)

## autovacuum\_vacuum\_threshold

**Parameter description:** Specifies the threshold for triggering the VACUUM operation. When the number of deleted or updated records in a table exceeds the specified threshold, the VACUUM operation is executed on this table.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647.

**Default value:** 50

## autovacuum\_analyze\_threshold

**Parameter description:** Specifies the threshold for triggering the ANALYZE operation. When the number of deleted, inserted, or updated records in a table exceeds the specified threshold, the ANALYZE operation is executed on this table.

If a global secondary index exists in a table, the ANALYZE operation is performed on the global secondary index only when the number of deleted, inserted, and updated records in the table exceeds the threshold 20 times.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647.

**Default value:** 50

## autovacuum\_vacuum\_scale\_factor

**Parameter description:** Specifies a fraction of the table size added to the **autovacuum\_vacuum\_threshold** parameter when deciding whether to vacuum a table.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0.0 to 100.0

**Default value:** 0.2

## autovacuum\_analyze\_scale\_factor

**Parameter description:** Specifies a fraction of the table size added to the **autovacuum\_analyze\_threshold** parameter when deciding whether to analyze a table.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0.0 to 100.0

**Default value:** 0.1

## autovacuum\_freeze\_max\_age

**Parameter description:** Specifies the maximum age (in transactions) that a table's **pg\_class.relfrozexid** column can attain before a VACUUM operation is performed.

- The old files under the subdirectory of **pg\_clog/** can also be deleted by the VACUUM operation.
- Even if the autovacuum process is not started, the system will invoke the process to prevent transaction ID wraparound.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100000 to 576460752303423487

**Default value:** 4000000000

## autovacuum\_vacuum\_cost\_delay

**Parameter description:** Specifies the value of the cost delay used in the autovacuum operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 100. The unit is ms. -1 indicates that the regular vacuum cost delay is used.

**Default value:** 20 ms

## autovacuum\_vacuum\_cost\_limit

**Parameter description:** Sets the value of the cost limit used in the autovacuum operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 10000 -1 indicates that the regular vacuum cost limit is used.

**Default value:** -1

## twophase\_clean\_workers

**Parameter description:** Specifies the maximum number of concurrent cleanup operations that can be performed by the gs\_clean tool.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 10

**Default value:** 3

## defer\_csn\_cleanup\_time

**Parameter description:** Specifies the local recycling interval.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 5000 ms (that is, 5s)

## 14.3.13 Default Settings of Client Connection

### 14.3.13.1 Statement Behavior

This section describes related default parameters involved in the execution of SQL statements.

## search\_path

**Parameter description:** Specifies the order in which schemas are searched when an object is referenced with no schema specified. The value of this parameter consists of one or more schema names. Different schema names are separated by commas (,).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

- If the schema of temporary tables exists in the current session, the scheme can be listed in **search\_path** by using the alias **pg\_temp**, for example, '**pg\_temp,public**'. The schema of temporary tables has the highest search priority and is always searched before all the other schemas specified in **pg\_catalog** and **search\_path**. Therefore, do not explicitly specify **pg\_temp** to be searched after other schemas in **search\_path**. This setting will not take effect and an error message will be displayed. If the alias **pg\_temp** is used, the temporary schema will be searched only for tables, views, and data types, and not for functions or operators.
- The system catalog schema, **pg\_catalog**, has the second highest search priority and is the first to be searched among all the schemas, excluding **pg\_temp**, specified in **search\_path**. Therefore, do not explicitly specify **pg\_catalog** to be searched after other schemas in **search\_path**. This setting will not take effect and an error message will be displayed.
- When an object is created without a specific target schema, the object will be placed in the first valid schema listed in **search\_path**. An error is reported if the search path is empty.
- The current effective value of the search path can be examined through the SQL function **current\_schema**. This is different from examining the value of **search\_path**, because the **current\_schema** function displays the first valid schema name in **search\_path**.

**Value range:** a string

### NOTE

- When this parameter is set to "**\$user**", **public**, shared use of a database (where no users have private schemas, and all share use of public), private per-user schemas and combinations of them are supported. Other effects can be obtained by modifying the default search path setting, either globally or per-user.
- When this parameter is set to a null string (""), the system automatically converts it into a pair of double quotation marks ("").
- If the content contains double quotation marks, the system considers them as insecure characters and converts each double quotation mark into a pair of double quotation marks.

**Default value:** "**\$user**",**public**

### NOTE

**\$user** indicates the name of the schema with the same name as the current session user. If the schema does not exist, **\$user** will be ignored.

## current\_schema

**Parameter description:** Specifies the current schema.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** "\$user",public

 NOTE

**\$user** indicates the name of the schema with the same name as the current session user. If the schema does not exist, **\$user** will be ignored.

## default\_tablespace

**Parameter description:** Specifies the default tablespace of the created objects (tables and indexes) when a **CREATE** command does not explicitly specify a tablespace.

- The value of this parameter is either the name of a tablespace, or an empty string that indicates the use of the default tablespace of the current database. If a non-default tablespace is specified, users must have CREATE privilege for it. Otherwise, creation attempts will fail.
- This parameter is not used for temporary tables. For them, [temp\\_tablespaces](#) is used instead.
- This parameter is not used when users create databases. By default, a new database inherits its tablespace setting from the template database.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that the default tablespace is used.

**Default value:** empty

## default\_storage\_nodegroup

**Parameter description:** Specifies the Node Group where a table is created by default. This parameter takes effect only for ordinary tables.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

- **installation** indicates that tables will be created in the Node Group created during database installation.
- A value other than **installation** indicates that tables will be created in the Node Group specified by this parameter.

**Value range:** a string

**Default value:** installation

## temp\_tablespaces

**Parameter description:** Specifies one or more tablespaces to which temporary objects (temporary tables and their indexes) will be created when a CREATE

command does not explicitly specify a tablespace. Temporary files for sorting large data sets are created in these tablespaces.

The value of this parameter can be a list of names of tablespaces. When there is more than one name in the list, GaussDB chooses a random tablespace from the list upon the creation of a temporary object each time. However, within a transaction, successively created temporary objects are placed in successive tablespaces in the list. If the element selected from the list is an empty string, GaussDB will automatically use the default tablespace of the current database instead.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string An empty string indicates that all temporary objects are created only in the default tablespace of the current database. For details, see [default\\_tablespace](#).

**Default value:** empty

## check\_function\_bodies

**Parameter description:** Specifies whether to enable validation of the function body string during the execution of **CREATE FUNCTION**. Verification is occasionally disabled to avoid problems, such as forward references when you restore function definitions from a dump. After the function is enabled, the word syntax of the PL/SQL in the stored procedure is verified, including the data type, statement, and expression. The SQL statements in the stored procedure are not checked in the Create phase. Instead, they are checked during running.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that validation of the function body string is enabled during the execution of **CREATE FUNCTION**.
- **off** indicates that validation of the function body string is disabled during the execution of **CREATE FUNCTION**.

**Default value:** on

## default\_transaction\_isolation

**Parameter description:** Specifies the default isolation level of each transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

### NOTE

The current version does not support the setting of the default transaction isolation level. The default value is **read committed**. Do not change the value.

**Value range:** enumerated values

- **read uncommitted** indicates that a transaction reads the uncommitted modifications made by other transactions.

- **read committed** indicates that the data read by a transaction is committed at the moment it is read.
- **repeatable read** indicates that the data that has been read by the current transaction cannot be modified by other transactions until the current transaction completes, thereby preventing unrepeatable reads.
- **serializable**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **repeatable read**.

**Default value:** read committed

## default\_transaction\_read\_only

**Parameter description:** Specifies whether each new transaction is in read-only state.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

If this parameter is set to **on**, the DML and write transactions cannot be executed.

---

**Value range:** Boolean

- **on** indicates that the transaction is in read-only state.
- **off** indicates that the transaction is in read/write state.

**Default value:** off

## default\_transaction\_deferrable

**Parameter description:** Specifies the default deferrable status of each new transaction. It currently has no effect on read-only transactions or those running at isolation levels lower than serializable.

GaussDB does not support the serializable isolation level. Therefore, the parameter takes no effect.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a transaction is delayed by default.
- **off** indicates that a transaction is not delayed by default.

**Default value:** off

## session\_replication\_role

**Parameter description:** Specifies the behavior of replication-related triggers and rules for the current session.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

Setting this parameter will discard all the cached execution plans.

---

**Value range:** enumerated values

- **origin** indicates that the system copies operations such as insert, delete, and update from the current session.
- **replica** indicates that the system copies operations such as insert, delete, and update from other places to the current session.
- **local** indicates that the system will detect the role that has logged in to the database when using the function to copy operations and will perform related operations.

**Default value:** origin

## statement\_timeout

**Parameter description:** If the statement execution time (starting from the time the server receives the command) is longer than the duration specified by the parameter, error information is displayed and the statement exits.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). The default value is 0, indicating that the parameter does not take effect.

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 0

## vacuum\_freeze\_min\_age

**Parameter description:** Specifies whether VACUUM replaces the xmin column of a record with FrozenXID when scanning a table (in the same transaction).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 576460752303423487

 **NOTE**

Although you can set this parameter to any value, **VACUUM** will limit the effective value to half the value of [autovacuum\\_freeze\\_max\\_age](#) by default.

**Default value:** 200000000

## vacuum\_freeze\_table\_age

**Parameter description:** Specifies when VACUUM scans the whole table and freezes old tuples. VACUUM performs a full table scan if the difference between the current transaction ID and the value of pg\_class.relfrozexid64 is greater than the specified time.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 576460752303423487

 **NOTE**

Although you can set this parameter to any value, **VACUUM** will limit the effective value to 95% of **autovacuum\_freeze\_max\_age** by default. Therefore, a periodic manual VACUUM has a chance to run before an anti-wraparound autovacuum is launched for the table.

**Default value:** 4000000000

## bytea\_output

**Parameter description:** Specifies the output format for values of the bytea type.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **hex** indicates that the binary data is converted to hexadecimal format.
- **escape** indicates that the traditional PostgreSQL format is used. It takes the approach of representing a binary string as a sequence of ASCII characters, while converting those bytes that cannot be represented as an ASCII character into special escape sequences.

**Default value:** hex

## xmlbinary

**Parameter description:** Specifies how binary values are to be encoded in XML.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

 **NOTE**

Currently, this parameter does not support data of the XML type.

**Value range:** enumerated values

- base64
- hex

**Default value:** base64

## xmloption

**Parameter description:** Specifies whether DOCUMENT or CONTENT is implicit when converting between XML and string values.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

 **NOTE**

Currently, this parameter does not support data of the XML type.

**Value range:** enumerated values

- **document** indicates an HTML document.
- **content** indicates a common string.

**Default value:** content

### max\_compile\_functions

**Parameter description:** Specifies the maximum number of function compilation results stored in the server. Excessive functions and compilation results of stored procedures may occupy large memory space. Setting this parameter to a proper value can reduce the memory usage and improve system performance.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 1000

### gin\_pending\_list\_limit

**Parameter description:** Specifies the maximum size of the GIN pending list which is used when **fastupdate** is enabled. If the list grows larger than this maximum size, it is cleaned up by moving the entries in it to the main GIN data structure in batches. This setting can be overridden for individual GIN indexes by changing index storage parameters.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 64 to 2147483647. The unit is KB.

**Default value:** 4 MB

## 14.3.13.2 Locale and Formatting

This section describes parameters related to the time format setting.

### DateStyle

**Parameter description:** Specifies the display format for date and time values, as well as the rules for interpreting ambiguous date input values.

This variable contains two independent components: the output format specifications (ISO, Postgres, SQL, or German) and the input/output order of year/month/day (DMY, MDY, or YMD). The two components can be set separately or together. The keywords Euro and European are synonyms for DMY; the keywords US, NonEuro, and NonEuropean are synonyms for MDY.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** 'ISO, MDY'

 NOTE

**gs\_initdb** will initialize this parameter so that its value is the same as that of **lc\_time**.

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

**Setting Suggestions:** The ISO format is recommended. Postgres, SQL, and German use abbreviations for time zones, such as **EST**, **WST**, and **CST**. These abbreviations can be ambiguous. For example, **CST** can represent Central Standard Time (USA) UT-6:00, Central Standard Time (Australia) UT+9:30, and China Standard Time UT+8:00. This may lead to incorrect time zone conversion and cause errors.

## IntervalStyle

**Parameter description:** Specifies the display format for interval values.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **sql\_standard** indicates that output matching SQL standards will be generated.
- **postgres** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **ISO**.
- **postgres\_verbose** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **non\_ISO**.
- **iso\_8601** indicates that output matching the time interval "format with designators" defined in ISO 8601 will be generated.
- **oracle** indicates the output that matches the numtodsinterval function in the Oracle Database. For details, see "SQL Reference > Functions and Operators > Date and Time Processing Functions and Operators > numtodsinterval" in *Developer Guide*.

---

**NOTICE**

The **IntervalStyle** parameter also affects the interpretation of ambiguous interval input.

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

---

**Default value:** postgres

## TimeZone

**Parameter description:** Specifies the time zone for displaying and interpreting timestamps.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. You can query the PG\_TIMEZONE\_NAMES view to obtain the value. For details, see "System Catalogs and System Views > System Views > PG\_TIMEZONE\_NAMES" in *Developer Guide*.

**Default value:**

### NOTE

**gs\_initdb** will set a time zone value that is consistent with the system environment.

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

## timezone\_abbreviations

**Parameter description:** Specifies the time zone abbreviations that will be accepted by the server.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. You can obtain it by querying the **pg\_timezone\_names** view.

**Default value:** Default

### NOTE

**Default** indicates abbreviations that work in most of the world. There are also other abbreviations, such as **Australia** and **India** that can be defined for a particular installation.

## extra\_float\_digits

**Parameter description:** Adjusts the number of digits displayed for floating-point values, including float4, float8, and geometric data types. The parameter value is added to the standard number of digits (FLT\_DIG or DBL\_DIG as appropriate).

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -15 to 3

### NOTE

- This parameter can be set to **3** to include partially-significant digits. It is especially useful for dumping float data that needs to be restored exactly.
- This parameter can also be set to a negative value to suppress unwanted digits.

**Default value:** 0

## client\_encoding

**Parameter description:** Specifies the client-side encoding (character set).

Set this parameter based on the situation of the front-end services. Try to keep the encoding consistent on the client and server to improve efficiency.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** encoding compatible with PostgreSQL. **UTF8** indicates that the database encoding is used.

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- To use consistent encoding for communication within the cluster, you are advised to retain the default value of **client\_encoding**. Modification to this parameter in the **postgresql.conf** file (by using the **gs\_guc** tool, for example) does not take effect.

**Default value:** UTF8

**Recommended value:** SQL\_ASCII or UTF8

## lc\_messages

**Parameter description:** Specifies the language in which messages are displayed.

- Acceptable values are system-related.
- On some systems, this locale category does not exist. Setting this variable will still work, but there will be no effect. In addition, translated messages for the desired language may not exist. In this case, you can still see the English messages.

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## lc\_monetary

**Parameter description:** Specifies the display format of monetary values. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

 NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

**Default value:** C

## lc\_numeric

**Parameter description:** Specifies the display format of numbers. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

 NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

**Default value:** C

## lc\_time

**Parameter description:** Specifies the display format of time and locale. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

 NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

**Default value:** C

## default\_text\_search\_config

**Parameter description:** Specifies the text search configuration.

If the specified text search configuration does not exist, an error will be reported. If the specified text search configuration is deleted, set **default\_text\_search\_config** again. Otherwise, an error will be reported, indicating incorrect configuration.

- The text search configuration is used by text search functions that do not have an explicit argument specifying the configuration.
- When a configuration file matching the environment is determined, **gs\_initdb** will initialize the configuration file with a setting that corresponds to the environment.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

 NOTE

GaussDB supports the following two configurations: **pg\_catalog.english** and **pg\_catalog.simple**.

**Default value:** **pg\_catalog.english**

### 14.3.13.3 Other Default Parameters

This section describes the default database loading parameters.

## dynamic\_library\_path

**Parameter description:** Specifies the path that the system will search for a shared database file that is dynamically loadable. When a dynamically loadable module needs to be opened and the file name specified in the **CREATE FUNCTION** or **LOAD** command does not have a directory component, the system will search this path for the required file. Only the sysadmin user can access this parameter.

The value of **dynamic\_library\_path** must be a list of absolute paths separated by colons (:) or by semi-colons (;) on the Windows OS. When the name of a path starts with the special variable \$libdir, the variable will be replaced with the directory in which the module provided by the GaussDB is installed. For example:

```
dynamic_library_path = '/usr/local/lib/postgresql/opt/testgs/lib:$libdir'
```

This is a SUSE parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

 **NOTE**

If the value of this parameter is set to an empty character string, the automatic path search is turned off.

**Default value:** \$libdir

## gin\_fuzzy\_search\_limit

**Parameter description:** Specifies the upper limit of the size of the set returned by GIN indexes.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## local\_preload\_libraries

**Parameter description:** Specifies one or more shared libraries that are to be preloaded at connection start. If multiple libraries are to be loaded, separate their names with commas (,). All library names are converted to lower case unless double-quoted.

- Any user can change this option. Therefore, library files that can be loaded are restricted to those saved in the **plugins** subdirectory of the standard library installation directory. It is the database administrator's responsibility to ensure that libraries in this directory are all safe. Entries in **local\_preload\_libraries** can specify the library directory explicitly, for example, **\$libdir/plugins/mylib**, or just specify the library name, for example, **mylib**. (**mylib** is equivalent to **\$libdir/plugins/mylib**.)
- Unlike **shared\_preload\_libraries**, there are no differences in performance between loading a module at session start or doing this during the session. The intent of this feature is to allow debugging or performance-measurement libraries to be loaded into specific sessions without an explicit LOAD command. For example, debugging can be enabled under a given user name by setting this parameter to **ALTER USER SET**.
- If a specified library is not found, the connection attempt will fail.
- Every GaussDB-supported library has a "magic block" that is checked to guarantee compatibility. For this reason, non-GaussDB-supported libraries cannot be loaded in this way.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## 14.3.14 Lock Management

In GaussDB, a deadlock may occur when concurrently executed transactions compete for resources. This section describes parameters used for managing transaction locks.

### deadlock\_timeout

**Parameter description:** Specifies the time, in milliseconds, to wait on a lock before checking whether there is a deadlock condition. When the applied lock exceeds the preset value, the system will check whether a deadlock occurs. This parameter takes effect only for common locks.

- The check for deadlock is relatively expensive. Therefore, the server does not check it when waiting for a lock every time. Deadlocks do not frequently occur when the system is running. Therefore, the system just needs to wait on the lock for a while before checking for a deadlock. Increasing this value reduces the time wasted in needless deadlock checks, but slows down reporting of real deadlock errors. On a heavily loaded server, you may need to raise it. The value you have set needs to exceed the transaction time. By doing this, the possibility that a lock will be checked for deadlocks before it is released will be reduced.
- If you want to write the lock wait time during query execution to logs by setting [log\\_lock\\_waits](#), ensure that the value of [log\\_lock\\_waits](#) is less than the specified value (or the default value) of **deadlock\_timeout**.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is ms.

**Default value:** 1s

### lockwait\_timeout

**Parameter description:** Specifies the timeout for attempts to acquire a lock. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 20 min

### update\_lockwait\_timeout

**Parameter description:** Specifies the maximum duration that a lock waits for concurrent updates on a row to complete when the concurrent update feature is enabled. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 120000 (2 min)

## max\_locks\_per\_transaction

**Parameter description:** Specifies the average number of object locks allocated for each transaction.

- The size of the shared lock table is calculated under the condition that a maximum of  $N$  independent objects need to be locked at any time.  $N = \text{max\_locks\_per\_transaction} \times (\text{max\_connections} + \text{max\_prepared\_transactions})$ . Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at database start.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.
- When running a standby server, you must set this parameter to a value that is no less than that on the primary server. Otherwise, queries will not be allowed on the standby server.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 2147483647

**Default value:** 256

## max\_pred\_locks\_per\_transaction

**Parameter description:** Specifies the average number of predicate locks allocated for each transaction.

- The size of the shared predicate lock table is calculated under the condition that a maximum of  $N$  independent objects need to be locked at any time.  $N = \text{max\_pred\_locks\_per\_transaction} \times (\text{max\_connections} + \text{max\_prepared\_transactions})$ . Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at server start.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 2147483647

**Default value:** 64

## gs\_clean\_timeout

**Parameter description:** Controls the average interval between **gs\_clean** invocations by the Coordinator.

- Transactions in GaussDB are committed in two phases. An unfinished two-phase transaction may hold a table-level lock, keeping tables from being locked by other connections. In this case, the database needs to invoke the **gs\_clean** tool to clean unfinished two-phase transactions. **gs\_clean\_timeout** is used to control the interval for the Coordinator to invoke the **gs\_clean** tool.
- A larger value of this parameter indicates a low frequency of **gs\_clean** invocation to clean unfinished two-phase transactions.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 1 min

## partition\_lock\_upgrade\_timeout

**Parameter description:** Specifies the timeout for attempts to upgrade an exclusive lock (read allowed) to an access exclusive lock (read/write blocked) on a partitioned table during the execution of some query statements. If there are concurrent read transactions running, the lock upgrade will need to wait. This parameter sets the waiting timeout for lock upgrade attempts.

- When you do **MERGE PARTITION** and **CLUSTER PARTITION** on a partitioned table, temporary tables are used for data rearrangement and file exchange. To concurrently perform as many operations as possible on the partitions, exclusive locks are acquired for the partitions during data rearrangement and access exclusive locks are acquired during file exchange.
- Generally, a partition waits until it acquires a lock, or a timeout occurs if the partition waits for a period longer than the value specified by the **lockwait\_timeout** parameter.
- When doing **MERGE PARTITION** or **CLUSTER PARTITION** on a partitioned table, an access exclusive lock needs to be acquired during file exchange. If the lock fails to be acquired, the acquisition is retried at an interval of 50 ms until timeout occurs. The **partition\_lock\_upgrade\_timeout** parameter specifies the time to wait before the lock acquisition attempt times out.
- If this parameter is set to **-1**, the lock upgrade never times out. The lock upgrade is continuously retried until it succeeds.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 3000. The unit is s.

**Default value:** 1800

## fault\_mon\_timeout

**Parameter description:** Specifies the period for detecting lightweight deadlocks. This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1440. The unit is minute.

**Default value:** 5 min

## enable\_online\_ddl\_waitlock

**Parameter description:** Specifies whether to block DDL operations to wait for the release of cluster locks, such as **pg\_advisory\_lock** and **pgxc\_lock\_for\_backup**. This parameter is mainly used in online OM operations and you are not advised to modify the settings.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## xloginsert\_locks

**Parameter description:** Specifies the number of locks on concurrent write-ahead logging. This parameter is used to improve the efficiency of writing write-ahead logs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000. If the CPU uses the NUMA architecture, the value must be an integer multiple of the number of NUMA nodes.

**Default value:** 16

## num\_internal\_lock\_partitions

**Parameter description:** Specifies the number of internal lightweight lock partitions. It is mainly used for performance optimization in various scenarios. The content is organized in the KV format of keywords and numbers. Different types of locks are separated by commas (.). The sequence does not affect the setting result. For example, **CLOG\_PART=256,CSNLOG\_PART=512** is equivalent to **CSNLOG\_PART=512,CLOG\_PART=256**. If you set the same keyword multiple times, only the latest setting takes effect. For example, if you set **CLOG\_PART** to **256** and **CLOG\_PART** to **2**, the value of **CLOG\_PART** is **2**. If no keyword is set, the default value is used. The usage description, maximum value, minimum value, and default value of each lock type are as follows:

- **CLOG\_PART:** number of Clog file controllers. Increasing the value of this parameter improves the Clog writing efficiency and transaction submission performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing Clogs and affect the performance. The value ranges from 1 to 256.
- **CSNLOG\_PART:** number of CSNLOG file controllers. Increasing the value of this parameter improves the CSNLOG log writing efficiency and transaction submission performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing CSNLOG logs and affect the performance. The value ranges from 1 to 512.

- **LOG2\_LOCKTABLE\_PART**: two logarithms of the number of common table lock partitions. Increasing the value can improve the concurrency of obtaining locks in the normal process, but may increase the time required for transferring and clearing locks. When wait events occur in **LockMgrLock**, you can increase the value to improve the performance. The minimum value is **4**, indicating that the number of lock partitions is 16. The maximum value is **16**, indicating that the number of lock partitions is 65536.
- **TWOPHASE\_PART**: number of partitions of the two-phase transaction lock. Increasing the value can increase the number of concurrent two-phase transaction commits. The value ranges from 1 to 64.
- **FASTPATH\_PART**: maximum number of locks that each thread can obtain without using the main lock table. When a partitioned table is read, updated, inserted, or deleted and the wait event is LockMgrLock, you can increase the value of this parameter to prevent LockMgrLock from being obtained and improve performance. It is recommended that the value be greater than or equal to that calculated using the following formula: Number of partitions x (1 + Number of local indexes) + Number of global indexes + 10. Increasing the value will increase the memory usage. The value ranges from 20 to 10000.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:**

- **CLOG\_PART**: 256
- **CSNLOG\_PART**: 512
- **LOG2\_LOCKTABLE\_PART**: 4
- **TWOPHASE\_PART**: 1
- **FASTPATH\_PART**: 20

## enable\_wait\_exclusive\_lock

**Parameter description:** Specifies whether to enable the hang detection and cure function for the exclusive lock of ProcArrayLock.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on**: enabled.
- **off**: disabled.

