## 10.9 Other Statements

### 10.9.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when Multi-Version Concurrency Control (MVCC) cannot give expected behaviors. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, ALTER TABLE cannot be executed on the same table.

### 10.9.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see [Explicit Cursor](#).

## 10.10 Cursors

### 10.10.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

**NOTICE**

- When a stored procedure uses returns to return a cursor, if JDBC is used to call the stored procedure, the returned cursor is unavailable. Using **out** to output parameters is not affected.
- In distributed mode, if the parameter of the stored procedure called in the SQL statement is of the refcursor type or the return value is of the refcursor type, pushdown is not supported.
- When a stored procedure contains COMMIT/ROLLBACK, an explicit cursor caches all data of the cursor to ensure that the cursor is still available after COMMIT/ROLLBACK. If the cursor data volume is large, this process may take a long time.

Cursors are classified into explicit cursors and implicit cursors. [Table 10-2](#) shows the usage conditions of explicit and implicit cursors for different SQL statements.

**Table 10-2** Cursor usage conditions

SQL Statement	Cursor
Non-query statements	Implicit
Query statements with single-line results	Implicit or explicit
Query statements with multi-line results	Explicit

### 10.10.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

#### Procedure

An explicit cursor performs the following six PL/SQL steps to process query statements:

- Step 1** Define a static cursor: Define a cursor name and its corresponding SELECT statement.

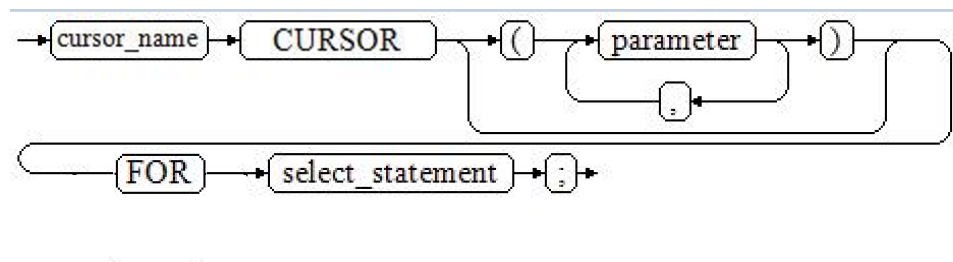

[Figure 10-34](#) shows the syntax diagram for defining a static cursor.

**Figure 10-34** static\_cursor\_define::=

or

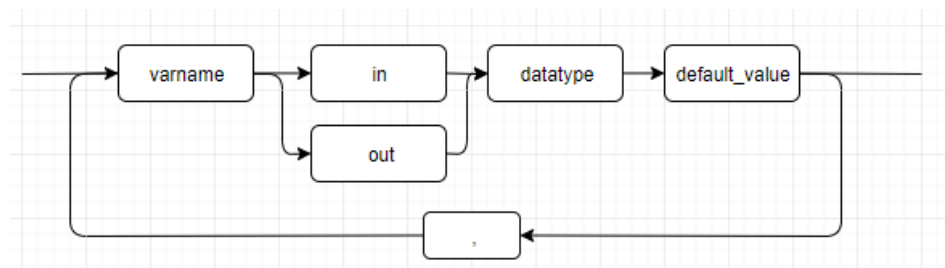

**Figure 10-35** static\_cursor\_define::=

Parameter description:

- **cursor\_name**: defines a cursor name.
- **parameter**: cursor parameter, which can only be an input parameter. The default value can be defined by :=, =, or **default**. For details about the format, see [Figure 10-36](#).

**Figure 10-36** Reference diagram for using the parameter format

- *select\_statement*: specifies a query statement.

**NOTE**

- The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.
- In syntax, **parameter** can be an output parameter, but its behavior is the same as that of an input parameter.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a SELECT statement through OPEN FOR when the cursor is opened.

[Figure 10-37](#) and [Figure 10-38](#) show the syntax diagrams for defining a dynamic cursor.

**Figure 10-37** cursor\_typename::=

GaussDB supports the dynamic cursor type **sys\_refcursor**. A function or stored procedure can use the **sys\_refcursor** parameter to pass on or pass out the cursor result set. A function can return **sys\_refcursor** to return the cursor result set.

**Figure 10-38** dynamic\_cursor\_define::=

**Step 2** Open the static cursor: Execute the SELECT statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement carries the **FOR UPDATE** option, the OPEN statement locks the data rows corresponding to the cursor result set in the database table.

**Figure 10-39** shows the syntax diagram for opening a static cursor.

**Figure 10-39** open\_static\_cursor::=

Open the dynamic cursor: Use the OPEN FOR statement to open the dynamic cursor and the SQL statement is dynamically bound.

**Figure 10-40** shows the syntax diagram for opening a dynamic cursor.

**Figure 10-40** open\_dynamic\_cursor::=

A PL/SQL program cannot use the OPEN statement to repeatedly open a cursor.

**Step 3** Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

**Figure 10-41** shows the syntax diagram for fetching cursor data.

**Figure 10-41** fetch\_cursor::=

- Step 4** Process the record.
- Step 5** Continue to process until the active set has no record.
- Step 6** Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the FETCH statement cannot be used to fetch data anymore. A closed cursor can be reopened by an OPEN statement.

Figure 10-42 shows the syntax diagram for closing a cursor.

Figure 10-42 close\_cursor::=

----End

## Attributes

Cursor attributes are used to control program procedures or learn about program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which returns **TRUE** if the last fetch fails to return a row.
- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

## Examples

DDL and DML statements are prepared. Subsequent examples in this section depend on this case.

```

gaussdb=# drop schema if exists hr cascade;
gaussdb=# create schema hr;
gaussdb=# set current_schema = hr;
gaussdb=# drop table if exists sections;
gaussdb=# drop table if exists staffs;
gaussdb=# drop table if exists department;
-- Create a department table.
gaussdb=# create table sections(
    section_name varchar(100),
    place_id int,
    section_id int
);
gaussdb=# insert into sections values ('hr',1,1);

-- Create an employee table.
gaussdb=# create table staffs(
    staff_id number(6),
    salary number(8,2),
    section_id int,
  
```

```
first_name varchar(20)
);
gaussdb=# insert into staffs values (1,100,1,'Tom');

-- Create a department table.
gaussdb=# create table department(
  section_id int

  EXIT WHEN C1%NOTFOUND;
END LOOP;
END;
/
1
1
ANONYMOUS BLOCK EXECUTE
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_sys_ref;
```

### 10.10.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

#### Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to process. Users can use only attributes related to implicit cursors to complete operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

Format call: **SQL%**

#### NOTE

- INSERT, UPDATE, DELETE, and SELECT statements do not need defined cursors.
- Implicit cursor attributes are not affected by the commit or rollback operation.

## Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which returns **TRUE** if the last fetch fails to return a row.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

## Examples

```
-- Delete all employees in a department from the hr.staffs table. If the department has no employees,
delete the department from the hr.department table.

gaussdb=# CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
  DECLARE
    V_DEPTNO NUMBER(4) := 100;
  BEGIN
    DELETE FROM hr.staffs WHERE section_id = V_DEPTNO;
    -- Proceed based on cursor status.
    IF SQL%NOTFOUND THEN
      DELETE FROM hr.department WHERE section_id = V_DEPTNO;
    END IF;
  END;
/

gaussdb=# CALL proc_cursor3();
proc_cursor3
-----
(1 row)

-- Drop the stored procedure and the temporary table.
gaussdb=# DROP PROCEDURE proc_cursor3;
```

### 10.10.4 Cursor Loop

Use of cursors in WHILE and LOOP statements is called a cursor loop. Generally, OPEN, FETCH, and CLOSE statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

## Syntax

**Figure 10-43** shows the syntax diagram of a FOR AS loop.

Figure 10-43 FOR\_AS\_loop::=

## Precautions

- The UPDATE operation for the queried table is not allowed in the loop statement.
- The variable *loop\_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select\_statement*. The value of *loop\_name* is the query result of *select\_statement*.
- The specific type of the **loop\_name** variable is not parsed during compilation. If the specific type needs to be parsed (for example, **loop\_name** is used as the input and output parameters of an overloaded function or stored procedure), a compilation error is reported.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.

## Examples

```

gaussdb=# BEGIN
FOR ROW_TRANS IN
  SELECT first_name FROM hr.staffs
LOOP
  DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name );
END LOOP;
END;
/
-- Execution result:
gaussdb=# Tom
ANONYMOUS BLOCK EXECUTE

-- Create a table.
gaussdb=# CREATE TABLE integerTable1( A INTEGER) DISTRIBUTE BY hash(A);
gaussdb=# CREATE TABLE integerTable2( B INTEGER) DISTRIBUTE BY hash(B);
gaussdb=# INSERT INTO integerTable2 VALUES(2);

-- Multiple cursors share the parameters of cursor attributes.
gaussdb=# DECLARE
  CURSOR C1 IS SELECT A FROM integerTable1;-- Declare the cursor.
  CURSOR C2 IS SELECT B FROM integerTable2;
  PI_A INTEGER;
  PI_B INTEGER;
BEGIN
  OPEN C1;-- Open the cursor.
  OPEN C2;
  FETCH C1 INTO PI_A; ---- The values of C1%FOUND and C2%FOUND are FALSE.
  FETCH C2 INTO PI_B; ---- The values of C1%FOUND and C2%FOUND are TRUE.
  -- Determine the cursor status.
  IF C1%FOUND THEN
    IF C2%FOUND THEN
      DBE_OUTPUT.PRINT_LINE('Dual cursor share parameter.');

```

```

CLOSE C2;
END;
/
ANONYMOUS BLOCK EXECUTE
-- Delete the temporary table.
gaussdb=# DROP TABLE integerTable1;
gaussdb=# DROP TABLE integerTable2;
    
```

## 10.11 Advanced Packages

Advanced packages have two sets of interfaces. The first set is basic interfaces, and the second set is secondary encapsulation interfaces that are used improve usability. The second set is recommended.

### 10.11.1 Basic Interfaces

#### 10.11.1.1 PKG\_SERVICE

[Table 10-3](#) lists all APIs supported by PKG\_SERVICE.

**Table 10-3** PKG\_SERVICE

API	Description
<a href="#">PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE</a>	Checks whether a context is registered.
<a href="#">PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS</a>	Deregisters all registered contexts.
<a href="#">PKG_SERVICE.SQL_REGISTER_CONTEXT</a>	Registers a context.
<a href="#">PKG_SERVICE.SQL_UNREGISTER_CONTEXT</a>	Deregisters a context.
<a href="#">PKG_SERVICE.SQL_SET_SQL</a>	Sets an SQL statement for a context. Currently, only the SELECT statement is supported.
<a href="#">PKG_SERVICE.SQL_RUN</a>	Executes the configured SQL statement on a context.
<a href="#">PKG_SERVICE.SQL_NEXT_ROW</a>	Reads the next row of data in a context.
<a href="#">PKG_SERVICE.SQL_GET_VALUE</a>	Reads a dynamically defined column value in a context.
<a href="#">PKG_SERVICE.SQL_SET_RESULT_TYPE</a>	Dynamically defines a column of a context based on the type OID.
<a href="#">PKG_SERVICE.JOB_CANCEL</a>	Removes a scheduled task by task ID.
<a href="#">PKG_SERVICE.JOB_FINISH</a>	Disables or enables scheduled task execution.

API	Description
<a href="#">PKG_SERVICE.JOB_SUBMIT</a>	Commits a scheduled job. Job ID can be automatically generated by the system or specified manually.
<a href="#">PKG_SERVICE.JOB_UPDATE</a>	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
<a href="#">PKG_SERVICE.SUBMIT_ON_NODES</a>	Commits a job to all nodes. The job ID is automatically generated by the system.
<a href="#">PKG_SERVICE.ISUBMIT_ON_NODES</a>	Commits a job to all nodes. The job ID is specified by the user.
<a href="#">PKG_SERVICE.SQL_GET_ARRAY_RESULT</a>	Obtains the array value returned in the context.
<a href="#">PKG_SERVICE.SQL_GET_VARIABLE_RESULT</a>	Obtains the column value returned in the context.

- [PKG\\_SERVICE.SQL\\_IS\\_CONTEXT\\_ACTIVE](#)

This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the [PKG\\_SERVICE.SQL\\_IS\\_CONTEXT\\_ACTIVE](#) function is as follows:

```
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
    context_id IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-4** [PKG\\_SERVICE.SQL\\_IS\\_CONTEXT\\_ACTIVE](#) parameters

Parameter	Description
context_id	ID of the context to be queried.

- [PKG\\_SERVICE.SQL\\_CLEAN\\_ALL\\_CONTEXTS](#)

This function cancels all contexts.

The prototype of the [PKG\\_SERVICE.SQL\\_CLEAN\\_ALL\\_CONTEXTS](#) function is as follows:

```
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
)
RETURN VOID;
```

- [PKG\\_SERVICE.SQL\\_REGISTER\\_CONTEXT](#)

This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It

automatically generates context IDs in an ascending order and returns values to INTEGER variables.

The prototype of the PKG\_SERVICE.SQL\_REGISTER\_CONTEXT function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT

This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

The prototype of the PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT function is as follows:

```
PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
context_id IN INTEGER
)
RETURN INTEGER;
```

**Table 10-5** PKG\_SERVICE.SQL\_UNREGISTER\_CONTEXT parameters

Parameter	Description
context_id	ID of the context to be closed.

- PKG\_SERVICE.SQL\_SET\_SQL

This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the SELECT query statement can be parsed. The statement parameters can be transferred only through the TEXT type. The length cannot exceed 1 GB.

The prototype of the PKG\_SERVICE.SQL\_SET\_SQL function is as follows:

```
PKG_SERVICE.SQL_SET_SQL(
context_id IN INTEGER,
query_string IN TEXT,
language_flag IN INTEGER
)
RETURN BOOLEAN;
```

**Table 10-6** PKG\_SERVICE.SQL\_SET\_SQL parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed.
query_string	Query statement to be parsed.

Parameter	Description
language_flag	Version language number, which specifies the behavior of different versions. <ul style="list-style-type: none"> <li>• <b>1</b>: incompatible version.</li> <li>• <b>2</b>: version in ORA-compatible mode.</li> </ul>

- **PKG\_SERVICE.SQL\_RUN**

This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the SELECT query statement can be executed.

The prototype of the **PKG\_SERVICE.SQL\_RUN** function is as follows:

```
PKG_SERVICE.SQL_RUN(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-7** PKG\_SERVICE.SQL\_RUN parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed.

- **PKG\_SERVICE.SQL\_NEXT\_ROW**

This function returns the number of data rows returned after the SQL statement is executed. Each time the API is executed, the system obtains a set of new rows until all data is read.

The prototype of the **PKG\_SERVICE.SQL\_NEXT\_ROW** function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(
context_id IN INTEGER,
)
RETURN INTEGER;
```

**Table 10-8** PKG\_SERVICE.SQL\_NEXT\_ROW parameters

Parameter	Description
context_id	ID of the context to be executed.

- **PKG\_SERVICE.SQL\_GET\_VALUE**

This function returns the context element value in a specified position of a context and accesses the data obtained by **PKG\_SERVICE.SQL\_NEXT\_ROW**.

The prototype of the **PKG\_SERVICE.SQL\_GET\_VALUE** function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(
context_id IN INTEGER,
pos IN INTEGER,
col_type IN ANYELEMENT
)
RETURN ANYELEMENT;
```

**Table 10-9** PKG\_SERVICE.SQL\_GET\_VALUE parameters

Parameter	Description
context_id	ID of the context to be executed.
pos	Position of a dynamically defined column in the query.
col_type	Variable of any type, which defines the return value type of columns.

- PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE

This function defines columns returned from a given context and can be used only for contexts defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The prototype of

**PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE** is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(
context_id  IN INTEGER,
pos        IN INTEGER,
coltype_oid IN ANYELEMENT,
maxsize    IN INTEGER
)
RETURN INTEGER;
```

**Table 10-10** PKG\_SERVICE.SQL\_SET\_RESULT\_TYPE parameters

Parameter	Description
context_id	ID of the context to be executed.
pos	Position of a dynamically defined column in the query.
coltype_oid	Variable of any type. The OID of the corresponding type can be obtained based on the variable type.
maxsize	Length of a defined column.

- PKG\_SERVICE.JOB\_CANCEL

The stored procedure **CANCEL** deletes a specified task.

The prototype of the **PKG\_SERVICE.JOB\_CANCEL** function is as follows:

```
PKG_SERVICE.JOB_CANCEL(
id IN INTEGER);
```

**Table 10-11** PKG\_SERVICE.JOB\_CANCEL parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	INTEGER	IN	No	Specifies the job ID.

- PKG\_SERVICE.JOB\_FINISH

The stored procedure **FINISH** disables or enables a scheduled task.

The prototype of the **PKG\_SERVICE.JOB\_FINISH** function is as follows:

```
PKG_SERVICE.JOB_FINISH(
id      IN  INTEGER,
broken  IN  BOOLEAN,
next_time IN  TIMESTAMP DEFAULT sysdate);
```

**Table 10-12** PKG\_SERVICE.JOB\_FINISH parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	INTEGER	IN	No	Specifies the job ID.
broken	BOOLEAN	IN	No	Specifies the status flag, <b>TRUE</b> for broken and <b>FALSE</b> for not broken. The current job is updated based on the parameter value <b>TRUE</b> or <b>FALSE</b> . If the parameter is left empty, the job status remains unchanged.
next_time	TIMESTAMP	IN	Yes	Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>TRUE</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>FALSE</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

- PKG\_SERVICE.JOB\_SUBMIT

The stored procedure **JOB\_SUBMIT** commits a scheduled task provided by the system.

The prototype of the **PKG\_SERVICE.JOB\_SUBMIT** function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id      IN  BIGINT,
content IN  TEXT,
```

```
next_time IN TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null',
job OUT INTEGER);
```

 **NOTE**

When a scheduled task (using **JOB**) is created, the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-13** PKG\_SERVICE.JOB\_SUBMIT parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	BIGINT	IN	No	Specifies the job ID. If the input ID is <b>NULL</b> , a job ID is generated internally.
content	TEXT	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
next_time	TIMESTAMP	IN	No	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is committed.
interval_time	TEXT	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a NUMERIC value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
job	INTEGER	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When <b>pkg_service.job_submit</b> is called using <b>select</b> , this parameter can be omitted.

- **PKG\_SERVICE.JOB\_UPDATE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the **PKG\_SERVICE.JOB\_UPDATE** function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id          IN BIGINT,
next_time   IN TIMESTAMP,
interval_time IN TEXT,
content     IN TEXT);
```

**Table 10-14** PKG\_SERVICE.JOB\_UPDATE parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	INTEGER	IN	No	Specifies the job ID.
next_time	TIMESTAMP	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.
interval_time	TEXT	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
content	TEXT	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job.

**Example:**

```
CREATE TABLE test_table(a int);
CREATE TABLE

CREATE OR REPLACE PROCEDURE test_job(a in int) IS
BEGIN
INSERT INTO test_table VALUES(a);
COMMIT;
END;
```

```

/
CREATE PROCEDURE

--PKG_SERVICE.JOB_SUBMIT
SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call test_job(1);', to_date('20180101','yyyymmdd'),'sysdate
+1');
job_submit
-----
      28269
(1 row)

SELECT PKG_SERVICE.JOB_SUBMIT(NULL, 'call test_job(1);', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');
job_submit
-----
      1506
(1 row)

CALL PKG_SERVICE.JOB_SUBMIT(NULL, 'INSERT INTO test_table VALUES(1); call test_job(1); call
test_job(1);', add_months(to_date('201701','yyyymm'),1), 'date_trunc("day",SYSDATE) + 1
+(8*60+30.0)/(24*60) ',:jobid);
job
-----
      14131
(1 row)

SELECT PKG_SERVICE.JOB_SUBMIT (101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
job_submit
-----
      101
(1 row)

--PKG_SERVICE.JOB_UPDATE
CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'call test_job(1);');
job_update
-----

(1 row)

CALL PKG_SERVICE.JOB_UPDATE(101, sysdate, 'sysdate + 1.0/1440', 'insert into test_table values(1);');
job_update
-----

(1 row)

--PKG_SERVICE.JOB_FINISH
CALL PKG_SERVICE.JOB_FINISH(101,true);
job_finish
-----

(1 row)

--PKG_SERVICE.JOB_CANCEL
CALL PKG_SERVICE.JOB_CANCEL(101);
job_cancel
-----

(1 row)

DROP TABLE test_table;
DROP TABLE

```

- **PKG\_SERVICE.SUBMIT\_ON\_NODES**

The stored procedure **SUBMIT\_ON\_NODES** creates a scheduled task on all CNs and DNs. Only users **sysadmin** and **monitor admin** have this permission.

The prototype of the **PKG\_SERVICE.SUBMIT\_ON\_NODES** function is as follows:

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name IN NAME,
database IN NAME,
what IN TEXT,
next_date IN TIMESTAMP WITHOUT TIME ZONE,
job_interval IN TEXT,
job OUT INTEGER);
```

**Table 10-15** PKG\_SERVICE.SUBMIT\_ON\_NODES parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
node_name	TEXT	IN	No	Specifies the job execution node. Currently, the value can only be <b>ALL_NODE</b> (indicating that the job is executed on all nodes) or <b>CCN</b> (indicating that the job is executed on the central coordinator node).
database	TEXT	IN	No	Database used by a cluster job. When the node type is <b>ALL_NODE</b> , the value can only be <b>postgres</b> .
what	TEXT	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
nextdate	TIMESTAMP	IN	No	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is committed.
job_interval	TEXT	IN	No	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a NUMERIC value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
job	INTEGER	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When <b>dbms.submit_on_nodes</b> is called using <b>select</b> , this parameter can be omitted.

Example:

```
SELECT pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
```

```

submit_on_nodes
-----
          12068
(1 row)

SELECT pkg_service.submit_on_nodes('CCN', 'postgres', 'select
capture_view_to_json("dbe_perf.statement", 0);', sysdate, 'interval "60 second"');
submit_on_nodes
-----
          9027
(1 row)

```

- **PKG\_SERVICE.ISUBMIT\_ON\_NODES**  
**ISUBMIT\_ON\_NODES** has the same syntax function as **SUBMIT\_ON\_NODES**, but the first parameter of **ISUBMIT\_ON\_NODES** is an input parameter, that is, a specified task ID. In contrast, that last parameter of **ISUBMIT\_ON\_NODES** is an output parameter, indicating the task ID automatically generated by the system. Only users **sysadmin** and **monitor admin** have this permission.

- **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT**

This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT** function is as follows:

```

PKG_SERVICE.SQL_GET_ARRAY_RESULT(
    context_id in int,
    pos in VARCHAR2,
    column_value inout anyarray,
    result_type in anyelement
);

```

**Table 10-16** PKG\_SERVICE.SQL\_GET\_ARRAY\_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried.
pos	Name of the bound parameter.
column_value	Return value.
result_type	Return type.

- **PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT**

This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.

The prototype of the **PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT** function is as follows:

```

PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
    context_id in int,
    pos in VARCHAR2,
    result_type in anyelement
)
RETURNS anyelement;

```

**Table 10-17** PKG\_SERVICE.SQL\_GET\_VARIABLE\_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried.
pos	Name of the bound parameter.
result_type	Return type.

### 10.11.1.2 PKG\_UTIL

**Table 10-18** lists all APIs supported by PKG\_UTIL.

**Table 10-18** PKG\_UTIL

API	Description
<a href="#">PKG_UTIL.LOB_GET_LENGTH</a>	Obtains the length of a LOB.
<a href="#">PKG_UTIL.LOB_READ</a>	Reads a part of a LOB.
<a href="#">PKG_UTIL.LOB_WRITE</a>	Writes the source object to the target object in the specified format.
<a href="#">PKG_UTIL.LOB_APPEND</a>	Appends the source LOB to the target LOB.
<a href="#">PKG_UTIL.LOB_COMPARE</a>	Compares two LOBs based on the specified length.
<a href="#">PKG_UTIL.LOB_MATCH</a>	Returns the position of the <i>M</i> th occurrence of a character string in a LOB.
<a href="#">PKG_UTIL.LOB_RESET</a>	Resets the character in specified position of a LOB to a specified character.
<a href="#">PKG_UTIL.LOB_GET_LENGTH</a>	Obtains and returns the specified length of a LOB.
<a href="#">PKG_UTIL.LOB_READ_HUGE</a>	Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.
<a href="#">PKG_UTIL.LOB_WRITEAPPEND_HUGE</a>	Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

API	Description
<a href="#">PKG_UTIL.LOB_APPEND_HUGE</a>	Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.
<a href="#">PKG_UTIL.READ_BFILE_TO_BLOB</a>	Loads the source BFILE file to the target BLOB and returns the target object.
<a href="#">PKG_UTIL.LOB_COPY_HUGE</a>	Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.
<a href="#">PKG_UTIL.BLOB_RESET</a>	Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.
<a href="#">PKG_UTIL.CLOB_RESET</a>	Sets a segment of data in a CLOB to spaces and returns the processed CLOB and the actually processed length.
<a href="#">PKG_UTIL.LOADBLOBFROMFILE</a>	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.
<a href="#">PKG_UTIL.LOADCLOBFROMFILE</a>	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.
<a href="#">PKG_UTIL.LOB_CONVERTTOBLOB_HUGE</a>	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. <i>amount</i> indicates the length to be converted.

API	Description
<a href="#">PKG_UTIL.LOB_CONVERTTOCLOB_HUGE</a>	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. <i>amount</i> indicates the length to be converted.
<a href="#">PKG_UTIL.BFILE_GET_LENGTH</a>	Obtains and returns the specified length of a BFILE file.
<a href="#">PKG_UTIL.BFILE_OPEN</a>	Opens a BFILE file and returns its file descriptor.
<a href="#">PKG_UTIL.BFILE_CLOSE</a>	Closes a BFILE file.
<a href="#">PKG_UTIL.LOB_WRITE_HUGE</a>	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
<a href="#">PKG_UTIL.IO_PRINT</a>	Displays character strings.
<a href="#">PKG_UTIL.RAW_GET_LENGTH</a>	Obtains the length of RAW data.
<a href="#">PKG_UTIL.RAW_CAST_FROM_VARCHAR2</a>	Converts VARCHAR2 data to RAW data.
<a href="#">PKG_UTIL.RAW_CAST_FROM_....</a>	Converts binary integers to RAW data.
<a href="#">PKG_UTIL.RAW_CAST_TO_BI....</a>	Converts RAW data to binary integers.
<a href="#">PKG_UTIL.RANDOM_SET_SEED</a>	Sets a random seed.
<a href="#">PKG_UTIL.RANDOM_GET_VALUE</a>	Returns a random value.
<a href="#">PKG_UTIL.FILE_SET_DIRNAME</a>	Sets the directory to be operated.
<a href="#">PKG_UTIL.FILE_OPEN</a>	Opens a file based on the specified file name and directory.
<a href="#">PKG_UTIL.FILE_SET_MAX_LINE_SIZE</a>	Sets the maximum length of a line to be written to a file.
<a href="#">PKG_UTIL.FILE_IS_CLOSE</a>	Checks whether a file handle is closed.
<a href="#">PKG_UTIL.FILE_READ</a>	Reads data of a specified length from an open file handle.
<a href="#">PKG_UTIL.FILE_READLINE</a>	Reads a line of data from an open file handle.
<a href="#">PKG_UTIL.FILE_WRITE</a>	Writes the data specified in the buffer to a file.

API	Description
<a href="#">PKG_UTIL.FILE_WRITELINE</a>	Writes the buffer to a file and adds newline characters.
<a href="#">PKG_UTIL.FILE_NEWLINE</a>	Adds a line.
<a href="#">PKG_UTIL.FILE_READ_RAW</a>	Reads binary data of a specified length from an open file handle.
<a href="#">PKG_UTIL.FILE_WRITE_RAW</a>	Writes binary data to a file.
<a href="#">PKG_UTIL.FILE_FLUSH</a>	Writes data from a file handle to a physical file.
<a href="#">PKG_UTIL.FILE_CLOSE</a>	Closes an open file handle.
<a href="#">PKG_UTIL.FILE_REMOVE</a>	Deletes a physical file. To do so, you must have the corresponding permission.
<a href="#">PKG_UTIL.FILE_RENAME</a>	Renames files on the disk, similar to <b>mv</b> in Unix.
<a href="#">PKG_UTIL.FILE_SIZE</a>	Returns the size of a file.
<a href="#">PKG_UTIL.FILE_BLOCK_SIZE</a>	Returns the number of blocks contained in a file.
<a href="#">PKG_UTIL.FILE_EXISTS</a>	Checks whether a file exists.
<a href="#">PKG_UTIL.FILE_GETPOS</a>	Specifies the offset of a returned file, in bytes.
<a href="#">PKG_UTIL.FILE_SEEK</a>	Sets the offset for file position.
<a href="#">PKG_UTIL.FILE_CLOSE_ALL</a>	Closes all file handles opened in a session.
<a href="#">PKG_UTIL.EXCEPTION_REPORT_ERROR</a>	Throws an exception.
<a href="#">PKG_UTIL.LOB_RAWTOTEXT</a>	Converts the RAW type to the TEXT type.
<a href="#">PKG_UTIL.UTILITY_COMPILE_SCHEMA</a>	Recompiles specified schemas, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the PL/SQL object is returned and the recompilation stops. This package has been discarded. <b>pkg_util.gs_compile_schema</b> is recommended.

API	Description
<a href="#">PKG_UTIL.GS_COMPILE_SCHEMA</a>	Recompiles specified schemas, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the exception is captured and the recompilation continues to compile other objects until all objects are compiled or the number of recompilation attempts reaches the upper limit. When the advanced package is executed through JDBC, the SQLSTATE 00000 is displayed, which indicates that the operation is successful. For details about the error code description, see "Standard SQL Error Codes" in <i>Error Code Reference</i> .
<a href="#">PKG_UTIL.APP_SET_MODULE</a>	Sets the value of a module.
<a href="#">PKG_UTIL.APP_READ_MODULE</a>	Reads the value of a module.
<a href="#">PKG_UTIL.APP_SET_ACTION</a>	Sets the value of an action.
<a href="#">PKG_UTIL.APP_READ_ACTION</a>	Reads the value of an action.
<a href="#">PKG_UTIL.MODIFY_PACKAGE_STATE</a>	Modifies the PL/SQL status of the current session.

- [PKG\\_UTIL.LOB\\_GET\\_LENGTH](#)

Obtains the length of the input data.

The prototype of the `PKG_UTIL.LOB_GET_LENGTH` function is as follows:

```

PKG_UTIL.LOB_GET_LENGTH(
lob   IN CLOB
)
RETURN INTEGER;

PKG_UTIL.LOB_GET_LENGTH(
lob   IN BLOB
)
RETURN INTEGER;

```

**Table 10-19** `PKG_UTIL.LOB_GET_LENGTH` parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB/ BLOB	IN	No	Indicates the object whose length is to be obtained.

- **PKG\_UTIL.LOB\_READ**

Reads an object and returns the specified part.

The prototype of the PKG\_UTIL.LOB\_READ function is as follows:

```
PKG_UTIL.LOB_READ(
lob    IN  ANYELEMENT,
len    IN  INT,
start  IN  INT,
mode   IN  INT
)
RETURN ANYELEMENT
```

**Table 10-20** PKG\_UTIL.LOB\_READ parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB / BLOB	IN	No	Specifies CLOB or BLOB data.
len	INT	IN	No	Specifies the length of the returned result.
start	INT	IN	No	Specifies the offset to the first character.
mode	INT	IN	No	Specifies the type of the read operation. <b>0</b> indicates <b>READ</b> , <b>1</b> indicates <b>TRIM</b> , and <b>2</b> indicates <b>SUBSTR</b> .

- **PKG\_UTIL.LOB\_WRITE**

Writes the source object to the target object based on the specified parameters and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITE function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob INOUT BLOB,
src_lob  IN   RAW
len      IN   INT,
start_pos IN  BIGINT
)
RETURN BLOB;
PKG_UTIL.LOB_WRITE(
dest_lob INOUT CLOB,
src_lob  IN   VARCHAR2
len      IN   INT,
start_pos IN  BIGINT
)
RETURN CLOB;
```

**Table 10-21** PKG\_UTIL.LOB\_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB / BLOB	INOUT	No	Specifies the target object that data will be written to.
src_lob	CLOB / BLOB	IN	No	Specifies the source object to be written.
len	INT	IN	No	Specifies the write length of the source object.
start_pos	BIGINT	IN	No	Specifies the write start position of the target object.

- PKG\_UTIL.LOB\_APPEND

Appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

The prototype of the PKG\_UTIL.LOB\_APPEND function is as follows:

```

PKG_UTIL.LOB_APPEND(
dest_lob INOUT BLOB,
src_lob IN BLOB,
len IN INT DEFAULT NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob INOUT CLOB,
src_lob IN CLOB,
len IN INT DEFAULT NULL
)
RETURN CLOB;

```

**Table 10-22** PKG\_UTIL.LOB\_APPEND parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB / CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
src_lob	BLOB / CLOB	IN	No	BLOB/CLOB from which data is to be written.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	INT	IN	Yes	Length read from <i>src</i> and appended to <i>dest</i> . The default value is <b>NULL</b> , indicating that all content of <i>src</i> is read and appended to <i>dest</i> .

- **PKG\_UTIL.LOB\_COMPARE**

Checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **-1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

The prototype of the PKG\_UTIL.LOB\_COMPARE function is as follows:

```
PKG_UTIL.LOB_COMPARE(
lob1    IN  ANYELEMENT,
lob2    IN  ANYELEMENT,
len     IN  INT DEFAULT 1073741771,
start_pos1  IN  INT DEFAULT 1,
start_pos2  IN  INT DEFAULT 1
)
RETURN INTEGER;
```

**Table 10-23** PKG\_UTIL.LOB\_COMPARE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
lob1	CLOB/BLOB	IN	No	Indicates the character string for comparison.
lob2	CLOB/BLOB	IN	No	Indicates the character string for comparison.
len	INT	IN	No	Indicates the length to be compared.
start_pos1	INT	IN	No	Specifies the start offset of <b>lob1</b> .
start_pos2	INT	IN	No	Specifies the start offset of <b>lob2</b> .

- **PKG\_UTIL.LOB\_MATCH**

Returns the position where a pattern is displayed in a LOB for the *match\_nth* time.

The prototype of the PKG\_UTIL.LOB\_MATCH function is as follows:

```
PKG_UTIL.LOB_MATCH(
lob     IN  ANYELEMENT,
```

```
pattern IN ANYELEMENT,
start IN INT,
match_nth IN INT DEFAULT 1
)
RETURN INTEGER;
```

**Table 10-24** PKG\_UTIL.LOB\_MATCH parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
lob	CLOB/BLOB	IN	No	Indicates the character string for comparison.
pattern	CLOB/BLOB	IN	No	Specifies the pattern to be matched.
start	INT	IN	No	Specifies the start position for LOB comparison.
match_nth	INT	IN	No	Specifies the matching times.

- PKG\_UTIL.LOB\_RESET

Clears a character string and resets the string to the value of **value**.

The prototype of the PKG\_UTIL.LOB\_RESET function is as follows:

```
PKG_UTIL.LOB_RESET(
lob IN BLOB,
len IN INT,
start IN INT,
value IN INT DEFAULT 0
)
RETURN RECORD;
```

**Table 10-25** PKG\_UTIL.LOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	IN	No	Specifies the character string for reset.
len	INT	IN	No	Specifies the length of the string to be reset.
start	INT	IN	No	Specifies the start position for reset.
value	INT	IN	Yes	Sets characters. Default value: '0'

- **PKG\_UTIL.LOB\_GET\_LENGTH**

Obtains and returns the specified length of a LOB.

The prototype of the PKG\_UTIL.LOB\_GET\_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(  
  lob IN BLOB)  
RETURN BIGINT;  
  
PKG_UTIL.LOB_GET_LENGTH(  
  lob IN CLOB)  
RETURN BIGINT;
```

**Table 10-26** PKG\_UTIL.LOB\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB/ CLOB	IN	No	LOB type.

- **PKG\_UTIL.LOB\_READ\_HUGE**

Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.

The prototype of the PKG\_UTIL.LOB\_READ\_HUGE function is as follows:

```
PKG_UTIL.LOB_READ_HUGE(  
  lob    IN CLOB,  
  len    IN BIGINT,  
  start_pos IN BIGINT,  
  mode   IN INTEGER)  
RETURN RECORD;  
  
PKG_UTIL.LOB_READ_HUGE(  
  lob    IN BLOB,  
  len    IN BIGINT,  
  start_pos IN BIGINT,  
  mode   IN INTEGER)  
RETURN RECORD;  
  
PKG_UTIL.LOB_READ_HUGE(  
  fd     IN INTEGER,  
  len    IN BIGINT,  
  start_pos IN BIGINT,  
  mode   IN INTEGER)  
RETURN RECORD;
```

**Table 10-27** PKG\_UTIL.LOB\_READ\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob/fd	BLOB/ CLOB/ INTEGER	IN	No	File descriptor of the specified LOB or BFILE file.
len	BIGINT	IN	No	Length to read.
start_pos	BIGINT	IN	No	Offset position from which read starts.
mode	INTEGER	IN	No	Read mode ( <b>0</b> : read, <b>1</b> : trim, <b>2</b> : substr).

- **PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE**

Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

The prototype of the PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(  
  dest_lob INOUT CLOB,  
  len IN INTEGER,  
  src_lob IN VARCHAR2  
)RETURN CLOB;
```

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(  
  dest_lob INOUT BLOB,  
  len IN INTEGER,  
  src_lob IN RAW  
)RETURN BLOB;
```

**Table 10-28** PKG\_UTIL.LOB\_WRITEAPPEND\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/ CLOB	INOUT	No	Target BLOB/CLOB to which data is written.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	INTEGER	IN	Yes	Length of the source object to be written. If the value is <b>NULL</b> , the entire source object is written by default.
src_lob	VARCHAR2/RAW	IN	No	BLOB/CLOB from which data is to be written.

- **PKG\_UTIL.LOB\_APPEND\_HUGE**

Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.

The prototype of the PKG\_UTIL.LOB\_APPEND\_HUGE function is as follows:

```
PKG_UTIL.LOB_APPEND_HUGE(
  dest_lob INOUT BLOB,
  src_lob IN BLOB)
RETURN BLOB;
PKG_UTIL.LOB_APPEND_HUGE(
  dest_lob INOUT CLOB,
  src_lob IN CLOB)
RETURN CLOB;
```

**Table 10-29** PKG\_UTIL.LOB\_APPEND\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
src_lob	BLOB/CLOB	IN	No	BLOB/CLOB from which data is to be written.

- **PKG\_UTIL.READ\_BFILE\_TO\_BLOB**

Loads the source BFILE file to the target BLOB and returns the target object.

The prototype of the PKG\_UTIL.READ\_BFILE\_TO\_BLOB function is as follows:

```
PKG_UTIL.READ_BFILE_TO_BLOB(
  fd IN INTEGER)
RETURN BLOB;
```

**Table 10-30** PKG\_UTIL.READ\_BFILE\_TO\_BLOB parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	Source BFILE file to be read.

- PKG\_UTIL.LOB\_COPY\_HUGE

Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

The prototype of the PKG\_UTIL.LOB\_COPY\_HUGE function is as follows:

```

PKG_UTIL.LOB_COPY_HUGE(
  lob_obj INOUT BLOB,
  source_obj IN BLOB,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1
)RETURN BLOB;

PKG_UTIL.LOB_COPY_HUGE(
  lob_obj INOUT CLOB,
  source_obj IN CLOB,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1
)RETURN CLOB;

```

**Table 10-31** PKG\_UTIL.LOB\_COPY\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob_obj	BLOB/CLOB	INOUT	No	Target BLOB/CLOB.
source_obj	BLOB/CLOB	IN	No	Source BLOB/CLOB.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	IN	No	Offset position of the target LOB to which the data is loaded.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_offset	BIGINT	IN	No	Offset position of the source LOB from which the data is read.

- **PKG\_UTIL.BLOB\_RESET**

Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.

The prototype of the PKG\_UTIL.BLOB\_RESET function is as follows:

```
PKG_UTIL.BLOB_RESET(
  lob      INOUT BLOB,
  len      INOUT BIGINT,
  start_pos IN  BIGINT DEFAULT 1,
  value    IN  INTEGER DEFAULT 0
)RETURN RECORD;
```

**Table 10-32** PKG\_UTIL.BLOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in bytes.
start	INTEGER	IN	No	Specifies the start position for reset.
value	INTEGER	IN	Yes	Sets characters. Default value: '0'.

- **PKG\_UTIL.CLOB\_RESET**

Sets a piece of data to spaces.

The prototype of the PKG\_UTIL.CLOB\_RESET function is as follows:

```
PKG_UTIL.CLOB_RESET(
  lob      INOUT CLOB,
  len      INOUT BIGINT,
  start_pos IN  BIGINT DEFAULT 1
)RETURN RECORD;
```

**Table 10-33** PKG\_UTIL.CLOB\_RESET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in characters.
start	INTEGER	IN	No	Reset start position. The default value is 1.

- PKG\_UTIL.LOADBLOBFROMFILE

Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.

The prototype of the PKG\_UTIL.LOADBLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADBLOBFROMFILE(
  dest_lob INOUT BLOB,
  fd      IN  INTEGER,
  amount  IN  BIGINT,
  dest_offset INOUT BIGINT,
  file_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-34** PKG\_UTIL.LOADBLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target BLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- **PKG\_UTIL.LOADCLOBFROMFILE**

Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.

The prototype of the PKG\_UTIL.LOADCLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADCLOBFROMFILE(
  dest_lob INOUT CLOB,
  fd       IN  INTEGER,
  amount   IN  BIGINT,
  dest_offset INOUT BIGINT,
  file_offset INOUT BIGINT
)RETURN RECORD;
```

**Table 10-35** PKG\_UTIL.LOADCLOBFROMFILE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target CLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length to copy (in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- **PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE**

Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE(
  dest_lob INOUT BLOB,
  src_clob IN CLOB,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
)RETURN RECORD;
```

**Table 10-36** PKG\_UTIL.LOB\_CONVERTTOBLOB\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target LOB.
src_clob	CLOB	IN	No	CLOB to be converted.
amount	BIGINT	IN	No	Length to convert, in characters.
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE

Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE(
  dest_lob INOUT CLOB,
  src_blob IN BLOB,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
```

```
src_offset INOUT BIGINT)
)RETURN RECORD;
```

**Table 10-37** PKG\_UTIL.LOB\_CONVERTTOCLOB\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target LOB.
src_blob	BLOB	IN	No	BLOB to be converted.
amount	BIGINT	IN	No	Length to convert, in bytes.
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG\_UTIL.BFILE\_GET\_LENGTH

Obtains and returns the specified length of a BFILE file.

The prototype of the PKG\_UTIL.BFILE\_GET\_LENGTH function is as follows:

```
PKG_UTIL.BFILE_GET_LENGTH(
  fd INTEGER
)RETURN BIGINT;
```

**Table 10-38** PKG\_UTIL.LOB\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- **PKG\_UTIL.BFILE\_OPEN**

Opens a BFILE file and returns its file descriptor.

The prototype of the PKG\_UTIL.BFILE\_OPEN function is as follows:

```
PKG_UTIL.BFILE_OPEN(  
  file_name TEXT,  
  open_mode TEXT)  
RETURN INTEGER;
```

**Table 10-39** PKG\_UTIL.BFILE\_OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	Name of the specified BFILE file.
open_mode	TEXT	IN	No	Open mode, which can only be set to r, that is, the read mode.

- **PKG\_UTIL.BFILE\_CLOSE**

Closes a BFILE file.

The prototype of the PKG\_UTIL.BFILE\_CLOSE function is as follows:

```
PKG_UTIL.BFILE_CLOSE(  
  fd INTEGER)  
RETURN BOOL;
```

**Table 10-40** PKG\_UTIL.BFILE\_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- **PKG\_UTIL.LOB\_WRITE\_HUGE**

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the PKG\_UTIL.LOB\_WRITE\_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITE_HUGE(  
  dest_lob INOUT BLOB,  
  len IN INTEGER,  
  start_pos IN BIGINT,  
  src_lob IN RAW  
)RETURN BLOB;  
  
PKG_UTIL.LOB_WRITE_HUGE(  
  dest_lob INOUT BLOB,  
  len IN INTEGER,  
  start_pos IN BIGINT,  
  src_lob IN RAW  
)RETURN BLOB;
```

```
dest_lob INOUT CLOB,  
len      IN INTEGER,  
start_pos IN BIGINT,  
src_lob  IN VARCHAR2  
)RETURN CLOB;
```

**Table 10-41** PKG\_UTIL.LOB\_WRITE\_HUGE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
len	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs).
start_pos	bigint	IN	No	Offset position for writing data to <i>dest_lob</i> .
src_lob	RAW/VARCHAR2	IN	No	Source LOB.

- PKG\_UTIL.IO\_PRINT

Outputs a string.

The prototype of the PKG\_UTIL.IO\_PRINT function is as follows:

```
PKG_UTIL.IO_PRINT(  
format      IN TEXT,  
is_one_line IN BOOLEAN  
)  
RETURN VOID;
```

**Table 10-42** PKG\_UTIL.IO\_PRINT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
format	TEXT	IN	No	Specifies the character string to be output.
is_one_line	BOOLEAN	IN	No	Specifies whether to output the string as a line.

- PKG\_UTIL.RAW\_GET\_LENGTH

Obtains the length of RAW data.

The prototype of the PKG\_UTIL.RAW\_GET\_LENGTH function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(  
value IN RAW  
)  
RETURN INTEGER;
```

**Table 10-43** PKG\_UTIL.RAW\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
raw	RAW	IN	No	Specifies the object whose length is to be obtained.

- PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2

Converts VARCHAR2 data to RAW data.

The prototype of the PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_VARCHAR2(  
str IN VARCHAR2  
)  
RETURN RAW;
```

**Table 10-44** PKG\_UTIL.RAW\_CAST\_FROM\_VARCHAR2 parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str	VARCHAR2	IN	No	Specifies the source data to be converted.

- PKG\_UTIL.RAW\_CAST\_FROM\_BINARY\_INTEGER

Converts BIGINT data to RAW data.

The prototype of the PKG\_UTIL.RAW\_CAST\_FROM\_BINARY\_INTEGER function is as follows:

```
PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER(  
value IN BIGINT,  
endianess IN INTEGER  
)  
RETURN RAW;
```

**Table 10-45** PKG\_UTIL.RAW\_CAST\_FROM\_BINARY\_INTEGER parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	BIGINT	IN	No	Specifies the source data to be converted.
endianess	INTEGER	IN	No	The value is an integer in lexicographic order. Currently, the value can be <b>1</b> (BIG_ENDIAN), <b>2</b> (LITTLE_ENDIAN), or <b>3</b> (MACHINE_ENDIAN).

- PKG\_UTIL.RAW\_CAST\_TO\_BINARY\_INTEGER

Converts RAW data into BINARY\_INTEGER.

The prototype of the PKG\_UTIL.RAW\_CAST\_TO\_BINARY\_INTEGER function is as follows:

```
PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER(
value IN RAW,
endianess IN INTEGER
)
RETURN INTEGER;
```

**Table 10-46** PKG\_UTIL.RAW\_CAST\_TO\_BINARY\_INTEGER parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	RAW	IN	No	Specifies the source data to be converted.
endianess	INTEGER	IN	No	The value is an integer in lexicographic order. Currently, the value can be <b>1</b> (BIG_ENDIAN), <b>2</b> (LITTLE_ENDIAN), or <b>3</b> (MACHINE_ENDIAN).

- PKG\_UTIL.RANDOM\_SET\_SEED

Sets a random seed.

The prototype of the PKG\_UTIL.RANDOM\_SET\_SEED function is as follows:

```
PKG_UTIL.RANDOM_SET_SEED(
seed IN INT
)
RETURN INTEGER;
```

**Table 10-47** PKG\_UTIL.RANDOM\_SET\_SEED parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
seed	INT	IN	No	Sets a random seed.

- PKG\_UTIL.RANDOM\_GET\_VALUE

Returns a 15-digit random number ranging from 0 to 1.

The prototype of the PKG\_UTIL.RANDOM\_GET\_VALUE function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(  
)  
RETURN NUMERIC;
```

- PKG\_UTIL.FILE\_SET\_DIRNAME

Sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

The prototype of the PKG\_UTIL.FILE\_SET\_DIRNAME function is as follows:

```
PKG_UTIL.FILE_SET_DIRNAME(  
dir IN TEXT  
)  
RETURN BOOL
```

**Table 10-48** PKG\_UTIL.FILE\_SET\_DIRNAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name.  <b>NOTE</b> File directories need to be added to the system catalog <b>PG_DIRECTORY</b> . If the input path does not match the path in <b>PG_DIRECTORY</b> , an error indicating that the path does not exist will be reported. Functions that involve <b>location</b> as parameters also comply with this rule.

- PKG\_UTIL.FILE\_OPEN

Opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

The prototype of the PKG\_UTIL.FILE\_OPEN function is as follows:

```
PKG_UTIL.FILE_OPEN(  
file_name IN TEXT,  
open_mode IN INTEGER)
```

**Table 10-49** PKG\_UTIL.FILE\_OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the OPEN function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	INTEGER	IN	No	File opening mode, including <b>r</b> (read), <b>w</b> (write), and <b>a</b> (append). <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE

Sets the maximum length of a line to be written to a file.

The prototype of the PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE function is as follows:

```
PKG_UTIL.FILE_SET_MAX_LINE_SIZE(  
max_line_size IN INTEGER)  
RETURN BOOL
```

**Table 10-50** PKG\_UTIL.FILE\_SET\_MAX\_LINE\_SIZE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
max_line_size	INTEGER	IN	Yes	Maximum number of characters in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.

- PKG\_UTIL.FILE\_IS\_CLOSE

Checks whether a file handle is closed.

The prototype of the PKG\_UTIL.FILE\_IS\_CLOSE function is as follows:

```
PKG_UTIL.FILE_IS_CLOSE(  
file IN INTEGER
```

```
)  
RETURN BOOL
```

**Table 10-51** PKG\_UTIL.FILE\_IS\_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- **PKG\_UTIL.FILE\_READ**

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READ function is as follows:

```
PKG_UTIL.FILE_READ(  
file IN INTEGER,  
buffer OUT TEXT,  
len IN BIGINT DEFAULT 1024)
```

**Table 10-52** PKG\_UTIL.FILE\_READ parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.
buffer	TEXT	OUT	No	Buffer used to receive data.
len	BIGINT	IN	No	Number of bytes read from a file.

- **PKG\_UTIL.FILE\_READLINE**

Reads a line of data from an open file handle based on the specified length.

The prototype of the PKG\_UTIL.FILE\_READLINE function is as follows:

```
PKG_UTIL.FILE_READLINE(  
file IN INTEGER,
```

```
buffer OUT TEXT,  
len IN INTEGER DEFAULT NULL)
```

**Table 10-53** PKG\_UTIL.FILE\_READLINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the <b>INVALID_OPERATION</b> exception is thrown.
buffer	TEXT	OUT	No	Buffer used to receive data.
len	INTEGER	IN	Yes	Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size.

- PKG\_UTIL.FILE\_WRITE

Writes the data specified in the buffer to a file.

The prototype of the PKG\_UTIL.FILE\_WRITE function is as follows:

```
PKG_UTIL.FILE_WRITE(  
file IN INTEGER,  
buffer IN TEXT  
)  
RETURN BOOL
```

**Table 10-54** PKG\_UTIL.FILE\_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	IN	No	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by PUT operations cannot exceed 32767 bytes. <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **PKG\_UTIL.FILE\_NEWLINE**

Writes a line terminator to an open file. The line terminator is related to the platform.

The prototype of the PKG\_UTIL.FILE\_NEWLINE function is as follows:

```
PKG_UTIL.FILE_NEWLINE(  
file IN INTEGER  
)  
RETURN BOOL
```

**Table 10-55** PKG\_UTIL.FILE\_NEWLINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- **PKG\_UTIL.FILE\_WRITELINE**

Writes a line to a file.

The prototype of the PKG\_UTIL.FILE\_WRITELINE function is as follows:

```
PKG_UTIL.FILE_WRITELINE(  
file IN INTEGER,  
buffer IN TEXT  
)  
RETURN BOOL
```

**Table 10-56** PKG\_UTIL.FILE\_WRITELINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.
buffer	TEXT	IN	No	Content to be written.

- PKG\_UTIL.FILE\_READ\_RAW

This function reads binary data of a specified length from an open file handle and returns the read binary data. The return type is raw.

The prototype of the PKG\_UTIL.FILE\_READ\_RAW function is as follows:

```
PKG_UTIL.FILE_READ_RAW(
file    IN INTEGER,
length  IN INTEGER DEFAULT NULL
)
RETURN RAW
```

**Table 10-57** PKG\_UTIL.FILE\_READ\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.
length	INTEGER	IN	Yes	Length of the data to be read. The default value is <b>NULL</b> . By default, all data in the file is read. The maximum size is 1 GB.

- PKG\_UTIL.FILE\_WRITE\_RAW

Writes the input binary object of the RAW type to an open file. If the insertion is successful, **true** is returned.

The prototype of the PKG\_UTIL.FILE\_WRITE\_RAW function is as follows:

```
PKG_UTIL.FILE_WRITE_RAW(
file IN INTEGER,
r    IN RAW
)
RETURN BOOL
```

**Table 10-58** PKG\_UTIL.FILE\_WRITE\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.
r	RAW	IN	No	Data to be written to the file. <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG\_UTIL.FILE\_FLUSH

Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

The prototype of the PKG\_UTIL.FILE\_FLUSH function is as follows:

```
PKG_UTIL.FILE_FLUSH (
file IN INTEGER
)
RETURN VOID
```

**Table 10-59** PKG\_UTIL.FILE\_FLUSH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- PKG\_UTIL.FILE\_CLOSE

Closes an open file handle.

The prototype of the PKG\_UTIL.FILE\_CLOSE function is as follows:

```
PKG_UTIL.FILE_CLOSE (
file IN INTEGER
```

```
)  
RETURN BOOL
```

**Table 10-60** PKG\_UTIL.FILE\_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- **PKG\_UTIL.FILE\_REMOVE**

Deletes a disk file. To perform this operation, you must have required permissions.

The prototype of the PKG\_UTIL.FILE\_REMOVE function is as follows:

```
PKG_UTIL.FILE_REMOVE(  
file_name IN TEXT  
)  
RETURN VOID
```

**Table 10-61** PKG\_UTIL.FILE\_REMOVE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	Name of the file to be deleted

- **PKG\_UTIL.FILE\_RENAME**

Renames a file on the disk, similar to **mv** in Unix.

The prototype of the PKG\_UTIL.FILE\_RENAME function is as follows:

```
PKG_UTIL.FILE_RENAME(  
src_dir IN TEXT,  
src_file_name IN TEXT,  
dest_dir IN TEXT,  
dest_file_name IN TEXT,  
overwrite BOOLEAN DEFAULT false)
```

**Table 10-62** PKG\_UTIL.FILE\_RENAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	No	Source file directory (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
src_file_name	TEXT	IN	No	Source file name
dest_dir	TEXT	IN	No	Target file directory (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
dest_file_name	TEXT	IN	No	Target file name
overwrite	BOOLEAN	IN	Yes	The default value is <b>false</b> . If a file with the same name exists in the destination directory, the file will not be rewritten.

- **PKG\_UTIL.FILE\_SIZE**

Returns the size of a specified file.

The prototype of the PKG\_UTIL.FILE\_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_SIZE(  
file_name IN TEXT  
)return BIGINT
```

**Table 10-63** PKG\_UTIL.FILE\_SIZE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG\_UTIL.FILE\_BLOCK\_SIZE

Returns the number of blocks contained in a specified file.

The prototype of the PKG\_UTIL.FILE\_BLOCK\_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_BLOCK_SIZE(
file_name IN TEXT
)return BIGINT
```

**Table 10-64** PKG\_UTIL.FILE\_BLOCK\_SIZE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG\_UTIL.FILE\_EXISTS

Checks whether a file exists.

The prototype of the PKG\_UTIL.FILE\_EXISTS function is as follows:

```
PKG_UTIL.FILE_EXISTS(
file_name IN TEXT
)
RETURN BOOL
```

**Table 10-65** PKG\_UTIL.FILE\_EXISTS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name

- PKG\_UTIL.FILE\_GETPOS

Specifies the offset of a returned file, in bytes.

The prototype of the PKG\_UTIL.FILE\_GETPOS function is as follows:

```
PKG_UTIL.FILE_GETPOS(
file IN INTEGER
)
RETURN BIGINT
```

**Table 10-66** PKG\_UTIL.FILE\_GETPOS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- PKG\_UTIL.FILE\_SEEK

Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the PKG\_UTIL.FILE\_SEEK function is as follows:

```
void PKG_UTIL.FILE_SEEK(
file IN INTEGER,
start IN BIGINT
)
RETURN VOID
```

**Table 10-67** PKG\_UTIL.FILE\_SEEK parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.
start	BIGINT	IN	No	File offset, in bytes.

- PKG\_UTIL.FILE\_CLOSE\_ALL

Closes all file handles opened in a session.

The prototype of the PKG\_UTIL.FILE\_CLOSE\_ALL function is as follows:

```
PKG_UTIL.FILE_CLOSE_ALL(
)
RETURN VOID
```

**Table 10-68** PKG\_UTIL.FILE\_CLOSE\_ALL parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
None	None	None	None	None

- PKG\_UTIL.EXCEPTION\_REPORT\_ERROR

Throws an exception.

The prototype of the PKG\_UTIL.EXCEPTION\_REPORT\_ERROR function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code INTEGER,
log TEXT,
flag BOOLEAN DEFAULT FALSE
)
RETURN INTEGER
```

**Table 10-69** PKG\_UTIL.EXCEPTION\_REPORT\_ERROR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
code	Integer	IN	No	Error code displayed when a running exception occurs.
log	TEXT	IN	No	Log information displayed when a running exception occurs.
flag	BOOLEAN	IN	Yes	Reserved. The default value is <b>FALSE</b> .

- PKG\_UTIL.APP\_READ\_CLIENT\_INFO

Reads the client information.

The prototype of the PKG\_UTIL.APP\_READ\_CLIENT\_INFO function is as follows:

```
PKG_UTIL.APP_READ_CLIENT_INFO(
OUT buffer TEXT
) return TEXT
```

**Table 10-70** PKG\_UTIL.APP\_READ\_CLIENT\_INFO parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	OUT	No	Client information returned

- PKG\_UTIL.APP\_SET\_CLIENT\_INFO

Sets the client information.

The prototype of the PKG\_UTIL.APP\_SET\_CLIENT\_INFO function is as follows:

```
PKG_UTIL.APP_SET_CLIENT_INFO(
str TEXT
)
```

**Table 10-71** PKG\_UTIL.APP\_SET\_CLIENT\_INFO parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str	TEXT	IN	No	Client information to be set

- PKG\_UTIL.LOB\_CONVERTTOBLOB

Converts a CLOB to a BLOB. *amount* indicates the conversion length.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOBLOB function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB(
dest_lob BLOB,
src_clob CLOB,
amount INTEGER,
dest_offset INTEGER,
src_offset INTEGER
)return RAW
```

**Table 10-72** PKG\_UTIL.LOB\_CONVERTTOBLOB parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	IN	No	Target LOB.
src_clob	CLOB	IN	No	CLOB to be converted.
amount	INTEGER	IN	No	Conversion length
dest_offset	INTEGER	IN	No	Start position of the target LOB.
src_offset	INTEGER	IN	No	Start position of the source CLOB.

- PKG\_UTIL.ILOB\_CONVERTTOCLOB

Converts a BLOB to a CLOB. *amount* indicates the conversion length.

The prototype of the PKG\_UTIL.LOB\_CONVERTTOCLOB function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB(
dest_lob CLOB,
src_blob BLOB,
amount INTEGER,
dest_offset INTEGER,
src_offset INTEGER
)return TEXT
```

**Table 10-73** PKG\_UTIL.LOB\_CONVERTTOCLOB parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	IN	No	Target LOB.
src_blob	BLOB	IN	No	BLOB to be converted.
amount	INTEGER	IN	No	Conversion length.
dest_offset	INTEGER	IN	No	Start position of the target LOB.
src_offset	INTEGER	IN	No	Start position of the source CLOB.

- PKG\_UTIL.LOB\_TEXTTORAW

Converts the text type to the raw type.

The prototype of the PKG\_UTIL.LOB\_TEXTTORAW function is as follows:

```
PKG_UTIL.LOB_TEXTTORAW(
src_lob CLOB
)
RETURN RAW
```

**Table 10-74** PKG\_UTIL.LOB\_TEXTTORAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_lob	LOB	IN	No	LOB to be converted.

- **PKG\_UTIL.LOB\_RAWTOTEXT**

Converts RAW data to TEXT data.

The prototype of the PKG\_UTIL.LOB\_RAWTOTEXT function is as follows:

```
PKG_UTIL.LOB_RAWTOTEXT(
src_lob IN BLOB
)
RETURN TEXT
```

**Table 10-75** PKG\_UTIL.LOB\_RAWTOTEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_lob	BLOB	IN	No	LOB to be converted.

- **PKG\_UTIL.MATCH\_EDIT\_DISTANCE\_SIMILARITY**

Calculates the difference between two character strings.

The prototype of the PKG\_UTIL.MATCH\_EDIT\_DISTANCE\_SIMILARITY function is as follows:

```
PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY(
str1 TEXT,
str2 TEXT
)
RETURN INTEGER
```

**Table 10-76** PKG\_UTIL.MATCH\_EDIT\_DISTANCE\_SIMILARITY parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str1	TEXT	IN	No	First character string
str2	TEXT	IN	No	Second character string

- PKG\_UTIL.RAW\_CAST\_TO\_VARCHAR2

Converts the raw type to the varchar2 type.

The prototype of the PKG\_UTIL.RAW\_CAST\_TO\_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_TO_VARCHAR2(
str RAW
)
RETURN VARCHAR2
```

**Table 10-77** PKG\_UTIL.RAW\_CAST\_TO\_VARCHAR2 parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
str	RAW	IN	No	Hexadecimal string

- PKG\_UTIL.SESSION\_CLEAR\_CONTEXT

Clears the session context.

The prototype of the PKG\_UTIL.SESSION\_CLEAR\_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_CLEAR_CONTEXT(
namespace TEXT,
client_identifier TEXT,
attribute TEXT
)
RETURN INTEGER
```

**Table 10-78** PKG\_UTIL.SESSION\_CLEAR\_CONTEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
client_id entifier	TEXT	IN	Yes	Usually same as the value of <b>namespace</b> . If this parameter is set to <b>null</b> , all namespaces are modified by default.
attribute	TEXT	IN	No	Attribute value to be cleared

- PKG\_UTIL.SESSION\_SEARCH\_CONTEXT

Searches for an attribute value.

The prototype of the PKG\_UTIL.SESSION\_SEARCH\_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_SEARCH_CONTEXT(  
namespace TEXT,  
attribute TEXT  
)  
RETURN INTEGER
```

**Table 10-79** PKG\_UTIL.SESSION\_SEARCH\_CONTEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
attribute	TEXT	IN	No	Attribute value to be searched for.

- PKG\_UTIL.SESSION\_SET\_CONTEXT

Sets an attribute value.

The prototype of the PKG\_UTIL.SESSION\_SET\_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_SET_CONTEXT(  
namespace TEXT,  
attribute TEXT,  
value TEXT
```

```
)  
RETURN INTEGER
```

**Table 10-80** PKG\_UTIL.SESSION\_SET\_CONTEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
attribute	TEXT	IN	No	Attribute to be set.
value	TEXT	IN	No	Attribute value.

- **PKG\_UTIL.UTILITY\_GET\_TIME**

Prints the Unix timestamp.

The prototype of the PKG\_UTIL.UTILITY\_GET\_TIME function is as follows:

```
PKG_UTIL.UTILITY_GET_TIME()  
RETURN BIGINT
```

- **PKG\_UTIL.UTILITY\_FORMAT\_ERROR\_BACKTRACE**

Displays the error stack of a stored procedure.

The prototype of the PKG\_UTIL.UTILITY\_FORMAT\_ERROR\_BACKTRACE function is as follows:

```
PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE()  
RETURN TEXT
```

- **PKG\_UTIL.UTILITY\_FORMAT\_ERROR\_STACK**

Displays the error information about a stored procedure.

The prototype of the PKG\_UTIL.UTILITY\_FORMAT\_ERROR\_STACK function is as follows:

```
PKG_UTIL.UTILITY_FORMAT_ERROR_STACK()  
RETURN TEXT
```

- **PKG\_UTIL.UTILITY\_FORMAT\_CALL\_STACK**

Displays the call stack of a stored procedure.

The prototype of the PKG\_UTIL.UTILITY\_FORMAT\_CALL\_STACK function is as follows:

```
PKG_UTIL.UTILITY_FORMAT_CALL_STACK()  
RETURN TEXT
```

- **PKG\_UTIL.UTILITY\_COMPILE\_SCHEMA**

Recompiles packages, functions and stored procedures under the specified schema.

The prototype of the PKG\_UTIL.UTILITY\_COMPILE\_SCHEMA function is as follows:

```
PKG_UTIL.UTILITY_COMPILE_SCHEMA (
  schema IN VARCHAR2,
  compile_all IN BOOLEAN DEFAULT TRUE,
  reuse_settings IN BOOLEAN DEFAULT FALSE
)
RETURNS VOID
```

- **PKG\_UTIL.GS\_COMPILE\_SCHEMA**

Recompiles packages, functions and stored procedures under the specified schema.

The prototype of the PKG\_UTIL.GS\_COMPILE\_SCHEMA stored procedure is as follows:

```
pkg_util.GS_COMPILE_SCHEMA (
  schema_name IN VARCHAR2 DEFAULT NULL,
  compile_all IN BOOLEAN DEFAULT FALSE,
  retry_times IN INT DEFAULT 10
)
```

**Table 10-81** PKG\_UTIL.GS\_COMPILE\_SCHEMA parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schema_name	VARCHAR2	IN	Yes	Specifies the name of the namespace.
compile_all	Boolean	IN	Yes	Specifies to compile all objects. <ul style="list-style-type: none"> <li>• <b>false</b>: Compile the packages, functions, and stored procedures whose status is false in the pg_object table.</li> <li>• <b>true</b>: Compile all packages, functions, and stored procedures in the pg_object table.</li> <li>• <b>retry_times</b>: number of retry times.</li> </ul>

- **PKG\_UTIL.APP\_SET\_MODULE**

Sets the value of a module.

The prototype of the PKG\_UTIL.APP\_SET\_MODULE stored procedure is as follows:

```
PKG_UTIL.APP_SET_MODULE (
  str TEXT)
returns VOID
```

**Table 10-82** PKG\_UTIL.APP\_SET\_MODULE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
text	Text	IN	No	Specifies the value of a module to be set.

Example:

```
CALL PKG_UTIL.APP_SET_MODULE('set module');
app_set_module
```

(1 row)

- PKG\_UTIL.APP\_READ\_MODULE

Reads the value of a module.

The prototype of the PKG\_UTIL.APP\_READ\_MODULE stored procedure is as follows:

```
PKG_UTIL.APP_READ_MODULE(
OUT buffer TEXT
)
```

**Table 10-83** PKG\_UTIL.APP\_READ\_MODULE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	OUT	No	Specifies the value of a module to be returned.

Example:

```
DECLARE
    module VARCHAR2(64);
BEGINPKG_UTIL.APP_READ_MODULE(module);
    dbe_output.print_line(module);
END;
/
set module
ANONYMOUS BLOCK EXECUTE
```

- PKG\_UTIL.APP\_SET\_ACTION

Sets the value of an action.

The prototype of the PKG\_UTIL.APP\_SET\_ACTION stored procedure is as follows:

```
PKG_UTIL.APP_SET_ACTION (
    str TEXT)
returns VOID
```

**Table 10-84** PKG\_UTIL.APP\_SET\_ACTION parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
text	Text	IN	No	Specifies the value of an action to be set.

Example:

```
CALL PKG_UTIL.APP_SET_ACTION('set action');
app_set_action
```

-----

(1 row)

- PKG\_UTIL.APP\_READ\_ACTION

Reads the value of an action.

The prototype of the PKG\_UTIL.APP\_READ\_ACTION stored procedure is as follows:

```
PKG_UTIL.APP_READ_ACTION(
    OUT buffer TEXT
)
```

**Table 10-85** PKG\_UTIL.APP\_READ\_ACTION parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	OUT	No	Specifies the value of an action to be returned.

Example:

```
DECLARE
    action VARCHAR2(64);
BEGIN
    PKG_UTIL.APP_READ_ACTION(action);
    dbe_output.print_line(action);
END;
```

```

/
set action
ANONYMOUS BLOCK EXECUTE
    
```

- **PKG\_UTIL.MODIFY\_PACKAGE\_STATE**

Modifies the PL/SQL status of the current session.

The prototype of the PKG\_UTIL.MODIFY\_PACKAGE\_STATE stored procedure is as follows:

```

PKG_UTIL.MODIFY_PACKAGE_STATE (
  flags INT)
returns VOID
    
```

**Table 10-86** PKG\_UTIL.MODIFY\_PACKAGE\_STATE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
flags	INT	IN	No	<p>Bit flag of the operation performed on the PL/SQL.</p> <p>When <b>flags</b> is set to <b>1</b>, the session cache of the PL/SQL that is currently running in the session is released after the top-level PL/SQL is executed. The current value of any package is cleared globally and the cached cursor is closed. On subsequent use, PL/SQL re-instantiates and re-initializes the package globally.</p> <p>Other bit flags are not supported.</p>

Example:

```

CALL PKG_UTIL.MODIFY_PACKAGE_STATE(1);
modify_package_state
    
```

(1 row)

### 10.11.1.3 DBE\_DESCRIBE

For details about the basic interfaces supported by DBE\_DESCRIBE, see [Table 1 DBE\\_DESCRIBE basic interfaces](#).

**Table 10-87** DBE\_DESCRIBE basic interfaces

Interface	Description
DBE_DESCRIBE.GET_PROCEDURE_NAME	This is an internal function and is not recommended. The name of a stored procedure or function is extracted from the original input of a user.
DBE_DESCRIBE.IS_NUMBER_TYPE	This is an internal function and is not recommended. It is used to determine whether the data type is numeric.

- DBE\_DESCRIBE.GET\_PROCEDURE\_NAME**  
 This is an internal function and is not recommended. It is used to extract the name of a stored procedure or function from the original input of a user.  
 The prototype of the DBE\_DESCRIBE.GET\_PROCEDURE\_NAME function is as follows:

```
DBE_DESCRIBE.GET_PROCEDURE_NAME(  
name IN VARCHAR2)  
RETURNS VARCHAR2;
```

**Table 10-88** DBE\_DESCRIBE.GET\_PROCEDURE\_NAME interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Entity name.

- DBE\_DESCRIBE.IS\_NUMBER\_TYPE**  
 This is an internal function and is not recommended. It is used to check whether the type is numeric.  
 The prototype of the DBE\_DESCRIBE.IS\_NUMBER\_TYPE function is as follows:

```
DBE_DESCRIBE.IS_NUMBER_TYPE(  
type_oid IN INTEGER)  
RETURNS BOOLEAN;
```

**Table 10-89** DBE\_DESCRIBE.IS\_NUMBER\_TYPE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
type_oid	INTEGER	IN	Yes	OID of the type.

### 10.11.1.4 DBE\_XML

**Table 10-90** lists all APIs supported by DBE\_XML.

**Table 10-90** DBE\_XML parameters

API	Description
<a href="#">DBE_XML.XML_FREE_PARSER</a>	Frees a parser.
<a href="#">DBE_XML.XML_PARSER_GET_DOCUMENT</a>	Obtains the parsed document node.
<a href="#">DBE_XML.XML_GET_VALIDATION_MODE</a>	Obtains the validation attribute.
<a href="#">DBE_XML.XML_NEW_PARSER</a>	Creates a parser instance.
<a href="#">DBE_XML.XML_PARSE_BUFFER</a>	Parses the VARCHAR string.
<a href="#">DBE_XML.XML_PARSE_CLOB</a>	Parses the CLOB string.
<a href="#">DBE_XML.XML_SET_VALIDATION_MODE</a>	Sets the validation attribute.
<a href="#">DBE_XML.XML_DOM_APPEND_CHILD</a>	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
<a href="#">DBE_XML.XML_DOM_CREATE_ELEMENT</a>	Returns the DOMELEMENT object with the specified name.
<a href="#">DBE_XML.XML_DOM_CREATE_ELEMENT_NS</a>	Returns the DOMELEMENT object with the specified name and namespace.
<a href="#">DBE_XML.XML_DOM_CREATE_TEXT_NODE</a>	Creates and returns a DOMText object.
<a href="#">DBE_XML.XML_DOM_FREE_DOCUMENT</a>	Frees a specified XML DOM object.
<a href="#">DBE_XML.XML_DOM_FREE_ELEMENT</a>	Frees a specified XML DOM object.
<a href="#">DBE_XML.XML_DOM_FREE_NODE</a>	Frees a DOMNode node.
<a href="#">DBE_XML.XML_DOM_FREE_NODELIST</a>	Frees a DOMNodeList node.
<a href="#">DBE_XML.XML_DOM_GET_ATTRIBUTES</a>	Obtains the attributes of a specified XML DOM object.
<a href="#">DBE_XML.XML_DOM_GET_ATTRIBUTES</a>	Returns the attribute values of a DOMNode node as a map.
<a href="#">DBE_XML.XML_DOM_GET_CHILD_NODES</a>	Converts several subnodes under a node into a node list.
<a href="#">DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME</a>	Obtains the list of specified subnodes of a specified XML DOM object.

API	Description
<a href="#">DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS</a>	Obtains the list of subnodes in the specified namespace of a specified XML DOM object.
<a href="#">DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT</a>	Returns the first subnode of the specified document.
<a href="#">DBE_XML.XML_DOM_GET_FIRST_CHILD</a>	Returns the first subnode of a node.
<a href="#">DBE_XML.XML_DOM_GET_LAST_CHILD</a>	Returns the last subnode of a node.
<a href="#">DBE_XML.XML_DOM_GET_LENGTH</a>	Returns the number of nodes based on the content in the node of the specified type.
<a href="#">DBE_XML.XML_DOM_GET_LOCALNAME</a>	Returns the local name of the given object.
<a href="#">DBE_XML.XML_DOM_GET_NAMED_ITEM</a>	Returns the node specified by name.
<a href="#">DBE_XML.XML_DOM_GET_NAMED_ITEM_NS</a>	Returns the node specified by name and namespace.
<a href="#">DBE_XML.XML_DOM_GET_NEXT_SIBLING</a>	Returns the next node of the specified node.
<a href="#">DBE_XML.XML_DOM_GET_NODE_NAME</a>	Returns the name of a node.
<a href="#">DBE_XML.XML_DOM_GET_NODE_TYPE</a>	Returns the type of a node.
<a href="#">DBE_XML.XML_DOM_GET_NODE_VALUE</a>	Returns the value of a node.
<a href="#">DBE_XML.XML_DOM_GET_PARENT_NODE</a>	Returns the parent node of the given node.
<a href="#">DBE_XML.XML_DOM_GET_TAGNAME</a>	Obtains the tag name of a specified XML DOM object.
<a href="#">DBE_XML.XML_DOM_HAS_CHILD_NODES</a>	Checks whether the DOMNode object has any subnode.
<a href="#">DBE_XML.XML_DOM_IMPORT_NODE</a>	Copies a node to another node and mounts the copied node to a specified document.
<a href="#">DBE_XML.XML_DOM_IS_NULL</a>	Checks whether the given object is null.
<a href="#">DBE_XML.XML_DOM_ITEM</a>	Returns the element corresponding to the index in a list or map based on the index.
<a href="#">DBE_XML.XML_DOM_MAKE_ELEMENT</a>	Returns the DOMELEMENT object after conversion.

API	Description
<a href="#">DBE_XML.XML_DOM_MAKENODE</a>	Converts the given object to the DOMNode type.
<a href="#">DBE_XML.XML_DOM_NEW_DOCUMENT_EMPTY</a>	Returns a new DOMDocument object.
<a href="#">DBE_XML.XML_DOM_NEW_DOCUMENT_CLOB</a>	Returns a new DOMDocument instance object created from the specified CLOB type.
<a href="#">DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE</a>	Returns a new DOMDocument instance object created from the specified XMLType type.
<a href="#">DBE_XML.XML_DOM_SET_ATTRIBUTE</a>	Sets the attributes of a specified XML DOM object.
<a href="#">DBE_XML.XML_DOM_SET_CHARACTERSET</a>	Sets the character set for a DOMDocument object.
<a href="#">DBE_XML.XML_DOM_SET_DOCTYPE</a>	Sets the external DTD of a DOMDocument object.
<a href="#">DBE_XML.XML_DOM_SET_NODE_VALUE</a>	Sets the value of a node in the DOMNode object.
<a href="#">DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC</a>	Writes the given DOMDocument object to the buffer.
<a href="#">DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE</a>	Writes the given DOMNode object to the buffer.
<a href="#">DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC</a>	Writes the given DOMDocument object to a CLOB.
<a href="#">DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE</a>	Writes the given DOMNode object to a CLOB.
<a href="#">DBE_XML.XML_DOM_WRITE_TO_FILE_DOC</a>	Writes an XML node to a specified file using the database character set.
<a href="#">DBE_XML.XML_DOM_WRITE_TO_FILE_NODE</a>	Writes an XML node to a specified file using the database character set.
<a href="#">DBE_XML.XML_DOM_GET_SESSION_TREE_NUM</a>	Displays the number of DOM trees of all types in the current session.
<a href="#">DBE_XML.XML_DOM_GET_DOCUMENT_TREES_INFO</a>	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
<a href="#">DBE_XML.XML_DOM_GET_DOCUMENT_TREE_INFO</a>	Displays the number of nodes of each type for a specific document variable.

- DBE\_XML.XML\_FREE\_PARSER

Frees a given parser object.

The stored procedure prototype of DBE\_XML.XML\_FREE\_PARSER is as follows:

```
DBE_XML.XML_FREE_PARSER(  
id IN RAW(13))  
returns VOID;
```

**Table 10-91** DBE\_XML.XML\_FREE\_PARSER parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object

- DBE\_XML.XML\_PARSER\_GET\_DOC

Returns the root node of the DOM tree document constructed by the parser.

The prototype of the DBE\_XML.XML\_PARSER\_GET\_DOC function is as follows:

```
DBE_XML.XML_PARSER_GET_DOC(  
id IN RAW(13))  
returns RAW(13);
```

**Table 10-92** DBE\_XML.XML\_PARSER\_GET\_DOC parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object

 **NOTE**

- If the DBE\_XML.XML\_PARSER\_GET\_DOC function is empty, **NULL** is returned.
- If the parser input by the DBE\_XML.XML\_PARSER\_GET\_DOC function has not parsed any document, **NULL** is returned.
- DBE\_XML.XML\_GET\_VALIDATION\_MODE

Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the DBE\_XML.XML\_GET\_VALIDATION\_MODE function is as follows:

```
DBE_XML.XML_GET_VALIDATION_MODE(  
id RAW(13))  
returns BOOL;
```

**Table 10-93** DBE\_XML.XML\_GET\_VALIDATION\_MODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object

- DBE\_XML.XML\_NEW\_PARSER

Creates a parser object and returns a new parser instance.

The prototype of the DBE\_XML.XML\_NEW\_PARSER function is as follows:

```
DBE_XML.XML_NEW_PARSER()
RETURNS RAW(13);
```

- DBE\_XML.XML\_PARSE\_BUFFER

Parses XML documents stored in strings.

The stored procedure prototype of DBE\_XML.XML\_PARSE\_BUFFER is as follows:

```
DBE_XML.XML_PARSE_BUFFER(
id RAW(13),
xmlstr VARCHAR2)
RETURNS VOID;
```

**Table 10-94** DBE\_XML.XML\_PARSE\_BUFFER parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object
xmlstr	VARCHAR2	IN	No	A string that stores XML documents

 **NOTE**

- The maximum length of a character string that can be parsed by the `xml_parse_buffer` function is 32767. If the length exceeds the maximum, an error is reported.
  - Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
  - DTD validation differences:
    - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
    - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
  - Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
  - Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in database ORA are not translated into characters.
- **DBE\_XML.XML\_PARSE\_CLOB**

Parses XML documents stored in XML\_PARSE\_CLOB.

The stored procedure prototype of DBE\_XML.XML\_PARSE\_CLOB is as follows:

```
DBE_XML.XML_PARSE_CLOB(
id IN RAW(13),
doc IN CLOB)
returns VOID;
```

**Table 10-95** DBE\_XML.XML\_PARSE\_CLOB parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object
doc	CLOB	IN	No	A string that stores XML documents

 **NOTE**

- xml\_parse\_clob cannot parse CLOBs larger than 1 GB.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and escaped to ' and ". However, predefined entities in database ORA are not escaped into characters.

- **DBE\_XML.XML\_SET\_VALIDATION\_MODE**

Sets the parsing validation mode of a specified parser.

The stored procedure prototype of DBE\_XML.XML\_SET\_VALIDATION\_MODE is as follows:

```
DBE_XML.XML_SET_VALIDATION_MODE(
id RAW(13),
validate BOOLEAN)
returns VOID;
```

**Table 10-96** DBE\_XML.XML\_SET\_VALIDATION\_MODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object
validate	BOOLEAN	IN	Yes	Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE</b>: DTD validation is enabled.</li> <li>• <b>FALSE</b>: DTD validation is disabled.</li> </ul>

 **NOTE**

- If the input parameter **validate** of the DBE\_XML.XML\_SET\_VALIDATION\_MODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

- **DBE\_XML.XML\_DOM\_APPEND\_CHILD**

Adds the newchild node to the end of the parent(n) node and returns the newly added node.

The stored procedure prototype of DBE\_XML.XML\_DOM\_APPEND\_CHILD is as follows:

```
DBE_XML.XML_DOM_APPEND_CHILD(
  parentId IN RAW(13),
  childId IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-97** DBE\_XML.XML\_DOM\_APPEND\_CHILD parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
parentId	RAW(13)	IN	No	XML DOM object
childId	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_CREATE\_ELEMENT

Returns the DOMELEMENT object with the specified name.

The prototype of the DBE\_XML.XML\_DOM\_CREATE\_ELEMENT function is as follows:

```
DBE_XML.XML_DOM_CREATE_ELEMENT(
  id IN RAW(13),
  tagname IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-98** DBE\_XML.XML\_DOM\_CREATE\_ELEMENT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
tagname	VARCHAR2	IN	No	Name of the new DOMELEMENT object

- DBE\_XML.XML\_DOM\_CREATE\_ELEMENT\_NS

Returns the DOMELEMENT object with the specified name and namespace.

The prototype of the DBE\_XML.XML\_DOM\_CREATE\_ELEMENT\_NS function is as follows:

```
DBE_XML.XML_DOM_CREATE_ELEMENT_NS(
  id IN RAW(13),
  tagname IN VARCHAR2,
  ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-99** DBE\_XML.XML\_DOM\_CREATE\_ELEMENT\_NS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
tagname	VARCHAR2	IN	No	Name of the new DOMElement object
ns	VARCHAR2	IN	No	Namespace

- DBE\_XML.XML\_DOM\_CREATE\_TEXT\_NODE

Creates and returns a DOMText object.

The prototype of the DBE\_XML.XML\_DOM\_CREATE\_TEXT\_NODE function is as follows:

```
DBE_XML.XML_DOM_CREATE_TEXT_NODE(
  id IN RAW(13),
  data IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-100** DBE\_XML.XML\_DOM\_CREATE\_TEXT\_NODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
data	VARCHAR2	IN	No	Content of the new DOMText node

- DBE\_XML.XML\_DOM\_FREE\_DOCUMENT

Frees a specified XML DOM object.

The stored procedure prototype of DBE\_XML.XML\_DOM\_FREE\_DOCUMENT is as follows:

```
DBE_XML.XML_DOM_FREE_DOCUMENT(
  id RAW(13)
)
RETURNS VOID;
```

**Table 10-101** DBE\_XML.XML\_DOM\_FREE\_DOCUMENT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_FREE\_ELEMENT

Frees a specified XML DOM object.

The stored procedure prototype of DBE\_XML.XML\_DOM\_FREE\_ELEMENT is as follows:

```
DBE_XML.XML_DOM_FREE_ELEMENT (
  id RAW(13)
)
RETURNS VOID;
```

**Table 10-102** DBE\_XML.XML\_DOM\_FREE\_ELEMENT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_FREE\_NODE

Frees a DOMNode node.

The prototype of the DBE\_XML.XML\_DOM\_FREE\_NODE function is as follows:

```
DBE_XML.XML_DOM_FREE_NODE (
  id RAW(13)
)
RETURNS VOID;
```

**Table 10-103** DBE\_XML.XML\_DOM\_FREE\_NODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_FREE\_NODELIST

Frees a DOMNodeList node.

The stored procedure prototype of DBE\_XML.XML\_DOM\_FREE\_NODELIST is as follows:

```
DBE_XML.XML_DOM_FREE_NODELIST(
  id IN RAW(13)
```

```
)  
RETURNS VOID
```

**Table 10-104** DBE\_XML.XML\_DOM\_FREE\_NODELIST parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_ATTRIBUTE

Obtains the attributes of a specified XML DOM object.

The stored procedure prototype of DBE\_XML.XML\_DOM\_GET\_ATTRIBUTE is as follows:

```
DBE_XML.XML_DOM_GET_ATTRIBUTE (  
  docid IN RAW(13),  
  name IN VARCHAR2  
)  
RETURNS VARCHAR2;
```

**Table 10-105** DBE\_XML.XML\_DOM\_GET\_ATTRIBUTE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String

- DBE\_XML.XML\_DOM\_GET\_ATTRIBUTES

Returns the attribute values of a DOMNode node as a map.

The prototype of the DBE\_XML.XML\_DOM\_GET\_ATTRIBUTES function is as follows:

```
DBE_XML.XML_DOM_GET_ATTRIBUTES (  
  id RAW(13)  
)  
RETURNS RAW(13);
```

**Table 10-106** DBE\_XML.XML\_DOM\_GET\_ATTRIBUTES parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_CHILD\_NODES

Converts several subnodes under a node into a node list.

The prototype of the DBE\_XML.XML\_DOM\_GET\_CHILD\_NODES function is as follows:

```
DBE_XML.XML_DOM_GET_CHILD_NODES(
  id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-107** DBE\_XML.XML\_DOM\_GET\_CHILD\_NODES parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_CHILDREN\_BY\_TAGNAME

Obtains the list of specified subnodes of a specified XML DOM object.

The stored procedure prototype of

DBE\_XML.XML\_DOM\_GET\_CHILDREN\_BY\_TAGNAME is as follows:

```
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME (
  docid IN RAW(13),
  name IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-108** DBE\_XML.XML\_DOM\_GET\_CHILDREN\_BY\_TAGNAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String

- DBE\_XML.XML\_DOM\_GET\_CHILDREN\_BY\_TAGNAME\_NS

Obtains the list of subnodes in the specified namespace of a specified XML DOM object.

The stored procedure prototype of

DBE\_XML.XML\_DOM\_GET\_CHILDREN\_BY\_TAGNAME\_NS is as follows:

```
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS (
  docid IN RAW(13),
  name IN VARCHAR2,
  ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-109** DBE\_XML.XML\_DOM\_GET\_CHILDREN\_BY\_TAGNAME\_NS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String
ns	VARCHAR2	IN	Yes	String

- DBE\_XML.XML\_DOM\_GET\_DOCUMENT\_ELEMENT

Returns the first subnode of the specified document.

The stored procedure prototype of

DBE\_XML.XML\_DOM\_GET\_DOCUMENT\_ELEMENT is as follows:

```
DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT(
  id RAW(13)
)
RETURNS RAW(13);
```

**Table 10-110** DBE\_XML.XML\_DOM\_GET\_DOCUMENT\_ELEMENT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_FIRST\_CHILD

Returns the first subnode of a node.

The prototype of the DBE\_XML.XML\_DOM\_GET\_FIRST\_CHILD function is as follows:

```
DBE_XML.XML_DOM_GET_FIRST_CHILD(
  id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-111** DBE\_XML.XML\_DOM\_GET\_FIRST\_CHILD parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_LAST\_CHILD

Returns the last subnode of a node.

The prototype of the DBE\_XML.XML\_DOM\_GET\_LAST\_CHILD function is as follows:

```
DBE_XML.XML_DOM_GET_LAST_CHILD(
  id IN RAW(13)
)
RETURNS RAW(13);
```

**Table 10-112** DBE\_XML.XML\_DOM\_GET\_LAST\_CHILD parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_LENGTH

Returns the number of nodes based on the content in the node of the specified type.

The stored procedure prototype of DBE\_XML.XML\_DOM\_GET\_LENGTH is as follows:

```
DBE_XML.XML_DOM_GET_LENGTH(
  id RAW(13)
)
RETURNS VOID;
```

**Table 10-113** DBE\_XML.XML\_DOM\_GET\_LENGTH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_LOCALNAME

Returns the local name of the given object.

The stored procedure prototype of DBE\_XML.XML\_DOM\_GET\_LOCALNAME is as follows:

```
DBE_XML.XML_DOM_GET_LOCALNAME (
  id RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-114** DBE\_XML.XML\_DOM\_GET\_LOCALNAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_NAMED\_ITEM

Returns the node specified by name.

The prototype of the DBE\_XML.XML\_DOM\_GET\_NAMED\_ITEM function is as follows:

```
DBE_XML.XML_DOM_GET_NAMED_ITEM(
  id IN RAW(13),
  nodeName IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-115** DBE\_XML.XML\_DOM\_GET\_NAMED\_ITEM parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved

- DBE\_XML.XML\_DOM\_GET\_NAMED\_ITEM\_NS

Returns the node specified by name and namespace.

The prototype of the DBE\_XML.XML\_DOM\_GET\_NAMED\_ITEM\_NS function is as follows:

```
DBE_XML.XML_DOM_GET_NAMED_ITEM_NS(
  id RAW(13),
  nodeName IN VARCHAR2,
  ns IN VARCHAR2
)
RETURNS RAW(13);
```

**Table 10-116** DBE\_XML.XML\_DOM\_GET\_NAMED\_ITEM\_NS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved
ns	VARCHAR2	IN	Yes	Namespace

- DBE\_XML.XML\_DOM\_GET\_NEXT\_SIBLING

Returns the next node of the specified node.

The prototype of the DBE\_XML.XML\_DOM\_GET\_NEXT\_SIBLING function is as follows:

```
DBE_XML.XML_DOM_GET_NEXT_SIBLING(  
  id IN RAW(13)  
)  
RETURNS RAW(13);
```

**Table 10-117** DBE\_XML.XML\_DOM\_GET\_NEXT\_SIBLING parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_NODE\_NAME

Returns the name of a node.

The prototype of the DBE\_XML.XML\_DOM\_GET\_NODE\_NAME function is as follows:

```
DBE_XML.XML_DOM_GET_NODE_NAME(  
  id IN RAW(13)  
)  
RETURNS VARCHAR2;
```

**Table 10-118** DBE\_XML.XML\_DOM\_GET\_NODE\_NAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_NODE\_TYPE

Returns the type of a node.

The prototype of the DBE\_XML.XML\_DOM\_GET\_NODE\_TYPE function is as follows:

```
DBE_XML.XML_DOM_GET_NODE_TYPE(  
  id IN RAW(13)  
)  
RETURNS INTEGER;
```

**Table 10-119** DBE\_XML.XML\_DOM\_GET\_NODE\_TYPE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_NODE\_VALUE

Returns the value of a node.

The stored procedure prototype of DBE\_XML.XML\_DOM\_GET\_NODE\_VALUE is as follows:

```
DBE_XML.XML_DOM_GET_NODE_VALUE(  
id IN RAW(13))  
RETURNS VARCHAR2;
```

**Table 10-120** DBE\_XML.XML\_DOM\_GET\_NODE\_VALUE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_PARENT\_NODE

Returns the parent node of the given node.

The stored procedure prototype of DBE\_XML.XML\_DOM\_GET\_PARENT\_NODE is as follows:

```
DBE_XML.XML_DOM_GET_PARENT_NODE(  
id IN RAW(13))  
RETURNS RAW(13);
```

**Table 10-121** DBE\_XML.XML\_DOM\_GET\_PARENT\_NODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_GET\_TAGNAME

Obtains the tag name of a specified XML DOM object.

The stored procedure prototype of DBE\_XML.XML\_DOM\_GET\_TAGNAME is as follows:

```
DBE_XML.XML_DOM_GET_TAGNAME (  
docid RAW(13)  
)  
RETURNS VARCHAR2;
```

**Table 10-122** DBE\_XML.XML\_DOM\_GET\_TAGNAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_HAS\_CHILD\_NODES

Checks whether the DOMNode object has any subnode.

The stored procedure prototype of DBE\_XML.XML\_DOM\_HAS\_CHILD\_NODES is as follows:

```
DBE_XML.XML_DOM_HAS_CHILD_NODES(
id IN RAW(13))
RETURNS BOOLEAN
```

**Table 10-123** DBE\_XML.XML\_DOM\_HAS\_CHILD\_NODES parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_IMPORT\_NODE

Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown.

The prototype of the DBE\_XML.XML\_DOM\_IMPORT\_NODE function is as follows:

```
DBE_XML.XML_DOM_IMPORT_NODE(
doc_id IN RAW(13),
node_id IN RAW(13),
deep IN BOOLEAN
)
RETURNS RAW(13);
```

**Table 10-124** DBE\_XML.XML\_DOM\_IMPORT\_NODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
doc_id	RAW(13)	IN	No	Document to which the node is mounted
node_id	RAW(13)	IN	No	Node to be imported

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
deep	BOOLEAN	IN	No	Specifies whether to perform recursive import. <ul style="list-style-type: none"> <li>If the value is <b>TRUE</b>, the node and all its subnodes are imported.</li> <li>If the value is <b>FALSE</b>, the node itself is imported.</li> </ul>

- DBE\_XML.XML\_DOM\_IS\_NULL

Checks whether the given object is null. If it is null, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the DBE\_XML.XML\_DOM\_IS\_NULL function is as follows:

```
DBE_XML.XML_DOM_IS_NULL (
  id RAW(13)
)
RETURNS BOOLEAN;
```

**Table 10-125** DBE\_XML.XML\_DOM\_IS\_NULL parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_ITEM

Returns the element corresponding to the index in a list or map based on the index.

The prototype of the DBE\_XML.XML\_DOM\_ITEM function is as follows:

```
DBE_XML.XML_DOM_ITEM (
  id IN RAW(13),
  index IN INTEGER
)
RETURNS RAW(13);
```

**Table 10-126** DBE\_XML.XML\_DOM\_ITEM parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
index	INTEGER	IN	No	Index of the element to be retrieved

- DBE\_XML.XML\_DOM\_MAKE\_ELEMENT

Returns the DOMElement object after conversion.

The stored procedure prototype of DBE\_XML.XML\_DOM\_MAKE\_ELEMENT is as follows:

```
DBE_XML.XML_DOM_MAKE_ELEMENT(  
id IN RAW(13))  
RETURNS RAW(13)
```

**Table 10-127** DBE\_XML.XML\_DOM\_MAKE\_ELEMENT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

- DBE\_XML.XML\_DOM\_MAKENODE

Converts the given object to the DOMNode type.

The stored procedure prototype of DBE\_XML.XML\_DOM\_MAKENODE is as follows:

```
DBE_XML.XML_DOM_MAKENODE(  
id RAW(13)  
)  
RETURNS DOMNODE;
```

**Table 10-128** DBE\_XML.XML\_DOM\_MAKENODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_NEW\_DOM\_DOCUMENT\_EMPTY

Returns a new DOMDocument object.

The prototype of the DBE\_XML.XML\_DOM\_NEW\_DOM\_DOCUMENT\_EMPTY function is as follows:

```
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY()
RETURNS RAW(13);
```

- **DBE\_XML.XML\_DOM\_NEW\_DOM\_DOCUMENT\_CLOB**

Returns a new DOMDocument instance object created from the specified CLOB type.

The prototype of the DBE\_XML.XML\_DOM\_NEW\_DOM\_DOCUMENT\_CLOB function is:

```
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_CLOB(
  content IN CLOB
)
RETURNS RAW(13);
```

**Table 10-129** xml\_dom\_new\_dom\_document\_clob parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	CLOB	IN	No	Specified CLOB type

- **DBE\_XML.XML\_DOM\_NEW\_DOCUMENT\_XMLTYPE**

Returns a new DOMDocument instance object created from the specified XMLType type.

The prototype of the DBE\_XML.XML\_DOM\_NEW\_DOCUMENT\_XMLTYPE function is as follows:

```
DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE(
  content IN CLOB
)
RETURNS RAW(13);
```

**Table 10-130** DBE\_XML.XML\_DOM\_NEW\_DOCUMENT\_XMLTYPE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	CLOB	IN	No	Specified CLOB type

- **DBE\_XML.XML\_DOM\_SET\_ATTRIBUTE**

Sets the attributes of a specified XML DOM object.

The stored procedure prototype of DBE\_XML.XML\_DOM\_SET\_ATTRIBUTE is as follows:

```
DBE_XML.XML_DOM_SET_ATTRIBUTE(
  docid IN RAW(13),
  name IN VARCHAR2,
  value IN VARCHAR2
)
RETURNS void;
```

**Table 10-131** DBE\_XML.XML\_DOM\_SET\_ATTRIBUTE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
name	VARCHAR2	IN	No	String
value	VARCHAR2	IN	No	String

- DBE\_XML.XML\_DOM\_SET\_CHARSET

Sets the character set for a DOMDocument object.

The prototype of the DBE\_XML.XML\_DOM\_SET\_CHARSET function is as follows:

```
DBE_XML.XML_DOM_SET_CHARSET(
  id    IN RAW(13),
  charset IN VARCHAR2
)
RETURNS void;
```

**Table 10-132** DBE\_XML.XML\_DOM\_SET\_CHARSET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
charset	VARCHAR2	IN	No	Character set

- DBE\_XML.XML\_DOM\_SET\_DOCTYPE

Sets the external DTD of a DOMDocument object.

The prototype of the DBE\_XML.XML\_DOM\_SET\_DOCTYPE function is as follows:

```
DBE_XML.XML_DOM_SET_DOCTYPE(
  id          IN RAW(13),
  dtd_name   IN VARCHAR2,
  system_id  IN VARCHAR2,
  public_id  IN VARCHAR2
)
RETURNS void;
```

**Table 10-133** DBE\_XML.XML\_DOM\_SET\_DOCTYPE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dtd_name	VARCHAR2	IN	No	Name of the DOCType to be initialized
system_id	VARCHAR2	IN	No	ID of the system whose DOCType needs to be initialized
public_id	VARCHAR2	IN	No	Public ID of the DOCType to be initialized

- DBE\_XML.XML\_DOM\_SET\_NODE\_VALUE**  
 Sets the value of a node in the DOMNode object.  
 The stored procedure prototype of DBE\_XML.XML\_DOM\_SET\_NODE\_VALUE is as follows:

```
DBE_XML.XML_DOM_SET_NODE_VALUE(
id IN RAW(13),
node_value IN VARCHAR2)
RETURNS VOID
```

**Table 10-134** DBE\_XML.XML\_DOM\_SET\_NODE\_VALUE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object
node_value	VARCHAR2	IN	No	String to be set in the DOMNode object

- DBE\_XML.XML\_DOM\_WRITE\_TO\_BUFFER\_DOC**  
 Writes the given DOMDocument object to the buffer.  
 The stored procedure prototype of DBE\_XML.XML\_DOM\_WRITE\_TO\_BUFFER\_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC(
id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-135** DBE\_XML.XML\_DOM\_WRITE\_TO\_BUFFER\_DOC parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_WRITE\_TO\_BUFFER\_NODE

Writes the given DOMNode object to the buffer.

The stored procedure prototype of

DBE\_XML.XML\_DOM\_WRITE\_TO\_BUFFER\_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE(
id IN RAW(13))
RETURNS VARCHAR2;
```

**Table 10-136** DBE\_XML.XML\_DOM\_WRITE\_TO\_BUFFER\_NODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_WRITE\_TO\_CLOB\_DOC

Writes the given DOMDocument object to a CLOB.

The stored procedure prototype of

DBE\_XML.XML\_DOM\_WRITE\_TO\_CLOB\_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC(
id IN RAW(13)
)
RETURNS VARCHAR2;
```

**Table 10-137** DBE\_XML.XML\_DOM\_WRITE\_TO\_CLOB\_DOC parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_WRITE\_TO\_CLOB\_NODE

Writes the given DOMNode object to a CLOB.

The stored procedure prototype of

DBE\_XML.XML\_DOM\_WRITE\_TO\_CLOB\_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE(
id IN RAW(13)
)
RETURNS CLOB;
```

**Table 10-138** DBE\_XML.XML\_DOM\_WRITE\_TO\_CLOB\_NODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object

- DBE\_XML.XML\_DOM\_WRITE\_TO\_FILE\_DOC**  
 Writes an XML node to a specified file using the database character set.  
 The stored procedure prototype of DBE\_XML.XML\_DOM\_WRITE\_TO\_FILE\_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_FILE_DOC(
id IN RAW(13),
file_dir IN VARCHAR2)
RETURNS VOID

DBE_XML.XML_DOM_WRITE_TO_FILE_DOC(
id IN RAW(13),
file_dir IN VARCHAR2,
charset IN VARCHAR2)
RETURNS VOID PACKAGE
```

**Table 10-139** DBE\_XML.XML\_DOM\_WRITE\_TO\_FILE\_DOC parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object
file_dir	VARCHAR2	IN	No	File to be written
charset	VARCHAR2	IN	No	Specified character set

- DBE\_XML.XML\_DOM\_WRITE\_TO\_FILE\_NODE**  
 Writes an XML node to a specified file using the database character set.  
 The stored procedure prototype of DBE\_XML.XML\_DOM\_WRITE\_TO\_FILE\_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_FILE_NODE(
id IN RAW(13),
filename IN VARCHAR2)
RETURNS VOID
```

**Table 10-140** DBE\_XML.XML\_DOM\_WRITE\_TO\_FILE\_NODE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
filename	VARCHAR2	IN	No	Specified file address

- DBE\_XML.XML\_DOM\_GET\_SESSION\_TREE\_NUM**  
Queries the number of DOM trees of all types in the current session.  
The prototype of the DBE\_XML.XML\_DOM\_GET\_SESSION\_TREE\_NUM function is as follows:  
DBE\_XML.XML\_DOM\_GET\_SESSION\_TREE\_NUM()  
RETURNS INTEGER
- DBE\_XML.XML\_DOM\_GET\_DOC\_TREES\_INFO**  
Queries the DOM tree information of the document type in the current session, such as the memory usage.  
The prototype of the DBE\_XML.XML\_DOM\_GET\_DOC\_TREES\_INFO function is as follows:  
DBE\_XML.XML\_DOM\_GET\_DOC\_TREES\_INFO()  
RETURNS VARCHAR2
- DBE\_XML.XML\_DOM\_GET\_DETAIL\_DOC\_TREE\_INFO**  
Queries the number of subnodes of each type in the transferred document.  
The prototype of the DBE\_XML.XML\_DOM\_GET\_DETAIL\_DOC\_TREE\_INFO function is as follows:  
dbe\_xml.xml\_dom\_get\_detail\_doc\_tree\_info(  
id IN RAW(13))  
RETURNS VARCHAR2

**Table 10-141** DBE\_XML.XML\_DOM\_GET\_DETAIL\_DOC\_TREE\_INFO parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object

## 10.11.2 Secondary Encapsulation APIs (Recommended)

### 10.11.2.1 DBE\_APPLICATION\_INFO

#### Interface Description

**Table 10-142** provides all interfaces supported by the **DBE\_APPLICATION\_INFO** package. **DBE\_APPLICATION\_INFO** applies to the current session.

**Table 10-142** DBE\_APPLICATION\_INFO

Interface	Description
<a href="#">DBE_APPLICATION_INFO.SET_CLIENT_INFO</a>	Writes client information.
<a href="#">DBE_APPLICATION_INFO.READ_CLIENT_INFO</a>	Reads client information.
<a href="#">DBE_APPLICATION_INFO.SET_MODULE</a>	Sets the name of the currently running module to the new module. You can set the module and action.
<a href="#">DBE_APPLICATION_INFO.READ_MODULE</a>	Reads the values of the module and action columns of the current session.
<a href="#">DBE_APPLICATION_INFO.SET_ACTION</a>	Sets the name of the current action in the current module.

- [DBE\\_APPLICATION\\_INFO.SET\\_CLIENT\\_INFO](#)  
Writes client information. The [DBE\\_APPLICATION\\_INFO.SET\\_CLIENT\\_INFO](#) function prototype is as follows:

```
DBE_APPLICATION_INFO.SET_CLIENT_INFO(  
  str text  
)returns void;
```

**Table 10-143** DBE\_APPLICATION\_INFO.SET\_CLIENT\_INFO interface parameters

Parameter	Description
str	Client information to be written. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

- [DBE\\_APPLICATION\\_INFO.READ\\_CLIENT\\_INFO](#)  
The [DBE\\_APPLICATION\\_INFO.READ\\_CLIENT\\_INFO](#) function prototype is as follows:

```
DBE_APPLICATION_INFO.READ_CLIENT_INFO(  
  OUT client_info text);
```

**Table 10-144** DBE\_APPLICATION\_INFO.READ\_CLIENT\_INFO interface parameters

Parameter	Description
client_info	Client information

- [DBE\\_APPLICATION\\_INFO.SET\\_MODULE](#)  
Sets the name of the currently running module to the new module. The prototype of the [DBE\\_APPLICATION\\_INFO.SET\\_MODULE](#) function is:

```
DBE_APPLICATION_INFO.SET_MODULE(  
  IN module_name text,  
  IN action_name text  
);
```

**Table 10-145** DBE\_APPLICATION\_INFO.SET\_MODULE parameters

Parameter	Description
module_name	Name of the running module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.
action_name	Name of the current action in the current module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

Example:

```
CALL dbe_application_info.set_module('module_name','action_name');  
set_module  
-----  
(1 row)
```

- **DBE\_APPLICATION\_INFO.READ\_MODULE**

Reads the values of the module and action columns of the current session. The prototype of the DBE\_APPLICATION\_INFO.READ\_MODULE function is:

```
DBE_APPLICATION_INFO.READ_MODULE(  
  OUT module_name text,  
  OUT action_name text  
);
```

**Table 10-146** DBE\_APPLICATION\_INFO.READ\_MODULE parameters

Parameter	Description
module_name	Name of the running module.
action_name	Name of the current action in the current module.

Example:

```
DECLARE  
  module varchar2(64);  
  action varchar2(64);  
BEGIN  
  dbe_application_info.read_module(module,action);  
  db_output.print_line(module);  
  db_output.print_line(action);  
END;  
/  
module_name  
action_name  
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_APPLICATION\_INFO.SET\_ACTION**

Sets the name of the current action in the current module. The prototype of the DBE\_APPLICATION\_INFO.SET\_ACTION function is:

```
DBE_APPLICATION_INFO.SET_ACTION(  
    IN action_name text  
);
```

**Table 10-147** DBE\_APPLICATION\_INFO.SET\_ACTION parameters

Parameter	Description
action_name	Name of the current action in the current module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

#### Examples

```
CALL dbe_application_info.set_action('action_name');  
set_action
```

(1 row)

## 10.11.2.2 DBE\_COMPRESSION

### Interface Description

Evaluates the sampling compression rate of a specified data object or obtains the compression type of a specified row of data based on the input parameters.

**Table 10-148** DBE\_COMPRESSION

Interface	Description
GET_COMPRESSION_RATIO	Evaluates the sampling compression ratio of a specified data object based on input parameters.
GET_COMPRESSION_TYPE	Obtains the compression type of data in a specified row based on input parameters.

#### CAUTION

The GET\_COMPRESSION\_TYPE interface supports only DNs in the distributed database.

- DBE\_COMPRESSION.GET\_COMPRESSION\_RATIO

Evaluates the sampling compression rate of a specified data object based on the input parameters. The prototype is as follows:

```
DBE_COMPRESSION.GET_COMPRESSION_RATIO (  
    scratchbsname IN TEXT,  
    ownname      IN TEXT,  
    objname      IN TEXT,
```

```

subobjname    IN TEXT,
comptype      IN INTEGER,
blkcnt_cmp    OUT INTEGER,
blkcnt_uncmp  OUT INTEGER,
row_cmp       OUT INTEGER,
row_uncmp     OUT INTEGER,
cmp_ratio     OUT NUMBER,
comptype_str  OUT VARCHAR2,
sample_ratio  IN NUMBER DEFAULT 20,
objtype       IN INTEGER DEFAULT 1);
    
```

**Table 10-149** DBE\_COMPRESSION.GET\_COMPRESSION\_RATIO parameters

Parameter	Description
scratchtblspace	Tablespace to which a data object belongs.
ownname	Data object owner (schema to which the data object belongs).
objname	Data object name.
subobjname	Name of a data subobject.
comptype	Compression type. The options are as follows: <ul style="list-style-type: none"> <li>1: uncompressed.</li> <li>2: advanced compression.</li> </ul>
blkcnt_cmp	Number of pages occupied by sampled rows after compression.
blkcnt_uncmp	Number of pages occupied by sampled rows before compression.
row_cmp	Number of compressed rows on a single page.
row_uncmp	Number of uncompressed rows on a single page.
cmp_ratio	Compression ratio.
comptype_str	Character string of the compression type.
sample_ratio	Sampling rate.
objtype	Object type. The options are as follows: <ul style="list-style-type: none"> <li>1: table object.</li> </ul>

- DBE\_COMPRESSION.GET\_COMPRESSION\_TYPE

This interface is used to obtain the compression type of a specified row based on input parameters. This interface is an O&M interface and does not check the visibility. That is, if the input CTID is a deleted row, this interface still returns the latest status of the current row on the page. The prototype is as follows:

```
DBE_COMPRESSION.GET_COMPRESSION_TYPE (
ownname      IN TEXT,
tablename    IN TEXT,
ctid         IN INTEGER,
subobjname   IN TEXT  DEFAULT NULL,
comptype     OUT INTEGER);
```

**Table 10-150** DBE\_COMPRESSION.GET\_COMPRESSION\_TYPE parameters

Parameter	Description
ownname	Data object owner (schema to which the data object belongs).
tablename	Data object name.
ctid	CTID of the target row.
subobjname	Name of a data subobject.
comptype	Compression type. The options are as follows: <ul style="list-style-type: none"> <li>• <b>1</b>: uncompressed.</li> <li>• <b>2</b>: advanced compression.</li> </ul>

### 10.11.2.3 DBE\_FILE

The DBE\_FILE package provides the capabilities of reading and writing OS text files for stored procedures.

#### Precautions

- DBE\_FILE requires that files opened using DBE\_FILE.FOPEN be encoded using the database character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE\_FILE.READ\_LINE is used to read files. DBE\_FILE requires that files opened using DBE\_FILE.FOPEN\_NCHAR be encoded using the UTF-8 character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE\_FILE.READ\_LINE\_NCHAR is used to read files.
- When DBE\_OUTPUT.PUT\_LINE is used to print the result obtained by the DBE\_FILE.READ\_LINE\_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE\_OUTPUT.PRINT\_LINE does not support this function.
- DBE\_FILE requires that the character set encoding of the client be the same as that of the database.
- Assume that the database character set encoding is ASCII, the client character set encoding supports Chinese, and the client calls DBE\_FILE.WRITE\_NCHAR or DBE\_FILE.WRITE\_LINE\_NCHAR to write Chinese content. If the entered content is in UTF-8 encoding format, the written content may not be encoded in UTF-8 format. An error may be reported when the DBE\_FILE.READ\_LINE\_NCHAR is used.

## Data Types

- **DBE\_FILE.FILE\_TYPE**  
Defines the representation of files in the DBE\_FILE package. The fields in DBE\_FILE.FILE\_TYPE are private fields of the DBE\_FILE package. Do not change the field value of the type defined in DBE\_FILE.FILE\_TYPE.

```
CREATE TYPE DBE_FILE.FILE_TYPE AS(
  id INTEGER,
  datatype INTEGER,
  byte_mode BOOLEAN
);
```

**Table 10-151** DBE\_FILE.FILE\_TYPE columns

Parameter	Description
id	File handle
datatype	File data type (CHAR, NCHAR, or binary). Currently, only CHAR and NCHAR files are supported. For a CHAR file, <b>1</b> is returned. For an NCHAR file, <b>2</b> is returned.
byte_mode	Specifies whether the file is opened in binary mode ( <b>TRUE</b> ) or text mode ( <b>FALSE</b> ).

## API Description

**Table 10-152** lists all APIs supported by the **DBE\_FILE** package.

**Table 10-152** DBE\_FILE

API	Description
<b>DBE_FILE.OPEN</b>	Opens a file based on the specified directory and file name. The corresponding file handle or the DBE_FILE.FILE_TYPE type object encapsulated with the file handle is returned.
<b>DBE_FILE.IS_CLOSE</b>	Checks whether a file is closed.
<b>DBE_FILE.IS_OPEN</b>	Checks whether a file is opened.
<b>DBE_FILE.READ_LINE</b>	Reads a line of a specified length from an open file handle.
<b>DBE_FILE.WRITE</b>	Writes data to an open file.
<b>DBE_FILE.NEW_LINE</b>	Writes one or more line terminators to an open file.
<b>DBE_FILE.WRITE_LINE</b>	Writes data to an open file and automatically appends a line terminator.
<b>DBE_FILE.FORMAT_WRITE</b>	Writes data in a specified format to the buffer of an open file.

API	Description
<a href="#">DBE_FILE.GET_RAW</a>	Reads RAW data from an open file.
<a href="#">DBE_FILE.PUT_RAW</a>	Writes RAW data to an open file.
<a href="#">DBE_FILE.FLUSH</a>	Writes cached data to a physical file.
<a href="#">DBE_FILE.CLOSE</a>	Closes an open file.
<a href="#">DBE_FILE.CLOSE_ALL</a>	Closes all files opened in a session.
<a href="#">DBE_FILE.REMOVE</a>	Deletes a disk file. To perform this operation, you must have required permissions.
<a href="#">DBE_FILE.RENAME</a>	Renames a disk file, which is similar to the mv command of Unix.
<a href="#">DBE_FILE.COPY</a>	Copies data in a continuous area to a new file. If <b>start_line</b> and <b>end_line</b> are omitted, the entire file is copied.
<a href="#">DBE_FILE.GET_ATTR</a>	Reads and returns the attributes of a disk file.
<a href="#">DBE_FILE.SEEK</a>	Adjusts the position of a file pointer forward or backward based on the specified number of bytes.
<a href="#">DBE_FILE.GET_POS</a>	Returns the current offset of a file, in bytes.
<a href="#">DBE_FILE.FOPEN_NCHAR</a>	Opens a file of the NCHAR type based on the specified directory and file name.
<a href="#">DBE_FILE.WRITE_NCHAR</a>	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type.
<a href="#">DBE_FILE.WRITE_LINE_NCHAR</a>	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type and automatically appends a line terminator.
<a href="#">DBE_FILE.FORMAT_WRITE_NCHAR</a>	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type in a specified format. It is a DBE_FILE.WRITE_NCHAR API that allows formatting.
<a href="#">DBE_FILE.READ_LINE_NCHAR</a>	Reads a line of a specified length from an open file of the NCHAR type.

- [DBE\\_FILE.OPEN/DBE\\_FILE.FOPEN](#)  
Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a file handle of the INTEGER type. The function of DBE\_FILE.FOPEN is similar to that of DBE\_FILE.OPEN. It returns an object of the type defined in DBE\_FILE.FILE\_TYPE.

The prototypes of the DBE\_FILE.OPEN and DBE\_FILE.FOPEN functions are:

```
DBE_FILE.OPEN (
dir          IN TEXT,
file_name    IN TEXT,
open_mode    IN TEXT,
max_line_size IN INTEGER DEFAULT 1024)
RETURN INTEGER;

DBE_FILE.FOPEN(
dir          IN TEXT,
file_name    IN TEXT,
open_mode    IN TEXT,
max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

**Table 10-153** DBE\_FILE.OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> </ul>
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the <b>OPEN</b> function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
open_mode	TEXT	IN	No	Open mode of a specified file, including: <ul style="list-style-type: none"> <li>• <b>r</b> (read text)</li> <li>• <b>w</b> (write text)</li> <li>• <b>a</b> (append text)</li> <li>• <b>rb</b> (read byte)</li> <li>• <b>wb</b> (write byte)</li> <li>• <b>ab</b> (append byte)</li> </ul> <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	INTEGER	IN	Yes	Maximum number of bytes in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.

- **DBE\_FILE.IS\_CLOSE**

Checks whether a file handle is closed. A Boolean value is returned. If an invalid file handle is detected, the **INVALID\_FILEHANDLE** exception is thrown.

The prototype of the DBE\_FILE.IS\_CLOSE function is as follows:

```
DBE_FILE.IS_CLOSE (
    file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_CLOSE(
    file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

**Table 10-154** DBE\_FILE.IS\_CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	Yes	File handle or DBE_FILE.FILE_TYPE object to be checked. If the value is empty, the DBE_FILE.IS_CLOSE API returns empty.

- DBE\_FILE.IS\_OPEN

Checks whether a file handle is opened. A Boolean value is returned. If an invalid file handle is detected, the **INVALID\_FILEHANDLE** exception is thrown.

The prototype of the DBE\_FILE.IS\_OPEN function is as follows:

```
DBE_FILE.IS_OPEN(
  file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_OPEN(
  file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

**Table 10-155** DBE\_FILE.IS\_OPEN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	Yes	File handle or DBE_FILE.FILE_TYPE object to be checked. If the value is empty, the DBE_FILE.IS_OPEN API returns <b>FALSE</b> .

- DBE\_FILE.READ\_LINE

Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be

read cannot exceed the value of **max\_line\_size** specified when the file is opened.

The prototype of the **DBE\_FILE.READ\_LINE** function is as follows:

```
DBE_FILE.READ_LINE(
  file IN INTEGER,
  buffer OUT TEXT,
  len IN INTEGER DEFAULT NULL)
RETURN TEXT;

DBE_FILE.READ_LINE(
  file IN DBE_FILE.FILE_TYPE,
  buffer OUT TEXT,
  len IN INTEGER DEFAULT NULL)
RETURN TEXT;
```

**Table 10-156** DBE\_FILE.READ\_LINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	TEXT	OUT	No	Buffer for receiving data.
len	INTEGER	IN	Yes	Number of bytes read from a file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_linesize</b> is used to specify the line size.

- **DBE\_FILE.WRITE**

Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation does not write a line terminator.

The prototype of the **DBE\_FILE.WRITE** function is as follows:

```
DBE_FILE.WRITE(
  file IN INTEGER,
  buffer IN TEXT)
RETURN BOOLEAN;

DBE_FILE.WRITE(
  file IN DBE_FILE.FILE_TYPE,
  buffer IN TEXT)
RETURN VOID;
```

**Table 10-157** DBE\_FILE.WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in write mode. This operation does not write line terminators.
buffer	TEXT	IN	Yes	Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of <b>max_line_size</b> specified when OPEN or FOPEN is used. Otherwise, an error is reported when the file is refreshed.  <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **DBE\_FILE.NEW\_LINE**

Writes one or more line terminators to the buffer corresponding to a file. The line terminators are related to the platform used.

The prototype of the DBE\_FILE.NEW\_LINE function is as follows:

```
DBE_FILE.NEW_LINE(
    file    IN INTEGER,
    line_nums IN INTEGER DEFAULT 1)
RETURN BOOLEAN;

DBE_FILE.NEW_LINE(
    file    IN DBE_FILE.FILE_TYPE,
    line_nums IN INTEGER DEFAULT 1)
RETURN VOID;
```

**Table 10-158** DBE\_FILE.NEW\_LINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in write mode. This operation does not write line terminators.
line_nums	INTEGER	IN	Yes	Number of line terminators written to a file. The default value is 1. If this parameter is left blank, line terminators are not written.

- DBE\_FILE.WRITE\_LINE

Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation automatically adds a line terminator.

The prototype of the DBE\_FILE.WRITE\_LINE function is as follows:

```
DBE_FILE.WRITE_LINE(
  file IN INTEGER,
  buffer IN TEXT,
  flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.WRITE_LINE(
  file IN DBE_FILE.FILE_TYPE,
  buffer IN TEXT,
  flush IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

**Table 10-159** DBE\_FILE.WRITE\_LINE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
buffer	TEXT	IN	Yes	Text data to be written to the file. The length of each line (including the newline character) cannot be greater than the value of <b>max_line_size</b> specified when OPEN or FOPEN is executed or the default value. Otherwise, an error is reported when the file is refreshed. <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	BOOLEAN	IN	Yes	Specifies whether to flush data to disks after WRITE_LINE. The default value is <b>FALSE</b> .

- DBE\_FILE.FORMAT\_WRITE

Writes formatted data to the buffer corresponding to an open file. It is a DBE\_FILE.WRITE API that allows formatting.

The prototype of the DBE\_FILE.FORMAT\_WRITE function is as follows:

```
DBE_FILE.FORMAT_WRITE(
  file IN INTEGER,
  format IN TEXT,
  arg1 IN TEXT DEFAULT NULL,
  ...
  arg6 IN TEXT DEFAULT NULL)
RETURN BOOLEAN;

DBE_FILE.FORMAT_WRITE(
  file IN DBE_FILE.FILE_TYPE,
  format IN TEXT,
  arg1 IN TEXT DEFAULT NULL,
  ...
  arg6 IN TEXT DEFAULT NULL)
RETURN VOID;
```

**Table 10-160** DBE\_FILE.FORMAT\_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
format	TEXT	IN	Yes	Formatted string, containing the text and format characters \n and %s. If this parameter is left blank, no data is written.
[arg1...arg6]	TEXT	IN	Yes	Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- **DBE\_FILE.GET\_RAW**

Reads RAW data from an open file, stores the read result in the buffer, and returns the result from *r*.

The prototype of the **DBE\_FILE.GET\_RAW** function is as follows:

```
DBE_FILE.GET_RAW(
  file IN INTEGER,
  r OUT RAW,
  length IN INTEGER DEFAULT NULL)
RETURN RAW;

DBE_FILE.GET_RAW(
  file IN DBE_FILE.FILE_TYPE,
  r OUT RAW,
  length IN INTEGER DEFAULT NULL)
RETURN BOOLEAN;
```

**Table 10-161** DBE\_FILE.GET\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
r	RAW	OUT	No	Buffer for receiving RAW data.
length	INTEGER	IN	Yes	Number of bytes read from the file. The default value is <b>NULL</b> . If the value is <b>NULL</b> , the maximum length of the RAW type is used to specify the size.

- DBE\_FILE.PUT\_RAW

Writes RAW data to a file. The return value is always **TRUE**.

The prototype of the DBE\_FILE.PUT\_RAW function is as follows:

```
DBE_FILE.PUT_RAW (
  file IN INTEGER,
  r    IN RAW,
  flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.PUT_RAW (
  file IN DBE_FILE.FILE_TYPE,
  r    IN RAW,
  flush IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

**Table 10-162** DBE\_FILE.PUT\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
r	RAW	IN	No	RAW data to be written to a file. <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	BOOLEAN	IN	Yes	Specifies whether to flush data to disks after PUT_RAW. The default value is <b>FALSE</b> .

- DBE\_FILE.FLUSH

Writes cached data to a physical file. The cached data must have a line terminator.

The prototype of the DBE\_FILE.FLUSH function is as follows:

```
DBE_FILE.FLUSH(
    file IN INTEGER)
RETURN VOID;

DBE_FILE.FLUSH(
    file IN DBE_FILE.FILE_TYPE)
RETURN VOID;
```

**Table 10-163** DBE\_FILE.FLUSH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE\_FILE.CLOSE

Closes an open file. When this function is called, if there is cached data to be written, exception information may be received and the return value is always **TRUE**.

The prototype of the DBE\_FILE.CLOSE function is as follows:

```
DBE_FILE.CLOSE(
  file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.CLOSE(
  file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

**Table 10-164** DBE\_FILE.CLOSE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE\_FILE.CLOSE\_ALL

Closes all file handles opened in a session. This function can be used for emergency cleanup.

The prototype of the DBE\_FILE.CLOSE\_ALL function is as follows:

```
DBE_FILE.CLOSE_ALL()
RETRUN VOID;
```

- DBE\_FILE.REMOVE

Deletes a disk file. To use this function, you must have the required permission.

The prototype of the DBE\_FILE.REMOVE function is as follows:

```
DBE_FILE.REMOVE(
  dir IN TEXT,
  file_name IN TEXT)
RETURN VOID;
```

**Table 10-165** DBE\_FILE.REMOVE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	File directory <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
file_name	TEXT	IN	No	File name.

- DBE\_FILE.RENAME

Renames a disk file. This function is similar to the mv command of Unix.

The prototype of the DBE\_FILE.RENAME function is as follows:

```
DBE_FILE.RENAME(
  src_dir      IN TEXT,
  src_file_name IN TEXT,
  dest_dir     IN TEXT,
  dest_file_name IN TEXT,
  overwrite    IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

**Table 10-166** DBE\_FILE.RENAME parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	No	Directory of the original file (case-sensitive) <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
src_file_name	TEXT	IN	No	Original file to be renamed
dest_dir	TEXT	IN	No	Target directory (case-sensitive). <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
dest_file_name	TEXT	IN	No	New file name
overwrite	BOOLEAN	IN	Yes	Specifies whether to overwrite the file. If the parameter is left empty or not specified, the parameter is not overwritten. If a file with the same name exists in the target directory, the file will not be overwritten.

- **DBE\_FILE.COPY**

Copies data in a continuous area to a new file. If **start\_line** and **end\_line** are omitted, the entire file is copied.

The prototype of the DBE\_FILE.COPY function is as follows:

```
DBE_FILE.COPY (
src_dir      IN TEXT,
src_file_name IN TEXT,
dest_dir     IN TEXT,
dest_file_name IN TEXT,
start_line  IN INTEGER DEFAULT 1,
end_line    IN INTEGER DEFAULT NULL)
RETURN VOID;
```

**Table 10-167** DBE\_FILE.COPY parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	NO	Directory of the original file <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
src_file_name	TEXT	IN	NO	Name of the source file to be copied.
dest_dir	TEXT	IN	NO	Directory of the destination file <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
dest_file_name	TEXT	IN	NO	Target file <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

Parameter	Type	In pu t/ Ou tp ut Pa ra m e t e r	Ca n Be E m p t y	Description
start_line	TEXT	IN	No	Number of the line where the copy starts. The default value is <b>1</b> .
end_line	TEXT	IN	Yes	Number of the line where the copy ends. The default value is <b>NULL</b> , indicating the end of the file.

- DBE\_FILE.GET\_ATTR

Reads and returns the attributes of a disk file.

The prototype of the **DBE\_FILE.GET\_ATTR** function is as follows:

```
DBE_FILE.GET_ATTR(
  location IN TEXT,
  filename IN TEXT,
  fexists OUT BOOLEAN,
  file_length OUT BIGINT,
  block_size OUT INTEGER)
RETURN RECORD;
```

**Table 10-168** DBE\_FILE.GET\_ATTR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
location	TEXT	IN	No	File directory <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to operate files in the file path specified by <b>safe_data_path</b>.</li> </ul>
filename	TEXT	IN	No	File name.
file_exists	BOOLEAN	OUTPUT	No	Specifies whether the file exists.
file_length	BIGINT	OUTPUT	No	File length (unit: byte). If the file does not exist, <b>NULL</b> is returned.
block_size	INTEGER	OUTPUT	No	Block size of the file system (unit: byte). If the file does not exist, <b>NULL</b> is returned.

- **DBE\_FILE.SEEK**  
Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

The prototype of the DBE\_FILE.SEEK function is as follows:

```
DBE_FILE.SEEK(
    file          IN INTEGER,
    absolute_start IN BIGINT DEFAULT NULL,
    relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;

DBE_FILE.SEEK(
    file          IN DBE_FILE.FILE_TYPE,
    absolute_start IN BIGINT DEFAULT NULL,
    relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;
```

**Table 10-169** DBE\_FILE.SEEK parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
absolute_start	BIGINT	IN	Yes	Absolute offset of a file. The default value is <b>NULL</b> .
relative_start	BIGINT	IN	Yes	Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is <b>NULL</b> . If both <b>absolute_start</b> and this parameter are specified, the <b>absolute_start</b> parameter is used.

- DBE\_FILE.GET\_POS

Returns the current offset of the file in bytes.

The prototype of the DBE\_FILE.FGETPOS function is as follows:

```
DBE_FILE.GET_POS(
  file IN INTEGER)
RETURN BIGINT;

DBE_FILE.GET_POS(
  file IN DBE_FILE.FILE_TYPE)
RETURN BIGINT;
```

**Table 10-170** DBE\_FILE.GET\_POS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE\_FILE.FOPEN\_NCHAR

Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a DBE\_FILE.FILE\_TYPE type object that encapsulates a file handle. This function opens a file in national character set mode for input or output.

The prototype of the DBE\_FILE.FOPEN\_NCHAR function is as follows:

```
DBE_FILE.FOPEN_NCHAR(
  dir      IN TEXT,
  file_name IN TEXT,
  open_mode IN TEXT,
  max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

**Table 10-171** DBE\_FILE.FOPEN\_NCHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. <b>NOTE</b> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> </ul>
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the FOPEN_NCHAR function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	TEXT	IN	No	Open mode of a specified file, including: <ul style="list-style-type: none"> <li><b>r</b> (read text)</li> <li><b>w</b> (write text)</li> <li><b>a</b> (append text)</li> <li><b>rb</b> (read byte)</li> <li><b>wb</b> (write byte)</li> <li><b>ab</b> (append byte)</li> </ul> <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	INTEGER	IN	Yes	Maximum number of bytes in each line, including newline characters. The minimum value is <b>1</b> and the maximum is <b>32767</b> . If this parameter is not specified, the default value <b>1024</b> is used.

- DBE\_FILE.WRITE\_NCHAR

Writes buffer data to the buffer of a file. The file must be opened in national character set or write mode. This operation does not write a line terminator. The text string is written in the UTF8 character set format.

The prototype of the DBE\_FILE.WRITE\_NCHAR function is as follows:

```
DBE_FILE.WRITE_NCHAR(
    file IN DBE_FILE.FILE_TYPE,
    buffer IN NVARCHAR2)
RETURN VOID;
```

**Table 10-172** DBE\_FILE.WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	DBE_FILE.FILE_TYPE	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in write mode. This operation does not write line terminators.
buffer	VARCHAR2	IN	Yes	Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of <b>max_line_size</b> specified by <b>FOPEN_NCHAR</b> . Otherwise, an error is reported when the file is refreshed.  <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE\_FILE.WRITE\_LINE\_NCHAR

Writes buffer data to the buffer of a file. The file must be opened in national character set or write mode. This operation automatically adds a line terminator. The text string is written in the UTF8 character set format.

The prototype of the DBE\_FILE.WRITE\_LINE\_NCHAR function is as follows:

```
DBE_FILE.WRITE_LINE_NCHAR(
    file IN DBE_FILE.FILE_TYPE,
    buffer IN NVARCHAR2)
RETURN VOID;
```

**Table 10-173** DBE\_FILE.WRITE\_LINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	DBE_FILE.FILE_TYPE	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
buffer	VARCHAR2	IN	Yes	Text data to be written to the file. The length of each line (including the newline character) cannot be greater than the value of <b>max_line_size</b> specified by <b>FOPEN_NCHAR</b> or the default value. Otherwise, an error is reported when the file is refreshed.  <b>NOTE</b> For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- **DBE\_FILE.FORMAT\_WRITE\_NCHAR**

Writes formatted data to the buffer of an open file. It is a DBE\_FILE.WRITE\_NCHAR API that allows formatting.

The prototype of the DBE\_FILE.FORMAT\_WRITE\_NCHAR function is as follows:

```
DBE_FILE.FORMAT_WRITE_NCHAR(
    file IN DBE_FILE.FILE_TYPE,
    format IN NVARCHAR2,
    arg1 IN NVARCHAR2 DEFAULT NULL,
    ...
    arg5 IN NVARCHAR2 DEFAULT NULL)
RETURN VOID;
```

**Table 10-174** DBE\_FILE.FORMAT\_WRITE\_NCHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	DBE_FILE.FILE_TYPE	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
format	VARCHAR2	IN	Yes	Formatted string, containing the text and format characters \n and %s.
[arg1...arg5]	VARCHAR2	IN	Yes	Five optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE\_FILE.READ\_LINE\_NCHAR

Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max\_line\_size** specified by **FOPEN\_NCHAR**.

The prototype of the DBE\_FILE.READ\_LINE\_NCHAR stored procedure is as follows:

```
DBE_FILE.READ_LINE_NCHAR(
  file IN DBE_FILE.FILE_TYPE,
  buffer OUT NVARCHAR2,
  len IN INTEGER DEFAULT NULL)
RETURN NVARCHAR2;
```

**Table 10-175** DBE\_FILE.READ\_LINE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	DBE_FILE.FILE_TYPE	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	VARCHAR2	OUT	No	Buffer for receiving data.
len	INTEGER	IN	Yes	Number of bytes read from the file. The default value is <b>NULL</b> . If the default value <b>NULL</b> is used, <b>max_line_size</b> is used to specify the line size.

## Examples

```
-- Add the /tmp/ directory to the PG_DIRECTORY system catalog as a system administrator.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- Execution result:
CREATE DIRECTORY
-- Use the DBE_FILE advanced package.
DECLARE
  f INTEGER;
  buffer VARCHAR2;
  raw_buffer RAW;

### 10.11.2.4 DBE\_HEAT\_MAP

#### API Description

Returns information such as the last modification time of a row in the target data block based on the input parameters. The information is used to browse the basis for determining cold and hot rows. This API is an O&M API and has no visibility check. That is, if the input CTID is a deleted row, this API still returns the latest status of the current row on the page.

**Table 10-176** DBE\_HEAT\_MAP

API	Description
ROW_HEAT_MAP	Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID.

- **DBE\_HEAT\_MAP.ROW\_HEAT\_MAP**  
Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID. The prototype is as follows:

```
DBE_HEAT_MAP.ROW_HEAT_MAP(
owner IN VARCHAR2,
segment_name IN VARCHAR2,
partition_name IN VARCHAR2 DEFAULT NULL,
ctid IN TEXT);
```

**Table 10-177** DBE\_HEAT\_MAP.ROW\_HEAT\_MAP parameters

Parameter	Description
owner	Schema to which a data object belongs.
segment_name	Data object name.
partition_name	Data object partition name. This parameter is optional. The default value is <b>NULL</b> .
ctid	Data row ID.

The DBE\_HEAT\_MAP.ROW\_HEAT\_MAP API supports only DNs in the distributed database.

## Examples

```
gaussdb=# ALTER DATABASE set ilm = on;
gaussdb=# CREATE Schema HEAT_MAP_DATA;
gaussdb=# SET current_schema=HEAT_MAP_DATA;

gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1';
gaussdb=# CREATE TABLE HEAT_MAP_DATA.heat_map_table(id INT, value TEXT) TABLESPACE example1;
gaussdb=# INSERT INTO HEAT_MAP_DATA.heat_map_table VALUES (1, 'test_data_row_1');

gaussdb=# SELECT * from DBE_HEAT_MAP.ROW_HEAT_MAP(
owner => 'heat_map_data',
segment_name => 'heat_map_table',
partition_name => NULL,
ctid => '(0,1)');
owner | segment_name | partition_name | tablespace_name | file_id | relative_fno | ctid | writetime
-----+-----+-----+-----+-----+-----+-----+-----
heat_map_data | heat_map_table | | example1 | 17291 | 17291 | (0,1) |
(1 row)
```

### 10.11.2.5 DBE\_ILM

#### API Description

Implements ILM policies and APIs for manually triggering and stopping ADO tasks.

**Table 10-178** DBE\_ILM

API	Description
EXECUTE_ILM	Evaluates the specified data and ILM policy based on parameters. If the evaluation is passed, the corresponding compression job is generated.
STOP_ILM	Stops a compression job that is being executed based on parameters.

- DBE\_ILM.EXECUTE\_ILM

Evaluates the specified data and ILM policy based on parameters. If the evaluation is passed, the corresponding compression job is generated. The prototype is as follows:

```
DBE_ILM.EXECUTE_ILM (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  task_id          OUT  Oid,
  subobject_name   IN  VARCHAR2 DEFAULT NULL,
  policy_name      IN  VARCHAR2 DEFAULT ILM_ALL_POLICIES,
  execution_mode   IN  NUMBER DEFAULT ILM_EXECUTION_ONLINE);
```

**Table 10-179** DBE\_ILM.EXECUTE\_ILM parameters

Parameter	Description
schema_name	Schema to which an object belongs.
object_name	Object name.
task_id	Descriptor ID of the generated ADO task.
subobject_name	Name of a subobject.
policy_name	Policy name. You can query the GS_ADM_ILMOBJECTS view to obtain the policy name. The default value <b>DBE_ILM.ILM_ALL_POLICIES</b> indicates all policies on the object.
execution_mode	Execution mode. This parameter is not supported in the current version and is reserved.

- DBE\_ILM.STOP\_ILM

Stops an ILM policy that is being executed based on parameters. The prototype is as follows:

```
DBE_ILM.STOP_ILM (
  TASK_ID          IN  NUMBER DEFAULT -1,
  P_DROP_RUNNING_JOBS  IN  BOOLEAN DEFAULT FALSE,
  P_JOBNAME        IN  VARCHAR2 DEFAULT NULL);
```

**Table 10-180** DBE\_ILM.STOP\_ILM parameters

Parameter	Description
TASK_ID	Descriptor ID of an ADO task.
P_DROP_RUNNING_JOBS	Determines whether to stop a task that is being executed. The value <b>TRUE</b> indicates that the task is forcibly stopped, and the value <b>FALSE</b> indicates that the task is not stopped.
P_JOBNAME	Task name.

 **NOTE**

When there are a large number of concurrent requests and you run DBE\_ILM.STOP\_ILM, the system may display the message "Resources are busy, please try again later." In this case, try again later.

## Examples

```

gaussdb=# CREATE DATABASE ilmtabledb with dbcompatibility = 'ORA';
gaussdb=# \c ilmtabledb
gaussdb=# ALTER DATABASE set ilm = on;
gaussdb=# CREATE Schema ILM_DATA;
gaussdb=# SET current_schema=ILM_DATA;
gaussdb=# CREATE SEQUENCE ILM_DATA.ORDER_TABLE_SE_ORDER_ID MINVALUE 1;
gaussdb=# CREATE OR REPLACE PROCEDURE ILM_DATA.ORDER_TABLE_CREATE_DATA(NUM INTEGER) IS
BEGIN
    FOR X IN 1..NUM
        LOOP
            INSERT INTO ORDER_TABLE VALUES(ORDER_TABLE_SE_ORDER_ID.nextval, 'Snack gift basket A',
NOW());
        END LOOP;
        COMMIT;
    END;

### 10.11.2.6 DBE\_ILM\_ADMIN

#### Interface Description

Implements ILM policies, and controls ADO background scheduling and concurrency control parameters.

**Table 10-181** DBE\_ILM\_ADMIN

Interface	Description
CUSTOMIZE_ILM	Customizes ILM policy attributes based on input parameters.
DISABLE_ILM	Disables background scheduling.
ENABLE_ILM	Enables background scheduling.

#### NOTE

When there are a large number of concurrent requests and you run DBE\_ILM\_ADMIN.DISABLE\_ILM or DBE\_ILM\_ADMIN.ENABLE\_ILM, the system may display the message "Resources are busy, please try again later." In this case, try again later.

- DBE\_ILM\_ADMIN.CUSTOMIZE\_ILM

Customizes ILM policy attributes based on input parameters. The prototype is as follows:

```
DBE_ILM_ADMIN.CUSTOMIZE_ILM (
  parameter      IN   int8,
  value          IN   int8);
```

**Table 10-182** DBE\_ILM\_ADMIN.CUSTOMIZE\_ILM parameters

Parameter	Description
parameter	Sequence number of a parameter.
value	Parameter value.

**Table 10-183** DBE\_ILM\_ADMIN.CUSTOMIZE\_ILM parameters

Parameter ID	Parameter Value	Description
1	EXECUTION_INTERVAL	Specifies the frequency of executing an ADO task, in minutes. The default value is <b>15</b> . The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
2	RETENTION_TIME	Specifies the retention period of ADO-related history records, in days. The default value is <b>30</b> . The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
7	ENABLE	Specifies the background scheduling status which cannot be modified in this interface. Otherwise, the message "Invalid argument value, ENABLED should be change by calling DBE_ILM_ADMIN.ENABLE_ILM and DBE_ILM_ADMIN.DISABLE_ILM" is displayed. Instead, use <code>disable_ilm()</code> and <code>enable()</code> to modify it.
11	POLICY_TIME	Specifies whether the time unit of ADO is day or second. The time unit second is used only for testing. Possible values are: <ul style="list-style-type: none"> <li>● <b>0</b>: ILM_POLICY_IN_DAYS (default value)</li> <li>● <b>1</b>: ILM_POLICY_IN_SECONDS</li> </ul>
12	ABS_JOBLIMIT	Specifies the maximum number of ADO jobs generated by an ADO task. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.

Parameter ID	Parameter Value	Description
13	JOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job. The unit is MB. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
14	WIND_DURATION	Specifies the maintenance window duration, in minutes. The default value is 240 minutes (4 hours). The value is an integer greater than or equal to 0 and less than 1440 (24 hours).
15	BLOCK_LIMITS	Specifies the upper limit of the instance-level row-store compression rate. The default value is <b>40</b> . The value ranges from 0 to 10000, in block/ms, indicating the maximum number of blocks that can be compressed per millisecond. <b>0</b> indicates that the rate is not limited.

- DBE\_ILM\_ADMIN.DISABLE\_ILM

Disables background scheduling. The prototype is as follows:

```
gaussdb=# DBE_ILM_ADMIN.DISABLE_ILM();
```

- DBE\_ILM\_ADMIN.ENABLE\_ILM

Enables background scheduling. The prototype is as follows:

```
gaussdb=# DBE_ILM_ADMIN.ENABLE_ILM();
```

Note: To make background scheduling take effect, you need to enable the GUC parameter **enable\_ilm** on the management and control plane.

## Examples

```
gaussdb=# CALL DBE_ILM_ADMIN.CUSTOMIZE_ILM(1, 15);
customize_ilm
-----
(1 row)
gaussdb=# SELECT * FROM gs_adm_ilmparameters;
 name      | value
-----+-----
EXECUTION_INTERVAL | 15
RETENTION_TIME    | 30
ENABLED          | 1

ABS_JOBLIMIT     | 10
JOB_SIZELIMIT    | 1024
WIND_DURATION    | 240
BLOCK_LIMITS     | 40
(8 rows)
```

## 10.11.2.7 DBE\_LOB

### API Description

**Table 10-184** lists all APIs supported by the DBE\_LOB package.

 **NOTE**

- In database ORA, the byte content of the space is 00. However, in GaussDB, the byte content corresponding to the space is ASCII code 32.
- In a distributed environment, the maximum size of a CLOB, BLOB, and BFILE is 1 GB.
- LOBMAXSIZE supports a maximum of 1073741771 bytes.

**Table 10-184** DBE\_LOB

API	Description
<a href="#">DBE_LOB.GET_LENGTH</a>	Obtains and returns the length of a specified LOB. The object cannot be greater than 2 GB.
<a href="#">DBE_LOB.LOB_GET_LENGTH</a>	Obtains and returns the length of a specified LOB or BFILE object.
<a href="#">DBE_LOB.OPEN</a>	Opens a LOB and returns a LOB descriptor.
<a href="#">DBE_LOB.READ</a>	Loads a part of LOB content to the buffer based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_READ</a>	Reads a part of LOB (including BFILE) content to the buffer based on the specified length and initial position offset.
<a href="#">DBE_LOB.WRITE</a>	Copies content in the buffer to a LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.WRITE_APPEND</a>	Copies content in the buffer to the end part of a LOB based on the specified length.
<a href="#">DBE_LOB.LOB_WRITE_APPEND</a>	Copies content in the buffer to the end part of a LOB based on the specified length.
<a href="#">DBE_LOB.COPY</a>	Copies content in a LOB to another LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_COPY</a>	Copies content in a LOB to another LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.ERASE</a>	Deletes content in a LOB (less than or equal to 1 GB) based on the specified length and initial position offset.
<a href="#">DBE_LOB.LOB_ERASE</a>	Deletes content in a LOB based on the specified length and initial position offset.
<a href="#">DBE_LOB.CLOSE</a>	Closes a LOB descriptor.

API	Description
<a href="#">DBE_LOB.MATCH</a>	Returns the position of the <i>M</i> th occurrence of a character string in a LOB.
<a href="#">DBE_LOB.COMPARE</a>	Compares two LOBs (including BFILE objects) or a certain part of two LOBs.
<a href="#">DBE_LOB.SUBSTR</a>	Reads a LOB substring and returns the read substring.
<a href="#">DBE_LOB.LOB_SUBSTR</a>	Reads a LOB or BFILE substring and returns the read substring.
<a href="#">DBE_LOB.STRIP</a>	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter.
<a href="#">DBE_LOB.LOB_STRIP</a>	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the <b>newlen</b> parameter.
<a href="#">DBE_LOB.CREATE_TEMPORARY</a>	Creates a temporary BLOB or CLOB.
<a href="#">DBE_LOB.APPEND</a>	Adds the content of a LOB to another LOB.
<a href="#">DBE_LOB.LOB_APPEND</a>	Adds the content of a LOB to another LOB.
<a href="#">DBE_LOB.FREETEMPORARY</a>	Deletes a temporary BLOB or CLOB.
<a href="#">DBE_LOB.FILEOPEN</a>	Opens a database BFILE file and returns its file descriptor.
<a href="#">DBE_LOB.FILECLOSE</a>	Closes a BFILE file that is opened by <b>FILEOPEN</b> .
<a href="#">DBE_LOB.BFILEOPEN</a>	Opens a database BFILE file.
<a href="#">DBE_LOB.BFILECLOSE</a>	Closes a BFILE file that is opened by <b>BFILEOPEN</b> .
<a href="#">DBE_LOB.LOADFROMFILE</a>	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
<a href="#">DBE_LOB.LOADFROMBFILE</a>	Loads the database BFILE file of the specified length in the specified location to the LOB in the specified location.
<a href="#">DBE_LOB.LOADBLOBFROMFILE</a>	Loads an external database file of the specified length in the specified location to a BLOB (less than or equal to 1 GB) in a specified location.
<a href="#">DBE_LOB.LOADBLOBFROMBFILE</a>	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.

API	Description
<b>DBE_LOB.LOADCLOBFROMFILE</b>	Loads an external database file of the specified length in the specified location to a CLOB (less than or equal to 1 GB) in a specified location.
<b>DBE_LOB.LOADCLOBFROMBFILE</b>	Loads the database BFILE file of the specified length in the specified location to the CLOB in the specified location.
<b>DBE_LOB.CONVERTTOBLOB</b>	Converts a CLOB file to a BLOB file (less than or equal to 1 GB).
<b>DBE_LOB.CONVERTTOCLOB</b>	Converts a BLOB file to a CLOB file (less than or equal to 1 GB).
<b>DBE_LOB.LOB_CONVERTTOBLOB</b>	Converts a CLOB file to a BLOB file.
<b>DBE_LOB.LOB_CONVERTTOCLOB</b>	Converts a BLOB file to a CLOB file.
<b>DBE_LOB.GETCHUNKSIZE</b>	Obtains the maximum size of LOB data that can be stored in the chunk structure in the database.
<b>DBE_LOB.LOB_WRITE</b>	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
<b>DBE_LOB.BFILENAME</b>	Constructs and returns the DBE_LOB.BFILE object based on the directory and file name.

- **DBE\_LOB.GET\_LENGTH**

Obtains and returns the size of a specified LOB. The maximum size of the object is 2 GB.

The prototype of the DBE\_LOB.GET\_LENGTH function is as follows:

```
DBE_LOB.GET_LENGTH (
    blob_obj IN BLOB)
RETURN INTEGER;

DBE_LOB.GET_LENGTH (
    clob_obj IN CLOB)
RETURN INTEGER;
```

**Table 10-185** DBE\_LOB.GET\_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB whose length is to be obtained

- **DBE\_LOB.LOB\_GET\_LENGTH**

Obtains and returns the length of a specified LOB or BFILE file. The maximum size of the object is 32 TB.

The prototype of the DBE\_LOB.LOB\_GET\_LENGTH function is as follows:

```
DBE_LOB.LOB_GET_LENGTH (
  blob_obj IN BLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
  clob_obj IN CLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
  bfile IN DBE_LOB.BFILE)
RETURN BIGINT;
```

**Table 10-186** DBE\_LOB.LOB\_GET\_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE whose length is to be obtained

- DBE\_LOB.OPEN

Opens a LOB and returns a LOB descriptor. This procedure is meaningless and is used only for compatibility.

The prototype of the DBE\_LOB.OPEN function is as follows:

```
DBE_LOB.OPEN (
  lob INOUT BLOB);

DBE_LOB.OPEN (
  lob INOUT CLOB);

DBE_LOB.OPEN (
  bfile INOUT DBE_LOB.BFILE,
  open_mode IN TEXT DEFAULT 'null');
```

**Table 10-187** DBE\_LOB.OPEN parameters

Parameter	Description
lob/bfile	Opened BLOB, CLOB or BFILE.
open_mode	Operation mode. Currently, the range is [R,W,A,RB,WB,AB].

- DBE\_LOB.READ

Reads a part of LOB content to the output buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.READ function is as follows:

```
DBE_LOB.READ (
  blob_obj IN BLOB,
  amount IN INTEGER,
  off_set IN INTEGER,
  out_put OUT RAW);

DBE_LOB.READ (
  clob_obj IN CLOB,
  amount IN INTEGER,
```

```
off_set IN INTEGER,  
out_put OUT VARCHAR2);
```

**Table 10-188** DBE\_LOB.READ parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to be read
amount	Length of read content <b>NOTE</b> If the length to read is less than 1 or greater than 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE\_LOB.LOB\_READ

Reads a part of LOB/BFILE content to the output buffer based on the specified length and initial position offset.

The prototype of the DBE\_LOB.LOB\_READ function is as follows:

```
DBE_LOB.LOB_READ(  
blob_obj IN BLOB,  
amount INOUT BIGINT,  
off_set IN BIGINT,  
out_put OUT RAW);  
  
DBE_LOB.LOB_READ(  
clob_obj IN CLOB,  
amount INOUT BIGINT,  
off_set IN BIGINT,  
out_put OUT VARCHAR2);  
  
DBE_LOB.LOB_READ(  
bfile IN DBE_LOB.BFILE,  
amount INOUT BIGINT,  
off_set IN BIGINT,  
out_put OUT RAW);
```

**Table 10-189** DBE\_LOB.LOB\_READ parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE object (can be greater than 1 GB) to be read
amount	Length to read as the IN parameter, or actual read length as the OUT parameter. <b>NOTE</b> If the length to read is less than 1 or greater than 32767, an error is reported.

Parameter	Description
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE\_LOB.WRITE

Writes content in the source to a LOB based on the specified length and initial position.

The prototype of the DBE\_LOB.WRITE function is as follows:

```
DBE_LOB.WRITE (
  blob_obj INOUT BLOB,
  amount IN INTEGER,
  off_set IN INTEGER,
  source IN RAW);

DBE_LOB.WRITE (
  clob_obj INOUT CLOB,
  amount IN INTEGER,
  off_set IN INTEGER,
  source IN VARCHAR2);
```

**Table 10-190** DBE\_LOB.WRITE parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. <b>NOTE</b> If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
off_set	Start position for writing content to the target LOB, that is, the offset bytes to the initial position of LOB content. <b>NOTE</b> If the offset is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported. The initial position is 1, and the maximum value is the maximum length of the LOB type.
source	Content to be written

- DBE\_LOB.WRITE\_APPEND

Writes content in the source object to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.WRITE\_APPEND function is as follows:

```
DBE_LOB.WRITE_APPEND (
  blob_obj INOUT BLOB,
  amount IN INTEGER,
  source_obj IN RAW);

DBE_LOB.WRITE_APPEND (
```

```
clob_obj INOUT CLOB,
amount IN INTEGER,
source_obj IN VARCHAR2);
```

**Table 10-191** DBE\_LOB.WRITE\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. <b>NOTE</b> If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE\_LOB.LOB\_WRITE\_APPEND

Writes content in the source object to the end part of a LOB based on the specified length.

The prototype of the DBE\_LOB.LOB\_WRITE\_APPEND function is as follows:

```
DBE_LOB.LOB_WRITE_APPEND(
 blob_obj INOUT BLOB,
 amount IN INTEGER,
 source_obj IN RAW);
```

```
DBE_LOB.LOB_WRITE_APPEND (
 clob_obj INOUT CLOB,
 amount IN INTEGER,
 source_obj IN VARCHAR2);
```

**Table 10-192** DBE\_LOB.LOB\_WRITE\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. <b>NOTE</b> If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE\_LOB.COPY

Copies content in a LOB to another LOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.COPY function is as follows:

```
DBE_LOB.COPY (
 dest_lob INOUT BLOB,
 src_lob IN BLOB,
 len IN INTEGER,
 dest_start IN INTEGER DEFAULT 1,
 src_start IN INTEGER DEFAULT 1);
```

**Table 10-193** DBE\_LOB.COPY parameters

Parameter	Description
dest_lob	LOB to which the buffer content is to be pasted
src_lob	LOB from which the buffer content is to be copied
len	Length of the copied data.
dest_start	Start position for pasting the buffer content to the target LOB ( <b>dest_lob</b> ), that is, the offset bytes to the initial position of LOB content.
src_start	Start position for copying the buffer content from the source LOB ( <b>src_lob</b> ), that is, the offset bytes to the initial position of LOB content.

- DBE\_LOB.LOB\_COPY

Copies content in a LOB to another LOB based on the specified length and initial position offset.