**Default value:** on

## 14.3.15 Version and Platform Compatibility

### 14.3.15.1 Compatibility with Earlier Versions

This section describes the parameters that control the backward compatibility and external compatibility of GaussDB. A backward compatible database supports

applications of earlier versions. This section describes parameters used for controlling backward compatibility of a database.

## array\_nulls

**Parameter description:** Controls whether the array input parser recognizes unquoted NULL as a null array element.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that null values can be entered in arrays.
- **off** indicates backward compatibility with the old behavior. Arrays containing the value **NULL** can still be created when this parameter is set to **off**.

**Default value:** on

## backslash\_quote

**Parameter description:** Controls whether a single quotation mark can be represented by \ in a string text.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

When the string text meets the SQL standards, \ has no other meanings. This parameter only affects the handling of non-standard-conforming string texts, including escape string syntax (E'...').

---

**Valid value:** enumerated values

- **on** indicates that the use of \ is always allowed.
- **off** indicates that the use of \ is rejected.
- **safe\_encoding** indicates that the use of \ is allowed only when client encoding does not allow ASCII \ within a multibyte character.

**Default value:** safe\_encoding

## default\_with\_oids

**Parameter description:** Specifies whether **CREATE TABLE** and **CREATE TABLE AS** include an **OID** field in newly-created tables if neither **WITH OIDS** nor **WITHOUT OIDS** is specified. It also determines whether OIDs will be included in tables created by **SELECT INTO**.

It is not recommended that OIDs be used in user tables. Therefore, this parameter is set to **off** by default. When OIDs are required for a particular table, **WITH OIDS** needs to be specified during the table creation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that **CREATE TABLE** and **CREATE TABLE AS** can include an **OID** field in newly-created tables.
- **off** indicates that **CREATE TABLE** and **CREATE TABLE AS** cannot include any **OID** field in newly-created tables.

**Default value:** off

## escape\_string\_warning

**Parameter description:** Specifies whether to issue a warning when a backslash (\) is used as an escape in an ordinary character string.

- Applications that wish to use a backslash (\) as an escape need to be modified to use escape string syntax (E'...'). This is because the default behavior of ordinary character strings treats the backslash as an ordinary character in each SQL standard.
- This variable can be enabled to help locate code lines that need to be changed.
- If E'...' is used as an escape, logs may be incomplete in some scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## lo\_compat\_privileges

**Parameter description:** Specifies whether to enable backward compatibility for the privilege check of large objects.

This parameter is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on** indicates that the privilege check is disabled when users read or modify large objects. This setting is compatible with versions earlier than PostgreSQL 9.0.

**off** indicates that privilege check is enabled for large objects.

**Default value:** off

## quote\_all\_identifiers

**Parameter description:** Specifies whether to forcibly quote all identifiers even if they are not keywords when the database generates SQL. This will affect the output of **EXPLAIN** and the results of functions, such as `pg_get_viewdef`. For details, see the `--quote-all-identifiers` parameter of `gs_dump`.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the forcible quotation is enabled.
- **off** indicates that the forcible quotation is disabled.

**Default value:** off

## sql\_inheritance

**Parameter description:** Controls the inheritance semantics. This parameter specifies the access policy of descendant tables. **off** indicates that subtables cannot be accessed by commands. That is, the ONLY keyword is used by default. It is set for compatibility with versions earlier than PostgreSQL 7.1.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that subtables can be accessed.
- **off** indicates that subtables cannot be accessed.

**Default value:** on

## standard\_conforming\_strings

**Parameter description:** Controls whether ordinary string texts ('...') treat backslashes as ordinary texts as specified in the SQL standard.

- Applications can check this parameter to determine how string texts will be processed.
- It is recommended that characters be escaped by using the escape string syntax (E'...').

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that backslashes are treated as ordinary texts.
- **off** indicates that backslashes are not treated as ordinary texts.

**Default value:** on

## synchronize\_seqscans

**Parameter description:** Controls sequential scans of tables to synchronize with each other, so that concurrent scans read the same data block at about the same time and share the I/O workload.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a scan may start in the middle of the table and then "wrap around" the end to cover all rows to synchronize with the activity of scans already in progress. This may result in unpredictable changes in the row ordering returned by queries that have no ORDER BY clause.

- **off** indicates that the scan always starts from the table heading.

**Default value:** on

## enable\_beta\_features

**Parameter description:** Specifies whether to enable some features that are not officially released and are used only for POC verification, such as GDS table join. Exercise caution when enabling these extended features because they may cause errors in some scenarios.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the features are enabled for forward compatibility. Note that enabling them may cause errors in certain scenarios.
- **off** indicates that the features are disabled.

**Default value:** off

### 14.3.15.2 Platform and Client Compatibility

Many platforms use the database system. External compatibility of the database system provides significant convenience for platforms.

## transform\_null\_equals

**Parameter description:** Specifies whether expressions of the form `expr = NULL` (or `NULL = expr`) are treated as `expr IS NULL`. They return true if `expr` evaluates to the null value, and false otherwise.

- The correct SQL-standard-compliant behavior of `expr = NULL` is to always return null (unknown).
- Filtered forms in Microsoft Access generate queries that appear to use `expr = NULL` to test for null values. If you turn this option on, you can use this interface to access the database.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that expressions of the form `expr = NULL` (or `NULL = expr`) are treated as `expr IS NULL`.
- **off** indicates that `expr = NULL` always returns null (unknown).

**Default value:** off

#### NOTE

New users are always confused about the semantics of expressions involving **NULL** values. Therefore, **off** is used as the default value.

## support\_extended\_features

**Parameter description:** Specifies whether extended database features are supported.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that extended database features are supported.
- **off** indicates that extended database features are not supported.

**Default value:** off

## lastval\_supported

**Parameter description:** Specifies whether the lastval function can be used.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the lastval function can be used and the nextval function cannot be pushed down.
- **off** indicates that the lastval function cannot be used and the nextval function can be pushed down.

**Default value:** off

## group\_concat\_max\_len

**Parameter description:** This parameter is used together with the **GROUP\_CONCAT** function to limit the length of the return value. If the length exceeds the limit, the exceeded part of the return value is truncated. However, the distributed does not support the **GROUP\_CONCAT** function. Therefore, this function can be set but has no actual effect.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 9223372036854775807

**Default value:** 1024

## sql\_compatibility

**Parameter description:** Specifies the type of mainstream database with which the SQL syntax and statement behavior of the database is compatible. This parameter is an INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** enumerated values

- **ORA** indicates that the SQL syntax and statement behavior of the database is compatible with the Oracle database.
- **TD** indicates that the SQL syntax and statement behavior of the database is compatible with the Teradata database.

- **MYSQL** indicates that the SQL syntax and statement behavior of the database is compatible with the MySQL database.
- **PG** indicates that the database is compatible with the PostgreSQL database.

**Default value:** MYSQL

---

#### NOTICE

- This parameter can be set only when you run the **CREATE DATABASE** command to create a database. For details, see "SQL Reference > SQL Syntax > CREATE DATABASE" in *Developer Guide*.
  - In the database, this parameter must be set to a specific value. It can be set to **ORA** or **TD** and cannot be changed randomly. Otherwise, the setting is not consistent with the database behavior.
- 

## behavior\_compat\_options

**Parameter description:** Specifies database compatibility behavior. Multiple items are separated by commas (,).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

#### NOTE

- Currently, only items in [Platform and Client Compatibility](#) are supported.
- Multiple items are separated by commas (,), for example, **set behavior\_compat\_options='end\_month\_calculate,display\_leading\_zero'**;

**Table 14-9** Compatibility configuration items

Compatibility Configuration Item	Behavior
display_leading_zero	<p>Specifies how floating point numbers are displayed. It controls the display of zeros before the decimal point of all character string types (such as char, character, nchar, varchar, character varying, varchar2, nvarchar2, text, and clob) and any precision types (such as float4, float8, and numeric) in the numeric type. In addition, the length of the calculated number is displayed synchronously.</p> <ul style="list-style-type: none"> <li>If this item is not specified, for a decimal number between -1 and 1, the 0 before the decimal point is not displayed. For example:  <pre>gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;  a   b   c   d -----+-----+-----+--- .1231243   .1231243   .123   8 (1 row)</pre> </li> <li>If this item is specified, for a decimal number between -1 and 1, the 0 before the decimal point is displayed. For example:  <pre>gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;  a   b   c   d -----+-----+-----+--- 0.1231243   0.1231243   0.123   9 (1 row)</pre> </li> </ul>
end_month_calculate	<p>Specifies the calculation logic of the <b>add_months</b> function. Assume that the two parameters of the <b>add_months</b> function are <b>param1</b> and <b>param2</b>, and that the month of <b>param1</b> and <b>param2</b> is <b>result</b>.</p> <ul style="list-style-type: none"> <li>If this item is not specified, and the <b>Day</b> of <b>param1</b> indicates the last day of a month shorter than <b>result</b>, the <b>Day</b> in the calculation result will equal that in <b>param1</b>. For example:  <pre>gaussdb=# select add_months('2018-02-28',3) from sys_dummy, add_months ----- 2018-05-28 00:00:00 (1 row)</pre> </li> <li>If this item is specified, and the <b>Day</b> of <b>param1</b> indicates the last day of a month shorter than <b>result</b>, the <b>Day</b> in the calculation result will equal that in <b>result</b>. For example:  <pre>gaussdb=# select add_months('2018-02-28',3) from sys_dummy, add_months ----- 2018-05-31 00:00:00 (1 row)</pre> </li> </ul>

Compatibility Configuration Item	Behavior
compat_analyze_sample	<p>Specifies the sampling behavior of the ANALYZE operation. If this item is specified, the sample collected by the ANALYZE operation will be limited to around 30,000 records, controlling CN memory consumption and maintaining the stability of ANALYZE.</p>
bind_schema_tablespace	<p>Binds a schema with the tablespace with the same name. If a tablespace name is the same as <i>sche_name</i>, <b>default_tablespace</b> will also be set to <i>sche_name</i> if <b>search_path</b> is set to <i>sche_name</i>.</p>
bind_procedure_searchpath	<p>Specifies the search path of the database object in a stored procedure for which no schema name is specified. If no schema name is specified for a stored procedure, the search is performed in the schema to which the stored procedure belongs. If the stored procedure is not found, the following operations are performed:</p> <ul style="list-style-type: none"> <li>• If this item is not specified, the system reports an error and exits.</li> <li>• If this item is specified, the search continues based on the settings of <b>search_path</b>. If the issue persists, the system reports an error and exits.</li> </ul>
correct_to_number	<p>Controls the compatibility of the <b>to_number()</b> result. If this item is not set, the result of the to_number() function is the same as that in the ORA database by default.</p> <pre>gaussdb=# select " AS to_number_14, to_number('34,50','999,99'); ERROR: invalid data. CONTEXT: referenced column: to_number</pre> <p>If this item is set, the result of the to_number() function is the same as that of pg11.</p> <pre>gaussdb=# select " AS to_number_14, to_number('34,50','999,99'); to_number_14   to_number -----+-----   3450 (1 row)</pre>

Compatibility Configuration Item	Behavior
<p>unbind_divide_bound</p>	<p>Controls the range check on the result of integer division. If this item is not set, the range of the division result is verified. For example, an out-of-bounds error is reported because the output result of <i>INT_MIN/(-1)</i> is greater than <i>INT_MAX</i>.</p> <pre>gaussdb=# select (-2147483648)::int4 / (-1)::int4; ERROR: integer out of range</pre> <p>If this item is set, the range of the division result does not need to be verified. For example, the output result of <i>INT_MIN/(-1)</i> is <i>INT_MAX+1</i>.</p> <pre>gaussdb=# select (-2147483648)::int4 / (-1)::int4; ?column? ----- 2147483648 (1 row)</pre>
<p>convert_string_digit_to_numeric</p>	<p>Determines whether to convert numeric constants of the character string type to those of the numeric type before these two types are compared.</p> <pre>gaussdb=# create table test1 (c1 int, c2 varchar); gaussdb=# insert into test1 values (2, '1.1'); gaussdb=# set behavior_compat_options=""; gaussdb=# select * from test1 where c2 &gt; 1; ERROR: invalid input syntax for type bigint: "1.1"</pre> <pre>gaussdb=# set behavior_compat_options='convert_string_digit_to_numeric'; gaussdb=# select * from test1 where c2 &gt; 1;  c1   c2 ----+----   2   1.1 (1 row)</pre>
<p>return_null_string</p>	<p>Specifies how to display the empty result (empty string ") of the lpad() and rpad() functions.</p> <ul style="list-style-type: none"> <li>If this item is not specified, the empty string is displayed as <b>NULL</b>.</li> </ul> <pre>gaussdb=# select length(lpad('123',0,'*')) from sys_dummy, length ----- (1 row)</pre> <ul style="list-style-type: none"> <li>If this item is specified, the empty string is displayed as single quotation marks (").</li> </ul> <pre>gaussdb=# select length(lpad('123',0,'*')) from sys_dummy, length ----- 0 (1 row)</pre>

Compatibility Configuration Item	Behavior
<p>compat_concat_variadic</p>	<p>Specifies the compatibility of variadic results of the <b>concat()</b> and <b>concat_ws()</b> functions. The MySQL database does not have the variadic type. Therefore, this option has no impact on the MY database.</p> <p>If this item is not set and the concat function parameter is of the variadic type, the results of the ORA and TD databases in compatibility mode are the same by default.</p> <pre>gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- t (1 row)</pre> <p>If this item is set and the concat function parameter is of the variadic type, different result formats of the ORA and TD databases in compatibility mode are retained.</p> <p>-- In the ORA database:</p> <pre>gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- t (1 row)</pre> <p>-- In the TD database:</p> <pre>gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- f (1 row)</pre>
<p>merge_update_multi</p>	<p>When MERGE INTO ... WHEN MATCHED THEN UPDATE (see "SQL Reference &gt; SQL Syntax &gt; MERGE INTO" in <i>Developer Guide</i>) and INSERT ... ON DUPLICATE KEY UPDATE (see "SQL Reference &gt; SQL Syntax &gt; INSERT" in <i>Developer Guide</i>) are used, it controls the UPDATE behavior if a piece of target data in the target table conflicts with multiple pieces of source data.</p> <p>If this item is specified and the preceding scenario exists, the system performs multiple UPDATE operations on the conflicting row. If this item is not specified and the preceding scenario exists, an error is reported, that is, the MERGE or INSERT operation fails.</p>
<p>plstmt_implicit_savepoint</p>	<p>Determines whether the execution of an UPDATE statement in a stored procedure has an independent subtransaction.</p> <p>If this parameter is set, the implicit savepoint is enabled before executing each UPDATE statement in the stored procedure, and the subtransaction is rolled back to the latest savepoint in the EXCEPTION block by default, ensuring that only the modification of failed statements is rolled back. This option is used to be compatible with the <b>EXCEPTION</b> behavior of the O database.</p>

Compatibility Configuration Item	Behavior
hide_tailing_zero	<p>Configuration item for numeric display. If this parameter is not set, numeric values are displayed based on the specified precision. If this parameter is set, all numeric values are output with trailing zeros (after a decimal point) hidden, including the to_char(numeric, format) scenario.</p> <p>For example:</p> <pre>gaussdb=# set behavior_compat_options='hide_tailing_zero'; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');  a   to_char -----+----- 123.123   123.123 (1 row) gaussdb=# set behavior_compat_options=""; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');  a   to_char -----+----- 123.1230000000   123.123000 (1 row)</pre>
plsql_security_definer	<p>After this parameter is enabled, the definer permission is used by default when a stored procedure is created.</p>

Compatibility Configuration Item	Behavior
char_coerce_compat	<p>Specifies the behavior when the char(n) type is converted to other variable-length string types. If this parameter is not set, spaces at the end are omitted when the char(n) type is converted to other variable-length string types. If this parameter is set, spaces at the end are not omitted during conversion. In addition, if the length of the char(n) type exceeds the length of other variable-length string types, an error is reported. This parameter is valid only when the <b>sql_compatibility</b> parameter is set to <b>ORA</b>. After this parameter is enabled, spaces at the end are not omitted in implicit conversion, explicit conversion, or conversion by calling the <b>text(bpchar)</b> function.</p> <pre> gaussdb=# set behavior_compat_options=""; gaussdb=# create table tab_1(col1 varchar(3)); gaussdb=# create table tab_2(col2 char(3)); gaussdb=# insert into tab_2 values(' '); gaussdb=# insert into tab_1 select col2 from tab_2; gaussdb=# select * from tab_1 where col1 is null; col1 ----- (1 row) gaussdb=# select * from tab_1 where col1=' '; col1 ----- (0 rows) gaussdb=# delete from tab_1; gaussdb=# set behavior_compat_options = 'char_coerce_compat'; gaussdb=# insert into tab_1 select col2 from tab_2; gaussdb=# select * from tab_1 where col1 is null; col1 ----- (0 rows) gaussdb=# select * from tab_1 where col1=' '; col1 ----- (1 row) </pre>
truncate_numeric_tail_zero	<p>Configuration item for numeric display. If this parameter is not set, numeric values are displayed based on the default precision. If this parameter is set, all numeric values are output with trailing zeros (after a decimal point) hidden, except for to_char(numeric, format). For example:</p> <pre> gaussdb=# set behavior_compat_options='truncate_numeric_tail_zero'; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999'); a   to_char -----+----- 123.123   123.123000 (1 row) gaussdb=# set behavior_compat_options=""; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999'); a   to_char -----+----- 123.1230000000   123.123000 (1 row) </pre>

Compatibility Configuration Item	Behavior
plpgsql_dependency	<p>If this parameter is set, a function or stored procedure containing undefined objects can be created. You can query the dependency in <b>GS_DEPENDENCIES</b> and <b>GS_DEPENDENCIES_OBJ</b>.</p> <p>If this parameter is enabled, when creating a PL/SQL object, the OID that depends on the PL/SQL object is automatically updated.</p> <p>Dependency can be established in the following scenarios:</p> <ol style="list-style-type: none"> <li>1. A function appears at the position of the dependency type and parameter default value in a function header.</li> <li>2. Type in the function and variable dependency type.</li> <li>3. In the function body, function A is called in the right value expression of the function call or assignment statement. If the input and output parameters of function A contain function B, no dependency is established for function B. For example, <b>functionA(functionB())</b>. Only the dependency for function A is established.</li> <li>4. Dependency function in a view.</li> </ol> <p>Dependency cannot be established in the following scenarios:</p> <ol style="list-style-type: none"> <li>1. A type in a schema depends on other types.</li> <li>2. Dependency on functions, variables, tables, and views in SQL statements. For example, dependency is not recorded for <b>select id into var1 from table1 join view1 on table1.id = pkg1.var1; table1,view1,pkg1</b>.</li> <li>3. Dependency on functions, variables, tables, and views in a view.</li> </ol> <p>Notes:</p> <ol style="list-style-type: none"> <li>1. When PL/SQL objects are concurrently created, deadlocks may occur if competition occurs among the object.</li> <li>2. If the objects to be modified exist in <b>gs_dependencies</b> and <b>gs_dependencies_obj</b>, you cannot rename the objects.</li> <li>3. When a function, stored procedure, or package depends on a synonym, the synonym must be created in advance. OIDs cannot be maintained manually.</li> </ol>
disable_rewrite_nesttable	The distributed mode does not support this parameter.

Compatibility Configuration Item	Behavior
proc_outparam_override	<p>Determines the overloading of output parameters of a stored procedure. After this parameter is enabled, the stored procedure can be properly created and invoked even if only the output parameters of the stored procedure are different. Currently, this parameter can be used only when gsql and JDBC are used to connect to the database. If this parameter is enabled for other tools to connect to the database, stored procedures with the <b>out</b> parameter cannot be invoked.</p> <p>It supports the functions that contain the <b>out</b> output parameter and returns data of the record type. Besides, a value is assigned to the <b>out</b> parameter.</p>
aformat_regexp_match	<p>Determines the matching behavior of regular expression functions.</p> <p>When this parameter is set and <b>sql_compatibility</b> is set to <b>ORA</b> or <b>MYSQL</b>, the options supported by the <b>flags</b> parameter of the regular expression are changed as follows:</p> <ol style="list-style-type: none"> <li>1. By default, the character '\n' cannot be matched.</li> <li>2. When <b>flags</b> contains the <b>n</b> option, the character '\n' can be matched.</li> <li>3. The <b>regexp_replace(source, pattern replacement)</b> function replaces all matching substrings.</li> <li>4. <b>regexp_replace(source, pattern, replacement, flags)</b> returns null when the value of <b>flags</b> is '' or null.</li> </ol> <p>Otherwise, the meanings of the options supported by the <b>flags</b> parameter of the regular expression are as follows:</p> <ol style="list-style-type: none"> <li>1. By default, the character '\n' can be matched.</li> <li>2. The <b>n</b> option in <b>flags</b> indicates that the multi-line matching mode is used.</li> <li>3. The <b>regexp_replace(source, pattern replacement)</b> function replaces only the first matched substring.</li> <li>4. If the value of <b>flags</b> is '' or null, the return value of <b>regexp_replace(source, pattern, replacement, flags)</b> is the character string after replacement.</li> </ol>
disable_emptystr2null	<p>If this parameter is enabled, the function of converting empty strings to null by default is disabled for the following character types: text, clob, blob, raw, bytea, varchar, nvarchar2, bpchar, char, name, byteawithoutorderwithqualcol, and byteawithoutordercol. This parameter is reserved for emergency. Do not set it unless necessary.</p>
select_into_return_null	<p>This parameter is invalid in distributed mode.</p>

Compatibility Configuration Item	Behavior
proc_uncheck_default_param	<p>When a function is called, the system does not check whether the default parameter is omitted.</p> <ul style="list-style-type: none"> <li>If this item is not set and a function with default parameters is invoked, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported. For example: <pre> gaussdb=# create or replace function test(f1 int, f2 int default 20, f3 int, f4 int default 40, f5 int default 50) return int gaussdb=# as gaussdb\$\$ begin gaussdb\$\$ raise info 'f1:%',f1; gaussdb\$\$ raise info 'f2:%',f2; gaussdb\$\$ raise info 'f3:%',f3; gaussdb\$\$ raise info 'f4:%',f4; gaussdb\$\$ raise info 'f5:%',f5; gaussdb\$\$ return 1; gaussdb\$\$ end; gaussdb\$\$ / CREATE FUNCTION gaussdb=# select test(1,2); ERROR: function test(integer, integer) does not exist LINE 1: select test(1,2);                 ^ HINT: No function matches the given name and argument types. You might need to add explicit type casts. CONTEXT: referenced column: test </pre> </li> <li>If this item is set and a function with default parameters is invoked, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter. For example: <pre> gaussdb=# create or replace function test(f1 int, f2 int default 20, f3 int, f4 int default 40, f5 int default 50) return int gaussdb=# as gaussdb\$\$ begin gaussdb\$\$ raise info 'f1:%',f1; gaussdb\$\$ raise info 'f2:%',f2; gaussdb\$\$ raise info 'f3:%',f3; gaussdb\$\$ raise info 'f4:%',f4; gaussdb\$\$ raise info 'f5:%',f5; gaussdb\$\$ return 1; gaussdb\$\$ end; gaussdb\$\$ / CREATE FUNCTION gaussdb=# select test(1,2); INFO: f1:1 CONTEXT: referenced column: test INFO: f2:2 CONTEXT: referenced column: test INFO: f3:20 CONTEXT: referenced column: test INFO: f4:40 CONTEXT: referenced column: test INFO: f5:50 CONTEXT: referenced column: test test </pre> </li> </ul>

Compatibility Configuration Item	Behavior
	<p>----- 1 (1 row)</p> <p>As shown above, f3 is filled with an incorrect default value.</p> <p><b>WARNING</b> In this scenario, a non-default parameter is filled with the previous default value.</p>
dynamic_sql_com pat	<p>After this parameter is enabled, the dynamic statement does not consider the template parameters with the same name in the template SQL statement as the same variable. Instead, the variables in the USING clause are matched in sequence.</p> <p><b>CAUTION</b></p> <ul style="list-style-type: none"> <li>• If a stored procedure is invoked when a dynamic statement executes an anonymous block statement, only the <b>IN</b> parameters are corrected. If <b>OUT</b> parameters need to be checked, set the <b>proc_outparam_override</b> parameter.</li> <li>• If a stored procedure is invoked when a dynamic statement executes an anonymous block statement and the parameter is enabled, the <b>IN</b> and <b>OUT</b> attributes in a stored procedure and the USING clause are not checked.</li> </ul>
dynamic_sql_chec k	<p>If this parameter is enabled, an error is reported during dynamic statement execution if the number of different template parameters in the dynamic statement template SQL is different from the number of variables in the USING clause.</p> <p><b>CAUTION</b></p> <ul style="list-style-type: none"> <li>• If the <b>dynamic_sql_compat</b> option is enabled, the <b>dynamic_sql_check</b> option does not take effect.</li> <li>• If a stored procedure is invoked when a dynamic statement executes an anonymous block statement, only the <b>IN</b> parameters are checked. If <b>OUT</b> parameters need to be checked, set the <b>proc_outparam_override</b> parameter.</li> <li>• If a stored procedure is invoked when a dynamic statement executes an anonymous block statement and the parameter is enabled, the <b>IN</b> and <b>OUT</b> attributes in a stored procedure and the USING clause are not checked.</li> </ul>