The prototype of the DBE\_LOB.LOB\_COPY function is as follows:

```
DBE_LOB.LOB_COPY(
  blob_obj INOUT BLOB,
  source_obj IN BLOB,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1);
```

```
DBE_LOB.LOB_COPY(
  clob_obj INOUT CLOB,
  source_obj IN CLOB,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1);
```

**Table 10-194** DBE\_LOB.LOB\_COPY parameters

Parameter	Description
blob_obj/ clob_obj	LOB to which the buffer content is to be pasted
source_obj	LOB from which the buffer content is to be copied
amount	Length of the copied data. <b>NOTE</b> If the length to copy is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported.
dest_offset	Start position for pasting the buffer content to the target LOB, that is, the offset bytes/characters to the initial position of LOB content. The unit is byte for BLOB and character for CLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <b>LOBMAXSIZE</b> , an error is reported.

Parameter	Description
src_offset	Start position for copying the content from the source object, that is, the offset bytes to the initial position of LOB content. The unit is byte for BLOB and character for CLOB.  <b>NOTE</b> If the offset is less than 1, an error is reported.

- DBE\_LOB.ERASE

Deletes the content in a BLOB (not greater than 1 GB) based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0.

The prototype of the DBE\_LOB.ERASE function is as follows:

```
DBE_LOB.ERASE (
  blob_obj INOUT BLOB,
  amount INOUT INTEGER,
  off_set IN INTEGER DEFAULT 1);
```

**Table 10-195** DBE\_LOB.ERASE parameters

Parameter	Description
blob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (in bytes for BLOBs) to delete as the IN parameter, or actual length deleted as the OUT parameter.  <b>NOTE</b> If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which LOB content is to be deleted, that is, the number of offset bytes to the initial position of BLOB content. The value cannot be greater than 1 GB.  <b>NOTE</b> If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE\_LOB.LOB\_ERASE

Deletes the content in the LOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0, and the characters of the deleted part in the CLOB are filled with spaces. The LOB can be greater than 1 GB and the maximum size is 32 TB.

The prototype of the DBE\_LOB.LOB\_ERASE function is as follows:

```
DBE_LOB.LOB_ERASE (
  blob_obj INOUT BLOB,
  amount INOUT BIGINT,
  off_set IN BIGINT DEFAULT 1);
```

```
DBE_LOB.LOB_ERASE (
```

```
clob_obj INOUT CLOB,  
amount INOUT BIGINT,  
off_set IN BIGINT DEFAULT 1);
```

**Table 10-196** DBE\_LOB.LOB\_ERASE parameters

Parameter	Description
blob_obj/ clob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (BLOB in bytes and CLOB in characters) to delete as the IN parameter, or actual length deleted as the OUT parameter. <b>NOTE</b> If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which the LOB content is to be deleted, that is, the number of bytes relative to the start position of the BLOB content or the number of characters relative to the start position of the CLOB content. <b>NOTE</b> If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE\_LOB.CLOSE

Closes the LOB descriptor that has been opened.

The prototype of the DBE\_LOB.CLOSE function is as follows:

```
DBE_LOB.CLOSE(  
lob IN BLOB);  
  
DBE_LOB.CLOSE (  
lob IN CLOB);  
  
DBE_LOB.CLOSE (  
file IN INTEGER);
```

**Table 10-197** DBE\_LOB.CLOSE parameters

Parameter	Description
lob/file	BLOB/CLOB/File object whose LOB descriptor is to be closed

- DBE\_LOB.MATCH

Returns the *M*th occurrence position of a string in a LOB or BFILE file. **NULL** is returned for an invalid input. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.MATCH function is as follows:

```
DBE_LOB.MATCH(  
blob_obj IN BLOB,  
blob_obj2 IN RAW,
```

```

    beg_index IN BIGINT DEFAULT 1,
    occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
    clob_obj IN CLOB,
    clob_obj2 IN VARCHAR2,
    beg_index IN BIGINT DEFAULT 1,
    occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
    bfile IN DBE_LOB.BFILE,
    blob_obj2 IN RAW,
    beg_index IN BIGINT DEFAULT 1,
    occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

```

**Table 10-198** DBE\_LOB.MATCH parameters

Parameter	Description
blob_obj/ clob_obj/ bfile	BLOB/CLOB descriptor to be searched for, or BFILE (which must be opened using DBE_LOB.BFILEOPEN first). If this parameter is left blank, <b>NULL</b> is returned.
blob_obj 2/ clob_obj2	Pattern to match. It is RAW for BLOB/BFILE objects and VARCHAR2 for CLOBs. If this parameter is left empty, <b>NULL</b> is returned.
beg_index	Absolute offset (in bytes) for BLOB/BFILE objects, or offset (in characters) for CLOBs. The start position for matching is 1. <b>NOTE</b> The value ranges from 1 to <i>LOBMAXSIZE</i> . If a value out of the range is input, <b>NULL</b> is returned.
occur_index	Number of pattern matching times. The minimum value is 1. <b>NOTE</b> If the value is greater than the maximum number of times that the pattern string can be matched in the LOB, <b>0</b> is returned. If the value is out of the range from 1 to <i>LOBMAXSIZE</i> , <b>NULL</b> is returned.

- **DBE\_LOB.COMPARE**

Compares LOBs or BFILE objects.

- If the compared objects are equal, **0** is returned. Otherwise, a non-zero value is returned.
- If the first LOB is smaller than the second, **-1** is returned. If the first LOB is larger than the second, **1** is returned.
- If any of the *len*, *start1*, and *start2* parameters is invalid, **NULL** is returned. The valid offset range is 1 to *LOBMAXSIZE*.
- If both the values of **start\_pos1** and **start\_pos2** exceed the LOB/BFILE length, **0** is returned.

The prototype of the DBE\_LOB.COMPARE function is as follows:

```

DBE_LOB.COMPARE (
    lob1 IN BLOB,
    lob2 IN BLOB,

```

```

len      IN BIGINT DEFAULT 1073741312,
start_pos1 IN BIGINT DEFAULT 1,
start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
lob1     IN CLOB,
lob2     IN CLOB,
len      IN BIGINT DEFAULT 1073741312,
start_pos1 IN BIGINT DEFAULT 1,
start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
file1    IN DBE_LOB.BFILE,
file2    IN DBE_LOB.BFILE,
len      IN BIGINT DEFAULT 1073741312,
start_pos1 IN BIGINT DEFAULT 1,
start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

```

**Table 10-199** DBE\_LOB.COMPARE parameters

Parameter	Description
lob1/file1	First BLOB/CLOB/BFILE to be compared (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first).
lob2/file2	Second BLOB/CLOB/BFILE to be compared (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first).
len	Number of characters or bytes to be compared. The default value is <b>1073741312</b> .
start_pos1	Offset of the first LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.
start_pos2	Offset of the second LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.

- **DBE\_LOB.SUBSTR**

Reads a LOB substring and returns the read substring.

The prototype of the DBE\_LOB.SUBSTR function is as follows:

```

DBE_LOB.SUBSTR(
lob_loc IN BLOB,
amount IN INTEGER DEFAULT 32767,
off_set IN INTEGER DEFAULT 1)
RETURN RAW;

DBE_LOB.SUBSTR(
lob_loc IN CLOB,
amount IN INTEGER DEFAULT 32767,
off_set IN INTEGER DEFAULT 1)
RETURN VARCHAR2;

```

**Table 10-200** DBE\_LOB.SUBSTR parameters

Parameter	Description
lob_loc	LOB descriptor whose substring is to be read. For BLOBs, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. <b>NOTE</b> The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. <b>NOTE</b> The value ranges from 1 to <i>LOBMAXSIZE</i> . If the value exceeds the range, null is returned.

- DBE\_LOB.LOB\_SUBSTR

Reads a LOB or BFILE substring and returns the read substring. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.LOB\_SUBSTR function is as follows:

```
DBE_LOB.LOB_SUBSTR(
  lob_loc IN BLOB,
  amount IN INTEGER DEFAULT 32767,
  off_set IN BIGINT DEFAULT 1)
RETURN RAW;

DBE_LOB.LOB_SUBSTR(
  lob_loc IN CLOB,
  amount IN INTEGER DEFAULT 32767,
  off_set IN BIGINT DEFAULT 1)
RETURN VARCHAR2;

DBE_LOB.LOB_SUBSTR(
  bfile IN DBE_LOB.BFILE,
  amount IN INTEGER DEFAULT 32767,
  off_set IN BIGINT DEFAULT 1)
RETURN RAW;
```

**Table 10-201** DBE\_LOB.LOB\_SUBSTR parameters

Parameter	Description
lob_loc/ bfile	LOB descriptor or BFILE file whose substring is to be read. The file must be opened by DBE_LOB.BFILEOPEN first. For BLOBs/ BFILE files, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. <b>NOTE</b> The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. <b>NOTE</b> The value ranges from 1 to <i>LOBMAXSIZE</i> . If the value exceeds the range, null is returned.

- **DBE\_LOB.STRIP**  
Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter.

The prototype of the DBE\_LOB.STRIP function is as follows:

```
DBE_LOB.STRIP(
  lob_loc INOUT BLOB,
  newlen IN INTEGER);

DBE_LOB.STRIP(
  lob_loc INOUT CLOB,
  newlen IN INTEGER);
```

**Table 10-202** DBE\_LOB.STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs.

- **DBE\_LOB.LOB\_STRIP**  
Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. The LOB can be greater than 1 GB, up to 32 TB.

The prototype of the DBE\_LOB.LOB\_STRIP function is as follows:

```
DBE_LOB.LOB_STRIP(
  lob_loc INOUT BLOB,
  newlen IN BIGINT);

DBE_LOB.LOB_STRIP(
  lob_loc INOUT CLOB,
  newlen IN BIGINT);
```

**Table 10-203** DBE\_LOB.LOB\_STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs. <b>NOTE</b> If the value is less than 1, null is returned. If the value is greater than the LOB length, an error is reported.

- **DBE\_LOB.CREATE\_TEMPORARY**  
Creates a temporary BLOB or CLOB. This API is used only for syntax compatibility.

The prototype of the DBE\_LOB.CREATE\_TEMPORARY function is as follows:

```
DBE_LOB.CREATE_TEMPORARY (
  lob_loc INOUT BLOB,
  cache IN BOOLEAN,
  dur IN INTEGER DEFAULT 10);

DBE_LOB.CREATE_TEMPORARY (
  lob_loc INOUT CLOB,
  cache IN BOOLEAN,
  dur IN INTEGER DEFAULT 10);
```

**Table 10-204** DBE\_LOB.CREATE\_TEMPORARY parameters

Parameter	Description
lob_loc	LOB descriptor
cache	Used only for syntax compatibility.
dur	Used only for syntax compatibility.

- DBE\_LOB.APPEND

Appends *source\_obj* to the end of the target LOB.

The prototype of the DBE\_LOB.APPEND function is as follows:

```
DBE_LOB.APPEND (
  blob_obj INOUT BLOB,
  source_obj IN BLOB);

DBE_LOB.APPEND (
  clob_obj INOUT CLOB,
  source_obj IN CLOB);
```

**Table 10-205** DBE\_LOB.APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE\_LOB.LOB\_APPEND

Appends *source\_obj* to the end of the target LOB.

The prototype of the DBE\_LOB.LOB\_APPEND function is as follows:

```
DBE_LOB.LOB_APPEND(
  blob_obj INOUT BLOB,
  source_obj IN BLOB);

DBE_LOB.LOB_APPEND(
  clob_obj INOUT CLOB,
  source_obj IN CLOB);
```

**Table 10-206** DBE\_LOB.LOB\_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE\_LOB.FREETEMPORARY

Frees LOB files created by CREATE\_TEMPORARY.

The prototype of the DBE\_LOB.FREETEMPORARY function is as follows:

```
DBE_LOB.FREETEMPORARY (  
  blob INOUT BLOB);
```

```
DBE_LOB.FREETEMPORARY (  
  clob INOUT CLOB);
```

**Table 10-207** DBE\_LOB.FREETEMPORARY parameters

Parameter	Description
blob/clob	BLOB/CLOB to be freed.

- DBE\_LOB.FILEOPEN

Opens an external database BFILE file and returns its file descriptor. A maximum of 10 BFILE files can be opened in a session.

The BFILE type is defined as follows:

```
DBE_LOB.BFILE (  
  directory TEXT,  
  filename TEXT,  
  fd INTEGER);
```

The prototype of the DBE\_LOB.FILEOPEN function is as follows:

```
DBE_LOB.FILEOPEN (  
  bfile IN DBE_LOB.BFILE,  
  open_mode IN TEXT)  
RETURN INTEGER;
```

**Table 10-208** DBE\_LOB.FILEOPEN parameters

Parameter	Description
bfile	<p>External database file to be opened. For a BFILE file, this parameter specifies the file path, file name, and file descriptor.</p> <p><b>NOTE</b> The <i>file</i> variable contains the location of the file directory <i>directory</i> and the file name <i>filename</i>.</p> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>File name with an extension (file type), excluding the path name. A path contained in a file name is ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a dot (/.).</li> </ul>
open_mode	File open mode, which can only be <b>r</b> (that is, read). An error is reported in other modes.

- DBE\_LOB.FILECLOSE

Closes an external BFILE file.

The prototype of the DBE\_LOB.FILECLOSE function is as follows:

```
DBE_LOB.FILECLOSE (  
file IN INTEGER);
```

**Table 10-209** DBE\_LOB.FILECLOSE parameters

Parameter	Description
file	External database file to be closed (that is opened by FILEOPEN).

- DBE\_LOB.BFILEOPEN

Opens an external database BFILE file. A maximum of 10 BFILE files can be opened in a session.

The prototype of DBE\_LOB.BFILEOPEN is as follows:

```
DBE_LOB.BFILEOPEN (  
bfile INOUT DBE_LOB.BFILE,  
open_mode IN TEXT DEFAULT 'R');
```

**Table 10-210** DBE\_LOB.BFILEOPEN parameters

Parameter	Description
bfile	<p>Opened database BFILE file as the INOUT parameter.</p> <p><b>NOTE</b> The <i>bfile</i> variable contains the location of the file directory <i>directory</i> and the file name <i>filename</i>.</p> <ul style="list-style-type: none"> <li>Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b>. If the input path does not match the path in <b>PG_DIRECTORY</b>, an error indicating that the path does not exist is reported.</li> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>File name with an extension (file type), excluding the path name. A path contained in a file name is ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a dot (/.).</li> </ul>
open_mode	File open mode, which can only be r (that is, read). An error is reported in other modes.

### Examples

```
-- Obtain the substring of the BFILE (the file content is ABCD).
DECLARE
bfile dbe_lob.bfile;
BEGIN
bfile = DBE_LOB.BFILENAME(dir_name, file_name); -- Obtain the corresponding BFILE.
DBE_LOB.bfileopen(bfile, 'r'); -- Open the BFILE.
RAISE NOTICE 'res:%', DBE_LOB.lob_substr(bfile, 10, 1); -- Obtain and print the substring.
DBE_LOB.bfileclose(bfile);-- Close the BFILE.
END;
/
NOTICE: res:41
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_LOB.BFILECLOSE**

Closes an external database BFILE file.

The prototype of DBE\_LOB.BFILECLOSE is as follows:

```
DBE_LOB.BFILECLOSE (
  bfile INOUT DBE_LOB.BFILE);
```

**Table 10-211** DBE\_LOB.BFILECLOSE parameters

Parameter	Description
bfile	Closed database BFILE file as the INOUT parameter.

- **DBE\_LOB.LOADFROMFILE**

Loads an external BFILE file to a BLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADFROMFILE function is as follows:

```
DBE_LOB.LOADFROMFILE (
  dest_lob IN BLOB,
```

```
src_file IN INTEGER,
amount IN INTEGER,
dest_offset IN INTEGER,
src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-212** DBE\_LOB.LOADFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB. The BFILE file will be loaded to the specified offset position of the BLOB.
src_bfile	Source BFILE file to be read.
amount	Length of the content to be read from the BFILE file. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.LOADFROMBFILE  
Loads an external BFILE file to a LOB.

The prototype of the DBE\_LOB.LOADFROMBFILE function is as follows:

```
DBE_LOB.LOADFROMBFILE (
  dest_lob INOUT BLOB,
  src_file IN DBE_LOB.BFILE,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1)
RETURN BLOB;

DBE_LOB.LOADFROMBFILE (
  dest_lob INOUT CLOB,
  src_file IN DBE_LOB.BFILE,
  amount IN BIGINT,
  dest_offset IN BIGINT DEFAULT 1,
  src_offset IN BIGINT DEFAULT 1)
RETURN CLOB;
```

**Table 10-213** DBE\_LOB.LOADFROMBFILE parameters

Parameter	Description
dest_lob	Target LOB as the INOUT parameter, to which the BFILE file will be loaded. The file must be opened by <b>DBE_LOB.BFILEOPEN</b> first. The LOB can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the content to be read from the BFILE file and to be written to the LOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the target LOB <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.LOADBLOBFROMFILE

Loads an external BFILE file to a BLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADBLOBFROMFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
  dest_lob IN BLOB,
  src_file IN INTEGER,
  amount IN INTEGER,
  dest_offset IN INTEGER,
  src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-214** DBE\_LOB.LOADBLOBFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.

Parameter	Description
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.LOADBLOBFROMBFILE

Loads an external BFILE file to a BLOB.

The prototype of the DBE\_LOB.LOADBLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMBFILE (
  dest_lob INOUT BLOB,
  src_file IN  DEB_LOB.BFILE,
  amount   IN  BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
```

**Table 10-215** DBE\_LOB.LOADBLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target BLOB as the INOUT parameter, to which the BFILE file (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the BLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.LOADCLOBFROMFILE

Loads an external BFILE file to a CLOB and returns the object of the RAW type.

The prototype of the DBE\_LOB.LOADCLOBFROMFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMFILE (
  dest_lob IN CLOB,
  src_file IN INTEGER,
  amount IN INTEGER,
  dest_offset IN INTEGER,
  src_offset IN INTEGER)
RETURN RAW;
```

**Table 10-216** DBE\_LOB.LOADCLOBFROMFILE parameters

Parameter	Description
dest_lob	Target CLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the CLOB. <b>NOTE</b> If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the CLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>• If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>• If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.LOADCLOBFROMBFILE

Loads an external BFILE file to a CLOB.

The prototype of the DBE\_LOB.LOADCLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMBFILE (
  dest_lob INOUT CLOB,
  src_file IN DEB_LOB.BFILE,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
```

**Table 10-217** DBE\_LOB.LOADCLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target CLOB as the INOUT parameter, to which the BFILE file (which must be opened using <b>DBE_LOB.BFILEOPEN</b> first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.

Parameter	Description
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB. <b>NOTE</b> If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the CLOB. <b>NOTE</b> If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BFILE file. <b>NOTE</b> <ul style="list-style-type: none"> <li>If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i>, an error is reported.</li> <li>If the sum of <i>amount</i> and <i>src_offset</i> is greater than the length of <i>src_bfile</i> plus 1, an error is reported.</li> </ul>

- DBE\_LOB.CONVERTTOBLOB

Converts a CLOB to a BLOB. The CLOB cannot be greater than 1 GB.

The prototype of the DBE\_LOB.CONVERTTOBLOB function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
  dest_blob IN BLOB,
  src_clob  IN CLOB,
  amount   IN INTEGER DEFAULT 32767,
  dest_offset IN INTEGER DEFAULT 1,
  src_offset IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-218** DBE\_LOB.CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the BLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the CLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.

- DBE\_LOB.LOB\_CONVERTTOBLOB

Converts a CLOB to a BLOB. The LOB can be greater than 1 GB.

The prototype of the DBE\_LOB.LOB\_CONVERTTOBLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOBLOB(
  dest_blob INOUT BLOB,
  src_clob  IN  CLOB,
  amount   IN  BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
```

**Table 10-219** DBE\_LOB.LOB\_CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
dest_offset	Offset length of the BLOB. If <b>dest_offset</b> is set to 1, data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the CLOB. If <b>src_offset</b> is set to 1, data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.CONVERTTOCLOB

Converts a BLOB to a CLOB. The BLOB cannot be greater than 1 GB.

The prototype of the DBE\_LOB.CONVERTTOCLOB function is as follows:

```
DBE_LOB.CONVERTTOCLOB(
  dest_clob IN CLOB,
  src_blob  IN BLOB,
  amount    IN INTEGER DEFAULT 32767,
  dest_offset IN INTEGER DEFAULT 1,
  src_offset IN INTEGER DEFAULT 1)
RETURN text;
```

**Table 10-220** DBE\_LOB.CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB.

Parameter	Description
dest_offset	Offset length of the CLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy.

- DBE\_LOB.LOB\_CONVERTTOCLOB

Converts a BLOB to a CLOB. The LOB can be greater than 1 GB.

The prototype of the DBE\_LOB.LOB\_CONVERTTOCLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOCLOB(
  dest_clob INOUT CLOB,
  src_blob IN BLOB,
  amount IN BIGINT,
  dest_offset INOUT BIGINT,
  src_offset INOUT BIGINT)
```

**Table 10-221** DBE\_LOB.LOB\_CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If <b>dest_offset</b> is set to <b>1</b> , data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.
src_offset	Offset length of the BLOB. If <b>src_offset</b> is set to <b>1</b> , data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of <i>LOBMAXSIZE</i> , an error is reported.

- DBE\_LOB.GETCHUNKSIZE

Returns *TOAST\_MAX\_CHUNK\_SIZE*. When LOB data is stored in the database, TOAST is used internally.

The prototype of the DBE\_LOB.GETCHUNKSIZE function is as follows:

```
DBE_LOB.GETCHUNKSIZE(
  lob_loc IN CLOB
)RETURN INTEGER

DBE_LOB.GETCHUNKSIZE(
  lob_loc IN BLOB
)RETURN INTEGER
```

**Table 10-222** DBE\_LOB.GETCHUNKSIZE parameters

Parameter	Description
lob_loc	Target CLOB/BLOB.

- DBE\_LOB.LOB\_WRITE

Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

The prototype of the DBE\_LOB.LOB\_WRITE function is as follows:

```
DBE_LOB.LOB_WRITE(
  clob_obj INOUT CLOB,
  amount IN INTEGER,
  off_set IN BIGINT,
  source IN VARCHAR2
)
RETURN CLOB;

DBE_LOB.LOB_WRITE(
  blob_obj INOUT BLOB,
  amount IN INTEGER,
  off_set IN BIGINT,
  source IN RAW
)
RETURN BLOB;
```

**Table 10-223** DBE\_LOB.LOB\_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
blob_obj / clob_obj	BLOB / CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
amount	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
off_set	BIGINT	IN	No	Offset position for writing data to <i>blob_obj/clob_obj</i>
source	RAW / VARCHAR2	IN	No	Source object

- DBE\_LOB.BFILENAME

Constructs a BFILE based on the directory and file name.

The prototype of DBE\_LOB.BFILENAME is as follows:

```
DBE_LOB.BFILENAME(  
  directory IN TEXT,  
  filename IN TEXT)  
RETURN DBE_LOB.BFILE;
```

**Table 10-224** DBE\_LOB.BFILENAME parameters

Parameter	Description
directory	File path <b>NOTE</b> Location of the file directory, which needs to be added to the system catalog <b>PG_DIRECTORY</b> . If the input path does not match the path in <b>PG_DIRECTORY</b> , an error indicating that the path does not exist is reported. <ul style="list-style-type: none"> <li>When the GUC parameter <b>safe_data_path</b> is enabled, you can only use an advanced package to read and write files in the file path specified by <b>safe_data_path</b>.</li> <li>File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a period (/).</li> </ul>
filename	File name

## Examples

```
-- Obtain the length of a string.  
SELECT DBE_LOB.GET_LENGTH('12345678');  
get_length  
-----  
      8

### 10.11.2.8 DBE\_MATCH

#### API Description

[Table 10-225](#) provides all APIs supported by the DBE\_MATCH package.

**Table 10-225** DBE\_MATCH

API	Description
<a href="#">DBE_MATCH.EDIT_DISTANCE_SIMILARITY</a>	Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value <b>100</b> indicates that the two character strings are the same, and the value <b>0</b> indicates that the two character strings are different.

- [DBE\\_MATCH.EDIT\\_DISTANCE\\_SIMILARITY](#)

Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are completely different. The `DBE_MATCH.EDIT_DISTANCE_SIMILARITY` function prototype is as follows:

```

DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
str1 IN text,

```

```
str2 IN text
)returns integer ;
```

**Table 10-226** DBE\_MATCH.EDIT\_DISTANCE\_SIMILARITY parameters

Parameter	Description
str1	First character string. If the value is <b>null</b> , <b>0</b> is returned.
str2	Second character string. If the value is <b>null</b> , <b>0</b> is returned.

### 10.11.2.9 DBE\_OUTPUT

 **NOTE**

When DBE\_OUTPUT.PUT\_LINE is used to print the result obtained by the DBE\_FILE.READ\_LINE\_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE\_OUTPUT.PRINT\_LINE does not support this function.

### Interface Description

**Table DBE\_OUTPUT** provides all interfaces supported by the **DBE\_OUTPUT** package.

**Table 10-227** DBE\_OUTPUT

Interface	Description
<b>DBE_OUTPUT.PRINT_LINE</b>	Outputs the specified text with newline characters.
<b>DBE_OUTPUT.PRINT</b>	Outputs the specified text without newline characters.
<b>DBE_OUTPUT.SET_BUFFER_SIZE</b>	Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes.
<b>DBE_OUTPUT.DISABLE</b>	Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and clears the output buffer.
<b>DBE_OUTPUT.ENABLE</b>	Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size.

Interface	Description
<b>DBE_OUTPUT.GET_LINE</b>	Obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client.
<b>DBE_OUTPUT.GET_LINES</b>	Obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client.
<b>DBE_OUTPUT.NEW_LINE</b>	Places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty.
<b>DBE_OUTPUT.PUT</b>	Places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.
<b>DBE_OUTPUT.PUT_LINE</b>	Places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.

- **DBE\_OUTPUT.PRINT\_LINE**  
The stored procedure **PRINT\_LINE** writes a line of text carrying a line end symbol in the buffer. The function prototype of **DBE\_OUTPUT.PRINT\_LINE** is as follows:

```
DBE_OUTPUT.PRINT_LINE (  
format IN VARCHAR2);
```

**Table 10-228** DBE\_OUTPUT.PRINT\_LINE interface parameters

Parameter	Description
format	Output text.

- **DBE\_OUTPUT.PRINT**  
The stored procedure **PRINT** outputs the specified text to the front of the specified text without adding a newline character. The prototype of the **DBE\_OUTPUT.PRINT** function is as follows:

```
DBE_OUTPUT.PRINT (  
format IN VARCHAR2);
```

**Table 10-229** DBE\_OUTPUT.PRINT interface parameters

Parameter	Description
format	Output text.

- DBE\_OUTPUT.SET\_BUFFER\_SIZE

The stored procedure **SET\_BUFFER\_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of DBE\_OUTPUT.SET\_BUFFER\_SIZE is as follows:

```
DBE_OUTPUT.SET_BUFFER_SIZE (
size IN INTEGER default 20000);
```

**Table 10-230** DBE\_OUTPUT.SET\_BUFFER\_SIZE interface parameters

Parameter	Description
size	Sets the output buffer size.

- DBE\_OUTPUT.DISABLE

The stored procedure **DISABLE** disables the calling of PUT, PUT\_LINE, NEW\_LINE, GET\_LINE and GET\_LINES, and clears the output buffer. The prototype of the DBE\_OUTPUT.DISABLE function is as follows:

```
DBE_OUTPUT.DISABLE;
```

- DBE\_OUTPUT.ENABLE

The stored procedure **ENABLE** enables the buffer, allows the calling of PUT, PUT\_LINE, NEW\_LINE, GET\_LINE, and GET\_LINES, and sets the buffer size. If the buffer size is not specified, 20,000 bytes are allowed by default. The prototype of the DBE\_OUTPUT.ENABLE function is as follows:

```
DBE_OUTPUT.ENABLE (
buffer_size IN INTEGER DEFAULT 20000
);
```

**Table 10-231** DBE\_OUTPUT.ENABLE parameters

Parameter	Description
buffer_size	Upper limit of the buffer size, in bytes. If <b>buffer_size</b> is set to <b>NULL</b> , the default value (20000 bytes) is used.

- DBE\_OUTPUT.GET\_LINE

The stored procedure **GET\_LINE** obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client. The prototype of the DBE\_OUTPUT.GET\_LINE function is as follows:

```
DBE_OUTPUT.GET_LINE (
line OUT VARCHAR2,
status OUT INTEGER
);
```

**Table 10-232** DBE\_OUTPUT.GET\_LINE parameters

Parameter	Description
line	Obtained character string.
status	Specifies whether the calling is normal. If a character string is obtained, the value is <b>0</b> . Otherwise, the value is <b>1</b> .

- DBE\_OUTPUT.GET\_LINES

The stored procedure **GET\_LINES** obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client. The prototype of the DBE\_OUTPUT.GET\_LINES function is as follows:

```
DBE_OUTPUT.GET_LINES (
    lines OUT VARCHAR[],
    numlines IN OUT INTEGER
);
```

**Table 10-233** DBE\_OUTPUT.GET\_LINES parameters

Parameter	Description
lines	Outputs an array of multi-line strings read from the buffer.
numlines	Inputs the number of lines to be retrieved from the buffer. The output value is the number of rows actually retrieved. If the output value is less than the input value, it indicates that the number of rows in the buffer is less than the input value.

- DBE\_OUTPUT.NEW\_LINE

The stored procedure **NEW\_LINE** places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty. The prototype of the DBE\_OUTPUT.NEW\_LINE function is as follows:

```
DBE_OUTPUT.NEW_LINE;
```

- DBE\_OUTPUT.PUT

The stored procedure **PUT** places an input string in the buffer without a newline character at the end. After the anonymous block is executed, the line ending with the newline character is displayed. The prototype of the DBE\_OUTPUT.PUT function is as follows:

```
DBE_OUTPUT.PUT (
    item IN VARCHAR2);
```

**Table 10-234** DBE\_OUTPUT.PUT parameters

Parameter	Description
item	Character or string item to be placed in the buffer.

- DBE\_OUTPUT.PUT\_LINE

The stored procedure **PUT\_LINE** places an input string in the buffer with a newline character at the end. After the anonymous block is executed, the line

ending with the newline character is displayed. The prototype of the DBE\_OUTPUT.PUT\_LINE function is as follows:

```
DBE_OUTPUT.PUT_LINE (
    item IN VARCHAR2);
```

**Table 10-235** DBE\_OUTPUT.PUT\_LINE parameters

Parameter	Description
item	Character or string item to be placed in the buffer.

## Examples

```
BEGIN
    DBE_OUTPUT.SET_BUFFER_SIZE(50);
    DBE_OUTPUT.PRINT('hello, ');
    DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!"
END;
/
-- The expected result is as follows:
hello, database!
ANONYMOUS BLOCK EXECUTE

-- Test DISABLE: Disable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The PUT_LINE
has no output.
BEGIN
    dbe_output.disable();
    dbe_output.put_line('1');
END;
/
-- The expected result is as follows:
ANONYMOUS BLOCK EXECUTE

-- Test ENABLE: Enable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The output of
PUT_LINE is 1.
BEGIN
    dbe_output.enable();
    dbe_output.put_line('1');
END;
/
-- The expected result is as follows:
1
ANONYMOUS BLOCK EXECUTE

-- Test PUT: Place the input character string a in the buffer without adding a newline character at the end.
a has no output.
BEGIN
    dbe_output.enable();
    dbe_output.put('a');
END;
/
-- The expected result is as follows:
ANONYMOUS BLOCK EXECUTE

-- Test NEW_LINE. Add a new line. The output is a.
BEGIN
    dbe_output.enable();
    dbe_output.put('a');
    dbe_output.new_line;
END;
/
-- The expected result is as follows:
a
ANONYMOUS BLOCK EXECUTE
```

```
-- Test GET_LINE: Obtain buffer data and save the data to variables and use PUT_LINE to output the data.
DECLARE
line VARCHAR(32672);
status INTEGER := 0;
BEGIN
dbe_output.put_line('hello');
dbe_output.get_line(line, status);
dbe_output.put_line('-----');
dbe_output.put_line(line);
dbe_output.put_line(status);
END;
/
-- The expected result is as follows:
-----
hello
0
ANONYMOUS BLOCK EXECUTE

-- Test get_lines: Obtain multiple lines of content in the buffer and use PUT_LINE to output the content.
DECLARE
lines varchar[];
linenum integer;
BEGIN
dbe_output.put_line('line 1');
dbe_output.put_line('line 2');
dbe_output.put_line('line 3');
linenum := 100;
dbe_output.get_lines(lines, linenum);
dbe_output.put_line('num: ' || linenum);
FOR i IN 1 .. linenum LOOP
dbe_output.put_line(lines[i]);
END LOOP;
END;
/
-- The expected result is as follows:
num: 3
line 1
line 2
line 3
ANONYMOUS BLOCK EXECUTE
```

#### NOTE

When the character encoding type `server_encoding` of the server is not UTF-8, if the character encoding in the data is valid UTF-8 encoding, when processing the character encoding, the `DBE_OUTPUT.PUTLINE` and `DBE_OUTPUT.PUT` functions convert the character encoding into the `server_encoding` encoding format based on the UTF8 encoding logic before performing subsequent operations, as a result, the return values of the functions may not meet the expectation or an error may be reported. After the GUC parameter **`enable_convert_illegal_char`** is enabled, the `DBE_OUTPUT.PUTLINE` and `DBE_OUTPUT.PUT` functions process such codes in the same way as when the parameter is disabled. Special characters are not output as placeholders, therefore, you are advised not to use the `DBE_OUTPUT.PUTLINE` and `DBE_OUTPUT.PUT` functions for data containing special characters.

### 10.11.2.10 DBE\_RANDOM

#### Interface Description

[Table 10-236](#) lists all interfaces supported by the **DBE\_RANDOM** package.

**Table 10-236** DBE\_RANDOM interface parameters

Interface	Description
<b>DBE_RANDOM.SET_SEED</b>	Sets a seed for a random number.
<b>DBE_RANDOM.GET_VALUE</b>	Generates a random number between a specified <b>low</b> and a specified <b>high</b> .

- **DBE\_RANDOM.SET\_SEED**

The stored procedure **SEED** is used to set a seed for a random number. The function prototype of **DBE\_RANDOM.SET\_SEED** is as follows:

```
DBE_RANDOM.SET_SEED (seed IN INTEGER);
```

**Table 10-237** DBE\_RANDOM.SET\_SEED interface parameters

Parameter	Description
seed	Generates a seed for a random number.

- **DBE\_RANDOM.GET\_VALUE**

The **GET\_VALUE** function generates a random number between a specified **low** and a specified **high**. The prototype of the **DBE\_RANDOM.GET\_VALUE** function is as follows:

```
DBE_RANDOM.GET_VALUE(  
min IN NUMBER default 0,  
max IN NUMBER default 1)  
RETURN NUMBER;
```

**Table 10-238** DBE\_RANDOM.GET\_VALUE interface parameters

Parameter	Description
min	Sets the low bound for a random number. The generated random number is greater than or equal to <b>min</b> .
max	Sets the high bound for a random number. The generated random number is less than <b>max</b> .

 **NOTE**

- The only requirement is that the parameter type is **NUMERIC** regardless of the right and left bound values.
- **DBE\_RANDOM** implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
- The generated random number contains 15 valid digits.

## Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);
   get_value
-----
.917468812743886
(1 row)

-- For integers within a specified range, add the arguments min and max, and truncate the decimals from
the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you
can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
   trunc
-----
      26
(1 row)
```

### 10.11.2.11 DBE\_RAW

#### Interface Description

[Table 10-239](#) provides all interfaces supported by the **DBE\_RAW** package.

**Table 10-239** DBE\_RAW

Interface	Description
<a href="#">DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW</a>	Converts a value of the INTEGER type to a binary representation (RAW type).
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER</a>	Converts a binary representation (RAW type) to a value of the INTEGER type.
<a href="#">DBE_RAW.GET_LENGTH</a>	Obtains the length of a RAW object.
<a href="#">DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW</a>	Converts a value of the VARCHAR2 type to a binary representation (RAW type).
<a href="#">DBE_RAW.CAST_TO_VARCHAR2</a>	Converts a value of the RAW type to a value of the VARCHAR2 type.
<a href="#">DBE_RAW.SUBSTR</a>	Returns the substring of the RAW type.
<a href="#">DBE_RAW.BIT_OR</a>	Performs the bitwise OR operation on RAW data.
<a href="#">DBE_RAW.BIT_AND</a>	Returns a RAW value after bitwise AND calculation.
<a href="#">DBE_RAW.BIT_COMPLEMENT</a>	Returns a RAW value after bitwise complement calculation.
<a href="#">DBE_RAW.BIT_XOR</a>	Returns a RAW value after bitwise XOR calculation.
<a href="#">DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW</a>	Converts a BINARY_DOUBLE value to a RAW value.
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE</a>	Converts a RAW value to a BINARY_DOUBLE value.

Interface	Description
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT</a>	Converts a RAW value to a FLOAT4 value.
<a href="#">DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW</a>	Converts a FLOAT4 value to a RAW value.
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_NUMBER</a>	Converts a RAW value to a NUMERIC value.
<a href="#">DBE_RAW.CAST_FROM_NUMBER_TO_RAW</a>	Converts a NUMERIC value to a RAW value.
<a href="#">DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2</a>	Converts a RAW value to an NVARCHAR2 value.
<a href="#">DBE_RAW.COMPARE</a>	Returns the first different position of two RAW values.
<a href="#">DBE_RAW.CONCAT</a>	Concatenates a maximum of 12 RAW values into a new RAW value and returns the value.
<a href="#">DBE_RAW.CONVERT</a>	Converts a RAW value from the source encoding mode <b>from_charset</b> to the target encoding mode <b>to_charset</b> .
<a href="#">DBE_RAW.COPIES</a>	Copies a RAW value for <i>n</i> times, concatenates the values, and returns the concatenated result.
<a href="#">DBE_RAW.OVERLAY</a>	Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.
<a href="#">DBE_RAW.REVERSE</a>	Reverses RAW data by byte.
<a href="#">DBE_RAW.TRANSLATE</a>	Converts or discards a specified byte of a RAW value.
<a href="#">DBE_RAW.TRANSLITERATE</a>	Converts a specified byte of a RAW value.
<a href="#">DBE_RAW.XRANGE</a>	Returns a value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

#### NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, the representation of RAW data 11001011 is 'CB', that is, the input for type conversion is 'CB'.

- [DBE\\_RAW.CAST\\_FROM\\_BINARY\\_INTEGER\\_TO\\_RAW](#)

The stored procedure **CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW** converts a value of the **INTEGER** type to a binary representation (**RAW** type).

The prototype of the **DBE\_RAW.CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW** function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW (
value      IN INTEGER,
endianess  IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-240** DBE\_RAW.CAST\_FROM\_BINARY\_INTEGER\_TO\_RAW parameters

Parameter	Description
value	Specifies the <b>INTEGER</b> value to be converted to the <b>RAW</b> value.
endianess	Specifies the <b>INTEGER</b> value <b>1</b> or <b>2</b> for the byte sequence. ( <b>1</b> indicates <b>BIG_ENDIAN</b> and <b>2</b> indicates <b>LITTLE-ENDIAN</b> .)

- **DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER**

The stored procedure **CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER** converts a binary representation (**RAW** type) to a value of the **INTEGER** type.

The prototype of the **DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER** function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER (
value      IN RAW,
endianess  IN INTEGER DEFAULT 1)
RETURN INTEGER;
```

**Table 10-241** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_INTEGER parameters

Parameter	Description
value	Specifies an <b>INTEGER</b> value in a binary representation ( <b>RAW</b> type).
endianess	Endianness. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates <b>BIG_ENDIAN</b> , <b>2</b> indicates <b>LITTLE_ENDIAN</b> , and <b>3</b> indicates <b>MACHINE_ENDIAN</b> . The default value is <b>1</b> . If <b>BIG_ENDIAN</b> is used on the host where the function is executed, the function execution result using <b>MACHINE_ENDIAN</b> is the same as that using <b>BIG_ENDIAN</b> . If <b>LITTLE_ENDIAN</b> is used on the host where the function is executed, the function execution result using <b>MACHINE_ENDIAN</b> is the same as that using <b>LITTLE_ENDIAN</b> .

- **DBE\_RAW.GET\_LENGTH**

The stored procedure **GET\_LENGTH** returns the length of a **RAW** object.

The prototype of the **DBE\_RAW.GET\_LENGTH** function is as follows:

```
DBE_RAW.GET_LENGTH(
value IN RAW)
RETURN INTEGER;
```

**Table 10-242** DBE\_RAW.GET\_LENGTH parameters

Parameter	Description
value	Specifies a RAW object.

- DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW

The stored procedure **CAST\_FROM\_VARCHAR2\_TO\_RAW** converts a VARCHAR2 object to a RAW object.

The prototype of the DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_TO_RAW(  
str IN VARCHAR2)  
RETURN RAW;
```

**Table 10-243** DBE\_RAW.CAST\_FROM\_VARCHAR2\_TO\_RAW parameters

Parameter	Description
str	VARCHAR2 value to be converted.

- DBE\_RAW.CAST\_TO\_VARCHAR2

The stored procedure **CAST\_TO\_VARCHAR2** converts a RAW object to a VARCHAR2 object.

The prototype of the DBE\_RAW.CAST\_TO\_VARCHAR2 function is as follows:

```
DBE_RAW.CAST_TO_VARCHAR2(  
str IN RAW)  
RETURN VARCHAR2;
```

**Table 10-244** DBE\_RAW.CAST\_TO\_VARCHAR2 parameters

Parameter	Description
str	VARCHAR2 value to be converted.

- DBE\_RAW.BIT\_OR

The stored procedure **BIT\_OR** calculates the bitwise OR result of two RAW data records.

The prototype of the DBE\_RAW.BIT\_OR function is as follows:

```
DBE_RAW.BIT_OR(  
str1 IN TEXT,  
str2 IN TEXT)  
RETURN TEXT;
```

**Table 10-245** DBE\_RAW.BIT\_OR parameters

Parameter	Description
str1	First character string of the bitwise OR calculation. <b>NOTE</b> Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.BIT_OR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.
str2	Second character string of the bitwise OR calculation. <b>NOTE</b> Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.BIT_OR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.

- DBE\_RAW.SUBSTR

The stored procedure **SUBSTR** truncates an object of the RAW type based on the start bit and length.

The prototype of the DBE\_RAW.SUBSTR function is as follows:

```
DBE_RAW.SUBSTR(
  IN lob_loc BLOB,
  IN off_set INTEGER DEFAULT 1,
  IN amount INTEGER DEFAULT 32767)
RETURN RAW;
```

**Table 10-246** DBE\_RAW.SUBSTR parameters

Parameter	Description
lob_loc	Source RAW value. <b>NOTE</b> Due to legacy reasons, this parameter is defined as the BLOB type. However, the DBE_RAW.SUBSTR interface expects to process RAW values. Defining this parameter as the BLOB type does not affect the processing of RAW values.
off_set	Start position of the substring. The default value is <b>1</b> .
amount	Substring length. The default value is <b>32767</b> .

- DBE\_RAW.BIT\_AND

Obtains the bitwise AND result of two RAW values.

The prototype of the DBE\_RAW.BIT\_AND function is as follows:

```
DBE_RAW.BIT_AND(
  r1 IN RAW,
  r2 IN RAW)
RETURN RAW;
```

**Table 10-247** DBE\_RAW.BIT\_AND parameters

Parameter	Description
r1	The RAW value for the bitwise AND operation with r2. The maximum length is 32767.
r2	The RAW value for the bitwise AND operation with r1. The maximum length is 32767.

- DBE\_RAW.BIT\_COMPLEMENT

Obtains the bitwise complement result of a RAW value.

The prototype of the DBE\_RAW.BIT\_COMPLEMENT function is as follows:

```
DBE_RAW.BIT_COMPLEMENT(  
  r IN RAW)  
RETURN RAW;
```

**Table 10-248** DBE\_RAW.BIT\_COMPLEMENT parameters

Parameter	Description
r	The RAW value for the bitwise complement operation. The maximum length is 32767.

- DBE\_RAW.BIT\_XOR

Obtains the bitwise XOR result of two RAW values.

The prototype of the DBE\_RAW.BIT\_XOR function is as follows:

```
DBE_RAW.BIT_XOR(  
  r1 IN RAW,  
  r2 IN RAW)  
RETURN RAW;
```

**Table 10-249** DBE\_RAW.BIT\_XOR parameters

Parameter	Description
r1	The RAW value for the bitwise XOR operation with r2. The maximum length is 32767.
r2	The RAW value for the bitwise XOR operation with r1. The maximum length is 32767.

- DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW

Converts the BINARY\_DOUBLE type to an INTEGER value in a binary representation (RAW type).

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW (  
  n IN BINARY_DOUBLE,  
  endianness IN INTEGER DEFAULT 1)  
RETURN RAW;
```

**Table 10-250** DBE\_RAW.CAST\_FROM\_BINARY\_DOUBLE\_TO\_RAW parameters

Parameter	Description
n	BINARY_DOUBLE value to be converted.
endianness	Endianness. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE

Converts an INTEGER value in a binary representation (RAW type) to a BINARY\_DOUBLE type.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE(
  r      IN RAW,
  endianness IN INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

**Table 10-251** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_DOUBLE parameters

Parameter	Description
r	The RAW value to be converted. The value contains 8 to 32767 characters.
endianness	Endianness. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT

Converts a RAW value to a FLOAT4 value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT(
  r      IN RAW,
  endianness IN INTEGER DEFAULT 1)
RETURN FLOAT4;
```

**Table 10-252** DBE\_RAW.CAST\_FROM\_RAW\_TO\_BINARY\_FLOAT parameters

Parameter	Description
r	The RAW value to be converted. The value contains 4 to 32767 characters.
endianness	Endianness. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW

Converts a FLOAT4 value to a RAW value.

The prototype of the DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW(
n      IN FLOAT4,
endianness IN INTEGER DEFAULT 1)
RETURN RAW;
```

**Table 10-253** DBE\_RAW.CAST\_FROM\_BINARY\_FLOAT\_TO\_RAW parameters

Parameter	Description
n	FLOAT4 value to be converted.
endianness	Endianness. The value can be <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>1</b> indicates BIG_ENDIAN, <b>2</b> indicates LITTLE_ENDIAN, and <b>3</b> indicates MACHINE_ENDIAN. The default value is <b>1</b> . If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER

Converts a RAW value to a NUMERIC value.

 **NOTE**

The bottom-layer implementation of the number data type in database ORA is different from that in GaussDB, and the RAW data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database ORA is different from that in GaussDB. You cannot obtain the same number-type data from GaussDB based on the RAW data corresponding to the number-type data in database ORA. For details about the number-type data in GaussDB, see the example.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NUMBER(  
  r IN RAW)  
RETURN NUMERIC;
```

**Table 10-254** DBE\_RAW.CAST\_FROM\_RAW\_TO\_NUMBER parameters

Parameter	Description
r	The RAW value to be converted. The value contains 6 to 32767 characters.

- DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW  
Converts a NUMERIC value to a RAW value.

 **NOTE**

The bottom-layer implementation of the number data type in database ORA is different from that in GaussDB, and the RAW data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database ORA is different from that in GaussDB. You cannot restore the RAW data corresponding to the number-type data in database ORA to the original number type in database ORA in the GaussDB database. For details about the performance of this function in GaussDB, see the example.

The prototype of the DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW function is as follows:

```
DBE_RAW.CAST_FROM_NUMBER_TO_RAW(  
  n IN NUMERIC)  
RETURN RAW;
```

**Table 10-255** DBE\_RAW.CAST\_FROM\_NUMBER\_TO\_RAW parameters

Parameter	Description
n	NUMERIC value to be converted.

- DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2  
Converts a RAW value to an NVARCHAR2 value.

The prototype of the DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2 function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2(  
  r IN RAW)  
RETURN NVARCHAR2;
```

**Table 10-256** DBE\_RAW.CAST\_FROM\_RAW\_TO\_NVARCHAR2 parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.

- DBE\_RAW.COMPARE

Returns the first different position of two RAW values.

The prototype of the DBE\_RAW.COMPARE function is as follows:

```
DBE_RAW.COMPARE(  
  r1 IN RAW,  
  r2 IN RAW,  
  pad IN RAW DEFAULT NULL)  
RETURN INTEGER;
```

**Table 10-257** DBE\_RAW.COMPARE parameters

Parameter	Description
r1	First data to be compared. The value can be <b>NULL</b> or the length is 0. The maximum length is 32767.
r2	Second data to be compared. The value can be <b>NULL</b> or the length is 0. The maximum length is 32767.
pad	The first byte of <b>pad</b> is used to extend the shorter one of <b>r1</b> or <b>r2</b> . The maximum length is 32767. If this parameter is set to <b>NULL</b> , the length is 0, or the default value is used, the extended value is <b>0x00</b> .

- DBE\_RAW.CONCAT

Concatenates a maximum of 12 RAW values into a new RAW value and returns the value. If the length after concatenation exceeds 32767, an error is reported.

The prototype of the DBE\_RAW.CONCAT function is as follows:

```
DBE_RAW.CONCAT(  
  r1 IN RAW DEFAULT NULL,  
  r2 IN RAW DEFAULT NULL,  
  r3 IN RAW DEFAULT NULL,  
  r4 IN RAW DEFAULT NULL,  
  r5 IN RAW DEFAULT NULL,  
  r6 IN RAW DEFAULT NULL,  
  r7 IN RAW DEFAULT NULL,  
  r8 IN RAW DEFAULT NULL,  
  r9 IN RAW DEFAULT NULL,  
  r10 IN RAW DEFAULT NULL,  
  r11 IN RAW DEFAULT NULL,  
  r12 IN RAW DEFAULT NULL)  
RETURN RAW;
```

**Table 10-258** DBE\_RAW.CONCAT parameters

Parameter	Description
r1...r12	The RAW values to be concatenated.

- DBE\_RAW.CONVERT

Converts a RAW value from the source encoding mode **from\_charset** to the target encoding mode **to\_charset**.

If the rule for converting between source and target encoding (for example, GBK and LATIN1) does not exist, the parameter **r** is returned without conversion. See the **pg\_conversion** system catalog for details.

The prototype of the DBE\_RAW.CONVERT function is as follows:

```
DBE_RAW.CONVERT(
  r          IN RAW,
  to_charset IN VARCHAR2,
  from_charset IN VARCHAR2)
RETURN RAW;
```

**Table 10-259** DBE\_RAW.CONVERT parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.
to_charset	Name of the target encoding character set.
from_charset	Name of the source encoding character set. In this encoding, r must be valid.

- DBE\_RAW.COPIES

Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result. If the length after copying exceeds 32767, an error is reported.

The prototype of the DBE\_RAW.COPIES function is as follows:

```
DBE_RAW.COPIES(
  r IN RAW,
  n IN NUMERIC)
RETURN RAW;
```

**Table 10-260** DBE\_RAW.COPIES parameters

Parameter	Description
r	The RAW values to be copied.
n	Number of replication times. The value must be a positive number. If the value is a decimal, the value is rounded off.

- DBE\_RAW.OVERLAY

Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.

The prototype of the DBE\_RAW.OVERLAY function is as follows:

```
DBE_RAW.OVERLAY(
  overlay_str IN RAW,
  target      IN RAW,
  pos         IN BINARY_INTEGER DEFAULT 1,
  len         IN BINARY_INTEGER DEFAULT NULL,
  pad         IN RAW             DEFAULT NULL)
RETURN RAW;
```

**Table 10-261** DBE\_RAW.OVERLAY parameters

Parameter	Description
overlay_str	Byte used for overwriting. The value cannot be NULL.
target	Source byte string to be overlaid. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
pos	Indicates the byte from which the overlay starts. The position of the first byte is 1. The value of <b>pos</b> must be greater than or equal to 1 and the value of <b>len+pos</b> must be less than or equal to 32767. The default value is <b>1</b> .
len	Length to be overlaid. The value of <b>len</b> must be greater than or equal to 0 and the value of <b>len+pos</b> must be less than or equal to 32767. The default value is the length of <b>overlay_str</b> .
pad	Padding byte. Only the first byte is valid. The default value is <b>NULL</b> . If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.

- DBE\_RAW.REVERSE

Reverses RAW data by byte.

The prototype of the DBE\_RAW.REVERSE function is as follows:

```
DBE_RAW.REVERSE(
  r IN RAW
)
RETURN RAW;
```

**Table 10-262** DBE\_RAW.REVERSE parameters

Parameter	Description
r	The RAW value to be reversed. The maximum length is 32767. If the value is <b>NULL</b> , <b>NULL</b> is returned.

- DBE\_RAW.TRANSLATE

Converts or discards a specified byte of a RAW value.

The prototype of the DBE\_RAW.TRANSLATE function is as follows:

```
DBE_RAW.TRANSLATE(
  r IN RAW,
  from_set IN RAW,
  to_set IN RAW)
RETURN RAW;
```

**Table 10-263** DBE\_RAW.TRANSLATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.

Parameter	Description
from_set	Bytecode to be converted in the source byte string. The value is of the RAW type. The value cannot be NULL. The bytes in <b>from_set</b> in the source byte string are replaced with the bytes in the corresponding positions in <b>to_set</b> . If <b>from_set</b> contains multiple identical bytes, only the first byte corresponding to the byte is replaced. For example, if <b>r[x]=from_set[n]</b> , <b>r[x]</b> is replaced with <b>to_set[n]</b> . If <b>to_set[n]</b> corresponding to <b>from_set[n]</b> does not exist (that is, the number of bytes of <b>to_set</b> does not exceed <b>n</b> ), <b>r[x]</b> will be discarded.
to_set	Byte code converted from the <b>from_set</b> byte. The value is of the RAW type. The value cannot be NULL.

- DBE\_RAW.TRANSLITERATE

Converts a RAW value to a NUMERIC value.

The prototype of the DBE\_RAW.TRANSLITERATE function is as follows:

```
DBE_RAW.TRANSLITERATE(
  r      IN RAW,
  from_set IN RAW DEFAULT NULL,
  to_set  IN RAW DEFAULT NULL,
  pad    IN RAW DEFAULT NULL)
RETURN RAW;
```

**Table 10-264** DBE\_RAW.TRANSLITERATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
to_set	Byte code converted from the <b>from_set</b> byte. The value is of the RAW type. The default value is <b>NULL</b> . If the value is <b>NULL</b> , all bytes in <b>r</b> that exist in <b>from_set</b> are converted to <b>pad</b> .
from_set	Bytecode to be converted in the source byte string <b>r</b> . The value is of the RAW type. The default value is <b>NULL</b> . If <b>from_set</b> is <b>NULL</b> , all bytes in the source byte string <b>r</b> are converted into equal-length data filled by <b>pad</b> . Otherwise, the bytes in <b>from_set</b> in the source byte string <b>r</b> are replaced with the bytes in the corresponding position in <b>to_set</b> . For example, if <b>r[x]=from_set[n]</b> , <b>r[x]</b> is converted to <b>to_set[n]</b> . If <b>to_set[n]</b> does not exist, <b>r[x]</b> will be converted to <b>pad</b> .
pad	Padding byte. Only the first byte is valid. The default value is <b>NULL</b> . If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.

- DBE\_RAW.XRANGE

Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

The prototype of the DBE\_RAW.XRANGE function is as follows:

```
DBE_RAW.XRANGE(
  start_byte IN RAW,
  end_byte IN RAW)
RETURN RAW;
```

**Table 10-265** DBE\_RAW.XRANGE parameters

Parameter	Description
start_byte	Start byte. Only the first byte is valid. If the value is <b>NULL</b> , it is regarded as <b>0x00</b> by default.
end_byte	End byte. Only the first byte is valid. If the value is <b>NULL</b> , it is regarded as <b>0xFF</b> by default. If <b>end_byte</b> is less than <b>start_byte</b> , <b>end_byte</b> is concatenated to <b>0xFF</b> , and then <b>0x00</b> is concatenated to <b>start_byte</b> .

## Examples

```
-- Perform operations on RAW data in a stored procedure.
CREATE OR REPLACE PROCEDURE proc_raw
AS
str varchar2(100) := 'abcdef';
source raw(100);
amount integer;
BEGIN
source := dbe_raw.cast_from_varchar2_to_raw(str);-- Convert the type.
amount := dbe_raw.get_length(source);-- Obtain the length.
dbe_output.print_line(amount);
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
CALL proc_raw();
6
proc_raw
-----

(1 row)
-- Delete the stored procedure.
DROP PROCEDURE proc_raw;
DROP PROCEDURE

DECLARE
v_raw RAW;
v_double BINARY_DOUBLE;
v_float FLOAT4;
v_numeric NUMERIC;
v_nvarchar2 NVARCHAR2;

-- All bytes between two bytes of the RAW type.
SELECT DBE_RAW.XRANGE('00','03') INTO v_raw; -- 00010203
END;
/
ANONYMOUS BLOCK EXECUTE

```

### 10.11.2.12 DBE\_SCHEDULER

#### API Description

The advanced package **DBE\_SCHEDULER** supports more flexible creation of scheduled tasks through scheduling and programming. For details about all the supported APIs, see [Table 10-266](#).

#### NOTICE

DBE\_SCHEDULER supports scheduled tasks for synchronizing data between CNs. Tasks with the same name cannot be created between different CNs.

The synchronization function is not implemented in versions earlier than 505.0.0. Therefore, all synchronization APIs synchronize data only in 505.0.0 and later versions.

Before the upgrade, the system checks whether jobs with the same name exist on CNs of the source version. If jobs with the same name exist on CNs of the source version and they are created on different nodes, an error message is displayed, prompting you to delete the jobs and perform the upgrade again.

**Table 10-266** DBE\_SCHEDULER

API	Description
<a href="#">DBE_SCHEDULER.CREATE_JOB</a>	Creates a scheduled task.

API	Description
<b>DBE_SCHEDULER. DROP_JOB</b>	Deletes a scheduled task.
<b>DBE_SCHEDULER. DROP_SINGLE_JOB</b>	Deletes a single scheduled task.
<b>DBE_SCHEDULER. SET_ATTRIBUTE</b>	Sets object attributes.
<b>DBE_SCHEDULER. RUN_JOB</b>	Executes a scheduled task.
<b>DBE_SCHEDULER. RUN_BACKEND_JOB</b>	Runs a scheduled task in the backend.
<b>DBE_SCHEDULER. RUN_FOREGROUND_JOB</b>	Runs a scheduled task in the frontend.
<b>DBE_SCHEDULER. STOP_JOB</b>	Stops a scheduled task.
<b>DBE_SCHEDULER. STOP_SINGLE_JOB</b>	Stops a single scheduled task.
<b>DBE_SCHEDULER. GENERATE_JOB_NAME</b>	Generates the name of a scheduled task.
<b>DBE_SCHEDULER. CREATE_PROGRAM</b>	Creates a program.
<b>DBE_SCHEDULER. DEFINE_PROGRAM_ARGUMENT</b>	Defines program parameters.
<b>DBE_SCHEDULER. DROP_PROGRAM</b>	Deletes a program.
<b>DBE_SCHEDULER. DROP_SINGLE_PROGRAM</b>	Deletes a single program.
<b>DBE_SCHEDULER. SET_JOB_ARGUMENT_VALUE</b>	Sets the parameters of a scheduled task.
<b>DBE_SCHEDULER. CREATE_SCHEDULE</b>	Creates a schedule.

API	Description
<b>DBE_SCHEDULER. DROP_SCHEDULE</b>	Deletes a schedule.
<b>DBE_SCHEDULER. DROP_SINGLE_SCHEDULE</b>	Deletes a single schedule.
<b>DBE_SCHEDULER. CREATE_JOB_CLASS</b>	Creates the class of a scheduled task.
<b>DBE_SCHEDULER. DROP_JOB_CLASS</b>	Deletes the class of a scheduled task.
<b>DBE_SCHEDULER. DROP_SINGLE_JOB_CLASS</b>	Deletes the class of a single scheduled task.
<b>DBE_SCHEDULER. GRANT_USER_AUTHORIZATION</b>	Grants special permissions to a user.
<b>DBE_SCHEDULER. REVOKE_USER_AUTHORIZATION</b>	Revokes special permissions from a user.
<b>DBE_SCHEDULER. CREATE_CREDENTIAL</b>	Creates a certificate.
<b>DBE_SCHEDULER. DROP_CREDENTIAL</b>	Destroys a certificate.
<b>DBE_SCHEDULER. ENABLE</b>	Enables an object.
<b>DBE_SCHEDULER. ENABLE_SINGLE</b>	Enables a single object.
<b>DBE_SCHEDULER. DISABLE</b>	Disables an object.
<b>DBE_SCHEDULER. DISABLE_SINGLE</b>	Disables a single object.
<b>DBE_SCHEDULER. EVAL_CALENDAR_STRING</b>	Analyzes the scheduling task period.
<b>DBE_SCHEDULER. EVALUATE_CALENDAR_STRING</b>	Analyzes the scheduling task period.

- DBE\_SCHEDULER.CREATE\_JOB

Creates a scheduled task and synchronize it to all CNs.

The prototypes of the DBE\_SCHEDULER.CREATE\_JOB function are as follows:

```
-- Scheduled tasks of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER          DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE  DEFAULT NULL,
repeat_interval TEXT                  DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE    DEFAULT NULL,
job_class TEXT                       DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                      DEFAULT FALSE,
auto_drop BOOLEAN                    DEFAULT TRUE,
comments TEXT                        DEFAULT NULL,
credential_name TEXT                 DEFAULT NULL,
destination_name TEXT                DEFAULT NULL
)

-- Reference the created scheduled tasks of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT                       DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                      DEFAULT FALSE,
auto_drop BOOLEAN                    DEFAULT TRUE,
comments TEXT                        DEFAULT NULL,
job_style TEXT                       DEFAULT 'REGULAR',
credential_name TEXT                 DEFAULT NULL,
destination_name TEXT                DEFAULT NULL
)

-- Reference the created program and the scheduled task of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE  DEFAULT NULL,
repeat_interval TEXT                  DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE    DEFAULT NULL,
job_class TEXT                       DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                      DEFAULT FALSE,
auto_drop BOOLEAN                    DEFAULT TRUE,
comments TEXT                        DEFAULT NULL,
job_style TEXT                       DEFAULT 'REGULAR',
credential_name TEXT                 DEFAULT NULL,
destination_name TEXT                DEFAULT NULL
)

-- Reference the created schedule and the scheduled task of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER          DEFAULT 0,
job_class TEXT                       DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                      DEFAULT FALSE,
auto_drop BOOLEAN                    DEFAULT TRUE,
comments TEXT                        DEFAULT NULL,
credential_name TEXT                 DEFAULT NULL,
destination_name TEXT                DEFAULT NULL
)
```

 **NOTE**

The scheduled task created through **DBE\_SCHEDULER** does not conflict with the scheduled task in **DBE\_TASK**.

The scheduled task created by **DBE\_SCHEDULER** generates the corresponding **job\_id**. However, the **job\_id** is meaningless.

For the create API, the validity of input parameter types is not verified. Successful creation does not mean successful execution. You can query the execution status of the current task in the **pg\_job** system catalog.

**Table 10-267** Parameters for **DBE\_SCHEDULER.CREATE\_JOB**

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name of a scheduled task.
job_type	TEXT	IN	No	Inline program type of a scheduled task. The options are as follows: <ul style="list-style-type: none"> <li>• <b>'PLSQL_BLOCK'</b>: fast anonymous stored procedure.</li> <li>• <b>'STORED_PROCEDURE'</b>: stored procedure that is saved.</li> <li>• <b>'EXTERNAL_SCRIPT'</b>: external script.</li> </ul>
job_action	TEXT	IN	No	Content executed by an inline program of a scheduled task.
number_of_arguments	INTEGER	IN	No	Number of inline program parameters of a scheduled task.
program_name	TEXT	IN	No	Name of the program referenced by a scheduled task.
start_date	TIMESTAMP WITH TIME ZONE	IN	Yes	Inline scheduling start time of a scheduled task.
repeat_interval	TEXT	IN	Yes	Inline scheduling period of a scheduled task.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
end_date	TIMESTAMP WITH TIME ZONE	IN	Yes	Inline scheduling expiration time of a scheduled task.
schedule_name	TEXT	IN	No	Name of the schedule referenced by a scheduled task.
job_class	TEXT	IN	No	Class name of a scheduled task.
enabled	BOOLEAN	IN	No	Status of a scheduled task.
auto_drop	BOOLEAN	IN	No	Automatic deletion of a scheduled task.
comments	TEXT	IN	Yes	Comments.
job_style	TEXT	IN	No	Behavior pattern of a scheduled task. Only <b>'REGULAR'</b> is supported.
credential_name	TEXT	IN	Yes	Certificate name of a scheduled task.
destination_name	TEXT	IN	Yes	Target name of a scheduled task. Currently, only <b>'CCN'</b> (case-insensitive) is supported. Tasks whose <b>destination_name</b> is set to <b>CCN</b> can be executed only on the central coordinator. Otherwise, the original processing logic is used.

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
create_program
```

-----  
(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
create_schedule
```

-----  
(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
create_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
-----
(1 row)
```

#### NOTICE

To create a scheduled task of the EXTERNAL\_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- **DBE\_SCHEDULER.DROP\_JOB**

Deletes a scheduled task. The operation is performed only when the task is synchronized.

The prototype of the DBE\_SCHEDULER.DROP\_JOB function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean          default false,
defer boolean          default false,
commit_semantics text  default 'STOP_ON_FIRST_ERROR'
)
```

#### NOTE

DBE\_SCHEDULER.DROP\_JOB can specify one or more tasks, or specify a task class to delete a scheduled task.

**Table 10-268** Parameters for DBE\_SCHEDULER.DROP\_JOB

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li><b>TRUE:</b> The current scheduled task is stopped and then deleted.</li> <li><b>FALSE:</b> The scheduled task fails to be deleted if it is running.</li> </ul>
defer	BOOLEAN	IN	No	Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li><b>TRUE:</b> A scheduled task can be deleted after it is complete.</li> <li><b>FALSE:</b> The scheduled task cannot be executed and is deleted.</li> </ul>
commit_semantics	TEXT	IN	No	Commit rules: <ul style="list-style-type: none"> <li><b>'STOP_ON_FIRST_ERROR':</b> The deletion operation performed before the first error is reported is committed.</li> <li><b>'TRANSACTIONAL':</b> Transaction-level commit. The deletion operation performed before an error is reported will be rolled back.</li> <li><b>'ABSORB_ERRORS':</b> The system attempts to bypass an error and commit the deletion operation that is performed successfully.</li> </ul>

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
create_program
```

-----  
(1 row)

```

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
create_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
-----
(1 row)

```

#### NOTICE

The **TRANSACTIONAL** option in **commit\_semantic** takes effect only when **force** is set to **false**.

- **DBE\_SCHEDULER.DROP\_SINGLE\_JOB**  
Deletes a scheduled task. The operation is performed only when the task is synchronized.  
The prototype of the **DBE\_SCHEDULER.DROP\_SINGLE\_JOB** function is as follows:

```

DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean           default false,
defer boolean          default false
)

```

**Table 10-269** Parameters for **DBE\_SCHEDULER.DROP\_SINGLE\_JOB**

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Specifies the name of a scheduled task or scheduled task class.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li>• <b>TRUE</b>: The current scheduled task is stopped and then deleted.</li> <li>• <b>FALSE</b>: The scheduled task fails to be deleted if it is running.</li> </ul>
defer	BOOLEAN	IN	No	Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li>• <b>TRUE</b>: A scheduled task can be deleted after it is complete.</li> <li>• <b>FALSE</b>: The scheduled task cannot be executed and is deleted.</li> </ul>

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 0, false, 'test');
create_program
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval "3 minute"',
'2121-07-20', 'DEFAULT_JOB_CLASS', false, false, 'test', 'style', NULL, NULL);
create_job
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_single_job('job1', false, false);
drop_single_job
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
```

```
-----
(1 row)
```

- **DBE\_SCHEDULER.SET\_ATTRIBUTE**

Modifies the attributes of a scheduled task.

The prototypes of the DBE\_SCHEDULER.SET\_ATTRIBUTE function are as follows:

```
DBE_SCHEDULER.set_attribute(
name          text,
attribute     text,
```

```

value          boolean
)

DBE_SCHEDULER.set_attribute(
name           text,
attribute      text,
value          text
)

DBE_SCHEDULER.set_attribute(
name           text,
attribute      text,
value          timestamp
)

DBE_SCHEDULER.set_attribute(
name           text,
attribute      text,
value          timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text          default NULL
)

```

 **NOTE**

**name** specifies any object in **DBE\_SCHEDULER**.

**Table 10-270** Parameters for DBE\_SCHEDULER.SET\_ATTRIBUTE

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
name	TEXT	IN	No	Object name.
attribute	TEXT	IN	No	Attribute name.

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
value	BOOLEAN/ DATE/ TIMESTAMP / TIMESTAMP WITH TIME ZONE /TEXT	IN	No	Attribute value. The options are as follows: <ul style="list-style-type: none"> <li>Scheduled-task-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, ob_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style.</li> <li>Program-related: program_action, program_type, number_of_arguments, and comments.</li> <li>Scheduling-related: start_date, repeat_interval, end_date, and comments.</li> </ul>
value 2	TEXT	IN	Yes	Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
create_program
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
set_attribute
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'program_type', 'STORED_PROCEDURE');
set_attribute
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
```

```
-----
(1 row)
```

**NOTICE**

Do not use DBE\_SCHEDULER.SET\_ATTRIBUTE to leave the parameters empty. The object name cannot be changed using DBE\_SCHEDULER.SET\_ATTRIBUTE. Inline objects cannot be changed by DBE\_SCHEDULER.SET\_ATTRIBUTE.

- **DBE\_SCHEDULER.RUN\_JOB**

Executes a scheduled task.

The prototype of the DBE\_SCHEDULER.RUN\_JOB function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean          default true
)
```

 **NOTE**

DBE\_SCHEDULER.RUN\_JOB is used to run scheduled tasks immediately. It is independent of the scheduling of scheduled tasks and can even run at the same time.

**Table 10-271** Parameters for DBE\_SCHEDULER.RUN\_JOB

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
use_current_session	BOOLEAN	IN	No	Specifies whether to run a scheduled task. <ul style="list-style-type: none"> <li>• <b>TRUE:</b> Use the current session to check whether the scheduled task can run properly.</li> <li>• <b>FALSE:</b> Start the scheduled task in the background. The execution result is recorded in logs.</li> </ul>

**Example:**

```
gaussdb=# SELECT db_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.run_job('job1', false);
run_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----
(1 row)
```

**NOTICE**

Currently, **use\_current\_session** applies only to scheduled tasks whose **job\_type** is set to **EXTERNAL\_SCRIPT**.

- **DBE\_SCHEDULER.RUN\_BACKEND\_JOB**

Runs a scheduled task in the backend.

The prototype of the DBE\_SCHEDULER.RUN\_BACKEND\_JOB function is as follows:

```
DBE_SCHEDULER.run_backend_job(
job_name text
)
```

**Table 10-272** Parameters for DBE\_SCHEDULER.RUN\_BACKEND\_JOB

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled task.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_backend_job('job1');
run_backend_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----
(1 row)
```

- **DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB**

Executes a scheduled task in the current session.

Only external tasks can be executed.

Return value: text

The prototype of the DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB function is as follows:

```
DBE_SCHEDULER.run_foreground_job(
job_name text
)return text
```

**Table 10-273** Parameters for DBE\_SCHEDULER.RUN\_FOREGROUND\_JOB

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name of a scheduled task.

Example:

```
gaussdb=# create user test1 identified by '*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# select DBE_SCHEDULER.create_credential('cre_1', 'test1', '*****');
create_credential
-----
(1 row)

gaussdb=# select DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'EXTERNAL_SCRIPT',
job_action=>'/usr/bin/pwd', enabled=>true, auto_drop=>false, credential_name => 'cre_1');
create_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_foreground_job('job1');
run_foreground_job
-----
Host key verification failed.\r+
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
drop_credential
-----
(1 row)

gaussdb=# drop user test1;
DROP ROLE
```

- **DBE\_SCHEDULER.STOP\_JOB**

Stops a scheduled task.

The prototype of the DBE\_SCHEDULER.STOP\_JOB function is as follows:

```
DBE_SCHEDULER.stop_job(
job_name text,
```

```
force boolean          default false,
commit_semantics text  default 'STOP_ON_FIRST_ERROR'
)
```

**Table 10-274** Parameters for DBE\_SCHEDULER.STOP\_JOB

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name or class of a scheduled task. You can specify one or more scheduled tasks. If you specify multiple scheduled tasks, separate them with commas (,).
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li><b>TRUE:</b> The scheduler sends a termination signal to end the task thread immediately.</li> <li><b>FALSE:</b> The scheduler attempts to use the interrupt signal to terminate the scheduled task thread.</li> </ul>
commit_semantics	TEXT	IN	No	Commit rules: <ul style="list-style-type: none"> <li><b>'STOP_ON_FIRST_ERROR':</b> The interrupt operation performed before the first error is reported is committed.</li> <li><b>'ABSORB_ERRORS':</b> The system attempts to bypass an error and commit the interrupt operation that is performed successfully.</li> </ul>

**Example:**

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.stop_job('job1', true, 'STOP_ON_FIRST_ERROR');
stop_job
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----
```

(1 row)

- **DBE\_SCHEDULER.STOP\_SINGLE\_JOB**

Stops a single scheduled task.

The prototype of the DBE\_SCHEDULER.STOP\_SINGLE\_JOB function is as follows:

```
DBE_SCHEDULER.stop_single_job(
job_name text,
force boolean                default false
)
```

**Table 10-275** Parameters for DBE\_SCHEDULER.STOP\_SINGLE\_JOB

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Specifies the name of a scheduled task or scheduled task class.
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled task. <ul style="list-style-type: none"> <li>• <b>TRUE:</b> The scheduler sends a termination signal to end the task thread immediately.</li> <li>• <b>FALSE:</b> The scheduler attempts to use the interrupt signal to terminate the scheduled task thread.</li> </ul>

**Example:**

```
gaussdb=# SELECT db_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
-----
```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.stop_single_job('job1', true);
stop_single_job
-----
```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

```
-----
(1 row)
```

- DBE\_SCHEDULER.GENERATE\_JOB\_NAME

Generates the name of a scheduled task.

The prototype of the DBE\_SCHEDULER.GENERATE\_JOB\_NAME function is as follows:

```
DBE_SCHEDULER.generate_job_name(
prefix text          default 'JOB$_'
)return text
```

**Table 10-276** Parameters for DBE\_SCHEDULER.GENERATE\_JOB\_NAME

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
prefix	TEXT	IN	No	Prefix of the generated name. The default value is 'JOB\$_'. Scheduled tasks that are repeatedly executed are named as follows: job\$_1, job\$_2, job\$_3 ...

Example:

```
gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
generate_job_name
-----
JOB$_1
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
generate_job_name
-----
JOB$_2
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
generate_job_name
-----
job3
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
generate_job_name
-----
job4
(1 row)
```

**NOTICE**

When DBE\_SCHEDULER.GENERATE\_JOB\_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE\_SCHEDULER.CREATE\_PROGRAM

Creates a program and synchronizes it to all CNs.

The prototype of the DBE\_SCHEDULER.CREATE\_PROGRAM function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer          default 0,
enabled boolean                      default false,
comments text                        default NULL
)
```

**Table 10-277** Parameters for DBE\_SCHEDULER.CREATE\_PROGRAM

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	TEXT	IN	No	Name of a program.
program_type	TEXT	IN	No	Program type. The options are as follows: <ul style="list-style-type: none"> <li>• 'PLSQL_BLOCK': fast anonymous stored procedure.</li> <li>• 'STORED_PROCEDURE': stored procedure that is saved.</li> <li>• 'EXTERNAL_SCRIPT': external script.</li> </ul>
program_action	TEXT	IN	No	Program operation.
number_of_arguments	INTEGER	IN	No	Number of parameters used by the program.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
enabled	BOOLEAN	IN	No	Specifies whether the program is enabled.
comments	TEXT	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
create_program
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
```

```
-----
(1 row)
```

- DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT

Defines program parameters. The operation is performed only when the program is synchronized.

An API with the default value **default\_value** will not convert characters to lowercase letters by default. In this version, characters are case sensitive.

The prototype of the DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text           default NULL,
argument_type text,
out_argument boolean         default false
)

-- With a default value --
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text           default NULL,
argument_type text,
default_value text,
out_argument boolean         default false
)
```

**Table 10-278** Parameters for  
DBE\_SCHEDULER.DEFINE\_PROGRAM\_ARGUMENT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	TEXT	IN	No	Name of a program.
argument_position	INTEGER	IN	No	Parameter location.
argument_name	TEXT	IN	No	Parameter name.
argument_type	TEXT	IN	No	Parameter type.
default_value	TEXT	IN	No	Default value.
out_argument	BOOLEAN	IN	No	Reserved parameter.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', false);
define_program_argument
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', 'value1',
false);
define_program_argument
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
-----
(1 row)
```

- DBE\_SCHEDULER.DROP\_PROGRAM

Deletes a program. The operation is performed only when the program is synchronized.

The prototype of the DBE\_SCHEDULER.DROP\_PROGRAM function is as follows:

```
DBE_SCHEDULER.drop_program(
program_name text,
force boolean          default false
)
```

**Table 10-279** Parameters for DBE\_SCHEDULER.DROP\_PROGRAM

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	TEXT	IN	No	Name of a program.
force	BOOLEAN	IN	No	Specifies whether to delete a program. <ul style="list-style-type: none"> <li><b>TRUE:</b> Before a program is deleted, all jobs that use the program are disabled.</li> <li><b>FALSE:</b> The program cannot be referenced by any job. Otherwise, an error is sent.</li> </ul>

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
```

(1 row)

- **DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM**

Deletes a single program. The operation is performed only when the program is synchronized.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM function is as follows:

```
DBE_SCHEDULER.drop_single_program(
program_name text,
force boolean          default false
)
```

**Table 10-280** Parameters for DBE\_SCHEDULER.DROP\_SINGLE\_PROGRAM

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	TEXT	IN	No	Name of a program.
force	BOOLEAN	IN	No	Specifies whether to delete a program. <ul style="list-style-type: none"> <li>• <b>TRUE:</b> Before a program is deleted, all jobs that use the program are disabled.</li> <li>• <b>FALSE:</b> The program cannot be referenced by any job. Otherwise, an error is sent.</li> </ul>

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
```

-----

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_single_program('program1', false);
drop_single_program
```

-----

(1 row)

- DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE

Sets the parameters of a scheduled task. The **argument\_value** can be left empty. The operation is performed only when the task is synchronized.

The prototype of the DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_position integer,
argument_value text
)
```

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_name text,
argument_value text
)
```

**Table 10-281** Parameters for DBE\_SCHEDULER.SET\_JOB\_ARGUMENT\_VALUE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name of a scheduled task.
argument_position	INTEGER	IN	No	Parameter location.
argument_name	TEXT	IN	Yes	Parameter name.
argument_value	TEXT	IN	Yes	Parameter value.

**Example:**

```
gaussdb=# CALL db_scheduler.create_job('job1','EXTERNAL_SCRIPT','begin insert into test1
values(12); end;',2,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.set_job_argument_value('job1', 1, 'value1');
set_job_argument_value
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
```

```
-----
(1 row)
```

- **DBE\_SCHEDULER.CREATE\_SCHEDULE**

Creates a schedule and synchronizes it to all CNs.

The prototype of the DBE\_SCHEDULER.CREATE\_SCHEDULE function is as follows:

```
DBE_SCHEDULER.create_schedule(
schedule_name text,
start_date timestamp with time zone    default NULL,
repeat_interval text,
end_date timestamp with time zone    default NULL,
comments text                          default NULL
)
```

**Table 10-282** Parameters for DBE\_SCHEDULER.CREATE\_SCHEDULE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	TEXT	IN	No	Name of a schedule.
start_date	TIMESTAMP WITH TIME ZONE	IN	Yes	Start time of a schedule.
repeat_interval	TEXT	IN	No	Repetition frequency of a schedule.
end_date	TIMESTAMP WITH TIME ZONE	IN	Yes	End time of a schedule.
comments	TEXT	IN	Yes	Comments.

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_single_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
drop_single_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
drop_single_schedule
-----
(1 row)
```

- DBE\_SCHEDULER.DROP\_SCHEDULE

Deletes a schedule. The operation is performed only when the schedule is synchronized.

The prototype of the DBE\_SCHEDULER.DROP\_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_schedule(
schedule_name text,
force boolean          default false
)
```

**Table 10-283** Parameters for DBE\_SCHEDULER.DROP\_SCHEDULE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	TEXT	IN	No	Name of a schedule.
force	BOOLEAN	IN	No	Specifies whether to delete a schedule. <ul style="list-style-type: none"> <li><b>true:</b> Any jobs or windows that use this schedule are disabled before the schedule is deleted.</li> <li><b>false:</b> The schedule cannot be referenced by any job or window. Otherwise, an error occurs.</li> </ul>

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
drop_single_schedule
-----
```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
drop_single_schedule
-----
```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
drop_single_schedule
-----
```

```
(1 row)
```

- **DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE**

Deletes a single schedule. The operation is performed only when the schedule is synchronized.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_single_schedule(
schedule_name text,
force boolean                default false
)
```

**Table 10-284** Parameters for DBE\_SCHEDULER.DROP\_SINGLE\_SCHEDULE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	TEXT	IN	No	Name of a schedule.
force	BOOLEAN	IN	No	Specifies whether to delete a schedule. <ul style="list-style-type: none"> <li>• <b>TRUE:</b> Any jobs or windows that use this schedule are disabled before the schedule is deleted.</li> <li>• <b>FALSE:</b> The schedule cannot be referenced by any job or window. Otherwise, an error occurs.</li> </ul>

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
create_schedule
-----
```

```
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
```

```

create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
create_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule1');
drop_single_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule2', false);
drop_single_schedule
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule3', true);
drop_single_schedule
-----
(1 row)

```

- **DBE\_SCHEDULER.CREATE\_JOB\_CLASS**

Creates a scheduled task class and synchronizes it to all CNs.

The prototype of the DBE\_SCHEDULER.CREATE\_JOB\_CLASS function is as follows:

```

DBE_SCHEDULER.create_job_class(
job_class_name text,
resource_consumer_group text          default NULL,
service text                        default NULL,
logging_level integer                default 0,
log_history integer                  default NULL,
comments text                        default NULL
)

```

**Table 10-285** Parameters for DBE\_SCHEDULER.CREATE\_JOB\_CLASS

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	TEXT	IN	No	Name of a scheduled task class.
resource_consumer_group	TEXT	IN	Yes	Inline resource consumer group of a scheduled task class.
service	TEXT	IN	Yes	Inline database service of a scheduled task class.
logging_level	INTEGER	IN	No	Number of scheduled task records.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
log_history	INTEGER	IN	Yes	Number of days for storing scheduled task records.
comments	TEXT	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group => '123');
create_job_class
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
drop_job_class
-----
(1 row)
```

- **DBE\_SCHEDULER.DROP\_JOB\_CLASS**

Deletes the class of a scheduled task. The operation is performed only when the scheduled task class is synchronized.

The prototype of the DBE\_SCHEDULER.DROP\_JOB\_CLASS function is as follows:

```
DBE_SCHEDULER.drop_job_class(
job_class_name text,
force boolean          default false
)
```

**Table 10-286** Parameters for DBE\_SCHEDULER.DROP\_JOB\_CLASS

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	TEXT	IN	No	Name of a scheduled task class.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
force	BOOLEAN	IN	No	<p>Specifies whether to delete a scheduled task class.</p> <ul style="list-style-type: none"> <li>• <b>TRUE:</b> Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted.</li> <li>• <b>FALSE:</b> The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.</li> </ul>

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group => '123');
create_job_class
```

```
-----
(1 row)
```

```
gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
drop_job_class
```

```
-----
(1 row)
```

- DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS

Deletes the class of a single scheduled task. The operation is performed only when the scheduled task class is synchronized.

The prototype of the DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS function is as follows:

```
DBE_SCHEDULER.drop_single_job_class(
job_class_name text,
force boolean                default false
)
```

**Table 10-287** Parameters for DBE\_SCHEDULER.DROP\_SINGLE\_JOB\_CLASS

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	TEXT	IN	No	Name of a scheduled task class.
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled task class. <ul style="list-style-type: none"> <li>• <b>TRUE:</b> Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted.</li> <li>• <b>FALSE:</b> The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.</li> </ul>

**Example:**

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group => '123');
create_job_class
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job_class('jc1', false);
drop_single_job_class
-----
(1 row)
```

- **DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION**

Grants the scheduled task permissions to the database user. The user who calls this function must have the SYSADMIN permission. Then, it is synchronized to all CNs.

The prototype of the DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION function is as follows:

```
DBE_SCHEDULER.grant_user_authorization(
username      text,
privilege     text
)
```

**Table 10-288** Parameters for DBE\_SCHEDULER.GRANT\_USER\_AUTHORIZATION

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
username	TEXT	IN	No	Database username.
privilege	TEXT	IN	No	Scheduled task permission.

Example:

```
gaussdb=# create user user1 password '1*s*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
grant_user_authorization
-----
```

```
(1 row)
gaussdb=# drop user user1;
DROP ROLE
```

- **DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION**

Revokes the scheduled task permissions from the database user. The user who calls this function must have the SYSADMIN permission. The operation is performed only when the permission granting is synchronized.

The prototype of the DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(
username          text,
privilege         text
)
```

**Table 10-289** Parameters for DBE\_SCHEDULER.REVOKE\_USER\_AUTHORIZATION

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
username	TEXT	IN	No	Database username.
privilege	TEXT	IN	No	Scheduled task permission.

Example:

```
gaussdb=# create user user1 password '1*s*****';
NOTICE: The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
grant_user_authorization
```

-----  
(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.revoke_user_authorization('user1', 'create job');
revoke_user_authorization
```

-----  
(1 row)

```
gaussdb=# drop user user1;
DROP ROLE
```

- **DBE\_SCHEDULER.CREATE\_CREDENTIAL**

Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission. Then, it is synchronized to all CNs.

The prototype of the DBE\_SCHEDULER.CREATE\_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.create_credential(
credential_name    text,
username          text,
password          text      default NULL,
database_role     text      default NULL,
windows_domain    text      default NULL,
comments          text      default NULL
)
```

**Table 10-290** Parameters for DBE\_SCHEDULER.CREATE\_CREDENTIAL

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
credential_name	TEXT	IN	No	Name of the authorization certificate.
username	TEXT	IN	No	Database username.
password	TEXT	IN	Yes	User password.
database_role	TEXT	IN	Yes	Database system permission.
windows_domain	TEXT	IN	Yes	Domain to which a Windows user belongs.
comments	TEXT	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
create_credential
```

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
drop_credential
-----
(1 row)
```

### NOTICE

The **password** parameter of DBE\_SCHEDULER.CREATE\_CREDENTIAL must be set to **NULL** or **'\*\*\*\*\*'**. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- DBE\_SCHEDULER.DROP\_CREDENTIAL

Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission. The operation is performed only when the certificate is synchronized.

The prototype of the DBE\_SCHEDULER.DROP\_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.drop_credential(
credential_name      text,
force boolean default false
)
```

**Table 10-291** Parameters for DBE\_SCHEDULER.DROP\_CREDENTIAL

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
credential_name	TEXT	IN	No	Name of the authorization certificate.
force	BOOLEAN	IN	No	Specifies whether to delete the authorization certificate. <ul style="list-style-type: none"> <li>• <b>TRUE</b>: The certificate will be deleted no matter whether it is referenced by any job.</li> <li>• <b>FALSE</b>: No job can reference the certificate. Otherwise, an error occurs.</li> </ul>

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
create_credential
```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
drop_credential
```

(1 row)

- **DBE\_SCHEDULER.ENABLE**

Enables objects and synchronizes them to all CNs.

The prototype of the DBE\_SCHEDULER.ENABLE function is as follows:

```
DBE_SCHEDULER.enable(
name text,
commit_semantics text          default 'STOP_ON_FIRST_ERROR'
)
```

**Table 10-292** Parameters for DBE\_SCHEDULER.ENABLE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	TEXT	IN	No	Object name. You can specify one or more objects. If you specify multiple objects, separate them with commas (,).
commit_semantics	TEXT	IN	No	Commit rules. The following types are supported: <ul style="list-style-type: none"> <li>• <b>'STOP_ON_FIRST_ERROR'</b>: The enabling operation performed before the first error is reported is committed.</li> <li>• <b>'TRANSACTIONAL'</b>: Transaction-level commit. The enabling operation performed before an error is reported will be rolled back.</li> <li>• <b>'ABSORB_ERRORS'</b>: The system attempts to bypass an error and commit the enabling operation that is performed successfully.</li> </ul>

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
```

```

lse, 'test');
create_job
-----

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
create_program
-----

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable('job1');
enable
-----

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable('program1', 'STOP_ON_FIRST_ERROR');
enable
-----

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
-----

(1 row)

```

- **DBE\_SCHEDULER.ENABLE\_SINGLE**

Enables a single object and synchronizes it to all CNs.

The prototype of the DBE\_SCHEDULER.ENABLE\_SINGLE function is as follows:

```

DBE_SCHEDULER.enable_single(
name text
)

```

**Table 10-293** Parameters for DBE\_SCHEDULER.ENABLE\_SINGLE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	TEXT	IN	No	Object name.

Example:

```

gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);

```

```

lse, 'test');
create_job
-----

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable_single('job1');
enable_single
-----

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----

(1 row)

```

- **DBE\_SCHEDULER.DISABLE**

Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object. Operations are synchronized only when operation synchronization is enabled.

The prototype of the DBE\_SCHEDULER.DISABLE function is as follows:

```

DBE_SCHEDULER.disable(
name text,
force boolean                default false,
commit_semantics text        default 'STOP_ON_FIRST_ERROR'
)

```

**Table 10-294** Parameters for DBE\_SCHEDULER.DISABLE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	TEXT	IN	No	Object name.
force	BOOLEAN	IN	No	Specifies whether to disable an object. <ul style="list-style-type: none"> <li>• <b>TRUE:</b> The object is disabled regardless of whether other objects depend on it.</li> <li>• <b>FALSE:</b> No object can depend on the object. Otherwise, an error occurs.</li> </ul>

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
commit_semantics	TEXT	IN	No	<p>Commit rules. The following types are supported:</p> <ul style="list-style-type: none"> <li>• <b>'STOP_ON_FIRST_ERROR'</b>: The disabling operation performed before the first error is reported is committed.</li> <li>• <b>'TRANSACTIONAL'</b>: Transaction-level commit. The disabling operation performed before an error is reported will be rolled back.</li> <li>• <b>'ABSORB_ERRORS'</b>: The system attempts to bypass an error and commit the disabling operation that is performed successfully.</li> </ul>

Example:

```

gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
create_program
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable('job1');
disable
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable('program1', false, 'STOP_ON_FIRST_ERROR');
disable
-----
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----
(1 row)

```

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
drop_program
-----
```

(1 row)

- DBE\_SCHEDULER.DISABLE\_SINGLE

Disables a single object. Operations are synchronized only when operation synchronization is enabled.

The prototype of the DBE\_SCHEDULER.DISABLE\_SINGLE function is as follows:

```
DBE_SCHEDULER.disable_single(
name text,
force boolean                default false
)
```

**Table 10-295** Parameters for DBE\_SCHEDULER.DISABLE\_SINGLE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	TEXT	IN	No	Object name.
force	BOOLEAN	IN	No	Specifies whether to disable an object. <ul style="list-style-type: none"> <li>• <b>TRUE:</b> The object is disabled regardless of whether other objects depend on it.</li> <li>• <b>FALSE:</b> No object can depend on the object. Otherwise, an error occurs.</li> </ul>

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
create_job
-----
```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.disable_single('job1', false);
disable_single
-----
```

(1 row)

```
gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
drop_job
-----
```

(1 row)

- DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING

Analyzes the scheduling task period.

Return type: timestamp with time zone

The prototype of the DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
  IN calendar_string text,
  IN start_date timestamp with time zone,
  IN return_date_after timestamp with time zone
) return timestamp with time zone
```

**Table 10-296** Parameters for DBE\_SCHEDULER.EVAL\_CALENDAR\_STRING

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
calendar_string	TEXT	IN	No	Date string of a scheduled task.
start_date	TIMESTAMP WITH TIME ZONE	IN	No	Start time of a scheduled task.
return_date_after	TIMESTAMP WITH TIME ZONE	IN	No	Date when a scheduled task is returned.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.eval_calendar_string('FREQ=DAILY; BYHOUR=6;', sysdate, sysdate);
eval_calendar_string
-----
2023-09-15 06:47:24+08
(1 row)
```

- DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING

Analyzes the scheduling task period.

Return type: timestamp with time zone

The prototype of the DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
  IN calendar_string text,
  IN start_date timestamp with time zone,
  IN return_date_after timestamp with time zone,
  OUT next_run_date timestamp with time zone
) return timestamp with time zone
```

**Table 10-297** Parameters for  
DBE\_SCHEDULER.EVALUATE\_CALENDAR\_STRING

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
calendar_string	TEXT	IN	No	Date string of a scheduled task.
start_date	TIMESTAMP WITH TIME ZONE	IN	No	Start time of a scheduled task.
return_date_after	TIMESTAMP WITH TIME ZONE	IN	No	Date when a scheduled task is returned.
next_run_date	TIMESTAMP WITH TIME ZONE	OUT	No	The next date when a scheduled task is returned.

Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE pr1(calendar_str text) as
DECLARE
    start_date      timestamp with time zone;
    return_date_after timestamp with time zone;
    next_run_date   timestamp with time zone;
BEGIN
    start_date := '2003-2-1 10:30:00.111111+8':timestamp with time zone;
    return_date_after := start_date;
    DBE_SCHEDULER.evaluate_calendar_string(
        calendar_str,
        start_date, return_date_after, next_run_date);
    DBE_OUTPUT.PRINT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
END;
/
CREATE PROCEDURE

gaussdb=# CALL pr1('FREQ=hourly;INTERVAL=2;BYHOUR=6,10;BYMINUTE=0;BYSECOND=0');
next_run_date: 2003-02-02 06:00:00+08
pr1
-----
(1 row)
```

### 10.11.2.13 DBE\_SESSION

#### API Description

**Table 10-298** provides all APIs supported by the **DBE\_SESSION** package. **DBE\_SESSION** takes effect at the session level.

**Table 10-298** DBE\_SESSION

API	Description
<a href="#">DBE_SESSION.SET_CONTEXT</a>	Sets the value of an attribute in a specified context.
<a href="#">DBE_SESSION.CLEAR_CONTEXT</a>	Clears the value of an attribute in a specified context.
<a href="#">DBE_SESSION.SEARCH_CONTEXT</a>	Queries the value of an attribute in a specified context.
<a href="#">DBE_SESSION.MODIFY_PACKAGE_STATUS</a>	Changes the PL/SQL status of the current session.

- **DBE\_SESSION.SET\_CONTEXT**

Sets the value of an attribute in a specified namespace (context). The prototype of the DBE\_SESSION.SET\_CONTEXT function is as follows:

```
DBE_SESSION.SET_CONTEXT(
    namespace text,
    attribute text,
    value text
)returns void;
```

**Table 10-299** Parameters for DBE\_SESSION.SET\_CONTEXT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	TEXT	IN	No	Attribute name. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.
value	TEXT	IN	No	Name of the value to be set. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

- **DBE\_SESSION.CLEAR\_CONTEXT**

Clears the value of an attribute in a specified namespace (context). The prototype of the DBE\_SESSION.CLEAR\_CONTEXT function is as follows:

```
DBE_SESSION.CLEAR_CONTEXT (
  namespace text,
  client_identifier text default null,
  attribute text default null
)returns void ;
```

**Table 10-300** Parameters for DBE\_SESSION.CLEAR\_CONTEXT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
client_identifier	TEXT	IN	Yes	Client authentication. The default value is <b>null</b> . Generally, you do not need to manually set this parameter.
attribute	TEXT	IN	Yes	Attribute to be cleared. The default value is <b>null</b> , indicating that all attributes of the specified context are cleared. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.  Note: To ensure forward compatibility, if the parameter value is ' <b>null</b> ', all attributes of the specified context are cleared.

- DBE\_SESSION.SEARCH\_CONTEXT

Queries the value of an attribute in a specified namespace (context). The prototype of the DBE\_SESSION.SEARCH\_CONTEXT function is as follows:

```
DBE_SESSION.SEARCH_CONTEXT (
  namespace text,
  attribute text
)returns text;
```

**Table 10-301** Parameters for DBE\_SESSION.SEARCH\_CONTEXT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	TEXT	IN	No	Attribute to be searched for. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

**Example:**

```

DECLARE
  a text;
BEGIN
  DBE_SESSION.set_context('test', 'gaussdb', 'one'); --Set the gaussdb attribute in the test context to one.
  a := DBE_SESSION.search_context('test', 'gaussdb');
  DBE_OUTPUT.PRINT_LINE(a);
  DBE_SESSION.clear_context('test', 'test','gaussdb');
END;
/
-- Expected result:
one
ANONYMOUS BLOCK EXECUTE

```

- **DBE\_SESSION.MODIFY\_PACKAGE\_STATE**

Changes the PL/SQL status of the current session. The prototype of the DBE\_SESSION.MODIFY\_PACKAGE\_STATE function is as follows:

```

DBE_SESSION.MODIFY_PACKAGE_STATE (
  flags int);

```

**Table 10-302** Parameters for DBE\_SESSION.MODIFY\_PACKAGE\_STATE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
flags	INT	IN	No	Bit flag of the operation performed on the PL/SQL.  When <b>flags</b> is set to <b>1</b> , the session cache of the PL/SQL that is currently running in the session is released after the top-level PL/SQL is executed. The current value of any package is cleared globally and the cached cursor is closed. On subsequent use, PL/SQL re-instantiates and re-initializes the package globally.  Other bit flags are not supported.

Example:

```
CALL dbe_session.modify_package_state(1);
modify_package_state
```

(1 row)

## 10.11.2.14 DBE\_SQL

### Data Types

- DBE\_SQL.DESC\_REC

This type is a composite type and is used to store the description of the SQL\_DESCRIBE\_COLUMNS API.

The prototype of the DBE\_SQL.DESC\_REC type is as follows:

```
CREATE TYPE DBE_SQL.DESC_REC AS (
  col_type      int,
  col_max_len   int,
  col_name      VARCHAR2(32),
  col_name_len  int,
  col_schema_name VARCHAR2(32),
  col_schema_name_len int,
  col_precision int,
  col_scale     int,
  col_charsetid int,
  col_charsetform int,
  col_null_ok   BOOLEAN
);
```

- DBE\_SQL.DESC\_TAB

This type is the TABLE type of DESC\_REC.

- DBE\_SQL.DATE\_TABLE

This type is the TABLE type of DATE.

- DBE\_SQL.NUMBER\_TABLE  
This type is the TABLE type of NUMBER.
- DBE\_SQL.VARCHAR2\_TABLE  
This type is the TABLE type of VARCHAR2.
  - DBE\_SQL.BLOB\_TABLE  
This type is the TABLE type of BLOB.

## API Description

**Table 10-303** lists APIs supported by the **DBE\_SQL** package.

**Table 10-303** DBE\_SQL

API	Description
<a href="#">DBE_SQL.REGISTER_CONTEXT</a>	Opens a cursor.
<a href="#">DBE_SQL.SQL_UNREGISTER_CONTEXT</a>	Closes an open cursor.
<a href="#">DBE_SQL.SQL_SET_SQL</a>	Passes a set of SQL statements or anonymous blocks to a cursor.
<a href="#">DBE_SQL.SQL_RUN</a>	Executes SQL statements or anonymous blocks in a given cursor.
<a href="#">DBE_SQL.NEXT_ROW</a>	Reads a row of cursor data.
<a href="#">DBE_SQL.SET_RESULT_TYPE</a>	Dynamically defines a column.
<a href="#">DBE_SQL.SET_RESULT_TYPE_CHAR</a>	Dynamically defines a column of the CHAR type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_INT</a>	Dynamically defines a column of the INT type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_LONG</a>	Dynamically defines a column of the LONG type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_RAW</a>	Dynamically defines a column of the RAW type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_TEXT</a>	Dynamically defines a column of the TEXT type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_UNKNOWN</a>	Dynamically defines a column of an unknown type.
<a href="#">DBE_SQL.GET_RESULT</a>	Reads a dynamically defined column value.
<a href="#">DBE_SQL.GET_RESULT_CHAR</a>	Reads a dynamically defined column value of the CHAR type.

API	Description
<a href="#">DBE_SQL.GET_RESULT_INT</a>	Reads a dynamically defined column value of the INT type.
<a href="#">DBE_SQL.GET_RESULT_LONG</a>	Reads a dynamically defined column value of the LONG type.
<a href="#">DBE_SQL.GET_RESULT_RAW</a>	Reads a dynamically defined column value of the RAW type.
<a href="#">DBE_SQL.GET_RESULT_TEXT</a>	Reads a dynamically defined column value of the TEXT type.
<a href="#">DBE_SQL.GET_RESULT_UNKNOWN</a>	Reads a dynamically defined column value of an unknown type.
<a href="#">DBE_SQL.DBE_SQL_GET_RESULT_CHAR</a>	Reads a dynamically defined column value of the CHAR type.
<a href="#">DBE_SQL.DBE_SQL_GET_RESULT_LONG</a>	Reads a dynamically defined column value of the LONG type.
<a href="#">DBE_SQL.DBE_SQL_GET_RESULT_RAW</a>	Reads a dynamically defined column value of the RAW type.
<a href="#">DBE_SQL.IS_ACTIVE</a>	Checks whether a cursor is opened.
<a href="#">DBE_SQL.LAST_ROW_COUNT</a>	Returns the cumulative count of obtained rows.
<a href="#">DBE_SQL.RUN_AND_NEXT</a>	Reads data of a cursor after a set of dynamically defined operations are performed on the cursor.
<a href="#">DBE_SQL.SQL_BIND_VARIABLE</a>	Binds a value to a variable in a statement.
<a href="#">DBE_SQL.SQL_BIND_ARRAY</a>	Binds a group of values to a variable in a statement.
<a href="#">DBE_SQL.SET_RESULT_TYPE_INTS</a>	Dynamically defines a column of the INT array type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_TEXTS</a>	Dynamically defines a column of the TEXT array type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_RAWS</a>	Dynamically defines a column of the RAW array type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_BYTEAS</a>	Dynamically defines a column of the BYTEA array type.
<a href="#">DBE_SQL.SET_RESULT_TYPE_CHARS</a>	Dynamically defines a column of the CHAR array type.

API	Description
<a href="#">DBE_SQL.SET_RESULTS_TYPE</a>	Dynamically defines a column of the array type.
<a href="#">DBE_SQL.GET_RESULTS_INT</a>	Reads a dynamically defined column value of the INT array type.
<a href="#">DBE_SQL.GET_RESULTS_TEXT</a>	Reads a dynamically defined column value of the TEXT array type.
<a href="#">DBE_SQL.GET_RESULTS_RAW</a>	Reads a dynamically defined column value of the RAW array type.
<a href="#">DBE_SQL.GET_RESULTS_BYTEA</a>	Reads a dynamically defined column value of the BYTEA array type.
<a href="#">DBE_SQL.GET_RESULTS_CHAR</a>	Reads a dynamically defined column value of the CHAR array type.
<a href="#">DBE_SQL.GET_RESULTS</a>	Reads a dynamically defined column value.
<a href="#">DBE_SQL.DESCRIBE_COLUMNS</a>	Describes the column information read by the cursor.
<a href="#">DBE_SQL.SQL_DESCRIBE_COLUMNS</a>	Describes the column information read by the cursor.
<a href="#">DBE_SQL.BIND_VARIABLE</a>	Binds parameters.
<a href="#">DBE_SQL.SQL_SET_RESULTS_TYPE_C</a>	Dynamically defines a column of the array type.
<a href="#">DBE_SQL.SQL_GET_VALUES_C</a>	Reads a dynamically defined column value.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT</a>	Reads the return value of an SQL statement.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT_CHAR</a>	Reads the return value (of the char type) of an SQL statement.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT_RAW</a>	Reads the return value (of the raw type) of an SQL statement.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT_TEXT</a>	Reads the return value (of the text type) of an SQL statement.
<a href="#">DBE_SQL.GET_VARIABLE_RESULT_INT</a>	Reads the return value (of the int type) of an SQL statement.

API	Description
<a href="#">DBE_SQL.GET_ARRAY_RESULT_TEXT</a>	Reads the return value (of the text array type) of an SQL statement.
<a href="#">DBE_SQL.GET_ARRAY_RESULT_RAW</a>	Reads the return value (of the raw array type) of an SQL statement.
<a href="#">DBE_SQL.GET_ARRAY_RESULT_CHAR</a>	Reads the return value (of the char array type) of an SQL statement.
<a href="#">DBE_SQL.GET_ARRAY_RESULT_INT</a>	Reads the return value (of the int array type) of an SQL statement.

 NOTE

- You are advised to use `dbe_sql.set_result_type` and `dbe_sql.get_result` to define columns.
- If the size of the result set is greater than the value of `work_mem`, the result set will be spilled to a disk temporarily. The value of `work_mem` must be no greater than 512 MB.
- `DBE_SQL.REGISTER_CONTEXT`  
This function opens a cursor, which is the prerequisite for the subsequent `dbe_sql` operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

 CAUTION

Cursors opened by `DBE_SQL` are session-level variables. Cross-session calling of opened cursors (such as autonomous transactions) is not supported. If a cross-session cursor is called, the behavior is unpredictable.

The prototype of the `DBE_SQL.REGISTER_CONTEXT` function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- `DBE_SQL.SQL_UNREGISTER_CONTEXT`  
This function closes a cursor, which is the end of each `dbe_sql` operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

The prototype of the `DBE_SQL.SQL_UNREGISTER_CONTEXT` function is as follows:

```
DBE_SQL.SQL_UNREGISTER_CONTEXT(
    context_id IN INT
)
RETURN INTEGER;
```

**Table 10-304** DBE\_SQL.SQL\_UNREGISTER\_CONTEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be closed

- DBE\_SQL.SQL\_SET\_SQL

Parses SQL statements or anonymous blocks in a given cursor. The statement parameters can be transferred only through the TEXT type. The length cannot exceed 1 GB.

The prototype of the DBE\_SQL.SQL\_SET\_SQL function is as follows:

```
DBE_SQL.SQL_SET_SQL(
  context_id IN INT,
  query_string IN TEXT,
  language_flag IN INT
)
RETURN BOOLEAN;
```

**Table 10-305** DBE\_SQL.SQL\_SET\_SQL parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor whose query statement is to be parsed
query_string	TEXT	IN	No	Query statement to be parsed

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
language_flag	INT	IN	No	Version language. The value <b>1</b> indicates an incompatible version, and the value <b>2</b> indicates an ORA-compatible version.

- DBE\_SQL.SQL\_RUN

This function executes a given cursor. This function receives a cursor ID and executes SQL statements or anonymous blocks in a given cursor.

The prototype of the DBE\_SQL.SQL\_RUN function is as follows:

```
DBE_SQL.SQL_RUN(
    context_id IN INT,
)
RETURN INTEGER;
```

**Table 10-306** DBE\_SQL.SQL\_RUN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor whose query statement is to be parsed

- DBE\_SQL.NEXT\_ROW

This function returns the number of data rows that meet query conditions. Each time the API is executed, the system obtains a set of new rows until all data is read.

The prototype of the DBE\_SQL.NEXT\_ROW function is as follows:

```
DBE_SQL.NEXT_ROW(
    context_id IN INT,
```

```
)  
RETURN INTEGER;
```

**Table 10-307** DBE\_SQL.NEXT\_ROW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.

- DBE\_SQL.SET\_RESULT\_TYPE

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(  
  context_id IN INT,  
  pos      IN INT,  
  column_ref IN ANYELEMENT,  
  maxsize  IN INT default 1024  
)  
RETURN INTEGER;
```

**Table 10-308** DBE\_SQL.SET\_RESULT\_TYPE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
column_ref	ANY ELEMENT	IN	No	Variable of any type. You can select an appropriate API to dynamically define columns based on variable types.
maxsize	INT	IN	Yes	Length of the defined column return type.

- DBE\_SQL.SET\_RESULT\_TYPE\_CHAR

This function defines columns of the CHAR type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_CHAR function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
    context_id IN INT,
    pos      IN INT,
    column_ref IN TEXT,
    column_size IN INT
)
RETURN INTEGER;
```

**Table 10-309** DBE\_SQL.SET\_RESULT\_TYPE\_CHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
column_ref	TEXT	IN	No	Parameter to be defined.
column_size	INT	IN	No	Length of a dynamically defined column.

- DBE\_SQL.SET\_RESULT\_TYPE\_INT

This function defines columns of the INT type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_INT function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(
    context_id IN INT,
    pos      IN INT
)
RETURN INTEGER;
```

**Table 10-310** DBE\_SQL.SET\_RESULT\_TYPE\_INT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

- DBE\_SQL.SET\_RESULT\_TYPE\_LONG

This function defines columns of a long column type (not LONG) returned from a given cursor and can be used only for the cursors defined by **SELECT**.

The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(
    context_id IN INT,
    pos      IN INT
)
RETURN INTEGER;
```

**Table 10-311** DBE\_SQL.SET\_RESULT\_TYPE\_LONG parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

- **DBE\_SQL.SET\_RESULT\_TYPE\_RAW**

This function defines columns of the RAW type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(
    context_id IN INT,
    pos      IN INT,
    column_ref IN BYTEA,
    column_size IN INT
)
RETURN INTEGER;
```

**Table 10-312** DBE\_SQL.SET\_RESULT\_TYPE\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	BYTEA	IN	No	RAW variable.
column_size	INT	IN	No	Column length.

- **DBE\_SQL.SET\_RESULT\_TYPE\_TEXT**

This function defines columns of the TEXT type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_TEXT function is as follows:

```
DBE_SQL.DEFINE_COLUMN_CHAR(
    context_id IN INT,
    pos      IN INT,
    maxsize  IN INT
)
RETURN INTEGER;
```

**Table 10-313** DBE\_SQL.SET\_RESULT\_TYPE\_TEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	IN	IN	No	ID of the cursor to be executed.
pos	IN	IN	No	Position of a dynamically defined column in the query.
maxsize	IN	IN	No	Maximum length of the defined TEXT type

- **DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN**  
This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_UNKNOWN(  
  context_id IN INT,  
  pos      IN INT,  
  col_type IN TEXT  
)  
RETURN INTEGER;
```

**Table 10-314** DBE\_SQL.SET\_RESULT\_TYPE\_UNKNOWN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	IN T	IN	No	ID of the cursor to be executed.
pos	IN T	IN	No	Position of a dynamically defined column in the query.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
col_type	TEXT	IN	No	Dynamically defined parameter.

- DBE\_SQL.GET\_RESULT

This stored procedure returns the cursor element value in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT stored procedure is as follows:

```
DBE_SQL.GET_RESULT(
  context_id IN INT,
  pos       IN INT,
  column_value INOUT ANYELEMENT
);
```

**Table 10-315** DBE\_SQL.GET\_RESULT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.
column_value	ANYELEMENT	INOUT	No	Return value of a defined column

- DBE\_SQL.GET\_RESULT\_CHAR

This stored procedure returns the value of the CHAR type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
  context_id IN INT,
  pos       IN INT,
  tr        INOUT CHAR,
  err       INOUT NUMERIC DEFAULT 0,
  actual_length INOUT INT DEFAULT 1024
);
```

**Table 10-316** DBE\_SQL.GET\_RESULT\_CHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.
tr	CHAR	INOUT	No	Return value.
err	NUMERIC	INOUT	Yes	Error No. It is an output parameter. The input parameter must be a variable. The default value is <b>0</b> . Currently, the output value is <b>-1</b> regardless of the input parameter.
actual_length	INT	INOUT	Yes	Length of a return value. The default value is <b>1024</b> .

- **DBE\_SQL.GET\_RESULT\_INT**

This function returns the value of the INT type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW. The prototype of the DBE\_SQL.GET\_RESULT\_INT function is as follows:

```
DBE_SQL.GET_RESULT_INT(
  context_id IN INT,
  pos       IN INT
)
RETURN INTEGER;
```

**Table 10-317** DBE\_SQL.GET\_RESULT\_INT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

- DBE\_SQL.GET\_RESULT\_LONG

This stored procedure returns the value of a long column type (not LONG or BIGINT) in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_LONG stored procedure is as follows:

```
DBE_SQL.GET_RESULT_LONG(
  context_id IN INT,
  pos      IN INT,
  lgth    IN INT,
  off_set IN INT,
  vl      INOUT TEXT,
  vl_length INOUT INT
);
```

**Table 10-318** DBE\_SQL.GET\_RESULT\_LONG parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lgth	INT	IN	No	Length of a return value
off_set	INT	IN	No	Start position of a return value.
vl	TEXT	OUTPUT	No	Return value.
vl_length	INT	OUTPUT	No	Length of a return value.

- DBE\_SQL.GET\_RESULT\_RAW

This stored procedure returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
  context_id IN INT,
  pos       IN INT,
  tr        INOUT BYTEA,
  err       INOUT NUMERIC DEFAULT 0,
  actual_length INOUT INT DEFAULT 1024
);
```

**Table 10-319** DBE\_SQL.GET\_RESULT\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.
tr	BYTEA	INPUT	No	Returned column value.
err	NUMERIC	INPUT	No	Error number. It is an output parameter. The input parameter must be a variable. The default value is <b>0</b> . Currently, the output value is <b>-1</b> regardless of the input parameter.
actual_length	INT	INPUT	No	Length of a return value. The value longer than this length will be truncated. The default value is <b>1024</b> .

- DBE\_SQL.GET\_RESULT\_TEXT

This function returns the value of the TEXT type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULT\_TEXT function is as follows:

```
DBE_SQL.GET_RESULT_TEXT(
  context_id IN INT,
  pos      IN INT
)
RETURN TEXT;
```

**Table 10-320** DBE\_SQL.GET\_RESULT\_TEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

- **DBE\_SQL.GET\_RESULT\_UNKNOWN**

This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling API when the type is not unknown.

The prototype of the DBE\_SQL.GET\_RESULT\_UNKNOWN function is as follows:

```
DBE_SQL.GET_RESULT_UNKNOWN(
  context_id IN INT,
  pos      IN INT,
  col_type IN TEXT
)
RETURN INTEGER;
```

**Table 10-321** DBE\_SQL.GET\_RESULT\_UNKNOWN parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.
col_type	TEXT	IN	No	Returned parameter type.

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR**  
 This function returns the value of the CHAR type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW. Different from DBE\_SQL.GET\_RESULT\_CHAR, the length of the return value is not set and the entire string is returned.

The prototype of the DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
    context_id IN INT,
    pos       IN INT
)
RETURN CHARACTER;
```

**Table 10-322** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_CHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG**  
 This function returns the value of a long column type (not LONG or BIGINT) in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

Different from DBE\_SQL.GET\_RESULT\_LONG, the length of the return value is not set and the entire BIGINT value is returned.

The prototype of the DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
    context_id IN INT,
    pos       IN INT
)
RETURN BIGINT;
```

**Table 10-323** DBE\_SQL.DBE\_SQL\_GET\_RESULT\_LONG parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

- DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW

This function returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

Different from DBE\_SQL.GET\_RESULT\_RAW, the length of the return value is not set and the entire string is returned.

The prototype of the DBE\_SQL.DBE\_SQL\_GET\_RESULT\_RAW function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_RAW(
  context_id IN INT,
  pos       IN INT
)
RETURN RAW;
```

**Table 10-324** DBE\_SQL.GET\_RESULT\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

- **DBE\_SQL.IS\_ACTIVE**  
This function returns the status of a cursor. When a cursor is opened, parsed, executed, or defined, the value is **TRUE**. When a cursor is closed, the value is **FALSE**. If the status is unknown, an error is reported. In other cases, the cursor is closed by default.

The prototype of the DBE\_SQL.IS\_ACTIVE function is as follows:

```
DBE_SQL.IS_ACTIVE(  
    context_id IN INT  
)  
RETURN BOOLEAN;
```

**Table 10-325** DBE\_SQL.IS\_ACTIVE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.

- **DBE\_SQL.LAST\_ROW\_COUNT**  
Returns the accumulated count of data rows obtained after the latest NEXT\_ROW execution.

The prototype of the DBE\_SQL.LAST\_ROW\_COUNT function is as follows:

```
DBE_SQL.LAST_ROW_COUNT(  
)  
RETURN INTEGER;
```

- **DBE\_SQL.RUN\_AND\_NEXT**  
Equivalent to calling SQL\_RUN and NEXT\_ROW in sequence.

The prototype of the DBE\_SQL.RUN\_AND\_NEXT function is as follows:

```
DBE_SQL.RUN_AND_NEXT(  
    context_id IN INT  
)  
RETURNS INTEGER;
```

**Table 10-326** DBE\_SQL.RUN\_AND\_NEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor whose query statement is to be parsed

- **DBE\_SQL.SQL\_BIND\_VARIABLE**

This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

The prototype of the DBE\_SQL.SQL\_BIND\_VARIABLE function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
  context_id   IN int,
  query_string IN text,
  language_flag IN anyelement,
  out_value_size IN int default null
)
RETURNS void;
```

**Table 10-327** DBE\_SQL.SQL\_BIND\_VARIABLE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
query_string	TEXT	IN	No	Name of the bound variable

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
language_flag	ANYELEMENT	IN	No	Bound value
out_value_size	INT	IN	Yes	Size of the return value. Default value: <b>NULL</b> .

- DBE\_SQL.SQL\_BIND\_ARRAY

This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

The prototype of the **DBE\_SQL.SQL\_BIND\_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
    context_id IN int,
    query_string IN text,
    value IN anyarray
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
    context_id IN int,
    query_string IN text,
    value IN anyarray,
    lower_index IN int,
    higher_index IN int
)
RETURNS void;
```

**Table 10-328** DBE\_SQL.SQL\_BIND\_ARRAY parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
query_string	TEXT	IN	No	Name of the bound variable.
value	ANY ARRAY	IN	No	Bound array.
lower_index	INT	IN	No	Minimum index of the bound array.
higher_index	INT	IN	No	Maximum index of the bound array.

- DBE\_SQL.SET\_RESULT\_TYPE\_INTS

This function defines columns of the INT array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_INTS function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INTS(
    context_id IN int,
    pos      IN int,
    column_ref IN anyarray,
    cnt      IN int,
    lower_bnd IN int
)
RETURNS integer;
```

**Table 10-329** DBE\_SQL.SET\_RESULT\_TYPE\_INTS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANYARRAY	IN	No	Type of the returned array.
cnt	INT	IN	No	Number of values obtained at a time.
lower_bnd	INT	IN	No	Start index when an array is returned.

- **DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS**

This function defines columns of the TEXT array type returned from a given cursor and can be used only for the cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_TEXTS(
  context_id IN int,
  pos      IN int,
  column_ref IN anyarray,
  cnt      IN int,
  lower_bnd IN int,
  maxsize  IN int
)
RETURNS VOID;
```

**Table 10-330** DBE\_SQL.SET\_RESULT\_TYPE\_TEXTS parameters

Parameter	Type	In pu t/ Ou tp ut Pa ra m e t e r	Ca n Be Em p ty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANY ARR AY	IN	No	Type of the returned array.
cnt	INT	IN	No	Number of values obtained at a time.
lower_bnd	INT	IN	No	Start index when an array is returned.
maxsize	INT	IN	No	Maximum length of the defined TEXT type.

- **DBE\_SQL.SET\_RESULT\_TYPE\_RAWS**

This function defines columns of the RAW array type returned from a given cursor and can be used only for the cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the DBE\_SQL.SET\_RESULT\_TYPE\_RAWS function is as follows:

```
DBE_SQL.set_result_type_raws(
  context_id IN int,
  pos      IN int,
  column_ref IN anyarray,
  cnt      IN int,
  lower_bnd IN int,
  column_size IN int
)
RETURNS integer;
```

**Table 10-331** DBE\_SQL.SET\_RESULT\_TYPE\_RAWS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANY ARRAY	IN	No	Type of the returned array.
cnt	INT	IN	No	Number of values obtained at a time.
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length.

- **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS**

This function defines columns of the BYTEA array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
  context_id IN int,
  pos      IN int,
  column_ref IN anyarray,
  cnt      IN int,
  lower_bnd IN int,
  column_size IN int
)
RETURNS integer;
```

**Table 10-332** DBE\_SQL.SET\_RESULT\_TYPE\_BYTEAS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANY ARRAY	IN	No	Type of the returned array.
cnt	INT	IN	No	Number of values obtained at a time.
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length.

- **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS**

This function defines columns of the CHAR array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULT\_TYPE\_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
  context_id IN int,
  pos      IN int,
  column_ref IN anyarray,
  cnt      IN int,
  lower_bnd IN int,
  column_size IN int
)
RETURNS integer;
```

**Table 10-333** DBE\_SQL.SET\_RESULT\_TYPE\_CHARS parameters

Parameter	Type	In pu t/ Ou tp ut Pa ra m e t e r	Ca n Be Em pty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANY ARRA Y	IN	No	Type of the returned array.
cnt	INT	IN	No	Number of values obtained at a time.
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length.

- **DBE\_SQL.SET\_RESULTS\_TYPE**

This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE\_SQL.SET\_RESULTS\_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
  context_id IN int,
  pos      IN int,
  column_ref IN anyarray,
  cnt      IN int,
  lower_bnd IN int,
  maxsize  IN int DEFAULT 1024
) returns void;
```

**Table 10-334** DBE\_SQL.SET\_RESULTS\_TYPE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANYARRAY	IN	No	Type of the returned array.
cnt	INT	IN	No	Number of values obtained at a time.
lower_bnd	INT	IN	No	Start index when an array is returned.
maxsize	INT	IN	Yes	Maximum length of the defined type

- DBE\_SQL.GET\_RESULTS\_INT

This stored procedure returns the value of the INT array type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULTS\_INT stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_INT(
  context_id IN int,
  pos      IN int,
  column_value INOUT anyarray
);
```

**Table 10-335** DBE\_SQL.GET\_RESULTS\_INT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANYARRAY	INOUT	No	Return value.

- DBE\_SQL.GET\_RESULTS\_TEXT

This stored procedure returns the value of the TEXT array type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULTS\_TEXT stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_TEXT(
  context_id IN int,
  pos IN int,
  column_value INOUT anyarray
);
```

**Table 10-336** DBE\_SQL.GET\_RESULTS\_TEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANYARRAY	INOUT	No	Return value.

- DBE\_SQL.GET\_RESULTS\_RAW

This stored procedure returns the value of the RAW array type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULTS\_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_RAW(
  context_id IN int,
  pos      IN int,
  column_value INOUT anyarray
);
```

**Table 10-337** DBE\_SQL.GET\_RESULTS\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANY ARRAY	IN OUT	No	Return value.

- DBE\_SQL.GET\_RESULTS\_BYTEA

This stored procedure returns the value of the BYTEA array type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

The prototype of the DBE\_SQL.GET\_RESULTS\_BYTEA stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
  context_id IN int,
  pos      IN int,
  column_value INOUT anyarray
);
```

**Table 10-338** DBE\_SQL.GET\_RESULTS\_BYTEA parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_value	ANY ARRAY	IN OUT	No	Return value.

- DBE\_SQL.GET\_RESULTS\_CHAR

This stored procedure returns the value of the CHAR array type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW. The prototype of the DBE\_SQL.GET\_RESULTS\_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
  context_id IN int,
  pos IN int,
  column_value INOUT anyarray
);
```

**Table 10-339** DBE\_SQL.GET\_RESULTS\_CHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
column_value	ANY ARRAY	INPUT	No	Return value.

- DBE\_SQL.GET\_RESULTS

This stored procedure returns the value of the array type in a specified position of a cursor and accesses the data obtained by DBE\_SQL.NEXT\_ROW.

 **NOTE**

The bottom-layer mechanism of DBE\_SQL.GET\_RESULTS is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of the Oracle database.

The prototype of the DBE\_SQL.GET\_RESULTS stored procedure is as follows:

```
DBE_SQL.GET_RESULTS(
  context_id IN int,
  pos      IN int,
  column_value INOUT anyarray
);
```

**Table 10-340** DBE\_SQL.GET\_RESULTS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
column_value	ANY ARRAY	IN OUT	No	Return value.

- DBE\_SQL.SQL\_DESCRIBE\_COLUMNS

This function is used to describe column information and can be used only for cursors defined by **SELECT**.

The prototype of the DBE\_SQL.SQL\_DESCRIBE\_COLUMNS function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
    context_id IN int,
    col_cnt INOUT int,
    desc_t INOUT dbe_sql.desc_tab
)RETURNS record;
```

**Table 10-341** DBE\_SQL.SQL\_DESCRIBE\_COLUMNS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
col_cnt	INT	IN OUT	No	Number of columns returned.
desc_t	DBE_SQL.DESCR_TAB	IN OUT	No	Description of the returned column.

- DBE\_SQL.DESCRIBE\_COLUMNS

This stored procedure describes column information and can be used only for cursors defined by SELECT. This API is developed for compatibility purposes.

The prototype of the DBE\_SQL.DESCRIBE\_COLUMNS stored procedure is as follows:

```
DBE_SQL.DESCRIBE_COLUMNS(
  context_id IN int,
  col_cnt OUT int,
  desc_t OUT dbe_sql.desc_tab
)
```

**Table 10-342** DBE\_SQL.DESCRIBE\_COLUMNS parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
col_cnt	INT	OUT	No	Number of columns returned.
desc_t	DBE_SQL.DESCRIBE_COLUMNS	OUT	No	Description of the returned column.

- DBE\_SQL.BIND\_VARIABLE

This function is used to bind parameters. You are advised to use **DBE\_SQL.SQL\_BIND\_VARIABLE**.

- DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C

This function is used to dynamically define a column of the array type. You are advised not to use it.

The prototype of the DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C function is as follows:

```
DBE_SQL.sql_set_results_type_c(
  context_id IN int,
  pos IN int,
  column_ref IN anyarray,
  cnt IN int,
  lower_bnd IN int,
  col_type IN anyelement,
  maxsize IN int
) return integer;
```

**Table 10-343** DBE\_SQL.SQL\_SET\_RESULTS\_TYPE\_C parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANY ARRAY	IN	No	Type of the returned array.
cnt	INT	IN	No	Number of values obtained at a time.
lower_bnd	INT	IN	No	Start index when an array is returned.
col_type	ANY ELEMENT	IN	No	Variable type corresponding to the returned array type.
maxsize	INT	IN	No	Maximum length of the defined type.

- DBE\_SQL.SQL\_GET\_VALUES\_C

This function is used to read a dynamically defined column value. You are advised not to use it.

The prototype of the DBE\_SQL.SQL\_GET\_VALUES\_C function is as follows:

```
DBE_SQL.sql_get_values_c(
    context_id IN int,
    pos IN int,
    results_type INOUT anyarray,
    result_type IN anyelement
) return anyarray;
```

**Table 10-344** DBE\_SQL.SQL\_GET\_VALUES\_C parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Parameter position
results_type	ANY ARRAY	IN OUT	No	Obtained result.
result_type	ANY ELEMENT	IN	No	Type of the obtained result.

- **DBE\_SQL.GET\_VARIABLE\_RESULT**

This stored procedure returns the value of the bound OUT parameter and obtains the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_VARIABLE\_RESULT stored procedure is as follows:

```
DBE_SQL.get_variable_result(
  context_id IN int,
  pos      IN VARCHAR2,
  column_value INOUT anyelement
);
```

**Table 10-345** DBE\_SQL.GET\_VARIABLE\_RESULT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
pos	VARCHAR2	IN	No	Name of the bound parameter.
column_value	ANYELEMENT	OUTPUT	No	Return value.

- DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR

This function is used to return the value of the bound OUT parameter of the CHAR type and obtain the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR function is as follows:

```
DBE_SQL.get_variable_result_char(
    context_id IN int,
    pos      IN VARCHAR2
)
RETURNS char
```

**Table 10-346** DBE\_SQL.GET\_VARIABLE\_RESULT\_CHAR parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	VARCHAR2	IN	No	Name of the bound parameter.

- DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW

This stored procedure returns the value of the bound OUT parameter of the RAW type and obtains the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW stored procedure is as follows:

```
DBE_SQL.get_variable_result_raw(
  context_id IN int,
  pos      IN VARCHAR2,
  value    INOUT anyelement
);
```

**Table 10-347** DBE\_SQL.GET\_VARIABLE\_RESULT\_RAW parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	VARCHAR2	IN	No	Name of the bound parameter.
value	ANYELEMENT	INOUT	No	Return value.

- DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT

This function is used to return the value of the bound OUT parameter of the TEXT type and obtain the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
  context_id IN int,
  pos      IN VARCHAR2
)
RETURNS text
```

**Table 10-348** DBE\_SQL.GET\_VARIABLE\_RESULT\_TEXT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	VARCHAR2	IN	No	Name of the bound parameter.

- **DBE\_SQL.GET\_VARIABLE\_RESULT\_INT**

This stored procedure returns the value of the bound OUT parameter of the INT type and obtains the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_VARIABLE\_RESULT\_INT stored procedure is as follows:

```
DBE_SQL.get_variable_result_int(
    context_id IN int,
    pos      IN VARCHAR2,
    value    INOUT anyelement
);
```

**Table 10-349** DBE\_SQL.GET\_VARIABLE\_RESULT\_INT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	VARCHAR2	IN	No	Name of the bound parameter.
value	ANYELEMENT	INOUT	No	Return value.

- DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT

This stored procedure returns the value of the bound OUT parameter of the TEXT array type and obtains the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT stored procedure is as follows:

```
DBE_SQL.get_array_result_text(
    context_id IN int,
    pos      IN VARCHAR2,
    column_value INOUT anyarray
);
```

**Table 10-350** DBE\_SQL.GET\_ARRAY\_RESULT\_TEXT parameters

Parameter	Type	In pu t/ Ou tp ut Pa ra m e t e r	Ca n Be Em p t y	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	VARC HAR2	IN	No	Name of the bound parameter.
column_val ue	ANYA RRAY	IN O UT	No	Return value.

- DBE\_SQL.GET\_ARRAY\_RESULT\_RAW

This stored procedure returns the value of the bound OUT parameter of the RAW array type and obtains the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_ARRAY\_RESULT\_RAW stored procedure is as follows:

```
DBE_SQL.get_array_result_raw(
    context_id IN int,
    pos      IN VARCHAR2,
    column_value INOUT anyarray
);
```

**Table 10-351** DBE\_SQL.GET\_ARRAY\_RESULT\_RAW parameters

Parameter	Type	In pu t/ Ou tp ut Pa ra m e t e r	Ca n Be Em p t y	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	VAR CHA R2	IN	No	Name of the bound parameter.
column_val ue	ANY ARR AY	IN O UT	No	Return value.

- DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR

This stored procedure returns the value of the bound OUT parameter of the CHAR array type and obtains the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR stored procedure is as follows:

```
DBE_SQL.get_array_result_char(
  context_id IN int,
  pos      IN VARCHAR2,
  column_value INOUT anyarray
);
```

**Table 10-352** DBE\_SQL.GET\_ARRAY\_RESULT\_CHAR parameters

Parameter	Type	In pu t/ Ou tp ut Pa ra m e t e r	Ca n Be Em p t y	Description
context_id	INT	IN	No	ID of the cursor to be queried.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
pos	VARCHAR2	IN	No	Name of the bound parameter.
column_value	ANYARRAY	INOUT	No	Return value.

- DBE\_SQL.GET\_ARRAY\_RESULT\_INT

This stored procedure returns the value of the bound OUT parameter of the INT array type and obtains the OUT parameter in a stored procedure.

The prototype of the DBE\_SQL.GET\_ARRAY\_RESULT\_INT stored procedure is as follows:

```
DBE_SQL.get_array_result_int(
  context_id IN int,
  pos      IN VARCHAR2,
  column_value INOUT anyarray
);
```

**Table 10-353** DBE\_SQL.GET\_ARRAY\_RESULT\_INT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	VARCHAR2	IN	No	Name of the bound parameter.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
column_value	ARRAY	INPUT	No	Return value.

## Examples

```

-- Example 1
-- Create a table and insert data into the table.
CREATE TABLE test_desc_cols(
  id NUMBER,
  name VARCHAR2(50)
);
INSERT INTO test_desc_cols(id, name) VALUES (1, 'xiaoming');
INSERT INTO test_desc_cols(id, name) VALUES (2, 'xiaohong');
INSERT INTO test_desc_cols(id, name) VALUES (3, 'xiaolan');

DECLARE
context_id INTEGER;
col_cnt INTEGER;
v_id int;
v_name varchar2;
execute_ret INTEGER;
BEGIN
-- Open a cursor.
context_id := DBE_SQL.REGISTER_CONTEXT();
-- Compile the cursor.
DBE_SQL.SQL_SET_SQL(context_id, 'SELECT * FROM test_desc_cols', 2);
-- Set the return value type of a column.
DBE_SQL.SET_RESULT_TYPE(context_id, 1, v_id);
DBE_SQL.SET_RESULT_TYPE(context_id, 2, v_name);
execute_ret := DBE_SQL.SQL_RUN(context_id);
loop
exit when (DBE_SQL.NEXT_ROW(context_id) <= 0);
-- Obtain values.
DBE_SQL.GET_RESULT(context_id, 1, v_id);
DBE_SQL.GET_RESULT(context_id, 2, v_name);
-- Output the result.
dbe_output.print_line('id: || v_id || ' name: ' || v_name);
end loop;
DBE_SQL.SQL_UNREGISTER_CONTEXT(context_id);
END;
/
-- Expected result:
id:1 name:xiaoming
id:2 name:xiaohong
id:3 name:xiaolan
ANONYMOUS BLOCK EXECUTE

-- Clean the environment.
drop table if exists test_desc_cols;

### 10.11.2.15 DBE\_TASK

#### API Description

[Table 10-354](#) lists all APIs supported by the DBE\_TASK package.

**Table 10-354** DBE\_TASK

API	Description
<a href="#">DBE_TASK.SUBMIT</a>	Commits a scheduled job. The job ID is automatically generated by the system.
<a href="#">DBE_TASK.JOB_SUBMIT</a>	Same as <a href="#">DBE_TASK.SUBMIT</a> . However, It provides syntax compatibility parameters.
<a href="#">DBE_TASK.ID_SUBMIT</a>	Commits a scheduled job. The job ID is specified by the user.
<a href="#">DBE_TASK.CANCEL</a>	Removes a scheduled task by job ID.
<a href="#">DBE_TASK.RUN</a>	Executes a scheduled task.
<a href="#">DBE_TASK.FINISH</a>	Disables or enables scheduled task execution.
<a href="#">DBE_TASK.UPDATE</a>	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
<a href="#">DBE_TASK.CHANGE</a>	Same as <a href="#">DBE_TASK.UPDATE</a> . However, It provides syntax compatibility parameters.

API	Description
<a href="#">DBE_TASK.CONTENT</a>	Modifies the content attribute of a scheduled task.
<a href="#">DBE_TASK.NEXT_TIME</a>	Modifies the next-execution time attribute of a scheduled task.
<a href="#">DBE_TASK.INTERVAL</a>	Modifies the execution interval attribute of a scheduled task.

 **NOTE**

DBE\_TASK scheduling in distributed mode does not ensure high reliability of task execution status information. The execution status of task scheduling can be queried only on the node where the task is committed. The information queried on other nodes may not be synchronized.

GaussDB provides a highly available, reliable, and flexible scheduling system using the DBE\_SCHEDULER API (recommended in distributed mode).

- [DBE\\_TASK.SUBMIT](#)

The stored procedure **SUBMIT** commits a scheduled job provided by the system.

The prototype of the DBE\_TASK.SUBMIT function is as follows:

```
DBE_TASK.SUBMIT(
  what      IN TEXT,
  next_time IN TIMESTAMP DEFAULT sysdate,
  interval_time IN TEXT DEFAULT 'null',
  id        OUT INTEGER
)RETURN INTEGER;
```

 **NOTE**

When a scheduled task is created (using DBE\_TASK), the system binds the current database and the username to the task by default. The function can be called using CALL or SELECT. If the function is called using CALL, you do not need to set the output parameter. If the function is called using SELECT, you need to set the output parameter. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current\_schema = xxx** before the SQL statement.

**Table 10-355** Parameters for DBE\_TASK.SUBMIT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
what	Text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
next_time	Timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is committed.
interval_time	Text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
id	Integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.

**NOTICE**

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are advised not to do so. Tasks created using this API may not be highly available. You are advised to use [PKG\\_SERVICE.SUBMIT\\_ON\\_N....](#) to create a task and specify the CCN as the job execution node.

**Example:**

```
gaussdb=# select DBE_TASK.SUBMIT('call pro_xxx()','; to_date('20180101','yyyymmdd'),'sysdate+1');
submit
-----
 31031
(1 row)

gaussdb=# select DBE_TASK.SUBMIT('call pro_xxx()','; to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');
submit
-----
   512
(1 row)

gaussdb=# DECLARE
gaussdb-#   jobid int;
gaussdb-# BEGIN
gaussdb$$   PERFORM DBE_TASK.SUBMIT('call pro_xxx()','; sysdate, 'interval "5 minute"', jobid);
gaussdb$$# END;
gaussdb$$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE\_TASK.JOB\_SUBMIT

The stored procedure **SUBMIT** commits a scheduled job provided by the system. In addition, it provides additional compatibility parameters.

The DBE\_TASK.JOB\_SUBMIT function prototype is as follows:

```
DBE_TASK.JOB_SUBMIT(
job      OUT INTEGER,
what     IN TEXT,
next_date IN TIMESTAMP DEFAULT sysdate,
job_interval IN TEXT DEFAULT 'null',
no_parse IN BOOLEAN DEFAULT false,
instance IN INTEGER DEFAULT 0,
force    IN BOOLEAN DEFAULT false
)RETURN INTEGER;
```

**Table 10-356** Parameters for DBE\_TASK.JOB\_SUBMIT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	Integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When <b>db.job_submit</b> is called using SELECT, this parameter can be omitted.
what	Text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.
next_date	Timestamp	IN	Yes	Specifies the next time the job will be executed. The default value is the current system time ( <b>sysdate</b> ). If the specified time has past, the job is executed at the time it is committed.
job_interval	Text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or <b>sysdate</b> followed by a numeric value, for example, <b>sysdate+1.0/24</b> . If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
no_parse	Boolean	IN	Yes	The default value is <b>false</b> , which is used only for syntax compatibility.
instance	Integer	IN	Yes	The default value is <b>0</b> , which is used only for syntax compatibility.
force	Boolean	IN	Yes	The default value is <b>false</b> , which is used only for syntax compatibility.

Example:

```
gaussdb=# DECLARE
gaussdb=#   id integer;
gaussdb=# BEGIN
gaussdb$$$   id = DBE_TASK.JOB_SUBMIT(
gaussdb$$$     what => 'insert into t1 values (1, 2)',
gaussdb$$$     job_interval => 'sysdate + 1' --daily
gaussdb$$$   );
gaussdb$$$ END;
gaussdb$$$ /
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_TASK.ID\_SUBMIT**

**ID\_SUBMIT** has the same syntax function as **SUBMIT**, but the first parameter of **ID\_SUBMIT** is an input parameter, that is, a specified job ID. In contrast, that last parameter of **ID\_SUBMIT** is an output parameter, indicating the job ID automatically generated by the system.

```
DBE_TASK.ID_SUBMIT(
id          IN  BIGINT,
what       IN  TEXT,
next_time  IN  TIMESTAMP DEFAULT sysdate,
interval_time IN TEXT DEFAULT 'null');
```

Example:

```
gaussdb=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
id_submit
-----
(1 row)
```

- **DBE\_TASK.CANCEL**

The stored procedure **CANCEL** deletes a specified task.

The function prototype of **DBE\_TASK.CANCEL** is as follows:

```
CANCEL(id IN INTEGER);
```

**Table 10-357** Parameters for DBE\_TASK.CANCEL

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.

Example:

```
gaussdb=# CALL dbe_task.cancel(101);
cancel
-----
(1 row)
```

- **DBE\_TASK.RUN**

The stored procedure runs a scheduled task.

The prototype of the **DBE\_TASK.RUN** function is as follows:

```
DBE_TASK.RUN(
job      IN  BIGINT,
force    IN  BOOLEAN DEFAULT FALSE);
```

**Table 10-358** Parameters for DBE\_TASK.RUN

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	bigint	IN	No	Specifies the job ID.
force	Boolean	IN	Yes	Used only for syntax compatibility.

Example:

```
gaussdb=# BEGIN
gaussdb$#  DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
gaussdb$#  DBE_TASK.RUN(12345);
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_TASK.FINISH**

The stored procedure **FINISH** disables or enables a scheduled task.

The function prototype of **DBE\_TASK.FINISH** is as follows:

```
DBE_TASK.FINISH(
id      IN  INTEGER,
broken  IN  BOOLEAN,
next_time IN  TIMESTAMP DEFAULT sysdate);
```

**Table 10-359** Parameters for DBE\_TASK.FINISH

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, <b>true</b> for broken and <b>false</b> for not broken. The current job is updated based on the parameter value <b>true</b> or <b>false</b> . If the parameter is left empty, the job status remains unchanged.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
next_time	Timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If <b>broken</b> is set to <b>true</b> , <b>next_time</b> is updated to '4000-1-1'. If <b>broken</b> is set to <b>false</b> and <b>next_time</b> is not empty, <b>next_time</b> is updated for the job. If <b>next_time</b> is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

Example:

```
gaussdb=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
id_submit
```

-----  
(1 row)

```
gaussdb=# CALL dbe_task.finish(101, true);
finish
```

-----  
(1 row)

```
gaussdb=# CALL dbe_task.finish(101, false, sysdate);
finish
```

-----  
(1 row)

- **DBE\_TASK.UPDATE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The DBE\_TASK.UPDATE function prototype is as follows:

```
dbe_task.UPDATE(
id          IN  INTEGER,
content     IN  TEXT,
next_time   IN  TIMESTAMP,
interval_time IN TEXT);
```

**Table 10-360** Parameters for DBE\_TASK.UPDATE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
content	Text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>content</b> parameter for the specified job. Otherwise, the system updates the <b>content</b> parameter for the specified job.
next_time	Timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_time</b> parameter for the specified job.
interval_time	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>interval_time</b> parameter for the specified job. Otherwise, the system updates the <b>interval_time</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job state will change to 'd' afterward.

Example:

```
gaussdb=# CALL dbe_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
update
```

-----

(1 row)

```
gaussdb=# CALL dbe_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate + 1.0/1440');
update
```

-----

(1 row)

- **DBE\_TASK.CHANGE**

The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

The prototype of the **DBE\_TASK.CHANGE** function is as follows:

```
DBE_TASK.CHANGE(
job          IN  INTEGER,
```

```

what      IN TEXT      DEFAULT NULL,
next_date IN TIMESTAMP DEFAULT NULL,
job_interval IN TEXT  DEFAULT NULL,
instance  IN INTEGER  DEFAULT NULL,
force     IN BOOLEAN  DEFAULT false);
    
```

**Table 10-361** Parameters for DBE\_TASK.CHANGE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	Integer	IN	No	Specifies the job ID.
what	Text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the <b>what</b> parameter for the specified job. Otherwise, the system updates the <b>what</b> parameter for the specified job.
next_date	Timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the <b>next_time</b> parameter for the specified job. Otherwise, the system updates the <b>next_date</b> parameter for the specified job.
job_interval	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the <b>job_interval</b> parameter for the specified job. Otherwise, the system updates the <b>job_interval</b> parameter for the specified job after necessary validity check. If this parameter is set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward.
instance	Integer	IN	Yes	Used only for syntax compatibility.
force	Boolean	IN	No	Used only for syntax compatibility.

Example:

```

gaussdb=# BEGIN
gaussdb$# DBE_TASK.CHANGE(
    
```

```
gaussdb$#      job => 101,
gaussdb$#      what => 'insert into t2 values (2);'
gaussdb$#    );
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_TASK.CONTENT**

The stored procedure **CONTENT** modifies the procedures to be executed by a specified task.

The function prototype of **DBE\_TASK.CONTENT** is as follows:

```
DBE_TASK.CONTENT(
id      IN  INTEGER,
content IN  TEXT);
```

**Table 10-362** Parameters for DBE\_TASK.CONTENT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
content	Text	IN	No	Specifies the name of the stored procedure, SQL statement block, or program block that is executed.

 **NOTE**

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as **INSERT** and **UPDATE**, a schema name must be added in front of the table name.

Example:

```
gaussdb=# CALL dbe_task.content(101, 'call userproc();');
content
-----
(1 row)

gaussdb=# CALL dbe_task.content(101, 'insert into tbl_a values(sysdate);');
content
-----
(1 row)
```

- **DBE\_TASK.NEXT\_TIME**

The stored procedure **NEXT\_TIME** modifies the next-execution time attribute of a task.

The function prototype of **DBE\_TASK.NEXT\_TIME** is as follows:

```
DBE_TASK.NEXT_TIME(
id      IN  BIGINT,
next_time IN TEXT);
```

**Table 10-363** Parameters for DBE\_TASK.NEXT\_TIME

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	bigint	IN	No	Specifies the job ID.
next_time	Text	IN	No	Specifies the next execution time.

 **NOTE**

If the specified **next\_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
gaussdb=# CALL dbe_task.next_time(101, sysdate);
next_time
-----
(1 row)
```

- **DBE\_TASK.INTERVAL**

The stored procedure **INTERVAL** modifies the execution interval attribute of a task.

The function prototype of **DBE\_TASK.INTERVAL** is as follows:

```
DBE_TASK.INTERVAL(
id          IN   INTEGER,
interval_time IN TEXT);
```

**Table 10-364** Parameters for DBE\_TASK.INTERVAL

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
interval_time	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to <b>null</b> , the job will be executed only once, and the job status will change to 'd' afterward. The job interval must be of a valid time type or interval type.

Example:

```
gaussdb=# CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
interval
-----
(1 row)

gaussdb=# CALL dbe_task.cancel(101);
cancel
-----
(1 row)
```

#### NOTE

For a job that is currently running (that is, **job\_status** is 'r'), it is not allowed to use **cancel**, **update**, **next\_time**, **content**, or **interval** to delete or modify job parameters.

## Constraints

1. After a job is created by using **SUMMIT/ID\_SUBMIT**, the job belongs to the current coordinator (that is, the job is scheduled and executed only on the current coordinator). Other coordinators do not schedule and execute the job. If the coordinator node is faulty, the job cannot be properly executed. You are advised to use the **PKG\_SERVICE.SUBMIT\_ON\_N...** API to specify the job execution node as CCN to ensure that the job is still available when a node is faulty. Not all coordinators can query, modify, and delete tasks created on other CNs.
2. You can create, update, and delete tasks only using the procedures provided by the **db\_task** package. These procedures synchronize task information between different CNs and associate primary keys between the **pg\_job** and **pg\_job\_proc** catalogs. If you use DML statements to add, delete, or modify records in the **pg\_job** catalog, task information will become inconsistent between CNs and system catalogs may fail to be associated, compromising internal task management.
3. Each task created by a user is bound to a CN. If the CN fails while a task is being executed, the task status cannot be updated in real time and will stay at 'r'. The task status will be updated to 's' only after the CN recovers. When a CN fails, all tasks on this CN cannot be scheduled or executed until the CN is restored manually, or deleted and then replaced.
4. For each task, the bound CN updates the real-time task information (including the task status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to the **pg\_job** catalog, and synchronizes the information to other CNs, ensuring consistent task information between different CNs. In the case of faults on other CNs, task information synchronization is reattempted by the bound CN, which increases job execution time. Although task information fails to be synchronized between CNs, task information can still be properly updated in **pg\_job** on the bound CN and the task can be executed successfully. After the faulty CN recovers, task information such as task execution time and status in its **pg\_job** catalog may be incorrect and will be updated only after the task is executed again on the bound CN.
5. For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

## 10.11.2.16 DBE\_UTILITY

### Interface Description

[Table 10-365](#) provides all interfaces supported by the **DBE\_UTILITY** package.

**Table 10-365** DBE\_UTILITY

Interface	Description
<a href="#">DBE_UTILITY.FORMAT_ERROR_BACKTRACE</a>	Outputs the call stack of an abnormal stored procedure.
<a href="#">DBE_UTILITY.FORMAT_ERROR_STACK</a>	Outputs detailed information about a stored procedure exception.
<a href="#">DBE_UTILITY.FORMAT_CALL_STACK</a>	Outputs the call stack of a stored procedure.
<a href="#">DBE_UTILITY.GET_TIME</a>	Outputs the current time, which is used to obtain the execution duration.
<a href="#">DBE_UTILITY.CANONICALIZE</a>	Canonicalizes the character string of a table name.
<a href="#">DBE_UTILITY.COMMA_TO_TABLE</a>	Converts a comma-delimited string of names into a PL/SQL table of names.
<a href="#">DBE_UTILITY.DB_VERSION</a>	Returns the version number and compatibility version number of the database.
<a href="#">DBE_UTILITY.EXEC_DDL_STATEMENT</a>	Executes DDL statements entered by users.
<a href="#">DBE_UTILITY.EXPAND_SQL_TEXT_PROC</a>	Expands the view of the SQL query.
<a href="#">DBE_UTILITY.GET_CPU_TIME</a>	Returns the measured value of the current CPU processing time.
<a href="#">DBE_UTILITY.GET_ENDIANNESS</a>	Obtains the big-endian and little-endian information of the byte order on the platform where the database is located.
<a href="#">DBE_UTILITY.GET_HASH_VALUE</a>	Returns the hash value of a given string.
<a href="#">DBE_UTILITY.GET_SQL_HASH</a>	Outputs the hash value of a given string. This stored procedure is used when <b>proc_outparam_override</b> is not enabled.
<a href="#">DBE_UTILITY.IS_BIT_SET</a>	Checks whether parameter <b>n</b> exists in <b>r</b> .
<a href="#">DBE_UTILITY.IS_CLUSTER_DATABASE</a>	Determines whether the current database is running in database cluster mode.

Interface	Description
<a href="#">DBE_UTILITY.NAME_RESOLVE</a>	Parses the given object name, including synonym translation and necessary authorization checks.
<a href="#">DBE_UTILITY.NAME_TOKENIZE</a>	Parses the name in the <b>a [ . b [ . c ] ] [ @ dblink ]</b> format.
<a href="#">DBE_UTILITY.OLD_CURRENT_SCHEMA</a>	Returns the name of the database schema in the current user environment.
<a href="#">DBE_UTILITY.OLD_CURRENT_USER</a>	Returns the name of the current user.
<a href="#">DBE_UTILITY.TABLE_TO_COMMA</a>	Converts a PL/SQL table of names into a comma-delimited string of names.
<a href="#">DBE_UTILITY.GET_SQL_HASH_FUNC</a>	Equivalent to DBE_UTILITY.GET_SQL_HASH. This function is used when <b>proc_outparam_override</b> is enabled.
DBE_UTILITY.EXPAND_SQL_TEXT	This is an internal function and is not recommended.
DBE_UTILITY.CANONICALIZE_RET	This is an internal function and is not recommended.
DBE_UTILITY.COMMA_TO_TABLE_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.COMPILE_SCHEMA	This is an internal function and is deprecated. You are advised not to use this function.
DBE_UTILITY.NAME_SEPARATE	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TO_KENIZE_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TO_KENIZE_LOWER	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TO_KENIZE_LOWER_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.PRIVILEGE_CHECK	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_CLASS_WITH_NSPOID_OBJECT_NAME_TYPE	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS_SYNONYM_FILL_SCHEMA	This is an internal function and is not recommended.

Interface	Description
DBE_UTILITY.SEARCH_PROCEDURE_WITH_NAMESPACE_OID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_SYNONYM_WITH_NAMESPACE_OID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.TABLE_TO_COMMA_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.USER_NAME	This is an internal function and is not recommended.

- DBE\_UTILITY.FORMAT\_ERROR\_BACKTRACE**

Returns the call stack where an error occurs during execution. The prototype of the DBE\_UTILITY.FORMAT\_ERROR\_BACKTRACE function is as follows:

```
DBE_UTILITY.FORMAT_ERROR_BACKTRACE()
RETURN TEXT;
```
- DBE\_UTILITY.FORMAT\_ERROR\_STACK**

Returns the detailed information about the error location when an error occurs during the execution. The prototype of the DBE\_UTILITY.FORMAT\_ERROR\_STACK function is as follows:

```
DBE_UTILITY.FORMAT_ERROR_STACK()
RETURN TEXT;
```
- DBE\_UTILITY.FORMAT\_CALL\_STACK**

Sets the call stack of the output function. The prototype of the DBE\_UTILITY.FORMAT\_CALL\_STACK function is as follows:

```
DBE_UTILITY.FORMAT_CALL_STACK()
RETURN TEXT;
```
- DBE\_UTILITY.GET\_TIME**

Sets the output time, which is usually used for difference. A separate return value is meaningless. The prototype of the DBE\_UTILITY.GET\_TIME function is as follows:

```
DBE_UTILITY.GET_TIME()
RETURN BIGINT;
```
- DBE\_UTILITY.CANONICALIZE**

Canonicalizes the character string of a table name. The procedure handles a single reserved word or keyword, and removes white spaces for a single identifier so that "table" becomes TABLE. The prototype of the DBE\_UTILITY.CANONICALIZE function is as follows:

```
DBE_UTILITY.CANONICALIZE(
  name      IN VARCHAR2,
  canon_name OUT VARCHAR2,
  canon_len IN BINARY_INTEGER DEFAULT 1024
);
```

**Table 10-366** DBEUTILITY.CANONICALIZE parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be canonicalized.
canon_name	VARCHAR2	OUT	Yes	Canonicalized character string.
canon_len	BINARY_INTEGER	IN	Yes	Length of the string to be canonicalized. The default value is <b>1024</b> (in bytes). If the value of this parameter is less than the actual length (in bytes) of the character string to be standardized, the character string is truncated by byte.

- DBEUTILITY.COMMA\_TO\_TABLE

Converts a comma-delimited string of names into a PL/SQL table of names. The prototype of the DBEUTILITY.COMMA\_TO\_TABLE function is as follows:

```
DBEUTILITY.COMMA_TO_TABLE (
  list IN VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab OUT VARCHAR2[]
);
```

**Table 10-367** DBEUTILITY.COMMA\_TO\_TABLE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
list	VARCHAR2	IN	No	A comma-delimited string of names.
tablen	BINARY_INTEGER	OUT	Yes	Number of names in the table.
tab	VARCHAR2	OUT	Yes	Table which contains the string of names.

- DBEUTILITY.DB\_VERSION

Returns the version number and compatibility version number of the database. The prototype of the DBE\_UTILITY.DB\_VERSION function is as follows:

```
DBE_UTILITY.DB_VERSION (
    version OUT VARCHAR2
);
```

**Table 10-368** DBE\_UTILITY.DB\_VERSION parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
version	VARCHAR2	OUT	No	Output parameter, which indicates the internal database software version. The value is a character string.

- DBE\_UTILITY.EXEC\_DDL\_STATEMENT

Executes DDL statements entered by users. The prototype of the DBE\_UTILITY.EXEC\_DDL\_STATEMENT function is as follows:

```
DBE_UTILITY.EXEC_DDL_STATEMENT (
    parse_string IN TEXT
);
```

**Table 10-369** DBE\_UTILITY.EXEC\_DDL\_STATEMENT parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
parse_string	TEXT	IN	Yes	DDL statements to be executed.

- DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC

Expands the view of the SQL query. It recursively expands the view objects in the view until a table is displayed. The function prototype of DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC is as follows:

```
DBE_UTILITY.EXPAND_SQL_TEXT_PROC (
    input_sql_text IN CLOB,
    output_sql_text OUT CLOB
);
```

**Table 10-370** DBE\_UTILITY.EXPAND\_SQL\_TEXT\_PROC parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
input_sql_text	CLOB	IN	No	Input SQL text.
output_sql_text	CLOB	OUT	No	Output SQL text of the expanded view.

 **NOTE**

In the **input\_sql\_text** parameter entered by a user, a schema prefix must be added to the object in the SQL statement. Otherwise, the function reports an error indicating that no object is found. If **behavior\_compat\_options** is set to **bind\_procedure\_searchpath**, you do not need to forcibly specify the schema prefix.

- **DBE\_UTILITY.GET\_CPU\_TIME**

Returns the measured value of the current CPU processing time, in hundredths of a second. The prototype of the DBE\_UTILITY.GET\_CPU\_TIME function is as follows:

```
DBE_UTILITY.GET_CPU_TIME()
RETURN BIGINT;
```

- **DBE\_UTILITY.GET\_ENDIANNES**

Obtains the big-endian and little-endian information of the byte order on the platform where the database is located. DBE\_UTILITY. The prototype of the GET\_ENDIANNES function is as follows:

```
DBE_UTILITY.GET_ENDIANNES
RETURN INTEGER;
```

- **DBE\_UTILITY.GET\_HASH\_VALUE**

Returns the hash value of a given string. The prototype of the DBE\_UTILITY.GET\_HASH\_VALUE function is as follows:

```
DBE_UTILITY.GET_HASH_VALUE(
  name   IN VARCHAR2(n),
  base   IN INTEGER,
  hash_size IN INTEGER)
RETURN INTEGER;
```

**Table 10-371** DBE\_UTILITY.GET\_HASH\_VALUE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
base	INTEGER	IN	No	Start value of the returned hash value.
hash_size	INTEGER	IN	No	Size of the hash table to which the hash is mapped.

- DBE\_UTILITY.GET\_SQL\_HASH

Outputs the hash value of a given character string using the MD5 algorithm. The prototype of the DBE\_UTILITY.GET\_SQL\_HASH function is as follows:

```
DBE_UTILITY.GET_SQL_HASH(
  name    IN VARCHAR2,
  hash    OUT RAW,
  last4bytes OUT BIGINT
)RETURN BIGINT;
```

**Table 10-372** DBE\_UTILITY.GET\_SQL\_HASH parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.
hash	RAW	OUT	No	Complete hexadecimal MD5 hash value.
last4bytes	BIGINT	OUT	No	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

 **NOTE**

After setting **behavior\_compat\_options** to a value other than **proc\_outparam\_override**, call the DBE\_UTILITY.GET\_SQL\_HASH function. If DBE\_UTILITY.GET\_SQL\_HASH\_FUNC is called, the value assignment fails. (Contact the administrator for parameter setting.)

- DBE\_UTILITY.IS\_BIT\_SET

Checks whether parameter **n** exists in **r**. DBE\_UTILITY. The prototype of the IS\_BIT\_SET function is as follows:

```
DBE_UTILITY.IS_BIT_SET (
  r IN RAW,
  n IN INTEGER)
RETURN INTEGER;
```

**Table 10-373** DBE\_UTILITY.IS\_BIT\_SET parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
r	RAW	IN	No	4 bytes plus the actual hexadecimal string.
n	INTEGER	IN	No	Determines whether the value exists in the binary system.

- **DBE\_UTILITY.IS\_CLUSTER\_DATABASE**

Determines whether the current database is running in database cluster mode. The prototype of the DBE\_UTILITY.IS\_CLUSTER\_DATABASE function is as follows:

```
DBE_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

- **DBE\_UTILITY.NAME\_RESOLVE**

Parses the given object name, including synonym translation and necessary authorization checks. The prototype of the DBE\_UTILITY.NAME\_RESOLVE function is as follows:

```
DBE_UTILITY.NAME_RESOLVE (
name      IN VARCHAR2,
context   IN INTEGER,
schema    OUT VARCHAR2,
part1     OUT VARCHAR2,
part2     OUT VARCHAR2,
dblink    OUT VARCHAR2,
part1_type OUT INTEGER,
object_number OUT OID
);
```

**Table 10-374** DBE\_UTILITY.NAME\_RESOLVE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Name of the object to be parsed. The structure is [[a.]b.]c[@d].
context	INTEGER	IN	No	Start value of the returned hash value.
schema	VARCHAR2	OUT	No	Schema of an object.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
part1	VARCHAR2	OUT	No	First part of the name. The type of this column is specified by <b>part1_type</b> .
part2	VARCHAR2	OUT	Yes	If this column is not empty, the value is the subprogram name.
dblink	VARCHAR2	OUT	Yes	Database link.
part1_type	INTEGER	OUT	No	Part 1 types: <ul style="list-style-type: none"> <li>• 5: synonym</li> <li>• 7: procedure (top level)</li> <li>• 8: function (top level)</li> </ul>
object_number	OID	OUT	No	Object ID. In database ORA, <b>object_number</b> is of the numeric type, indicating the object ID. In GaussDB, <b>object_number</b> is of the OID type and does not support implicit conversion from a number to an OID.