Compatibility Configuration Item	Behavior
enable_funcname_with_argsname	<p>If the parameter is enabled, the projection alias displays the complete function when the SELECT function is invoked.</p> <ul style="list-style-type: none"> <li> <p>If this item is not set, the projection alias displays the function name when the SELECT function is invoked. For example:</p> <pre>gaussdb=# SELECT power(2,3); power -----       8 (1 row)  gaussdb=# SELECT count(*) FROM db_ind_columns; count -----    611 (1 row)  gaussdb=# SELECT count(index_name) FROM db_ind_columns; count -----    611 (1 row)  gaussdb=# SELECT left('abcde', 2); left -----   ab (1 row)  gaussdb=# SELECT pg_client_encoding(); pg_client_encoding -----       UTF8 (1 row)</pre> </li> <li> <p>If the item is set, the projection alias displays the complete function when the SELECT function is invoked. For example:</p> <pre>gaussdb=# SET behavior_compat_options = 'enable_funcname_with_argsname'; SET gaussdb=# SELECT power(2,3); power(2,3) -----       8 (1 row)  gaussdb=# SELECT count(*) FROM db_ind_columns; count(*) -----    611 (1 row)  gaussdb=# SELECT count(index_name) FROM db_ind_columns; count(index_name) -----           611 (1 row)  gaussdb=# SELECT left('abcde', 2); left('abcde',2)</pre> </li> </ul>

Compatibility Configuration Item	Behavior
	<pre> ----- ab (1 row)  gaussdb=# SELECT pg_client_encoding(); pg_client_encoding() ----- UTF8 (1 row) </pre> <p><b>CAUTION</b></p> <ul style="list-style-type: none"> <li>• Currently, only <b>func_name(args_list)</b>, <b>func_name()</b>, and <b>func_name(*)</b> are supported to display complete functions. The <b>args</b> parameter only supports character type, value type, column name, and function. A function name can contain a schema or package name. The parameter cannot contain other clauses (such as the ORDER BY clause) or be an expression. The parameter can contain only the DISTINCT keyword. If the parameter contains other keywords, the complete function cannot be displayed.</li> <li>• Some special functions do not support displaying projection alias, including COLLATION FOR, CURRENT_DATE, CURRENT_TIME, CURRENT_TIMESTAMP, DBTIMEZONE, LOCALTIME, LOCALTIMESTAMP, SYSDATE, SESSIONTIMEZONE, ROWNUM, CURRENT_ROLE, CURRENT_USER, SESSION_USER, USER, CURRENT_CATALOG, CURRENT_SCHEMA, CAST, EXTRACT, TIMESTAMPDIFF, OVERLAY, POSITION, SUBSTRING, TREAT, TRIM, NULLIF, NVL, NVL2, COALESCE, GREATEST, LEAST, LNNVL, REGEXP_LIKE, and XML functions.</li> <li>• Some security encryption and decryption functions, anonymization functions, and projection aliases display functions may have security problems. Therefore, only function names are displayed here, including gs_encrypt_aes128, gs_decrypt_aes128, gs_encrypt, gs_decrypt, aes_encrypt, aes_decrypt, pg_create_physical_replication_slot_extern, dblink_connect,creditcardmasking, "basicemailmasking", fullemailmasking, alldigitsmasking, shufflemasking, randommasking, regexprmasking, and gs_digest.</li> <li>• Parameter transfer using =&gt; is not supported for the projection alias to display the complete function. The projection alias cannot contain double quotation marks (""), for example, <b>select "power"(2,3)</b>.</li> <li>• To enable the projection alias to display the complete function, this function is not affected by parameters such as removing 0 at the end.</li> </ul>

Compatibility Configuration Item	Behavior
allow_rownum_alias	<p>After this parameter is enabled, ROWNUM can be used as a column alias in SQL statements using the AS syntax. ROWNUM is used as a common identifier and cannot be used as a pseudocolumn.</p> <p><b>WARNING</b> You are not advised to change the status of this parameter during service execution. When the parameter is enabled, database objects (such as table names, column names, and database names) created using ROWNUM as the name in the database can be used only when the parameter is enabled. Otherwise, ambiguity occurs and the behavior is unpredictable. When the parameter is disabled, the behavior of using ROWNUM as a pseudocolumn in the database becomes invalid after the parameter is enabled and the behavior is unpredictable.</p>
current_sysdate	<p>If this parameter is enabled, the current OS time is returned when the <b>sysdate</b> command is executed.</p> <pre>gaussdb=# set behavior_compat_options='current_sysdate'; SET gaussdb=# select sysdate; current_sysdate ----- 2023-06-20 20:15:27 (1 row)</pre>

## a\_format\_version

**Parameter description:** Specifies the database platform compatibility configuration item. The value of this parameter is an enumerated string.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

### NOTICE

- Currently, only compatibility configuration items in [Table 14-10](#) are supported.
- Set a character string for the compatibility configuration item, for example, **set a\_format\_version='10c'**.

**Table 14-10** Compatibility configuration items

Compatibility Configuration Item	Behavior
10c	The ORA platform is compatible with the 10C version.

## a\_format\_dev\_version

**Parameter description:** Specifies the database platform minor version compatibility configuration item. The value of this parameter is an enumerated string.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

### NOTICE

- Currently, only compatibility configuration items in [Table 14-11](#) are supported.
- Set a character string for the compatibility configuration item, for example, **set a\_format\_dev\_version='s1'**.

**Table 14-11** Compatibility configuration items

Compatibility Configuration Item	Behavior
s1	<ul style="list-style-type: none"> <li>• Compatible minor version of the ORA platform, which affects functions TRUNC(date, fmt), ROUND(date, fmt), NVL2, LPAD, RPAD, ADD_MONTHS, MONTHS_BETWEEN, REGEXP_REPLACE, REGEXP_COUNT, TREAT, EMPTY_CLOB, INSTRB, trunc(number), greatest, least, mod, round(number), cast, to_date, to_timestamp, chr, rtrim, translate, to_char, to_number, and to_timestamp_tz.</li> <li>• Data type conversion: A decimal character string is rounded off when it is converted to an integer (int1/int2/int4/int8/int16).</li> <li>• Data type conversion: Implicit conversion from timestamp with time zone to timestamp without time zone is supported.</li> </ul>

Compatibility Configuration Item	Behavior
s2	<ul style="list-style-type: none"> <li>Compatible minor version of platform A, which affects functions, such as <code>dump</code>, <code>to_single_byte</code>, <code>to_multi_byte</code>, <code>nls_upper</code>, <code>nls_lower</code>, <code>initcap</code>, <code>ascii2</code>, <code>asciistr</code>, <code>unistr</code>, <code>vsize</code>, <code>cosh</code>, <code>remainder</code>, <code>sinh</code>, <code>tanh</code>, <code>nanvl</code>, <code>current_date</code>, <code>current_timestamp</code>, <code>dbtimezone</code>, <code>numtodsinterval</code>, <code>numtoyminterval</code>, <code>new_time</code>, <code>sessiontimezone</code>, <code>sys_extract_utc</code>, <code>tz_offset</code>, <code>to_binary_double</code>, <code>to_binary_float</code>, <code>to_dsinterval</code>, <code>to_yminterval</code>, <code>lnnvl</code>, and <code>ora_hash</code>.</li> <li>Supports all behaviors when the compatibility configuration item is set to <b>s1</b>.</li> </ul>

### plpgsql.variable\_conflict

**Parameter description:** Sets the priority of using stored procedure variables and table columns with the same name.

This is a USERSET parameter. Set it based on method 3 provided in [Table 14-1](#).

**Value range:** a string

- error** indicates that a compilation error is reported when the name of a stored procedure variable is the same as that of a table column.
- use\_variable** indicates that if the name of a stored procedure variable is the same as that of a table column, the variable is used preferentially.
- use\_column** indicates that if the name of a stored procedure variable is the same as that of a table column, the column name is used preferentially.

**Default value:** error

### td\_compatible\_truncation

**Parameter description:** Specifies whether to enable features compatible with a Teradata database. You can set this parameter to **on** when connecting to a database compatible with the Teradata database, so that when you perform the INSERT operation, overlong strings are truncated based on the allowed maximum length before being inserted into char- and varchar-type columns in the target table. This ensures all data is inserted into the target table without errors reported.

 NOTE

The string truncation function cannot be used if the INSERT statement includes a foreign table.

If inserting multi-byte character data (such as Chinese characters) to database with the character set byte encoding (such as SQL\_ASCII or LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that overlong strings are truncated.
- **off** indicates that overlong strings are not truncated.

**Default value:** off

## nls\_timestamp\_format

**Parameter description:** Specifies the default timestamp format.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** DD-Mon-YYYY HH:MI:SS.FF AM

## nls\_timestamp\_tz\_format

**Parameter description:** Specifies the default timestamp with time zone format.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. The supported formats are the same as those of `nls_timestamp_format`.

**Default value:** DD-Mon-YYYY HH:MI:SS.FF AM

 NOTE

This parameter is valid only when `a_format_version` is set to **10c** and `a_format_dev_version` is set to **s1**.

## max\_function\_args

**Parameter description:** Specifies the maximum number of parameters allowed for a function.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer.

**Default value:** 8192

## convert\_string\_to\_digit

**Parameter description:** Specifies the implicit conversion priority, which determines whether to preferentially convert strings into numbers.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that strings are preferentially converted into numbers.
- **off** indicates that strings are not preferentially converted into numbers.

**Default value:** on

---

### NOTICE

Adjusting this parameter will change the internal data type conversion rule and cause unexpected behavior. Exercise caution when performing this operation.

---

## 14.3.16 Fault Tolerance

This section describes parameters used for controlling how the server processes an error occurring in the database system.

### exit\_on\_error

**Parameter description:** If this function is enabled, errors of the ERROR level will be upgraded to PANIC errors, and core stacks will be generated. It is mainly used to locate problems and test services.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that errors of the ERROR level will be upgraded to PANIC errors.
- **off** indicates that errors of the ERROR level will not be upgraded.

**Default value:** off

### restart\_after\_crash

**Parameter description:** If this parameter is set to **on** and a backend process crashes, GaussDB automatically reinitializes the backend process.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** maximizes the availability of the database.  
In some circumstances (for example, when a management tool, such as xCAT, is used to manage GaussDB), setting this parameter to **on** maximizes the availability of the database.

- **off** indicates that a management tool is enabled to obtain control permission and take proper measures when a backend process crashes.

**Default value:** on

## omit\_encoding\_error

**Parameter description:** If this parameter is set to **on** and the client character set of the database is encoded in UTF-8 format, character encoding conversion errors will be recorded in logs. Additionally, converted characters that have conversion errors will be ignored and replaced with question marks (?).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that characters that have conversion errors will be ignored and replaced with question marks (?), and error information will be recorded in logs.
- **off** indicates that characters that have conversion errors cannot be converted and error information will be directly displayed.

**Default value:** off

### NOTE

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

## cn\_send\_buffer\_size

**Parameter description:** Specifies the size of the data buffer used for data transmission on CNs.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 8 to 128. The unit is KB.

**Default value:** 8 KB

## data\_sync\_retry

**Parameter description:** Specifies whether to keep running the database when updated data fails to be written into disks by using the **fsync** function. In some OSs, no error is reported even if **fsync** fails after the second attempt. As a result, data is lost.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the database keeps running and **fsync** is executed again after **fsync** fails.
- **off** indicates that a PANIC-level error is reported and the database is stopped after **fsync** fails.

**Default value:** off

## remote\_read\_mode

**Parameter description:** Specifies whether to enable the remote read function. This function allows pages on the standby server to be read when reading pages on the primary server fails.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **off** indicates that the remote read function is disabled.
- **non\_authentication** indicates that the remote read function is enabled but certificate authentication is not required.
- **authentication** indicates that the remote read function is enabled and certificate authentication is required.

**Default value:** authentication

## 14.3.17 Connection Pool Parameters

When a connection pool is used to access the database, database connections are established and then stored in the memory as objects during system running. When you need to access the database, no new connection is established. Instead, an existing idle connection is selected from the connection pool. After you finish accessing the database, the database does not disable the connection but puts it back into the connection pool. The connection can be used for the next access request.

### pooler\_port

**Parameter description:** Specifies the O&M management port of internal tools, such as **cm\_agent** and **cm\_ctl**. This port is used by the initial user or system administrator to connect to the database through the client.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** the value of the GUC parameter **port** of a CN or DN plus 1

**Default value:** the default value of the GUC parameter **port** of a CN or DN plus 1. The default value of this parameter is **8001** for CNs and **40001** for DNs.

### pooler\_maximum\_idle\_time

**Parameter description:** Specifies the maximum amount of time that the connections can remain idle in a pool before being removed. After that, the automatic connection clearing mechanism is triggered to reduce the number of connections on each node to the value of **minimum\_pool\_size**.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 2147483647. The smallest unit is s.

**Default value:** 10 min (600s)

## minimum\_pool\_size

**Parameter description:** Specifies the minimum number of remaining connections in the pool on each node after the automatic connection clearing is triggered. If this parameter is set to **0**, the automatic connection clearing is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535.

**Default value:** 50

## max\_pool\_size

**Parameter description:** Specifies the maximum number of connections between a CN and another CN/DN in a connection pool. This parameter may need to be modified when the cluster scale changes. For example, nodes are added or deleted.

**Parameter type:** integer

**Unit:** none

**Value range:** 1 to 65535

**Default value:**

- Independent deployment:  
**32768** (60-core CPU/480 GB memory); **16384** (32-core CPU/256 GB memory);  
**8192** (16-core CPU/128 GB memory); **4096** (8-core CPU/64 GB memory);  
**2048** (4-core CPU/32 GB memory); **1000** (4-core CPU/16 GB memory)

**Setting method:** This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Setting suggestion:** Set this parameter based on the default value of different instance specifications. The value of this parameter must be greater than the value of **max\_connections**. During the adjustment, the connections consumed by internal threads must be reserved. When the number of concurrent services is large, the connections from the CN to other CNs/DNs in the connection pool are consumed. If this parameter is set to a small value, an error is reported when the number of connections reaches the upper limit. As a result, services fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

## persistent\_datanode\_connections

**Parameter description:** Specifies whether to release the connection for the current session.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **off** indicates that the connection for the current session will be released.
- **on** indicates that the connection for the current session will not be released.

---

**NOTICE**

After this parameter is set to **on**, a session may hold a connection but does not run a query. As a result, other query requests fail to be connected. To fix this problem, the number of sessions must be less than or equal to **max\_active\_statements**.

---

**Default value:** off

## max\_coordinators

**Parameter description:** Specifies the maximum number of CNs in a cluster. This parameter may need to be modified when the cluster scale changes, for example, nodes are added or deleted. During scale-out, ensure that the value of this parameter is greater than the number of CNs in the target cluster. Otherwise, the scale-out will fail. If this parameter is set to a large value during scale-in, more memory resources are consumed when the CN is started. However, in general, the impact on the CN memory is small.

**Parameter type:** integer

**Unit:** none

**Value range:** 2 to 1024

**Default value:** 128

**Setting method:** This is a POSTMASTER parameter. You are not advised to modify it. If you need to modify it, set it based on instructions provided in [Table 14-2](#).

**Setting suggestion:** Set this parameter based on the actual cluster specifications. If the value of this parameter is less than the number of CNs in the cluster, node creation will fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

## max\_datanodes

**Parameter description:** Specifies the maximum number of DN nodes in a cluster. This parameter may need to be modified when the cluster scale changes, for example, nodes are added or deleted. During scale-out, ensure that the value of this parameter is greater than the total number of DN shards in the target cluster. Otherwise, the scale-out will fail. If this parameter is set to a large value during scale-in, more memory resources are consumed when the CN is started. However, in general, the impact on the CN memory is small.

**Parameter type:** integer

**Unit:** none

**Value range:** 2 to 65535

**Default value:** 256

**Setting method:** This is a POSTMASTER parameter. You are not advised to modify it. If you need to modify it, set it based on instructions provided in [Table 14-2](#).

**Setting suggestion:** Set this parameter based on the actual cluster specifications. If the value of this parameter is less than the number of DNs in the cluster, node creation will fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

## cache\_connection

**Parameter description:** Specifies whether to reclaim the connections of a connection pool.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the connections of a connection pool will be reclaimed.
- **off** indicates that the connections of a connection pool will not be reclaimed.

**Default value:** on

## enable\_force\_reuse\_connections

**Parameter description:** Specifies whether a session forcibly reuses a new connection.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the new connection is forcibly used.
- **off** indicates that the current connection is used.

**Default value:** off

## pooler\_connect\_max\_loops

**Parameter description:** Specifies whether to enable the connection retries to enhance stability of setting up connections in primary/standby switchover scenarios. If a service fails to connect to the primary server, it will retry by attempting to connect to the standby server. If the standby server is successfully promoted to primary, the retry attempt will succeed. This parameter specifies the total number of retry attempts. If this parameter is set to **0**, retries are disabled. The service only establishes a connection to the primary server.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 20.

**Default value:** 1

## pooler\_connect\_interval\_time

**Parameter description:** Specifies the interval between retries when **pooler\_connect\_max\_loops** is set to a value greater than 1. You are advised to set this parameter to a value slightly greater than the time required for primary/standby switchover in the current cluster.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 7200. The smallest unit is s.

**Default value:** 15s

## pooler\_timeout

**Parameter description:** Specifies the timeout period of communication between each connection in a CN's connection pool and another CN/DN.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 7200. The smallest unit is s.

**Default value:** 10 min

## pooler\_connect\_timeout

**Parameter description:** Specifies the timeout period of connecting a CN's connection pool to another CN/DN in the same cluster.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 7200. The smallest unit is s.

**Default value:** 1 min

## pooler\_cancel\_timeout

**Parameter description:** Specifies the timeout period of canceling a connection by a CN's connection pool during error processing. If similar timeout occurs when an exception of the subtransaction or stored procedure is captured, the transaction containing the subtransaction or the stored procedure rolls back. If the source data from the COPY FROM operation is not consistent with that of the table structure in the target table, and the parameter value is not 0, an error is reported.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 7200. The smallest unit is s. **0** (not recommended) indicates that the timeout is disabled.

**Default value:** 15s

## 14.3.18 Cluster Transaction Parameters

This section describes the settings and value ranges of transaction parameters for the cluster.

### transaction\_isolation

**Parameter description:** specifies the isolation level of the current transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string of case-sensitive characters. The values include:

- **serializable:** This value is equivalent to REPEATABLE READ in GaussDB.
- **read committed** indicates that only the data in committed transactions will be read.
- **repeatable read** indicates that only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **read uncommitted** indicates that data is readable at any time.
- **default:** The value is the same as that of **default\_transaction\_isolation**.

**Default value:** read committed

### transaction\_read\_only

**Parameter description:** Specifies whether the current transaction is a read-only transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the current transaction is a read-only transaction.
- **off** indicates that the current transaction can be a read/write transaction.

**Default value:** off

### xc\_maintenance\_mode

**Parameter description:** Specifies whether the system is in maintenance mode.

This parameter is a SUSERSET parameter. Set it based on method 3 in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the system is in maintenance mode.
- **off** indicates that the system is not in maintenance mode.

---

**NOTICE**

Exercise caution when setting this parameter to **on** to avoid data inconsistencies in the cluster.

---

**Default value:** off

## allow\_concurrent\_tuple\_update

**Parameter description:** Specifies whether to allow concurrent update.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that concurrent update is allowed.
- **off** indicates that concurrent update is disallowed.

**Default value:** on

## gtm\_host

**Parameter description:** Specifies the IP address of the primary GTM process. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string

**Default value:** IP address of the primary GTM

## gtm\_port

**Parameter description:** Specifies the listening port of the primary GTM process. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter.

 **NOTE**

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Value range:** an integer ranging from 1 to 65535

**Default value:** specified during installation

## gtm\_host1

**Parameter description:** Specifies the IP address of the standby GTM process. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string

**Default value:** IP address of the standby GTM

## gtm\_port1

**Parameter description:** Specifies the listening port of the standby GTM process. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter.

### NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Value range:** an integer ranging from 1 to 65535

**Default value:** The value is specified during installation if the standby GTM 1 is deployed. Otherwise, the value is **6665**.

## pgxc\_node\_name

**Parameter description:** Specifies the name of a node.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

When a standby node requests to replicate logs on the primary node, if the **application\_name** parameter is not set, the **pgxc\_node\_name** parameter is used as the name of the streaming replication slot of the standby node on the primary node. The streaming replication slot is named in the following format: Value of this parameter\_IP address of the standby node\_Port number of the standby node. The IP address and port number of the standby node are obtained from the IP address and port number of the standby node specified by the **replconninfo** parameter. The maximum length of a streaming replication slot name is 61 characters. If the length of the concatenated string exceeds 61 characters, the truncated **pgxc\_node\_name** will be used for concatenation to ensure that the length of the streaming replication slot name is less than or equal to 61 characters.

---

### CAUTION

After this parameter is modified, the cluster will fail to be connected. You are advised not to modify this parameter.

---

**Value range:** a string

**Default value:** current node name

## gtm\_backup\_barrier

**Parameter description:** Specifies whether to create a restoration point for the GTM starting point.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that a restoration point will be created for the GTM starting point.
- **off** indicates that a restoration point will not be created for the GTM starting point.

**Default value:** off

## gtm\_conn\_check\_interval

**Parameter description:** Sets the intervals between two consecutive performed checks performed by the CN on the connections between local threads and the primary GTM.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 10s

## transaction\_deferrable

**Parameter description:** Specifies whether to delay the execution of a read-only serial transaction without incurring an execution failure. Assume this parameter is set to **on**. When the server detects that the tuples read by a read-only transaction are being modified by other transactions, it delays the execution of the read-only transaction until the other transactions finish modifying the tuples. This parameter is reserved and does not take effect in this version. Similar to this parameter, the [default\\_transaction\\_deferrable](#) parameter is used to specify whether to allow delayed execution of a transaction.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the execution of a read-only serial transaction can be delayed.
- **off** indicates that the execution of a read-only serial transaction cannot be delayed.

**Default value:** off

## enable\_show\_any\_tuples

**Parameter description:** This parameter is available only in a read-only transaction and is used for analysis. When this parameter is set to **on** or **true**, all versions of tuples in the table are displayed.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** or **true** indicates that all versions of tuples in the table are displayed.
- **off** or **false** indicates that no versions of tuples in the table are displayed.

**Default value:** off

## gtm\_connect\_timeout

**Parameter description:** Specifies the GTM connection timeout. If the connection time of the GTM exceeds its value, the connection times out and exits.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is s.

**Default value:** 2s

## gtm\_connect\_retries

**Parameter description:** Specifies the number of GTM reconnection attempts.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 30

## gtm\_rw\_timeout

**Parameter description:** Specifies the GTM response timeout. If the time spent waiting for GTM responses exceeds its value, the operation times out and exits.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is s.

**Default value:** 1min

## enable\_redistribute

**Parameter description:** Specifies whether unmatched nodes are redistributed.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that unmatched nodes are redistributed.
- **off** indicates that unmatched nodes are not redistributed.

**Default value:** off

## replication\_type

**Parameter description:** Specifies whether the current HA mode is primary/standby/secondary, one primary multiple standbys, or single primary.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

This parameter is used for CM deployment. Do not set it.

**Value range:** 0 to 2

- **0:** indicates that the HA nodes consist of a primary, a standby, and a secondary node.
- **1** Indicates that the one-primary-multiple-standby mode is used, covering all scenarios. This mode is recommended.
- **2** Indicates the single primary mode. In this mode, the standby node cannot be expanded.

**Default value:** 1

## enable\_gtm\_free

**Parameter description:** Specifies whether the GTM-Free mode is enabled. In large concurrency scenarios, the snapshots delivered by the GTM increase in number and size. The network between the GTM and the CN becomes the performance bottleneck. The GTM-Free mode is used to eliminate the bottleneck. In this mode, the CN communicates with DNs instead of the GTM. The CN sends queries to each DN, which locally generates snapshots and xids, ensuring external write consistency but not external read consistency.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

---

 **CAUTION**

When the GTM-Free mode is used, you are advised to set **application\_type** to **perfect\_sharding\_type** so that you can find SQL statements that may cause data inconsistency. Otherwise, the system does not intercept statements that may cause data inconsistency.

---

**Value range:** Boolean

- **on** indicates that the GTM-FREE mode is enabled and the cluster ensures eventual read consistency.
- **off** indicates that the GTM-FREE mode is disabled.

**Default value:** off

## enable\_twophase\_commit

**Parameter description:** Specifies whether to enable distributed two-phase commit in the GTM-Free mode adopted to address the replacement issues of SDS

in the cloud database. This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that distributed two-phase commit is allowed in the GTM-Free mode.
- **off** indicates that distributed two-phase commit is not allowed in the GTM-Free mode.

**Default value:** on

## application\_type

**Parameter description:** valid only when **enable\_gtm\_free** is set to **on**. This parameter specifies the service type of a user. This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#). This parameter cannot be set using **gs\_guc**. Only the following ways are allowed:

1. Use the **gsql** client to perform session-level configuration.
2. When JDBC is used to connect to the database, set the **ApplicationType** parameter for the connection string.

**Value range:** enumerated values

- **not\_perfect\_sharding\_type** indicates a service across nodes. If this value is used, statements across nodes can be executed.
- **perfect\_sharding\_type** indicates a service on a single node. If this value is used and the SQL statement involves multiple nodes, an error is reported. The corresponding SQL statement is recorded in the system log.
  - If this value is used, you can run the **/\*+ multinode \*/ hint** command to allow SQL statements to be executed on multiple nodes. The multinode hint can be added after the select, insert, update, delete, and merge keywords.

## gtm\_host2

**Parameter description:** Specifies the host name or IP address of the standby GTM 2 if the standby GTM 2 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string

**Default value:** the IP address of the standby GTM 2 if the standby GTM 2 is deployed. Otherwise, the value is "".

## gtm\_host3

**Parameter description:** Specifies the host name or IP address of the standby GTM 3 if the standby GTM 3 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string

**Default value:** the IP address of the standby GTM 3 if the standby GTM 3 is deployed. Otherwise, the value is "".

## gtm\_host4

**Parameter description:** Specifies the host name or IP address of the standby GTM 4 if the standby GTM 4 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string

**Default value:** the IP address of the standby GTM 4 if the standby GTM 4 is deployed. Otherwise, the value is "".

## gtm\_host5

**Parameter description:** Specifies the host name or IP address of the standby GTM 5 if the standby GTM 5 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string

**Default value:** the IP address of the standby GTM 5 if the standby GTM 5 is deployed. Otherwise, the value is "".

## gtm\_host6

**Parameter description:** Specifies the host name or IP address of the standby GTM 6 if the standby GTM 6 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string

**Default value:** the IP address of the standby GTM 6 if the standby GTM 6 is deployed. Otherwise, the value is "".

## gtm\_host7

**Parameter description:** Specifies the host name or IP address of the standby GTM 7 if the standby GTM 7 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a string

**Default value:** the IP address of the standby GTM 7 if the standby GTM 7 is deployed. Otherwise, the value is "".

## gtm\_port2

**Parameter description:** Specifies the listening port of the standby GTM 2 if the standby GTM 2 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535

**Default value:** The value is specified during installation if the standby GTM 2 is deployed. Otherwise, the value is **6666**.

## gtm\_port3

**Parameter description:** Specifies the listening port of the standby GTM 3 if the standby GTM 3 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535

**Default value:** The value is specified during installation if the standby GTM 3 is deployed. Otherwise, the value is **6666**.

## gtm\_port4

**Parameter description:** Specifies the listening port of the standby GTM 4 if the standby GTM 4 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535

**Default value:** The value is specified during installation if the standby GTM 4 is deployed. Otherwise, the value is **6666**.

## gtm\_port5

**Parameter description:** Specifies the listening port of the standby GTM 5 if the standby GTM 5 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535

**Default value:** The value is specified during installation if the standby GTM 5 is deployed. Otherwise, the value is **6666**.

## gtm\_port6

**Parameter description:** Specifies the listening port of the standby GTM 6 if the standby GTM 6 is deployed. This parameter is visible only to the sysadmin user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535

**Default value:** The value is specified during installation if the standby GTM 6 is deployed. Otherwise, the value is **6666**.

## gtm\_port7

**Parameter description:** Specifies the listening port of the standby GTM 7 if the standby GTM 7 is deployed. This parameter is visible only to the **sysadmin** user.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535

**Default value:** The value is specified during installation if the standby GTM 7 is deployed. Otherwise, the value is **6666**.

## enable\_defer\_calculate\_snapshot

**Parameter description:** Specifies the delay in calculating **xmin** and **oldestxmin**. Calculation is triggered only when 1000 transactions are executed or the interval is 1s. If this parameter is set to **on**, the overhead of calculating snapshots can be reduced in heavy-load scenarios, but the progress of **oldestxmin** is slow, affecting tuple recycling. If this parameter is set to **off**, **xmin** and **oldestxmin** can be calculated in real time, but the overhead for calculating snapshots increases.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that snapshots **xmin** and **oldestxmin** are calculated with a delay.
- **off** indicates that snapshots **xmin** and **oldestxmin** are calculated in real time.

**Default value:** on

## 14.3.19 Dual-Cluster Replication Parameters

### enable\_roach\_standby\_cluster

**Parameter description:** Sets the instances of the standby cluster to read-only in dual-cluster mode. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the read-only mode is enabled for the standby cluster.
- **off** indicates that the read-only mode is disabled for the standby cluster. In this case, the standby cluster can be read and written.

**Default value:** off

## enable\_slot\_log

**Parameter description:** Specifies whether to enable primary/standby synchronization for replication slots. Currently, only archive slots are involved.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that primary/standby synchronization is enabled for replication slots.
- **off** indicates that primary/standby synchronization is disabled for replication slots.

**Default value:** on

## max\_changes\_in\_memory

**Parameter description:** Specifies the maximum number of DML statements cached in memory for a single transaction during logical decoding.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 4096

## max\_cached\_tuplebufs

**Parameter description:** Specifies the upper limit of the total tuple information cached in the memory during logical decoding. You are advised to set this parameter to a value greater than or equal to twice of [max\\_changes\\_in\\_memory](#).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 8192

## logical\_decode\_options\_default

**Parameter description:** Specifies the global default value for unspecified decoding options when logical decoding starts.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

Currently, the following logical decoding options are supported: **parallel-decode-num**, **parallel-queue-size**, **max-txn-in-memory**, **max-reorderbuffer-in-memory**,

and **exclude-users**. For details about the options, see "Application Development Guide > Development Based on JDBC > Example: Logical Replication Code" in *Developer Guide*.

**Value range:** a string of key=value characters separated by commas (,), for example, '**parallel-decode-num=4,parallel-queue-size=128,exclude-users=userA**'. An empty string indicates that the default value hardcoded by the program is used.

**Default value:** ""

---

#### NOTICE

- The SIGHUP parameter does not affect the started logic decoding process. The options specified by this parameter are used as the default settings for subsequent logic decoding startup, and the settings specified in the startup command are preferentially used.
  - The **exclude-users** option is different from the logic decoding startup option. You are not allowed to specify multiple blacklisted users.
- 

## logical\_sender\_timeout

**Parameter description:** Specifies the maximum waiting time for the sender to wait for the receiver to receive logical logs.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 30s

## RepOriginId

**Parameter description:** This parameter is a session-level GUC parameter. In bidirectional logical replication, set it to a non-zero value to avoid infinite data replication.

This parameter is a USERSET parameter. Set it based on **Method 3** provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## hadr\_max\_size\_for\_xlog\_receiver

**Parameter description:** Specifies the maximum difference between the OBS logs obtained by instances in the DR cluster and the local replay logs. If the difference is greater than the value of this parameter, the instances stop obtaining OBS logs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Handling suggestion:** The value of this parameter is related to the local disk size. You are advised to set this parameter to 50% of the local disk size.

**Value range:** an integer ranging from 0 to 2147483647. The unit is KB.

**Default value:** 256 GB

## auto\_csn\_barrier

**Parameter description:** Specifies whether the barrier logging function is enabled for the primary cluster for streaming DR.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## stream\_cluster\_run\_mode

**Parameter description:** Specifies whether a CN or DN belongs to the primary or standby cluster in a dual-cluster streaming DR scenario. In a single-cluster scenario, the primary cluster is selected by default.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **cluster\_primary** indicates that the node is in the primary cluster.
- **cluster\_standby** indicates that the node is in the standby cluster.

**Default value:** cluster\_primary

## 14.3.20 Developer Options

### allow\_system\_table\_mods

**Parameter description:** Specifies whether the structure of a system catalog or the name of a system schema can be modified.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the structure of the system catalog or the name of the system schema can be modified.
- **off** indicates that the structure of the system catalog or the name of the system schema cannot be modified.

**Default value:** off

 CAUTION

You are not advised to change the default value of this parameter. If this parameter is set to **on**, system tables may be damaged and the database may fail to be started.

## allow\_create\_sysobject

**Parameter description:** Specifies whether objects such as functions, stored procedures, and synonyms can be created or modified in the system schema. The system schema refers to the schema provided by the database after initialization, excluding the public schema. The OID of the system schema is usually less than 16384.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that initial users and system administrators can create or modify objects such as functions, stored procedures, and synonyms in the system schema. The **sysadmin** user has the permission to create or replace, alter, grant, and revoke system objects by default. For details about whether other users are allowed to create these objects, see the permission requirements of the corresponding schema.
- **off** indicates that all users are not allowed to create or modify objects such as functions, stored procedures, and synonyms in the system schema. The **sysadmin** user does not have the permission to create or replace, alter, grant, or revoke system objects by default.

**Default value:** on

## debug\_assertions

**Parameter description:** Specifies whether to enable various assertion checks. This parameter assists in debugging. If you are experiencing strange problems or crashes, set this parameter to **on** to identify programming defects. To use this parameter, the macro USE\_ASSERT\_CHECKING must be defined (through the configure option **--enable-cassert**) during the GaussDB compilation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that various assertion checks are enabled.
- **off** indicates that various assertion checks are disabled.

 NOTE

If you compile GaussDB with the assertion check enabled, this parameter is set to **on** by default.

**Default value:** off

## ignore\_checksum\_failure

**Parameter description:** Specifies whether to ignore check failures (but still generate an alarm) and continue reading data. Continuing reading data may result in breakdown, damaged data being transferred or stored, failure of data recovery from remote nodes, or other serious problems. You are not advised to modify the settings.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that data check errors are ignored.
- **off** indicates that data check errors are reported.

**Default value:** off

## ignore\_system\_indexes

**Parameter description:** Specifies whether to ignore system indexes when reading system tables (but still update the indexes when modifying the tables).

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

This parameter is useful for recovering data from tables whose system indexes are damaged.

---

**Value range:** Boolean

- **on** indicates that system indexes are ignored.
- **off** indicates that system indexes are not ignored.

**Default value:** off

## post\_auth\_delay

**Parameter description:** Specifies the delay in the connection to the server after a successful authentication. Developers can attach a debugger to the server startup process.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147. The unit is second.

**Default value:** 0

 NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than 0, the cluster status may be abnormal due to a long authentication delay.

## pre\_auth\_delay

**Parameter description:** Specifies the period of delaying authentication after the connection to the server is started. Developers can attach a debugger to the authentication procedure.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 60. The unit is s.

**Default value:** 0

 NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than 0, the cluster status may be abnormal due to a long authentication delay.

## trace\_notify

**Parameter description:** Specifies whether to enable the function of generating debugging output for the **LISTEN** and **NOTIFY** commands. The level of [client\\_min\\_messages](#) or [log\\_min\\_messages](#) must be **debug1** or lower so that debugging output can be recorded in the client or server logs, respectively.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** off

## trace\_recovery\_messages

**Parameter description:** Specifies whether to enable logging of recovery-related debugging output. This parameter allows users to overwrite the normal setting of [log\\_min\\_messages](#), but only for specific messages. This is intended for the use in debugging the standby server.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values include **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, and **log**. For details about the parameter values, see [log\\_min\\_messages](#).

**Default value:** log

 NOTE

- **log** indicates that recovery-related debugging information will not be logged.
- Except the default value **log**, each of the other values indicates that recovery-related debugging information at the specified level will also be logged. Common settings of **log\_min\_messages** enable logs to be unconditionally recorded into server logs.

## trace\_sort

**Parameter description:** Specifies whether to print information about resource usage during sorting operations. This parameter is available only when the macro TRACE\_SORT is defined during the GaussDB compilation. However, TRACE\_SORT is currently defined by default.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** off

## zero\_damaged\_pages

**Parameter description:** Specifies whether to detect a damaged page header that causes GaussDB to report an error, aborting the current transaction.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- Setting this parameter to **on** causes the system to report a warning, zero out the damaged page, and continue processing. This behavior will destroy data, including all the rows on the damaged page. However, it allows you to bypass the error and retrieve rows from any undamaged pages that may be present in the table. Therefore, it is useful for restoring data if corruption has occurred due to a hardware or software error. In most cases, you are advised not to set this parameter to **on** if you want to restore data from damaged pages.
- If this parameter is set to **off**, the system does not fill zeros in damaged pages.

**Default value:** off

## string\_hash\_compatible

**Parameter description:** Specifies whether to use the same method to calculate char-type hash values and varchar- or text-type hash values. Based on the setting of this parameter, you can determine whether a redistribution is required when a distribution column is converted from a char-type data distribution into a varchar- or text-type data distribution.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the same calculation method is used and a redistribution is not required.
- **off** indicates that different calculation methods are used and a redistribution is required.

 **NOTE**

Calculation methods differ in the length of input strings used for calculating hash values. (For a char-type hash value, spaces following a string are not counted as the length. For a text- or varchar-type hash value, the spaces are counted.) The hash value affects the calculation result of queries. To avoid query errors, do not modify this parameter during database running once it is set.

**Default value:** off

## remotetype

**Parameter description:** Specifies the remote connection type.

This parameter is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **application**, **coordinator**, **datanode**, **gtm**, **gtmproxy**, **internaltool**, and **gtmtool**.

**Default value:** application

## max\_user\_defined\_exception

**Parameter description:** Specifies the maximum number of exceptions.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. Currently, only the fixed value **1000** is supported.

**Default value:** 1000

## enable\_compress\_spill

**Parameter description:** Specifies whether to enable the compression function of writing data to disk.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that optimization for writing data to disk is enabled.
- **off** or **false** indicates that optimization for writing data to a disk is disabled.

**Default value:** on

## enable\_parallel\_ddl

**Parameter description:** Specifies whether multiple CNs can concurrently perform DDL operations on the same database object.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** DDL operations can be concurrently performed without distributed deadlocks.
- **off:** DDL operations cannot be concurrently performed as distributed deadlocks may occur.

**Default value:** on

## support\_batch\_bind

**Parameter description:** Specifies whether to batch bind and execute PBE statements through interfaces such as JDBC, ODBC, and libpq.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that batch binding and execution are used.
- **off** indicates that batch binding and execution are not used.

**Default value:** on

## numa\_distribute\_mode

**Parameter description:** Specifies the distribution of some shared data and threads among NUMA nodes. This parameter is used to optimize the performance of large-scale ARM servers with multiple NUMA nodes. Generally, you do not need to set this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. The valid values are **none** and **all**.

- **none** indicates that this function is disabled.
- **all** indicates that some shared data and threads are distributed to different NUMA nodes to reduce the number of remote access times and improve performance. Currently, this function applies only to ARM servers with multiple NUMA nodes. All NUMA nodes must be available for database processes. You cannot select only some NUMA nodes.

### NOTE

In the current version, **numa\_distribute\_mode** cannot be set to **all** on the x86 platform.

**Default value:** none

## log\_pagewriter

**Parameter description:** Specifies whether to display the page refresh information of a thread and details about an incremental check point after the incremental check point is enabled. You are not advised to set this parameter to **true** because a large amount of information will be generated.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** off

## advance\_xlog\_file\_num

**Parameter description:** Specifies the number of Xlog files that are periodically initialized in advance in the background. This parameter is used to prevent the Xlog file initialization from affecting the performance during transaction submission. However, such a fault may occur only when the system is overloaded. Therefore, you do not need to set this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000. The value **0** indicates that initialization is not performed in advance. For example, the value **10** indicates that the background thread periodically initializes 10 Xlog files in advance based on the write location of the current xlog.

**Default value:** 0

## comm\_sender\_buffer\_size

**Parameter description:** Specifies the size of the buffer for each interaction between CNs and DN and between DNs in the stream plan. In some cases, different values affect the stream performance. After the value is reset, the cluster needs to be restarted for the reset to take effect.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1024. The unit is KB.

**Default value:** 8

## ustore\_attr

**Parameter description:** This parameter is used to control the information statistics of Ustore tables, rollback type, and data verification during the running of key modules (including data, indexes, rollback segments, and playback). This parameter helps R&D engineers locate faults.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. This parameter is set in key-value mode. The mapping between keys and values is as follows: If multiple key-value pairs are used, use

semicolons (;) to separate them. For example, `ustore_attr='ustore_verify_level=FAST;ustore_verify_module=UPAGE:UBTREE:UNDO:REDO'`.

 **NOTE**

When setting `ustore_attr`, do not leave spaces or other characters before and after the equal sign (=) between key and value, for example, `ustore_attr='ustore_verify_level = FAST'`. Otherwise, the parameter is invalid during kernel code verification and the parameter setting fails.

- **ustore\_verify\_level:** Specifies the verification level.  
**Value range:** a string of case-insensitive characters. For details, see the following table.

**Table 14-12** Parameter value meaning of `ustore_verify_level`

Parameter Value	Description
NONE	<b>NONE</b> indicates that the verification function is disabled. You are advised to enable this function to test performance.
FAST	<b>FAST</b> indicates fast verification. A few contents are verified and the impact on performance is minimized.
COMPLETE	<b>COMPLETE</b> indicates complete verification. The verification content is the largest and the performance is greatly affected.

**Default value:** **FAST**

- **ustore\_verify\_module:** Specifies a module that controls verification.  
**Value range:** a string. The value is case-insensitive and can be **UPAGE**, **UBTREE**, **UNDO**, **REDO**, **ROACH**, **ALL**, or **NULL**.  
When more than one of **UPAGE**, **UBTREE**, **UNDO**, **REDO**, and **ROACH** are set, use colons (:) to separate them, for example, `ustore_verify_module=UPAGE:UBTREE:UNDO:REDO`.  
When the **ROACH** module is enabled by users, the value of the `ustore_verify_level` parameter is ignored during the backup of the **ROACH** module. By default, the level of verification is the highest and the performance is greatly affected. Therefore, exercise caution when using the `ustore_verify_module` parameter.

**Table 14-13** Parameter value meaning of `ustore_verify_module`

Parameter Value	Description
UPAGE	Indicates that data page verification is enabled.
UBTREE	Indicates that UB-tree index verification is enabled.

UNDO	Indicates that rollback segment data verification is enabled.
REDO	Indicates that data page verification for the REDO process is enabled.
ROACH	Indicates that data page verification for the ROACH backup is enabled.
ALL	Indicates that data verification is enabled for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules.
NULL	Indicates that data verification for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules is disabled.

**Default value:** UPAGE:UBTREE:UNDO

- **index\_trace\_level:** determines whether to enable index tracing and control the printing level. After this function is enabled, information about index tuples that meet the conditions is printed based on the printing level during index scanning.

**Value range:** a string. The values are described in the following table.

**Default value:** NO

**Table 14-14** Parameter value meaning of index\_trace\_level

Parameter Value	Description
NO	No additional information is printed.
NORMAL	Information about visible index tuples is printed, including: <ul style="list-style-type: none"> <li>• ID and offset of the index page where the current index tuple is located</li> <li>• Current tuple status</li> <li>• TID and partOid corresponding to the current tuple</li> <li>• xmin and xmax information corresponding to the current tuple</li> <li>• Current tuple content (if <b>enable_log_tuple</b> is set to <b>on</b>).</li> </ul>
VISIBILITY	On the basis of <b>NORMAL</b> , the information about the index tuples that do not pass the visibility check is printed and whether the index tuples are visible is marked.
SHOWHIKEY	On the basis of <b>VISIBILITY</b> , the system tries to print the information about the HIKEY tuple on the page.
ALL	Information about all tuples on the scanned index page is printed.

- **enable\_log\_tuple**: specifies whether to print the contents of related tuples when printing log-level prompts for troubleshooting and locating.  
**Value range:** on or off (case-insensitive)  
**Default value:** off
  - **enable\_ustore\_sync\_rollback**: indicates whether to enable synchronous rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** true
  - **enable\_ustore\_async\_rollback**: indicates whether to enable asynchronous rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** true
  - **enable\_ustore\_page\_rollback**: indicates whether to enable page rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** true
  - **enable\_ustore\_partial\_seqscan**: indicates whether to enable partial scan for Ustore tables.  
**Value range:** Boolean  
**Default value:** false
  - **enable\_candidate\_buf\_usage\_count**: indicates whether to enable buffer usage statistics.  
**Value range:** Boolean  
**Default value:** false
  - **ustats\_tracker\_naptime**: specifies the interval for collecting statistics on Ustore tables.  
**Value range:** [1,INT\_MAX/1000]  
**Default value:** 20, in seconds
  - **umax\_search\_length\_for\_prune**: specifies the maximum search depth of the prune operation on the Ustore table.  
**Value range:** [1,INT\_MAX/1000]  
**Default value:** 10 (times)
  - **ustore\_unit\_test**: specifies a test parameter for the white-box test.  
**Value range:** a string  
**Default value:** empty
- Default value:** an empty string

---

 CAUTION

Exercise caution when setting the **ustore\_attr** parameter. You are advised to modify this parameter with the assistance of engineers.

---

## default\_index\_kind

**Parameter description:** Controls the default behavior of creating indexes.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

Value range: an integer. Currently, only the fixed values **0**, **1**, and **2** are supported.

- **0:** The global partition index function is disabled for distributed deployment.
- **1:** A local index is created by default.
- **2:** A global index is created by default.

**Default value:** 2

---

 **CAUTION**

You are advised not to change the default value of this parameter. Otherwise, the index validity may be affected.

---

## 14.3.21 Auditing

### 14.3.21.1 Audit Switch

#### audit\_enabled

**Parameter description:** Specifies whether to enable or disable the audit process. After the audit process is enabled, the auditing information written by the background process can be read from the pipe and written into audit files.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the auditing function is enabled.
- **off** indicates that the auditing function is disabled.

**Default value:** on

#### audit\_directory

**Parameter description:** Specifies the storage directory of audit files. The value can be a path relative to the **data** directory or an absolute path. Only user **sysadmin** can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** **pg\_audit** If **om** is used for cluster deployment, audit logs are stored in *\$GAUSSLOG/pg\_audit/Instance name*.

---

**NOTICE**

- You need to set different audit file directories for different CNs or DNs. Otherwise, audit logs will be abnormal.
  - If the value of **audit\_directory** in the configuration file is an invalid path, the audit function cannot be used.
- 

**NOTE**

- Valid path: You have read and write permissions on the path.
- Invalid path: You do not have read or write permissions on the path.

## audit\_data\_format

**Parameter description:** Audits the format of log files. Currently, only the binary format is supported. Only user **sysadmin** can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** binary

## audit\_rotation\_interval

**Parameter description:** Specifies the interval of creating an audit log file. If the difference between the current time and the time when the previous audit log file is created is greater than the value of **audit\_rotation\_interval**, a new audit log file will be generated.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 35791394. The unit is min.

**Default value:** 1d

---

**NOTICE**

Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the [audit\\_resource\\_policy](#), [audit\\_space\\_limit](#), and [audit\\_file\\_remain\\_time](#) parameters.

---

## audit\_rotation\_size

**Parameter description:** Specifies the maximum capacity of an audit log file. If the total number of messages in an audit log exceeds the value of **audit\_rotation\_size**, the server will generate a new audit log file.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1024 to 1048576. The unit is KB.

**Default value:** 10 MB

---

#### NOTICE

- Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.
  - If the space occupied by a single record in an audit log file exceeds the value of this parameter, the log file is regarded as an invalid log file.
- 

## audit\_resource\_policy

**Parameter description:** Specifies the policy for determining whether audit logs are preferentially stored by space or time.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that audit logs are preferentially stored by space. A maximum of **audit\_space\_limit** logs can be stored.
- **off** indicates that audit logs are preferentially stored by time. A minimum duration of **audit\_file\_remain\_time** logs must be stored.

**Default value:** on

## audit\_file\_remain\_time

**Parameter description:** Specifies the minimum duration required for recording audit logs. This parameter is valid only when **audit\_resource\_policy** is set to **off**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 730. The unit is day. **0** indicates that the storage duration is not limited.

**Default value:** 90

## audit\_space\_limit

**Parameter description:** Specifies the total disk space occupied by audit files.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1024 KB to 1024 GB. The unit is KB.

**Default value:** 1 GB

---

**NOTICE**

- This parameter takes effect only for a single process instance folder in the **pg\_audit** directory. By default, the total disk space occupied by audit files on each CN or DN is 1 GB.
  - In the multi-audit thread scenario, the minimum disk space occupied by audit files is the product of values of **audit\_thread\_num** and **audit\_rotation\_size**. If the value of this parameter is too small, the disk space occupied by audit files may exceed the value of this parameter.
- 

## audit\_file\_remain\_threshold

**Parameter description:** Specifies the maximum number of audit files in the audit directory.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 to 1048576.