- DBE\_UTILITY.NAME\_TOKENIZE

Parses names in the **a [ . b [ . c ] ][@ dblink ]** format. If a name contains double quotation marks, the double quotation marks are deleted. Otherwise, the name becomes uppercase letters. The prototype of the DBE\_UTILITY.NAME\_TOKENIZE function is as follows:

```
DBE_UTILITY.NAME_TOKENIZE (
name IN VARCHAR2,
a OUT VARCHAR2,
b OUT VARCHAR2,
c OUT VARCHAR2,
dblink OUT VARCHAR2,
nextpos OUT INTEGER
);
```

**Table 10-375** DBE\_UTILITY.NAME\_TOKENIZE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Name, consisting of SQL identifiers (for example, <b>scott.foo@dblink</b> ).

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
a	VARCHAR2	OUT	No	First token of the name.
b	VARCHAR2	OUT	Yes	Second token of the name.
c	VARCHAR2	OUT	Yes	Third token of the name.
dblink	VARCHAR2	OUT	Yes	Database link.
nextpos	INTEGER	OUT	No	Next position of a parsed character string.

- DBE\_UTILITY.OLD\_CURRENT\_SCHEMA

Returns the name of the database schema in the current user environment. The prototype of the DBE\_UTILITY.OLD\_CURRENT\_SCHEMA function is as follows:

```
DBE_UTILITY.OLD_CURRENT_SCHEMA()
RETURN VARCHAR;
```

- DBE\_UTILITY.OLD\_CURRENT\_USER

Returns the name of the current user. The prototype of the DBE\_UTILITY.OLD\_CURRENT\_USER function is as follows:

```
DBE_UTILITY.OLD_CURRENT_USER()
RETURN TEXT;
```

- DBE\_UTILITY.TABLE\_TO\_COMMA

Converts a PL/SQL table of names into a comma-delimited string of names. The prototype of the DBE\_UTILITY.TABLE\_TO\_COMMA function is as follows:

```
DBE_UTILITY.TABLE_TO_COMMA (
  tab IN VARCHAR2[],
  tablen OUT BINARY_INTEGER,
  list OUT VARCHAR2
);
```

**Table 10-376** DBE\_UTILITY.TABLE\_TO\_COMMA parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
tab	VARCHAR2[]	IN	No	PL/SQL table which contains the string of names.
tablen	BINARY_INTEGER	OUT	No	Number of names in the PL/SQL table.
list	VARCHAR2	OUT	No	A comma-delimited string of names.

- **DBE\_UTILITY.GET\_SQL\_HASH\_FUNC**  
Uses the MD5 algorithm to output the hash value of a given character string. The prototype of the DBE\_UTILITY.GET\_SQL\_HASH\_FUNC function is:

```
DBE_UTILITY.GET_SQL_HASH_FUNC(
    name    IN VARCHAR2,
    hash    OUT RAW,
    last4bytes OUT BIGINT
);
```

**Table 10-377** DBE\_UTILITY.GET\_SQL\_HASH\_FUNC parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.
hash	RAW	OUT	No	Complete hexadecimal MD5 hash value.
last4bytes	BIGINT	OUT	No	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

 **NOTE**

After setting **set behavior\_compat\_options** to 'proc\_outparam\_override', invoke the DBE\_UTILITY.GET\_SQL\_HASH\_FUNC function. If you invoke the DBE\_UTILITY.GET\_SQL\_HASH function, a parameter mismatch error is reported.

## Examples

```
-- Example 1
create or replace procedure print_err() as
DECLARE
    a bool;
BEGIN
    a := not_exist;
exception
    when others then
        db_output.print_line('err_stack: ' || DBE_UTILITY.FORMAT_ERROR_STACK());
END;
/
CREATE PROCEDURE

call print_err();
-- The expected result is as follows:
err_stack: 50360452: column "not_exist" does not exist
print_err
-----
(1 row)

-- Clean the environment.
drop procedure print_err;
DROP PROCEDURE
```

```
-- Example 2
create or replace procedure print_err() as
DECLARE
  a bool;

### 10.11.2.17 DBE\_XMLDOM

#### API Description

The advanced function package DBE\_XMLDOM is used to access XMLType objects and implement Document Object Model (DOM), which is an API used to access HTML and XML documents. For details about all types supported by the advanced function package DBE\_XMLDOM, see [Table 10-378](#). For details about all APIs supported by DBE\_XMLDOM, see [Table 10-379](#).

#### NOTE

When the DBE\_XMLDOM advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

**Table 10-378** DBE\_XMLDOM data types

Type	Description
DOMATTR	Implements the DOMAttribute API.
DOMDOCUMENT	Implements the DOMDocument API.
DOMELEMENT	Implements the DOMELEMENT API.
DOMNAMEDNODEMAP	Implements the DOMNamedNodeMap API.
DOMNODELIST	Implements the DOMNodeList API.
DOMNODE	Implements the DOMNode API.
DOMTEXT	Implements the DOMText API.

**Table 10-379** DBE\_XMLDOM parameters

API	Description
<a href="#">DBE_XMLDOM.APPENDCHILD</a>	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
<a href="#">DBE_XMLDOM.CREATEELEMENT</a>	Creates a DOMELEMENT object with the specified name.
<a href="#">DBE_XMLDOM.CREATETEXTNODE</a>	Creates a DOMText node.
<a href="#">DBE_XMLDOM.FREEDOCUMENT</a>	Frees resources related to DOMDocument nodes.
<a href="#">DBE_XMLDOM.FREEELEMENT</a>	Frees resources related to DOMELEMENT nodes.
<a href="#">DBE_XMLDOM.FREENODE</a>	Frees resources related to DOMNode nodes.
<a href="#">DBE_XMLDOM.FREENODELIST</a>	Frees resources related to DOMNodeList nodes.
<a href="#">DBE_XMLDOM.GETATTRIBUTE</a>	Returns the attribute values of a DOMELEMENT object by name.
<a href="#">DBE_XMLDOM.GETATTRIBUTES</a>	Returns the attribute values of a DOMNode node as a map.
<a href="#">DBE_XMLDOM.GETCHILDNODES</a>	Converts several subnodes under a node into a node list.
<a href="#">DBE_XMLDOM.GETCHILDRENBYTAGNAME</a>	Returns the subnodes of a DOMELEMENT node by name.
<a href="#">DBE_XMLDOM.GETDOCUMENTELEMENT</a>	Returns the first subnode of the specified document.

API	Description
<a href="#">DBE_XMLDOM.GETFIRSTCHILD</a>	Returns the first subnode.
<a href="#">DBE_XMLDOM.GETLASTCHILD</a>	Returns the last subnode.
<a href="#">DBE_XMLDOM.GETLENGTH</a>	Obtains the number of subnodes under a specified node.
<a href="#">DBE_XMLDOM.GETLOCALNAME</a>	Returns the local name of a node.
<a href="#">DBE_XMLDOM.GETNAMEDITEM</a>	Returns the node specified by name.
<a href="#">DBE_XMLDOM.GETNEXTSIBLING</a>	Returns the next node of the specified node.
<a href="#">DBE_XMLDOM.GETNODENAME</a>	Returns the name of a node.
<a href="#">DBE_XMLDOM.GETNODETYPE</a>	Returns the type of a node.
<a href="#">DBE_XMLDOM.GETNODEVALUE</a>	Obtains the value of a node, depending on its type.
<a href="#">DBE_XMLDOM.GETPARENTNODE</a>	Returns the parent node of a node.
<a href="#">DBE_XMLDOM.GETTAGNAME</a>	Returns the tag name of the specified DOMElement node.
<a href="#">DBE_XMLDOM.HASCHILDNODES</a>	Checks whether the DOMNode object has any subnode.
<a href="#">DBE_XMLDOM.IMPORTNODE</a>	Copies a node and specifies the document to which the node belongs.
<a href="#">DBE_XMLDOM.ISNULL</a>	Checks whether a node is null.
<a href="#">DBE_XMLDOM.ITEM</a>	Returns the item corresponding to the index parameter in the mapping.
<a href="#">DBE_XMLDOM.MAKEELEMENT</a>	Converts a DOMNode object to the DOMElement type.
<a href="#">DBE_XMLDOM.MAKENODE</a>	Forcibly converts a node to the DOMNode type.
<a href="#">DBE_XMLDOM.NEWDOMDOCUMENT</a>	Returns a new DOMDocument object.
<a href="#">DBE_XMLDOM.SETATTRIBUTE</a>	Sets the value of the DOMElement attribute by name.

API	Description
<a href="#">DBE_XMLDOM.SETCHARSET</a>	Sets the character set for a DOMDocument object.
<a href="#">DBE_XMLDOM.SETDOCTYPE</a>	Sets the external DTD of a DOMDocument object.
<a href="#">DBE_XMLDOM.SETNODEVALUE</a>	Sets the value of a node in the DOMNode object.
<a href="#">DBE_XMLDOM.WRITETOBUFFER</a>	Writes an XML node to a specified buffer.
<a href="#">DBE_XMLDOM.WRITETOCLOB</a>	Writes an XML node to a specified CLOB.
<a href="#">DBE_XMLDOM.WRITETOFILE</a>	Writes an XML node to a specified file.
<a href="#">DBE_XMLDOM.GETSESSIONTREECOUNT</a>	Displays the number of DOM trees of all types in the current session.
<a href="#">DBE_XMLDOM.GETDOCTREEINFO</a>	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
<a href="#">DBE_XMLDOM.GETDETAILEDDOCTREEINFO</a>	Displays the number of nodes of each type for a specific document variable.
<a href="#">DBE_XMLDOM.GETELEMENTSBYTAGNAME</a>	Returns the list of DOMNodeList nodes that matches TAGNAME.

- DBE\_XMLDOM.APPENDCHILD**  
 Adds the newchild node to the end of the parent(n) node and returns the newly added node. The prototype of the DBE\_XMLDOM.APPENDCHILD function is as follows:
 

```
DBE_XMLDOM.APPENDCHILD(
    n IN DOMNode,
    newchild IN DOMNode)
RETURN DOMNODE;
```

**Table 10-380** DBE\_XMLDOM.APPENDCHILD parameters

Parameter	Description
n	Node to be added
newchild	New node added

 NOTE

1. The error message "operation not support" is displayed for the APPEND ATTR node under the DOCUMENT node. Database ORA does not report an error in this scenario, but the mounting fails.
2. The error message "operation not support" is displayed for the APPEND ATTR node under the ATTR node. Database ORA does not report an error in this scenario, but the mounting fails.
3. When multiple child nodes of the ATTR type are added to a parent node, the child nodes with the same key value cannot exist under the same parent node.

## Example:

-- Add a DOMNode node to a specified DOC tree and use DBE\_XMLDOM.HASCHILDNODES() to check whether the subnode is successfully added.

```
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  doc1 DBE_XMLDOM.DOMDocument;
  root DBE_XMLDOM.DOMELEMENT;
  rootnode DBE_XMLDOM.DOMNode;
  child1 DBE_XMLDOM.DOMELEMENT;
  child2 DBE_XMLDOM.DOMELEMENT;
  attr DBE_XMLDOM.DOMAttr;
  text DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNode;
  child1_node DBE_XMLDOM.DOMNode;
  attr_node DBE_XMLDOM.DOMNode;
  parent DBE_XMLDOM.DOMNode;
  buf varchar2(1000);
BEGIN
  doc := DBE_XMLDOM.newDOMDocument();
  root := DBE_XMLDOM.createElement(doc, 'root');
  rootnode := DBE_xmlldom.makeNode(root);
  node := DBE_XMLDOM.appendChild(DBE_xmlldom.makeNode(doc), rootnode);
  child1 := DBE_XMLDOM.createElement(doc, 'child1');
  child1_node := DBE_XMLDOM.makeNode(child1);
  node := DBE_XMLDOM.appendChild(rootnode, child1_node);
  attr := DBE_XMLDOM.createAttribute(doc, 'abc');
  attr_node := DBE_XMLDOM.makeNode(attr);
  node := DBE_XMLDOM.appendChild(child1_node, attr_node);
  IF DBE_XMLDOM.HASCHILDNODES(child1_node) THEN
    DBE_OUTPUT.print_line('HAS CHILD NODES');
  ELSE
    DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
  END IF;
  parent := DBE_XMLDOM.GETPARENTNODE(attr_node);
  buf := DBE_XMLDOM.GETNODENAME(parent);
  DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
NOT HAS CHILD NODES
ANONYMOUS BLOCK EXECUTE
```

## ● DBE\_XMLDOM.CREATEELEMENT

Returns the DOMELEMENT object with the specified name. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
  doc IN DOMDOCUMENT,
  tagName IN VARCHAR2)
RETURN DOMELEMENT;
```

Returns the DOMELEMENT object with the specified name and namespace. The prototype of the DBE\_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
  doc IN DOMDOCUMENT,
  tagName IN VARCHAR2,
```

```
ns IN VARCHAR2)
RETURN DOMELEMENT;
```

**Table 10-381** DBE\_XMLDOM.CREATEELEMENT parameters

Parameter	Description
doc	Specified DOMDocument object
tagName	Name of the new DOMELEMENT object
ns	Namespace

 **NOTE**

1. When the **tagName** parameter is set to null or an empty character string, the exception "NULL or invalid TagName argument specified" is thrown.
2. The default maximum length of **tagName** and **ns** is 32767. If the length exceeds 32767, an exception is thrown.

**Example:**

```
-- 1. Create a DOMELEMENT object with the specified name.
DECLARE
  doc db_xmldom.domdocument;
  attr DBE_XMLDOM.DOMATTR;
  elem DBE_XMLDOM.DOMELEMENT;
  ans DBE_XMLDOM.DOMATTR;
  buf varchar2(1010);
BEGIN
  doc := db_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
  <computer size="ITX"><cpu>Ryzen 9 3950X</cpu>
  <ram>32GBx2 DDR4 3200MHz</ram>

  <case>LIANLI TU150</case>
  </computer>');
  elem := db_xmldom.createelement(doc,'elem');
  DBE_XMLDOM.WRITETOBUFFER(db_xmldom.makenode(elem), buf);
  DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- 2. Create a DOMELEMENT object with the specified name and namespace.
DECLARE
  doc db_xmldom.domdocument;
  attr DBE_XMLDOM.DOMATTR;
  elem DBE_XMLDOM.DOMELEMENT;
  ans DBE_XMLDOM.DOMNODE;
  buf varchar2(1010);
  list DBE_XMLDOM.DOMNODELIST;
  node DBE_XMLDOM.DOMNODE;
BEGIN
  doc := db_xmldom.newdomdocument('<h:data xmlns:h="http://www.w3.org/TR/html4/">
  <h:da1 len="10">test namespace</h:da1><h:da1>bbbbbbbbbb</h:da1></h:data>');
  elem := db_xmldom.createelement(doc,'elem','http://www.w3.org/TR/html5/');
  ans := DBE_XMLDOM.APPENDCHILD(db_xmldom.makenode(doc), db_xmldom.makenode(elem));
  DBE_XMLDOM.WRITETOBUFFER(doc, buf);
  DBE_OUTPUT.print_line(buf);
END;
```

```

/
-- Expected result:
<?xml version="1.0" encoding="UTF-8"?>
<h:data xmlns:h="http://www.w3.org/TR/html4/">
  <h:da1 len="10">test namespace</h:da1>
  <h:da1>bbbbbbbbbb</h:da1>
</h:data>
<elem xmlns="http://www.w3.org/TR/html5"/>

```

ANONYMOUS BLOCK EXECUTE

- DBE\_XMLDOM.CREATETEXTNODE

Creates and returns a DOMText object. The prototype of the DBE\_XMLDOM.CREATETEXTNOD function is as follows:

```

DBE_XMLDOM.CREATETEXTNODE(
  doc IN DOMDocument,
  data IN VARCHAR2)
RETURN DOMTEXT;

```

**Table 10-382** DBE\_XMLDOM.CREATETEXTNODE parameters

Parameter	Description
doc	Specified DOMDocument object
data	Content of the DOMText node

 **NOTE**

1. You can enter an empty string or null value for **data**.
2. The default maximum length of **data** is 32767. If the length exceeds 32767, an exception is thrown.

**Example:**

-- Add a DOMText node to the DOC tree and print the DOC tree to the buffer.

```

DECLARE
  doc DBE_XMLDOM.DOMDOCUMENT;
  doctext DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNODE;

- **DBE\_XMLDOM.FREEDOCUMENT**  
Frees a DOMDocument node. The prototype of the DBE\_XMLDOM.FREEDOCUMENT function is as follows:  
DBE\_XMLDOM.FREEDOCUMENT(  
doc IN DOMDOCUMENT);

**Table 10-383** DBE\_XMLDOM.FREEDOCUMENT parameters

Parameter	Description
doc	Specified DOMDocument node

**Example:**

```
-- Free the entire DOC tree after the DOMNode node is added to the DOC tree.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  doc_node dbe_xmldom.DOMNODE;
  root_elmt dbe_xmldom.DOMELEMENT;
  root_node dbe_xmldom.DOMNODE;
  value varchar(1000);
BEGIN
  doc := dbe_xmldom.newdomdocument();
  doc_node := dbe_xmldom.MAKENODE(doc);
  root_elmt := dbe_xmldom.CREATEELEMENT(doc,'staff');
  root_node:=dbe_xmldom.APPENDCHILD(doc_node, dbe_xmldom.MAKENODE(root_elmt));
  dbe_xmldom.freedocument(doc);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_XMLDOM.FREEELEMENT**  
Frees a DOMELEMENT node. The prototype of the DBE\_XMLDOM.FREEELEMENT function is as follows:  
DBE\_XMLDOM.FREEELEMENT(  
elem IN DOMELEMENT);

**Table 10-384** DBE\_XMLDOM.FREEELEMENT parameters

Parameter	Description
elem	Specified DOMELEMENT node

**Example:**

```
-- Obtain a DOMELEMENT node from the DOC tree and free the node. Check whether the node is empty before and after the node is freed.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
  <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
```

```

<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>]>
<note>
  <to>Chinese</to>
  <from>Jani</from>
  <heading>Reminder</heading>

ANONYMOUS BLOCK EXECUTE

```

- **DBE\_XMLDOM.FREENODE**

Frees a DOMNode node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```

DBE_XMLDOM.FREENODE(
  n IN DOMNODE);

```

**Table 10-385** DBE\_XMLDOM.FREENODE parameters

Parameter	Description
n	Specified DOMNode node

 **NOTE**

1. After GaussDB performs the FREENODE operation, the freed node is not available again. After the database ORA performs the FREENODE operation, the freed node is available again and becomes another node.
2. When other APIs call the freed DOMNode node, the calling is different from that in database ORA.

**Example:**

-- Obtain a DOMNode node from the DOC tree and free the node. Check whether the node is empty before and after the node is freed.

```

DECLARE
  doc dbe_xmlDOM.domdocument;
  node dbe_xmlDOM.domnode;
  node1 dbe_xmlDOM.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer1 varchar2(1010);
BEGIN
  doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
  <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>

```

```

<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>

IS NULL
ANONYMOUS BLOCK EXECUTE

```

- **DBE\_XMLDOM.FREENODELIST**

Frees a DOMNodeList node. The prototype of the DBE\_XMLDOM.FREENODE function is as follows:

```

DBE_XMLDOM.GETLENGTH(
  nl IN DOMNODELIST);

```

**Table 10-386** DBE\_XMLDOM.FREENODELIST parameters

Parameter	Description
nl	Specified DOMNodeList node

 **NOTE**

1. A DOMNodeList node will be completely freed by FREENODELIST.
2. When other APIs call the freed DOMNodeList node, the calling is different from that in database ORA.
3. The input parameter **freenodelist** cannot be empty.

**Example:**

-- Obtain a DOMNodeList node from the DOC tree and free the node. Check the node length before and after the node is freed.

```

DECLARE
  doc dbe_xmlDOM.domdocument;
  node dbe_xmlDOM.domnode;
  node1 dbe_xmlDOM.domnode;

- **DBE\_XMLDOM.GETATTRIBUTE**

Returns the attribute values of a DOMELEMENT object by name. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```

DBE_XMLDOM.GETATTRIBUTE(
  elem   IN   DOMELEMENT,
  name   IN   VARCHAR2)
RETURN VARCHAR2;

```

Returns the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.GETATTRIBUTE function is as follows:

```

DBE_XMLDOM.GETATTRIBUTE(
  elem   IN   DOMELEMENT,
  name   IN   VARCHAR2,
  ns     IN   VARCHAR2)
RETURN VARCHAR2;

```

**Table 10-387** DBE\_XMLDOM.GETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMELEMENT node
name	Attribute name
ns	Namespace

 **NOTE**

1. The **ns** parameter of the DBE\_XMLDOM.GETATTRIBUTE API does not support the asterisk (\*) parameter.
2. GaussDB does not support the namespace prefix as an attribute, and the value of the prefix cannot be queried through the DBE\_XMLDOM.GETATTRIBUTE API.

**Example:**

```

-- 1. Return the attribute values of a DOMELEMENT object by name.
DECLARE
  doc dbe_xmlDOM.domdocument;
  elem dbe_xmlDOM.domelement;

```

```
docnode DBE_XMLDOM.DOMNode;

- **DBE\_XMLDOM.GETLOCALNAME**

Returns the local name of the given DOMAttr node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```

DBE_XMLDOM.GETLOCALNAME(
  a    IN  DOMATTR)
RETURN VARCHAR2;

```

Returns the local name of the given DOMELEMENT node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```

DBE_XMLDOM.GETLOCALNAME(
  elem  IN  DOMELEMENT)
RETURN VARCHAR2;

```

Returns the local name of the given DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```

DBE_XMLDOM.GETLOCALNAME(
  n    IN  DOMNODE,
  data OUT VARCHAR2);

```

**Table 10-395** DBE\_XMLDOM.GETLOCALNAME parameters

Parameter	Description
a	Specified DOMAttr node
elem	Specified DOMELEMENT node
n	Specified DOMNode node
data	Returned local name

**Example:**

```
-- 1. Use the createAttribute function to generate an attr node to obtain the local name.

- **DBE\_XMLDOM.GETNAMEDITEM**

Returns the node specified by name. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```

DBE_XMLDOM.GETNAMEDITEM(
  nnm IN DOMNAMEDNODEMAP,
  name IN VARCHAR2)
RETURN DOMNODE;

```

Returns the node specified by name and namespace. The prototype of the DBE\_XMLDOM.GETNAMEDITEM function is as follows:

```

DBE_XMLDOM.GETNAMEDITEM(
  nnm IN DOMNAMEDNODEMAP,
  name IN VARCHAR2,
  ns IN VARCHAR2)
RETURN DOMNODE;

```

**Table 10-396** DBE\_XMLDOM.GETNAMEDITEM parameters

Parameter	Description
nnm	Specified DOMNamedNodeMap object
name	Name of the element to be retrieved.
ns	Namespace

 **NOTE**

1. The values of **name** and **nnm** can be null, but they are required arguments.
2. The default maximum length of **name** and **ns** is 32767. If the length exceeds 32767, an error is reported.
3. The values of **name** and **ns** can be of the int type and contain more than 127 bits.

**Example:**

```

-- 1. Return the node specified by name.

- **DBE\_XMLDOM.ISNULL**

Checks whether the given DOMAttr node is null. If it is null, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  a IN DOMATTR)
RETURN BOOLEAN;
```

Checks whether the given DOMDocument node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  doc IN DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMELEMENT node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  elem IN DOMELEMENT)
RETURN BOOLEAN;
```

Checks whether the given DOMNamedNodeMap node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  nnm IN DOMNAMEDNODEMAP)  
RETURN BOOLEAN;
```

Checks whether the given DOMNode node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  n IN DOMNODE)  
RETURN BOOLEAN;
```

Checks whether the given DOMNodeList node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  nl IN DOMNODELIST)  
RETURN BOOLEAN;
```

Checks whether the given DOMText node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE\_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(  
  t IN DOMTEXT)  
RETURN BOOLEAN;
```

**Table 10-405** DBE\_XMLDOM.ISNULL parameters

```

- **DBE\_XMLDOM.ITEM**

Returns the element corresponding to the index in a list based on the index.

The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```

DBE_XMLDOM.ITEM(
  nl IN DOMNODELIST,
  index IN NUMBER)
RETURN DOMNODE;

```

Returns the element corresponding to the index in a map based on the index. The prototype of the DBE\_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nnm IN DOMNAMEDNODEMAP,
  index IN NUMBER)
RETURN DOMNODE;
```

**Table 10-406** DBE\_XMLDOM.ITEM parameters

Parameter	Description
nl	Specified DOMNodeList object
nnm	Specified DOMNamedNodeMap object
index	Index of the element to be retrieved

 **NOTE**

For improper input parameters such as Boolean and CLOB, the item function of the map type points to the value of the first index by default.

**Example:**

```
-- 1. Return the element corresponding to the index in a map based on the index.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMELEMENT;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;

- **DBE\_XMLDOM.MAKEELEMENT**

Returns the **DOMElement** object after conversion. The prototype of the **DBE\_XMLDOM.MAKEELEMENT** function is as follows:

```

DBE_XMLDOM.MAKEELEMENT(
    n IN DOMNODE)
RETURN DOMELEMENT;

```

**Table 10-407** DBE\_XMLDOM.MAKEELEMENT parameters

Parameter	Description
n	Specified <b>DOMNode</b> object

**Example:**

```

-- Forcibly convert the DOMNode node converted from the DOMElement type back to the
DOMElement type.
DECLARE
buf VARCHAR2(1000);
doc DBE_XMLDOM.DOMDocument;
elem DBE_XMLDOM.DOMElement;
elem2 DBE_XMLDOM.DOMElement;
node DBE_XMLDOM.DOMNode;
BEGIN
doc := DBE_XMLDOM.NEWDOMDOCUMENT();
elem := DBE_XMLDOM.createElement(doc, 'aaa');
node := DBE_XMLDOM.makeNode(elem);
elem2 := DBE_XMLDOM.makeElement(node);

DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
aaa
ANONYMOUS BLOCK EXECUTE

```

- **DBE\_XMLDOM.MAKENODE**

Forcibly converts a specified **DOMAttr** node to a **DOMNode** node and returns the **DOMNode** node. The prototype of the **DBE\_XMLDOM.MAKENODE** function is as follows:

```
DBE_XMLDOM.MAKENODE(  
  a    IN  DOMATTR)  
RETURN DOMNODE;
```

Forcibly converts a specified DOMDocument node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(  
  doc  IN  DOMDOCUMENT)  
RETURN DOMNODE;
```

Forcibly converts a specified DOMELEMENT node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(  
  elem IN  DOMELEMENT)  
RETURN DOMNODE;
```

Forcibly converts a specified DOMText node to a DOMNode node and returns the DOMNode node. The prototype of the DBE\_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.MAKENODE(  
  t    IN  DOMTEXT)  
RETURN DOMNODE;
```

**Table 10-408** DBE\_XMLDOM.MAKENODE parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMELEMENT node
t	Specified DOMText node

 **NOTE**

Due to syntax restrictions, when DBE\_XMLDOM.MAKENODE is used as the return value of a function, it cannot be directly implemented by running the following command:

```
return DBE_XMLDOM.MAKENODE(doc);
```

You are advised to run the following command:

```
tmp_node := DBE_XMLDOM.MAKENODE(doc );  
return tmp_node;
```

**Example:**

-- 1. Use createattr to generate ATTR and convert it to a node.

```
DECLARE

```

- **DBE\_XMLDOM.NEWDOMDOCUMENT**

Returns a new DOMDocument object. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;

```

Returns a new DOMDocument instance object created from the specified XMLType type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT(
xml doc IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;

```

Returns a new DOMDocument instance object created from the specified CLOB type. The prototype of the DBE\_XMLDOM.NEWDOMDOCUMENT function is as follows:

```

DBE_XMLDOM.NEWDOMDOCUMENT(
cl IN CLOB)
RETURN DOMDOCUMENT;

```

**Table 10-409** DBE\_XMLDOM.NEWDOMDOCUMENT parameters

Parameter	Description
xml doc	Specified XMLType type
cl	Specified CLOB type

 **NOTE**

- The size of the input parameter must be less than 1 GB.
- Currently, external DTD parsing is not supported.
- The document created by NEWDOMDOCUMENT uses the UTF-8 character set by default.
- Each document parsed from the same XMLType instance is independent, and the modification of the document does not affect the XMLType.
- For details about the differences between our database and database ORA, see [DBE\\_XMLPARSER.PARSECLOB](#).

**Example:**

```
-- 1. Return a new DOMDocument object.
DECLARE
  doc dbe_xmlDOM.domdocument;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmlDOM.newDOMdocument();

ANONYMOUS BLOCK EXECUTE

- **DBE\_XMLDOM.SETATTRIBUTE**

Sets the value of the DOMELEMENT attribute by name. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```
DBE_XMLDOM.SETATTRIBUTE(
  elem IN DOMELEMENT,
  name IN VARCHAR2,
  value IN VARCHAR2);
```

Sets the attribute values of a DOMELEMENT object by name and namespace URI. The prototype of the DBE\_XMLDOM.SETATTRIBUTE function is as follows:

```
DBE_XMLDOM.SETATTRIBUTE(
  elem IN DOMELEMENT,
  name IN VARCHAR2,
  value IN VARCHAR2,
  ns IN VARCHAR2);
```

**Table 10-410** DBE\_XMLDOM.SETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMELEMENT node
name	Attribute name
value	Attribute value
ns	Namespace

 **NOTE**

Multiple attributes can be added through the DBE\_XMLDOM.SETATTRIBUTE API. The attribute name cannot be null, and attributes with the same name cannot exist in the same DOMELEMENT node. If you want to add attributes with the same name, you should explicitly set a namespace for each attribute with the same name, but you are advised not to perform such operations. If an attribute exists in a namespace, the specified namespace must be displayed when you modify the attribute. Otherwise, the attribute with the same name is added.

**Example:**

```
-- 1. Set the value of the DOMELEMENT attribute by name.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value varchar(1000);
BEGIN
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
  DBE_XMLDOM.makeNode(elem));
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');
  dbe_output.print_line(buffer);
END;
```

```
/
-- Expected result:

ANONYMOUS BLOCK EXECUTE

```

- **DBE\_XMLDOM.SETCHARSET**

Sets the character set for a DOMDocument object. The prototype of the DBE\_XMLDOM.SETCHARSET function is as follows:

```

DBE_XMLDOM.SETCHARSET(
doc IN DOMDocument,
charset IN VARCHAR2);

```

**Table 10-411** DBE\_XMLDOM.SETCHARSET parameters

Parameter	Description
doc	Specified DOMDocument node
charset	Character set

 **NOTE**

- The value of **charset** contains a maximum of 60 bytes.
- Currently, the following character sets are supported: UTF-8, UTF-16, UCS-4, UCS-2, ISO-8859-1, ISO-8859-2, ISO-8859-3, ISO-8859-4, ISO-8859-5, ISO-8859-6, ISO-8859-7, ISO-8859-8, ISO-8859-9, ISO-2022-JP, Shift\_JIS, EUC-JP and ASCII. If you enter other character sets, an error is reported or garbled characters may be displayed.

**Example:**

```

-- Set the UTF-16 character set for the DOC tree and print the DOC tree to the buffer.
DECLARE
doc dbe_xmldom.domdocument;
buffer varchar2(1010);
BEGIN
doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><ELEMENT to (#PCDATA)>
<ELEMENT from (#PCDATA)><ELEMENT heading (#PCDATA)><ELEMENT body (#PCDATA)>]')
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don't forget me this weekend!</body></note>');
dbe_xmldom.setcharset(doc, 'utf-16');
dbe_xmldom.writetobuffer(doc, buffer);
dbe_output.print_line('buffer: ');
dbe_output.print_line(buffer);
dbe_xmldom.freedocument(doc);
END;
/
-- Expected result:

<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<note>
  <to>test</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>Don't forget me this weekend!</body>
</note>
```

ANONYMOUS BLOCK EXECUTE

- **DBE\_XMLDOM.SETDOCTYPE**

Sets the external DTD of a DOMDocument object. The prototype of the DBE\_XMLDOM.SETDOCTYPE function is as follows:

```
DBE_XMLDOM.SETDOCTYPE(
  doc IN DOMDocument,
  name IN VARCHAR2,
  sysid IN VARCHAR2,
  pubid IN VARCHAR2);
```

**Table 10-412** DBE\_XMLDOM.SETDOCTYPE parameters

Parameter	Description
doc	Specified DOMDocument node
name	Name of the DOCTYPE to be initialized
sysid	ID of the system whose DOCTYPE needs to be initialized
pubid	Public ID of the DOCTYPE to be initialized

 **NOTE**

The total length of **name**, **sysid**, and **pubid** cannot exceed 32500 bytes.

**Example:**

-- After the initial system ID, public ID, and name are set for the external DTD of the DOMDocument, the DOC tree modified each time is output to the buffer.

```
DECLARE
  doc dbexml.domdocument;
  buffer varchar2(1010);
begin
  doc := dbexml.newdomdocument('<?xml version="1.0"?>
    <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>

ANONYMOUS BLOCK EXECUTE

```

- **DBE\_XMLDOM.SETNODEVALUE**

Sets the value of a node in the DOMNode object. The prototype of the DBE\_XMLDOM.SETNODEVALUE function is as follows:

```

DBE_XMLDOM.SETNODEVALUE(
n IN DOMNODE,
nodeValue IN VARCHAR2);

```

**Table 10-413** DBE\_XMLDOM.SETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object
nodeValue	String to be set in the DOMNode object

 **NOTE**

1. You can enter an empty string or null value for **nodeValue**, but the node value will not be changed.
2. Currently, **nodeValue** does not support the escape character '&'. If the character string contains the escape character, the node value will be cleared.
3. The default maximum length of **nodeValue** is restricted by the VARCHAR2 type and is 32767 bytes. If the length exceeds 32767 bytes, an exception is thrown.

**Example:**

-- After setting a node value different from the initial value for the DOMNode node that is converted from DOMText, obtain and output the node value.

```
DECLARE
buf VARCHAR2(1000);
doc DBE_XMLDOM.DOMDocument;
text DBE_XMLDOM.DOMText;
elem2 DBE_XMLDOM.DOMELEMENT;
node DBE_XMLDOM.DOMNode;
BEGIN
doc := DBE_XMLDOM.NEWDOMDOCUMENT();
text := DBE_XMLDOM.createTextNode(doc, 'aaa');
DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
ccc
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_XMLDOM.WRITETOBUFFER**

Writes an XML node to a specified buffer using the database character set. The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
doc IN DOMDOCUMENT,
buffer INOUT VARCHAR2);
```

Writes an XML document to a specified buffer using the database character set. The prototype of the DBE\_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
n IN DOMNODE,
buffer INOUT VARCHAR2);
```

**Table 10-414** DBE\_XMLDOM.WRITETOBUFFER parameters

Parameter	Description
doc	Specified DOMDocument node
buffer	Buffer for the write operation
n	Specified DOMNode node

 **NOTE**

- The buffer to which the writetobuffer function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

**Example:**

-- 1. Enter a parameter of the DOMNode type.

```
DECLARE
  doc dbe_xmlDOM.domdocument;
  elem DBE_XMLDOM.DOMELEMENT;
  buf varchar2(1000);
BEGIN
  doc := dbe_xmlDOM.newdomdocument();
  elem := dbe_xmlDOM.createelement(doc,'elem');
  DBE_XMLDOM.WRITETOBUFFER(dbe_xmlDOM.makenode(elem), buf);
  DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
<elem/>
ANONYMOUS BLOCK EXECUTE
```

-- 2. Enter a parameter of the DOMDocument type.

```
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  buf VARCHAR2(1000);
BEGIN
  doc := dbe_xmlDOM.newdomdocument('<?xml version="1.0"?>
  <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
  <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]')
  <note><to>test</to><from>Jani</from><heading>Reminder</heading>
  <body>Don't forget me this weekend!</body></note>');
  DBE_XMLDOM.WRITETOBUFFER(doc, buf);
  DBE_OUTPUT.print_line('doc: ');
  DBE_OUTPUT.print_line(buf);
  DBE_XMLDOM.FREEDOCUMENT(doc);
END;
/
-- Expected result:
doc:

<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<note>
  <to>test</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>Don't forget me this weekend!</body>
</note>
ANONYMOUS BLOCK EXECUTE
```

- **DBE\_XMLDOM.WRITETOCLOB**

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  doc IN DOMDOCUMENT,
  cl INOUT CLOB);
```

Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE\_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
n    IN    DOMNODE,
cl   INOUT CLOB);
```

**Table 10-415** DBE\_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
cl	CLOB to be written
n	Specified DOMNode node

 **NOTE**

- The **doc** parameter is an input parameter. The CLOB to which the writetoclob function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

**Example:**

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
CL CLOB;
N DBE_XMLDOM.DOMNODE;
BEGIN
DBE_XMLDOM.WRITETOCLOB(N, CL);
DBE_OUTPUT.PRINT_LINE(CL);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- 2. Enter a parameter of the DOMDocument type.
DECLARE
doc dbe_xmldom.domdocument;
mclob clob;
BEGIN
doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
<!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
<note><to>test</to><from>Jani</from><heading>Reminder</heading>
<body>Don"t forget me this weekend!</body></note>');
dbe_xmldom.writetoclob(doc, mclob);
dbe_output.print_line('mclob: ');
dbe_output.print_line(mclob);
dbe_xmldom.freedocument(doc);
END;
/
-- Expected result:
mclob:
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE note [
<!ELEMENT note (to , from , heading , body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<note>
<to>test</to>
```

```
<from>Jani</from>
<heading>Reminder</heading>
<body>Don't forget me this weekend!</body>
</note>
```

ANONYMOUS BLOCK EXECUTE

- **DBE\_XMLDOM.WRITETOFILE**

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  doc IN DOMDOCUMENT,
  fileName IN VARCHAR2);
```

Writes an XML node to a specified file using the database character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  n IN DOMNODE,
  fileName IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  doc IN DOMDOCUMENT,
  fileName IN VARCHAR2,
  charset IN VARCHAR2);
```

Writes an XML document to a specified file using the specified character set. The prototype of the DBE\_XMLDOM.WRITETOFILE function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  n IN DOMNODE,
  fileName IN VARCHAR2,
  charset IN VARCHAR2);
```

**Table 10-416** DBE\_XMLDOM.WRITETOFILE parameters

Parameter	Description
doc	Specified DOMDocument node
fileName	File to be written
n	Specified DOMNode node
charset	Specified character set

 NOTE

- The **doc** parameter is an input parameter. The value of **filename** can contain a maximum of 255 bytes, and the value of **charset** can contain a maximum of 60 bytes. For details about the character sets supported by **charset**, see the [DBE\\_XMLDOM.SETCHARSET](#) API.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- If `newdomdocument()` is used to create a document without parameters, no error is reported when **charset** is not specified. The UTF-8 character set is used by default.
- The **filename** must be in the path created in **pg\_directory**. The backslash (\) in the filename will be converted to a slash (/). Only one slash (/) is allowed. The file name must be in the **pg\_directory\_name/file\_name.xml** format. The output file must be in the XML format.
- When the GUC parameter **safe\_data\_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe\_data\_path**.
- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory. For details about how to create a directory, see [CREATE DIRECTORY](#).

## Example:

-- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory.

create directory dir as '/tmp';

-- 1. Write an XML node to a specified file using the database character set.

```
DECLARE
  FPATH VARCHAR2(1000);
  DOC DBE_XMLDOM.DOMDOCUMENT;
BEGIN
  DOC := DBE_XMLDOM.NEWDOMDOCUMENT('<ROOT>
    <A ATTR1="A_VALUE">
      <ACHILD>ACHILD TXT</ACHILD>
    </A>
    <B>B TXT</B>
    <C/>
  </ROOT>');
  FPATH := 'dir/simplexml.xml';
  DBE_XMLDOM.WRITETOFILE(DOC, FPATH);
END;
```

/

-- Expected result:

ANONYMOUS BLOCK EXECUTE

-- 2. Write an XML document to a specified file using the specified character set.

```
DECLARE
  SRC VARCHAR(1000);
  FPATH VARCHAR2(1000);
  DOC DBE_XMLDOM.DOMDOCUMENT;
  ELE DBE_XMLDOM.DOMELEMENT;
BEGIN
  FPATH := 'dir/simplexml.xml';
  SRC := '<ROOT>
    <A ATTR1="A_VALUE">
      <ACHILD>ACHILD TXT</ACHILD>
    </A>
    <B>B TXT</B>
    <C/>
  </ROOT>';
  DOC := DBE_XMLDOM.NEWDOMDOCUMENT(SRC);
  ELE := DBE_XMLDOM.GETDOCUMENTELEMENT(DOC);
  DBE_XMLDOM.WRITETOFILE(DBE_XMLDOM.MAKENODE(ELE), FPATH, 'ASCII');
  DBE_XMLDOM.FREEDOCUMENT(DOC);
END;
```

```
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- Clean the environment.
drop directory dir;
```

- **DBE\_XMLDOM.GETSESSIONTREENUM**

Queries the number of DOM trees of all types in the current session. The prototype of the DBE\_XMLDOM.GETSESSIONTREENUM function is as follows:

```
DBE_XMLDOM.GETSESSIONTREENUM()
RETURN INTEGER;
```

 **NOTE**

For DOM trees that have used FREEElement and FREENode, this function still counts them.

**Example:**

```
-- Create three documents and obtain the number of DOM trees in the current session.
```

```
DECLARE
doc DBE_XMLDOM.DOMDocument;
doc2 DBE_XMLDOM.DOMDocument;
doc3 DBE_XMLDOM.DOMDocument;

### 10.11.2.18 DBE\_XMLPARSER

#### API Description

The DBE\_XMLPARSER API is used to deserialize XML character strings and convert the character strings that store XML documents to document nodes. [Table 10-419](#) lists all APIs supported by the DBE\_XMLPARSER advanced package.

The XMLParser data type can be used to store XMLParser data. The maximum number of XMLParser data records that can be stored is 16777215. The XMLPARSER data type can parse and create the DOMDocument node according to the input character string. The advanced package also provides the corresponding set and get APIs to perform operations on the constraint attributes of the parsing process.

#### NOTE

When the DBE\_XMLPARSER advanced package is used in the database whose character set is set to **SQL\_ASCII**, an error is reported if characters beyond the ASCII range are input.

The DBE\_XMLPARSER advanced package supports only the O-compatible mode.

**Table 10-419** Parameters for DBE\_XMLPARSER

API	Description
<a href="#">DBE_XMLPARSER.FREEPARSER</a>	Frees a parser.
<a href="#">DBE_XMLPARSER.GETDOCUMENT...</a>	Obtains the parsed document node.

API	Description
<a href="#">DBE_XMLPARSER.GETVALIDAT...</a>	Obtains the validation attribute.
<a href="#">DBE_XMLPARSER.NEWPARSER</a>	Creates a parser instance.
<a href="#">DBE_XMLPARSER.PARSEBUFFE...</a>	Parses the VARCHAR string.
<a href="#">DBE_XMLPARSER.PARSECLOB</a>	Parses the CLOB string.
<a href="#">DBE_XMLPARSER.SETVALIDAT...</a>	Sets the validation attribute.

- [DBE\\_XMLPARSER.FREEPARSER](#)  
Frees a given parser object.  
The stored procedure prototype of [DBE\\_XMLPARSER.FREEPARSER](#) is as follows:

```
DBE_XMLPARSER.FREEPARSER (
  p IN parser);
```

**Table 10-420** Parameters for [DBE\\_XMLPARSER.FREEPARSER](#)

Parameter	Description
p	Parser object

Example:

```
-- Create a parser and then release it.
DECLARE
  l_parser dbe_xmlparser.parser;
BEGIN
  l_parser := dbe_xmlparser.newparser();
-- Directly release the l_parser instance.
  dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- [DBE\\_XMLPARSER.GETDOCUMENT](#)  
Returns the root node of the DOM tree document constructed by the parser. This function can be called only after the document is parsed.  
The prototype of the [DBE\\_XMLPARSER.GETDOCUMENT](#) function is as follows:

```
DBE_XMLPARSER.GETDOCUMENT (
  p IN parser)
RETURN DOMDocument;
```

**Table 10-421** Parameters for [DBE\\_XMLPARSER.GETDOCUMENT](#)

Parameter	Description
p	Parser object

 **NOTE**

- If the GETDOCUMENT function has no input parameter, an error is reported.
- If the **parser** parameter of the GETDOCUMENT function is null, null is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, null is returned.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmlldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
BEGIN
  l_parser := dbe_xmlparser.newparser();
  -- The l_parser parses the character string and obtains the DOMDocument node through
  GETDOCUMENT.
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbe_xmlparser.getdocument(l_parser);
  -- Print the content in l_doc.
  dbe_xmlldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;

  dbe_xmlparser.freeparser(l_parser);
  dbe_xmlldom.freedocument(l_doc);
END;
/
```

**Execution result:**

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- **DBE\_XMLPARSER.GETVALIDATIONMODE**  
Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

The prototype of the DBE\_XMLPARSER.GETVALIDATIONMODE function is as follows:

```
DBE_XMLPARSER.GETVALIDATIONMODE (
  p IN parser)
RETURN BOOLEAN;
```

**Table 10-422** Parameters for DBE\_XMLPARSER.GETVALIDATIONMODE

Parameter	Description
p	Parser object

**Example:**

```
-- Create a parser and use GETVALIDATIONMODE to check whether the parser validation mode is
enabled.
DECLARE
  l_parser dbe_xmlparser.parser;
BEGIN
  l_parser := dbe_xmlparser.newparser();
  if (dbe_xmlparser.GETVALIDATIONMODE(l_parser) = true) then
    RAISE NOTICE 'validation';
  else
    RAISE NOTICE 'no validation';
  end if;
  dbe_xmlparser.freeparser(l_parser);
END;
/
```

Execution result:

```
NOTICE: validation
```

- **DBE\_XMLPARSER.NEWPARSER**

Creates a parser object and returns a new parser instance.

The prototype of the DBE\_XMLPARSER.NEWPARSER function is as follows:

```
DBE_XMLPARSER.NEWPARSER
RETURN Parser;
```

Example:

```
-- Create a parser to parse character strings and then free the parser.
DECLARE
  -- Create a parser.
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2(1000) :=
    '<?xml version="1.0" encoding="UTF-8"?>
    <note>
    <to>Tove</to>
    <from>Jani</from>
    <heading>Reminder</heading>
    <body>Donot forget me this weekend!</body>
    </note>';
  buffer2 varchar2(1000);
BEGIN
  l_parser := dbe_xmlparser.newparser();
  -- Parse the document and create a new DOM document.
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);

  dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- **DBE\_XMLPARSER.PARSEBUFFER**

Parses XML documents stored in strings.

The stored procedure prototype of DBE\_XMLPARSER.PARSEBUFFER is as follows:

```
DBE_XMLPARSER.PARSEBUFFER (
  p IN parser,
  doc IN VARCHAR2);
```

**Table 10-423** Parameters for DBE\_XMLPARSER.PARSEBUFFER

Parameter	Description
p	Parser object

Parameter	Description
doc	A string that stores XML documents

 NOTE

- The maximum length of a character string that can be parsed by the PARSEBUFFER function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in ORA database are not translated into characters.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbexmlparser.parser;
  l_doc dbexmlDOM.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
BEGIN
  l_parser := dbexmlparser.newparser();
  dbexmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbexmlparser.getdocument(l_parser);

  dbexmlDOM.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;

  dbexmlparser.freeparser(l_parser);
  dbexmlDOM.freedocument(l_doc);
END;
/
```

Execution result:

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- DBE\_XMLPARSER.PARSECLOB

Parses XML documents stored in a CLOB.

The stored procedure prototype of DBE\_XMLPARSER.PARSECLOB is as follows:

```
DBE_XMLPARSER.PARSECLOB (
  p IN parser,
  doc IN CLOB);
```

**Table 10-424** Parameters for DBE\_XMLPARSER.PARSECLOB

Parameter	Description
p	Parser object
doc	A CLOB that stores XML documents

 **NOTE**

- PARSECLOB cannot parse CLOBs larger than 1 GB.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value "Ch..." is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **&apos;** and **&quot;** are parsed and translated into ' and ". However, predefined entities in ORA database are not translated into characters.

**Example:**

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_clob clob :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>';
-- Create a parser.
l_parser dbe_xmlparser.parser;
l_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
BEGIN
l_parser := dbe_xmlparser.newparser();
-- Parse the document and create a new DOM document.
dbe_xmlparser.parseclob(l_parser, l_clob);
l_doc := dbe_xmlparser.getdocument(l_parser);
dbe_xmldom.writetobuffer(l_doc, buffer);
RAISE NOTICE '%',buffer;
```

```

dbe_xmlparser.freeparser(L_parser);
dbe_xmldom.freedocument(L_doc);

END;
/

```

**Execution result:**

```

NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<note>
  <to>Tove</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>this weekend!</body>
</note>

```

- **DBE\_XMLPARSER.SETVALIDATIONMODE**  
Sets the parsing validation mode of a specified parser.

The stored procedure prototype of DBE\_XMLPARSER.SETVALIDATIONMODE is as follows:

```

DBE_XMLPARSER.SETVALIDATIONMODE(
  p IN parser)
  yes IN BOOLEAN);

```

**Table 10-425** Parameters for DBE\_XMLPARSER.SETVALIDATIONMODE

Parameter	Description
p	Parser object
yes	Mode to be set: <ul style="list-style-type: none"> <li>• <b>TRUE</b>: DTD validation is enabled.</li> <li>• <b>FALSE</b>: DTD validation is disabled.</li> </ul>

 **NOTE**

- If the input parameter **yes** of the SETVALIDATIONMODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

**Example 1:**

```

-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- If setValidationMode is set to false, the string can be parsed. If setValidationMode is set to true,
an error is reported during parsing.
DECLARE
  l_clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;

```

```
buffer varchar2(1000);
BEGIN
  _parser := dbe_xmlparser.newparser();
  -- Set it to false for parsing.
  dbe_xmlparser.setValidationMode(_parser, false);
  dbe_xmlparser.parseclob(_parser, _clob);
  _doc := dbe_xmlparser.getdocument(_parser);
  dbe_xmldom.writetobuffer(_doc, buffer);
  RAISE NOTICE '%', buffer;
  dbe_xmlparser.freeparser(_parser);
  dbe_xmldom.freedocument(_doc);
END;
/
```

#### Execution result:

```
NOTICE: <?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE note [
<!ELEMENT note (to , from , heading , body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>
```

#### Example 2:

```
-- Create a parser. The XML character string to be parsed does not match the DTD format.
-- An error is reported during parsing after setValidationMode is set to true.
DECLARE
  _clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>
<name attr1="WEB" attr2="web2">African Coffee Table</name>
<width>80</width>
<length>120</length>
</table>';
  _parser dbe_xmlparser.parser;
  _doc dbe_xmldom.domdocument;
  buffer varchar2(1000);
BEGIN
  _parser := dbe_xmlparser.newparser();
  -- Set it to true for parsing.
  -- The XML character string does not match the DTD format. An error is expected.
  dbe_xmlparser.setValidationMode(_parser, true);
  dbe_xmlparser.parseclob(_parser, _clob);
  _doc := dbe_xmlparser.getdocument(_parser);
  dbe_xmldom.writetobuffer(_doc, buffer);
  dbe_xmlparser.freeparser(_parser);
  dbe_xmldom.freedocument(_doc);
END;
/
```

#### Execution result:

```
An error is reported during xmlparser parsing.
ERROR: invalid XML document
```

## 10.11.2.19 DBE\_DESCRIBE

### Data Types

The advanced package DBE\_DESCRIBE has two built-in data types. The two data types used for the return values of the DESCRIBE\_PROCEDURE API.

- DBE\_DESCRIBE.NUMBER\_TABLE
- DBE\_DESCRIBE.VARCHAR2\_TABLE

### API Description

The advanced package DBE\_DESCRIBE provides the DESCRIBE\_PROCEDURE API to return the parameter information (such as parameter names and parameter data types) of functions or stored procedures in a list.

**Table 10-426** DBE\_DESCRIBE overview

API	Description
DBE_DESCRIBE.DESCRIBE_PROCEDURE	Displays the parameters of a stored procedure or function.

#### DBE\_DESCRIBE.DESCRIBE\_PROCEDURE

The stored procedure DESCRIBE\_PROCEDURE is used to display the parameter information of a stored procedure or function, such as the parameter name, parameter mode, and parameter location. The parameter information of a function or stored procedure is returned in a list.

The prototype of the DBE\_DESCRIBE.DESCRIBE\_PROCEDURE function is as follows:

```
DBE_DESCRIBE.DESCRIBE_PROCEDURE(
object_name          IN VARCHAR2,
reserved1           IN VARCHAR2,
reserved2           IN VARCHAR2,
overload            OUT DBE_DESCRIBE.NUMBER_TABLE,
dataposition        OUT DBE_DESCRIBE.NUMBER_TABLE,
datalevel           OUT DBE_DESCRIBE.NUMBER_TABLE,
argument_name       OUT DBE_DESCRIBE.VARCHAR2_TABLE,
datatype            OUT DBE_DESCRIBE.NUMBER_TABLE,
default_value       OUT DBE_DESCRIBE.NUMBER_TABLE,
in_out              OUT DBE_DESCRIBE.NUMBER_TABLE,
datalength          OUT DBE_DESCRIBE.NUMBER_TABLE,
dataprecision       OUT DBE_DESCRIBE.NUMBER_TABLE,
scale               OUT DBE_DESCRIBE.NUMBER_TABLE,
radix                OUT DBE_DESCRIBE.NUMBER_TABLE,
spare                OUT DBE_DESCRIBE.NUMBER_TABLE,
include_string_constraints OUT BOOLEAN
);
```

**Table 10-427** DBE\_DESCRIBE.DESCRIBE\_PROCEDURE API

Parameter	Type	Whether NULL Is Allowed	Description
object_name	varchar2	No	Stored procedure name. The syntax format of this parameter is <code>[[<i>schema.</i>]] <i>function</i>[@<i>dblink</i>]</code> , in which: <ul style="list-style-type: none"> <li><i>schema</i> (optional): schema name.</li> <li><i>function</i> (required): name of a function or stored procedure.</li> <li><i>dblink</i> (optional): remote connection name.</li> </ul>
reserved1	varchar2	Yes	Reserved parameter.
reserved2	varchar2	Yes	Reserved parameter.
overload	number_table	Yes	Unique ID assigned to a stored procedure or function. If a stored procedure or function is overloaded, <i>overload</i> is each overload of the stored procedure or function. <i>Overload</i> is numbered from 1 in ascending order based on the entire stored procedure or function. If a stored procedure or function is not overloaded, <b>overload</b> is set to <b>0</b> .
dataposition	number_table	Yes	Position of a specified parameter in the parameter list.
datalevel	number_table	Yes	It is set to <b>0</b> .
argument_name	varchar2_table	Yes	Name of the parameter associated with the specified stored procedure.
datatype	number_table	Yes	OID of the data type of the specified parameter.
default_value	number_table	Yes	If the specified parameter has a default value, the value is <b>1</b> . Otherwise, the value is <b>0</b> .

Parameter	Type	Whether NULL Is Allowed	Description
in_out	number_table	Yes	Parameter mode. The options are as follows: <ul style="list-style-type: none"> <li>• 0: IN</li> <li>• 1: OUT</li> <li>• 2: IN OUT</li> </ul>
datalength	number_table	Yes	Not supported. Set it to <b>0</b> by default.
dataprecision	number_table	Yes	Not supported. Set it to <b>0</b> by default.
scale	number_table	Yes	Not supported. Set it to <b>0</b> by default.
radix	number_table	Yes	If the value is of the numeric type (such as <b>NUMBER</b> and <b>INTEGER</b> ), <b>10</b> is returned. Otherwise, <b>0</b> is returned. For details about the numeric type, see <a href="#">numeric types</a> .
spare	number_table	Yes	Reserved parameter. Set it to <b>0</b> by default.
include_string_constraints	Boolean	Yes	Reserved parameter, which does not need to be processed.

 NOTE

- The data type of the **datatype** parameter is different from that of the ORA-compatible database. The GaussDB returns the OID of the data type, and the ORA-compatible database returns the number of the data type in the ORA-compatible database.
- The **include\_string\_constraints** parameter does not take effect on the stored procedure. The value of the **include\_string\_constraints** parameter does not change, and the return values of other parameters are not affected.
- The OIDs of the data types created by the create type operation are uncertain. Therefore, do not use these OIDs for fixed judgment.
- For the **dataposition** parameter, if a stored procedure is specified, the return value starts from **1**. If a function is specified, the return value starts from **0**. **0** indicates the position sequence number of the return value of the function.
- For the **argument\_name** parameter, if a function is specified, the first position of the return value is empty. This position indicates the name of the return value of the described function (that is, the empty name).
- If you do not have the execute permission on a stored procedure, function, or package, the system considers that the stored procedure, function, or package does not exist and reports an error.
- The input parameters **reserved1** and **reserved2** are not involved in internal processing. Entering any character string does not affect the returned result.
- The advanced package cannot specify the stored procedures or functions obtained through DBLINK.
- You are advised to add the schema prefix before the specified stored procedure or function. If the schema prefix is omitted, the advanced package uses the current schema of the session to search for the entity to which the advanced package belongs. In this case, you need to change the value of **behavior\_compat\_options** to **bind\_procedure\_searchpath** for the advanced package to take effect.
- If the %type operation is used to obtain the data type from a table column, the constraint on the data type (such as NUMBER(3) and VARCHAR2(10)) is not retained.

## Example:

```
-- Create a stored procedure to encapsulate the advanced package for printing return values.
CREATE PROCEDURE PRINT_DESCRIBE (obj_name IN VARCHAR2)
AS
  a_overload DBE_DESCRIBE.NUMBER_TABLE;
  a_position DBE_DESCRIBE.NUMBER_TABLE;
  a_level DBE_DESCRIBE.NUMBER_TABLE;
  a_arg_name DBE_DESCRIBE.VARCHAR2_TABLE;
  a_dty DBE_DESCRIBE.NUMBER_TABLE;
  a_def_val DBE_DESCRIBE.NUMBER_TABLE;
  a_mode DBE_DESCRIBE.NUMBER_TABLE;
  a_length DBE_DESCRIBE.NUMBER_TABLE;
  a_precision DBE_DESCRIBE.NUMBER_TABLE;
  a_scale DBE_DESCRIBE.NUMBER_TABLE;
  a_radix DBE_DESCRIBE.NUMBER_TABLE;
  a_spare DBE_DESCRIBE.NUMBER_TABLE;
  a_include_string_constraints BOOLEAN;
BEGIN
  DBE_DESCRIBE.DESCRIBE_PROCEDURE(
    obj_name,
    null,
    null,
    a_overload,
    a_position,
    a_level,
    a_arg_name,
    a_dty,
    a_def_val,
    a_mode,
    a_length,
```

```
a_precision,
a_scale,
a_radix,
a_spare,
a_include_string_constraints
);
dbe_output.print('overflow      ' || chr(9));
for indx in 1 .. a_overflow.count
loop
  dbe_output.print(a_overflow(indx) || chr(9));
end loop;

dbe_output.print_line(' ');

dbe_output.print('dataposition  ' || chr(9));
for indx in 1 .. a_position.count
loop
  dbe_output.print(a_position(indx) || chr(9));
end loop;

dbe_output.print_line(' ');

dbe_output.print('datalevel    ' || chr(9));
for indx in 1 .. a_level.count
loop
  dbe_output.print(a_level(indx) || chr(9));
end loop;

dbe_output.print_line(' ');

dbe_output.print('argument_name  ' || chr(9));
for indx in 1 .. a_arg_name.count
loop
  dbe_output.print(a_arg_name(indx) || chr(9));
end loop;

dbe_output.print_line(' ');

dbe_output.print('default_value  ' || chr(9));
for indx in 1 .. a_def_val.count
loop
  dbe_output.print(a_def_val(indx) || chr(9));
end loop;

dbe_output.print_line(' ');

dbe_output.print('in_out        ' || chr(9));
for indx in 1 .. a_mode.count
loop
  dbe_output.print(a_mode(indx) || chr(9));
end loop;

dbe_output.print_line(' ');

dbe_output.print('length        ' || chr(9));
for indx in 1 .. a_length.count
loop
  dbe_output.print(a_length(indx) || chr(9));
end loop;

dbe_output.print_line(' ');

dbe_output.print('precision     ' || chr(9));
for indx in 1 .. a_precision.count
loop
  dbe_output.print(a_precision(indx) || chr(9));
end loop;

dbe_output.print_line(' ');
```

```

dbe_output.print('scale          ' || chr(9));
for indx in 1 .. a_scale.count
loop
  dbe_output.print(a_scale(indx) || chr(9));
end loop;

dbe_output.print_line(' ');

dbe_output.print('radix          ' || chr(9));
for indx in 1 .. a_radix.count
loop
  dbe_output.print(a_radix(indx) || chr(9));
end loop;

dbe_output.print_line(' ');
END;
/

```

### 10.11.2.20 prvt\_ilm

The prvt\_ilm API is an internal API of the ILM feature and cannot be directly called by users. Only the API names are listed and the API prototypes are not described.

API	Description
be_active_ado_window	The maintenance window updates the ilmadowindow triggering time and action.
be_create_ado_window_for_each_db	The maintenance window creates ilmadowindow in each database of the instance.
be_execute_ilm	The ilmadowind performs automatic evaluation.
be_execute_ilm_dn	Automatic evaluation is performed on distributed DNs. This operation affects the overall ILM background scheduling of the cluster.
flush_task_executestate	The automatic scheduling task updates the task status.
generate_taskoid	CN generates a task ID for this scheduling.
evaluate_obj_policy	Data objects are evaluated after scheduling is triggered.
change_be_ilm	dbe_ilm_admin.enable_ilm() and disable_ilm() help functions. This operation affects the overall ILM background scheduling of the cluster.
get_compression_ratio	dbe_compression.get_compression_ratio() help function.
get_compression_type	dbe_compression.get_compression_type() help function.
get_lastmodified_time	dbe_heat_map.row_heat_map() help function.
execute_ilm_dn	dbe_ilm.execute_ilm () help function for DNs.

API	Description
stop_ilm_dn	dbe_ilm.stop_ilm () help function for DNs.
ilm_job_action	Compression task executor, which is used for distributed DNs.
delete_expired_ilm_log	Expired logs are cleared in distributed mode.
delete_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.
insert_gs_ilm_jobdetail	System catalog related to the operation feature, which is used for distributed DNs.
insert_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.
insert_gs_ilm_taskdetail	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_jobdetail	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_object	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_param	System catalog related to the operation feature, which is used for distributed DNs. This operation affects the overall ILM background scheduling of the cluster.
update_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.
gs_ilm_ticker	The maintenance window performs an action, performs a dotting operation, and records the mapping between the LSN and time.
compress_blocks	prvt_ilm.ilm_job_action() help function.
get_job_status	dbe_ilm.stop_ilm help function.
insert_gs_ilm_param	System catalogs related to the operation feature.
query_unfinishedjob_num	Queries whether there are jobs that are not complete, including jobs in the initial and running states.
update_gs_ilm_object_flag2	System catalog related to the operation feature, which is used for distributed DNs.
ilm_seq_nextval	Obtains the next sequence value of the ILM.
ilm_seq_setval	Sets the current sequence value of the ILM.

### 10.11.2.21 DBE\_XMLGEN

#### Interface Description

The **DBE\_XMLGEN** system package converts the result of an SQL query into a standard XML format and returns the result. For details about all supported interfaces, see [Table 2 DBE\\_XMLGEN](#).

**Table 10-428** DBE\_XMLGEN data type

Type	Description
DBE_XMLGEN.CTXHANDLE	Data type used to store the XML output status.

#### NOTE

1. A maximum of 65,535 context handles can exist in a session. Closing the context handle does not reclaim the number.
2. The connect by statement is not supported in the distributed system. Therefore, the newcontextfromhierarchy function data cannot be constructed.
3. In a distributed system, the cursor cannot be moved reversely. Therefore, the restartquery function is unavailable.
4. The case of the table column and type in the output XML file is the same as that of the table column and type created by the user. If you need to write a large column and type name, use double quotation marks (""") to specify the column and type name.
5. During NEWCONTEXTFROMHIERARCHY initialization, the SETNULLHANDLING, USENULLATTRIBUTEINDICATOR, and SETCONVERTSPECIALCHARS methods are used to set this parameter, but the setting does not take effect.
6. If ORDER BY is not added for query, the query result is disordered, which affects the return result of the GETXML function.

**Table 10-429** DBE\_XMLGEN

Interface	Description
<a href="#">DBE_XMLGEN.CONVERT</a>	Encodes or decodes the input character string in XML format.
<a href="#">DBE_XMLGEN.NEWCONTEXT</a>	Initializes the common context handle.
<a href="#">DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY</a>	Initializes the context handle with recursive elements.
<a href="#">DBE_XMLGEN.SETCONVERTSPECIALCHARS</a>	Specifies whether the output XML needs to be encoded.
<a href="#">DBE_XMLGEN.SETNULLHANDLING</a>	Sets how to display the null value in the XML file.

Interface	Description
<b>DBE_XMLGEN.SETROWSETTAG</b>	Sets the name of the XML root node.
<b>DBE_XMLGEN.SETROWTAG</b>	Sets the tag name of each row of data in the XML file.
<b>DBE_XMLGEN.USENULLATTRIBUTEINDICATOR</b>	Adds the <b>xsi:nil="true"</b> attribute to the element where the <b>null</b> value is located in the XML file.
<b>DBE_XMLGEN.USEITEMTAGSFORCOLL</b>	Adds the suffix <b>_item</b> to the element where the variable of the array type is located.
<b>DBE_XMLGEN.GETNUMROWSPROCESSED</b>	Views the number of data rows returned by GETXML or GETXMLTYPE last time.
<b>DBE_XMLGEN.SETMAXROWS</b>	Sets the maximum number of rows returned for a GETXML operation.
<b>DBE_XMLGEN.SETSKIPROWS</b>	Sets the number of SQL rows to be skipped.
<b>DBE_XMLGEN.RESTARTQUERY</b>	Restarts the SQL.
<b>DBE_XMLGEN.GETXMLTYPE</b>	Returns the XML text of the XMLTYPE type.
<b>DBE_XMLGEN.GETXML</b>	Returns the XML text of the CLOB type.
<b>DBE_XMLGEN.CLOSECONTEXT</b>	Disables the context handle.

- **DBE\_XMLGEN.CONVERT**  
Encodes or decodes the input character string in XML format. The conversion is performed according to the following rules.

**Table 10-430** XML encoding rules

Original Value	Code Value
&	&amp;
<	&lt;
>	&gt;
"	&quot;
'	&apos;

The function prototype of DBE\_XMLGEN.CONVERT is:

DBE\_XMLGEN.CONVERT(XMLSTR IN VARCHAR2, FLAG IN NUMBER := 0) RETURNS VARCHAR2;  
DBE\_XMLGEN.CONVERT(XMLCLOB IN CLOB, FLAG IN NUMBER := 0) RETURNS CLOB;

**Table 10-431** DBE\_XMLGEN.CONVERT interface parameters

Parameter	Description
XMLSTR	XML character string to be converted. The value is of the VARCHAR2 type.
XMLCLOB	XML character string to be converted. The value is of the CLOB type.
FLAG	Transcodes or decodes character strings. <b>0</b> : encoding. <b>1</b> : decoding.

**Example:**

```
-- XML decoding
SELECT DBE_XMLGEN.CONVERT('<foo/>', 1);
convert
-----
<foo/>
(1 row)
-- XML encoding
SELECT DBE_XMLGEN.CONVERT('<foo><qwe</foo>', 0);
convert
-----
&lt;foo&gt;&lt;qwe&lt;/foo&gt;
```

- **DBE\_XMLGEN.NEWCONTEXT**

Initializes the common context handle.

The function prototype of DBE\_XMLGEN.NEWCONTEXT is:

DBE\_XMLGEN.NEWCONTEXT(QUERYSTRING IN VARCHAR2) RETURNS DBE\_XMLGEN.CTXHANDLE;  
DBE\_XMLGEN.NEWCONTEXT(QUERYSTRING IN SYS\_REFCURSOR) RETURNS  
DBE\_XMLGEN.CTXHANDLE;

**Table 10-432** DBE\_XMLGEN.NEWCONTEXT interface parameters

Parameter	Description
QUERYSTRING	Queries SQL statement or SYS_REFCURSOR used to generate XML files.

- **DBE\_XMLGEN.NEWCONTEXTFROMHIERARCHY**

Initializes the context handle with recursive elements. The data format must contain two columns. The first column is of the numeric type, and the second column is of the XML or XMLTYPE type. Generally, the value is generated by the connect by statement. The first column specifies the generation level. The

distributed system does not support the connect by statement. Therefore, this function case cannot be constructed.

 **NOTE**

The number of nested layers in the generated XML file cannot exceed 50 million.  
The function prototype of DBE\_XMLGEN.NEWCONTEXTFROMHIERARCHY is:  
DBE\_XMLGEN.NEWCONTEXTFROMHIERARCHY(QUERYSTRING IN VARCHAR2);

**Table 10-433** DBE\_XMLGEN.NEWCONTEXTFROMHIERARCHY interface parameters

Parameter	Description
QUERYSTRING	XML character string to be converted. The value is of the VARCHAR2 type.

- **DBE\_XMLGEN.SETCONVERTSPECIALCHARS**  
Specifies whether the output XML needs to be encoded. If XML encoding is canceled, XML injection may occur. If the XML is secured and the performance is considered, XML encoding is not required.

The function prototype of DBE\_XMLGEN.SETCONVERTSPECIALCHARS is:

DBE\_XMLGEN.SETCONVERTSPECIALCHARS(CTX IN DBE\_XMLGEN.CTXHANDLE, CONV IN BOOLEAN);

**Table 10-434** DBE\_XMLGEN.SETCONVERTSPECIALCHARS interface parameters

Parameter	Description
CTX	Context handle.
CONV	Specifies whether to encode the output XML file. <ul style="list-style-type: none"> <li>• <b>true</b>: Perform XML encoding.</li> <li>• <b>false</b>: Do not perform XML encoding.</li> </ul>

- **DBE\_XMLGEN.SETNULLHANDLING**  
Sets how to display the null value in the XML file.

The function prototype of DBE\_XMLGEN.SETNULLHANDLING is:

DBE\_XMLGEN.SETNULLHANDLING(CTX IN DBE\_XMLGEN.CTXHANDLE, FLAG IN NUMBER := 0);

**Table 10-435** DBE\_XMLGEN.SETNULLHANDLING interface parameters

Parameter	Description
CTX	Context handle.

Parameter	Description
FLAG	Null value display format. <ul style="list-style-type: none"> <li>• <b>0</b>: The element is not displayed.</li> <li>• <b>1</b>: The <b>xsi:nil="true"</b> attribute is added to the element.</li> <li>• <b>2</b>: Self-closed elements are displayed.</li> </ul>

- DBE\_XMLGEN.SETROWSETTAG

Sets the name of the XML root node.

The function prototype of DBE\_XMLGEN.SETROWSETTAG is:

```
DBE_XMLGEN.SETROWSETTAG(CTX IN DBE_XMLGEN.CTXHANDLE, ROWSETTAGNAME IN VARCHAR2);
```

**Table 10-436** DBE\_XMLGEN.SETROWSETTAG interface parameters

Parameter	Description
CTX	Context handle.
ROWSETTAGNAME	Name of the XML root node.

- DBE\_XMLGEN.SETROWTAG

Sets the tag name of each row of data in the XML file.

The function prototype of DBE\_XMLGEN.SETROWTAG is:

```
DBE_XMLGEN.SETROWTAG(CTX IN DBE_XMLGEN.CTXHANDLE, ROWTAGNAME IN VARCHAR2);
```

**Table 10-437** DBE\_XMLGEN.SETROWTAG interface parameters

Parameter	Description
CTX	Context handle.
ROWTAGNAME	Tag name of each row of data.

- DBE\_XMLGEN.USENULLATTRIBUTEINDICATOR

Adds the **xsi:nil="true"** attribute to the element where the **null** value is located in the XML file.

The function prototype of DBE\_XMLGEN.USENULLATTRIBUTEINDICATOR is:

```
DBE_XMLGEN.USENULLATTRIBUTEINDICATOR(CTX IN DBE_XMLGEN.CTXHANDLE, ATTRIND IN BOOLEAN);
```

**Table 10-438** DBE\_XMLGEN.USENULLATTRIBUTEINDICATOR interface parameters

Parameter	Description
CTX	Context handle.
ATTRIND	None.

- **DBE\_XMLGEN.USEITEMTAGSFORCOLL**  
Adds the suffix **\_item** to the element where the variable of the array type is located.

The function prototype of DBE\_XMLGEN.USEITEMTAGSFORCOLL is:

```
DBE_XMLGEN.USEITEMTAGSFORCOLL(CTX IN DBE_XMLGEN.CTXHANDLE);
```

**Table 10-439** DBE\_XMLGEN.USEITEMTAGSFORCOLL interface parameters

Parameter	Description
CTX	Context handle.

Example:

```
-- Preset data.
CREATE TABLE test_for_array(idd number, id INT[]);
INSERT INTO test_for_array VALUES(1, ARRAY[1,2,3]);
SELECT DBE_XMLGEN.GETXML('SELECT * from test_for_array');
-- Add the suffix _item to the array type.
DECLARE
qryctx DBE_XMLGEN.CTXHANDLE;
result CLOB;
BEGIN
  qryctx := DBE_XMLGEN.NEWCONTEXT('SELECT id from test_for_array');
  DBE_XMLGEN.useItemTagsForColl(qryctx);
  result:=DBE_XMLGEN.GETXML(qryctx);
  DBE_XMLGEN.CLOSECONTEXT(qryctx);
  DBE_OUTPUT.PUT_LINE(result);
END;
/
<?xml version="1.0"?>
<rowset>
<row>
  <id>
    <int4_ITEM>1</int4_ITEM>
    <int4_ITEM>2</int4_ITEM>
    <int4_ITEM>3</int4_ITEM>
  </id>
</row>
</rowset>
```

- **DBE\_XMLGEN.GETNUMROWSPROCESSED**  
Views the number of data rows returned by GETXML or GETXMLTYPE last time.

The function prototype of DBE\_XMLGEN.GETNUMROWSPROCESSED is:

```
DBE_XMLGEN.GETNUMROWSPROCESSED(CTX IN DBE_XMLGEN.CTXHANDLE);
```

**Table 10-440** DBE\_XMLGEN.GETNUMROWSPROCESSED interface parameters

Parameter	Description
CTX	Context handle.

- **DBE\_XMLGEN.SETMAXROWS**  
Sets maximum number of rows returned by each GETXML operation.

The function prototype of DBE\_XMLGEN.SETMAXROWS is:

```
DBE_XMLGEN.SETMAXROWS(CTX IN DBE_XMLGEN.CTXHANDLE, MAXROWS IN NUMBER);
```

**Table 10-441** DBE\_XMLGEN.SETMAXROWS interface parameters

Parameter	Description
CTX	Context handle.
MAXROWS	Maximum number of rows returned by each GETXML operation.

- DBE\_XMLGEN.SETSKIPROWS  
Sets the number of SQL rows to be skipped.

The function prototype of DBE\_XMLGEN.SETSKIPROWS is:

```
DBE_XMLGEN.SETSKIPROWS(CTX IN DBE_XMLGEN.CTXHANDLE, SKIPROWS IN NUMBER);
```

**Table 10-442** DBE\_XMLGEN.SETSKIPROWS interface parameters

Parameter	Description
CTX	Context handle.
SKIPROWS	Number of SQL header rows that are skipped.

- DBE\_XMLGEN.RESTARTQUERY  
Restarts the SQL. This interface is not supported in distributed mode.

The function prototype of DBE\_XMLGEN.RESTARTQUERY is:

```
DBE_XMLGEN.RESTARTQUERY(CTX IN DBE_XMLGEN.CTXHANDLE);
```

**Table 10-443** DBE\_XMLGEN.RESTARTQUERY interface parameters

Parameter	Description
CTX	Context handle.

- DBE\_XMLGEN.GETXMLTYPE  
Returns the XML text of the XMLTYPE type.

The function prototype of DBE\_XMLGEN.GETXMLTYPE is:

```
DBE_XMLGEN.GETXMLTYPE(SQLQUERY IN VARCHAR2, DTDORSHEMA IN NUMBER := 0) RETURNS XMLTYPE;
```

```
DBE_XMLGEN.GETXMLTYPE(CTX IN DBE_XMLGEN.CTXHANDLE, DTDORSHEMA IN NUMBER := 0) RETURNS XMLTYPE;
```

**Table 10-444** DBE\_XMLGEN.GETXMLTYP interface parameters

Parameter	Description
SQLQUERY	Query SQL statements that need to be converted into XML files.
DTDORSHEMA	None.
CTX	Context handle.

- DBE\_XMLGEN.GETXML

Returns the XML text of the CLOB type.

The function prototype of DBE\_XMLGEN.GETXML is:

```
DBE_XMLGEN.GETXML(SQLQUERY IN VARCHAR2, DTDORSHEMA IN NUMBER := 0) RETURNS CLOB;
DBE_XMLGEN.GETXML(CTX IN DBE_XMLGEN.CTXHANDLE, DTDORSHEMA IN NUMBER := 0)
RETURNS CLOB;
DBE_XMLGEN.GETXML(CTX IN DBE_XMLGEN.CTXHANDLE, TMPCLOB INOUT CLOB, DTDORSHEMA
IN NUMBER := 0);
```

**Table 10-445** DBE\_XMLGEN.GETXML interface parameters

Parameter	Description
SQLQUERY	Query SQL statements that need to be converted into XML files.
DTDORSHEMA	None.
CTX	Context handle.
TMPCLOB	CLOB variable for storing the output XML.

- DBE\_XMLGEN.CLOSECONTEXT

Disables the context handle.

The function prototype of DBE\_XMLGEN.CLOSECONTEXT is:

```
DBE_XMLGEN.CLOSECONTEXT(CTX IN DBE_XMLGEN.CTXHANDLE);
```

**Table 10-446** DBE\_XMLGEN.CLOSECONTEXT interface parameters

Parameter	Description
CTX	Context handle.

Example:

```
CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
VARCHAR2(30), manager NUMBER, location NUMBER);
INSERT INTO department VALUES(10, 'administrator', 200, 1700);
INSERT INTO department VALUES(11, 'aaa', 200, 1700);
INSERT INTO department VALUES(12, 'bbb', 300, 1600);
INSERT INTO department VALUES(13, 'ccc', 400, 1600);
INSERT INTO department VALUES(14, 'aaa</row><a>asd</a><row>', 400, 1600);
```

```
INSERT INTO department VALUES(15, NULL, 500,1600);
INSERT INTO department VALUES(16, '!@#$%^&*()+=<>/\"a3_a', 400, 1600);
-- Disable the context.
DECLARE
  qryctx DBE_XMLGEN.CTXHANDLE;
  result CLOB;
BEGIN
  qryctx := DBE_XMLGEN.NEWCONTEXT('SELECT * from department where department_id=14');
  DBE_XMLGEN.SETCONVERTSPECIALCHARS(qryctx, false);
  result:=DBE_XMLGEN.GETXML(qryctx);
  DBE_XMLGEN.CLOSECONTEXT(qryctx);
  DBE_OUTPUT.PUT_LINE(result);
END;
/
<?xml version="1.0"?>
<rowset>
<row>
  <department_id>14</department_id>
  <department_name>aaa</row><a>asd</a><row></department_name>
  <manager>400</manager>
  <location>1600</location>
</row>
</rowset>
```

## 10.12 Retry Management

Retry is a process in which the database executes an SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. In addition, the database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE retry_basic ( IN x INT)
AS
BEGIN
  INSERT INTO t1 (a) VALUES (x);
  INSERT INTO t1 (a) VALUES (x+1);
END;
/
gaussdb=# CALL retry_basic(1);
```

## 10.13 Debugging

### Syntax

RAISE has the following five syntax formats.

Figure 10-44 raise\_format::=

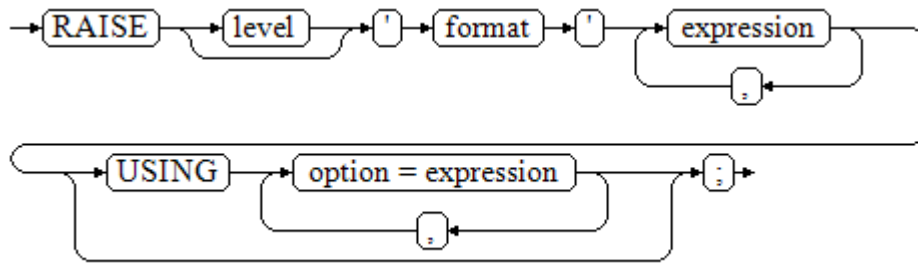

Figure 10-45 raise\_condition::=

Figure 10-46 raise\_sqlstate::=

Figure 10-47 raise\_option::=

Figure 10-48 raise::=

**Parameters:**

- **level:** specifies the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The GUC parameters **log\_min\_messages** and **client\_min\_messages** control whether the error messages of specific levels are reported to the client and are written to the server log.
- **format:** specifies the error message text to be reported, a format string. The format string can be appended with an expression for insertion to the

message text. In a format string, % is replaced by the parameter value attached to format and %% is used to print %. For example:

```
-- v_job_id replaces % in the string.  
RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;
```

- **option = expression:** inserts additional information to an error report. The **keyword** option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE:** specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL:** specifies detailed information of an error.
  - **HINT:** prints hint information.
  - **ERRCODE:** designates an error code (SQLSTATE) to a report. A condition name or a five-character SQLSTATE error code can be used.
- **condition\_name:** specifies the condition name corresponding to the error code.
- **sqlstate:** specifies the error code.

If neither a condition name nor an SQLSTATE is specified in the **RAISE EXCEPTION** command, **RAISE EXCEPTION (P0001)** is used by default. If no message text is specified, the condition name or SQLSTATE is used as the message text by default.

#### NOTICE

- If the SQLSTATE specifies an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII uppercase rather than **00000**. Do not use an error code ended with three zeros because such error codes are category codes and can be captured by the whole category.
- In ORA-compatible mode, SQLCODE is equivalent to SQLSTATE.

#### NOTE

The syntax described in [Figure 10-48](#) does not append any parameter. This form is used only for the **EXCEPTION** statement in a **BEGIN** block so that the error can be re-processed.

#### EXCEPTION\_INIT

In ORA-compatible mode, EXCEPTION\_INIT can be used to define the SQLCODE error code. The syntax is as follows:

**Figure 10-49** exception\_init::=

#### Parameters:

- **exception\_name** indicates the name of the exception declared by the user. The EXCEPTION\_INIT syntax must follow the declared exception.

- **sqlcode** is a customized SQL code, which must be a negative integer ranging from -2147483647 to -1.

**Precautions:**

- This function can be used in ORA-compatible mode but cannot be bound to system error codes.
- Only exception\_init can be used to assign a value to sqlcode joined with exception. Other value assignment modes are invalid.
- Cross-database.schema.package.exception calling is not supported.

**NOTICE**

When **EXCEPTION\_INIT** is used to customize an SQL code, SQLSTATE is equivalent to SQLCODE, and SQLERRM is in the format of *xxx: non-GaussDB Exception*. For example, if the customized SQL code is -1, SQLSTATE is -1 and SQLERRM is 1: **non-GaussDB Exception**.

## Examples

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result
ERROR: Noexistence ID --> 300011
HINT: Please check your user ID
```

Two methods are available for setting SQLSTATE:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result
ERROR: Duplicate user ID: 300011
SQLSTATE: 23505
```

If the main parameter is a condition name or SQLSTATE, the following applies:

```
RAISE division_by_zero;

RAISE SQLSTATE '22012';
```

For example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
```

```
BEGIN
IF dividend=0 THEN
  RAISE division_by_zero;
RETURN;
ELSE
  res := div/dividend;
  RAISE INFO 'division result: %', res;
RETURN;
END IF;
END;
/
call division(3,0);

-- Execution result
ERROR: division_by_zero
```

**Alternatively:**

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

# 11 Autonomous Transaction

---

An autonomous transaction is an independent transaction that is started during the execution of a primary transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. In addition, an autonomous transaction is not affected by the primary transaction.

Autonomous transactions are defined in stored procedures, functions, and anonymous blocks, and are declared using the **PRAGMA AUTONOMOUS\_TRANSACTION** keyword.

## 11.1 Restrictions

---

 CAUTION

- When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max\_concurrent\_autonomous\_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 10000, and the default value is **10**.
  - When **max\_concurrent\_autonomous\_transactions** is set to **0**, autonomous transactions cannot be executed.
  - After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.
  - Theoretically, the upper limit of autonomous transactions is 10000. Actually, the upper limit is a dynamic value. For details, see the description of the GUC parameter **max\_concurrent\_autonomous\_transactions**.
  - Autonomous transactions are affected by the communication buffer. The size of the information returned to the client is limited by the length of the communication buffer. If the size exceeds the length of the communication buffer, an error is reported.
-

- A trigger function does not support autonomous transactions.

```

gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 int, id2 int, id3 int);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'id1' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
$$
DECLARE
  PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
INSERT INTO test_trigger_des_tbl VALUES(new.id1, new.id2, new.id3);
RETURN new;END$$ LANGUAGE plpgsql;
ERROR: Triggers do not support autonomous transactions
DETAIL: N/A

gaussdb=# DROP TABLE test_trigger_des_tbl;
DROP TABLE

```
- Autonomous transactions cannot be called by non-top-layer anonymous blocks (but can only be called by top-layer autonomous transactions, including stored procedures, functions, and anonymous blocks).

```

gaussdb=# CREATE TABLE t1(a INT ,b TEXT);

END;
/
ERROR: Autonomous transactions do not support RETURN SETOF.
DETAIL: N/A
```

## 11.2 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. For details, see [CREATE PROCEDURE](#). The following is an example:

```
-- Create a table.
gaussdb=# CREATE TABLE t2(a INT, b INT);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# INSERT INTO t2 VALUES(1,2);
INSERT 0 1
gaussdb=# SELECT * FROM t2;
 a | b
---+---
 1 | 2
(1 row)
```

```
-- Create a stored procedure that contains an autonomous transaction.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_4(a INT, b INT) AS
DECLARE
  num3 INT := a;
  num4 INT := b;
  PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
  INSERT INTO t2 VALUES(num3, num4);
  DBE_OUTPUT.PRINT_LINE('JUST USE CALL.');
```

END;

```
/
CREATE PROCEDURE

-- Create a common stored procedure that invokes an autonomous transaction stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_5(a INT, b INT) AS
DECLARE
BEGIN
  DBE_OUTPUT.PRINT_LINE('JUST NO USE CALL.');
```

INSERT INTO t2 VALUES(666, 666);

```
autonomous_4(a,b);
ROLLBACK;
END;
/
CREATE PROCEDURE

-- Invoke a common stored procedure.
gaussdb=# SELECT autonomous_5(11,22);
JUST NO USE CALL.
JUST USE CALL.
autonomous_5
-----

(1 row)

-- View the table result.
gaussdb=# SELECT * FROM t2 ORDER BY a;
 a | b
----+----
  1 |  2
 11 | 22
(2 rows)

gaussdb=# DROP TABLE t2;
DROP TABLE
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.3 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an anonymous block. For details, see [Anonymous Blocks](#). The following is an example:

```
gaussdb=# CREATE TABLE t1(a INT ,B TEXT);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
```

```
CREATE TABLE
gaussdb=# START TRANSACTION;
START TRANSACTION
gaussdb=# DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
DBE_OUTPUT.PRINT_LINE('JUST USE CALL. ');
INSERT INTO t1 VALUES(1,'YOU ARE SO CUTE,WILL COMMIT!');
END;
/
JUST USE CALL.
ANONYMOUS BLOCK EXECUTE

gaussdb=# INSERT INTO t1 VALUES(1,'YOU WILL ROLLBACK!');
INSERT 0 1
gaussdb=# ROLLBACK;
ROLLBACK
gaussdb=# SELECT * FROM t1;
 a |      b
---+-----
 1 | YOU ARE SO CUTE,WILL COMMIT!
(1 row)

gaussdb=# DROP TABLE t1;
DROP TABLE
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

## 11.4 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS\_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. For details, see [CREATE FUNCTION](#). The following is an example:

```
gaussdb=# CREATE TABLE t4(a INT, b INT, c TEXT);
NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# CREATE OR REPLACE FUNCTION autonomous_32(a INT ,b INT ,c TEXT) RETURN INT AS
DECLARE
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
INSERT INTO t4 VALUES(a, b, c);
RETURN 1;
END;
/
CREATE FUNCTION
gaussdb=# CREATE OR REPLACE FUNCTION autonomous_33(num1 INT) RETURN INT AS
DECLARE
num3 INT := 220;
tmp INT;
PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
num3 := num3/num1;
RETURN num3;
EXCEPTION
WHEN DIVISION_BY_ZERO THEN
SELECT autonomous_32(num3, num1, SQLERRM) INTO tmp;
```

```
ROLLBACK;  
RETURN 0;  
END;  
/  
CREATE FUNCTION  
gaussdb=# SELECT autonomous_33(0);  
autonomous_33  
-----  
0  
(1 row)  
  
gaussdb=# SELECT * FROM t4;  
a | b | c  
-----  
220 | 0 | division by zero  
(1 row)  
  