**Default value:** 1048576

---

**NOTICE**

- Ensure that this parameter is set to **1048576**. Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.
  - In the multi-audit thread scenario, do not adjust this parameter unless necessary. Ensure that the value of this parameter is greater than or equal to the value of **audit\_thread\_num**. Otherwise, the audit function cannot be used and the database is abnormal.
- 

## audit\_thread\_num

**Parameter description:** Specifies the number of audit threads.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 48.

**Default value:** 1

---

**NOTICE**

When **audit\_dml\_state** is enabled and high performance is required, you are advised to increase the value of this parameter to ensure that audit messages can be processed and recorded in a timely manner.

---

## 14.3.21.2 User and Permission Audit

### audit\_login\_logout

**Parameter description:** Specifies whether to audit users' login (including login success and failure) and logout.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 7

- 0 indicates that the function of auditing users' logins and logouts is disabled.
- 1 indicates that only successful user logins are audited.
- 2 indicates that only failed user logins are audited.
- 3 indicates that successful and failed user logins are audited.
- 4 indicates that only user logouts are audited.
- 5 indicates that successful user logouts and logins are audited.
- 6 indicates that failed user logouts and logins are audited.
- 7 indicates that successful user logins, failed user logins, and logouts are audited.

**Default value:** 7

### audit\_database\_process

**Parameter description:** Specifies whether to audit the database startup, stop, switchover, and recovery.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- 0 indicates that the function of auditing database startup, stop, switchover, and recovery is disabled.
- 1 indicates that the function of auditing database startup, stop, switchover, and recovery is enabled.

**Default value:** 1

### audit\_user\_locked

**Parameter description:** Specifies whether to audit the users' locking and unlocking.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- 0 indicates that the function of auditing user's locking and unlocking is disabled.
- 1 indicates that the function of auditing user's locking and unlocking is enabled.

**Default value:** 1

## audit\_user\_violation

**Parameter description:** Specifies whether to audit the access violation operations of a user.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- 0 indicates that the function of auditing the access violation operations of a user is disabled.
- 1 indicates that the function of auditing the access violation operations of a user is enabled.

**Default value:** 0

## audit\_grant\_revoke

**Parameter description:** Specifies whether to audit the granting and revoking of user permissions.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1

- 0 indicates that the function of auditing the granting and reclaiming of a user's permission is disabled.
- 1 indicates that the function of auditing the granting and reclaiming of a user's permission is enabled.

**Default value:** 1

## full\_audit\_users

**Parameter description:** Specifies the full audit user list. Audit logs are recorded for all auditable operations performed by users in the list.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. Use commas (,) to separate multiple usernames.

**Default value:** empty

## no\_audit\_client

**Parameter description:** Specifies the names and IP addresses of clients that do not need to be audited. The parameter format is *client name@IP address*, which is the same as that of the **client\_conninfo** column in the **pg\_query\_audit** function, for example, *cm\_agent@127.0.0.1* or *gs\_clean@127.0.0.1*.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a character string. Use commas (,) to separate multiple configuration items.

**Default value:** empty

---

**NOTICE**

- If the executed SQL statement meets the configuration requirements of **full\_audit\_users** and **no\_audit\_client**, the **no\_audit\_client** is preferentially configured.
  - Audit logs are generated for communication among tools or nodes in the database server. To save space occupied by audit logs and improve the query performance of audit logs, the low-risk scenarios cannot be audited by configuring the **no\_audit\_client** parameter.
- 

### 14.3.21.3 Operation Auditing

#### audit\_system\_object

**Parameter description:** Specifies whether to audit the CREATE, DROP, and ALTER operations on database objects. Database objects include databases, users, schemas, and tables. You can change the value of this parameter to audit only the operations on required database objects. In the scenario where the leader node is forcibly selected, you are advised to set **audit\_system\_object** to the maximum value and audit all DDL objects.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 536870911

- **0** indicates that the function of auditing the CREATE, DROP, and ALTER operations on database objects can be disabled.
- Other values indicate that the CREATE, DROP, and ALTER operations on a certain or some database objects are audited.

**Value description:**

The value of this parameter is calculated by 29 binary bits. The 29 binary bits represent 29 types of database objects. If the corresponding binary bit is set to **0**, the CREATE, DROP, and ALTER operations on corresponding database objects are not audited. If it is set to **1**, the CREATE, DROP, and ALTER operations are audited. For details about the audit contents represented by these 29 binary bits, see [Table 14-15](#).

When SQL patches are audited and **audit\_dml\_state\_select** are enabled, an SQL patch operation will be audited twice and recorded as DML and DDL operations in the audit log, respectively. If a remote interface is invoked, the DDL logs are generated on the node corresponding to the input parameter, instead of on the node where the statement is issued.

**Default value:** **67121159**, indicating that DDL operations on databases, schemas, users, data sources, node groups, and SQL patches are audited.

**Table 14-15** Meaning of each value for the **audit\_system\_object** parameter

Binary Bit	Description	Value Range
Bit 0	Whether to audit the CREATE, DROP, and ALTER operations on databases.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 1	Whether to audit the CREATE, DROP, and ALTER operations on schemas.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 2	Whether to audit the CREATE, DROP, and ALTER operations on users and user mappings.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 3	Whether to audit the CREATE, DROP, ALTER, and TRUNCATE operations on tables.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are audited.</li> </ul>
Bit 4	Whether to audit the CREATE, DROP, and ALTER operations on indexes.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 5	Whether to audit the CREATE and DROP operations on VIEW and MATVIEW objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE and DROP operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE and DROP operations on these objects are audited.</li> </ul>

Binary Bit	Description	Value Range
Bit 6	Whether to audit the CREATE, DROP, and ALTER operations on triggers.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 7	Whether to audit the CREATE, DROP, and ALTER operations on procedures/functions.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 8	Whether to audit the CREATE, DROP, and ALTER operations on tablespaces.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 9	Whether to audit the CREATE, DROP, and ALTER operations on resource pools.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 10	Whether to audit the CREATE, DROP, and ALTER operations on workloads.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 11	Reserved	-
Bit 12	Whether to audit the CREATE, DROP, and ALTER operations on data sources.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 13	Whether to audit the CREATE and DROP operations on node groups.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE and DROP operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE and DROP operations on these objects are audited.</li> </ul>

Binary Bit	Description	Value Range
Bit 14	Whether to audit the CREATE, DROP, and ALTER operations on ROW LEVEL SECURITY objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 15	Whether to audit the CREATE, DROP, and ALTER operations on types.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on types are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on types are audited.</li> </ul>
Bit 16	Whether to audit the CREATE, DROP, and ALTER operations on text search objects (CONFIGURATION and DICTIONARY).	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on text search objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on text search objects are audited.</li> </ul>
Bit 17	Whether to audit the CREATE, DROP, and ALTER operations on directories.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on directories are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on directories are audited.</li> </ul>
Bit 18	Whether to audit the CREATE, DROP, and ALTER operations on synonyms.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on synonyms are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on synonyms are audited.</li> </ul>
Bit 19	Whether to audit the CREATE, DROP, and ALTER operations on sequences.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on sequences are not audited.</li> <li>• <b>1</b> indicates that the operations are audited.</li> </ul>
Bit 20	Whether to audit the CREATE, ALTER, and DROP operations on CMKs and CEKs.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ALTER, and DROP operations on CMKs and CEKs are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ALTER, and DROP operations on CMKs and CEKs are audited.</li> </ul>

Binary Bit	Description	Value Range
Bit 21	Whether to audit the CREATE, DROP, and ALTER operations on packages. (Currently, the operations on packages can be audited only in the centralized deployment scenario.)	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on packages are not audited.</li> <li>• <b>1</b> indicates that the operations are audited.</li> </ul>
Bit 22	Reserved	-
Bit 23	Reserved	-
Bit 24	Whether to audit the ALTER and DROP operations on the <b>gs_global_config</b> objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the ALTER and DROP operations on the <b>gs_global_config</b> objects are not audited.</li> <li>• <b>1</b> indicates that the ALTER and DROP operations are audited.</li> </ul>
Bit 25	Reserved	-
Bit 26	Whether to audit the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are audited.</li> </ul>
Bit 27	Reserved	-
Bit 28	Whether to audit the CREATE, ALTER, and DROP operations on database links. Currently, the database link function is not supported.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ALTER, and DROP operations on database links are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ALTER, and DROP operations on database links are audited.</li> </ul>

## audit\_dml\_state

**Parameter description:** Specifies whether to audit the INSERT, UPDATE, and DELETE operations on a specific table.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**

- **0** indicates that the function of auditing the DML operations (except SELECT) is disabled.

- **1** indicates that the function of auditing the DML operations (except SELECT) is enabled.

**Default value:** 0

### **audit\_dml\_state\_select**

**Parameter description:** Specifies whether to audit the SELECT operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**

- **0** indicates that auditing the SELECT operation is disabled.
- **1** indicates that auditing the SELECT operation is enabled.

**Default value:** 0

### **audit\_function\_exec**

**Parameter description:** Specifies whether to record the audit information during the execution of the stored procedures, anonymous blocks, or user-defined functions (excluding system functions).

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** **0** or **1**

- **0** indicates that the function of auditing the procedure or function execution is disabled.
- **1** indicates that the function of auditing the procedure or function execution is enabled.

**Default value:** 0

### **audit\_system\_function\_exec**

**Parameter description:** Specifies whether to record audit logs when system functions in the whitelist are executed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** **0** or **1**

- **0** indicates that the function of auditing the execution of system functions is disabled.
- **1** indicates that the function of auditing system function execution is enabled.

**Default value:** 0

The following table lists the whitelist of system functions that can be audited.

set_working_grand_version_num_manually	set_config	pg_terminate_backend	pg_cancel_backend	pg_cancel_session	pg_cancel_invalid_query
pg_reload_conf	pg_rotate_logfile	pg_terminate_session	pg_terminate_backend	pg_start_backup	pg_stop_backup
pg_create_restore_point	pg_switch_xlog	pg_cbm_get_merged_file	pg_cbm_recycle_file	pg_enable_delay_ddl_recycle	pg_disable_delay_ddl_recycle
pg_cbm_rotate_file	gs_roach_enable_delay_ddl_recycle	gs_roach_disable_delay_ddl_recycle	gs_roach_stop_backup	pg_last_xlog_receive_location	pg_xlog_replay_pause
pg_xlog_replay_resume	gs_roach_switch_xlog	gs_pitr_archive_slot_force_advance	gs_pitr_clean_history_global_barriers	gs_download_obs_file	gs_upload_obs_file

## audit\_copy\_exec

**Parameter description:** Specifies whether to audit the COPY operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**

- **0** indicates that auditing the COPY operation is disabled.
- **1** indicates that auditing the COPY operation is enabled.

**Default value:** **1**

## audit\_set\_parameter

**Parameter description:** Specifies whether to audit the SET operation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**

- **0** indicates that auditing the SET operation is disabled.
- **1** indicates that auditing the SET operation is enabled.

**Default value:** **0**

## audit\_xid\_info

**Parameter description:** Specifies whether to record the transaction ID of the SQL statement in the **detail\_info** column of the audit log.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**

- **0** indicates that the function of recording transaction IDs in the audit log is disabled.
- **1** indicates that the function of recording transaction IDs in the audit log is enabled.

**Default value:** **0**

---

### NOTICE

If this function is enabled, the **detail\_info** information in the audit log starts with *xid*. For example:

```
detail_info: xid=14619 , create table t1(id int);
```

If transaction IDs do not exist, *xid* is recorded as **NA** in the audit log.

---

## enableSeparationOfDuty

**Parameter description:** Specifies whether the separation of duties is enabled.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the separation of duties is enabled.
- **off** indicates that the separation of duties is disabled.

**Default value:** off

## enable\_nonsysadmin\_execute\_direct

**Parameter description:** Specifies whether non-system administrator and non-monitor administrator users are allowed to execute the EXECUTE DIRECT ON statement.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that any user is allowed to execute the EXECUTE DIRECT ON statement.
- **off** indicates that only the system administrator and monitor administrator are allowed to execute the EXECUTE DIRECT ON statement.

**Default value:** off

## enable\_access\_server\_directory

**Parameter description:** Specifies whether to allow non-initial users to create, modify, and delete directories.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that non-initial users have the permission to create, modify, and delete directories.
- **off** indicates that non-initial users do not have the permission to create, modify, and delete directories.

**Default value:** off

#### NOTICE

To use the advanced package UTL\_FILE to access files on the server, you must have the permissions on the specified directory.

For security purposes, only the initial user can create, modify, and delete directories by default.

If **enable\_access\_server\_directory** is enabled, users with the **SYSADMIN** permission and users who inherit the **gs\_role\_directory\_create** permission of the built-in role can create directories. A user with the **SYSADMIN** permission, the owner of a directory, a user who is granted with the **DROP** permission for the directory, or a user who inherits the **gs\_role\_directory\_drop** permission of the built-in role can delete the directory. A user with the **SYSADMIN** permission and the owner of a directory object can change the owner of the directory, and the user must be a member of the new owning role.

## 14.3.22 Transaction Monitoring

The automatic rollback transaction can be monitored and its statement problems can be located by setting the transaction timeout warning. In addition, the statements with long execution time can also be monitored.

### transaction\_sync\_naptime

**Parameter description:** For data consistency, when the local transaction's status differs from that in the snapshot of GTM, other transactions will be blocked. You need to wait for a few minutes until the transaction status of the local host is consistent with that of the GTM. The `gs_clean` tool is automatically triggered for cleansing when the waiting period on the CN exceeds that of **transaction\_sync\_naptime**. The tool will shorten the blocking time after it completes the cleansing.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 30s

#### NOTE

If the value of this parameter is set to **0**, `gs_clean` will not be automatically invoked for the cleansing before the blocking arrives the duration. Instead, the `gs_clean` tool is invoked by **gs\_clean\_timeout**. The default value is 5 minutes.

### transaction\_sync\_timeout

**Parameter description:** For data consistency, when the local transaction's status differs from that in the snapshot of GTM, other transactions will be blocked. You need to wait for a few minutes until the transaction status of the local host is consistent with that of the GTM. An exception is reported when the waiting duration on the CN exceeds the value of **transaction\_sync\_timeout**. Roll back the transaction to avoid system blocking due to long time of process response failures (for example, sync lock).

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 10min

 NOTE

- If the value is **0**, no error is reported when the blocking times out or the transaction is rolled back.
- The value of this parameter must be greater than **gs\_clean\_timeout**. Otherwise, unnecessary transaction rollback will probably occur due to a block timeout caused by residual transactions that have not been deleted by **gs\_clean** on the DN.

## 14.3.23 CM Parameters

Modifying CM parameters affects the running mechanism of GaussDB. You are advised to ask GaussDB engineers to do it for you. For details about how to modify the CM parameters, see method 1 in [Table 14-2](#).

You can view CM Agent parameters in the **cm\_agent.conf** file in the CM Agent data directory and CM Server parameters in the **cm\_server.conf** file in the CM Server data directory.

### 14.3.23.1 CM Agent Parameters

#### log\_dir

**Parameter description:** Specifies the directory where CM Agent logs are stored. The value can be an absolute path, or relative to the CM Agent data directory.

**Value range:** a string. Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** "log", indicating that CM Agent logs are generated in the CM Agent data directory.

#### log\_file\_size

**Parameter description:** Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

**Value range:** an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 16 MB

#### log\_min\_messages

**Parameter description:** Specifies which message levels are written to the CM Agent log. A higher level covers the messages of all the lower levels. The lower the level is, the fewer messages will be written into the log.

**Value range:** enumerated type. Valid values are **debug5**, **debug1**, **warning**, **error**, **log**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** warning

## incremental\_build

**Parameter description:** Specifies whether a standby DN is incrementally built. If this function is enabled, the standby DN is incrementally rebuilt. Otherwise, the standby DN is fully rebuilt.

**Value range:** Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** on

## alarm\_component

**Parameter description:** Specifies the location of the alarm component that processes alarms.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** /opt/huawei/snas/bin/snas\_cm\_cmd

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Value range:** a non-negative integer. The unit is s.

**Default value:** 1

## alarm\_report\_max\_count

**Parameter description:** Specifies the maximum number of times an alarm is reported. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Value range:** a non-negative integer.

**Default value:** 1

## agent\_report\_interval

**Parameter description:** Specifies the interval at which CM Agent reports the instance status.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## agent\_phony\_dead\_check\_interval

**Parameter description:** Specifies the interval at which CM Agent checks whether the CN, DN, or GTM process is suspended.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## agent\_check\_interval

**Parameter description:** Specifies the interval at which the CM Agent queries the status of instances, such as the DNs, CN, and GTM.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

## agent\_heartbeat\_timeout

**Parameter description:** Specifies the heartbeat timeout interval for CM Agent to connect to CM Server.

**Value range:** an integer ranging from 2 to  $2^{31} - 1$ . The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 8

## agent\_connect\_timeout

**Parameter description:** Specifies the time to wait before the attempt of CM Agent to connect to CM Server times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## agent\_connect\_retries

**Parameter description:** Specifies the number of times CM Agent tries to connect to the CM Server.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 15

## agent\_kill\_instance\_timeout

**Parameter description:** Specifies the interval from the time when CM Agent fails to connect to the primary CM Server to the time when CM Agent kills all instances on the node.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0, indicating that the operation of killing all instances on the node is not initiated.

## enable\_gtm\_phony\_dead\_check

**Parameter description:** Specifies whether to enable the GTM zombie check function.

**Value range:** an integer. The value 1 indicates that the zombie check is enabled, and the value 0 indicates that the zombie check is disabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## security\_mode

**Parameter description:** Specifies whether CNs and DNPs are started in secure mode. If this parameter is set to **on**, CNs and DNPs are started in secure mode.

**Value range:** Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** off

## upgrade\_from

**Parameter description:** Specifies the internal version number of the cluster before an in-place upgrade. Do not modify the value of this parameter.

**Value range:** a non-negative integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

The recommended value range is [0, *Version number of the installation package*].

**Default value:** 0

## process\_cpu\_affinity

**Parameter description:** Specifies whether to bind a primary DN process to a CPU core before starting the process. If this parameter is set to **0**, core binding will not be performed. If it is set to another value, core binding will be performed, and the number of physical CPU cores is  $2^n$ . Only ARM is supported.

**Value range:** an integer ranging from 0 to 2. The modification of this parameter takes effect only after the cluster and CM Agent are restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## enable\_xc\_maintenance\_mode

**Parameter description:** Specifies whether the **pgxc\_node** system catalog can be modified when the cluster is in read-only mode.

**Value range:** Boolean Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify the parameter, see [Table 14-2](#).

- **on** indicates that the **pgxc\_node** system catalog can be modified.
- **off** indicates that the **pgxc\_node** system catalog cannot be modified.

**Default value:** on

## log\_threshold\_check\_interval

**Parameter description:** Specifies the interval for compressing and clearing logs. Typically, this interval is set to 1800s.

**Value range:** an integer ranging from 0 to  $2^{31} - 1$ . The unit is second. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1800

## dilatation\_shard\_count\_for\_disk\_capacity\_alarm

**Parameter description:** Specifies the number of shards to be added in the scale-out scenario. This parameter is used to calculate the threshold for reporting a disk capacity alarm.

### NOTE

The parameter value must be the same as the actual number of shards to be added.

**Value range:** an integer ranging from 0 to  $2^{31} - 1$ . If this parameter is set to **0**, the disk scale-out alarm is not reported. If this parameter is set to a value greater than **0**, the disk scale-out alarm is reported and the threshold is calculated based on the number of shards specified by this parameter. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## log\_max\_size

**Parameter description:** Specifies the maximum size of a log file.

**Value range:** an integer ranging from 0 to  $2^{31} - 1$ . The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10240

## log\_max\_count

**Parameter description:** Specifies the maximum number of logs that can be stored on hard disks.

**Value range:** an integer ranging from 0 to 10000. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10000

## log\_saved\_days

**Parameter description:** Specifies the number of days for storing logs.

**Value range:** an integer ranging from 0 to 1000. The unit is day. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 90

## enable\_log\_compress

**Parameter description:** Specifies whether to enable log compression.

**Value range:** Boolean The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **on** indicates that log compression is enabled.
- **off** indicates that log compression is disabled.

**Default value:** on

## enable\_cn\_auto\_repair

**Parameter description:** Specifies whether to enable automatic CN recovery.

**Value range:** Boolean The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **on** indicates that the automatic CN recovery is enabled. That is, after a CN is removed, the agent automatically attempts to recover the CN and add the CN back.
- **off** indicates that automatic CN recovery is disabled.

**Default value:** on

## agent\_backup\_open

**Parameter description:** Specifies whether to enable the DR cluster. After the DR cluster is enabled, the CM runs in DR cluster mode.

**Value range:** an integer, **0** or **1**. Any modification of this parameter takes effect only after CM Agent is restarted. For details about how to modify the parameter, see [Table 14-2](#).

- **0:** disabled.
- **1:** enabled.

**Default value:** **0**

## enable\_e2e\_rto

**Parameter description:** Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout time are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance ≤ 10s; RTO for combined faults ≤ 30s).

**Value range:** an integer, **0** or **1**. The value **1** indicates enabled, while the value **0** indicates disabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:**

Independent deployment: **1**

## enable\_dcf

**Parameter description:** Specifies the status of the DCF mode.

**Value range:** Boolean The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **0:** disabled.
- **1:** enabled.

**Default value:** **off**

## unix\_socket\_directory

**Parameter description:** Specifies the directory location of the Unix socket.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** **"**

## disaster\_recovery\_type

**Parameter description:** Specifies the type of the DR relationship between primary and standby clusters.

**Value range:** an integer ranging from 0 to 2. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- 0 indicates that no DR relationship is established.
- 1 indicates that the OBS DR relationship is established.
- 2 indicates that the streaming DR relationship is established.

**Default value:** 0

## environment\_threshold

**Parameter description:** Specifies the thresholds for the physical environment and node status monitored by the agent. If the thresholds are exceeded, logs will be printed. The thresholds include the memory usage threshold, CPU usage threshold, disk usage threshold, instance memory usage threshold, and instance thread pool usage threshold.

**Value range:** a string, in the format of (0, 0, 0, 0). The value range for each number is [0,100]. The unit is %. Value 0 indicates that the detection is disabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** (0,0,0,0,0)

### 14.3.23.2 CM Server Parameters

#### log\_dir

**Parameter description:** Specifies the directory where CM Server logs are stored. The value can be an absolute path, or relative to the CM Server data directory.

**Value range:** a string. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** "log", indicating that CM Server logs are generated in the CM Server data directory.

#### log\_file\_size

**Parameter description:** Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

**Value range:** an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 16 MB

#### log\_min\_messages

**Parameter description:** Specifies the level of messages to be written to the CM Server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

**Value range:** enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** warning

## thread\_count

**Parameter description:** Specifies the number of threads in the CM Server thread pool. If the value is greater than the sum of the number of cluster nodes and the number of threads for processing cm\_ctl requests (if the number of cluster nodes is less than 32, one thread is used by default; otherwise, four threads are used), the value that takes effect is the sum of the number of cluster nodes and the number of threads for processing cm\_ctl requests.

**Value range:** an integer ranging from 2 to 1000. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1000

## alarm\_component

**Parameter description:** Specifies the location of the alarm component that processes alarms.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** /opt/huawei/snas/bin/snas\_cm\_cmd

## instance\_failover\_delay\_timeout

**Parameter description:** Specifies the delay in the CM Server failover when the primary CM Server breakdown is detected.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## instance\_heartbeat\_timeout

**Parameter description:** Specifies the time to wait before the instance heartbeat times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

### **coordinator\_heartbeat\_timeout**

**Parameter description:** Specifies the heartbeat timeout that triggers the automatic removal of faulty CNs. The setting of this parameter takes effect immediately, and you do not need to restart CM Server. If this parameter is set to 0, faulty CNs are not automatically removed.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 25

### **cmserver\_ha\_connect\_timeout**

**Parameter description:** Specifies the time to wait before the connection between the primary and standby CM Servers times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

### **cmserver\_ha\_heartbeat\_timeout**

**Parameter description:** Specifies the time to wait before the heartbeat between the primary and standby CM Servers times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

### **phony\_dead\_effective\_time**

**Parameter description:** Specifies the maximum number of times CN, DN, or GTM processes are detected as zombie. If the number of times a process is detected as zombie is greater than the specified value, the process is considered as a zombie process and will be restarted.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 5

### **enable\_transaction\_read\_only**

**Parameter description:** Specifies whether to enable the automatic threshold detection function of the CM Server disk. After this function is enabled, CM Server

automatically sets the database to read-only when the disk usage is greater than the value of **datastorage\_threshold\_value\_check**.