gaussdb=# DROP TABLE t4;  
DROP TABLE
```

In the preceding example, a function containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

# 12 System Catalogs and System Views

---

## 12.1 Overview of System Catalogs and System Views

System catalogs store the structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query system catalogs and internal database status.

System catalogs and system views are visible to either system administrators or all users. Some of the following system catalogs and views have marked the need of administrator permissions. They are accessible only to administrators.

You can delete and re-create system catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

---

### NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
  - Do not add, delete, or modify system catalogs because doing so will result in exceptions or even cluster unavailability.
  - System catalogs and views do not support foreign key-related columns.
  - For details about column types in system catalogs and system views, see [Data Types](#).
  - For ADM views, the accessed objects are all objects of this type in the database. Therefore, unified permission management is required for ADM views. By default, only the system administrator has the permission to access ADM views. Some ADM view data comes from public and non-sensitive columns in base tables. For DB views, the objects that the current user has the permission to access in the database can be queried. Common users can access these views. For MY views, objects to which the current user belongs can be queried. Common users can access these views.
-

## 12.2 System Catalogs

### 12.2.1 Partitioned Table

#### 12.2.1.1 PG\_PARTITION

PG\_PARTITION records all partitioned tables, table partitions, and index partitions in the database. Partitioned index information is not stored in the system catalog PG\_PARTITION. The partitioned table does not have actual physical files. Therefore, pg\_partition does not record information such as **relfilenode**, **relpages**, **reltuples**, **reltoastrelid**, and **reltoastidxid**.

**Table 12-1** PG\_PARTITION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Names of the partitioned tables, table partitions, TOAST tables on table partitions, and index partitions.
parttype	"char"	Object type. <ul style="list-style-type: none"> <li>• 'r': partitioned table.</li> <li>• 'p': table partition.</li> <li>• 'x': index partition.</li> </ul>
parentid	oid	<ul style="list-style-type: none"> <li>• OID of the partitioned table in PG_CLASS when the object is a partitioned table or a partition.</li> <li>• OID of the partitioned index when the object is an index partition.</li> </ul>
rangenum	integer	Reserved column.
intervalnum	integer	Reserved column.
partstrategy	"char"	Partition policy of the partitioned table. <ul style="list-style-type: none"> <li>• 'r': range partition.</li> <li>• 'l': list partition.</li> <li>• 'h': hash partition.</li> <li>• 'n': no partition policy. The object is not a table partition.</li> </ul>
relfilenode	oid	Physical storage locations of the table partition, index partition, and TOAST table on the table partition.

Name	Type	Description
reltablespace	oid	OID of the tablespace containing the table partition, index partition, and TOAST table on the table partition.
relpages	double precision	Statistics: numbers of data pages of the table partition and index partition.
reltuples	double precision	Statistics: numbers of tuples of the table partition and index partition.
relallvisible	integer	Statistics: number of visible data pages of the table partition and index partition.
reltoastrelid	oid	OID of the TOAST table corresponding to the table partition.
reltoastidxid	oid	OID of the TOAST table index corresponding to the table partition.
indextblid	oid	OID of the table partition corresponding to the index partition.
indisusable	boolean	Specifies whether the index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
relfrozenxid	xid32	Frozen transaction ID. To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.
intspnum	integer	Number of tablespaces that the interval partition belongs to.
partkey	int2vector	Column number of the partition key.
intervaltablespace	oidvector	Tablespace that the interval partition belongs to. Interval partitions fall in the tablespaces in the round-robin manner.
interval	text[]	Interval value of the interval partition.
boundaries	text[]	Upper boundary of the range partition and interval partition.
transit	text[]	Transit of the interval partition.
reloptions	text[]	Storage property of a partition used for collecting online scale-out information. Same as <b>pg_class.reloptions</b> , it is expressed in a string in the format of keyword=value.
relfrozenxid64	xid	Frozen transaction ID.

Name	Type	Description
relminmxid	xid	Frozen multi-transaction ID.
partitionno	integer	Used for maintaining the partition map of a partitioned table. <ul style="list-style-type: none"> <li>If the object is a partition, this column indicates the partition ID, which starts from 1 in ascending order.</li> <li>If the object is a partitioned table, this column indicates the maximum partition ID and a negative value is used for special meaning. The value increases with the DDL syntax of some partitions.</li> <li>If the object is of other types, this column is null and has no meaning.</li> </ul> <b>partitionno</b> is a permanent auto-increment column, which can be reset or reclaimed by using the syntax ALTER TABLE t_name RESET PARTITION.
subpartitionno	integer	Reserved column.

## 12.2.2 OLTP Table Compression

### 12.2.2.1 GS\_ILM

The GS\_ILM system catalog provides the main information about the ILM policy, including the policy name, policy owner, policy type, policy ID, and policy status.

**Table 12-2** GS\_ILM columns

Name	Type	Description
pidx	integer	Policy sequence number, which is globally unique and starts with 1.
creator	oid	Policy owner.
name	name	Policy name. Currently, the policy name cannot be customized. The default name is p + pidx.
ptype	"char"	Policy type: <ul style="list-style-type: none"> <li><b>m</b>: data movement.</li> </ul>
flag	smallint	Value range: <ul style="list-style-type: none"> <li><b>0</b>: The policy is enabled.</li> <li><b>1</b>: The policy is disabled.</li> </ul>

### 12.2.2.2 GS\_ILM\_OBJECT

GS\_ILM\_OBJECT records the relationships between data objects and policies as well as the scheduling information of policies on the data objects. When a policy is set for a partitioned table, this catalog generates an independent record for each partition or subpartition.

**Table 12-3** GS\_ILM\_OBJECT columns

Name	Type	Description
pidx	integer	Policy ID.
objoid	oid	OID of a logical data object which has a partitioned table.
dataobjoid	oid	OID of a physical data object, which is the entity that needs to execute the policy and the leaf of the tree-level partition relationship.
objtype	"char"	Current data object type. The options are as follows: <ul style="list-style-type: none"> <li>• Table ('r')</li> <li>• Partition ('p')</li> </ul>
origobjoid	oid	OID of the original object that defines the policy.
origobjtype	"char"	Type of the original data object that defines the policy. The options are as follows: <ul style="list-style-type: none"> <li>• Table ('r')</li> <li>• Partition ('p')</li> </ul>
lastchktime	timestamp with time zone	Time of the last ADO task.
lastexetime	timestamp with time zone	Time of the last ADO job.
roundcnt	smallint	Number of successful rounds.
failcnt	smallint	Number of failures.
lastjobstatus	"char"	Execution status of the last job.
lastroundstarttime	timestamp with time zone	Start time of the full table scan.
lastjobblkid	bigint	ID of the block that has been processed by the job last time.

Name	Type	Description
flag	smallint	Value range: <ul style="list-style-type: none"> <li>● 0: enabled.</li> <li>● 1: disabled.</li> </ul>

### 12.2.2.3 GS\_ILM\_JOBDETAIL

The GS\_ILM\_JOBDETAIL system catalog records policy action types and judgment conditions.

**Table 12-4** GS\_ILM\_JOBDETAIL columns

Name	Type	Description
taskoid	bigint	OID of an ADO task.
jobtype	"char"	Current job type: compression ('c').
jobstatus	smallint	Current job status: <ul style="list-style-type: none"> <li>● 1: JOB CREATED</li> <li>● 2: COMPLETED SUCCESSFULLY</li> <li>● 3: FAILED</li> <li>● 4: STOPPED</li> <li>● 5: JOB CREATION FAILED</li> </ul>
jobname	text	The ADO job name is unique in the table and is joined with <b>job_name</b> in the <b>PG_JOB</b> system catalog.
starttime	timestamp with time zone	Start time.
completetime	timestamp with time zone	Completion time.
payload	text	PL/SQL code of the current job.
statistics	text	Statistics of the current job.
comments	text	Description of the current job execution, such as the failure cause.

### 12.2.2.4 GS\_ILM\_PARAM

GS\_ILM\_PARAM is a feature parameter table, which records the parameters related to the ILM feature, such as the control parameters of background scheduling.

**Table 12-5** GS\_ILM\_PARAM columns

Name	Type	Description
idx	smallint	Parameter ID.
name	name	Parameter name.
value	double precision	Parameter value.

**Table 12-6** GS\_ILM\_PARAM feature parameter range

Parameter ID	Parameter Value	Description
1	EXECUTION_INTERVAL	Specifies the frequency of executing an ADO task, in minutes. The default value is <b>15</b> . The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
2	RETENTION_TIME	Specifies the retention period of ADO-related history records, in days. The default value is <b>30</b> . The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
7	ENABLE	Specifies the background scheduling status which cannot be modified in this interface. Otherwise, the message "Invalid argument value, ENABLED should be change by calling DBE_ILM_ADMIN.ENABLE_ILM and DBE_ILM_ADMIN.DISABLE_ILM" is displayed. Instead, use disable_ilm() and enable_ilm() to modify it.
11	POLICY_TIME	Specifies whether the time unit of ADO is day or second. The time unit second is used only for testing. The value can be <b>ILM_POLICY_IN_SECONDS</b> or <b>ILM_POLICY_IN_DAYS</b> (default value).
12	ABS_JOBLIMIT	Specifies the maximum number of ADO jobs generated by an ADO task. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
13	JOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job. The unit is MB. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.

Parameter ID	Parameter Value	Description
14	WIND_DURATION	Specifies the maintenance window duration, in minutes. The default value is 240 minutes (4 hours). The value is an integer greater than or equal to 0 and less than 1440 (24 hours).
15	BLOCK_LIMITS	Specifies the upper limit of the instance-level row-store compression rate. The default value is <b>40</b> . The value ranges from 0 to 10000, in block/ms, indicating the maximum number of blocks that can be compressed per millisecond. <b>0</b> indicates that the rate is not limited.

### 12.2.2.5 GS\_ILM\_POLICY

The GS\_ILM\_POLICY system catalog records policy action types and judgment conditions.

**Table 12-7** GS\_ILM\_POLICY columns

Name	Type	Description
pidx	integer	Policy ID.
action	"char"	Policy action. Only compression ('c') is supported.
ctype	"char"	Compression type. Only advanced row compression ('a') is supported.
condition	"char"	Condition type. Only LAST MODIFICATION('m') is supported.
days	smallint	Number of judgment days.
scope	"char"	Policy scope. Only row ('r') is supported.
predicate	pg_node_tree	Policy row-level expression.

### 12.2.2.6 GS\_ILM\_TASK

The GS\_ILM\_TASK system catalog records ADO task information, such as the creation time, start time, end time, and execution status.

**Table 12-8** GS\_ILM\_TASK columns

Name	Type	Description
taskoid	bigint	OID of an ADO task.
creator	oid	Creator of an ADO task.
createtime	timestamp with time zone	Creation time.
starttime	timestamp with time zone	Start time.
completetime	timestamp with time zone	Completion time.
executestate	smallint	Value range: <ul style="list-style-type: none"> <li>• 1: 'INACTIVE'</li> <li>• 2: 'ACTIVE'</li> <li>• 3: 'COMPLETED'</li> </ul>
flag	smallint	Reserved column.

### 12.2.2.7 GS\_ILM\_TASKDETAIL

The GS\_ILM\_TASKDETAIL system catalog records the evaluation result of a specified data object and policy.

**Table 12-9** GS\_ILM\_TASKDETAIL columns

Name	Type	Description
pidx	integer	Policy ID.
objoid	oid	Data OID.
objtype	"char"	Data object type.
taskoid	bigint	OID of an ADO task.
evalresult	smallint	Evaluation result: <ul style="list-style-type: none"> <li>• 0: SELECTED FOR EXECUTION. The evaluation is passed.</li> <li>• 1: PRECONDITION NOT SATISFIED. The condition is not met.</li> <li>• 2: JOB ALREADY EXISTS. The job already exists.</li> </ul>
jobname	text	ADO job name generated after the evaluation is passed is joined with the <b>jobname</b> column in the <a href="#">GS_ILM_JOBDETAIL</a> system catalog.

### 12.2.2.8 GS\_ILM\_TICKER

The `GS_ILM_TICKER` system catalog records the mapping between LSNs and time. A maximum of 3650 lines of records can be retained.

**Table 12-10** `GS_ILM_TICKER` columns

Name	Type	Description
<code>ilm_ticker_lsn</code>	bigint	LSN when the dotting operation is triggered.
<code>ilm_ticker_time</code>	timestamp with time zone	Time when the dotting operation is triggered.

## 12.2.3 Encrypted Equality Query

### 12.2.3.1 GS\_CLIENT\_GLOBAL\_KEYS

`GS_CLIENT_GLOBAL_KEYS` records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

**Table 12-11** `GS_CLIENT_GLOBAL_KEYS` columns

Name	Type	Description
<code>oid</code>	oid	Row identifier (hidden column)
<code>global_key_name</code>	name	CMK name
<code>key_namespace</code>	oid	A namespace OID that contains this CMK
<code>key_owner</code>	oid	CMK owner
<code>key_acl</code>	aclitem[]	Access permissions that this key should have on creation
<code>create_date</code>	timestamp without time zone	Time when a key is created

### 12.2.3.2 GS\_CLIENT\_GLOBAL\_KEYS\_ARGS

`GS_CLIENT_GLOBAL_KEYS_ARGS` records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-12** GS\_CLIENT\_GLOBAL\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_id	oid	CMK OID
function_name	name	The value is <b>encryption</b> .
key	name	CMK metadata name
value	bytea	Value of the CMK metadata name

### 12.2.3.3 GS\_COLUMN\_KEYS

GS\_COLUMN\_KEYS records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

**Table 12-13** GS\_COLUMN\_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_name	name	CEK name
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK
global_key_id	oid	A foreign key, which is the CMK OID.
key_namespace	oid	A namespace OID that contains this CEK
key_owner	oid	CEK owner
create_date	timestamp without time zone	Time when the CEK is created
key_acl	aclitem[]	Access permissions that this CEK should have on creation

### 12.2.3.4 GS\_COLUMN\_KEYS\_ARGS

GS\_COLUMN\_KEYS\_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

**Table 12-14** GS\_COLUMN\_KEYS\_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_id	oid	CEK OID
function_name	name	The value is <b>encryption</b> .
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

### 12.2.3.5 GS\_ENCRYPTED\_COLUMNS

GS\_ENCRYPTED\_COLUMNS records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

**Table 12-15** GS\_ENCRYPTED\_COLUMNS columns

Name	Type	Description
rel_id	oid	Table OID
column_name	name	Name of an encrypted column.
column_key_id	oid	A foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be <b>2(DETERMINISTIC)</b> or <b>1(RANDOMIZED)</b> .
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the values, see the oid columns in the <a href="#">PG_TYPE</a> system catalog.
data_type_original_mod	integer	Modifiers of the original data type of the encrypted column. For details about the values, see the atttypmod columns in the <a href="#">PG_ATTRIBUTE</a> system catalog.
create_date	timestamp without time zone	Time when an encrypted column is created

### 12.2.3.6 GS\_ENCRYPTED\_PROC

GS\_ENCRYPTED\_PROC provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

**Table 12-16** GS\_ENCRYPTED\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
func_id	oid	OID of the function, corresponding to the OID row identifier in the <a href="#">PG_PROC</a> system catalog.
prorettype_orig	integer	Original data type of the return value.
last_change	timestamp without time zone	Last modification time of the encrypted function
proargcachedcol	oidvector	OID of the encrypted column corresponding to the <b>INPUT</b> parameter of the function, corresponding to the OID row identifier in the <a href="#">GS_ENCRYPTED_COLUMNS</a> system catalog.
proallargtypes_orig	oid[]	Original data type of all function parameters.

## 12.2.4 Communications

### 12.2.4.1 PGXC\_NODE

PGXC\_NODE records information about cluster nodes.

#### NOTICE

- PGXC\_NODE stores information about database instance nodes. The PGXC\_NODE system catalog has specific meanings only on CNs and its data is valid and correct.
- In the result of querying the PGXC\_NODE system catalog on a DN, only the **node\_id** column is meaningful. Other columns are meaningless and invalid.

**Table 12-17** PGXC\_NODE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
node_name	name	Node name.

Name	Type	Description
node_type	"char"	Node type. <ul style="list-style-type: none"> <li>• <b>C</b>: CN</li> <li>• <b>D</b>: DN</li> <li>• <b>S</b>: standby node</li> </ul>
node_port	integer	Port number of the node.
node_host	name	Host name or IP address of a node. (If a virtual IP address is configured, its value is a virtual IP address.)
node_port1	integer	Port number of a replication node.
node_host1	name	Host name or IP address of a replication node. (If a virtual IP address is configured, its value is a virtual IP address.)
hostis_primary	Boolean	Specifies whether a primary/standby switchover occurs on the current node. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
nodeis_primary	Boolean	Specifies whether the current node is preferred to execute non-query operations in the <b>replication</b> table. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
nodeis_preferred	Boolean	Specifies whether the current node is preferred to execute queries in the <b>replication</b> table. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
node_id	integer	Node identifier. The value is obtained by calculating the value of <b>node_name</b> using the hash function.
sctp_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the data channel. (The Sctp communications library is no longer supported in the current version.)
control_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the control channel.
sctp_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the data channel. (The Sctp communications library is no longer supported in the current version.)

Name	Type	Description
control_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the control channel.
nodeis_central	Boolean	Specifies whether the current node is a central control node. It is used only for CNs and is invalid for DNs. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
nodeis_active	Boolean	Specifies whether the current node is normal. It is used to mark whether the CN is removed and is invalid for DNs. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

## 12.2.5 Ledger Database

### 12.2.5.1 GS\_GLOBAL\_CHAIN

GS\_GLOBAL\_CHAIN records information about modification operations performed by users on the tamper-proof user table. Each record corresponds to a table-level modification operation. Users with the audit administrator permission can query this system catalog, but no user is allowed to modify this system catalog.

**Table 12-18** GS\_GLOBAL\_CHAIN columns

Name	Type	Description
blocknum	bigint	Block number, which is the sequence number of the current user operation recorded in the ledger.
dbname	name	Name of the database to which the modified tamper-proof user table belongs.
username	name	Username, which is the name of the user who performs the operation of modifying the user table.
starttime	timestamp with time zone	Time when a user performs an operation.
relid	oid	OID of the modified tamper-proof user table
relnsp	name	Schema name, which is the name of the schema to which the modified tamper-proof user table belongs.

Name	Type	Description
relname	name	User table name, which is the name of the modified tamper-proof user table.
relhash	hash16	Table-level hash change amount generated by operations.
globalhash	hash32	Global digest, which is calculated based on the information of the current row and <b>globalhash</b> of the previous row. It connects the entire table to verify the integrity of GS_GLOBAL_CHAIN data.
txcommand	text	SQL statement whose operations are recorded.

## 12.2.6 SPM

### 12.2.6.1 GS\_SPM\_SQL

GS\_SPM\_SQL is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store SPM information. Users with sysadmin permissions can read the system catalog, but only initial users can write the system catalog.

**Table 12-19** GS\_SPM\_SQL columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
sql_text	text	SQL text string.
param_num	integer	Number of parameters required for SQL execution.
user	oid	OID of the login user.
creation_time	timestamp with time zone	Time when a record is created.

### 12.2.6.2 GS\_SPM\_PARAM

GS\_SPM\_PARAM is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store SQL parameters. Each SQL statement stores only one group of parameters. Users with

the sysadmin permission can read the system catalog, but only initial users can write the system catalog.

**Table 12-20** GS\_SPM\_PARAM columns

Name	Type	Description
sql_namespace	oid	Schema OID
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
position	integer	Position index of a parameter in the SQL statement, starting from 0.
datatype	integer	OID of the parameter type.
datatype_string	text	Character string of a parameter type.
value_string	text	Character string of a parameter value.
is_null	boolean	Determines whether a parameter value is <b>NULL</b> .
hash_value	bigint	Hash value of a parameter value.
user	oid	User who creates the record.
creation_time	timestamp with time zone	Time when a record is created.

### 12.2.6.3 GS\_SPM\_BASELINE

GS\_SPM\_BASELINE is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store baseline information. Users with sysadmin permissions can read the system catalog, but only initial users can write the system catalog.

**Table 12-21** GS\_SPM\_BASELINE columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
cost	double precision	Total plan cost.

Name	Type	Description
user	oid	User who creates the baseline.
status	integer	Baseline status. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b> (UNACC): indicates that the plan is not accepted.</li> <li>• <b>1</b> (ACC): indicates that the plan has been accepted.</li> <li>• <b>2</b> (FIXED): indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plan.</li> </ul>
source	text	Baseline source.
gplan	Boolean	Determines whether the plan is a gplan.
creation_time	timestamp with time zone	Time when the baseline is created.
last_used_time	timestamp with time zone	Last time when a plan was used.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

#### 12.2.6.4 GS\_SPM\_EVOLUTION

GS\_SPM\_EVOLUTION is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store plan evolution result. Users with sysadmin permissions can read the system catalog, but only initial users can write the system catalog.

**Table 12-22** GS\_SPM\_EVOLUTION columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Plan ID.

Name	Type	Description
better	boolean	Determines whether it is a positive evolution. <ul style="list-style-type: none"> <li>• <b>t</b> indicates positive evolution.</li> <li>• <b>f</b> indicates negative evolution.</li> </ul>
refer_plan	bigint	Plan hash used as a reference for report generation.
status	integer	Determines whether exceptions occur during the evolution. <ul style="list-style-type: none"> <li>• The value <b>0</b> indicates that no exception occurs.</li> <li>• The value <b>1</b> indicates that an exception occurs.</li> </ul>
reason	text	Content of the evolution report.
user	oid	User who generates the evolution result.
creation_time	timestamp with time zone	Time when the evolution result is created.

### 12.2.6.5 GS\_SPM\_ID\_HASH\_JOIN

GS\_SPM\_ID\_HASH\_JOIN is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. The system catalog stores the relationship between unique\_sql\_id and sql\_hash. Users with sysadmin permissions can read the system catalog, but only initial users can write data to the system catalog.

**Table 12-23** GS\_SPM\_ID\_HASH\_JOIN columns

Name	Type	Description
unique_sql_id	bigint	Unique ID of an SQL statement in the database.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.

## 12.2.7 AI

### 12.2.7.1 GS\_MODEL\_WAREHOUSE

**GS\_MODEL\_WAREHOUSE** stores AI engine training models, including the models and detailed description of the training process.

**Table 12-24** GS\_MODEL\_WAREHOUSE columns

Name	Data Type	Description
oid	oid	Hidden column
modelname	name	Unique constraint
modelowner	oid	OID of a model owner
createtime	timestamp without time zone	Time when a model is created
processedtuples	integer	Number of tuples involved in training
discardedtuples	integer	Number of unqualified tuples not involved in training
preprocesstime	real	Data preprocessing time
exectime	real	Training duration
iterations	integer	Iteration round
outputtype	oid	OID of the output data type
modeltype	text	AI operator type
query	text	Query statement executed to create a model
modeldata	bytea	Stored binary model information
weight	real[]	Currently, this column applies only to GD operator models.
hyperparametersnames	text[]	Involved hyperparameter name
hyperparametersvalues	text[]	Hyperparameter value
hyperparametersoids	oid[]	OID of the data type corresponding to a hyperparameter
coefnames	text[]	Model parameter
coefvalues	text[]	Value of a model parameter
coefoids	oid[]	OID of the data type corresponding to a model parameter

Name	Data Type	Description
trainingscoresname	text[]	Method used to measure model performance
trainingscoresvalue	real[]	Value used to measure model performance
modeldescribe	text[]	Model description

### 12.2.7.2 GS\_OPT\_MODEL

GS\_OPT\_MODEL is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

 **NOTE**

In the distributed scenario, this system catalog is provided, but the AI capabilities are unavailable.

### 12.2.7.3 GS\_ABO\_MODEL\_STATISTIC

GS\_ABO\_MODEL\_STATISTIC records the metadata, model name, and operator information of the ABO-based model estimation based on the feedback cardinality.

 **NOTE**

This system catalog is provided in distributed scenarios, but the capability of estimating based on the feedback cardinality is unavailable.

## 12.2.8 Auditing

### 12.2.8.1 GS\_AUDITING\_POLICY

GS\_AUDITING\_POLICY records the main information about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-25** GS\_AUDITING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
polname	name	Policy name, which must be unique

Name	Type	Description
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	The latest timestamp when a policy is created or modified
polenabled	boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled.</li> <li>• <b>f</b> (false): disabled.</li> </ul>

### 12.2.8.2 GS\_AUDITING\_POLICY\_ACCESS

GS\_AUDITING\_POLICY\_ACCESS records the unified audit information about DML database operations. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-26** GS\_AUDITING\_POLICY\_ACCESS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
accesstype	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
labelname	name	Specifies the resource label name. This parameter corresponds to the <b>polname</b> column in the system catalog in <a href="#">GS_AUDITING_POLICY</a> .
policyoid	oid	OID of the audit policy, corresponding to the OID in the <a href="#">12.2.9.1 GS_AUDITING_POLICY</a> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

### 12.2.8.3 GS\_AUDITING\_POLICY\_FILTERS

GS\_AUDITING\_POLICY\_FILTERS records the filtering policies about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-27** GS\_AUDITING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
labelname	name	Name. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of the audit policy, corresponding to the OID in the system catalog in <a href="#">GS_AUDITING_POLICY</a> .
modifydate	timestamp without time zone	Latest creation or modification timestamp.
logicaloperator	text	Logical character string of a filter criterion.

#### 12.2.8.4 GS\_AUDITING\_POLICY\_PRIVILEGES

GS\_AUDITING\_POLICY\_PRIVILEGES records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-28** GS\_AUDITING\_POLICY\_PRIVI columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
privilege_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
labelname	name	Resource label name. This parameter corresponds to the <b>polname</b> column in the <a href="#">12.2.9.1 GS_AUDITING_POLICY</a> system catalog.
policyoid	oid	This parameter corresponds to OIDs in the <a href="#">12.2.9.1 GS_AUDITING_POLICY</a> system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

## 12.2.9 User and Permission Management

### 12.2.9.1 GS\_DB\_PRIVILEGE

**GS\_DB\_PRIVILEGE** records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-29** GS\_DB\_PRIVILEGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roleid	oid	User ID
privilege_type	text	ANY permission of a user. For details about the value, see <a href="#">Table 7-243</a> .
admin_option	boolean	Whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted <ul style="list-style-type: none"> <li>• t: yes</li> <li>• f: no</li> </ul>

### 12.2.9.2 PG\_DB\_ROLE\_SETTING

**PG\_DB\_ROLE\_SETTING** records the default values of configuration items bound to each role and data when the database is running.

**Table 12-30** PG\_DB\_ROLE\_SETTING columns

Name	Type	Description
setdatabase	oid	Database corresponding to the configuration items ( <b>0</b> if no database is specified).
setrole	oid	Role corresponding to the configuration items ( <b>0</b> if no role is specified).
setconfig	text[]	Default value of runtime configuration items. Contact the administrator to configure it.

### 12.2.9.3 PG\_DEFAULT\_ACL

**PG\_DEFAULT\_ACL** records initial permissions assigned to newly created objects.

**Table 12-31** PG\_DEFAULT\_ACL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
defaclrole	oid	ID of the role associated with the permission
defaclnamespace	oid	Namespace associated with the permission ( <b>0</b> if no ID)
defaclobjtype	"char"	Object type of the permission <ul style="list-style-type: none"> <li>• <b>r</b>: table or view</li> <li>• <b>S</b>: sequence</li> <li>• <b>f</b>: function</li> <li>• <b>T</b>: type</li> <li>• <b>K</b>: client master key</li> <li>• <b>k</b>: column encryption key</li> </ul>
defaclacl	aclitem[]	Access permissions that this type of object should have on creation

#### 12.2.9.4 PG\_RLSPOLICY

PG\_RLSPOLICY records row-level security policies.

**Table 12-32** PG\_RLSPOLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Name of the row-level security policy.
polrelid	oid	OID of the table object on which the row-level security policy takes effect.
polcmd	"char"	SQL operations affected by the row-level security policy.
polpermissive	Boolean	Attribute of the row-level security policy. <ul style="list-style-type: none"> <li>• <b>t</b>: OR condition concatenation of expressions.</li> <li>• <b>f</b>: AND condition concatenation of expressions.</li> </ul>
polroles	oid[]	OID list of users affected by the row-level security policy. If this parameter is not specified, all users are affected.

Name	Type	Description
polqual	pg_node_tree	Expression of the row-level security policy.

### 12.2.9.5 PG\_SECLABEL

**PG\_SECLABEL** records security labels on database objects.

See also [PG\\_SHSECLABEL](#), which provides a similar function for security labels of database objects that are shared across a database cluster.

**Table 12-33** PG\_SECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to
classoid	oid	<a href="#">PG_CLASS</a> .oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a security label on a table column
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

### 12.2.9.6 PG\_SHSECLABEL

**PG\_SHSECLABEL** records security labels on shared database objects. Security labels can be manipulated with the **SECURITY LABEL** command.

For an easier way to view security labels, see [PG\\_SECLABELS](#).

See also [PG\\_SECLABEL](#), which provides a similar function for security labels involving objects within a single database.

Unlike most system catalogs, **PG\_SHSECLABEL** is shared across all databases of a cluster. There is only one copy of **PG\_SHSECLABEL** per cluster, not one per database.

**Table 12-34** PG\_SHSECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to

Name	Type	Reference	Description
classoid	oid	<a href="#">PG_CLASS.oid</a>	OID of the system catalog where the object appears
provider	text	-	Label provider associated with the label
label	text	-	Security label applied to the object

### 12.2.9.7 PG\_USER\_MAPPING

**PG\_USER\_MAPPING** records mappings from local users to remote.

This system catalog is accessible only to system administrators. Common users can query the [PG\\_USER\\_MAPPINGS](#) view.

**Table 12-35** PG\_USER\_MAPPING columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
umuser	oid	<a href="#">PG_AUTHID.oid</a>	OID of the local role being mapped ( <b>0</b> if the user mapping is public)
umserver	oid	<a href="#">PG_FOREIGN_SERVER.oid</a>	OID of the foreign server that contains the mapping
umoptions	text[]	-	User mapping specific options, expressed in a string in the format of keyword=value

### 12.2.9.8 PG\_USER\_STATUS

**PG\_USER\_STATUS** records the states of users who access the database. This system catalog is accessible only to users with the system administrator permission.

**Table 12-36** PG\_USER\_STATUS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of a role
failcount	integer	Number of failed attempts

Name	Type	Description
locktime	timestamp with time zone	By default, the creation date of the role is displayed. If the role is locked by the administrator or the role is locked because the number of login failures exceeds the threshold, the date when the role is locked is displayed.
rolstatus	smallint	Role state. <ul style="list-style-type: none"> <li>• <b>0</b>: normal.</li> <li>• <b>1</b>: The role is locked for a specific period of time because the failed login attempts exceed the threshold.</li> <li>• <b>2</b>: The role is locked by the administrator.</li> </ul>
permstorage	bigint	Size of the permanent table storage space used by a role.
tempstorage	bigint	Size of the temporary table storage space used by a role.
password expired	smallint	Specifies whether a password is valid. <ul style="list-style-type: none"> <li>• <b>0</b>: The password is valid.</li> <li>• <b>1</b>: The password is invalid.</li> </ul>

## 12.2.10 Connection and Authentication

### 12.2.10.1 PG\_AUTHID

PG\_AUTHID records information about database authentication identifiers (roles). The concept of users is contained in that of roles. A user is actually a role whose **rolcanlogin** has been set. Any role, whether its **rolcanlogin** is set or not, can use other roles as members.

For a cluster, only one PG\_AUTHID exists, which is not available for every database. This system catalog is accessible only to system administrators.

**Table 12-37** PG\_AUTHID columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rolname	name	Role name.

Name	Type	Description
rolsuper	boolean	Specifies whether a role is the initial system administrator with the highest permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolinherit	boolean	Specifies whether a role automatically inherits permissions of roles of which it is a member. <ul style="list-style-type: none"> <li>• <b>t</b> (true): automatically inherited</li> <li>• <b>f</b> (false): not automatically inherited</li> </ul>
rolcreatorole	boolean	Specifies whether a role can create more roles. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcreatedb	boolean	Specifies whether a role can create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcatupdate	boolean	Specifies whether the role can directly update system catalogs. Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. It is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolcanlogin	boolean	Specifies whether the role can log in, that is, whether the role can be given as the initial session authorization identifier. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolreplication	boolean	Specifies whether the role has the replication permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolauditadmin	boolean	Specifies whether the role has the audit administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Description
rolsystemadmin	boolean	Specifies whether the role has the system administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolconnlimit	integer	Maximum number of concurrent connections that this role can make (valid for roles that can log in). The value <b>-1</b> indicates there is no limit.
rolpassword	text	Password ciphertext. If there is no password, the value is <b>NULL</b> .
rolvalidbegin	timestamp with time zone	Account validity start time ( <b>NULL</b> if no start time).
rolvaliduntil	timestamp with time zone	Password expiry time ( <b>NULL</b> if no expiration).
rolrespool	name	Resource pool that a user can use.
roluseft	boolean	Specifies whether the role can perform operations on foreign tables. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolparentid	oid	OID of a group user to which the user belongs.
roltabspace	text	Maximum size of a user data table
rolkind	"char"	Type of a user. <ul style="list-style-type: none"> <li>• <b>n</b>: common user</li> <li>• <b>p</b>: permanent user</li> </ul>
roltemp space	text	Maximum size of a user's temporary table, in KB.
rolspillspace	text	Maximum size of data that can be written to disks when a user executes a job, in KB.
rolexcpdata	text	Query rules that can be set by users (reserved).
rolmonitoradmin	boolean	Specifies whether the role has the monitor administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Description
roloperatoradmin	boolean	Specifies whether the role has the O&M administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
rolpolicyadmin	boolean	Specifies whether the role has the security policy administrator permission. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

### 12.2.10.2 PG\_AUTH\_HISTORY

PG\_AUTH\_HISTORY records the authentication history of a role. This system catalog is accessible only to system administrators.

**Table 12-38** PG\_AUTH\_HISTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of a role.
passwordtime	timestamp with time zone	Time of password creation and change.
rolpassword	text	Ciphertext of the role password. The encryption mode is determined by the GUC parameter <b>password_encryption_type</b> .

### 12.2.10.3 PG\_AUTH\_MEMBERS

PG\_AUTH\_MEMBERS records the membership between roles.

**Table 12-39** PG\_AUTH\_MEMBERS columns

Name	Type	Description
roleid	oid	ID of a role that has a member
member	oid	ID of a role that is a member of ROLEID
grantor	oid	ID of a role that grants this membership

Name	Type	Description
admin_option	boolean	Whether a member can grant membership in ROLEID to others. The value can be <b>true</b> (yes) and <b>false</b> (no).

## 12.2.11 Dynamic Data Masking

### 12.2.11.1 GS\_MASKING\_POLICY

**GS\_MASKING\_POLICY** records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-40** GS\_MASKING\_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique.
polcomments	name	Policy description field, which records policy-related description information and is represented by the <b>COMMENTS</b> keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified.
polenabled	boolean	Specifies whether to enable the policy. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled</li> <li>• <b>f</b> (false): disabled</li> </ul>

### 12.2.11.2 GS\_MASKING\_POLICY\_ACTIONS

**GS\_MASKING\_POLICY\_ACTIONS** records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-41** GS\_MASKING\_POLICY\_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
actiontype	name	Name of a masking function used by a masking policy
actparams	name	Parameter information transferred to a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> .
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

### 12.2.11.3 GS\_MASKING\_POLICY\_FILTERS

**GS\_MASKING\_POLICY\_FILTERS** records the user filtering criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the system administrator or security policy administrator can access this system catalog.

**Table 12-42** GS\_MASKING\_POLICY\_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is <b>logical_expr</b> .
filterlabelname	name	Filtering range. Currently, the value is <b>logical_expr</b> .
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in <a href="#">GS_MASKING_POLICY</a> .
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified.
logicaloperator	text	Polish notation of the filter criteria.

## 12.2.12 DATABASE LINK

### 12.2.12.1 GS\_DATABASE\_LINK

GS\_DATABASE\_LINK stores database link information, mainly recording detailed information about database links. Only sysadmin can read this system catalog.

Table 12-43 GS\_DATABASE\_LINK columns

Name	Type	Description
oid	oid	Unique ID of the current database link object (hidden attribute, which must be specified).
dlname	name	Name of the current database link.
dlowner	oid	ID of the owner of the current database link. If the owner is <b>public</b> , the value is <b>0</b> .
dlfdw	oid	OID of the foreign-data wrapper of the current database link.
dlcreator	oid	ID of the creator of the current database link.
options	text[]	Current database link connection information in the format of "keyword=value".
useroptions	text[]	User information used by the current database link to connect to the remote end, in the format of "keyword=value".
dlacl	aclitem[]	Current database link access permission.

## 12.2.13 Materialized Views

### 12.2.13.1 GS\_MATVIEW

GS\_MATVIEW provides information about each materialized view in the database.

Table 12-44 GS\_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.

Name	Type	Description
mapid	oid	OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a full materialized view does not correspond to a map table, the value of this column is <b>0</b> .
ivm	boolean	Type of a materialized view. The value <b>t</b> indicates an incremental materialized view, and the value <b>f</b> indicates a full materialized view.
needrefresh	boolean	Reserved column.
refresh_time	timestamp without time zone	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for incremental materialized views on DNs. In other cases, the value is null.

### 12.2.13.2 GS\_MATVIEW\_DEPENDENCY

**GS\_MATVIEW\_DEPENDENCY** provides association information about each incremental materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the full materialized view. Therefore, no record is written into the Mlog table.

**Table 12-45** GS\_MATVIEW\_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
relid	oid	OID of a base table of a materialized view.
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	integer	Reserved column.

## 12.2.14 Other System Catalogs

### 12.2.14.1 GS\_ASP

GS\_ASP displays the persistent ACTIVE SESSION PROFILE samples. This system catalog can be queried only in the system library.

**Table 12-46** GS\_ASP columns

Name	Type	Description
sampleid	bigint	Sample ID
sample_time	timestamp with time zone	Sampling time
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
databaseid	oid	Database ID
thread_id	bigint	Thread ID
sessionid	bigint	Session ID
start_time	timestamp with time zone	Start time of a session
event	text	Event name. For details about key events in the kernel, see <a href="#">Table 12-403</a> , <a href="#">Table 12-404</a> , <a href="#">Table 12-405</a> , and <a href="#">Table 12-406</a> . For details about the impact of each transaction lock on services, see <a href="#">LOCK</a> .
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent thread of the streaming thread
tlevel	integer	Level of the streaming thread The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode
userid	oid	ID of a session user
application_name	text	Name of an application

Name	Type	Description
client_addr	inet	IP address of a client
client_hostname	text	Name of a client
client_port	integer	TCP port number used by a client to communicate with the backend
query_id	bigint	Debug query ID
unique_query_id	bigint	Unique query ID
user_id	oid	User ID in the key of the unique query
cn_id	integer	CN from which the unique SQL statement comes. <b>cn_id</b> is in the key of the unique query.
unique_query	text	Standardized unique SQL text string
locktag	text	Information of a lock that the session waits for, which can be parsed using <b>locktag_decode</b>
lockmode	text	Mode of a lock that the session waits for <ul style="list-style-type: none"> <li>● <b>LW_EXCLUSIVE</b>: exclusive lock</li> <li>● <b>LW_SHARED</b>: shared lock</li> <li>● <b>LW_WAIT_UNTIL_FREE</b>: waits for <b>LW_EXCLUSIVE</b> to be available</li> </ul>
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID. The structure is <i>nodeid:sessionid#seqid</i> . <i>nodeid</i> : ID of the delivery node. <i>sessionid</i> : session ID of the delivery node. <i>seqid</i> : sequence number in ascending order. The ID is 0 on the delivery node. The <i>nodeid</i> and <i>sessionid</i> values of this column are the same for sessions delivered to other nodes in the same session.

Name	Type	Description
xact_start_time	timestamp with time zone	Start time of the transaction
query_start_time	timestamp with time zone	Time when the statement starts to be executed
state	text	Current statement state. The options are as follows: <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	ID of the current transaction.
top_xid	xid	ID of the top-level transaction that is being executed.

### 12.2.14.2 GS\_DEPENDENCIES

GS\_DEPENDENCIES records object dependency information and has a one-to-many relationship with the [GS\\_DEPENDENCIES\\_OBJ](#) table.

**Table 12-47** GS\_DEPENDENCIES columns

Name	Type	Description
schemaname	name	Name of a namespace

Name	Type	Description
refobjpos	integer	Position of the referenced object <ul style="list-style-type: none"> <li>• 1: type</li> <li>• 2: package header</li> <li>• 4: function header</li> <li>• 8: function body</li> <li>• 16: package body</li> <li>• 32: view</li> </ul>
refobjoid	oid	OID of the referenced object
objectname	text	Name of the dependent object

### 12.2.14.3 GS\_DEPENDENCIES\_OBJ

GS\_DEPENDENCIES\_OBJ records the detailed information about the referenced object.

**Table 12-48** GS\_DEPENDENCIES\_OBJ columns

Name	Type	Description
schemaname	name	Name of a namespace
type	integer	Type of the referenced object <ul style="list-style-type: none"> <li>• 1: unknown type</li> <li>• 2: variable</li> <li>• 3: type</li> <li>• 4: function</li> <li>• 5: view</li> <li>• 6: function header</li> </ul>
name	text	Name of the referenced object
objnode	pg_node_tree	Detailed information about the referenced object

### 12.2.14.4 GS\_GLOBAL\_CONFIG

GS\_GLOBAL\_CONFIG records the parameter values specified by users during cluster initialization. In addition, it also stores weak passwords set by users and status of the cluster (whether it is being scaled, which is specified by **redis\_bucket\_expansion**). Initial database users can write, modify, and delete parameters in system catalogs by using ALTER and DROP. Only the initial user, system administrator, and security administrator can access this system catalog. Other users do not have such permission.

**Table 12-49** GS\_GLOBAL\_CONFIG columns

Name	Type	Description
name	name	Preset parameter name, weak password name, or parameter required by users during cluster initialization.
value	text	Preset parameter value, weak password value, or parameter value required by users during cluster initialization.

**NOTICE**

You are advised not to write, modify, or delete the **redis\_bucket\_expansion** parameter. The parameter name has been used to indicate that the cluster is being scaled.

### 12.2.14.5 GS\_JOB\_ATTRIBUTE

GS\_JOB\_ATTRIBUTE records attributes of DBE\_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules. Common users do not have the permission to access the newly installed database cluster.

**Table 12-50** GS\_JOB\_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized user names.
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

### 12.2.14.6 GS\_JOB\_ARGUMENT

GS\_JOB\_ARGUMENT provides the parameter attributes of DBE\_SCHEDULER scheduled tasks and programs.

**Table 12-51** GS\_JOB\_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
argument_position	integer	Location of a parameter of a scheduled task or program.
argument_type	name	Parameter type of a scheduled task or program.
job_name	text	Name of a scheduled task or program.
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

### 12.2.14.7 GS\_PLAN\_TRACE

GS\_PLAN\_TRACE is used to store plan traces. It records details about the plan generation process of DML statements. Only users with the sysadmin permission can use this system catalog. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

**Table 12-52** GS\_PLAN\_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request
query	text	SQL statement of the current request. The value of this field cannot exceed the value of <b>track_activity_query_size</b> .
unique_sql_id	bigint	Unique ID of the SQL statement of the current request
plan	text	Query plan text corresponding to the current request SQL statement. The value of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.

Name	Type	Description
owner	oid	OID of the user who initiates the current SQL request
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created)

### 12.2.14.8 GS\_POLICY\_LABEL

GS\_POLICY\_LABEL records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the resource label to which a database resource belongs. Only the system administrator or security policy administrator can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

**Table 12-53** GS\_POLICY\_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
labelname	name	Specifies the resource label name.
labeltype	name	Resource tag type. Currently, the value is <b>RESOURCE</b> .
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs.
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.
fqdtype	name	Type of the identified database resource, for example, schema, table, column, or view.

## 12.2.14.9 GS\_RECYCLEBIN

GS\_RECYCLEBIN describes details about objects in the recycle bin of the flashback feature.

**Table 12-54** GS\_RECYCLEBIN columns

Name	Type	Description
oid	oid	System column.
rcybaseid	oid	Base table object ID, which references <b>gs_recyclebin.oid</b> .
rcydbid	oid	OID of the database to which the current object belongs.
rcyrelid	oid	OID of the current object.
rcyname	name	Name of the object in the recycle bin. The format is BIN\$ <i>unique_id</i> \$ <i>oid</i> \$. <i>unique_id</i> indicates the unique identifier with a maximum of 16 characters, and <i>oid</i> indicates the OID.
rcyoriginname	name	Original object name.
rcyoperation	char	Operation type. <ul style="list-style-type: none"> <li>• <b>d</b>: drop</li> <li>• <b>t</b>: truncate</li> </ul>
rcytype	integer	Object type. <ul style="list-style-type: none"> <li>• <b>0</b>: table</li> <li>• <b>1</b>: index.</li> <li>• <b>2</b>: TOAST table.</li> <li>• <b>3</b>: TOAST index.</li> <li>• <b>4</b>: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types.</li> <li>• <b>5</b>: partition.</li> <li>• <b>6</b>: global index.</li> <li>• <b>7</b>: materialized view.</li> <li>• <b>8</b>: global secondary index.</li> </ul>
rcyrecyclecsn	bigint	CSN when an object is dropped or truncated.
rcyrecycletime	timestamp with time zone	Time when an object is dropped or truncated.
rcycreatecsn	bigint	CSN when an object is created.
rcychangecsn	bigint	CSN when an object definition is modified.

Name	Type	Description
rcynamespace	oid	OID of the namespace that contains this relationship.
rcyowner	oid	Owner of the relationship.
rcytablespace	oid	Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file.
rcyrelfilenode	oid	File name of the recycle bin object on a disk, or <b>0</b> if none, which is used to restore the physical file when the TRUNCATE object is restored.
rcycanrestore	Boolean	Specifies whether flashback can be performed separately.
rcycanpurge	Boolean	Specifies whether the purge operation can be performed independently.
rcyfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcyfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcybucket	oid	Bucket information in <a href="#">12.2.15.42 PG_HASHBUCKET</a> .

### 12.2.14.10 GS\_SECURITY\_LABEL

The GS\_SECURITY\_LABEL is a shared system catalog that records information about security labels. Each record corresponds to a security label.

**Table 12-55** GS\_SECURITY\_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
label_name	name	Security label name.
label_content	text	Content of the security label.

### 12.2.14.11 GS\_SQL\_PATCH

GS\_SQL\_PATCH records the status information about SQL\_PATCH on the current node.

**Table 12-56** GS\_SQL\_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Global unique query ID
owner	oid	ID of the user who creates the patch.
enable	boolean	Specifies whether the patch takes effect.
status	"char"	Patch status (reserved column).
abort	boolean	Specifies whether the patch is an abort hint.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved column).
patched_query	text	Patched statement (reserved column).
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.
parent_unique_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which the patch takes effect. The value of this parameter is <b>0</b> for statements outside a stored procedure. For statements inside the stored procedure, and the value of this parameter is the globally unique ID of the statement that invokes the stored procedure.

### 12.2.14.12 GS\_STATISTIC\_EXT\_HISTORY

GS\_STATISTIC\_EXT\_HISTORY is a multi-column historical statistics management table. It stores historical extended statistics about tables in the database, including multi-column statistics and expression statistics (supported later). This table is visible and unavailable in distributed mode.

**Table 12-57** GS\_STATISTIC\_EXT\_HISTORY columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.

Name	Type	Description
starelkind	"char"	Type of the object to which a table belongs. 'c' indicates an ordinary table, and 'p' indicates a partitioned table.
stainherit	Boolean	Determines whether to collect statistics for objects that have inheritance relationship.
statimestamp	timestamp with time zone	Time when the statistics are collected.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadndistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
standvfunc	"char"	Algorithm used to calculate the NDV based on the statistics. <ul style="list-style-type: none"> <li>• <b>d</b>: The original DUJ1 algorithm is used for estimation.</li> <li>• <b>c</b>: The C19 algorithm is used for estimation.</li> </ul>

Name	Type	Description
staorigin	"char"	Source of the statistics collection mode. <ul style="list-style-type: none"> <li>• <b>a</b>: The collection is triggered by AUTOANALYZE.</li> <li>• <b>m</b>: The collection is triggered by manual ANALYZE.</li> <li>• <b>g</b>: The gsstat thread is triggered to perform ANALYZE collection when a large amount of data is inserted.</li> </ul>
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stakey	int2vector	Array of a column ID.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.
stasource	"char"	Source of extended statistics: <ul style="list-style-type: none"> <li>• <b>'a'</b>: indicates that the statistics data is automatically created, which is controlled by the GUC parameter <b>auto_statistic_ext_columns</b>.</li> <li>• <b>'m'</b>: indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).</li> </ul>

Name	Type	Description
stastatus	"char"	Status of extended statistics: <ul style="list-style-type: none"> <li>'a': active and available.</li> <li>'d': disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.</li> </ul>
staextname	name	Alias of the multi-column group of multi-column statistics.

### 12.2.14.13 GS\_STATISTIC\_HISTORY

GS\_STATISTIC\_HISTORY is a single-column historical statistics management table that stores historical statistics about tables and index columns in a database. This table is visible and unavailable in distributed mode.

**Table 12-58** GS\_STATISTIC\_HISTORY columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	Boolean	Determines whether to collect statistics for objects that have inheritance relationship.
statimestamp	timestamp with time zone	Time when the statistics are collected.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. <ul style="list-style-type: none"> <li>A value greater than 0 is the actual number of distinct values.</li> <li>A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>

Name	Type	Description
standvfunc	"char"	Algorithm used to calculate the NDV based on the statistics. <ul style="list-style-type: none"> <li>• <b>d</b>: The original DUJ1 algorithm is used for estimation.</li> <li>• <b>c</b>: The C19 algorithm is used for estimation.</li> </ul>
staorigin	"char"	Source of the statistics collection mode. <ul style="list-style-type: none"> <li>• <b>a</b>: The collection is triggered by AUTOANALYZE.</li> <li>• <b>m</b>: The collection is triggered by manual ANALYZE.</li> <li>• <b>g</b>: The gsstat thread is triggered to perform ANALYZE collection when a large amount of data is inserted.</li> </ul>
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadndistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
staextinfo	text	Information about extension statistics. Reserved column.

### 12.2.14.14 GS\_TABLESTATS\_HISTORY

GS\_TABLESTATS\_HISTORY is a table for managing historical statistics at the table, index, and partition levels. It stores historical statistics about tables, indexes, and partitions in a database. This table is visible and unavailable in distributed mode.

**Table 12-59** GS\_TABLESTATS\_HISTORY columns

Name	Type	Description
relid	oid	Unique ID of a table, index, or partition in <a href="#">PG_CLASS</a> or <a href="#">PG_PARTITION</a> .
relname	name	Name of a table, index, or partition.
relnamespace	oid	OID of the namespace that contains this object.
relkind	"char"	Object type. <ul style="list-style-type: none"> <li>• <b>r</b>: ordinary table.</li> <li>• <b>I</b>: table-level index.</li> <li>• <b>i</b>: partitioned index.</li> <li>• <b>p</b>: level-1 partition.</li> <li>• <b>s</b>: level-2 partition.</li> </ul>
reltimestamp	timestamp with time zone	Time when the statistics are collected.
relpages	double precision	Size of the table on disk in pages. This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table.

### 12.2.14.15 GS\_TXN\_SNAPSHOT

GS\_TXN\_SNAPSHOT is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN corresponding to the timestamp in the range.

**Table 12-60** GS\_TXN\_SNAPSHOT columns

Name	Type	Description
snptime	timestamp with time zone	Snapshot time

Name	Type	Description
snpxmin	bigint	Minimum snapshot ID
snpcsn	bigint	Snapshot CSN
snpsnapshot	text	Serialized snapshot text

### 12.2.14.16 GS\_UID

GS\_UID records the unique identification meta information of the **hasuids** attribute table in the database.

**Table 12-61** GS\_UID columns

Name	Type	Description
relid	oid	OID of a table
uid_backup	bigint	Largest unique identifier that can be assigned to a table

### 12.2.14.17 GS\_WORKLOAD\_RULE

The GS\_WORKLOAD\_RULE system catalog records information about SQL concurrency control rules. There is no permission restriction on this system catalog. All users can query this system catalog.

**Table 12-62** GS\_WORKLOAD\_RULE columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID, which is automatically generated by the system.
rule_name	name	Name of the concurrency control rule, which is used for search. The name may not be unique and can be <b>NULL</b> .
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is <b>NULL</b> , the concurrency control rules take effect for all databases.
max_workload	bigint	Maximum number of concurrent rule settings.
is_valid	boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to <b>false</b> .

Name	Type	Description
start_time	timestamp with time zone	Start time of the concurrency control rules. The value <b>NULL</b> indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value <b>NULL</b> indicates that the rules are always effective.
rule_type	text	Concurrency control rule type. Currently, only "sqlid", "select", "insert", "update", "delete", "merge", and "resource" are supported. Other values are invalid.
option_val	text[]	Parameter values of concurrency control rules, including SQL ID, keyword list, and resource restriction.  For details, see the description of the <a href="#">gs_add_workload_rule</a> API.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

### 12.2.14.18 PG\_AGGREGATE

PG\_AGGREGATE records information about aggregate functions. Each entry in PG\_AGGREGATE is an extension of an entry in PG\_PROC. The PG\_PROC entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

**Table 12-63** PG\_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	<a href="#">PG_PROC</a> .proname	<a href="#">PG_PROC</a> proname of the aggregate function.
aggtransfn	regproc	<a href="#">PG_PROC</a> .proname	Transition function.
aggcollectfn	regproc	<a href="#">PG_PROC</a> .proname	Collect function.
aggfinalfn	regproc	<a href="#">PG_PROC</a> .proname	Final function ( <b>0</b> if none).
aggsortop	oid	<a href="#">PG_OPERATOR</a> .oid	Associated sort operator ( <b>0</b> if none).

Name	Type	Reference	Description
aggtranstype	oid	<a href="#">PG_TYPE.oid</a>	Data type of the aggregate function's internal transition (state) data.  The possible values and their meanings are defined by the types in <a href="#">pg_type.h</a> . The main two types are polymorphic (isPolymorphicType) and non-polymorphic.
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: <ul style="list-style-type: none"> <li>● <b>n</b>: normal aggregate</li> <li>● <b>o</b>: ordered set aggregate</li> </ul>
aggnumdirect args	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is 0.
agginitfn	regproc	<a href="#">PG_PROC.proname</a>	Initialization function.

### 12.2.14.19 PG\_AM

PG\_AM records information about index access methods. There is one row for each index access method supported by the system.

**Table 12-64** PG\_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amname	name	-	Name of the access method
amstrategies	smallint	-	Number of operator strategies for the access method ( <b>0</b> if the access method does not have a fixed set of operator strategies)
amsupport	smallint	-	Number of support routines for the access method
amcanorder	boolean	-	Whether the access method supports ordered scans sorted by the indexed column's value <ul style="list-style-type: none"> <li>● <b>t (true)</b>: supported.</li> <li>● <b>f (false)</b>: not supported.</li> </ul>
amcanorderbyop	boolean	-	Whether the access method supports ordered scans sorted by the result of an operator on the indexed column <ul style="list-style-type: none"> <li>● <b>t (true)</b>: supported.</li> <li>● <b>f (false)</b>: not supported.</li> </ul>
amcanbackward	boolean	-	Whether the access method supports backward scanning <ul style="list-style-type: none"> <li>● <b>t (true)</b>: supported.</li> <li>● <b>f (false)</b>: not supported.</li> </ul>
amcanunique	boolean	-	Whether the access method supports unique indexes <ul style="list-style-type: none"> <li>● <b>t (true)</b>: supported.</li> <li>● <b>f (false)</b>: not supported.</li> </ul>
amcanmulticol	boolean	-	Whether the access method supports composite indexes <ul style="list-style-type: none"> <li>● <b>t (true)</b>: supported.</li> <li>● <b>f (false)</b>: not supported.</li> </ul>
amoptionalkey	boolean	-	Whether the access method supports scanning without any constraint for the first index column <ul style="list-style-type: none"> <li>● <b>t (true)</b>: supported.</li> <li>● <b>f (false)</b>: not supported.</li> </ul>

Name	Type	Reference	Description
amsearcharray	boolean	-	Whether the access method supports <b>ScalarArrayOpExpr</b> searches <ul style="list-style-type: none"> <li>• <b>t</b> (true): supported.</li> <li>• <b>f</b> (false): not supported.</li> </ul>
amsearchnulls	boolean	-	Whether the access method supports <b>IS NULL/NOT NULL</b> searches <ul style="list-style-type: none"> <li>• <b>t (true)</b>: supported.</li> <li>• <b>f (false)</b>: not supported.</li> </ul>
amstorage	boolean	-	Whether the index storage data type can differ from the column data type <ul style="list-style-type: none"> <li>• <b>t</b> (true): allowed.</li> <li>• <b>f</b> (false): not allowed.</li> </ul>
amclusterable	boolean	-	Whether an index of this type can be clustered on <ul style="list-style-type: none"> <li>• <b>t (true)</b>: allowed.</li> <li>• <b>f (false)</b>: not allowed.</li> </ul>
ampredlocks	boolean	-	Whether an index of this type manages fine-grained predicate locks <ul style="list-style-type: none"> <li>• <b>t (true)</b>: allowed.</li> <li>• <b>f (false)</b>: not allowed.</li> </ul>
amkeytype	oid	OID in <b>PG_TYPE</b>	Type of data stored in index ( <b>0</b> if it is not a fixed type)
aminsert	regproc	<b>prname</b> in <b>PG_PROC</b>	"Insert this tuple" function
ambeginscan	regproc	<b>prname</b> in <b>PG_PROC</b>	"Prepare for index scan" function
amgettupl	regproc	<b>prname</b> in <b>PG_PROC</b>	"Next valid tuple" function ( <b>0</b> if none)
amgetbitmap	regproc	<b>prname</b> in <b>PG_PROC</b>	"Fetch all valid tuples" function ( <b>0</b> if none)
amrescan	regproc	<b>prname</b> in <b>PG_PROC</b>	"(Re)start index scan" function
amendscan	regproc	<b>prname</b> in <b>PG_PROC</b>	"Clean up after index scan" function

Name	Type	Reference	Description
ammarkpos	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	"Mark current scan position" function
amrestrpos	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	"Restore marked scan position" function
ammerge	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	"Merge multiple indexes" function
ambuild	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	"Build new index" function
ambuildempty	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	"Build empty index" function
ambulkdelete	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	Bulk-delete function
amvacuumcleanup	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	Post-VACUUM cleanup function
amcanreturn	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	Function to check whether the index supports index-only scans ( <b>0</b> if none)
amcostestimate	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	Function to estimate cost of an index scan
amoptions	regproc	<a href="#">prname</a> in <a href="#">PG_PROC</a>	Function to parse and validate <b>reloptions</b> for an index

### 12.2.14.20 PG\_AMOP

PG\_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

**Table 12-65** PG\_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amopfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	Operator family of this entry

Name	Type	Reference	Description
amoplefttype	oid	<a href="#">PG_TYPE.oid</a>	Left-hand input data type of the operator For details about the possible values and their descriptions, see <a href="#">7.3 Data Type</a> .
amoprightrighttype	oid	<a href="#">PG_TYPE.oid</a>	Right-hand input data type of the operator For details about the possible values and their descriptions, see <a href="#">7.3 Data Type</a> .
amopstrategy	smallint	-	Number of operator strategies
amoppurpose	"char"	-	Purpose of the operator. <ul style="list-style-type: none"> <li>• s: search</li> <li>• o: order</li> </ul>
amopopr	oid	<a href="#">PG_OPERATOR.oid</a>	OID of the operator
amopmethod	oid	<a href="#">PG_AM.oid</a>	Operator family of the index access method
amopsortfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	The B-tree operator family according to which this entry sorts for an ordering operator ( <b>0</b> for a search operator)

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed\_column operator constant**. Obviously, such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed\_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of **ORDER BY** are specified by the **amopsortfamily** column, which must reference the B-tree operator family for the operator's result type.

### 12.2.14.21 PG\_AMPROC

PG\_AMPROC records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

**Table 12-66** PG\_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amprocfamily	oid	<a href="#">PG_OPFAMILY.oid</a>	Operator family of this entry
amproclefttype	oid	<a href="#">PG_TYPE.oid</a>	Left-hand input data type of the associated operator For details about common data types, see <a href="#">Data Types</a> .
amprocrighttype	oid	<a href="#">PG_TYPE.oid</a>	Right-hand input data type of the associated operator For details about common data types, see <a href="#">Data Types</a> .
amprocnum	smallint	-	Support procedure number
amproc	regproc	<a href="#">PG_PROC.proname</a>	OID of the procedure

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

## 12.2.14.22 PG\_ATTRDEF

PG\_ATTRDEF records default values of columns.

**Table 12-67** PG\_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
adrelid	oid	Table to which a column belongs
adnum	smallint	Number of columns
adbin	pg_node_tree	Internal representation of the default value of the column
adsrc	text	Internal representation of the human-readable default value

Name	Type	Description
adgencol	"char"	Specifies whether a column is a generated column. The value 's' indicates that the column is a generated column, and the value '\0' indicates that the column is a common column. The default value is '\0'.
adbin_on_update	pg_node_tree	Internal representation of the attribute expression <b>on update current_timestamp</b> of the column.
adsrc_on_update	text	Internal representation of the readable attribute expression <b>on update current_timestamp</b> .

### 12.2.14.23 PG\_ATTRIBUTE

PG\_ATTRIBUTE records information about table columns.

**Table 12-68** PG\_ATTRIBUTE columns

Name	Type	Description
attrelid	oid	Table to which a column belongs.
attname	name	Column name.
atttypid	oid	Column type.
attstattarget	integer	Level of details of statistics collected for this column by ANALYZE. <ul style="list-style-type: none"><li>• The value <b>0</b> indicates that no statistics should be collected.</li><li>• A negative value indicates that the system default statistic object is used.</li><li>• The exact meaning of positive values is data type-dependent.</li></ul> For scalar data types, <b>attstattarget</b> is both the target number of "most common values" to collect, and the target number of histogram bins to create.
attlen	smallint	Copy of typlen in <a href="#">12.2.15.78 PG_TYPE</a> of the column type.
attnum	smallint	Number of the column.
attn_dims	integer	Number of dimensions if the column is an array ( <b>0</b> in other cases).

Name	Type	Description
attcacheoff	integer	This column is always set to <b>-1</b> on disks. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.
atttypmod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need <b>ATTYPMOD</b> .
attbyval	Boolean	Copy of <b>typbyval</b> in <a href="#">12.2.15.78 PG_TYPE</a> of the column type.
attstorage	"char"	Copy of <b>typstorage</b> in <a href="#">12.2.15.78 PG_TYPE</a> of the column type.
attalign	"char"	Copy of <b>typalign</b> in <a href="#">12.2.15.78 PG_TYPE</a> of the column type.
attnotnull	Boolean	A NOT NULL constraint. It is possible to change this column to enable or disable the constraint.
atthasdef	Boolean	This column has a default value, in which case there will be a corresponding entry in <a href="#">12.2.15.25 PG_ATTRDEF</a> that actually defines the value.
attisdropped	Boolean	Indicates that this column has been deleted and is no longer valid. A deleted column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.
attislocal	Boolean	Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.
attcmprmode	tinyint	Compressed modes for a specific column. The compressed mode includes: <ul style="list-style-type: none"> <li>• <b>0</b>: not compressed (<b>ATT_CMPR_NOCOMPRESS</b>)</li> <li>• <b>1</b>: DELTA compression algorithm (<b>ATT_CMPR_DELTA</b>)</li> <li>• <b>2</b>: dictionary compression algorithm (<b>ATT_CMPR_DICTIONARY</b>)</li> <li>• <b>3</b>: prefix compression algorithm (<b>ATT_CMPR_PREFIX</b>)</li> <li>• <b>4</b>: digital string compression algorithm (<b>ATT_CMPR_NUMSTR</b>)</li> </ul>
attinhcount	integer	Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.

Name	Type	Description
attcollation	oid	Defined collation of a column.
attacl	aclitem[]	Permissions for column-level access.
attoptions	text[]	Column attribute. Currently, the following attributes are supported: <ul style="list-style-type: none"> <li><b>n_distinct</b>: number of <b>distinct</b> values of a column (excluding subtables).</li> <li><b>n_distinct_inherited</b>: number of <b>distinct</b> values of a column (including subtables).</li> </ul>
attfdwptions	text[]	Column attribute of a foreign table. Currently, <b>dist_fdw</b> , <b>file_fdw</b> , and <b>log_fdw</b> do not use foreign table column attributes.
attinitdefval	bytea	Stores the default value expression. ADD COLUMN in the row-store table must use this column.
attkvtype	tinyint	Specifies a key value type for a column. Types include: <ul style="list-style-type: none"> <li><b>0</b>: default value (<b>ATT_KV_UNDEFINED</b>).</li> <li><b>1</b>: dimension (<b>ATT_KV_TAG</b>).</li> <li><b>2</b>: indicator (<b>ATT_KV_FIELD</b>).</li> <li><b>3</b>: time column (<b>ATT_KV_TIMETAG</b>).</li> <li><b>4</b>: hidden distribution key (<b>ATT_KV_HIDETAG</b>).</li> </ul>
attidentity	"char"	Identity type of a column. Value: <ul style="list-style-type: none"> <li>'0' or '\0': The column is a non-IDENTITY column.</li> <li>'a': The <b>IDENTITY</b> column attribute is of the <b>ALWAYS</b> type.</li> <li>'d': The <b>IDENTITY</b> column attribute is of the <b>BY DEFAULT</b> type.</li> <li>'n': The <b>IDENTITY</b> column attribute is of the <b>BY DEFAULT ON NULL</b> type.</li> </ul>

### 12.2.14.24 PG\_CAST

PG\_CAST records the conversion relationship between data types.

**Table 12-69** PG\_CAST columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

Name	Type	Description
castsource	oid	OID of the source data type.
casttarget	oid	OID of the target data type.
castfunc	oid	OID of the conversion function. The value <b>0</b> indicates that no conversion function is required.
castcontext	"char"	Conversion mode between the source and target data types. <ul style="list-style-type: none"> <li>• 'e': Only explicit conversion can be performed (using the CAST or :: syntax).</li> <li>• 'i': Implicit conversion can be performed.</li> <li>• 'a': Both explicit and implicit conversion can be performed between data types.</li> </ul>
castmethod	"char"	Conversion method. <ul style="list-style-type: none"> <li>• 'f': Conversion is performed using the specified function in the <b>castfunc</b> column.</li> <li>• 'b': Binary forcible conversion rather than the specified function in the <b>castfunc</b> column is performed between data types.</li> </ul>

### 12.2.14.25 PG\_CLASS

PG\_CLASS records database objects and their relationship.

**Table 12-70** PG\_CLASS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Name of an object, such as a table, index, or view.
relnamespace	oid	OID of the namespace that contains the relationship.
reltype	oid	Data type that corresponds to the table's row type. The index is 0 because the index does not have PG_TYPE records.
reloftype	oid	OID of the composite type ( <b>0</b> for other types).
relowner	oid	Owner of the relationship.
relam	oid	Access method used, such as B-tree, if the row is an index.

Name	Type	Description
relfilenode	oid	Name of the on-disk file of this relationship ( <b>0</b> if such file does not exist).
reltablespace	oid	Tablespace in which this relationship is stored. If the value is <b>0</b> , the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file.
relpages	double precision	Size of the on-disk representation of the table in pages (of size BLCKSZ). This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by VACUUM, ANALYZE, and a few DDL statements such as CREATE INDEX.
reltoastrelid	oid	OID of the TOAST table associated with the table ( <b>0</b> if no TOAST table exists). The TOAST table stores large columns "offline" in a secondary table.
reltoastidxid	oid	OID of the index for a TOAST table ( <b>0</b> for a table other than a TOAST table).
relhasindex	boolean	Its value is <b>true</b> if this column is a table and has (or recently had) at least one index. It is set by CREATE INDEX but is not immediately cleared by DROP INDEX. If the VACUUM thread detects that a table has no index, it clears the <b>relhasindex</b> column and sets the value to <b>false</b> .
relisshared	boolean	Its value is <b>true</b> if the table is shared across all databases in the entire cluster. Otherwise, the value is <b>false</b> . Only certain system catalogs (such as PG_DATABASE) are shared.
relpersistence	"char"	<ul style="list-style-type: none"> <li>• <b>p</b>: permanent table</li> <li>• <b>u</b>: non-log table</li> <li>• <b>t</b>: temporary table</li> <li>• <b>g</b>: global temporary table.</li> </ul>

Name	Type	Description
relkind	"char"	<ul style="list-style-type: none"> <li>• <b>r</b>: ordinary table</li> <li>• <b>i</b>: index</li> <li>• <b>G</b>: global secondary index</li> <li>• <b>s</b>: sequence</li> <li>• <b>v</b>: view</li> <li>• <b>t</b>: TOAST table</li> <li>• <b>f</b>: foreign table</li> <li>• <b>m</b>: materialized view</li> <li>• <b>e</b>: STREAM object.</li> <li>• <b>o</b>: CONTVIEW object.</li> </ul>
relnatts	smallint	Number of user columns in the relationship (excluding system columns). <b>PG_ATTRIBUTE</b> has the same number of rows as the user columns.
relchecks	smallint	Number of check constraints in the table. For details, see the system catalog <b>PG_CONSTRAINT</b> .
relhasoids	boolean	Its value is <b>true</b> if an OID is generated for each row of the relationship. Otherwise, the value is <b>false</b> .
relhaspkey	boolean	Its value is <b>true</b> if the table has (or once had) a primary key. Otherwise, the value is <b>false</b> .
relhasrules	boolean	Its value is <b>true</b> if the table has rules. For details, see the system catalog <b>PG_REWRITE</b> .
relhastriggers	boolean	The value is <b>true</b> if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog <b>PG_TRIGGER</b> .
relhassubclass	boolean	Its value is <b>true</b> if the table has (or once had) any inheritance child table. Otherwise, the value is <b>false</b> .
relcmprs	tinyint	<p>Specifies whether the compression feature is enabled for the table. Note that only batch insertion triggers compression, so ordinary CRUD does not trigger compression.</p> <ul style="list-style-type: none"> <li>• <b>0</b>: Tables that do not support compression (primarily system catalogs, on which the compression attribute cannot be modified).</li> <li>• <b>1</b>: The compression feature of the table data is NOCOMPRESS or has no specified keyword.</li> <li>• <b>2</b>: The compression feature of the table data is COMPRESS.</li> </ul>

Name	Type	Description
relrowmovement	boolean	Specifies whether row migration is allowed when the partitioned table is updated. <ul style="list-style-type: none"> <li>• <b>true</b>: Row migration is allowed.</li> <li>• <b>false</b>: Row migration is not allowed.</li> </ul>
parttype	"char"	Specifies whether the table or index has the property of a partitioned table. <ul style="list-style-type: none"> <li>• <b>p</b>: The table or index has the property of a partitioned table.</li> <li>• <b>n</b>: The table or index does not have the property of a partitioned table.</li> </ul>
relfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.  To ensure forward compatibility, this column is reserved. The <b>relfrozenxid64</b> column is added to record the information.
relacl	aclitem[]	Access permissions. For details about the ACLItem type, see <a href="#">ACLItem Type</a> .  The command output of the query is as follows: <i>user1=privs/user2</i> indicates that the permission granted by user 2 to user 1 is <b>privs</b> . <i>=privs/user3</i> indicates that the permission granted to the <b>public</b> role by user 3 is <b>privs</b> .  In the preceding command, user 1, user 2, and user 3 are the existing users or roles in the database, and <b>privs</b> indicates the permissions supported by the database. For details on permission descriptions, see <a href="#">Table 12-71</a> .
reloptions	text[]	Table or index access method, using character strings in the format of <i>keyword=value</i> .
relreplident	"char"	Identifier of a decoding column in logical decoding. <ul style="list-style-type: none"> <li>• <b>d</b>: default (primary key, if any).</li> <li>• <b>n</b>: none.</li> <li>• <b>f</b>: all columns.</li> <li>• <b>i</b>: The indisreplident of the index is specified or the default index is used.</li> </ul>

Name	Type	Description
relfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.
relbucket	oid	Specifies whether the current catalog contains hash bucket shards. A valid OID points to the specific shard information recorded in the PG_HASHBUCKET catalog. <b>NULL</b> indicates that hash bucket shards are not included.
relbucketkey	int2vect or	Hash partition column information. <b>NULL</b> indicates that the column information is not included.
relminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the table. This is used to track whether the table needs to be vacuumed in order to prevent multi-transaction IDs wraparound or to allow PG_CLOG to be shrunk. The value is <b>0 (InvalidTransactionId)</b> if the relationship is not a table.

**Table 12-71** Description of permissions

Parameter	Description
r	SELECT (read)
w	UPDATE (write)
a	INSERT (insert)
d	DELETE
D	TRUNCATE
x	REFERENCES
t	TRIGGER
X	EXECUTE
U	USAGE
C	CREATE
c	CONNECT
T	TEMPORARY

Parameter	Description
A	ALTER
P	DROP
m	COMMENT
i	INDEX
v	VACUUM
*	Authorization options for preceding permissions

### 12.2.14.26 PG\_COLLATION

PG\_COLLATION describes available collations, which are essentially mappings from an SQL name to operating system locale categories.

**Table 12-72** PG\_COLLATION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
collname	name	-	Collation name (unique per namespace and encoding)
collnamespace	oid	OID in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains this collation
collowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the collation
collencoding	integer	-	Encoding in which the collation is applicable, or <b>-1</b> if it works for any encoding. It is compatible with PostgreSQL.
collcollate	name	-	<b>LC_COLLATE</b> for this collation object
collctype	name	-	<b>LC_CTYPE</b> for this collation object
collpadattr	text	-	Collation padding attribute. <ul style="list-style-type: none"> <li>• <b>NULL</b>: not applicable.</li> <li>• <b>NO PAD</b>: no padding.</li> <li>• <b>PAD SPACE</b>: blank spaces padded at the end.</li> </ul>

Name	Type	Reference	Description
collisdef	boolean	-	Determines whether the collation is the default collation of the character set.

### 12.2.14.27 PG\_CONSTRAINT

PG\_CONSTRAINT records check, primary key, unique, and foreign key constraints on tables.

**Table 12-73** PG\_CONSTRAINT columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of the namespace that contains the constraint.
contype	"char"	<ul style="list-style-type: none"> <li>● <b>c</b>: check constraint.</li> <li>● <b>p</b>: primary key constraint.</li> <li>● <b>u</b>: unique constraint.</li> <li>● <b>t</b>: trigger constraint.</li> <li>● <b>x</b>: mutual exclusion constraint.</li> <li>● <b>f</b>: foreign key constraint.</li> <li>● <b>s</b>: clustering constraint.</li> <li>● <b>i</b>: invalid constraint.</li> </ul>
condeferrable	Boolean	Specifies whether the constraint is deferrable. <ul style="list-style-type: none"> <li>● <b>true</b>: yes.</li> <li>● <b>false</b>: no.</li> </ul>
condeferred	Boolean	Specifies whether the constraint can be deferrable by default. <ul style="list-style-type: none"> <li>● <b>true</b>: yes.</li> <li>● <b>false</b>: no.</li> </ul>
convalidated	Boolean	Specifies whether the constraint is valid. Currently, it can be set to <b>false</b> only for foreign key and check constraints. <ul style="list-style-type: none"> <li>● <b>true</b>: valid.</li> <li>● <b>false</b>: invalid.</li> </ul>
conrelid	oid	Table containing this constraint ( <b>0</b> if it is not a table constraint).

Name	Type	Description
contypid	oid	Domain containing this constraint ( <b>0</b> if it is not a domain constraint).
conindid	oid	ID of the index associated with the constraint.
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is <b>0</b> .
confupdtype	"char"	Foreign key update action code. <ul style="list-style-type: none"> <li>• <b>a</b>: no action.</li> <li>• <b>r</b>: restriction.</li> <li>• <b>c</b>: cascading.</li> <li>• <b>n</b>: The parameter is set to <b>null</b>.</li> <li>• <b>d</b>: The default value is used.</li> </ul>
confdeltype	"char"	Foreign key deletion action code. <ul style="list-style-type: none"> <li>• <b>a</b>: no action.</li> <li>• <b>r</b>: restriction.</li> <li>• <b>c</b>: cascading.</li> <li>• <b>n</b>: The parameter is set to <b>null</b>.</li> <li>• <b>d</b>: The default value is used.</li> </ul>
confmatchtype	"char"	Foreign key match type. <ul style="list-style-type: none"> <li>• <b>f</b>: full match.</li> <li>• <b>p</b>: partial match.</li> <li>• <b>u</b>: unspecified. (The NULL value can be matched if <b>f</b> is specified.)</li> </ul>
conislocal	Boolean	Specifies whether the constraint is defined locally for the relation. <ul style="list-style-type: none"> <li>• <b>true</b>: yes.</li> <li>• <b>false</b>: no.</li> </ul>
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not <b>0</b> , the constraint cannot be deleted or renamed.
connoinherit	Boolean	Specifies whether the constraint can be inherited. <ul style="list-style-type: none"> <li>• <b>true</b>: yes.</li> <li>• <b>false</b>: no.</li> </ul>

Name	Type	Description
consoft	Boolean	Specifies whether the column indicates an informational constraint. <ul style="list-style-type: none"><li>• <b>true</b>: yes.</li><li>• <b>false</b>: no.</li></ul>
conopt	Boolean	Specifies whether you can use the informational constraint to optimize the execution plan. <ul style="list-style-type: none"><li>• <b>true</b>: yes.</li><li>• <b>false</b>: no.</li></ul>
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
conpfeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key.
conexclp	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
conbin	pg_node_tree	Internal representation of the expression if this column is a check constraint.
consrc	text	Readable representation of the expression if this column is a check constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of <b>INDEX</b> .

**NOTICE**

- **consrc** is not updated when referenced objects change and does not track new column names. You are advised to use `pg_get_constraintdef()` to extract the definition of a check constraint.
- **relchecks** in [12.2.15.28 PG\\_CLASS](#) must agree with the number of check-constraint entries found in the table for each relationship.

## 12.2.14.28 PG\_CONVERSION

**PG\_CONVERSION** describes encoding conversion information.

**Table 12-74** PG\_CONVERSION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
conname	name	-	Conversion name (unique within a namespace)
connamespace	oid	OID in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains this conversion
conowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the conversion
conforencoding	integer	-	Source encoding ID
contoencoding	integer	-	Destination encoding ID
conproc	regproc	<a href="#">proname</a> in <a href="#">PG_PROC</a>	Conversion procedure
condefault	boolean	-	If this is the default conversion, the value is <b>true</b> . Otherwise, the value is <b>false</b> .

## 12.2.14.29 PG\_DATABASE

PG\_DATABASE records information about available databases.

**Table 12-75** PG\_DATABASE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
datname	name	Database name
datdba	oid	Owner of the database, usually the user who created it
encoding	integer	Character encoding for the database
datcollate	name	Sequence used by the database
datctype	name	Character type used by the database
datistemplate	boolean	Whether the database can be used as a template database <ul style="list-style-type: none"> <li>• <b>true</b>: allowed.</li> <li>• <b>false</b>: not allowed.</li> </ul>

Name	Type	Description
datallowconn	boolean	This column is used to protect the <b>template0</b> database from being altered. <ul style="list-style-type: none"><li>• <b>true</b>: Users can connect to the database.</li><li>• <b>false</b>: No user can connect to the database.</li></ul>
datconnlimit	integer	Maximum number of concurrent connections allowed on this database. The value <b>-1</b> indicates no limit.
datlastsysoid	oid	Last system OID in the database
datfrozenxid	xid32	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is discarded in the current version. To ensure forward compatibility, this column is reserved. The <b>datfrozenxid64</b> column is added to record the information.
dattablespace	oid	Default tablespace of the database
datcompatibility	name	Database compatibility mode Currently, four compatible modes are supported: PG, ORA, MYSQL, and TD.
datacl	aclitem[]	Access permission
datfrozenxid64	xid	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.
datminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction IDs wraparound or to allow PG_CLOG to be shrunk. It is the minimum value of <b>relminmxid</b> in <b>PG_CLASS</b> of all tables in the database.
dattimezone	name	Database time zone. The default is PRC.

### 12.2.14.30 PG\_DEPEND

PG\_DEPEND records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also **PG\_SHDEPEND**, which performs a similar function for dependencies involving objects that are shared across a database cluster.

**Table 12-76** PG\_DEPEND columns

Name	Type	Reference	Description
classid	oid	<a href="#">PG_CLASS</a> .oid	OID of the system catalog where a dependent object resides
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column ( <b>objid</b> and <b>classid</b> refer to the table itself); <b>0</b> for all other object types
refclassid	oid	<a href="#">PG_CLASS</a> .oid	OID of the system catalog where a referenced object resides
refobjid	oid	Any OID column	OID of the referenced object
refobjsubid	integer	-	Column number for a table column ( <b>refobjid</b> and <b>refclassid</b> refer to the table itself); <b>0</b> for all other object types
deptype	"char"	-	A code defining the specific semantics of this dependency

In all cases, a PG\_DEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- **DEPENDENCY\_NORMAL** (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying **CASCADE**, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- **DEPENDENCY\_AUTO** (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of **RESTRICT** or **CASCADE** mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- **DEPENDENCY\_INTERNAL** (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A **DROP** of the dependent object will be disallowed outright (We'll tell the user to issue a **DROP** against the referenced object, instead). A **DROP** of the referenced object will be propagated through to drop the dependent object whether **CASCADE** is specified or not. Example: A trigger created to enforce a foreign-key constraint is made internally dependent on the constraint's [PG\\_CONSTRAINT](#) entry.
- **DEPENDENCY\_EXTENSION** (e): The dependent object is a member of the extension of the referenced object (see [PG\\_EXTENSION](#)). The dependent object can be dropped only via **DROP EXTENSION** on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify **GS\_DUMP**.

**NOTICE**

The extended function is for internal use only. You are advised not to use it.

- **DEPENDENCY\_PIN** (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

### 12.2.14.31 PG\_DESCRIPTION

**PG\_DESCRIPTION** records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of **PG\_DESCRIPTION**.

See also **PG\_SHDESCRIPTION**, which provides a similar function for descriptions involving objects that are shared across a database cluster.

**Table 12-77** PG\_DESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to
classoid	oid	<b>PG_CLASS</b> .oid	OID of the system catalog where the object appears
objsubid	integer	-	Column number for a comment on a table column ( <b>objoid</b> and <b>classoid</b> refer to the table itself); <b>0</b> for all other object types
description	text	-	Arbitrary text that serves as the description of the object

### 12.2.14.32 PG\_DIRECTORY

**PG\_DIRECTORY** stores directory objects added by users. You can execute the **CREATE DIRECTORY** statement to add records to this system catalog. When **enable\_access\_server\_directory** is set to **off**, only the initial user can create directory objects. When **enable\_access\_server\_directory** is set to **on**, users with the SYSADMIN permission and users inheriting the built-in role permission **gs\_role\_directory\_create** can create directory objects. Common users can access this system catalog only after being authorized.

**Table 12-78** PG\_DIRECTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)

Name	Type	Description
dirname	name	Name of a directory object
owner	oid	Owner of a directory object
dirpath	text	Directory path.
diracl	aclitem[]	Access permissions.

### 12.2.14.33 PG\_ENUM

PG\_ENUM contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in PG\_ENUM.

**Table 12-79** PG\_ENUM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
enumtypid	oid	<a href="#">PG_TYPE.oid</a>	OID of the <a href="#">PG_TYPE</a> entry owning this enumerated value
enumsortorder	real	-	Sort position of this enumerated value within its enumerated type
enumlabel	name	-	Textual label for this enumerated value

The OIDs for PG\_ENUM rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to *n*. However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

### 12.2.14.34 PG\_EXTENSION

PG\_EXTENSION records information about the installed extensions. By default, GaussDB provides the following extensions: PL/pgSQL, DIST\_FDW, FILE\_FDW, LOG\_FDW, GC\_FDW, DBLINK\_FDW, ROACH\_API, STREAMING, TSDB, DIMSEARCH, GSREDISTRIBUTE, SECURITY\_PLUGIN, GSSTAT\_PLUGIN, NUMERIC\_ENHANCE,

PKG\_DBE\_RAW, PKG\_DBE\_OUTPUT, PKG\_DBE\_UTILITY, PKG\_DBE\_XML, PKG\_ILM, PKG\_DBE\_XMLGEN, and PKG\_DBE\_DESCRIBE. This system catalog is for internal use only. You are advised not to use it.

 **NOTE**

DIMSEARCH is no longer supported in the current version due to specification changes. Do not use it.

**Table 12-80** PG\_EXTENSION

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
extname	name	Extension name.
extowner	oid	Owner of the extension.
extnamespace	oid	Namespace containing the extension's exported objects.
extrelocatable	Boolean	Specifies whether the extension can be relocated to another namespace. The value can be <b>true</b> (yes) or <b>false</b> (no).
extversion	text	Version number of the extension.
extconfig	oid[]	Configuration information about the extension.
extcondition	text[]	Filter conditions for the extension's configuration information.

### 12.2.14.35 PG\_FOREIGN\_DATA\_WRAPPER

**PG\_FOREIGN\_DATA\_WRAPPER** records foreign-data wrapper definitions. A foreign-data wrapper is the mechanism by which external data, residing on foreign servers, is accessed.

**Table 12-81** PG\_FOREIGN\_DATA\_WRAPPER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
fdwnam e	name	-	Name of a foreign-data wrapper
fdwown er	oid	<a href="#">PG_AUTHID</a> .oid	Owner of the foreign-data wrapper

Name	Type	Reference	Description
fdwhandler	oid	<a href="#">PG_PROC.oid</a>	References a handler function that is responsible for supplying execution routines for the foreign-data wrapper ( <b>0</b> if no handler is provided)
fdwvalidator	oid	<a href="#">PG_PROC.oid</a>	References a validator function that is responsible for checking the validity of the options given to the foreign-data wrapper, as well as options for foreign servers and user mappings using the foreign-data wrapper. ( <b>0</b> if no handler is provided)
fdwacl	aclitem[]	-	Access permissions
fdwoptions	text[]	-	Foreign-data wrapper specific option, expressed in a string in the format of keyword=value

### 12.2.14.36 PG\_FOREIGN\_SERVER

**PG\_FOREIGN\_SERVER** records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign-data wrappers.

**Table 12-82** PG\_FOREIGN\_SERVER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
srvname	name	-	Name of a foreign server
srvowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the foreign server
srvfdw	oid	<a href="#">PG_FOREIGN_DATA_WRAPPER.oid</a>	OID of the foreign-data wrapper on this foreign server
srvtype	text	-	Type of the server (optional)
srvversion	text	-	Version of the server (optional)
svracl	aclitem[]	-	Access permissions
srvoptions	text[]	-	Option used for foreign servers, expressed in a string in the format of keyword=value

### 12.2.14.37 PG\_HASHBUCKET

PG\_HASHBUCKET records hash bucket information.

**Table 12-83** PG\_HASHBUCKET columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
bucketid	oid	Node group bound to the database where the PG_HASHBUCKET system catalog resides on the CN. This column is empty on the DN.
bucketcnt	integer	This parameter is not used on the CN. It indicates the number of buckets owned by the current DN on the DN.
bucketmapsize	integer	This parameter is not used in the current version.
bucketref	integer	Reserved column with 1 as its default value
bucketvector	oidvector_extend	This parameter is not used on the CN. It indicates the list of buckets owned by the current DN on the DN.
bucketmap	text	Stores the mapping between logical buckets and physical buckets, that is, the mapping between 16384 and 1024.
bucketversion	oidvector_extend	Records the version number of the information that changes during subsequent hash bucket scale-out.
bucketcsn	text	Maximum CSN of each bucket on the source node before hash bucket redistribution, which is used to determine the visibility of the new node.
bucketxid	text	<b>next_xid</b> set for bringing a new node online during hash bucket scaling. This parameter is used to check whether the value is within the threshold range.

### 12.2.14.38 PG\_INDEX

PG\_INDEX records part of index information. The rest is mostly recorded in PG\_CLASS.

**Table 12-84** PG\_INDEX columns

Name	Type	Description
indexrelid	oid	OID of the <a href="#">PG_CLASS</a> entry for the index.
indrelid	oid	OID of the <a href="#">PG_CLASS</a> entry for the table that uses the index.
indnatts	smallint	Number of columns in the index.
indisunique	Boolean	Specifies whether the index is unique. <ul style="list-style-type: none"> <li>• <b>true</b>: The index is unique.</li> <li>• <b>false</b>: The index is not unique.</li> </ul>
indisprimary	Boolean	Specifies whether the index is the primary key of the table. <ul style="list-style-type: none"> <li>• <b>true</b>: The index is the primary key of the table. <b>indisunique</b> should always be <b>true</b> when the value of this column is <b>true</b>.</li> <li>• <b>false</b>: The index is not the primary key of the table.</li> </ul>
indisexclusion	Boolean	Specifies whether the index supports exclusive constraints. <ul style="list-style-type: none"> <li>• <b>true</b>: The index supports exclusive constraints.</li> <li>• <b>false</b>: The index does not support exclusive constraints.</li> </ul>
indimmediate	Boolean	Specifies whether to check the uniqueness of data to be inserted. <ul style="list-style-type: none"> <li>• <b>true</b>: The uniqueness check is performed immediately when data is inserted.</li> <li>• <b>false</b>: The uniqueness check is not performed when data is inserted.</li> </ul>
indisclustered	Boolean	Specifies whether the table is clustered on the index. <ul style="list-style-type: none"> <li>• <b>true</b>: The table is clustered on the index.</li> <li>• <b>false</b>: The table is not clustered on the index.</li> </ul>
indisusable	Boolean	Specifies whether the index is available for insert and select operations. <ul style="list-style-type: none"> <li>• <b>true</b>: The index is available for insert and select operations.</li> <li>• <b>false</b>: The index is unavailable for insert and select operations.</li> </ul>

Name	Type	Description
indisvalid	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: The index can be used for query.</li> <li>• <b>false</b>: The index is possibly incomplete and must still be modified by INSERT or UPDATE operations, but it cannot be securely used for queries. If it is a unique index, the uniqueness property is also not <b>true</b>.</li> </ul>
indcheckxmin	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: Queries must not use the index until the xmin of this row in PG_INDEX is lower than their <b>TransactionXmin</b>, because the table may contain broken HOT chains with incompatible rows that they can see.</li> <li>• <b>false</b>: Indexes can be used for query.</li> </ul>
indisready	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: The index is available for inserting data.</li> <li>• <b>false</b>: The index is ignored when data is inserted or modified.</li> </ul>
indkey	int2vector	This is an array of <b>indnatts</b> values indicating that this index creates table columns. For example, a value of <b>1 3</b> indicates that the first and the third columns make up the index key. The value <b>0</b> in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference.
indcollation	oidvector	OID of the collation corresponding to each index column. For details, see <a href="#">PG_COLLATION</a> .
indclass	oidvector	For each column in the index key, this contains the OID of the operator class to use. For details, see section <a href="#">12.2.15.53 PG_OPCLASS</a> .
indoption	int2vector	Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.
indexprs	pg_node_tree	Expression trees (in <b>nodeToString()</b> representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in indkey. The value is null if all index attributes are simple references.
indpred	pg_node_tree	Expression tree (in <b>nodeToString()</b> representation) for partial index predicate. If the index is not a partial index, this column is an empty string.

Name	Type	Description
indisreplident	Boolean	Specifies whether the column of this index is a decoded column of logical decoding. <ul style="list-style-type: none"> <li>• <b>true</b>: The column of this index is a decoded column of logical decoding.</li> <li>• <b>false</b>: The column of this index is not a decoded column of logical decoding.</li> </ul>
indnkeyatts	smallint	Total number of columns in the index. The columns that exceed the value of <b>indnatts</b> are not involved in the index query.
indcctmpid	oid	OID of the temporary table when the Ustore builds indexes online.
indisvisible	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: The index status is visible, that is, the optimizer can use the index.</li> <li>• <b>false</b>: The index is invisible. If the value of <b>enable_invisible_indexes</b> is <b>off</b>, the optimizer cannot use the index. If the value of <b>enable_invisible_indexes</b> is <b>on</b>, the optimizer can use the index.</li> </ul>

### 12.2.14.39 PG\_INHERITS

**PG\_INHERITS** records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

**Table 12-85** PG\_INHERITS columns

Name	Type	Reference	Description
inhrelid	oid	<a href="#">PG_CLASS.oid</a>	OID of a child table
inhparent	oid	<a href="#">PG_CLASS.oid</a>	OID of a parent table
inhseqno	integer	-	If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1.

### 12.2.14.40 PG\_JOB

**PG\_JOB** records detailed information about jobs created by users. Dedicated threads poll the system catalog **PG\_JOB** and trigger jobs based on scheduled job execution time, and update job status in **PG\_JOB**. This system catalog belongs to

the Shared Relation category. All job records are visible to all databases. Common users can access this system catalog only after being authorized.

**Table 12-86** PG\_JOB columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	bigint	Job ID, which is the primary key and is unique (with a unique index).
current_postgres_pid	bigint	If the current job has been executed, the thread ID of this job is recorded. The default value is <b>-1</b> , indicating that the job has not yet been executed.
log_user	name	Username of the creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database in which the job will be executed.
node_name	name	CN on which the job will be executed.
job_status	"char"	<p>Execution status of the current task. The default value is 's'. The options are as follows:</p> <ul style="list-style-type: none"> <li>• 'r': running</li> <li>• 's': successfully finished</li> <li>• 'f': job failed</li> <li>• 'd': disable</li> </ul> <p>If a job fails to be executed for 16 consecutive times, <b>job_status</b> is automatically set to 'd', and no more attempt will be made on this job.</p> <p>Note: When you disable a scheduled task (by setting <b>job_queue_processes</b> to <b>0</b>), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled task function is enabled (<b>job_queue_processes</b> is not set to <b>0</b>), the system updates the value of this column based on the real-time job status.</p>
start_date	timestamp without time zone	Start time of the first job execution, accurate to millisecond.
next_run_date	timestamp without time zone	Time when a scheduled task is executed next time. The time is accurate to milliseconds.

Name	Type	Description
failure_count	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
interval	text	Job execution interval.
last_start_date	timestamp without time zone	Start time of the last job execution, accurate to millisecond.
last_end_date	timestamp without time zone	End time of the last job execution, accurate to millisecond.
last_suc_date	timestamp without time zone	Start time of the last successful job execution, accurate to millisecond.
this_run_date	timestamp without time zone	Start time of the ongoing job execution, accurate to millisecond.
nspname	name	Name of the schema used for job execution.
job_name	text	Name of the DBE_SCHEDULER scheduled task.
end_date	timestamp without time zone	Expiration time of the DBE_SCHEDULER scheduled task, accurate to millisecond.
enable	Boolean	The DBE_SCHEDULER scheduled task enabling status. The options are as follows: <ul style="list-style-type: none"> <li>• <b>true</b>: enabled</li> <li>• <b>false</b>: disabled</li> </ul>
failure_message	text	Error information about the latest task execution.

#### 12.2.14.41 PG\_JOB\_PROC

PG\_JOB\_PROC records the content of each job in the **PG\_JOB** catalog, including the PL/SQL code blocks and anonymous blocks. Storing such information in the system catalog PG\_JOB and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed. Common users can access this system catalog only after being authorized.

**Table 12-87** PG\_JOB\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	integer	Foreign key, which is associated with <b>job_id</b> in <b>PG_JOB</b> .
what	text	Job content, which is the program content in the DBE_SCHEDULER scheduled task.
job_name	text	Name of the DBE_SCHEDULER scheduled task or program.

## 12.2.14.42 PG\_LANGUAGE

PG\_LANGUAGE registers programming languages. You can use them and interfaces to write functions or stored procedures.

**Table 12-88** PG\_LANGUAGE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
lanname	name	-	Name of the language.
lanowner	oid	OID in <b>PG_AUTHID</b>	Owner of the language.
lanispl	boolean	-	<ul style="list-style-type: none"><li>● <b>true</b>: user-defined language.</li><li>● <b>false</b>: internal language, for example, SQL.</li></ul> Currently, <code>gs_dump</code> still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.
lanpltrusted	boolean	-	<ul style="list-style-type: none"><li>● <b>true</b>: The language is trusted, which means that it is believed not to grant access to anything outside the normal SQL execution environment.</li><li>● <b>false</b>: The language is untrusted. Only the initial user can create functions in untrusted languages.</li></ul>

Name	Type	Reference	Description
lanplcallfoid	oid	OID in <a href="#">PG_PROC</a>	For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.
laninline	oid	OID in <a href="#">PG_PROC</a>	This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is <b>0</b> if inline blocks are not supported.
lanvalidator	oid	OID in <a href="#">PG_PROC</a>	This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is <b>0</b> if no validator is provided.
lanacl	aclitem[]	-	Access permission.

### 12.2.14.43 PG\_LARGEOBJECT

PG\_LARGEOBJECT records data making up large objects. A large object is identified by an OID assigned when it is created. Each large object is broken into segments or "pages" small enough to be conveniently stored as rows in PG\_LARGEOBJECT. The amount of data per page is defined as **LOBLKSIZE**.

This system catalog is accessible only to system administrators.

**Table 12-89** PG\_LARGEOBJECT columns

Name	Type	Reference	Description
loid	oid	OID in <a href="#">PG_LARGEOBJECT_METADATA</a>	Identifier of the large object that includes this page.
pageno	integer	-	Page number of this page within its large object (counting from zero).
data	bytea	-	Data stored in the large object. This will never be more than <b>LOBLKSIZE</b> bytes and might be less.

Each row of **PG\_LARGEOBJECT** holds data for one page of a large object, beginning at byte offset (**pageno \* LOBLKSIZE**) within the object. The

implementation allows sparse storage: pages might be missing, and might be shorter than **LOBLKSIZE** bytes even if they are not the last page of the object. Missing regions within a large object read as zeroes.

#### 12.2.14.44 PG\_LARGEOBJECT\_METADATA

**PG\_LARGEOBJECT\_METADATA** records metadata associated with large objects. The actual large object data is stored in **PG\_LARGEOBJECT**.

**Table 12-90** PG\_LARGEOBJECT\_METADATA columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lomowner	oid	<a href="#">PG_AUTHID</a> .oid	Owner of the large object
lomacl	aclitem[]	-	Access permissions

#### 12.2.14.45 PG\_NAMESPACE

**PG\_NAMESPACE** records namespaces, that is, schema-related information. If the database object isolation attribute is enabled, users can view only the schema information that they have the permission to access.

**Table 12-91** PG\_NAMESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
nspname	name	Name of a namespace.
nspowner	oid	Owner of a namespace.
nsptimeline	bigint	Timeline when the namespace is created on the DN. This column is for internal use and valid only on the DN.
nspacl	aclitem[]	Access permission. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> .
in_redistribution	"char"	Specifies whether the content is in the redistribution state.
nspblockchain	Boolean	Specifies whether the mode is the tamper-proof mode. <ul style="list-style-type: none"> <li><b>true</b>: The mode is the tamper-proof mode.</li> <li><b>false</b>: The mode is not the tamper-proof mode.</li> </ul>

Name	Type	Description
nspcollation	oid	Default collation of the namespace (a value may exist only when <b>sql_compatibility</b> is set to 'MYSQL').

### 12.2.14.46 PG\_OBJECT

PG\_OBJECT records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

**Table 12-92** PG\_OBJECT columns

Name	Type	Description
object_oid	oid	Object identifier.
object_type	"char"	Object type. <ul style="list-style-type: none"> <li>• <b>r</b>: ordinary table</li> <li>• <b>i</b>: index</li> <li>• <b>s</b>: sequence</li> <li>• <b>v</b>: view</li> <li>• <b>p</b>: stored procedure and function</li> <li>• <b>S</b>: package header</li> <li>• <b>B</b>: package body</li> </ul>
creator	oid	ID of a creator.
ctime	timestamp with time zone	Creation time of an object.
mtime	timestamp with time zone	Last modification time of an object. The modification operations include <b>ALTER</b> , <b>GRANT</b> , and <b>REVOKE</b> .
createcsn	bigint	CSN when an object is created.
changeocsn	bigint	CSN when DDL operations are performed on a table or an index.
valid	Boolean	Validity of an object. <b>t</b> indicates valid, and <b>f</b> indicates invalid.

**NOTICE**

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG\_OBJECT** does not contain these object records.
- A database upgraded to this version cannot record objects created before the upgrade. **PG\_OBJECT** does not contain these object records.
- When the preceding two types of objects are modified again, the modification time (**mtime**) is recorded. Because the creation time of the objects cannot be obtained, **ctime** is empty.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changeagn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createagn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createagn** and **changeagn** record the transaction commit sequence number of the transaction to which the current operation belongs.
- If the statement for creating an object has an undefined object, or the referenced object is modified or deleted, the object to be created will be invalid.

### 12.2.14.47 PG\_OPCLASS

PG\_OPCLASS defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type. The set of operators from the family that are actually usable with the indexed column are data types that accept the left-hand column.

**Table 12-93** PG\_OPCLASS columns

Name	Type	Reference	Description
OID	OID	-	Row identifier (hidden attribute, which must be specified)
opcmethod	OID	OID in <a href="#">PG_AM</a>	Index access method operator class served by an operator class
opcname	name	-	Name of the operator class
opcnamespace	OID	OID in <a href="#">PG_NAMESPACE</a>	Namespace of the operator class
opcowner	OID	OID in <a href="#">PG_AUTHID</a>	Owner of the operator class

Name	Type	Reference	Description
opcfamily	OID	OID in <a href="#">PG_OPFAMILY</a>	Operator family containing the operator class
opcintype	OID	OID in <a href="#">PG_TYPE</a>	Data type that the operator class indexes
opcdefault	Boolean	-	The value is <b>t</b> (true) if the operator class is the default for <b>opcintype</b> . Otherwise, the value is <b>f</b> (false).
opckeytype	OID	OID in <a href="#">PG_TYPE</a>	Type of data stored in index, or zero if same as <b>opcintype</b>

An operator class's **opcmethod** must match the **opfmetho**d of its containing operator family.

#### 12.2.14.48 PG\_OPERATOR

PG\_OPERATOR records information about operators.

**Table 12-94** PG\_OPERATOR columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
oprname	name	-	Name of an operator.
oprnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains the operator.
oprowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the operator.
oprkind	"char"	-	<ul style="list-style-type: none"> <li>• <b>b</b>: infix (both sides)</li> <li>• <b>l</b>: prefix (left side)</li> <li>• <b>r</b>: suffix (right side)</li> </ul>
oprcanmerge	boolean	-	<p>Specifies whether the operator supports merge joins.</p> <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>

Name	Type	Reference	Description
oprcanhash	boolean	-	Specifies whether the operator supports hash joins. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
oprleft	oid	OID in <a href="#">PG_TYPE</a>	Type of the left operand.
oprright	oid	OID in <a href="#">PG_TYPE</a>	Type of the right operand.
oprresult	oid	OID in <a href="#">PG_TYPE</a>	Type of the result.
oprcom	oid	OID in <a href="#">PG_OPERATOR</a>	If it exists, the value is the exchange character of this operator. If it does not exist, the value is <b>0</b> .
oprnegate	oid	OID in <a href="#">PG_OPERATOR</a>	If it exists, the value is the invertor of this operator. If it does not exist, the value is <b>0</b> .
oprcode	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Function that implements the operator.
oprrest	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Restriction selectivity estimation function for the operator.
oprjoin	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Join selectivity estimation function for the operator.

### 12.2.14.49 PG\_OPFAMILY

**PG\_OPFAMILY** defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is specified by the access method. The operator family allows cross-data-type operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

**Table 12-95** PG\_OPFAMILY columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)

Name	Type	Reference	Description
opfmethod	oid	<a href="#">PG_AM.oid</a>	Index access method used by an operator family
opfname	name	-	Name of the operator family
opfnamespace	oid	<a href="#">PG_NAMESPACE.oid</a>	Namespace of the operator family
opfowner	oid	<a href="#">PG_AUTHID.oid</a>	Owner of the operator family

The majority of the information defining an operator family is not in its **PG\_OPFAMILY** row, but in the associated rows in [PG\\_AMOP](#), [PG\\_AMPROC](#), and [PG\\_OPCLASS](#).

### 12.2.14.50 PG\_PLTEMPLATE

**PG\_PLTEMPLATE** records template information for procedural languages.

**Table 12-96** PG\_PLTEMPLATE columns

Name	Type	Description
tmplname	name	Name of the language for which this template is used
tmpltrusted	boolean	The value is <b>true</b> if the language is considered trusted. Otherwise, the value is <b>false</b> .
tmpldbcreate	boolean	The value is <b>true</b> if the language is created by the owner of the database. Otherwise, the value is <b>false</b> .
tmplhandler	text	Name of the call handler function
tmplinline	text	Name of the anonymous block handler ( <b>NULL</b> if no name of the block handler exists)
tmplvalidator	text	Name of the verification function ( <b>NULL</b> if no verification function is available)
tmpllibrary	text	Path of the shared library that implements languages
tmplacl	aclitem[]	Access permissions for template (not yet used)

## 12.2.14.51 PG\_PROC

PG\_PROC records information about functions or procedures.

**Table 12-97** PG\_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
proname	name	Function name.
pronamespace	oid	OID of the namespace that contains the function.
proowner	oid	Owner of the function.
prolang	oid	Implementation language or call interface of the function.
procost	real	Estimated execution cost.
prorows	real	Estimated number of rows that are influenced.
provariadic	oid	Data type of parameter element.
protransform	regproc	Simplified call method for the function.
proisagg	Boolean	Specifies whether the function is an aggregate function. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
proiswindow	Boolean	Specifies whether the function is a window function. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
prosecdef	Boolean	Specifies whether the function is a security definer (or a setuid function). <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
proleakproof	Boolean	Specifies whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. <ul style="list-style-type: none"><li>• <b>t</b> (true): There is no side effect.</li><li>• <b>f</b> (false): There are side effects.</li></ul>

Name	Type	Description
proisstrict	Boolean	<ul style="list-style-type: none"> <li>• <b>t</b> (true): When this function is used, the function does not invoke the function and returns null if the input parameter is null.</li> <li>• <b>f</b> (false): When this function is used, it is invoked even if the input parameter is null. Therefore, this function must process null input.</li> </ul>
proretset	Boolean	<p>Specifies whether the return value of the function is a set (that is, multiple values of the specified data type).</p> <ul style="list-style-type: none"> <li>• <b>true</b>: The return value of the function is a set.</li> <li>• <b>false</b>: The return value of the function is not a set.</li> </ul>
provolatile	"char"	<p>Specifies whether the function's result depends only on its input parameters, or is affected by outside factors.</p> <ul style="list-style-type: none"> <li>• <b>i</b>: immutable functions, which always deliver the same result for the same inputs.</li> <li>• <b>s</b>: stable functions, whose results (for fixed inputs) do not change within a scan.</li> <li>• <b>v</b>: volatile functions, whose results may change at any time. Use <b>v</b> also for functions with side-effects, so that the engine cannot get optimized if volatile functions are called.</li> </ul>
pronargs	smallint	Number of parameters.
pronargdefaults	smallint	Number of parameters that have default values.
prorettype	oid	Data type of return values.
proargtypes	oidvector	Array that stores the data types of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (interface) of the function.
proallargtypes	oid[]	Array that contains the data types of function parameters. This array includes all parameter types (including <b>OUT</b> and <b>INOUT</b> parameters); however, if all the parameters are <b>IN</b> parameters, this column is null. Note that array subscripting is 1-based, whereas for historical reasons, <b>proargtypes</b> is subscripted from 0.

Name	Type	Description
proargmodes	"char"[]	<p>Array with the modes of the function parameters, encoded as follows:</p> <ul style="list-style-type: none"> <li>• <b>i</b> indicates the <b>IN</b> parameter.</li> <li>• <b>o</b> indicates the <b>OUT</b> parameter.</li> <li>• <b>b</b> indicates the <b>INOUT</b> parameter.</li> <li>• <b>v</b> indicates the <b>VARIADIC</b> parameter.</li> </ul> <p>If all the parameters are <b>IN</b> parameters, this column is null. Note that subscripts correspond to positions of <b>proallargtypes</b>, not <b>proargtypes</b>.</p>