**Value range:** Boolean values **on**, **off**, **true**, **false**, **yes**, **no**, **1**, and **0** The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** on

## **datastorage\_threshold\_check\_interval**

**Parameter description:** Specifies the interval for checking the disk usage. The system checks the disk usage at the interval specified by the user.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## **datastorage\_threshold\_value\_check**

**Parameter description:** Specifies the usage threshold of a read-only disk in a database. When the disk usage of the data directory exceeds the specified value, the database is automatically set to read-only mode. When adjusting this parameter, you are advised to adjust the **max\_size\_for\_xlog\_retention** parameter of the DN to prevent the cluster read-only threshold from being triggered by backup operations.

**Value range:** an integer ranging from 1 to 99, in percentage. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 85

## **max\_datastorage\_threshold\_check**

**Parameter description:** Specifies the maximum interval for checking the disk usage. After you modify the **enable\_transaction\_read\_only** parameter, the system automatically checks whether the disk usage reaches the threshold at the specified interval.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 43200

## **cmserver\_ha\_status\_interval**

**Parameter description:** Specifies the interval between synchronizations of primary and standby CM Server status.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

### cmserver\_self\_vote\_timeout

**Parameter description:** Specifies the time to wait before the CM Server self-voting times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

### alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported.

**Value range:** a non-negative integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

### alarm\_report\_max\_count

**Parameter description:** Specifies the maximum number of times an alarm is reported.

**Value range:** a non-negative integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

### enable\_az\_auto\_switchover

**Parameter description:** Specifies whether to enable automatic AZ switchover. If it is set to **1**, CM Server automatically switches over services among AZs. Otherwise, when a DN is faulty, services will not be automatically switched to another AZ even if the current AZ is unavailable. You can run the switchover command to manually switch services to another AZ.

**Value range:** a non-negative integer. The value **0** indicates that automatic AZ switchover is disabled, and the value **1** indicates that automatic AZ switchover is enabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

### instance\_keep\_heartbeat\_timeout

**Parameter description:** The CM Agent periodically checks the instance status and reports the status to the CM Server. If the instance status cannot be detected for a long time and the accumulated number of times exceeds the value of this parameter, the CM Server delivers a command to the CM Agent to restart the instance.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 40

## az\_switchover\_threshold

**Parameter description:** If the failure rate of a DN shard in an AZ (Number of faulty DN shards/Total number of DN shards x 100%) exceeds the specified value, automatic AZ switchover is triggered.

**Value range:** an integer ranging from 0 to 100. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 100

## az\_check\_and\_arbitrate\_interval

**Parameter description:** Specifies the interval for checking the AZ status. If the status of an AZ is abnormal, automatic AZ switchover is triggered.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

## az\_connect\_check\_interval

**Parameter description:** Specifies the interval at which the network connection between AZs is checked.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 60

## az\_connect\_check\_delay\_time

**Parameter description:** Specifies the delay between two retries to check the network connection between AZs.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 150

## cmserver\_demote\_delay\_on\_etcd\_fault

**Parameter description:** Specifies the interval at which CM Server switches from the primary state to the standby state due to unhealthy etcd.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 8

## instance\_phony\_dead\_restart\_interval

**Parameter description:** Specifies the interval at which the CM Agent process restarts and kills a zombie CN, DN, or GTM instance. The interval between two consecutive kill operations cannot be less than the value of this parameter. Otherwise, the CM Agent process does not deliver commands.

**Value range:** an integer ranging from 1800 to  $2^{31} - 1$ . The unit is second. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 21600

## cm\_auth\_method

**Parameter description:** Specifies the port authentication mode of the CM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the CM cannot communicate properly, affecting the cluster status.

**Value range:** **gss** or **trust**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** trust

## cm\_krb\_server\_keyfile

**Parameter description:** Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the `/${GAUSSHOME}/kerberos` directory and ends with `keytab`. The file name is the same as the name of the user who runs the cluster. This parameter is used together with **cm\_auth\_method**. If the **cm\_auth\_method** parameter is changed to **gss**, **cm\_krb\_server\_keyfile** must also be configured as the correct path. Otherwise, the cluster status will be affected.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** `/${GAUSSHOME}/kerberos/{UserName}.keytab`. The default value cannot take effect and is used only as a prompt.

## cm\_server\_arbitrate\_delay\_base\_time\_out

**Parameter description:** Specifies the basic delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay

duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

**Value range:** an integer. The unit is s. The index should be larger than 0. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## cm\_server\_arbitrate\_delay\_incremental\_time\_out

**Parameter description:** Specifies the incremental delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

**Value range:** an integer. The unit is s. The index should be larger than 0. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

## force\_promote

**Parameter description:** Specifies whether CM Server enables the forcible startup logic (that is, when the cluster status is unknown, ensure that the basic functions of the cluster are available at the cost of partial data loss). The value **0** indicates that forcible startup is disabled, and the value **1** indicates that forcible startup is enabled. This parameter applies to CNs and DNs.

**Value range:** **0** or **1**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## switch\_rto

**Parameter description:** Specifies the delay for the forcible switchover of CM Server. When **force\_promote** is set to **1** and a shard in the cluster does not have primary CM Server, the system starts timing. After the delay, the forcible startup logic starts to be executed.

**Value range:** an integer ranging from 0 to 2147483647. The unit is second. The minimum value that takes effect is 60. If this parameter is set to a value less than 60, 60s is used. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 600

## enable\_finishredo\_retrieve

**Parameter description:** Specifies whether to retrieve data of Xlogs that have been cut off by redo after a forcible CM Server switchover. If this parameter is set to **on**, data is automatically retrieved after a forcible switchover.

**Value range:** Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **off:** disabled.
- **on:** enabled.

**Default value:** off

## backup\_open

**Parameter description:** Specifies whether to enable the DR cluster. After the DR cluster is enabled, the CM runs in DR cluster mode.

**Value range:** an integer, **0** or **1**. Any modification of this parameter takes effect only after CM Server is restarted. This parameter cannot be enabled for non-DR clusters. For details about how to modify the parameter, see [Table 14-2](#).

- **0:** disabled.
- **1:** enabled.

**Default value:** 0

## enable\_e2e\_rto

**Parameter description:** Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout time are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance  $\leq 10s$ ; RTO for combined faults  $\leq 30s$ ).

**Value range:** **0** or **1**. The value **1** indicates enabled, while the value **0** indicates disabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:**

Independent deployment: **1**

## cluster\_starting\_aribt\_delay

**Parameter description:** Specifies the time that CM Server waits for the static primary DN to be promoted to primary during cluster startup.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 180

## enable\_dcf

**Parameter description:** Specifies the status of the DCF mode.

**Value range:** Boolean The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- 0: disabled.
- 1: enabled.

**Default value:** off

## ddb\_type

**Parameter description:** Specifies whether to switch between ETCD and DCC modes.

**Value range:** an integer. 0: ETCD; 1: DCC. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## enable\_ssl

**Parameter description:** Specifies whether to enable SSL.

**Value range:** Boolean After this function is enabled, the SSL certificate is used to encrypt communication. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:**

- on indicates that SSL is enabled.
- off indicates that SSL is disabled.
- **Default value:** off

---

### NOTICE

To ensure security, you are not advised to disable it. After this function is disabled, the CM does not use encrypted communication and all information is transmitted in plaintext, which may bring security risks such as eavesdropping, tampering, and spoofing.

---

## ssl\_cert\_expire\_alert\_threshold

**Parameter description:** Specifies the SSL certificate expiration alerting time.

**Value range:** an integer. The unit is day. If the certificate expiration time is less than the value of this parameter, an alarm indicating that the certificate is about to expire is reported. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 90

## ssl\_cert\_expire\_check\_interval

**Parameter description:** Specifies the period for checking whether the SSL certificate expires.

**Value range:** an integer. The unit is s. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 86400

## ddb\_log\_level

**Parameter description:** Sets the DDB log level.

To disable the log function, set this parameter to **NONE**, which cannot be used together with the following log levels:

To enable the log function, set this parameter to one or a combination of the following log levels: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**. If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty string.

**Value range:** a string containing one or a combination of the following log levels: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** RUN\_ERR|RUN\_WAR|DEBUG\_ERR|OPER|RUN\_INF|PROFILE

## ddb\_log\_backup\_file\_count

**Parameter description:** Specifies the maximum number of log files that can be saved.

**Value range:** an integer ranging from 1 to 100. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## ddb\_max\_log\_file\_size

**Parameter description:** Specifies the maximum number of bytes in a log.

**Value range:** a string, in the range [1 MB, 1000 MB]. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10 MB

## ddb\_log\_suppress\_enable

**Parameter description:** Specifies whether to enable the log suppression function.

**Value range:** an integer. **0:** disabled; **1:** enabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## ddb\_election\_timeout

**Parameter description:** Specifies the DCC election timeout period.

**Value range:** an integer, in the range [1,600], in seconds. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

## delay\_arbitrate\_timeout

**Parameter description:** Specifies the waiting time for a node in the same AZ as the primary DN to be promoted to primary after redo replay.

**Value range:** an integer, in the range [0,21474836] (unit: second). The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## install\_type

**Parameter description:** Specifies the settings related to the DR cluster to distinguish the cluster type.

**Value range:** an integer ranging from 0 to 2. Any modification of this parameter takes effect only after CM Server is restarted. This parameter cannot be enabled for non-DR clusters. For details about how to modify the parameter, see [Table 14-1](#).

**Default value:** 0

- **0** indicates the cluster for which no DR relationship is established.
- **1** indicates a Dorado-based cluster.
- **2** indicates a streaming-based cluster.

## enable\_synclist\_single\_inst

**Parameter description:** Specifies whether to reduce copies to one primary and zero standby.

**Value range:** Boolean. If this function is enabled, the copies are reduced to one primary and zero standby. If this parameter is incorrectly set, the default value is used. The modification of this parameter takes effect after reloading. For details about how to modify parameters, see the **Set cm parameter** table in section "Unified Database Management Tool > cm\_ctl Tool Introduction" in *Tool Reference*.

- **off:** indicates that this function is disabled.

- **on**: indicates that this function is enabled.

**Default value:** off

## 14.3.24 GTM Parameters

GTM parameters can be set in the **gtm.conf** file or using **gs\_guc**.

### nodename

**Parameter description:** Specifies the name of the primary or standby GTM.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which complies with the identifier naming convention

**Default value:** NULL

### port

**Parameter description:** Specifies the host port number listened by the primary or standby GTM.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

**Default value:** 6666

### log\_file

**Parameter description:** Specifies a log file name.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which complies with the identifier naming convention

**Default value:** `gtm-%Y-%m-%d_%H%M%S.log`

### active\_host

**Parameter description:** Specifies the IP address of a target GTM. For the primary GTM, it is the IP address of the standby GTM; for the standby GTM, it is the IP address of the primary GTM.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which complies with the identifier naming convention

**Default value:** NULL

## local\_host

**Parameter description:** Specifies the HA local address. Set this parameter based on the cluster configuration file. You do not need to manually set this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which complies with the identifier naming convention.

**Default value:** NULL

## active\_port

**Parameter description:** Specifies the port number of the target GTM server.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

 **NOTE**

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Default value:** 0

## local\_port

**Parameter description:** Specifies the local port for HA.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

 **NOTE**

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Default value:** 0

## standby\_connection\_timeout

**Parameter description:** Specifies the timeout interval between the primary and standby GTMs. A larger value enhances the fault tolerance capability of the network between the primary and standby GTMs, but increases the duration for reporting disconnection between them.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 5 to 2147483647. The unit is s.

**Default value:** 5

## keepalives\_count

**Parameter description:** Specifies the number of keepalived signals that can be waited before the GTM server is disconnected from the client if the OS supports the **TCP\_KEEPCNT** socket parameter. This parameter takes effect only on the standby GTM.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0, indicating that the connection is immediately broken if no keepalived signal from the client is received by the GTM.

## keepalives\_idle

**Parameter description:** Specifies the interval for sending keepalived signals.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is s.

**Default value:** 0

## keepalives\_interval

**Parameter description:** Specifies the response time before retransmission on an OS that supports the **TCP\_KEEPINTVL** socket option.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is s.

**Default value:** 0

## synchronous\_backup

**Parameter description:** Specifies whether to enable synchronization for backing up data to the standby GTM.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** **off**, **on**, or **auto**

- **on:** Synchronization is enabled.
- **off:** Synchronization is disabled.
- **auto:** Automatic synchronization is enabled.

**Default value:** **auto**

## query\_memory\_limit

**Parameter description:** Specifies the limit of memory available for queries. This parameter applies only to the default resource group. For other resource groups, the memory available for queries is not limited.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating point number ranging from **0.0** to **1.0**

**Default value:** **0.25**

## wlm\_max\_mem

**Parameter description:** Specifies the maximum memory for GTM execution.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 512 MB to 2147483647 MB.

**Default value:** **2048**

## config\_file

**Parameter description:** Specifies the name of a GTM configuration file. Only the sysadmin user can access this parameter.

**Value range:** a string Set it based on instructions provided in [Table 14-1](#).

**Default value:** **gtm.conf**

## data\_dir

**Parameter description:** Specifies the GTM data file directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** **NULL**

## listen\_addresses

**Parameter description:** Specifies the TCP/IP address of the client for a server to listen on.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**

- Host name or IP address. Multiple values are separated with commas (,).
- An asterisk (\*), indicating all IP addresses.
- If the parameter is not specified, the server does not listen on any IP address. In this case, only Unix domain sockets can be used for database connections.

**Default value:** \*

## log\_directory

**Parameter description:** Specifies the directory for storing log files when **logging\_collector** is set to **on**. The value can be an absolute path, or relative to the data directory.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the value of **log\_directory** in the configuration file is an invalid path (that is, the user does not have the permission to read or write this path), the cluster cannot be restarted.
- If the value of **log\_directory** is changed to a valid path (that is, the user has the permission to read and write this path), logs are generated in the new path. If the specified path is invalid, log files are generated in the last valid path and the database running is not affected. The invalid value is still written into the configuration file.

---

**Value range:** a string

**Default value:** **gtm\_log**, indicating that server logs will be generated in the **gtm\_log/** directory under the data directory.

## log\_min\_messages

**Parameter description:** Specifies which level of messages will be written into server logs. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

---

### NOTICE

If the values of **client\_min\_messages** and **log\_min\_messages** are the same, they indicate different levels.

---

**Valid values:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details, see [Table 14-6](#).

**Default value:** **warning**

## alarm\_component

**Parameter description:** Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm\_report\_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** **/opt/huawei/snas/bin/snas\_cm\_cmd**

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a non-negative integer (unit: s)

**Default value:** **10**

## standby\_only

**Parameter description:** Specifies whether to forcibly synchronize information to standby nodes. In one primary+multiple standbys mode, information is only forcibly synchronized to the ETCD.

**Value range:** **0** or **1**. Set this parameter based on instructions provided in [Table 14-1](#).

- **0**: Information is not forcibly synchronized to standby nodes.
- **1**: Information is forcibly synchronized to standby nodes.

**Default value:** **0**

## gtm\_max\_trans

**Parameter description:** Specifies the maximum number of connections accepted by the GTM. You are not advised to change the value. If you have to, set this parameter to a value no less than the maximum number of connections plus 100.

**Value range:** an integer ranging from 256 to 200000. Set it based on instructions provided in [Table 14-1](#).

**Default value:** **8192**

## enable\_connect\_control

**Parameter description:** Specifies whether the GTM verifies that a connection IP address is within the cluster.

**Value range:** Boolean. Set it based on instructions provided in [Table 14-1](#).

- **true**: The GTM checks whether a connection IP address is within the cluster. If it is not, the access is rejected.
- **false**: The GTM does not check whether a connection IP address is within the cluster.

**Default value:** true

## gtm\_authentication\_type

**Parameter description:** Specifies the port authentication mode of the GTM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the GTM cannot communicate properly, affecting the cluster status.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** gss or trust.

**Default value:** trust

## gtm\_krb\_server\_keyfile

**Parameter description:** Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the  $\$ \{GAUSSHOME\}/\text{kerberos}$  directory and ends with keytab. The file name is the same as the name of the user who runs the cluster. This parameter is used together with **gtm\_authentication\_type**. If **gtm\_authentication\_type** is changed to **gss**, **gtm\_krb\_server\_keyfile** must be configured as the correct path. Otherwise, the cluster status will be affected.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** "

## gtm\_option

**Parameter description:** Specifies the GTM mode, which must be set to the same value on all GTMs, CNs, and DNS. There are three GTM modes: GTM, GTM-Lite, and GTM-FREE. For details, see "GTM Mode" in *Feature Guide*. The GTM and GTM-Lite modes take effect only when the **enable\_gtm\_free** parameter is set to **off**. The current version does not support switching between different GTM modes for installed clusters.

**Value range:** an integer ranging from 0 to 2. The value **0** indicates the GTM mode, the value **1** indicates the GTM-Lite mode, and the value **2** indicates the GTM-FREE mode. Set it based on instructions provided in [Table 14-1](#).

**Default value:** 1

## csn\_sync\_interval

**Parameter description:** Specifies the interval for synchronizing CSN between the primary and standby GTMs.

**Value range:** an integer ranging from 1 to 2147483647 . The unit is s. Set it based on instructions provided in [Table 14-1](#).

**Default value:** 1

## restore\_duration

**Parameter description:** Specifies the pre-allocation interval of XID or CSN on the GTM.

**Value range:** an integer ranging from 1000000 to 2147483647. Set it based on instructions provided in [Table 14-1](#).

**Default value:** 1000000

## gtm\_enable\_threadpool

**Parameter description:** Specifies whether to enable the GTM thread pool function. The setting takes effect only after the GTM is restarted.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** true

## gtm\_num\_threads

**Parameter description:** Specifies the number of work threads in the thread pool when the thread pool function **gtm\_enable\_threadpool** is enabled.

The value is related to the size of **gtm\_max\_trans** and cannot exceed the result of (Value of **gtm\_max\_trans** - 1 - Number of auxiliary threads). The number of auxiliary threads is 2 in the current version.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 16384

**Default value:** 1024

## 14.3.25 Upgrade Parameters

### IsInplaceUpgrade

**Parameter description:** Specifies whether an upgrade is ongoing. This parameter is an upgrade parameter and cannot be modified. Only the sysadmin user can access the parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates an upgrade is ongoing.
- **off** indicates no upgrade is ongoing.

**Default value:** off

## inplace\_upgrade\_next\_system\_object\_oids

**Parameter description:** Specifies the OID of a new system object during the in-place upgrade. This parameter is used for upgrade and cannot be modified by users.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** empty

## upgrade\_mode

**Parameter description:** Specifies the upgrade mode. This parameter is used for upgrade. You are advised not to modify it.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer ranging from 0 to 2147483647

- **0:** indicates that the local upgrade and the minor version gray upgrade are not in progress.
- **1:** indicates that the upgrade is in progress. The upgrade command is executed and takes effect after the check is completed.
- **2:** indicates that the major version gray upgrade is in progress. The upgrade command is executed and takes effect after the check is completed.

**Default value:** 0

### NOTE

Execute the precommand on new packages, switch to the cluster user, and use the **source** command to invalidate environment variables. Run the **gs\_upgradectl -t chose-strategy** command to check whether the upgrade is a major version upgrade or minor version upgrade.

If "Upgrade strategy: large-binary-upgrade" is returned, the major version is upgraded.

If "Upgrade strategy: small-binary-upgrade" is returned, the minor version is upgraded.

## 14.3.26 Miscellaneous Parameters

### enable\_default\_ustore\_table

**Parameter description:** Specifies whether to enable the Ustore storage engine by default. If this parameter is set to **on**, all created tables are Ustore tables.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space expansion may occur.

**Value range:** [off, on]

**Default value:** off

## enable\_ustore

**Parameter description:** Specifies whether to enable the Ustore storage engine. If this parameter is set to **on**, Ustore tables can be created. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space expansion may occur.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [off, on]

**Default value:** on

## reserve\_space\_for\_nullable\_atts

**Parameter description:** Specifies whether to reserve space for the nullable attribute of an Ustore table. If this parameter is set to **on**, space is reserved for the nullable attribute of the Ustore table by default.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [off, on]

**Default value:** on

## server\_version

**Parameter description:** Specifies the server version number (string).

This parameter is a fixed INTERNAL parameter and cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with PostgreSQL's **server\_version**. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool APIs (which will be queried when the tool is connected). This parameter is not recommended. You can use the **opengauss\_version()** function to obtain the kernel version.

**Value range:** a string.

**Default value:** 9.2.4

## server\_version\_num

**Parameter description:** Specifies the server version number (integer).

This parameter is a fixed INTERNAL parameter and cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with PostgreSQL's **server\_version\_num**. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool APIs (which will be queried when the tool is connected).

**Value range:** an integer

**Default value:** 90204

## block\_size

**Parameter description:** Specifies the block size of the current database.

This parameter is a fixed INTERNAL parameter and cannot be modified. This parameter is inherited from the PostgreSQL kernel, indicating that the current database kernel is compatible with PostgreSQL's **server\_version\_num**. This parameter is reserved to ensure the ecosystem compatibility of the northbound external tool APIs.

**Default value:** 8192

## segment\_size

**Parameter description:** Specifies the segment file size of the current database.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** 1 GB

## max\_index\_keys

**Parameter description:** Specifies the maximum number of index keys supported by the current database.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** 32

## integer\_datetimes

**Parameter description:** Specifies whether the date and time are in the 64-bit integer format.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** Boolean

- **on** indicates that the 64-bit integer format is used.
- **off** indicates that the 64-bit integer format is not used.

**Default value:** on

## enable\_cluster\_resize

**Parameter description:** If an SQL statement involves tables belonging to different groups, you can enable this parameter to push the execution plan of the statement to improve performance.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the execution plan of the statement can be pushed.

- **off** indicates that the execution plan of the statement cannot be pushed.

**Default value:** off

 **NOTE**

This parameter is used for internal O&M. Do not set it to **on** unless absolutely necessary.

## lc\_collate

**Parameter description:** Specifies the locale in which sorting of textual data is done.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** Determined by the configuration set during the cluster installation and deployment.

## lc\_ctype

**Parameter description:** Specifies the locale that determines character classifications. For example, it specifies what a letter and its upper-case equivalent are.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** Determined by the configuration set during the cluster installation and deployment.

## max\_identifier\_length

**Parameter description:** Specifies the maximum identifier length.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer

**Default value:** 63

## server\_encoding

**Parameter description:** Specifies the database encoding (character set).

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** Determined when the database is created.

## enable\_upgrade\_merge\_lock\_mode

**Parameter description:** If this parameter is set to **on**, the delta merge operation internally increases the lock level, and errors can be prevented when update and delete operations are performed at the same time.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the delta merge operation internally increases the lock level. In this way, when the **DELTAMERGE** operation is concurrently performed with the **UPDATE** or **DELETE** operation, one operation can be performed only after the previous one is complete.
- If this parameter is set to **off** and the **DELTAMERGE** operation is concurrently performed with the **UPDATE** or **DELETE** operation to the data in a row in the delta table of the table, errors will be reported during the later operation, and the operation will stop.

**Default value:** off

## transparent\_encrypt\_kms\_region

**Parameter description:** This parameter is discarded. It stores the deployment region of the entire cluster. The content must contain only the characters specified in RFC3986, and the maximum length is 2047 bytes.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** empty.

## datanode\_heartbeat\_interval

**Parameter description:** Specifies the interval at which heartbeat messages are sent between heartbeat threads. You are advised to set this parameter to a value no more than **wal\_receiver\_timeout/2**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1000 to 60000. The unit is ms.

**Default value:** 1s

## dfs\_partition\_directory\_length

**Parameter description:** Specifies the maximum directory name length for the partition directory of a table partitioned by VALUE in the HDFS.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 92 to 7999

**Default value:** 512

## max\_concurrent\_autonomous\_transactions

**Parameter description:** Specifies the maximum number of autonomous transaction connections, that is, the maximum number of concurrent autonomous transactions executed at the same time. If this parameter is set to **0**, autonomous transactions cannot be executed.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0–10000. The theoretical maximum value is **10000**, and the actual maximum value is a dynamic value. The calculation formula is  $262143 - \text{job\_queue\_processes} - \text{autovacuum\_max\_workers} - \text{max\_inner\_tool\_connections} - \text{max\_connections} - \text{AUXILIARY\_BACKENDS} - \text{AV\_LAUNCHER\_PROCS}$ . The values of [job\\\_queue\\\_processes](#), [autovacuum\\\_max\\\_workers](#), [max\\\_inner\\\_tool\\\_connections](#), and [max\\\_connections](#) depend on the settings of the corresponding GUC parameters. **AUXILIARY\\_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV\\_LAUNCHER\\_PROCS** indicates the number of reserved launcher threads for autovacuum, which is fixed to **2**.

**Default value:**

Independent deployment: **80** (60-core CPU/480 GB memory); **40** (32-core CPU/256 GB memory); **20** (16-core CPU/128 GB memory); **10** (8-core CPU/64 GB memory, 4-core CPU/32 GB memory, 4-core CPU/16 GB memory)

**Suggestion:** Set this parameter based on actual service requirements and hardware configurations. It is recommended that this parameter be set to a value less than or equal to 1/10 of **max\\_connections**. If you only increase the value of this parameter but do not adjust the memory parameters in the same proportion, the memory may be insufficient and the error message "memory is temporarily unavailable" is displayed when the service load is heavy.

 **NOTE**

If the value range of this parameter is changed during the upgrade and the value is changed before the commit operation, you need to change the value range to the value allowed before the upgrade if you roll back the upgrade. Otherwise, the database may fail to be started.

## mot\_config\_file

This parameter is unavailable in a distributed system.

## enable\_gpi\_auto\_update

**Parameter description:** Determines whether global indexes are updated by default in partition DDL commands.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). This parameter must be set to the same value on CNs and DNPs. Otherwise, the global index function may be abnormal.

**Value range:** Boolean

- The value **on** indicates that global indexes are updated regardless of whether the partition DDL commands contain the UPDATE GLOBAL INDEX clause.
- The value **off** indicates that global indexes are not updated unless the partition DDL commands contain the UPDATE GLOBAL INDEX clause.

**Default value:** off

## change\_cluster\_mode

**Parameter description:** Specifies whether the cluster is in the mode switchover process. Mode switchover refers to: A cluster with one primary and two standby nodes is switched to a cluster with one primary node, one standby node, and one log; a cluster with one primary node, one standby node, and one log is switched to a cluster with one primary and two standby nodes; standby DNs and log DNs in a cluster with one primary node, one standby node, and one log are switched to each other.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

- The value **0** indicates that the cluster mode is not being switched.
- The value **1** indicates that the cluster mode is being switched.
- Other values are meaningless and have the same effect as the value **0**.

**Default value:** 0

---

 **CAUTION**

This parameter specifies whether the read function of the standby node in a distributed system is available. If this parameter is set to **1**, the read function of the standby node in a distributed system cannot be used. Exercise caution when setting this parameter.

---

## 14.3.27 Wait Event

### enable\_instr\_track\_wait

**Parameter description:** Specifies whether to enable real-time collection of wait event information.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of collecting wait event information is enabled.
- **off** indicates that the function of collecting wait event information is disabled.

**Default value:** on

## 14.3.28 Query

### instr\_unique\_sql\_count

**Parameter description:** Specifies the maximum number of unique SQL records to be collected. The value **0** indicates that the function of collecting unique SQL information is disabled.

If the value is changed from a larger one to a smaller one, unique SQL statistics will be reset and re-collected (the standby node does not support this function). There is no impact if the value is changed from a smaller one to a larger one.

When the number of unique SQL records generated in the system (to view the statistics, query **dbperf.statement** or **dbperf.summary\_statement**) is greater than the value of **instr\_unique\_sql\_count**, the extra unique SQL records are not collected.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU/256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3% by enabling or disabling this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 200000

## instr\_unique\_sql\_track\_type

**Parameter description:** Specifies which SQL statements are recorded in Unique SQL.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **top:** Only top-level SQL statements are recorded.
- **all:** All SQL statements are recorded.

**Default value:** top

## unique\_sql\_retention\_time

**Parameter description:** Specifies the interval for cleaning the unique SQL hash table. The default value is 30 minutes.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 3650. The unit is minute.

**Default value:** 30min

## enable\_instr\_rt\_percentile

**Parameter description:** Specifies whether to enable the function of calculating the response time of 80% and 95% SQL statements in the system.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of calculating the response time of 80% and 95% SQL statements is enabled.
- **off** indicates that the function of calculating the response time of 80% and 95% SQL statements is disabled.

**Default value:** on

## percentile

**Parameter description:** Specifies the percentage of SQL statements whose response time is to be calculated by the background calculation thread.

This parameter is an INTERNAL parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** "80,95"

## instr\_rt\_percentile\_interval

**Parameter description:** Specifies the interval at which the background calculation thread calculates the SQL response time.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

**Default value:** 10s

## enable\_instr\_cpu\_timer

**Parameter description:** Specifies whether to capture the CPU time consumed during SQL statement execution.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU/256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3.5% by enabling or disabling this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the CPU time consumed during SQL statement execution is captured.
- **off** indicates that the CPU time consumed during SQL statement execution is not captured.

**Default value:** on

## query\_log\_file (Deprecated)

**Parameter description:** Specifies the name of a slow query log file on the server. If **enable\_slow\_query\_log** is set to **ON**, slow query records are written into log

files. Only the **sysadmin** user can access this parameter. Generally, log file names are generated in strftime mode. Therefore, the system time can be used to define log file names, which are implemented using the escape character %. This parameter has been deprecated in this version.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

You are advised to use escape character % to specify the log file names for efficient management of log files.

---

**Value range:** a string

**Default value:** `slow_query_log-%Y-%m-%d_%H%M%S.log`

## query\_log\_directory (Deprecated)

**Parameter description:** Specifies the directory for storing low query log files when **enable\_slow\_query\_log** is set to **on**. Only the **sysadmin** user can access this parameter. It can be an absolute path or a relative path (relative to the data directory), which has been deprecated in this version.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

If this parameter is set to an invalid path, the cluster cannot be started.

---

** NOTE**

Valid path: You have read and write permissions on the path.

Invalid path: You do not have read or write permission on the path.

**Value range:** a string

**Default value:** specified during installation

## asp\_log\_directory

**Parameter description:** Specifies the directory for storing ASP log files on the server when **asp\_flush\_mode** is set to **all** or **file**. The value can be an absolute path, or relative to the data directory. Only the **sysadmin** user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

If this parameter is set to an invalid path, the cluster cannot be started.

---

 **NOTE**

- Valid path: You have read and write permissions on the path.
- Invalid path: You do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## perf\_directory

**Parameter description:** Specifies the directory of the output file of the performance view dotting task. Only the sysadmin user can access this parameter. The value can be an absolute path, or relative to the data directory.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

 **NOTE**

- Valid path: You have read and write permissions on the path.
- Invalid path: You do not have read or write permissions on an invalid path.

**Value range:** a string

**Default value:** specified during installation

## enable\_stmt\_track

**Parameter description:** Specifies whether to enable the full/slow SQL statement feature.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU/256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 1.2% by enabling or disabling this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** Full/Slow SQL capture is enabled.
- **off:** Full/Slow SQL capture is disabled.

**Default value:** on

## track\_stmt\_parameter

**Parameter description:** After **track\_stmt\_parameter** is enabled, the executed statements recorded in **statement\_history** are not normalized. The complete SQL statement information can be displayed to help the database administrator locate

faults. For a simple query, the complete statement information is displayed. For a PBE statement, the complete statement information and information about each variable value are displayed. The format is "query string; parameters: \$1=value1,\$2=value2, ...". This parameter is used to display full SQL information for users and is not controlled by the **track\_activity\_query\_size** parameter. When the SQL bypass logic is used for PBE statements, parameters are directly delivered to DNs. Therefore, the number of complete statements cannot be obtained by querying **statement\_history** on CNs. In addition, DNs do not have query character strings. Therefore, complete statement information cannot be obtained by querying **statement\_history** on DNs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on:** The function of displaying complete SQL statement information is enabled.
- **off:** The function of displaying complete SQL statement information is disabled.

**Default value:** off

## track\_stmt\_session\_slot

**Parameter description:** Specifies the maximum number of full/slow SQL statements that can be cached in a session. If the number of full/slow SQL statements exceeds this value, new statements will not be traced until the flush thread flushes the cached statements to the disk to reserve free space.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 1000

## track\_stmt\_details\_size

**Parameter description:** Specifies the maximum size of execution events that can be collected by a single statement.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100000000. The unit is byte.

**Default value:** 4096

## track\_stmt\_retention\_time

**Parameter description:** Specifies the retention period of full/slow SQL statement records. This parameter is a combination of parameters. This parameter is read every 60 seconds and records older than the retention period are deleted. Only the **sysadmin** user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string consisting of two parts in the format of 'full sql retention time, slow sql retention time'.

- **full sql retention time** indicates the retention period of full SQL statements. The value ranges from 0 to 86400. The unit is second.
- **slow sql retention time** indicates the retention period of slow SQL statements. The value ranges from 0 to 604800. The unit is second.

**Default value:** 3600,604800

## track\_stmt\_stat\_level

**Parameter description:** Determines the level of statement execution tracing.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). Letters are case insensitive. If the full SQL function is enabled, the performance will be affected and a large amount of disk space may be occupied.

**Value range:** a string

This parameter consists of two parts in the format of 'full sql stat level, slow sql stat level'.

- The first part indicates the tracing level of full SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.
- The second part indicates the tracing level of slow SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.

### NOTE

If the tracing level of full SQL statements is not **OFF**, the current SQL statement tracing level is a higher level ( $L2 > L1 > L0$ ) of full and slow SQL statements. For details about the levels, see "System Catalogs and System Views > System Catalogs > STATEMENT\_HISTORY > STATEMENT\_HISTORY columns" in *Developer Guide*.

**Default value:** OFF,L0

## track\_stmt\_standby\_chain\_size

**Parameter description:** Specifies the maximum memory and disk space occupied by fast/slow SQL statement records on the standby node. This parameter is a combination of parameters. This parameter is unavailable in a distributed system.

## 14.3.29 System Performance Snapshot

### enable\_wdr\_snapshot

**Parameter description:** Specifies whether to enable the database monitoring snapshot function.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the database monitoring snapshot function is enabled.

- **off** indicates that the database monitoring snapshot function is disabled.

**Default value:** on

## wdr\_snapshot\_retention\_days

**Parameter description:** Specifies the number of days database monitoring snapshots are retained. If the number of days that the snapshots are retained exceeds the value of this parameter, the system deletes the snapshots with the smallest ID at an interval specified by **wdr\_snapshot\_interval**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 30. The unit is day.

**Default value:** 8

## wdr\_snapshot\_query\_timeout

**Parameter description:** Specifies the execution timeout for the SQL statements associated with database monitoring snapshot operations. If the SQL statement execution is not complete and no result is returned within the specified time, the snapshot operation fails.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#). The value **0** indicates that this parameter does not take effect.

**Value range:** an integer ranging from 0 to 2147483647. The unit is s.

**Default value:** 100s

## wdr\_snapshot\_interval

**Parameter description:** Specifies the interval at which the backend thread Snapshot automatically performs snapshot operations on the database monitoring data.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 60. The unit is min.

**Default value:** 1h

## enable\_asp

**Parameter description:** Specifies whether to enable the active session profile function.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The function is enabled.
- **off:** The function is disabled.

**Default value:** on

## asp\_sample\_num

**Parameter description:** Specifies the maximum number of samples allowed in the LOCAL\_ACTIVE\_SESSION view. Only the sysadmin user can access this parameter.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10000 to 100000

**Default value:** 100000

## asp\_sample\_interval

**Parameter description:** Specifies the sampling interval.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 10. The unit is s.

**Default value:** 1s

## asp\_flush\_rate

**Parameter description:** When the number of samples reaches the value of **asp\_sample\_num**, the samples in the memory are updated to the disk based on a certain proportion. **asp\_flush\_rate** indicates the update proportion. If this parameter is set to **10**, the update ratio is 10:1.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 10

**Default value:** 10

## asp\_flush\_mode

**Parameter description:** Specifies the mode for the ASP to update data to the disk. The value can be **file** (default value), **table** (system catalog), or **all** (system catalog and file). Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which can be **table**, **file**, or **all**

**Default value:** table

## asp\_retention\_days

**Parameter description:** Specifies the maximum number of days for reserving ASP samples when they are written to the system catalog.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 7. The unit is day.

**Default value:** 2

## asp\_log\_filename

**Parameter description:** Specifies the file name format when writing files using ASP. Only the sysadmin user can access this parameter.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** asp-%Y-%m-%d\_%H%M%S.log

## 14.3.30 Security Configuration

### enable\_security\_policy

**Parameter description:** Specifies whether the unified audit and dynamic data masking policies take effect.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on:** The security policy is enabled.

**off:** The security policy is disabled.

**Default value:** off

### use\_elastic\_search

**Parameter description:** Specifies whether to send unified audit logs to Elasticsearch. If **enable\_security\_policy** and this parameter are enabled, unified audit logs are sent to Elasticsearch through HTTP or HTTPS (used by default). After this parameter is enabled, ensure that the Elasticsearch service corresponding to **elastic\_search\_ip\_addr** can be properly connected. Otherwise, the process fails to be started.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**on:** Unified audit logs are sent to Elasticsearch.

**off:** Unified audit logs are not sent to Elasticsearch.

**Default value:** off

## elastic\_search\_ip\_addr

**Parameter description:** Specifies the IP address of the Elasticsearch system. If HTTPS is used, the format is **https://ip:port.username**. If HTTP is used, the format is **http://ip:port**. In the preceding command, *ip* indicates the IP address of the Elasticsearch server. *port* indicates the listening port for Elasticsearch HTTP communication, and the value ranges from 9200 to 9299. *username* indicates the username used for registering an Elasticsearch account. The initial user is **elastic**. If HTTPS is used, related certificates need to be configured. For details, see "Unified Auditing" in the *Security Hardening Guide*.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** "

## is\_sysadmin

**Parameter description:** Specifies whether the current user is an initial user.

This parameter is a fixed INTERNAL parameter and cannot be modified.

**Value range:** Boolean

**on** indicates that the user is an initial user.

**off** indicates that the user is not an initial user.

**Default value:** off

## block\_encryption\_mode

**Parameter description:** Specifies the block encryption mode used by the `aes_encrypt` and `aes_decrypt` functions for encryption and decryption.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **aes-128-cbc**, **aes-192-cbc**, **aes-256-cbc**, **aes-128-cfb1**, **aes-192-cfb1**, **aes-256-cfb1**, **aes-128-cfb8**, **aes-192-cfb8**, **aes-256-cfb8**, **aes-128-cfb128**, **aes-192-cfb128**, **aes-256-cfb128**, **aes-128-ofb**, **aes-192-ofb**, and **aes-256-ofb**. **aes** indicates the encryption or decryption algorithm. **128**, **192**, and **256** indicate the key length (unit: bit). **cbc**, **cfb1**, **cfb8**, **cfb128**, and **ofb** indicate the block encryption or decryption mode.

**Default value:** aes-128-cbc

## 14.3.31 HyperLogLog

### hll\_default\_log2m

**Parameter description:** Specifies the number of buckets for HLL data. The number of buckets affects the precision of distinct values calculated by HLL. The more buckets there are, the smaller the deviation is. The deviation range is as follows:  $[-1.04/2^{\log_2 m^{*1/2}}, +1.04/2^{\log_2 m^{*1/2}}]$

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 16

**Default value:** 14

## hll\_default\_log2explicit

**Parameter description:** Specifies the default threshold for switching from the explicit mode to the sparse mode.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 12 The value 0 indicates that the explicit mode is skipped. The value 1 to 12 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_log2explicit}}$ .

**Default value:** 10

## hll\_default\_log2sparse

**Parameter description:** Specifies the default threshold for switching from the sparse mode to the full mode.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 14 The value 0 indicates that the explicit mode is skipped. The value 1 to 14 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_log2sparse}}$ .

**Default value:** 12

## hll\_duplicate\_check

**Parameter description:** Specifies whether duplicatecheck is enabled by default.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1 0: disabled; 1: enabled

**Default value:** 0

## hll\_default\_regwidth (Discarded)

**Parameter description:** Specifies the number of bits in each bucket for HLL data. A larger value indicates more memory occupied by HLL. **hll\_default\_regwidth** and **hll\_default\_log2m** determine the maximum number of distinct values that can be calculated by HLL. Currently, **regwidth** is set to a fixed value and is no longer used.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 5

**Default value:** 5

### hll\_default\_expthresh (Discarded)

**Parameter description:** Specifies the default threshold for switching from the **explicit** mode to the **sparse** mode. Currently, the **hll\_default\_log2explicit** parameter is used to replace the similar function.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 7 -1 indicates the auto mode; 0 indicates that the **explicit** mode is skipped; a value from 1 to 7 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_expthresh}}$ .

**Default value:** -1

### hll\_default\_sparseon (Discarded)

**Parameter description:** Specifies whether to enable the **sparse** mode by default. Currently, the **hll\_default\_log2sparse** parameter is used to replace the similar function. When **hll\_default\_log2sparse** is set to 0, the **sparse** mode is disabled.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1 0 indicates that the **sparse** mode is disabled by default. 1 indicates that the **sparse** mode is enabled by default.

**Default value:** 1

### hll\_max\_sparse (Discarded)

**Parameter description:** Specifies the size of **max\_sparse**. Currently, the **hll\_default\_log2sparse** parameter is used to replace the similar function.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

**Default value:** -1

### enable\_compress\_hll (Discarded)

**Parameter description:** Specifies whether to enable memory optimization for HLL. Currently, the HLL memory has been optimized, and this parameter is no longer used.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that memory optimization is enabled.
- **off** or **false** indicates that memory optimization is disabled.

**Default value:** off

## 14.3.32 User-defined Functions

### udf\_memory\_limit

**Parameter description:** Specifies the maximum physical memory that can be used when each CN or DN executes UDFs. This parameter does not take effect in the current version. Use **FencedUDFMemoryLimit** and **UDFWorkerMemHardLimit** to control virtual memory used by fenced udf worker.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 200 x 1024 to 2147483647. The unit is KB.

**Default value:** 200 MB

### FencedUDFMemoryLimit

**Parameter description:** Specifies the virtual memory used by each fenced udf worker process.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting Suggestions:** For details, see "User-defined Functions > PL/Java Functions" in *Developer Guide*.

**Value range:** an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB. **0** indicates that the memory is not limited.

**Default value:** 0

### UDFWorkerMemHardLimit

**Parameter description:** Specifies the maximum value of **fencedUDFMemoryLimit**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB.

**Default value:** 1GB

## 14.3.33 Collaborative Analysis

Due to specification changes, the current version no longer supports this feature. Do not use it.

### enable\_agg\_pushdown\_for\_ca

**Parameter description:** In collaborative analysis, this parameter specifies whether to convert the Agg operator above the ForeignScan operator into a remote SQL statement and send it to a remote cluster.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the Agg operator above ForeignScan is converted into a remote SQL statement.
- **off** indicates that only the ForeignScan operator is converted to a remote SQL statement.

**Default value:** on

### 14.3.34 Acceleration Cluster

Due to specification changes, the current version no longer supports this feature. Do not use it.

#### `show_acce_estimate_detail`

**Parameter description:** When the cluster is accelerated (`acceleration_with_compute_pool` is set to **on**), this parameter specifies whether the **EXPLAIN** statement displays the evaluation information about execution plan pushed down to the accelerated cluster. (Due to specification changes, the current version no longer supports this feature. Do not use it.) The evaluation information is generally used by O&M personnel during maintenance, and it may affect the output display of the **EXPLAIN** statement. Therefore, this parameter is disabled by default. The evaluation information is displayed only if the **verbose** option of the **EXPLAIN** statement is enabled.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the evaluation information is displayed in the output of the **EXPLAIN** statement.
- **off** indicates that the evaluation information is not displayed in the output of the **EXPLAIN** statement.

**Default value:** off

#### `acceleration_with_compute_pool`

**Parameter description:** Specifies whether to use the computing resource pool for acceleration when an OBS is queried. (Due to specification changes, the current version no longer supports this feature. Do not use it.)

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the query covering the OBS is accelerated based on the cost when the computing resource pool is available.
- **off** indicates that no query is accelerated using the computing resource pool.

**Default value:** off

## max\_resource\_package

**Parameter description:** Specifies the upper limit of the concurrent task threads for accelerating each cluster each DN.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 2147483647

**Default value:** 0

## 14.3.35 Scheduled Task

### job\_queue\_processes

**Parameter description:** Specifies the number of jobs that can be concurrently executed. This parameter is a POSTMASTER parameter. You can set it using **gs\_guc**, and you need to restart **gaussdb** to make the setting take effect.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 1000

Function:

- Setting **job\_queue\_processes** to **0** indicates that the scheduled job function is disabled and that no job will be executed. (Enabling scheduled jobs may affect the system performance. At sites where this function is not required, you are advised to disable it.)
- Setting **job\_queue\_processes** to a value that is greater than **0** indicates that the scheduled job function is enabled and this value is the maximum number of jobs that can be concurrently processed.

After the scheduled job function is enabled, the **job\_scheduler** thread polls the **pg\_job** system catalog at a scheduled interval. The scheduled job check is performed every second by default.

Too many concurrent jobs consume many system resources, so you need to set the number of concurrent jobs to be processed. If the current number of concurrent jobs reaches the value of **job\_queue\_processes** and some of them expire, these jobs will be postponed to the next polling period. Therefore, you are advised to set the polling interval (the **Interval** parameter of the **submit** API) based on the execution duration of each job to avoid the problem that jobs in the next polling period cannot be properly processed because of overlong job execution time.

Note: If the number of concurrent jobs is large and the value is too small, these jobs will wait in queues. However, a large parameter value leads to large resource consumption. You are advised to set this parameter to **100** and change it based on the system resource condition.

**Default value:** 10

### enable\_prevent\_job\_task\_startup

**Parameter description:** Specifies whether to start the job thread.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the job thread is not started.
- **off** indicates that the job thread is started.

**Default value:** off

### 14.3.36 Thread Pool

The overall design idea of the thread pool technology is to pool thread resources and reuse them among different connections. After the system is started, a fixed number of worker threads are started based on the current number of cores or user configuration. A worker thread serves one or more connection sessions. In this way, the session and thread are decoupled.

#### enable\_thread\_pool

**Parameter description:** Specifies whether to enable the thread pool function. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the thread pool function is enabled.
- **off** indicates that the thread pool function is disabled.

**Default value:** on

#### thread\_pool\_attr

**Parameter description:** Specifies the detailed attributes of the thread pool function. This parameter is valid only when **enable\_thread\_pool** is set to **on**. Only user **sysadmin** can access this parameter. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

This parameter consists of three parts: **thread\_num**, **group\_num**, and **cpubind\_info**. The meanings of the three parts are as follows:

- **thread\_num** indicates the total number of threads in the thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **thread\_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **thread\_num** = *Number of CPU cores* × **3-5**. The maximum value of **thread\_num** is **4096**.
- **group\_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the

number of thread groups in the thread pool is the same as the value of **group\_num**.

- **cpubind\_info** indicates whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '(nobind)': The thread is not bound to a core. 2. '(allbind)': Use all CPU cores that can be queried in the current system to bind threads. 3. '(nodebind: 1, 2)': Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. '(cpubind: 0-30)': Use CPU cores 0 to 30 to bind threads. 5. '(numabind: 0-30)': Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive.

**Default value:**

- Independent deployment: '**1024,2,(nobind)**' (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); '**512,2,(nobind)**' (16-core CPU/128 GB memory); '**256,2,(nobind)**' (8-core CPU/64 GB memory); '**128,2,(nobind)**' (4-core CPU/32 GB memory); '**64,2,(nobind)**' (4-core CPU/16 GB memory)

## thread\_pool\_stream\_attr

**Parameter description:** Specifies the detailed attributes of the stream thread pool function. This parameter is valid only when **enable\_thread\_pool** is set to **on** and only takes effect on DNs. Only user **sysadmin** can access this parameter. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

This parameter consists of four parts: **stream\_thread\_num**, **stream\_proc\_ratio**, **group\_num**, **cpubind\_info**. The meanings of the four parts are as follows:

- **stream\_thread\_num** indicates the total number of threads in the stream thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **stream\_thread\_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **stream\_thread\_num** = *Number of CPU cores* x **3-5**. The maximum value of **stream\_thread\_num** is **4096**.
- **stream\_proc\_ratio** indicates the ratio of proc resources reserved for stream threads. The value is a floating-point number. The default value is **0.2**. The reserved proc resources are calculated as follows: The value of **stream\_proc\_ratio** x the value of **stream\_thread\_num**.
- **group\_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group\_num**. The value of **group\_num** in **thread\_pool\_stream\_attr** must be the same as that in **thread\_pool\_attr**. If they are set to different values, the value of **group\_num** in **thread\_pool\_attr** is used.
- **cpubind\_info** indicates whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '(nobind)': The thread is not bound to a core. 2. '(allbind)': Use all CPU cores that can be queried in the

current system to bind threads. 3. '**(nodebind: 1, 2)**': Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. '**(cpubind: 0-30)**': Use CPU cores 0 to 30 to bind threads. 5. '**(numabind: 0-30)**': Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. The value of **cpubind\_info** in **thread\_pool\_stream\_attr** must be the same as that in **thread\_pool\_attr**. If they are set to different values, the value of **cpubind\_info** in **thread\_pool\_attr** is used.

**Default value:**

**stream\_thread\_num:** 16

**stream\_proc\_ratio:** 0.2

**group\_num** and **cpubind\_info**: For details, see [thread\\_pool\\_attr](#).

## resilience\_threadpool\_reject\_cond

**Parameter description:** Specifies the percentage of thread pool usage for escape from overload. This parameter takes effect only when the GUC parameters **enable\_thread\_pool** and **use\_workload\_manager** are enabled. This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

This parameter consists of **recover\_threadpool\_percent** and **overload\_threadpool\_percent**. The meanings of the two parts are as follows:

- **recover\_threadpool\_percent:** specifies the thread pool usage when the thread pool recovers to the normal state. When the thread pool usage is less than the value of this parameter, the escape from overload function is disabled and new connections are allowed. The value ranges from 0 to *INT\_MAX*. The value indicates a percentage.
- **overload\_threadpool\_percent:** specifies thread pool usage when the thread pool is overloaded. If the thread pool usage is greater than the value of this parameter, the current thread pool is overloaded. In this case, the escape from overload function is enabled to kill sessions and forbid new connections. The value ranges from 0 to *INT\_MAX*. The value indicates a percentage.

**Default value:** '0,0', indicating that the thread pool escape function is disabled.

**Example:**

```
resilience_threadpool_reject_cond = '50,90'
```

When the thread pool usage exceeds 90%, new connections are forbidden and stacked sessions are killed. When the thread pool usage decreases to 50%, session killing is stopped and new connections are allowed.

#### NOTICE

- The thread pool usage can be queried in the DBE\_PERF.local\_threadpool\_status view. The initial number of threads in the thread pool can be obtained by querying the **thread\_pool\_attr** parameter.
- If this parameter is set to a small value, the thread pool escape from overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual thread pool usage.
- If the **use\_workload\_manager** parameter is disabled and the **bypass\_workload\_manager** parameter is enabled, this parameter also takes effect. The **bypass\_workload\_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The values of **recover\_threadpool\_percent** and **overload\_threadpool\_percent** can be 0 at the same time. In addition, the value of **recover\_threadpool\_percent** must be smaller than that of **overload\_threadpool\_percent**. Otherwise, the setting does not take effect.

## 14.3.37 Full Text Search

### ngram\_gram\_size

**Parameter description:** Specifies the length of the ngram parser segmentation.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 4

**Default value:** 2

### ngram\_grapsymbol\_ignore

**Parameter description:** Specifies whether the ngram parser ignores graphical characters.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The ngram parser ignores graphical characters.
- **off:** The ngram parser does not ignore graphical characters.

**Default value:** off

### ngram\_punctuation\_ignore

**Parameter description:** Specifies whether the ngram parser ignores punctuation marks.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The ngram parser ignores punctuation marks.
- **off:** The ngram parser does not ignore punctuation marks.

**Default value:** on

## 14.3.38 Backup and Restoration

### operation\_mode

**Parameter description:** Specifies whether the system enters the backup and restoration mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the system is in the backup and restoration mode.
- **off** indicates that the system is not in the backup and restoration mode.

**Default value:** off

### enable\_cbm\_tracking

**Parameter description:** Specifies whether to enable cbm tracking. To perform full or incremental backup for the cluster by using Roach, set this parameter to **on**. Otherwise, the backup will fail.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The cbm tracking is enabled.
- **off:** The cbm tracking is disabled.

**Default value:** off

### max\_size\_for\_xlog\_retention

**Parameter description:** Specifies when to forcibly push the backup replication slot to prevent the disk from being full and the cluster from being read-only because logs cannot be recycled during backup. It is recommended that the value of this parameter be a little smaller than the value of **datastorage\_threshold\_value\_check** of the CM Server component to prevent the cluster from entering the read-only state.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** -100 to 2147483647

- The value **0** indicates that this function is disabled.
- A negative value indicates that the backup replication slot is forcibly pushed when the disk usage exceeds 80% and log recycling is blocked due to backup operations. For example, **-80** indicates that the backup replication slot is forcibly pushed when the disk usage exceeds 80%.
- A positive value indicates that the backup replication slot is triggered based on the size of stacked logs. For example, **32** indicates that the backup replication slot is forcibly pushed when the redo position of the current checkpoint exceeds 32 log segments (the size of each log segment is 16 MB) and logs are recycled because the backup operation is blocked.

**Default value:** 0

### max\_cbm\_retention\_time

**Parameter description:** Specifies the interval at which CBM backup files are forcibly recycled. If CBM files cannot be recycled during backup, the disk will be full and the cluster will be read-only. You are advised to set this parameter based on the full backup interval.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 86400 to 2147483647

- The unit is second.
- The minimum value is 1 day.
- The default value is 2 weeks.

**Default value:** 1209600

## 14.3.39 AI Features

### enable\_hypo\_index

**Parameter description:** Specifies whether the database optimizer considers the created virtual index when executing the **EXPLAIN** statement. By executing **EXPLAIN** on a specific query statement, you can evaluate whether the index can improve the execution efficiency of the query statement based on the execution plan provided by the optimizer.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that a virtual index is created during **EXPLAIN** execution.
- **off** indicates that no virtual index is created during **EXPLAIN** execution.

**Default value:** off

### enable\_ai\_stats

**Parameter description:** Specifies whether to create or use intelligent statistics.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

**Default value:** off

## multi\_stats\_type

**Parameter description:** Specifies the type of statistics to be created when **enable\_ai\_stats** is set to **on**.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** BAYESNET, MCV, or ALL.

- **BAYESNET:** Only intelligent statistics are created.
- **MCV:** Only traditional statistics are created.
- **ALL:** Both traditional statistics and intelligent statistics are created.

**Default value:** BAYESNET

## ai\_stats\_cache\_limit

**Parameter description:** Specifies the maximum number of models that can be cached when **enable\_ai\_stats** is set to **on**.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 30 to 1000

**Default value:** 100

## enable\_operator\_prefer

**Parameter description:** Specifies whether to enable the operator preference rule. If the estimated costs are similar, the parameterized path is preferred for table join. Note: There are two prerequisites for this parameter to take effect: 1. The parameterized path is generated. 2. The estimated cost of the parameterized path is similar to that of other index scan operators.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

**Default value:** off

## enable\_ai\_watchdog

**Parameter description:** Enables or disables the AI watchdog function.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_ai\_watchdog\_forcible\_oom\_detection

**Parameter description:** Forcibly enables or disables OOM detection of the AI watchdog. If this parameter is disabled, the system automatically determines whether to enable OOM detection based on the current database specifications. In automatic determination mode, OOM detection is enabled only when **max\_process\_memory** is set to 64 GB or larger.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## enable\_ai\_watchdog\_healing

**Parameter description:** Enables or disables the self-healing function of the AI watchdog. You are advised not to enable this function because it is easy to cause suspension in high-load scenarios with 16-core CPU or lower specifications.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## ai\_watchdog\_max\_cpu\_usage

**Parameter description:** Specifies the expected upper limit of the database CPU usage. The value is normalized based on the multi-core situation. If this parameter is set to **0**, the system does not check the CPU usage.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.8

## ai\_watchdog\_oom\_dynamic\_used\_threshold

**Parameter description:** Specifies the expected upper limit of the dynamic memory usage of the database.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.95

## ai\_watchdog\_oom\_growth\_confidence

**Parameter description:** Specifies the confidence level of the OOM detection algorithm.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0.1 to 1.

**Default value:** 0.95

## ai\_watchdog\_oom\_malloc\_failures

**Parameter description:** Specifies the maximum number of consecutive memory allocation failures tolerated. If the number of consecutive memory allocation failures exceeds this value, the OOM detection function may be triggered.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 32000.

**Default value:** 50

## ai\_watchdog\_oom\_other\_used\_memory\_threshold

**Parameter description:** Specifies the expected upper limit of memory usage of other parts of the database, in MB.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 32000.

**Default value:** 20480

## ai\_watchdog\_oom\_process\_threshold

**Parameter description:** Specifies the expected percentage of the database process usage to the value of **max\_process\_memory**. When the threshold is reached, memory leakage determination is triggered. The value can be greater than 1.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0 to 10.

**Default value:** 1.1

## ai\_watchdog\_oom\_shared\_threshold

**Parameter description:** Specifies the expected upper limit of the shared memory usage of the database.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.4

## ai\_watchdog\_rto\_restriction\_time

**Parameter description:** Specifies the RTO threshold of the AI watchdog self-healing function. If the RTO threshold is exceeded, self-healing is not performed. The unit is second.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 36000.

**Default value:** 600

## ai\_watchdog\_tolerance\_times

**Parameter description:** Specifies the maximum number of consecutive abnormal events that can be tolerated by the AI watchdog before self-healing is started. This parameter can be used to avoid incorrect operations.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 100.

**Default value:** 4

## ai\_watchdog\_tps\_threshold

**Parameter description:** Specifies the lower limit of the expected TPS usage of the database instance. If the TPS usage is lower than the value of this parameter, the exception determination logic is triggered.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 32000.

**Default value:** 2

## ai\_watchdog\_wait\_time

**Parameter description:** Adjusts the waiting time, in seconds. To prevent the database from frequently performing self-healing operations, the database waits for a period of time after startup.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 36000.

**Default value:** 1800

## ai\_watchdog\_warning\_retention

**Parameter description:** Specifies the maximum number of alarm records that the AI watchdog can retain in the `db_perf.ai_watchdog_detection_warnings` view.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 32000.

**Default value:** 20

## 14.3.40 Global SysCache Parameters

### enable\_global\_syscache

**Parameter description:** Specifies whether to enable the global system cache function. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the global system cache function is enabled.
- **off** indicates that the global system cache function is disabled.

**Default value:** on

You are advised to use this parameter together with the thread pool parameter. After this parameter is enabled, you are advised to set **wal\_level** of the standby node to **hot\_standby** or higher if you need to access the standby node.

### global\_syscache\_threshold

**Parameter description:** Specifies the maximum memory usage of the global system cache.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

The **enable\_global\_syscache** parameter must be enabled.

**Value range:** an integer ranging from 16384 to 1073741824. The unit is KB.

**Default value:** 163840

Recommended calculation formula: The smaller value of the number of hot databases and the number of threads x Memory size allocated to each database, that is, **global\_syscache\_threshold = min(count(hot dbs),count(threads)) x memofdb**.

The number of hot databases refers to the number of frequently accessed databases. In thread pool mode, the number of threads is the sum of the number of threads in the thread pool and the number of background threads. In non-thread pool mode, the number of hot databases is used.

**memofdb** indicates the average memory allocated to each database. The background noise memory of each database is 2 MB. Each time a table or index is added, 11 KB memory is added.

If this parameter is set to a small value, memory is frequently evicted, and a large number of memory fragments cannot be recycled. As a result, memory control fails.

## 14.3.41 Reserved Parameters

### NOTE

The following parameters are reserved and do not take effect in this version.

acce\_min\_datasize\_per\_thread

cstore\_insert\_mode  
dfs\_partition\_directory\_length

### Discarded Parameters

max\_query\_retry\_times  
enable\_slow\_query\_log

## 14.3.42 Read Parameters of the Standby Node in a Distributed System

### enable\_standby\_read

**Parameter description:** Specifies whether to enable the read function of the standby node for a session. This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the read function of the standby node in a distributed system is enabled for the session.
- **off** indicates that the read function of the standby node in a distributed system is disabled for the session.

**Default value:** off

#### NOTE

- This function can be enabled only in GTM-free mode, non-transaction block, and hot-standby mode.
- This parameter can be set only at the session level and cannot be set using `gs_guc`.
- If this parameter is set at a non-session level (for example, manually enabling this parameter in the configuration file), the cluster cannot be started when a parameter conflict occurs. If no parameter conflict occurs, the read function of the standby node in a distributed system is also enabled for background threads such as `autovacuum` and `WorkloadMonitor`. As a result, DDL and DML operations are affected and errors are reported.

## standby\_read\_delay

**Parameter description:** Specifies the maximum difference between the primary and standby nodes when data is read from the standby node. If the difference exceeds the value of this parameter, data cannot be read from the standby node. This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to *INT\_MAX*. The unit is ms. -1 indicates that the difference between the primary and standby nodes does not need to be verified when data is read from the standby node. 0 indicates that data is read from the standby node only when there is no difference between the primary and standby nodes.

**Default value:** 10000000

## standby\_read\_rto

**Parameter description:** Specifies the maximum RTO of the system when data is read from the standby node. If the RTO exceeds the value of this parameter, data cannot be read from the standby node. This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to *INT\_MAX*. The unit is ms. The value -1 indicates that the system RTO verification is not required when data is read from the standby node. The value 0 indicates that data is read from the standby node only when the RTO of at least one standby node is 0.

**Default value:** 60000

## 14.3.43 Restoring Data on the Standby Node

### standby\_page\_repair

**Parameter description:** Specifies whether to enable page repair during playback on the standby node. This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the standby node automatically detects and repairs pages during playback.
- **off** indicates that the standby node does not automatically detect and repair pages during playback.

**Default value:** off

## 14.3.44 Undo

### undo\_space\_limit\_size

**Parameter description:** Specifies the threshold for forcibly recycling undo space. When the undo space usage reaches 80% of the threshold, forcible recycling starts. You are advised to set **undo\_space\_limit\_size** to a value greater than or equal to that of **undo\_limit\_size\_per\_transaction**.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 102400 to 2147483647. The unit is 8 KB.

**Default value:** 256 GB

## undo\_limit\_size\_per\_transaction

**Parameter description:** Specifies the undo space threshold of a single transaction. If the threshold is reached, the transaction is rolled back due to an error. You are advised to set **undo\_limit\_size\_per\_transaction** to a value less than or equal to that of **undo\_space\_limit\_size**. If the value of **undo\_limit\_size\_per\_transaction** is greater than that of **undo\_space\_limit\_size**, the displayed value is the same as the configured value when you run the **show undo\_limit\_size\_per\_transaction** command to query the parameter value. The only difference is that the smaller value between **undo\_space\_limit\_size** and **undo\_limit\_size\_per\_transaction** is used as the actual undo space threshold of a single transaction. If the **undo\_limit\_size\_per\_transaction** is set to a value greater than 1 TB, the system performance and stability may be affected.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 256 to 2147483647. The unit is 8 KB.

**Default value:** 32 GB

## 14.3.45 Rollback Parameters

### max\_undo\_workers

**Parameter description:** Specifies the number of undo worker threads invoked during asynchronous rollback. The parameter setting takes effect after the system is restarted.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 100

**Default value:** 5

## 14.3.46 DCF Parameters Settings

### enable\_dcf

**Parameter description:** Specifies whether to enable the DCF mode.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value can be **on** or **off**. **on** indicates that the current log replication mode is DCF, and **off** indicates that the current log replication mode is not DCF.

**Default value:** off

## dcf\_ssl

**Parameter description:** This parameter is no longer used. The DCF reuses the GUC parameter [ssl](#).

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value can be **on** or **off**. The value **on** indicates that SSL is used, and the value **off** indicates that SSL is not used.

**Default value:** on

## dcf\_config

**Parameter description:** Specifies the customized configuration information during installation.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a string, which is specified by users during installation

## dcf\_data\_path

**Parameter description:** Specifies the DCF data path.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a string, which is the **dcf\_data** directory under the data directory of the DN

## dcf\_log\_path

**Parameter description:** Specifies the DCF log path.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a string, which is the **dcf\_log** directory under the data directory of the DN.

## dcf\_node\_id

**Parameter description:** Specifies the ID of the DN where the DCF is located. This parameter is defined by the user during installation and mode switching.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** an integer, which is specified by users during installation

## dcf\_max\_workers

**Parameter description:** Specifies the number of DCF callback function threads. If the number of nodes exceeds 7, increase the value of this parameter (for example,

to **40**). Otherwise, the primary node may remain in the promoting state and the log replication between the primary and standby nodes has no progress.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 262143

**Default value:** 20

## dcf\_truncate\_threshold

**Parameter description:** Specifies the threshold for a DN to truncate DCF logs.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 100000

## dcf\_election\_timeout

**Parameter description:** Specifies the timeout interval for selecting the DCF leader and follower. The election timeout interval depends on the status of the network between DNs. If the timeout interval is short and the network quality is poor, timeout occurs. After the network recovers, the election becomes normal. You are advised to set a proper timeout interval based on the current network status. Restriction on the DCF node clock: The maximum clock difference between DCF nodes is less than half of the election timeout period. In DCF manual election mode, to ensure timely CM arbitration, do not modify this parameter. Instead, use the default election timeout period.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 600, in seconds

**Default value:** 3

## dcf\_enable\_auto\_election\_priority

**Parameter description:** Specifies whether the DCF priority can be automatically adjusted. The value **0** indicates that automatic adjustment is not allowed, and the value **1** indicates that automatic adjustment is allowed.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1.

**Default value:** 1

## dcf\_election\_switch\_threshold

**Parameter description:** Specifies the DCF threshold for preventing frequent switchover to primary. It is recommended that this parameter be set based on the maximum fault duration acceptable for user services.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in seconds.

**Default value:** 0

## dcf\_run\_mode

**Parameter description:** Specifies the DCF election mode. The value **0** indicates the automatic election mode, the value **1** indicates the manual election mode, and the value **2** indicates that the election mode is disabled. Currently, the election mode can be disabled only in minority restoration scenarios. If the election mode is disabled, the database instance will become unavailable.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

Note: The working mode of a cluster can be switched only when the cluster is running properly. Otherwise, the cluster is still abnormal after the switching. The DCF working mode configured in GUC parameters must be the same as that configured by using `cm_ctl`. That is, both DCF working modes must be set to manual or automatic at the same time.

For example, to set the DCF manual mode, run the following command:

```
cm_ctl set --param --server -k dn_arbitrate_mode=quorum
cm_ctl reload --param --server
gs_guc reload -Z datanode -I all -N all -c "dcf_run_mode=1"
```

To set the DCF automatic mode, run the following command:

```
cm_ctl set --param --server -k dn_arbitrate_mode=paxos
cm_ctl reload --param --server
gs_guc reload -Z datanode -I all -N all -c "dcf_run_mode=0"
```

**Value range:** 0, 1, or 2

**Default value:** 1

## dcf\_log\_level

**Parameter description:** Specifies the DCF log level.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- Disable the log function: **NONE**, indicating that the log function is disabled and cannot be used for the following log levels:
- Enable the log function: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**

You can select a string from the preceding strings and use vertical bars (|) to combine the strings. The log level cannot be left blank.

**Default value:** **RUN\_ERR|RUN\_WAR|DEBUG\_ERR|OPER|RUN\_INF|PROFILE**

## dcf\_log\_backup\_file\_count

**Parameter description:** Specifies the number of DCF run log backups.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 100

### dcf\_max\_log\_file\_size

**Parameter description:** Specifies the maximum size of a DCF run log file.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000, in MB

**Default value:** 10

### dcf\_socket\_timeout

**Parameter description:** Specifies the timeout interval for the DCF communication module to connect to the socket. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, a connection may fail to be set up. In this case, you need to increase the value.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 600000, in ms

**Default value:** 5000

### dcf\_connect\_timeout

**Parameter description:** Specifies the timeout interval for the DCF communication module to set up a connection. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, the connection may fail to be set up. In this case, you need to increase the value.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 600000, in ms

**Default value:** 60000

### dcf\_mec\_fragment\_size

**Parameter description:** Specifies the fragment size of the DCF communication module. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 10240, in KB

**Default value:** 64

## dcf\_stg\_pool\_max\_size

**Parameter description:** Specifies the maximum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 2048

## dcf\_stg\_pool\_init\_size

**Parameter description:** Specifies the minimum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 32

## dcf\_mec\_pool\_max\_size

**Parameter description:** Specifies the maximum size of the memory pool of the DCF communication module. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 200

## dcf\_flow\_control\_disk\_rawait\_threshold

**Parameter description:** Specifies the disk waiting threshold for DCF flow control.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in  $\mu$ s

**Default value:** 100000

## dcf\_flow\_control\_net\_queue\_message\_num\_threshold

**Parameter description:** Specifies the threshold for the number of messages in a network queue for DCF flow control.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 1024

## dcf\_flow\_control\_cpu\_threshold

**Parameter description:** Specifies the threshold for DCF CPU flow control.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in percentage (%)

**Default value:** 100

## dcf\_mec\_batch\_size

**Parameter description:** Specifies the number of batch messages for DCF communication. When the value is **0**, the DCF automatically adjusts the value based on the network and the amount of data to be written. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1024

**Default value:** 0

## dcf\_mem\_pool\_max\_size

**Parameter description:** Specifies the maximum DCF memory. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 2048

## dcf\_mem\_pool\_init\_size

**Parameter description:** Specifies the initial size of the DCF memory. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB

**Default value:** 32

## dcf\_compress\_algorithm

**Parameter description:** Specifies the compression algorithm for DCF run log transmission. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer

- 0 indicates no compression.
- 1 indicates the ZSTD compression algorithm.
- 2 indicates the LZ4 compression algorithm.

**Default value:** 0

## dcf\_compress\_level

**Parameter description:** Specifies the compression level for DCF log transmission. This parameter takes effect upon the system restart. Before this parameter takes effect, a valid compression algorithm must be configured, that is, the **dcf\_compress\_algorithm** parameter is set.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 22

If compression is disabled, the configured compression level does not take effect.

**Default value:** 1

## dcf\_mec\_channel\_num

**Parameter description:** Specifies the number of DCF communication channels. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 64

**Default value:** 1

## dcf\_rep\_append\_thread\_num

**Parameter description:** Specifies the number of DCF log replication threads. This parameter takes effect upon the system restart.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 2

## dcf\_mec\_agent\_thread\_num

**Parameter description:** Specifies the number of DCF communication working threads. This parameter takes effect upon the system restart. It is recommended that the value of **dcf\_mec\_agent\_thread\_num** be greater than or equal to 2 x Number of nodes x Value of **dcf\_mec\_channel\_num**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000

**Default value:** 10

## dcf\_mec\_reactor\_thread\_num

**Parameter description:** Specifies the number of reactor threads used by the DCF. This parameter takes effect upon the system restart. It is recommended that the ratio of the value of **dcf\_mec\_reactor\_thread\_num** to the value of **dcf\_mec\_agent\_thread\_num** be 1:40.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 100

**Default value:** 1

## dcf\_log\_file\_permission

**Parameter description:** Specifies the attribute of the DCF run log file. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access logs, ensure that all parent directories can be accessed by other users in the same group. That is, if **dcf\_log\_path\_permission** is set to **750**, **dcf\_log\_file\_permission** can only be set to **600** or **640**. If **dcf\_log\_path\_permission** is set to **700**, **dcf\_log\_file\_permission** must be set to **600**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated type. The value can be **600** or **640**.

**Default value:** 600

## dcf\_log\_path\_permission

**Parameter description:** Specifies the attribute of the DCF run log directory. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access the log path, set this parameter to **750**. Otherwise, set this parameter to **700**.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated type. The value can be **700** or **750**.

**Default value:** 700

## dcf\_majority\_groups

**Parameter description:** Sets the DCF policy-based majority function. For a group that requires this parameter, at least one standby node in the group receives logs. That is, there is a synchronous standby node in the group. If nodes are added to or deleted from the DCF instance or the group value of a node in the instance is changed, you need to modify the configuration accordingly.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- To disable the policy-based majority function, enter an empty string "".
- To enable the function, configure valid group values separated by commas (.). The group values must exist in **dcf\_config**. For example, if the group values 1 and 2 are added to the DCF policy-based majority configuration, you can set this parameter to "1,2". If the group value does not exist in **dcf\_config** or other characters are configured, the DCF considers the configured group invalid.

**Default value:** empty

---

 CAUTION

If all nodes in a group are faulty after the parameter is configured, you need to remove the group from the parameter list when performing node build operations (node recovery or node replacement without changing the IP address) on a node. After the node recovers, you can configure the group again.

---

## dcf\_node\_id\_map

**Parameter description:** Specifies the dictionary mapping between standby DN names and DCF node IDs. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. This parameter is used in DCF cluster installation, upgrade, and node replacement scenarios. The value of **standby\_name** configured in the GUC parameter **synchronous\_standby\_names** must be included in this dictionary.

This parameter is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. The configuration format is 'standby\_name1:dcf\_node\_id1,standby\_name2:dcf\_node\_id2'. The values of standby DN names and the corresponding DCF node IDs are separated by commas (.).

**Default value:** empty

## 14.3.47 Flashback

This section describes parameters related to the flashback function. In this version, only the Ustore engine supports flashback, while the Astore engine does not support flashback.

## enable\_recyclebin

**Parameter description:** Specifies whether the recycle bin is enabled or disabled in real time.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** off

## recyclebin\_retention\_time

**Parameter description:** Specifies the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is s.

**Default value:** 15 min (900s)

## undo\_retention\_time

**Parameter description:** Specifies the period for retaining undo logs of earlier versions.

This parameter is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 259200. The unit is second.

**Default value:** 0

---

 **CAUTION**

1. If this parameter is set to **0** during the Ustore flashback query, the snapshot information at the flashback point will be cleared. In earlier versions, no flashback query can be performed. When a flashback query is performed, the error message "cannot find the restore point" is displayed.
  2. If the time within which the undo logs of earlier versions need to be retained is time1 and the SQL statement execution time for the flashback query is time2, you need to set **undo\_retention\_time** to a value greater than time1 + time2. That is, set **undo\_retention\_time** to a value greater than time1 + time2 + 3s. You are advised to set **undo\_retention\_time** to a value equal to time1 + 1.5 x time2. For example, if you want to retain the logs of earlier versions within the latest 3 hours, and the SQL statement execution time for the flashback query is 1 hour, set **undo\_retention\_time** to a value equal to 3 hours + 1.5 x 1 hour, that is, 4.5 hours.
-