proargnames	text[]	<p>Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that subscripts correspond to positions of <b>proallargtypes</b>, not <b>proargtypes</b>.</p>
proargdefaults	pg_node_tree	<p>Expression tree of the default value. This is the list of <b>pronargdefaults</b> elements.</p>
prosrc	text	<p>A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a link symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.</p>
probin	text	<p>Additional information about how to call the function. Again, the interpretation is language-specific.</p>
proconfig	text[]	<p>Function's local settings for run-time configuration variables.</p>
proacl	aclitem[]	<p>Access permission. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a>.</p>
prodefaultargpos	int2vector	<p>Position of the input parameter of a function with a default value.</p>
fencedmode	Boolean	<p>Execution mode of a function, indicating whether the function is executed in fence or not fence mode.</p> <ul style="list-style-type: none"> <li>• <b>true</b>: fence mode. In this mode, the function is executed in the fork process.</li> <li>• <b>false</b>: not fence mode.</li> </ul> <p>For built-in functions in the system, <b>fencedmode</b> is set to <b>false</b>, indicating the not fence mode.</p>

Name	Type	Description
proshippable	Boolean	Specifies whether the function can be pushed down to DNs for execution. The default value is <b>false</b> . <ul style="list-style-type: none"> <li>Functions of the <b>IMMUTABLE</b> type can always be pushed down to DNs.</li> <li>Functions of the <b>STABLE</b> or <b>VOLATILE</b> type can be pushed down to DNs only if their attribute is <b>SHIPPABLE</b>.</li> </ul>
propackage	Boolean	Specifies whether the function supports overloading. The default value is <b>false</b> . <ul style="list-style-type: none"> <li><b>t</b> (true): supported.</li> <li><b>f</b> (false): not supported.</li> </ul>
prokind	"char"	Specifies whether the object is a function or a stored procedure. <ul style="list-style-type: none"> <li><b>'f'</b>: The object is a function.</li> <li><b>'p'</b>: The object is a stored procedure.</li> </ul>
proargsrc	text	Describes the parameter input strings of functions or stored procedures that are compatible with ORA syntax, including parameter comments. The default value is <b>NULL</b> .
proargtypesext	oidvector_ _extend	Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including <b>INOUT</b> parameters), and indicates the call signature (interface) of the function.
prodefaultargpo- sxt	int2vector_ _extend	Position of the input parameter with a default value when the function has a large number of parameters.
allargtypes	oidvector	Array for storing the data types of stored procedure parameters, including all parameters (input parameters, output parameters, and <b>INOUT</b> parameters) of the stored procedure.
allargtypesext	oidvector_ _extend	Array for storing the data types of stored procedure parameters when the number of function parameters is greater than 666. The array contains all parameters (including input parameters, output parameters, and <b>INOUT</b> parameters).

 NOTE

When a function is created, data is inserted into the PG\_PROC catalog to update the index. When there are a large number of input and output parameters, the index length may exceed one third of the page length. As a result, the error "Index row size xxx exceeds maximum xxx for index 'pg\_proc\_proname\_all\_args\_nsp\_index'" may be reported as expected. You can reduce the number of parameters to avoid this error.

### 12.2.14.52 PG\_RANGE

PG\_RANGE records information about range types, except for records of types in [PG\\_TYPE](#).

**Table 12-98** PG\_RANGE columns

Name	Type	Reference	Description
rngtypid	oid	OID in <a href="#">PG_TYPE</a>	OID of the range type
rngsubtype	oid	OID in <a href="#">PG_TYPE</a>	OID of the element type (subtype) of this range type
rngcollation	oid	OID in <a href="#">PG_COLLATION</a>	OID of the collation used for range comparisons ( <b>0</b> if none)
rngsubopc	oid	OID in <a href="#">PG_OPCLASS</a>	OID of the subtype's operator class used for range comparisons
rngcanonical	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the function to convert a range value into canonical form ( <b>0</b> if none)
rngsubdiff	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the function used to calculate the difference between two elements in a range. The return value of the function is of the double-precision type. If the function does not exist, the value of <b>rngsubdiff</b> is <b>0</b> .

If the element type is discrete, **rngcanonical** determines the collation used for the range type. If the element type is not collatable, **rngsubopc** determines the collation used for the range type. If the element type is collatable, **rngsubopc** and **rngcollation** determine the collation used for the range type.

### 12.2.14.53 PG\_REPLICATION\_ORIGIN

PG\_REPLICATION\_ORIGIN contains all created replication sources and is shared among all databases in a cluster. Each cluster has only one copy of PG\_REPLICATION\_ORIGIN, not one copy per database instance.

**Table 12-99** PG\_REPLICATION\_ORIGIN columns

Name	Type	Description
roident	oid	Unique replication source identifier within a cluster.
roname	text	External user-defined replication source name.

### 12.2.14.54 PG\_RESOURCE\_POOL

PG\_RESOURCE\_POOL provides information about database resource pools.

**Table 12-100** PG\_RESOURCE\_POOL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
respool_name	name	Name of a resource pool
mem_percent	integer	Percentage of the memory configuration
cpu_affinity	bigint	Value of cores bound to the CPU
control_group	name	Name of the Cgroup where the resource pool is located
max_dop	integer	Maximum scanning concurrency during data redistribution. This column is used only for scaling.
memory_limit	name	Maximum memory of the resource pool
parentid	oid	OID of the parent resource pool
io_limits	integer	Upper limit of IOPS. It is counted by ones and by 10 thousands.
io_priority	name	I/O priority set for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.
max_worker	integer	Concurrency in a table during data redistribution. This column is used only for scaling.
max_connections	integer	Maximum number of connections that can be used by a resource pool.
max_dynamic_memory	name	Maximum dynamic memory that can be used by a resource pool.
max_shared_memory	name	Maximum shared memory that can be used by a resource pool.

Name	Type	Description
max_concurrency	integer	Maximum number of concurrent requests that can be used by a resource pool.

### 12.2.14.55 PG\_REWRITE

PG\_REWRITE records rewrite rules defined for tables and views.

**Table 12-101** PG\_REWRITE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rulename	name	Name of a rule.
ev_class	oid	Name of the table that uses the rule.
ev_attr	smallint	Column to which this rule applies (always <b>0</b> to indicate the entire table).
ev_type	"char"	Event type for the rule. <ul style="list-style-type: none"> <li>• <b>1</b>: SELECT</li> <li>• <b>2</b>: UPDATE</li> <li>• <b>3</b>: INSERT</li> <li>• <b>4</b>: DELETE</li> </ul>
ev_enabled	"char"	Controls the mode in which the rule is triggered. <ul style="list-style-type: none"> <li>• <b>O</b>: The rule is triggered in origin and local modes.</li> <li>• <b>D</b>: The rule is disabled.</li> <li>• <b>R</b>: The rule is triggered in replica mode.</li> <li>• <b>A</b>: The rule is always triggered.</li> </ul>
is_instead	Boolean	The value is <b>true</b> if the rule is of the <b>INSTEAD</b> type. Otherwise, the value is <b>false</b> .
ev_qual	pg_node_tree	Expression tree (in the form of a nodeToString() representation) for the rule's qualifying condition.
ev_action	pg_node_tree	Query tree (in the form of a nodeToString() representation) for the rule's action.

### 12.2.14.56 PG\_SET

**PG\_SET** records metadata defined by the SET data type. Currently, this function is not supported in distributed mode.

### 12.2.14.57 PG\_SHDEPEND

**PG\_SHDEPEND** records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also **PG\_DEPEND**, which provides a similar function for dependencies involving objects within a single database.

**PG\_SHDEPEND** is shared among all databases of cluster. That is, there is only one **PG\_SHDEPEND** for each cluster, not for each database.

**Table 12-102** PG\_SHDEPEND columns

Name	Type	Reference	Description
dbid	oid	OID in <b>PG_DATABASE</b>	OID of the database the dependent object is in, or zero for a shared object.
classid	oid	OID in <b>PG_CLASS</b>	OID of the system catalog where a dependent object resides.
objid	oid	Any OID column	OID of the dependent object.
objsubid	integer	-	Column number of a table column (the table to which the column points can be determined based on <b>objid</b> and <b>classid</b> ). The value is <b>0</b> for all other object types.
refclassid	oid	OID in <b>PG_CLASS</b>	OID of the system catalog the referenced object is in (must be a shared catalog).
refobjid	oid	Any OID column	OID of the referenced object.
deptype	"char"	-	Code segment defining the specific semantics of this dependency relationship. The value can be <b>o</b> , <b>a</b> , <b>p</b> , <b>d</b> , or <b>l</b> . For details, see the following text.
objfile	text	-	Path of the user-defined C function library file.

In all cases, a **PG\_SHDEPEND** entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- **SHARED\_DEPENDENCY\_OWNER (o)**  
The referenced object (which must be a role) is the owner of the dependent object.
- **SHARED\_DEPENDENCY\_ACL (a)**  
The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. **SHARED\_DEPENDENCY\_ACL** is not added to the owner of the object because the owner will have a **SHARED\_DEPENDENCY\_OWNER** record.
- **SHARED\_DEPENDENCY\_PIN (p)**  
This type of record indicates that the system itself depends on the depended object. Therefore, such an object cannot be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.
- **SHARED\_DEPENDENCY\_DBPRIV(d)**  
The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the **GS\_DB\_PRIVILEGE** system catalog).
- **SHARED\_DEPENDENCY\_SECLABEL(l)**  
The referenced object (must be a security label) is applied to the dependent object.

### 12.2.14.58 PG\_SHDESCRIPTION

**PG\_SHDESCRIPTION** records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with the **\d** command.

See also **PG\_DESCRIPTION**, which provides a similar function for descriptions involving objects within a single database.

**PG\_SHDESCRIPTION** is shared among all databases of cluster. That is, there is only one **PG\_SHDESCRIPTION** for each cluster, not for each database.

**Table 12-103** PG\_SHDESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the described object.
classoid	oid	OID in <b>PG_CLASS</b>	OID of the system catalog where the object appears.
description	text	-	Description of the object.

### 12.2.14.59 PG\_STATISTIC

**PG\_STATISTIC** stores statistics about tables and index columns in a database. By default, only a system administrator can access the system catalog. Common users can access this system catalog only after being authorized.

**Table 12-104** PG\_STATISTIC columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stanumbers N	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.

Name	Type	Description
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>A value greater than 0 is the actual number of distinct values.</li> <li>A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadndistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
staextinfo	text	Information about extension statistics. This is reserved.
stastate	"char"	Specifies whether the statistics are locked. If the statistics are locked, they cannot be updated. Currently, this parameter is meaningless in distributed mode. <ul style="list-style-type: none"> <li><b>l</b>: locked</li> <li><b>u</b>: unlocked</li> </ul>

**NOTICE**

PG\_STATISTIC stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG\_STATISTIC system catalog to query the sensitive information about the statistical objects.

### 12.2.14.60 PG\_STATISTIC\_EXT

PG\_STATISTIC\_EXT displays extended statistics of tables in a database, such as statistics of multiple columns. Statistics of expressions will be supported later. You can specify the extended statistics to be collected. This system catalog is accessible only to system administrators.

**Table 12-105** PG\_STATISTIC\_EXT columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	char	Type of an object. 'c' indicates a table, and 'p' indicates a partition.

Name	Type	Description
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stadndistinct	real	Number of unique non-null data values in the <b>DN1</b> column. <ul style="list-style-type: none"> <li>• A value greater than 0 is the actual number of distinct values.</li> <li>• A value less than 0 is the ratio of the <b>distinct</b> value to the total number of rows. For example, if <b>stadndistinct</b> is <b>-0.5</b>, the actual <b>distinct</b> value is the total number of rows multiplied by 0.5.</li> <li>• The value <b>0</b> indicates that the number of distinct values is unknown.</li> </ul>
stakindN	smallint	Code number stating that the type of statistics is stored in slot <i>N</i> of the <i>pg_statistic</i> row. The value of <i>N</i> ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot <i>N</i> . For example, a histogram slot shows the < operator that defines the sort order of the data. The value of <i>N</i> ranges from 1 to 5.
stakey	int2vector	Array of a column ID.
stanumbers N	real[]	Numerical statistics of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot does not involve numerical values. The value of <i>N</i> ranges from 1 to 5.

Name	Type	Description
stavaluesN	anyarray	Column data values of the appropriate type for slot <i>N</i> . The value is <b>NULL</b> if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of <i>N</i> ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.
stasource	char	Source of extended statistics: <ul style="list-style-type: none"><li>• 'a': indicates automatic creation. For details, see the GUC parameter <b>auto_statistic_ext_columns</b>.</li><li>• 'm': indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).</li></ul>
stastatus	char	Status of extended statistics: <ul style="list-style-type: none"><li>• 'a': active and available.</li><li>• 'd': disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.</li></ul>
staextname	name	Alias of the multi-column group of multi-column statistics.
stastate	char	Specifies whether the statistics are locked. If the statistics are locked, they cannot be updated. Currently, this parameter is meaningless in distributed mode. <ul style="list-style-type: none"><li>• l: locked</li><li>• u: unlocked</li></ul>

**NOTICE**

PG\_STATISTIC\_EXT stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG\_STATISTIC\_EXT system catalog to query the sensitive information about the statistical objects.

### 12.2.14.61 PG\_SYNONYM

PG\_SYNONYM records the mapping between synonym object names and other database object names.

**Table 12-106** PG\_SYNONYM columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
synname	name	Synonym name.
synnamespace	oid	OID of the namespace that contains a synonym. The OID of the PUBLIC synonym namespace is 0.
synowner	oid	Owner of a synonym, usually the OID of the user who created it. The owner of the PUBLIC synonym is 0.
synobjschema	name	Schema name specified by an associated object.
synobjname	name	Name of an associated object.
syndblinkname	name	Database link name.

## 12.2.14.62 PG\_TABLESPACE

PG\_TABLESPACE records tablespace information.

**Table 12-107** PG\_TABLESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
spcname	name	Tablespace name
spcowner	oid	Owner of the tablespace, usually the user who created it
spcacl	aclitem[]	Access permissions. For details, see <a href="#">GRANT</a> and <a href="#">REVOKE</a> .
spcoptions	text[]	Options of the tablespace
spcmmaxsize	text	Maximum size of the available disk space, in bytes
relative	boolean	Whether the storage path specified by the tablespace is a relative path <ul style="list-style-type: none"> <li>• <b>t (true)</b>: yes.</li> <li>• <b>f (false)</b>: no.</li> </ul>

### 12.2.14.63 PG\_TRIGGER

PG\_TRIGGER records trigger information.

**Table 12-108** PG\_TRIGGER columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
tgrelid	oid	OID of the table where the trigger is located.
tgname	name	Trigger name.
tgfoid	oid	Function to be invoked by the trigger.
tgtype	smallint	Trigger type.
tgenabled	"char"	<ul style="list-style-type: none"><li>● <b>O</b>: The trigger is triggered in origin and local modes.</li><li>● <b>D</b>: The trigger is disabled.</li><li>● <b>R</b>: The trigger is triggered in replica mode.</li><li>● <b>A</b>: The trigger is always triggered.</li></ul>
tgisinternal	Boolean	Internal trigger ID. If the value is <b>true</b> , it indicates an internal trigger.
tgconstrelid	oid	Table referenced by the integrity constraint.
tgconstridid	oid	Index of the integrity constraint.
tgconstraint	oid	OID of the constraint trigger in <a href="#">PG_CONSTRAINT</a> .
tgdeferrable	Boolean	Specifies whether the constraint trigger is of the DEFERRABLE type. <ul style="list-style-type: none"><li>● <b>t</b> (true): yes</li><li>● <b>f</b> (false): no</li></ul>
tginitdeferred	Boolean	Specifies whether the trigger is of the INITIALLY DEFERRED type. <ul style="list-style-type: none"><li>● <b>t</b> (true): yes</li><li>● <b>f</b> (false): no</li></ul>
tgargs	smallint	Number of input parameters of the trigger function.
tgattr	int2vector	Column ID specified by the trigger. If no column is specified, an empty array is used.
tgargs	bytea	Parameter transferred to the trigger.
tgqual	pg_node_tree	WHEN condition of the trigger ( <b>NULL</b> if the WHEN condition does not exist).

Name	Type	Description
tgowner	oid	Trigger owner.

### 12.2.14.64 PG\_TS\_CONFIG

PG\_TS\_CONFIG contains entries representing text search configurations. Each of these configurations contains a list of specific text search parsers and dictionary mappings.

The parser is shown in the PG\_TS\_CONFIG entry, but the token-to-dictionary mapping is defined by subsidiary entries in [PG\\_TS\\_CONFIG\\_MAP](#).

**Table 12-109** PG\_TS\_CONFIG columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
cfgname	name	-	Text search configuration name.
cfgnamespace	oid	oid in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains the configuration.
cfgowner	oid	OID in <a href="#">PG_AUTHID</a>	Owner of the configuration.
cfgparser	oid	OID in <a href="#">PG_TS_PARSER</a>	OID of the text search parser for this configuration.
cfgoptions	text[]	-	Configuration options.

### 12.2.14.65 PG\_TS\_CONFIG\_MAP

PG\_TS\_CONFIG\_MAP contains parser symbol mappings for each text search configuration.

**Table 12-110** PG\_TS\_CONFIG\_MAP columns

Name	Type	Reference	Description
mapcfg	oid	OID in <a href="#">PG_TS_CONFIG</a>	OID of the <a href="#">PG_TS_CONFIG</a> entry owning this map entry.
maptokentype	integer	-	Token type generated by the configuration's parser.

Name	Type	Reference	Description
mapseqno	integer	-	Sequence number of a token type when the values of <b>mapcfg</b> or <b>maptokentype</b> are the same.
mapdict	oid	OID in <a href="#">PG_TS_DICT</a>	OID of the text search dictionary to consult.

### 12.2.14.66 PG\_TS\_DICT

**PG\_TS\_DICT** contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinitoption**, whose format and meaning vary depending on the template.

**Table 12-111** PG\_TS\_DICT columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
dictname	name	-	Text search dictionary name
dictnamespace	oid	<a href="#">PG_NAMESPACE</a> .oid	OID of the namespace that contains the dictionary
dictowner	oid	<a href="#">PG_AUTHID</a> .oid	Owner of the dictionary
dicttemplate	oid	<a href="#">PG_TS_TEMPLATE</a> .oid	OID of the text search template for the dictionary
dictinitoption	text	-	Initialization option string for the template

### 12.2.14.67 PG\_TS\_PARSER

**PG\_TS\_PARSER** contains definition of text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. Because the parser must be implemented through functions at the C language level, the new parser must be created by the database system administrator.

**Table 12-112** PG\_TS\_PARSER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
prsname	name	-	Text search parser name.
prsnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains the parser.
prsstart	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the parser's startup function.
prstoken	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the parser's next-token function.
prsend	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the parser's shutdown function.
prshheadline	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the parser's headline function.
prsllextype	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the parser's lextype function.

### 12.2.14.68 PG\_TS\_TEMPLATE

PG\_TS\_TEMPLATE contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

**Table 12-113** PG\_TS\_TEMPLATE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
tmplname	name	-	Text search template name.
tmplnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace that contains the template.
tmplinit	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the template's initialization function.
tmpllexize	regproc	<b>prname</b> in <a href="#">PG_PROC</a>	Name of the template's lexize function.

## 12.2.14.69 PG\_TYPE

PG\_TYPE stores information about data types.

**Table 12-114** PG\_TYPE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
typname	name	Data type name.
typnamespace	oid	OID of the namespace that contains the type.
typowner	oid	Owner of the type.
typlen	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. <ul style="list-style-type: none"> <li>• <b>-1</b>: a "varlena" type (one that has a length word).</li> <li>• <b>-2</b>: a null-terminated C string.</li> </ul>
typbyval	Boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: A value of this type is transferred by value internally.</li> <li>• <b>false</b>: A value of this type is transferred by reference internally.</li> </ul> <p>If <b>typlen</b> of this type is not <b>1, 2, 4, or 8</b>, you are advised to transfer a reference value for <b>typbyval</b>. You can also transfer a value for <b>typbyval</b>. Variable-length types are usually passed by reference or by value.</p>
typtype	"char"	<ul style="list-style-type: none"> <li>• <b>b</b>: basic type.</li> <li>• <b>d</b>: domain type.</li> <li>• <b>p</b>: pseudo type.</li> <li>• <b>r</b>: range type.</li> <li>• <b>e</b>: enumeration type.</li> <li>• <b>u</b>: undefined type.</li> </ul> <p>For details, see <b>typrelid</b> and <b>typbasetype</b>.</p>
typcategory	"char"	Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.
typispreferred	boolean	<ul style="list-style-type: none"> <li>• <b>true</b>: Data is converted when it complies with the conversion rule specified by <b>typcategory</b>.</li> <li>• <b>false</b>: Data is not converted.</li> </ul>

Name	Type	Description
typisdefined	boolean	<ul style="list-style-type: none"> <li><b>true</b>: The type has been defined.</li> <li><b>false</b>: The placeholder of an undefined type is used. In this case, there is no reliable information except the name, namespace, and OID of the type.</li> </ul>
typdelim	"char"	Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.
typrelid	oid	If this is a composite type (see <b>typtype</b> ), then this column points to the <b>PG_CLASS</b> entry that defines the corresponding table. For a free-standing composite type, the PG_CLASS entry does not represent a table, but it is required for the type's <b>PG_ATTRIBUTE</b> entries to link to. It is <b>0</b> for non-composite type.
typelem	oid	If <b>typelem</b> is not <b>0</b> , it identifies another row in PG_TYPE. The current type can be described as an array yielding values of type <b>typelem</b> . A "true" array type has a variable length ( <b>typlen</b> = -1), but some fixed-length types ( <b>typlen</b> > 0) also have non-zero <b>typelem</b> , for example <b>name</b> and <b>point</b> . If a fixed-length type has a <b>typelem</b> , its internal representation must be a number of values of the <b>typelem</b> data type with no other data. Variable-length array types have a header defined by the array subroutines.
typarray	oid	If the value is not <b>0</b> , the corresponding type record is available in PG_TYPE.
typinput	regproc	Input conversion function (text format).
typoutput	regproc	Output conversion function (text format).
typreceive	regproc	Input conversion function (binary format); <b>0</b> for non-input conversion function.
typsend	regproc	Output conversion function (binary format); <b>0</b> for non-output conversion function.
typmodin	regproc	Input type modifier function; <b>0</b> if none.
typmodout	regproc	Output type modifier function; <b>0</b> if none.
typanalyze	regproc	Custom ANALYZE function; <b>0</b> if the standard function is used.

Name	Type	Description
typalign	"char"	<p>Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>c</b>: char alignment, that is, no alignment required</li> <li>• <b>s</b>: short alignment (2 bytes on most machines)</li> <li>• <b>i</b>: integer alignment (4 bytes on most machines)</li> <li>• <b>d</b>: double alignment (8 bytes on many machines, but by no means all)</li> </ul> <p><b>NOTICE</b> For types used in system tables, the size and alignment defined in PG_TYPE must agree with the way that the compiler lays out the column in a structure representing a table row.</p>
typstorage	"char"	<p><b>typstorage</b> tells for varlena types (those with <b>typlen = -1</b>) if the type is prepared for toasting and what the default strategy for attributes of this type should be. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>p</b>: Values are always stored plain.</li> <li>• <b>e</b>: Values can be stored in a secondary relationship (if the relation has one, see <b>reltoastrelid</b> in <a href="#">12.2.15.28 PG_CLASS</a>).</li> <li>• <b>m</b>: Values can be stored compressed inline.</li> <li>• <b>x</b>: Values can be stored compressed inline or stored in secondary storage.</li> </ul> <p><b>NOTICE</b> <b>m</b> domains can also be moved out to secondary storage, but only as a last resort (<b>e</b> and <b>x</b> domains are moved first).</p>
typnotnull	boolean	Specifies whether the type has a NOTNULL constraint. Currently, it is used for domains only.
typbasetype	oid	If this is a domain (see <b>typtype</b> ), then <b>typbasetype</b> identifies the type that this one is based on. The value is <b>0</b> if this type is not a derived type.
typtypmod	integer	Records the <b>typtypmod</b> to be applied to domains' base types by domains (the value is <b>-1</b> if the base type does not use <b>typmod</b> ). This is <b>-1</b> if this type is not a domain.
typndims	integer	If a field is an array, <b>typndims</b> is the number of array dimensions. This is <b>0</b> for types other than domains over array types.

Name	Type	Description
typcollation	oid	Sorting rule of a specified type. For details about the values, see the <a href="#">PG_COLLATION</a> system catalog. (0 if sequencing is not supported.)
typdefaultbin	pg_node_tree	nodeToString() representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.
typdefault	text	The value is <b>NULL</b> if a type has no associated default value. If <b>typdefaultbin</b> is not set to <b>NULL</b> , <b>typdefault</b> must contain a default expression represented by <b>typdefaultbin</b> . If <b>typdefaultbin</b> is <b>NULL</b> and <b>typdefault</b> is not, then <b>typdefault</b> is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.
typacl	aclitem[]	Access permission.

### 12.2.14.70 PGXC\_CLASS

PGXC\_CLASS records replicated or distributed information for each table.

**Table 12-115** PGXC\_CLASS columns

Name	Type	Description
pcrelid	oid	OID of the table.
plocator_type	"char"	Locator type. <ul style="list-style-type: none"> <li>● <b>H</b>: Hash</li> <li>● <b>G</b>: Range</li> <li>● <b>L</b>: List</li> <li>● <b>M</b>: Modulo</li> <li>● <b>N</b>: Round Robin</li> <li>● <b>R</b>: Replication</li> <li>● <b>U</b>: MurmurHash</li> </ul>
pchashalgorithm	smallint	Distributed tuple using the hash algorithm. <ul style="list-style-type: none"> <li>● <b>1</b>: default hash algorithm.</li> <li>● <b>2</b>: MURMURHASH algorithm.</li> </ul>
pchashbuckets	smallint	Value of a harsh container.
pgroup	name	Name of the node.
redistributed	"char"	Indicates that a table has been redistributed.

Name	Type	Description
redis_order	integer	Redistribution sequence. Tables whose values are <b>0</b> will not be redistributed in this round of redistribution.
pcattnum	int2vector	Column number used as a distributed key.
nodeoids	oidvector_extend	List of distributed table node OIDs.
options	text	Extension status information. This is a reserved column in the system.
diskey	text	Character string of the distribution key expression in the brackets of the DISTRIBUTE BY clause in the SQL table creation statement. Currently, only MURMURHASH distribution is supported.
diskeyexprs	pg_node_tree	Character string information obtained by serializing diskey by using the pack_node_to_string() function.

### 12.2.14.71 PGXC\_GROUP

PGXC\_GROUP records information about node groups.

**Table 12-116** PGXC\_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
group_name	name	Name of a node group
in_redistribution	"char"	Specifies whether redistribution is required. Valid value: <ul style="list-style-type: none"> <li><b>n</b>: The node group is not redistributed.</li> <li><b>y</b>: The source node group is in redistribution.</li> <li><b>t</b>: The destination node group is in redistribution.</li> </ul>
group_members	oidvector_extend	Node OID list of the node group.
group_buckets	text	Distributed data bucket group.
is_installation	Boolean	Specifies whether to install a sub-cluster. <ul style="list-style-type: none"> <li><b>t</b> (true): yes</li> <li><b>f</b> (false): no</li> </ul>

Name	Type	Description
group_acl	aclitem[]	Access permission.
group_kind	"char"	Node group type. The options are as follows: <ul style="list-style-type: none"> <li>• <b>i</b>: installation node group</li> <li>• <b>n</b>: node group in a common cluster.</li> <li>• <b>e</b>: elastic cluster</li> </ul>
group_parent	oid	For a child node group, this field indicates the OID of the parent node group. For a parent node group, this field is left blank.
bucket_map	text	Mapping between physical buckets and logical buckets.

### 12.2.14.72 PGXC\_SLICE

PGXC\_SLICE is a system catalog created for recording range distribution and list distribution details. Currently, range interval cannot be used to automatically scale out shards. It is reserved in the system catalog.

**Table 12-117** PGXC\_SLICE columns

Name	Type	Description
relname	name	Table name or shard name, which is distinguished by <b>type</b> .
type	"char"	<ul style="list-style-type: none"> <li>• <b>'t'</b>: <b>relname</b> is the table name.</li> <li>• <b>'s'</b>: <b>relname</b> is the shard name.</li> </ul>
strategy	"char"	<ul style="list-style-type: none"> <li>• <b>'r'</b>: range distributed table.</li> <li>• <b>'l'</b>: list distributed table.</li> </ul> This value will be extended for subsequent interval shards.
relid	oid	OID of the distributed table to which the tuple belongs.
referenc eoid	oid	OID of the referenced distributed table, which is used for slice reference table creation syntax.
sindex	integer	Position of the current boundary in a shard when the table is a list distributed table.
interval	text[]	Reserved column.
transitb oundary	text[]	Reserved column.

Name	Type	Description
transitno	integer	Reserved column.
nodeoid	oid	When <b>relname</b> is set to a shard name, <b>nodeoid</b> indicates the OID of the DN where the shard data is stored.
boundaries	text[]	When <b>relname</b> is set to a shard name, this parameter indicates the boundary value of the shard.
specified	boolean	Specifies whether the DN corresponding to the current shard is explicitly specified in the DDL.
sliceorder	integer	User-defined shard sequence.

### 12.2.14.73 PLAN\_TABLE\_DATA

PLAN\_TABLE\_DATA stores plan information collected by EXPLAIN PLAN. Different from the PLAN\_TABLE view, the system catalog PLAN\_TABLE\_DATA stores EXPLAIN PLAN information collected by all sessions and users.

**Table 12-118** PLAN\_TABLE\_DATA columns

Name	Type	Description
session_id	text	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by <b>NOT NULL</b> .
user_id	oid	User who inserts the data. Values are constrained by <b>NOT NULL</b> .
statement_id	character varying(30)	Query tag specified by a user
plan_id	bigint	Query plan ID. The ID is automatically generated in the plan generation phase and is used by kernel engineers for debugging.
id	integer	Node ID in a plan.
operation	character varying(30)	Operation description.
options	character varying(255)	Operation action.
object_name	name	Name of an operated object. It is defined by users.

Name	Type	Description
object_type	character varying(30)	Object type.
object_owner	name	Schema to which an object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.

 NOTE

- PLAN\_TABLE\_DATA records data of all users and sessions on the current node. Only administrators can access all the data. Common users can view their own data in the [PLAN\\_TABLE](#) view.
- Data of inactive (exited) sessions is cleaned from PLAN\_TABLE\_DATA by gs\_clean after being stored in this system catalog for a certain period of time (5 minutes by default). You can also manually run **gs\_clean -C** to delete inactive session data from the table.
- Data is automatically inserted into PLAN\_TABLE\_DATA after **EXPLAIN PLAN** is executed. Therefore, do not manually insert data into or update data in PLAN\_TABLE\_DATA. Otherwise, data in PLAN\_TABLE\_DATA may be disordered. When you need to delete data from a table, it is recommended that you use the [PLAN\\_TABLE](#) view.
- Information in the **statement\_id**, **object\_name**, **object\_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.

### 12.2.14.74 STATEMENT\_HISTORY

Displays information about statements executed on the current node. To query this system catalog, you must have the sysadmin permission. The result can be queried only in the system database but cannot be queried in the user database.

The constraints on the query of this system catalog are as follows:

- Data must be queried in the Postgres database. No data exists in other databases.
- This system catalog is controlled by **track\_stmt\_stat\_level**. The default value is **OFF,L0**, where the first part controls full SQL statements, and the second part controls slow SQL statements. For details about the record level of each field, see the following table. To ensure system performance, you are advised to use the SET statement to change the value of this parameter so that the parameter takes effect only for the current session.
- For slow SQL statements, if the value of **track\_stmt\_stat\_level** is not **OFF** and the SQL execution time exceeds the value of **log\_min\_duration\_statement**, the SQL statement is recorded as a slow SQL statement.

**Table 12-119** STATEMENT\_HISTORY columns

Name	Type	Description	Record Level
db_name	name	Database name.	L0
schema_name	name	Schema name.	L0
origin_node	integer	Node name.	L0
user_name	name	Username.	L0
application_name	text	Name of the application that sends a request.	L0
client_addr	text	IP address of the client that sends a request.	L0
client_port	integer	Port number of the client that sends a request.	L0
unique_query_id	bigint	ID of the normalized SQL statement.	L0
debug_query_id	bigint	ID of the unique SQL statement. Some statements are not unique. For example, the value of <b>debug_query_id</b> in the Parse packet, DCL statements, and TCL statements is <b>0</b> .	L0
query	text	Normalized SQL (available only on CNs). When <b>track_stmt_parameter</b> is enabled, complete SQL statements are displayed.	L0
start_time	timestamp with time zone	Time when a statement starts.	L0
finish_time	timestamp with time zone	Time when a statement ends.	L0
slow_sql_threshold	bigint	Standard for slow SQL statement execution.	L0
transaction_id	bigint	Transaction ID.	L0
thread_id	bigint	ID of an execution thread.	L0
session_id	bigint	Session ID of a user.	L0

Name	Type	Description	Record Level
n_soft_parse	bigint	Number of soft parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .	L0
n_hard_parse	bigint	Number of hard parsing times. The value of <b>n_soft_parse</b> plus the value of <b>n_hard_parse</b> may be greater than the value of <b>n_calls</b> because the number of subqueries is not counted in the value of <b>n_calls</b> .	L0
query_plan	text	Statement execution plan.	L1(Full SQL) L0(Low SQL)
n_returned_rows	bigint	Number of rows in the result set returned by the <b>SELECT</b> statement.	L0
n_tuples_fetched	bigint	Number of rows randomly scanned.	L0
n_tuples_returned	bigint	Number of rows sequentially scanned.	L0
n_tuples_inserted	bigint	Number of rows inserted.	L0
n_tuples_updated	bigint	Number of rows updated.	L0
n_tuples_deleted	bigint	Number of rows deleted.	L0
n_blocks_fetched	bigint	Number of buffer block access times.	L0
n_blocks_hit	bigint	Number of buffer block hits.	L0
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).	L0
cpu_time	bigint	CPU time (unit: $\mu$ s).	L0

Name	Type	Description	Record Level
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).	L0
parse_time	bigint	SQL parsing time (unit: $\mu$ s).	L0
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).	L0
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).	L0
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).	L0
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s).	L0
data_io_time	bigint	I/O time (unit: $\mu$ s).	L0
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with the client, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <b>{"time":xxx, "n_calls":xxx, "size":xxx}</b> .	L0
net_rcv_info	text	Network status of messages received through a physical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with the client, and CNs communicate with DN through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <b>{"time":xxx, "n_calls":xxx, "size":xxx}</b> .	L0

Name	Type	Description	Record Level
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <code>{"time":xxx, "n_calls":xxx, "size":xxx}</code> .	L0
net_stream_receive_info	text	Network status of messages received through a logical connection, including the time (unit: $\mu$ s), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: <code>{"time":xxx, "n_calls":xxx, "size":xxx}</code> .	L0
lock_count	bigint	Number of locks.	L0
lock_time	bigint	Time required for locking.	L1
lock_wait_count	bigint	Number of lock waits.	L0
lock_wait_time	bigint	Time required for lock waiting.	L1
lock_max_count	bigint	Maximum number of locks.	L0
lwlock_count	bigint	Number of lightweight locks (reserved).	L0
lwlock_wait_count	bigint	Number of lightweight lock waits.	L0
lwlock_time	bigint	Time required for lightweight locking (reserved).	L1
lwlock_wait_time	bigint	Time required for lightweight lock waiting.	L1

Name	Type	Description	Record Level
details	bytea	<p>List of wait events and statement lock events.</p> <p>When the value of the record level is greater than or equal to L0, the list of wait events starts to be recorded. It displays statistics about wait events on the current node. For details about key events in the kernel, see <a href="#">Table 12-403</a>, <a href="#">Table 12-404</a>, <a href="#">Table 12-405</a>, and <a href="#">Table 12-406</a>. You can also view the list of all events in the system in the <code>wait_event_info</code> view. For details about the impact of each transaction lock on services, see <a href="#">LOCK</a>.</p> <p>When the value of <code>track_stmt_stat_level</code> is L2, the list of statement lock events is recorded. The list records events in chronological order. The number of records is affected by the value of the <code>track_stmt_details_size</code> parameter.</p> <p>This field is in binary format and needs to be read by using the parsing function <code>pg_catalog.statement_detail_decode</code>. For details, see <a href="#">Table 7-132</a>.</p> <p>Events include:</p> <ul style="list-style-type: none"> <li>• Start locking.</li> <li>• Complete locking.</li> <li>• Start lock waiting.</li> <li>• Complete lock waiting.</li> <li>• Start unlocking.</li> <li>• Complete unlocking.</li> <li>• Start lightweight lock waiting.</li> <li>• Complete lightweight lock waiting.</li> </ul>	L0/L2
is_slow_sql	Boolean	<p>Specifies whether the SQL statement is a slow SQL statement.</p> <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes</li> <li>• <b>f</b> (false): no</li> </ul>	L0
trace_id	text	Driver-specific trace ID, which is associated with an application request.	L0

Name	Type	Description	Record Level
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement.	L0
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that invokes the stored procedure. For statements outside the stored procedure, the value is <b>0</b> .	L0
finish_status	text	Statement completion status. <ul style="list-style-type: none"> <li><b>normal</b> (default)</li> <li><b>cancelled</b>: cancellation or termination.</li> </ul>	L0

#### NOTICE

- The record level of the **query\_plan** column is L1 for full SQL statements and L0 for slow SQL statements.
- For the **db\_time** time model, the time statistics of each dimension in **statement\_history** meet the requirement that **db\_time** is greater than or equal to **max(cpu\_time, parse\_time, plan\_time, rewrite\_time, data\_io\_time, net\_send\_info.time, net\_rcv\_info.time, net\_stream\_send\_info.time, net\_stream\_rcv\_info.time)**.
- For the **db\_time** time model formula, the following dimensions are not included in the statistical accuracy scope:
  1. **execution\_time**
  2. **pl\_execution\_time**
  3. **pl\_compilation\_time**
- The maximum nesting depth of wait events is **20**. If the nesting depth exceeds 20, a new wait event overwrites the last wait event.

### 12.2.14.75 STREAMING\_STREAM

**STREAMING\_STREAM** records the metadata of all STREAM objects.

**Table 12-120** STREAMING\_STREAM column

Name	Type	Description
relid	oid	STREAM object ID.
queries	bytea	Bitmap mapping of the CONTVIEW corresponding to the STREAM.

### 12.2.14.76 STREAMING\_CONT\_QUERY

STREAMING\_CONT\_QUERY records the metadata of all CONTVIEW objects.

**Table 12-121** STREAMING\_CONT\_QUERY columns

Name	Type	Description
id	integer	Unique identifier of the CONTVIEW object.
type	"char"	CONTVIEW type. <ul style="list-style-type: none"> <li>'r': CONTVIEW is based on the row-store model.</li> </ul>
relid	oid	CONTVIEW object ID.
defrelid	oid	ID of the continuous computing rule view corresponding to CONTVIEW.
active	Boolean	Specifies whether the CONTVIEW is in the continuous computing state. <ul style="list-style-type: none"> <li><b>t</b> (true): yes</li> <li><b>f</b> (false): no</li> </ul>
streamrelid	oid	ID of STREAM corresponding to CONTVIEW.
matrelid	oid	ID of the materialized table corresponding to CONTVIEW.
lookupidxid	oid	ID of GROUP LOOK UP INDEX corresponding to CONTVIEW. This column is for internal use and is available only in row-store tables.
step_factor	smallint	CONTVIEW step mode. The main values are <b>0</b> (no overlapping window) and <b>1</b> (sliding window, with one step).
ttn	integer	Value of <b>ttn_interval</b> set by CONTVIEW.
ttn_attno	smallint	Number of a time column corresponding to the TTL function set by CONTVIEW.
dictrelid	oid	ID of the dictionary table corresponding to CONTVIEW.

Name	Type	Description
grpnum	smallint	Number of dimension columns in the CONTVIEW continuous computing rule. This column is for internal use.
grpidx	int2vector	Index of the dimension column in TARGET LIST in the CONTVIEW continuous computing rule. This column is for internal use.

## 12.3 System Views

### 12.3.1 Partitioned Table

#### 12.3.1.1 ADM\_IND\_PARTITIONS

ADM\_IND\_PARTITIONS displays the partition information about local indexes of level-1 partitioned table in the database. Each local index partition of level-1 index partitioned table in the database, if present, has a row of records in ADM\_IND\_PARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-122** ADM\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.

Name	Type	Description
high_value	text	Upper limit of the partition corresponding to the index partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
index_partition_usable	Boolean	Specifies whether an index partition is available. <ul style="list-style-type: none"> <li><b>t</b> (true): yes.</li> <li><b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is <b>0</b> .
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.

Name	Type	Description
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the <b>analyze</b> command to collect statistics.
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.1.2 ADM\_IND\_SUBPARTITIONS

ADM\_IND\_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table in the database (excluding global indexes on partitioned tables). Each local index partition of level-2 index partitioned table in the database, if present, has a row of records in ADM\_IND\_SUBPARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Currently, all fields in this table are set to **NULL**.

**Table 12-123** ADM\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
index_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
partition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
high_value	text	Not supported. Set it to <b>NULL</b> .
high_value_length	numeric	Not supported. Set it to <b>NULL</b> .
partition_position	numeric	Not supported. Set it to <b>NULL</b> .
subpartition_position	numeric	Not supported. Set it to <b>NULL</b> .
status	character varying(8)	Not supported. Set it to <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Set it to <b>NULL</b> .
pct_free	numeric	Not supported. Set it to <b>NULL</b> .
ini_trans	numeric	Not supported. Set it to <b>NULL</b> .
max_trans	numeric	Not supported. Set it to <b>NULL</b> .
initial_extent	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
next_extent	numeric	Not supported. Set it to <b>NULL</b> .
min_extent	numeric	Not supported. Set it to <b>NULL</b> .
max_extent	numeric	Not supported. Set it to <b>NULL</b> .
max_size	numeric	Not supported. Set it to <b>NULL</b> .
pct_increase	numeric	Not supported. Set it to <b>NULL</b> .
freelists	numeric	Not supported. Set it to <b>NULL</b> .
freelist_groups	numeric	Not supported. Set it to <b>NULL</b> .
logging	character varying(7)	Not supported. Set it to <b>NULL</b> .
compression	character varying(13)	Not supported. Set it to <b>NULL</b> .
blevel	numeric	Not supported. Set it to <b>NULL</b> .
leaf_blocks	numeric	Not supported. Set it to <b>NULL</b> .
distinct_keys	numeric	Not supported. Set it to <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Set it to <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Set it to <b>NULL</b> .
clustering_factor	numeric	Not supported. Set it to <b>NULL</b> .
num_rows	numeric	Not supported. Set it to <b>NULL</b> .
sample_size	numeric	Not supported. Set it to <b>NULL</b> .
last_analyzed	date	Not supported. Set it to <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
global_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
interval	character varying(3)	Not supported. Set it to <b>NULL</b> .
segment_created	character varying(3)	Not supported. Set it to <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Set it to <b>NULL</b> .
parameters	character varying(1000)	Not supported. Set it to <b>NULL</b> .

### 12.3.1.3 ADM\_PART\_COL\_STATISTICS

ADM\_PART\_COL\_STATISTICS displays the column statistics and histogram information about all table partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-124** ADM\_PART\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to <b>NULL</b> .
low_value	raw	Not supported. Set it to <b>NULL</b> .
high_value	raw	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
density	numeric	Not supported. Set it to <b>NULL</b> .
num_nulls	numeric	Not supported. Set it to <b>NULL</b> .
num_buckets	numeric	Not supported. Set it to <b>NULL</b> .
sample_size	numeric	Not supported. Set it to <b>NULL</b> .
last_analyzed	date	Not supported. Set it to <b>NULL</b> .
global_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
notes	character varying(63)	Not supported. Set it to <b>NULL</b> .
avg_col_len	numeric	Not supported. Set it to <b>NULL</b> .
histogram	character varying(15)	Not supported. Set it to <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.1.4 ADM\_PART\_INDEXES

ADM\_PART\_INDEXES displays information about all partitioned table indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-125** ADM\_PART\_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Name of the owner of a partitioned table index.

Name	Type	Description
index_name	character varying(64)	Name of the partitioned table index.
partition_count	bigint	Number of index partitions of the partitioned table index.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
schema	character varying(64)	Name of the schema to which the partitioned table index belongs.
table_name	character varying(64)	Name of the partitioned table to which the partitioned table index belongs.

### 12.3.1.5 ADM\_PART\_TABLES

ADM\_PART\_TABLES displays information about all partitioned tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-126** ADM\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of a partitioned table.

Name	Type	Description
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partition policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. The distributed system does not support level-2 partitions. Set this parameter to <b>NONE</b> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
status	character varying(8)	Not supported. Set it to <b>valid</b> .
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Set it to <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_max_extents	character varying(40)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
def_max_size	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_freelists	numeric	Not supported. Set it to <b>NULL</b> .
def_freelist_groups	numeric	Not supported. Set it to <b>NULL</b> .
def_logging	character varying(7)	Not supported. Set it to <b>NULL</b> .
def_compression	character varying(8)	Default compression mode used when a partition is added. The options are as follows: <ul style="list-style-type: none"> <li>• <b>NONE</b></li> <li>• <b>ENABLED</b></li> <li>• <b>DISABLED</b></li> </ul>
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <p><b>NOTE</b> For available compression modes and compression levels, see <b>WITH ( { storage_parameter = value } [, ... ] )</b>.</p>
def_buffer_pool	character varying(7)	Not supported. Set it to <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
def_cell_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Set it to <b>NO</b> .
interval_subpartition	character varying(1000)	Not supported. Set it to <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Set it to <b>NO</b> .
is_nested	character varying(3)	Not supported. Set it to <b>NO</b> .

Name	Type	Description
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, set it to <b>YES</b> .
def_indexing	character varying(3)	Not supported. Set it to <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Set it to <b>NONE</b> .
def_inmemory_priority	character varying(8)	Not supported. Set it to <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Set it to <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Set it to <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Set it to <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Set it to <b>NO</b> .
def_cellmemory	character varying(24)	Not supported. Set it to <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Set it to <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Set it to <b>NULL</b> .

### 12.3.1.6 ADM\_SUBPART\_KEY\_COLUMNS

ADM\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

**Table 12-127** ADM\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Not supported. The value is <b>NULL</b> .
name	character varying(128)	Not supported. The value is <b>NULL</b> .

Name	Type	Description
object_type	character varying(128)	Not supported. The value is <b>NULL</b> .
column_name	character varying(4000)	Not supported. The value is <b>NULL</b> .
column_position	numeric	Not supported. The value is <b>NULL</b> .
collated_column_id	numeric	Not supported. The value is <b>NULL</b> .

### 12.3.1.7 ADM\_TAB\_PARTITIONS

ADM\_TAB\_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

**Table 12-128** ADM\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.

Name	Type	Description
subpartition_count	numeric	Not supported. Its value is <b>NULL</b> .
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.1.8 DB\_IND\_PARTITIONS

DB\_IND\_PARTITIONS displays partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-129** DB\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>

Name	Type	Description
index_partition_usable	Boolean	Specifies whether an index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is <b>0</b> .
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the <b>analyze</b> command to collect statistics.
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.1.9 DB\_IND\_SUBPARTITIONS

DB\_IND\_SUBPARTITIONS displays partition information about local indexes of level-2 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Currently, all fields in this table are set to **NULL**.

**Table 12-130** DB\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
index_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
partition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
high_value	text	Not supported. Set it to <b>NULL</b> .
high_value_length	numeric	Not supported. Set it to <b>NULL</b> .
partition_position	numeric	Not supported. Set it to <b>NULL</b> .
subpartition_position	numeric	Not supported. Set it to <b>NULL</b> .
status	character varying(8)	Not supported. Set it to <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Set it to <b>NULL</b> .
pct_free	numeric	Not supported. Set it to <b>NULL</b> .
ini_trans	numeric	Not supported. Set it to <b>NULL</b> .
max_trans	numeric	Not supported. Set it to <b>NULL</b> .
initial_extent	numeric	Not supported. Set it to <b>NULL</b> .
next_extent	numeric	Not supported. Set it to <b>NULL</b> .
min_extent	numeric	Not supported. Set it to <b>NULL</b> .
max_extent	numeric	Not supported. Set it to <b>NULL</b> .
max_size	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
pct_increase	numeric	Not supported. Set it to <b>NULL</b> .
freelists	numeric	Not supported. Set it to <b>NULL</b> .
freelist_groups	numeric	Not supported. Set it to <b>NULL</b> .
logging	character varying(7)	Not supported. Set it to <b>NULL</b> .
compression	character varying(13)	Not supported. Set it to <b>NULL</b> .
blevel	numeric	Not supported. Set it to <b>NULL</b> .
leaf_blocks	numeric	Not supported. Set it to <b>NULL</b> .
distinct_keys	numeric	Not supported. Set it to <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Set it to <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Set it to <b>NULL</b> .
clustering_factor	numeric	Not supported. Set it to <b>NULL</b> .
num_rows	numeric	Not supported. Set it to <b>NULL</b> .
sample_size	numeric	Not supported. Set it to <b>NULL</b> .
last_analyzed	date	Not supported. Set it to <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Set it to <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
global_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
interval	character varying(3)	Not supported. Set it to <b>NULL</b> .
segment_created	character varying(3)	Not supported. Set it to <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Set it to <b>NULL</b> .
parameters	character varying(1000)	Not supported. Set it to <b>NULL</b> .

### 12.3.1.10 DB\_PART\_COL\_STATISTICS

DB\_PART\_COL\_STATISTICS displays column statistics and histogram information about table partitions accessible to the current user. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-131** DB\_PART\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to <b>NULL</b> .
low_value	raw	Not supported. Set it to <b>NULL</b> .
high_value	raw	Not supported. Set it to <b>NULL</b> .
density	numeric	Not supported. Set it to <b>NULL</b> .
num_nulls	numeric	Not supported. Set it to <b>NULL</b> .
num_buckets	numeric	Not supported. Set it to <b>NULL</b> .
sample_size	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
last_analyzed	date	Not supported. Set it to <b>NULL</b> .
global_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
notes	character varying(63)	Not supported. Set it to <b>NULL</b> .
avg_col_len	numeric	Not supported. Set it to <b>NULL</b> .
histogram	character varying(15)	Not supported. Set it to <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.1.11 DB\_PART\_KEY\_COLUMNS

DB\_PART\_KEY\_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-132** DB\_PART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a partitioned table or index.
name	character varying(128)	Name of a partitioned table or index.
object_type	character(5)	Object type. <ul style="list-style-type: none"> <li>Its value is <b>table</b> for a partitioned table.</li> <li>Its value is <b>index</b> for a partitioned index.</li> </ul>
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.1.12 DB\_PART\_TABLES

DB\_PART\_TABLES displays information about partitioned tables accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-133** DB\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partition policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. The distributed system does not support level-2 partitions. Set this parameter to <b>NONE</b> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> in the distributed system.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> in the distributed system.
status	character varying(8)	Not supported. Set it to <b>valid</b> .

Name	Type	Description
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Set it to <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_max_extents	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_max_size	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_freelists	numeric	Not supported. Set it to <b>NULL</b> .
def_freelist_groups	numeric	Not supported. Set it to <b>NULL</b> .
def_logging	character varying(7)	Not supported. Set it to <b>NULL</b> .
def_compression	character varying(8)	Default compression mode used when a partition is added. The options are as follows: <ul style="list-style-type: none"> <li>• <b>NONE - Not specified</b></li> <li>• <b>ENABLED</b></li> <li>• <b>DISABLED</b></li> </ul>
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <p><b>NOTE</b> For available compression modes and compression levels, see <b>WITH ( { storage_parameter = value } [, ... ] )</b>.</p>
def_buffer_pool	character varying(7)	Not supported. Set it to <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
def_cell_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Set it to <b>NO</b> .
interval_subpartition	character varying(1000)	Not supported. Set it to <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Set it to <b>NO</b> .
is_nested	character varying(3)	Not supported. Set it to <b>NO</b> .
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, set it to <b>YES</b> .
def_indexing	character varying(3)	Not supported. Set it to <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Set it to <b>NONE</b> .
def_inmemory_priority	character varying(8)	Not supported. Set it to <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Set it to <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Set it to <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Set it to <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Set it to <b>NO</b> .
def_cellmemory	character varying(24)	Not supported. Set it to <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Set it to <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Set it to <b>NULL</b> .

### 12.3.1.13 DB\_SUBPART\_KEY\_COLUMNS

DB\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

**Table 12-134** DB\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
name	character varying(128)	Not supported. Its value is <b>NULL</b> .
object_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
column_position	numeric	Not supported. Its value is <b>NULL</b> .
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.1.14 DB\_TAB\_PARTITIONS

DB\_TAB\_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) accessible to the current user. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

**Table 12-135** DB\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.

Name	Type	Description
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
subpartition_count	numeric	Not supported. Its value is <b>NULL</b> .
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .

Name	Type	Description
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.1.15 DB\_TAB\_SUBPARTITIONS

DB\_TAB\_SUBPARTITIONS displays information about level-2 partitioned tables accessible to the current user. It is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

**Table 12-136** DB\_TAB\_SUBPARTITIONS columns

Name	Type	Description
table_owner	character varying(128)	Not supported. The value is <b>NULL</b> .
table_name	character varying(128)	Not supported. The value is <b>NULL</b> .

Name	Type	Description
partition_name	character varying(128)	Not supported. The value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. The value is <b>NULL</b> .
high_value	text	Not supported. The value is <b>NULL</b> .
high_value_length	numeric	Not supported. The value is <b>NULL</b> .
partition_position	numeric	Not supported. The value is <b>NULL</b> .
subpartition_position	numeric	Not supported. The value is <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. The value is <b>NULL</b> .
pct_free	numeric	Not supported. The value is <b>NULL</b> .
pct_used	numeric	Not supported. The value is <b>NULL</b> .
ini_trans	numeric	Not supported. The value is <b>NULL</b> .
max_trans	numeric	Not supported. The value is <b>NULL</b> .
initial_extent	numeric	Not supported. The value is <b>NULL</b> .
next_extent	numeric	Not supported. The value is <b>NULL</b> .
min_extent	numeric	Not supported. The value is <b>NULL</b> .
max_extent	numeric	Not supported. The value is <b>NULL</b> .
max_size	numeric	Not supported. The value is <b>NULL</b> .
pct_increase	numeric	Not supported. The value is <b>NULL</b> .
freelists	numeric	Not supported. The value is <b>NULL</b> .
freelist_groups	numeric	Not supported. The value is <b>NULL</b> .

Name	Type	Description
logging	character varying(3)	Not supported. The value is <b>NULL</b> .
compression	character varying(8)	Not supported. The value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. The value is <b>NULL</b> .
num_rows	numeric	Not supported. The value is <b>NULL</b> .
blocks	numeric	Not supported. The value is <b>NULL</b> .
empty_blocks	numeric	Not supported. The value is <b>NULL</b> .
avg_space	numeric	Not supported. The value is <b>NULL</b> .
chain_cnt	numeric	Not supported. The value is <b>NULL</b> .
avg_row_len	numeric	Not supported. The value is <b>NULL</b> .
sample_size	numeric	Not supported. The value is <b>NULL</b> .
last_analyzed	date	Not supported. The value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. The value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. The value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. The value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. The value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. The value is <b>NULL</b> .
interval	character varying(3)	Not supported. The value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. The value is <b>NULL</b> .
indexing	character varying(3)	Not supported. The value is <b>NULL</b> .

Name	Type	Description
read_only	character varying(3)	Not supported. The value is <b>NULL</b> .

inmemory_priority	character varying(8)	Not supported. The value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. The value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. The value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. The value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. The value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. The value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. The value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. The value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. The value is <b>NULL</b> .

### 12.3.1.16 MY\_IND\_PARTITIONS

MY\_IND\_PARTITIONS displays the partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-137** MY\_IND\_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.

Name	Type	Description
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. <ul style="list-style-type: none"> <li>• For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>• For list partitioning, the value list of each partition is displayed.</li> <li>• For hash partitioning, the number of each partition is displayed.</li> </ul>
index_partition_usable	Boolean	Specifies whether an index partition is available. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is <b>NO</b> .
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is <b>0</b> .

Name	Type	Description
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to an index are logged.

Name	Type	Description
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the <b>analyze</b> command to collect statistics.
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Last date when the partition was analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.1.17 MY\_IND\_SUBPARTITIONS

MY\_IND\_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table owned by the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Currently, all fields in this table are set to **NULL**.

**Table 12-138** MY\_IND\_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
index_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
partition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
high_value	text	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
high_value_length	numeric	Not supported. Set it to <b>NULL</b> .
partition_position	numeric	Not supported. Set it to <b>NULL</b> .
subpartition_position	numeric	Not supported. Set it to <b>NULL</b> .
status	character varying(8)	Not supported. Set it to <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Set it to <b>NULL</b> .
pct_free	numeric	Not supported. Set it to <b>NULL</b> .
ini_trans	numeric	Not supported. Set it to <b>NULL</b> .
max_trans	numeric	Not supported. Set it to <b>NULL</b> .
initial_extent	numeric	Not supported. Set it to <b>NULL</b> .
next_extent	numeric	Not supported. Set it to <b>NULL</b> .
min_extent	numeric	Not supported. Set it to <b>NULL</b> .
max_extent	numeric	Not supported. Set it to <b>NULL</b> .
max_size	numeric	Not supported. Set it to <b>NULL</b> .
pct_increase	numeric	Not supported. Set it to <b>NULL</b> .
freelists	numeric	Not supported. Set it to <b>NULL</b> .
freelist_groups	numeric	Not supported. Set it to <b>NULL</b> .
logging	character varying(7)	Not supported. Set it to <b>NULL</b> .
compression	character varying(13)	Not supported. Set it to <b>NULL</b> .
blevel	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
leaf_blocks	numeric	Not supported. Set it to <b>NULL</b> .
distinct_keys	numeric	Not supported. Set it to <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Set it to <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Set it to <b>NULL</b> .
clustering_factor	numeric	Not supported. Set it to <b>NULL</b> .
num_rows	numeric	Not supported. Set it to <b>NULL</b> .
sample_size	numeric	Not supported. Set it to <b>NULL</b> .
last_analyzed	date	Not supported. Set it to <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Set it to <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
global_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
interval	character varying(3)	Not supported. Set it to <b>NULL</b> .
segment_created	character varying(3)	Not supported. Set it to <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Set it to <b>NULL</b> .
parameters	character varying(1000)	Not supported. Set it to <b>NULL</b> .

### 12.3.1.18 MY\_PART\_COL\_STATISTICS

MY\_PART\_COL\_STATISTICS displays column statistics and histogram information about table partitions owned by the current user. It is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-139** MY\_PART\_COL\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to <b>NULL</b> .
low_value	raw	Not supported. Set it to <b>NULL</b> .
high_value	raw	Not supported. Set it to <b>NULL</b> .
density	numeric	Not supported. Set it to <b>NULL</b> .
num_nulls	numeric	Not supported. Set it to <b>NULL</b> .
num_buckets	numeric	Not supported. Set it to <b>NULL</b> .
sample_size	numeric	Not supported. Set it to <b>NULL</b> .
last_analyzed	date	Not supported. Set it to <b>NULL</b> .
global_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
notes	character varying(63)	Not supported. Set it to <b>NULL</b> .
avg_col_len	numeric	Not supported. Set it to <b>NULL</b> .
histogram	character varying(15)	Not supported. Set it to <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.1.19 MY\_PART\_INDEXES

MY\_PART\_INDEXES displays information about partitioned table indexes accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-140** MY\_PART\_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Name of the owner of a partitioned table index.
index_name	character varying(64)	Name of a partitioned table index.
partition_count	bigint	Number of index partitions of the partitioned table index.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
schema	character varying(64)	Schema of a partitioned table index.
table_name	character varying(64)	Name of the partitioned table to which the partitioned table index belongs.

### 12.3.1.20 MY\_PART\_KEY\_COLUMNS

MY\_PART\_KEY\_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-141** MY\_PART\_KEY\_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a partitioned table or index.

Name	Type	Description
object_type	character(5)	Object type. <ul style="list-style-type: none"> <li>Its value is <b>table</b> for a partitioned table.</li> <li>Its value is <b>index</b> for a partitioned index.</li> </ul>
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.1.21 MY\_PART\_TABLES

MY\_PART\_TABLES displays information about partitioned tables accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-142** MY\_PART\_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. <b>NOTE</b> For details about the supported partitioning policies of the current partitioned table, see <a href="#">CREATE TABLE PARTITION</a> .
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.

Name	Type	Description
subpartitioning_type	text	Partition policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, <b>NONE</b> is displayed. The distributed system does not support level-2 partitions. Set this parameter to <b>NONE</b> .
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is <b>1</b> for a level-2 partitioned table and <b>0</b> for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to <b>0</b> .
status	character varying(8)	Not supported. Set it to <b>valid</b> .
def_pct_free	numeric	Default value of <b>PCTFREE</b> used when a partition is added.
def_pct_used	numeric	Not supported. Set it to <b>NULL</b> .
def_ini_trans	numeric	Default value of <b>INITRANS</b> used when a partition is added.
def_max_trans	numeric	Default value of <b>MAXTRANS</b> used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_next_extent	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_min_extents	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_max_extents	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_max_size	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_pct_increase	character varying(40)	Not supported. Set it to <b>NULL</b> .
def_freelists	numeric	Not supported. Set it to <b>NULL</b> .
def_freelist_groups	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
def_logging	character varying(7)	Not supported. Set it to <b>NULL</b> .
def_compression	character varying(8)	Default compression mode used when a partition is added. The options are as follows: <ul style="list-style-type: none"> <li>• <b>NONE</b></li> <li>• <b>ENABLED</b></li> <li>• <b>DISABLED</b></li> </ul>
def_compress_for	character varying(30)	Default compression mode used when a partition is added. <b>NOTE</b> For available compression modes and compression levels, see <a href="#">WITH ( { storage_parameter = value } [, ... ] )</a> .
def_buffer_pool	character varying(7)	Not supported. Set it to <b>DEFAULT</b> .
def_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
def_cell_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
ref_ptn_constraint_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Set it to <b>NO</b> .
interval_subpartition	character varying(1000)	Not supported. Set it to <b>NULL</b> .
autolist_subpartition	character varying(3)	Not supported. Set it to <b>NO</b> .
is_nested	character varying(3)	Not supported. Set it to <b>NO</b> .
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, set it to <b>YES</b> .
def_indexing	character varying(3)	Not supported. Set it to <b>ON</b> .
def_inmemory	character varying(8)	Not supported. Set it to <b>NONE</b> .
def_inmemory_priority	character varying(8)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
def_inmemory_distribute	character varying(15)	Not supported. Set it to <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. Set it to <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Set it to <b>NULL</b> .
def_read_only	character varying(3)	Not supported. Set it to <b>NO</b> .
def_cellmemory	character varying(24)	Not supported. Set it to <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Set it to <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Set it to <b>NULL</b> .

### 12.3.1.22 MY\_SUBPART\_KEY\_COLUMNS

MY\_SUBPART\_KEY\_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

**Table 12-143** MY\_SUBPART\_KEY\_COLUMNS columns

Name	Type	Description
name	character varying(128)	Not supported. The value is <b>NULL</b> .
object_type	character varying(128)	Not supported. The value is <b>NULL</b> .
column_name	character varying(4000)	Not supported. The value is <b>NULL</b> .
column_position	numeric	Not supported. The value is <b>NULL</b> .
collated_column_id	numeric	Not supported. The value is <b>NULL</b> .

### 12.3.1.23 MY\_TAB\_PARTITIONS

MY\_TAB\_PARTITIONS displays information about level-1 table partitions accessible to the current user (including level-2 partitioned tables). Each level-1 table partition of a partitioned table accessible to the current user has one record in MY\_TAB\_PARTITIONS. It is accessible to all users. This view exists in both

PG\_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

**Table 12-144** MY\_TAB\_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of a partition. <ul style="list-style-type: none"> <li>For range partitioning and interval partitioning, the upper limit of each partition is displayed.</li> <li>For list partitioning, the value list of each partition is displayed.</li> <li>For hash partitioning, the number of each partition is displayed.</li> </ul>
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
subpartition_count	numeric	Not supported. Its value is <b>NULL</b> .
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Initial number of transactions. The default value is <b>4</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.

Name	Type	Description
max_trans	numeric	Maximum number of transactions. The default value is <b>128</b> . The value is <b>NULL</b> for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_extent	numeric	Not supported. Its value is <b>NULL</b> .
max_size	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_row_len	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is <b>NULL</b> .
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is <b>NO</b> .
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(4)	Not supported. Its value is <b>NULL</b> .
inmemory	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(100)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .

### 12.3.1.24 GS\_STATIO\_ALL\_PARTITIONS

**GS\_STATIO\_ALL\_PARTITIONS** contains I/O statistics about each partition in a partitioned table of the current database. The information can be queried by using the `gs_statio_get_all_partitions_stats()` function.

**Table 12-145** GS\_STATIO\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Specifies a partition OID.
schemaname	name	Specifies the name of a partition schema.
relname	name	Specifies the name of a table where the partition is located.
partition_name	name	Specifies the name of a level-1 partition to which the partition belongs.
sub_partition_name	name	Specifies the name of a level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set this parameter to <b>NULL</b> .
heap_blks_read	bigint	Specifies the number of disk blocks read from the partition.
heap_blks_hit	bigint	Specifies the number of cache hits in the partition.
idx_blks_read	bigint	Specifies the number of disk blocks read from indexes in the partition.
idx_blks_hit	bigint	Specifies the number of cache hits in indexes in the partition.
toast_blks_read	bigint	Specifies the number of disk blocks read from the TOAST table partition (if any) in the partition.
toast_blks_hit	bigint	Specifies the number of buffer hits in the TOAST table partition (if any) in the partition.
tidx_blks_read	bigint	Specifies the number of disk blocks read from the TOAST table partitioned index (if any) in the partition.
tidx_blks_hit	bigint	Specifies the number of buffer hits in the TOAST table partitioned index (if any) in the partition.

### 12.3.1.25 GS\_STAT\_XACT\_ALL\_PARTITIONS

GS\_STAT\_XACT\_ALL\_PARTITIONS displays the transaction status about all partitions of partitioned tables in a namespace. The information can be queried by using the `gs_stat_get_xact_all_partitions_stats()` function.

**Table 12-146** GS\_STAT\_XACT\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Name of a partition schema.
relname	name	Name of a table where the partition is located.
partition_name	name	Name of a level-1 partition to which the partition belongs.
sub_partition_name	name	Name of a level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set it to <b>NULL</b> .
seq_scan	bigint	Number of sequential scans initiated by a partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by a partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

### 12.3.1.26 GS\_STAT\_ALL\_PARTITIONS

GS\_STAT\_ALL\_PARTITIONS displays information about each partition in all partitioned tables in the current database. Each partition occupies a row, showing statistics about access to the partition. The view information is queried by the `gs_stat_get_all_partitions_stats()` function.

**Table 12-147** GS\_STAT\_ALL\_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Schema name of a table to which the partition belongs.
relname	name	Name of a table where the partition is located.
partition_name	name	Name of a level-1 partition to which the partition belongs.

Name	Type	Description
sub_partition_name	name	Name of a level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set it to <b>null</b> .
seq_scan	bigint	Number of sequential scans initiated by a partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by a partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Time when the partition was last cleared.
last_autovacuum	timestamp with time zone	Time when the partition was last cleared by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Time when the partition was last analyzed.
last_autoanalyze	timestamp with time zone	Time when the partition was last analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that a partition is cleared.
autovacuum_count	bigint	Number of times that a partition is cleared by the autovacuum daemon thread.
analyze_count	bigint	Number of times that a partition is analyzed.
autoanalyze_count	bigint	Number of times that a partition is analyzed by the autovacuum daemon thread.

## 12.3.2 OLTP Table Compression

### 12.3.2.1 GS\_ADM\_ILMDATAMOVEMENTPOLICIES

GS\_ADM\_ILMDATAMOVEMENTPOLICIES displays the data movement summary of ILM policies, including the policy name, action type, and conditions. Only the system administrator can access this system view.

**Table 12-148** GS\_ADM\_ILMDATAMOVEMENTPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is <i>p+Policy ID</i> .
action_type	character varying(11)	Action type. The current version supports only compression.
scope	character varying(7)	Scope. In the current version, only rows are supported.
compression_level	character varying(30)	Compression level. This parameter is available when the action type is compression.
tier_tablespace	character varying(128)	Target space. This parameter is available only when the action type is migration. The value is <b>null</b> in the current version.
tier_status	character varying(9)	Specifies whether the target space is read-only. The value is <b>null</b> in the current version.
condition_type	character varying(22)	Condition type. The current version supports only the last modification time.
condition_days	numeric	Number of days as a condition.
custom_function	character varying(128)	Name of a user-defined function. The value is <b>null</b> in the current version.
policy_subtype	character varying(10)	Policy subtype. The value is <b>null</b> in the current version.
action_clause	clob	Text that can be automatically executed during policy execution. The value is <b>null</b> in the current version.
tier_to	character varying(10)	Type of the target database to which data is migrated. The value is <b>null</b> in the current version.
node_name	name	Name of a data source node.

### 12.3.2.2 GS\_ADM\_ILMOBJECTS

GS\_ADM\_ILMOBJECTS displays the brief information about all data objects to which ILM policies are applied and the corresponding policies, including the policy name, data object name, policy source, and policy enabling/disabling status. Only the system administrator can access this system view.

**Table 12-149** GS\_ADM\_ILMOBJECTS columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is <i>p+Policy ID</i> .
object_owner	character varying(128)	Owner of a data object.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(18)	Data object type. Value range: <ul style="list-style-type: none"><li>● <b>r</b>: table.</li><li>● <b>p</b>: partition.</li><li>● <b>s</b>: level-2 partition.</li></ul>
inherited_from	character varying(20)	Object whose policy is inherited by the current policy. Value range: <ul style="list-style-type: none"><li>● <b>TABLE</b>: table.</li><li>● <b>TABLE PARTITION</b>: partition.</li><li>● <b>POLICY NOT INHERITED</b>: not inherited.</li></ul>
tbs_inherited_from	character varying(30)	Tablespace whose policy is inherited by the current policy. In the current version, this parameter is set to <b>NULL</b> .
enabled	character varying(7)	Specifies whether the policy is enabled for the current object.
deleted	character varying(7)	Specifies that the ILM policy on the object is deleted. If the partition or the policy on the partition is deleted, the record (ILMOBJ) is deleted.
node_name	name	Name of a data source node.

### 12.3.2.3 GS\_ADM\_ILMPOLICIES

GS\_ADM\_ILMPOLICIES displays the brief information about an ILM policy, including the policy name, type, enabling status, disabling status, and deletion status. Only the system administrator can access this system view.

**Table 12-150** GS\_ADM\_ILMPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.
policy_type	character varying(13)	Policy type.
tablespace	character varying(30)	Tablespace name. This parameter has a value when the policy is created on a tablespace. The value is <b>null</b> in the current version.
enabled	character varying(6)	Specifies whether the policy is enabled.
deleted	character varying(7)	Specifies whether the policy is deleted.
node_name	name	Name of a data source node.

### 12.3.2.4 GS\_ADM\_ILMEVALUATIONDETAILS

GS\_ADM\_ILMEVALUATIONDETAILS displays the evaluation details of an ADO task, including the task ID, policy information, object information, evaluation result, and ADO job name. By default, only the system administrator can access the system view.

**Table 12-151** GS\_ADM\_ILMEVALUATIONDETAILS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.
object_owner	character varying(128)	Name of the schema where the data object is located.
object_name	character varying(128)	Data object name.

Name	Type	Description
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(18)	Data object type. <ul style="list-style-type: none"> <li>• <b>r</b>: table</li> <li>• <b>p</b>: partition</li> <li>• <b>s</b>: level-2 partition</li> </ul>
selected_for_execution	character varying(42)	Evaluation result: <ul style="list-style-type: none"> <li>• <b>SELECTED FOR EXECUTION</b>: The evaluation is passed.</li> <li>• <b>PRECONDITION NOT SATISFIED</b>: The evaluation fails.</li> <li>• <b>JOB ALREADY EXISTS</b>: The task already exists.</li> </ul>
job_name	character varying(128)	Name of the task that executes a specific ADO job. If the evaluation result is "passed", this parameter has a value.
comments	character varying(4000)	Reserved column.
node_name	name	Name of a data source node.

### 12.3.2.5 GS\_ADM\_ILMPARAMETERS

GS\_ADM\_ILMPARAMETERS displays the environment parameters related to ILM scheduling and execution. The parameters can be modified through the DBE\_ILM\_ADMIN.CUSTOMIZE\_ILM interface. By default, only the system administrator can access the system view.

**Table 12-152** GS\_ADM\_ILMPARAMETERS columns

Name	Type	Description
name	character varying(128)	ADO-related environment parameters, which can be modified through the DBE_ILM_ADMIN.CUSTOMIZE_ILM interface.
value	numeric	Parameter value.

### 12.3.2.6 GS\_ADM\_ILMRESULTS

GS\_ADM\_ILMRESULTS displays the execution details of an ADO job, including the task ID, job name, job status, and job time. By default, only the system administrator can access this system view. Common users can access the system view only after being authorized.

**Table 12-153** GS\_ADM\_ILMRESULTS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
job_name	character varying(128)	ADO job name.
job_state	character varying(35)	ADO job status.
start_time	timestamp with time zone	Time when a job starts to be scheduled.
completion_time	timestamp with time zone	Completion time.
comments	character varying(4000)	If a job fails, the failure cause is recorded here.
statistics	clob	Statistics.
node_name	name	Name of a data source node.

### 12.3.2.7 GS\_ADM\_ILMTASKS

GS\_ADM\_ILMTASKS displays the brief information about an ADO task, including the task ID, task owner, status, and time. By default, only the system administrator can access this system view. Common users can access the system view only after being authorized.

**Table 12-154** GS\_ADM\_ILMTASKS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
task_owner	character varying(128)	User who initiates an ADO task. This column exists only in the ADM view.
state	character varying(9)	Status. <ul style="list-style-type: none"> <li>● <b>INACTIVE</b></li> <li>● <b>ACTIVE</b></li> <li>● <b>COMPLETED</b></li> <li>● <b>UNKNOWN</b>: being evaluated</li> </ul>
creation_time	timestamp with time zone	Creation time.

Name	Type	Description
start_time	timestamp with time zone	Time when the status changes to active.
completion_time	timestamp with time zone	Completion time.
node_name	name	Name of a data source node.

### 12.3.2.8 GS\_MY\_ILMEVALUATIONDETAILS

GS\_MY\_ILMEVALUATIONDETAILS displays the evaluation details of an ADO task, including the task ID, policy information, object information, evaluation result, and ADO job name.

**Table 12-155** GS\_MY\_ILMEVALUATIONDETAILS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.
object_owner	character varying(128)	Schema name of a data object.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(18)	Data object type. <ul style="list-style-type: none"> <li>● <b>r</b>: table</li> <li>● <b>p</b>: partition</li> <li>● <b>s</b>: level-2 partition</li> </ul>
selected_for_execution	character varying(42)	Evaluation result: <ul style="list-style-type: none"> <li>● <b>SELECTED FOR EXECUTION</b>: The evaluation is passed.</li> <li>● <b>PRECONDITION NOT SATISFIED</b>: The evaluation fails.</li> <li>● <b>JOB ALREADY EXISTS</b>: The task already exists.</li> </ul>
job_name	character varying(128)	Name of the task that executes a specific ADO job. If the evaluation result is "passed", this parameter has a value.

Name	Type	Description
comments	character varying(4000)	Reserved column.
node_name	name	Name of a data source node.

### 12.3.2.9 GS\_MY\_ILMRESULTS

GS\_MY\_ILMRESULTS displays the execution details of an ADO job, including the task ID, job name, job status, and job time.

**Table 12-156** GS\_MY\_ILMRESULTS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
job_name	character varying(128)	ADO job name.
job_state	character varying(35)	ADO job status.
start_time	timestamp with time zone	Time when a job starts to be scheduled.
completion_time	timestamp with time zone	Completion time.
comments	character varying(4000)	If a job fails, the failure cause is recorded here.
statistics	clob	Statistics.
node_name	name	Name of a data source node.

### 12.3.2.10 GS\_MY\_ILMTASKS

GS\_MY\_ILMTASKS displays the brief information about an ADO task, including the task ID, task owner, status, and time.

**Table 12-157** GS\_MY\_ILMTASKS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.

Name	Type	Description
task_owner	character varying(128)	User who initiates an ADO task.
state	character varying(9)	Status. <ul style="list-style-type: none"> <li>● <b>INACTIVE</b></li> <li>● <b>ACTIVE</b></li> <li>● <b>COMPLETED</b></li> <li>● <b>UNKNOWN</b>: being evaluated</li> </ul>
creation_time	timestamp with time zone	Creation time.
start_time	timestamp with time zone	Time when the status changes to active.
completion_time	timestamp with time zone	Completion time.
node_name	name	Name of a data source node.

### 12.3.2.11 GS\_MY\_ILMDATAMOVEMENTPOLICIES

GS\_MY\_ILMDATAMOVEMENTPOLICIES displays the data movement summary of ILM policies, including the policy name, action type, and conditions.

**Table 12-158** GS\_MY\_ILMDATAMOVEMENTPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.
action_type	character varying(11)	Action type. The current version supports only compression.
scope	character varying(7)	Scope. In the current version, only rows are supported.
compression_level	character varying(30)	Compression level. This parameter is available when the action type is compression.
tier_tablespace	character varying(128)	Target space. This parameter is available only when the action type is migration. The value is <b>null</b> in the current version.

Name	Type	Description
tier_status	character varying(9)	Specifies whether the target space is read-only. The value is <b>null</b> in the current version.
condition_type	character varying(22)	Condition type. The current version supports only the last modification time.
condition_days	numeric	Number of days as a condition.
custom_function	character varying(128)	Name of a user-defined function. The value is <b>null</b> in the current version.
policy_subtype	character varying(10)	Policy subtype. The value is <b>null</b> in the current version.
action_clause	clob	Text that can be automatically executed during policy execution. The value is <b>null</b> in the current version.
tier_to	character varying(10)	Type of the target database to which data is migrated. The value is <b>null</b> in the current version.
node_name	name	Name of a data source node.

### 12.3.2.12 GS\_MY\_ILMOBJECTS

GS\_MY\_ILMOBJECTS displays the brief information about all data objects to which ILM policies are applied and the corresponding policies, including the policy name, data object name, policy source, and policy enabling/disabling status.

**Table 12-159** GS\_MY\_ILMOBJECTS

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.
object_owner	character varying(128)	Schema name of a data object.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.

Name	Type	Description
object_type	character varying(18)	Data object type. <ul style="list-style-type: none"> <li>● <b>r</b>: table</li> <li>● <b>p</b>: partition</li> <li>● <b>s</b>: level-2 partition</li> </ul>
inherited_from	character varying(20)	Object whose policy is inherited by the current policy. The options are as follows: <ul style="list-style-type: none"> <li>● <b>TABLE</b>: table</li> <li>● <b>TABLE PARTITION</b>: partition</li> <li>● <b>POLICY NOT INHERITED</b>: not inherited</li> </ul>
tbs_inherited_from	character varying(30)	Tablespace whose policy is inherited by the current policy. The value is <b>null</b> in the current version.
enabled	character varying(7)	Specifies whether the policy is enabled for the current object.
deleted	character varying(7)	Specifies that the ILM policy on the object is deleted. If the partition or the policy on the partition is deleted, the record (ILMOBJ) is deleted.
node_name	name	Name of a data source node.

### 12.3.2.13 GS\_MY\_ILMPOLICIES

GS\_MY\_ILMPOLICIES displays the brief information about an ILM policy, including the policy name, type, enabling status, disabling status, and deletion status.

**Table 12-160** GS\_MY\_ILMPOLICIES

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.
policy_type	character varying(13)	Policy type.
tablespace	character varying(30)	Tablespace name. This parameter has a value when the policy is created on a tablespace. The value is <b>null</b> in the current version.
enabled	character varying(6)	Specifies whether the policy is enabled.
deleted	character varying(7)	Specifies whether the policy is deleted.

Name	Type	Description
node_name	name	Name of a data source node.

## 12.3.3 Communications

### 12.3.3.1 COMM\_CLIENT\_INFO

COMM\_CLIENT\_INFO displays information about active client connections of a single node (You can query this view on a DN to view the information about the connection between the CN and DN). By default, only the users with system administrator permission can access this view.

**Table 12-161** COMM\_CLIENT\_INFO columns

Name	Type	Description
node_name	text	Name of the current DN, for example, dn_6001_6002_6003.
app	text	Query a view on a DN. The app displays the client connected to the current DN, such as the coordinator (CN), GTM, or DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
socket	integer	<b>socket fd</b> is displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.
logic_id	integer	Displayed if the connection is a logical connection.

### 12.3.3.2 GLOBAL\_COMM\_CLIENT\_INFO

GLOBAL\_COMM\_CLIENT\_INFO queries information about active client connections of global nodes in a cluster. By default, only the system administrator has the permission to access this system view.

**Table 12-162** GLOBAL\_COMM\_CLIENT\_INFO columns

Name	Type	Description
node_name	text	Current node name.
app	text	Client that connects to the current DN, such as a CN, GTM, or DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
socket	integer	Displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.
logic_id	integer	Displayed if the connection is a logical connection.

### 12.3.3.3 GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO

GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO queries DFX information, such as threads, sessions, and socket, for connecting the extended IP addresses of the current DN. For details about the application scenarios, see [gs\\_comm\\_listen\\_address\\_ext\\_info\(\)](#).

**Table 12-163** GS\_COMM\_LISTEN\_ADDRESS\_EXT\_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
app	text	Client connected to the DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID of the current thread.
socket	integer	Socket FD of the current physical connection.
remote_ip	text	Peer IP address of the current connection.
remote_port	text	Peer port of the current connection.
local_ip	text	Local IP address of the current connection.

Name	Type	Description
local_port	text	Local port of the current connection.

### 12.3.3.4 GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO

GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO queries the extended IP address configured for the current DN instance. For details about the application scenarios, see [gs\\_get\\_listen\\_address\\_ext\\_info\(\)](#).

**Table 12-164** GS\_GET\_LISTEN\_ADDRESS\_EXT\_INFO columns

Name	Type	Description
node_name	text	DN name.
host	text	Listening IP address of a DN.
port	bigint	Listening port of a DN.
ext_listen_ip	text	Extended IP address configured for a DN.

### 12.3.3.5 GS\_LIBCOMM\_FD\_INFO

Records information about socket persistent connections of the libcomm communications library. Only the user with the PUBLIC permission can query this view.

**Table 12-165** GS\_LIBCOMM\_FD\_INFO columns

Name	Type	Description
node_name	text	DN name.
ip	text	IP address of the DN.
ctrl_port	bigint	Control channel port.
data_port	bigint	Data channel port.
remote_name	text	Instance name of the DN at the peer site.
remote_ip	text	Peer IP address.
remote_port	bigint	Peer port number.
local_ip	text	Local IP address.
local_port	bigint	Local port number.
fd	bigint	Socket connection.

Name	Type	Description
type	text	Type of the TCP connection channel. The options are as follows: <ul style="list-style-type: none"> <li>• <b>DATA_SEND_FD</b>: socket of the sender of the data channel</li> <li>• <b>DATA_RECV_FD</b>: socket of the receiver of the data channel.</li> <li>• <b>CTL_SEND_FD</b>: socket of the sender of the control channel.</li> <li>• <b>CTL_RECV_FD</b>: socket of the receiver of the control channel.</li> </ul>

### 12.3.3.6 GS\_LIBCOMM\_MEMORY\_INFO

Records the basic configuration information used by the internal memory of the current libcomm communication library. Only the user with the PUBLIC permission can query this view.

**Table 12-166** GS\_LIBCOMM\_MEMORY\_INFO columns

Name	Type	Description
node_name	text	DN name.
current_used_memory	bigint	Memory used by the libcomm communication library, in bytes.
current_data_item_num	bigint	Number of data blocks in the libcomm lockless queue.
init_mailbox_memory	bigint	Memory used by libcomm to initialize the mailbox, in bytes.
max_datanode	bigint	Maximum number of DNs supported by the libcomm communications library.
max_stream	bigint	Maximum number of data streams supported by a single TCP connection of the libcomm.
max_quota_size	bigint	Total buffer size of the libcomm logical connection, in bytes.
max_usable_memory	bigint	Maximum memory that can be used by the libcomm communications library cache, in bytes.
max_memory_pool	bigint	Total size of the memory resource pool that can be used by the libcomm communications library on each DN. The unit is byte.

### 12.3.3.7 GS\_STATIC\_THREADPOOL\_CTRL\_STATUS

GS\_STATIC\_THREADPOOL\_CTRL\_STATUS returns statistics about static threads related to the thread pool of the current instance. When the thread pool is enabled, the CN thread pool can be queried using this view. A blank row is returned when a DN is connected for query. Only the user with the PUBLIC permission can query this view.

**Table 12-167** GS\_STATIC\_THREADPOOL\_CTRL\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
group_id	integer	Group ID of the thread pool.
worker_info	text	Dynamic statistics about the running thread pool of the current group. The information includes: <b>default</b> and <b>default_s</b> : number of threads, including default value of the dynamic thread pool and default value of the static thread pool. <b>expect</b> and <b>expect_s</b> : number of threads, including the expected value of the dynamic thread pool and expected value of the static thread pool. <b>actual</b> : actual number of running threads, including dynamic pool threads and static pool threads. <b>static threads limit</b> : indicates the number of static pool threads configured for the current group. <b>has static threads</b> : specifies whether a static pool is created for the current group. The default value is <b>0</b> , indicating that no user is created. <b>idle static threads</b> : number of idle static pool threads. <b>wait session num</b> : number of waiting sessions.

### 12.3.3.8 PG\_COMM\_DELAY

PG\_COMM\_DELAY displays the communications library delay status for a single DN.

**Table 12-168** PG\_COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node

Name	Type	Description
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond. <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond.
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond.

### 12.3.3.9 PG\_COMM\_RECV\_STREAM

PG\_COMM\_RECV\_STREAM displays the receiving stream status of all the communications libraries for a single DN.

**Table 12-169** PG\_COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Status of the stream. <ul style="list-style-type: none"> <li>• <b>UNKNOWN</b>: The logical connection status is unknown.</li> <li>• <b>READY</b>: The logical connection is ready.</li> <li>• <b>RUN</b>: The logical connection sends packets normally.</li> <li>• <b>HOLD</b>: The logical connection is waiting to send packets.</li> <li>• <b>CLOSED</b>: The logical connection is closed.</li> <li>• <b>TO_CLOSED</b>: The logical connection will be closed.</li> </ul>

Name	Type	Description
query_id	bigint	<b>debug_query_id</b> corresponding to the stream.
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream.
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream.
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream, in byte.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average receiving rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in byte.
buff_usize	bigint	Current size of the data cache of the stream, in byte.

### 12.3.3.10 PG\_COMM\_SEND\_STREAM

PG\_COMM\_SEND\_STREAM displays the sending stream status of all the communication libraries for a single DN.

**Table 12-170** PG\_COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.

Name	Type	Description
state	text	Status of the stream. <ul style="list-style-type: none"> <li>• <b>UNKNOWN</b>: The logical connection status is unknown.</li> <li>• <b>READY</b>: The logical connection is ready.</li> <li>• <b>RUN</b>: The logical connection sends packets normally.</li> <li>• <b>HOLD</b>: The logical connection is waiting to send packets.</li> <li>• <b>CLOSED</b>: The logical connection is closed.</li> <li>• <b>TO_CLOSED</b>: The logical connection will be closed.</li> </ul>
query_id	bigint	<b>debug_query_id</b> corresponding to the stream.
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream.
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream.
rcv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream, in bytes.
time	bigint	Current life cycle of a stream. The unit is ms.
speed	bigint	Average sending rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in bytes.
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms.

### 12.3.3.11 PG\_COMM\_STATUS

PG\_COMM\_STATUS displays the communications library status for a single DN.

**Table 12-171** PG\_COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.

Name	Type	Description
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in kbyte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in kbyte/s.
buffer	bigint	Cache size of the cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the <b>libcomm</b> thread, in bytes.
memkbyte_libpq	bigint	Communication memory size of the <b>libpq</b> thread, in bytes.
used_pm	integer	Real-time usage of the <b>postmaster</b> thread.
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread.
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread.
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads.
stream	integer	Total number of used logical connections.

### 12.3.3.12 PG\_GET\_INVALID\_BACKENDS

The PG\_GET\_INVALID\_BACKENDS view displays information about current standby DN backend threads connected to the CN. Only system administrator and monitor administrator can access this view.

**Table 12-172** PG\_GET\_INVALID\_BACKENDS columns

Name	Type	Description
pid	bigint	Thread ID
node_name	text	Node information connected to the backend thread
dbname	name	Name of the connected database
backend_start	timestamp with time zone	Backend thread startup time
query	text	Query statement executed by the backend thread

### 12.3.3.13 PG\_POOLER\_STATUS

PG\_POOLER\_STATUS queries the cache connection status in the pooler. This view can only query on the CN, and displays the connection cache information about the pooler module.

**Table 12-173** PG\_POOLER\_STATUS columns

Name	Type	Description
database	text	Database name.
user_name	text	Username.
tid	bigint	<ul style="list-style-type: none"><li>• ID of the thread connected to the CN for non-thread pool logic.</li><li>• Session ID for connecting to the CN for thread pool logic.</li></ul>
node_oid	bigint	OID of the node connected
node_name	name	Name of the node connected
in_use	boolean	Specifies whether the connection is currently used. <ul style="list-style-type: none"><li>• <b>t</b> (true): The connection is in use.</li><li>• <b>f</b> (false): The connection is not in use.</li></ul>
local_host	text	Local IP address.
local_port	bigint	Local port number.
remote_host	text	IP address of the node connected.
node_port	integer	Port number of the connected instance node.
fdsock	bigint	Peer socket.
remote_pid	bigint	If the peer site is not in the thread pool logic, the value is the thread ID of the peer site. If the peer site is in the thread pool logic, the value is the session ID of the peer site.
session_params	text	GUC session parameter delivered by the connection.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

### 12.3.3.14 PGXC\_COMM\_DELAY

PGXC\_COMM\_DELAY displays the communications library delay status for all DNs. Only the system administrator and monitoring administrator can view this view.

**Table 12-174** PGXC\_COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond. <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond.
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond.

### 12.3.3.15 PGXC\_COMM\_RECV\_STREAM

PGXC\_COMM\_RECV\_STREAM displays the receiving stream status of the communications libraries for all the DNs.

**Table 12-175** PGXC\_COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.

Name	Type	Description
state	text	Status of the stream. <ul style="list-style-type: none"> <li>• <b>UNKNOWN</b>: The logical connection status is unknown.</li> <li>• <b>READY</b>: The logical connection is ready.</li> <li>• <b>RUN</b>: The logical connection sends packets normally.</li> <li>• <b>HOLD</b>: The logical connection is waiting to send packets.</li> <li>• <b>CLOSED</b>: The logical connection is closed.</li> <li>• <b>TO_CLOSED</b>: The logical connection will be closed.</li> </ul>
query_id	bigint	<b>debug_query_id</b> corresponding to the stream.
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream.
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream.
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream, in byte.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average receiving rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in byte.
buff_usize	bigint	Current size of the data cache of the stream, in byte.

### 12.3.3.16 PGXC\_COMM\_SEND\_STREAM

PGXC\_COMM\_SEND\_STREAM displays the sending stream status of the communications libraries for all the DN.

**Table 12-176** PGXC\_COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.

Name	Type	Description
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Status of the stream. The options are as follows: <ul style="list-style-type: none"> <li>● <b>UNKNOWN</b>: The connection status is unknown.</li> <li>● <b>READY</b>: The connection is ready.</li> <li>● <b>RUN</b>: The connection sends packets normally.</li> <li>● <b>HOLD</b>: The connection is waiting to send packets.</li> <li>● <b>CLOSED</b>: The connection is closed.</li> <li>● <b>TO_CLOSED</b>: The connection will be closed.</li> </ul>
query_id	bigint	<b>debug_query_id</b> corresponding to the stream.
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream.
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream.
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream, in bytes.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average sending rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in byte.
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms.

### 12.3.3.17 PGXC\_COMM\_STATUS

PGXC\_COMM\_STATUS displays the communications library status for all the DNs.

**Table 12-177** PGXC\_COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on a node, in bytes/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the bigint node, in KB/s.
txkbyte_rate	bigint	Sending rate of the communications library on the bigint node, in KB/s.
buffer	bigint	Cache size of the cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the libcomm process, in bytes.
memkbyte_libpq	bigint	Communication memory size of the libpq process in bytes.
used_pm	integer	Real-time usage of the postmaster thread
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads
stream	integer	Total number of used logical connections.

## 12.3.4 Segment-Page Storage

### 12.3.4.1 GLOBAL\_GS\_SEG\_DATAFILES

GLOBAL\_GS\_SEG\_DATAFILES displays information about data files in all tablespaces on all nodes, which can only be executed on the CN. Only an administrator can query the information.

**Table 12-178** GLOBAL\_GS\_SEG\_DATAFILES columns

Name	Type	Description
node_name	text	Node name.
file_name	text	Data file name. Example: <b>base/17467/2_fsm</b> .

Name	Type	Description
file_id	integer	Data file ID.
bucketnode	integer	<ul style="list-style-type: none"> <li>● <b>0</b> to <b>1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>● <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>● <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>● <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>● <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
forknum	integer	Fork type of a segment object. Value range: <ul style="list-style-type: none"> <li>● <b>0</b>: main fork.</li> <li>● <b>1</b>: fsm fork.</li> <li>● <b>2</b>: vm fork.</li> </ul>
tablespace_name	name	Name of the tablespace to which a data file belongs.
contents	text	Storage content of a data file. Value range: <ul style="list-style-type: none"> <li>● <b>permanent</b>: permanent.</li> <li>● <b>unlogged</b>: no log.</li> <li>● <b>temporary</b>: global temporary.</li> <li>● <b>temporary2</b>: local temporary.</li> </ul>
extent_size	integer	Extent size of a data file.
meta_blocks	bigint	Number of allocated metadata pages of a data file.
data_blocks	bigint	Number of allocated data pages of a data file.
total_blocks	bigint	Total number of physical pages in a data file.
high_water_mark	bigint	High watermark of the number of pages used by a data file.
utilization	real	Percentage of used blocks to the total number of blocks, that is, <b>(data_blocks + meta_blocks)/total_blocks</b> .

#### 12.3.4.2 GLOBAL\_GS\_SEG\_EXTENTS

GLOBAL\_GS\_SEG\_EXTENTS displays the extent information about all tablespaces on all nodes, which can only be executed on the CN. This view displays all extents of user segments, including segment heads, fork heads, and level-1 pages in file 1 and data extents in files 2 to 5. Only an administrator can query the information.

**Table 12-179** GLOBAL\_GS\_SEG\_EXTTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace to which a segment object belongs.
bucketnode	integer	<ul style="list-style-type: none"> <li>• <b>0</b> to <b>1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>• <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>• <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>• <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>• <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
head_block_id	bigint	Page number of the segment header.
extent_id	integer	Logical extent number.
file_id	integer	ID of the data file where the extent is located.
forknum	integer	Fork of a segment object. Value range: <ul style="list-style-type: none"> <li>• <b>0</b>: main.</li> <li>• <b>1</b>: fsm.</li> <li>• <b>2</b>: vm.</li> </ul>
block_id	bigint	Start page number in the data file where the extent is located.
blocks	integer	Extent size. The value can be <b>1</b> , <b>8</b> , <b>128</b> , <b>1024</b> , or <b>4096</b> .
usage_type	text	Usage type of the extension. Value range: <ul style="list-style-type: none"> <li>• <b>segment head</b>: segment header.</li> <li>• <b>fork head</b>: fork header.</li> <li>• <b>level1 page</b>: level-1 page.</li> <li>• <b>data extent</b>: data extents.</li> </ul>

### 12.3.4.3 GLOBAL\_GS\_SEG\_SEGMENTS

GLOBAL\_GS\_SEG\_SEGMENTS displays the segment information of all tablespaces on all nodes, including the table, index, TOAST and TOAST INDEX segments, and

fsm fork and vm fork segments. It can only be executed on the CN. Only an administrator can query the information.

**Table 12-180** GLOBAL\_GS\_SEG\_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
schema_name	name	Namespace to which a segment belongs.
segment_name	name	Segment object name, which is obtained from pg_class and relname in pg_partition.
partition_name	name	Partition name of the segment object; <b>NULL</b> if the segment object is not partitioned. Source: pg_partition.relname.
forknum	integer	Fork type of a segment object. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: main fork</li> <li>• <b>1</b>: fsm fork</li> <li>• <b>2</b>: vm fork</li> </ul>
segment_type	text	Segment object type. Value range: <ul style="list-style-type: none"> <li>• <b>table</b>: segment-page ordinary table</li> <li>• <b>table partition</b>: segment-page partitioned table (main table and child table) and segment-page level-2 partitioned table (level-1 partitioned table)</li> <li>• <b>table subpartition</b>: segment-page level-2 partitioned table (top node table and level-2 partitioned table)</li> <li>• <b>index</b>: index of a segment-page ordinary table</li> <li>• <b>index partition</b>: index of a segment-page partitioned table or level-2 partitioned table</li> <li>• <b>global partition index</b>: global index for segment-page partitioned tables and level-2 partitioned tables</li> <li>• <b>toast</b>: segment-page TOAST table</li> <li>• <b>toast index</b>: index of a segment-page TOAST table</li> </ul>
tablespace_name	name	Tablespace to which a segment object belongs.

Name	Type	Description
bucketnode	integer	<ul style="list-style-type: none"> <li>• <b>0 to 1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>• <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>• <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>• <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>• <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
head_block_id	bigint	Page number of the segment header.
contents	text	Storage content of a data file. The options are as follows: <ul style="list-style-type: none"> <li>• <b>permanent</b>: permanent</li> <li>• <b>unlogged</b>: no log</li> <li>• <b>temporary</b>: global temporary</li> <li>• <b>temporary2</b>: local temporary</li> </ul>
table_name	name	Name of the base table to which a segment belongs.
blocks	bigint	Number of logical pages of a segment.
total_blocks	bigint	Number of physical pages of a segment.
extents	integer	Number of logical extents of a segment.
total_extents	integer	Number of physical extents of a segment.
head_lsn	text	Segment header LSN.
level0_slots	bigint[]	Level-0 slot array of segment extent mapping.
level1_slots	bigint[]	Level-1 slot array of segment extent mapping.
fork_head	bigint[]	Fork head array of a segment.

#### 12.3.4.4 GLOBAL\_GS\_SEG\_SPC\_EXTENTS

GLOBAL\_GS\_SEG\_SPC\_EXTENTS displays the information about used extents of all tablespaces on all nodes, which can only be executed on the CN. The output contains segment heads, fork heads, level-1 pages, data extents. Only an administrator can query the information.

**Table 12-181** GLOBAL\_GS\_SEG\_SPC\_EXTENTS

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	<ul style="list-style-type: none"> <li>• <b>0 to 1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>• <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>• <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>• <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>• <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
forknum	integer	Fork type of a segment object. Value range: <ul style="list-style-type: none"> <li>• <b>0</b>: main fork.</li> <li>• <b>1</b>: fsm fork.</li> <li>• <b>2</b>: vm fork.</li> </ul>
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be <b>1, 8, 128, 1024, or 4096</b> .
contents	text	Storage content of a data file. Value range: <ul style="list-style-type: none"> <li>• <b>permanent</b>: permanent.</li> <li>• <b>unlogged</b>: no log.</li> <li>• <b>temporary</b>: global temporary.</li> <li>• <b>temporary2</b>: local temporary.</li> </ul>
in_used	text	Specifies whether a resource has been allocated. The value can be <b>Y</b> or <b>N</b> .
mapblock_location	text	Position of the extension in the map block. The format is ( <i>page_id, offset</i> ).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.

Name	Type	Description
usage_type	text	Extended usage type. The options are as follows: <ul style="list-style-type: none"> <li>● <b>segment head</b>: segment header.</li> <li>● <b>fork head</b>: fork header.</li> <li>● <b>level1 page</b>: level-1 page.</li> <li>● <b>data extent</b>: data extents.</li> </ul>
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be <b>Y</b> or <b>N</b> .
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is ( <i>block_id, offset</i> ).

### 12.3.4.5 GLOBAL\_GS\_SEG\_SPC\_SEGMENTS

GLOBAL\_GS\_SEG\_SPC\_SEGMENTS displays the information about used segments of all tablespaces on all nodes, which can only be executed on the CN. Only an administrator can query the information.

**Table 12-182** GLOBAL\_GS\_SEG\_SPC\_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	<ul style="list-style-type: none"> <li>● <b>0 to 1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>● <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>● <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>● <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>● <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>

Name	Type	Description
forknum	integer	Fork type of a segment object. The options are as follows: <ul style="list-style-type: none"><li>• <b>0</b>: main fork</li><li>• <b>1</b>: fsm fork</li><li>• <b>2</b>: vm fork</li></ul>
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extension size. The value can be <b>1, 8, 128, 1024, or 4096</b> .
contents	text	Storage content of a data file. Value range: <ul style="list-style-type: none"><li>• <b>permanent</b>: permanent</li><li>• <b>unlogged</b>: no log</li><li>• <b>temporary</b>: global temporary</li><li>• <b>temporary2</b>: local temporary</li></ul>
in_used	text	Specifies whether a resource has been allocated. The value can be <b>Y</b> or <b>N</b> .
mapblock_location	text	Position of the extension in the map block. The format is ( <i>page_id, offset</i> ).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: <ul style="list-style-type: none"><li>• <b>segment head</b> indicates the segment header.</li><li>• <b>fork head</b> indicates the fork header.</li><li>• <b>level1 page</b> indicates the level-1 page.</li><li>• <b>data extent</b> indicates data extents.</li></ul>
remain_flag	text	Specifies whether it is a shrink residual extension. The value can be <b>Y</b> or <b>N</b> .
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is ( <i>block_id, offset</i> ).

#### 12.3.4.6 GS\_SEG\_DATAFILES

GS\_SEG\_DATAFILES displays information about data files in all tablespaces. Only an administrator can query the information.

**Table 12-183** GS\_SEG\_DATAFILES columns

Name	Type	Description
node_name	text	Node name.
file_name	text	Data file name, for example, <b>base/17467/2_fsm</b> .
file_id	integer	Data file ID.
bucketnode	integer	<ul style="list-style-type: none"> <li>• <b>0</b> to <b>1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>• <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>• <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>• <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>• <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
forknum	integer	Segment fork type. Value range: <ul style="list-style-type: none"> <li>• <b>0</b>: main fork</li> <li>• <b>1</b>: fsm fork</li> <li>• <b>2</b>: vm fork</li> </ul>
tablespace_name	name	Name of the tablespace to which a data file belongs.
contents	text	Storage content of a data file. Value range: <ul style="list-style-type: none"> <li>• <b>permanent</b>: permanent</li> <li>• <b>unlogged</b>: no log</li> <li>• <b>temporary</b>: global temporary</li> <li>• <b>temporary2</b>: local temporary</li> </ul>
extent_size	integer	Extent size of a data file.
meta_blocks	bigint	Number of allocated metadata pages of a data file.
data_blocks	bigint	Number of allocated data pages of a data file.
total_blocks	bigint	Total number of physical pages in a data file.
high_water_mark	bigint	High watermark of the number of pages used by a data file.

Name	Type	Description
utilization	real	Percentage of used blocks to the total number of blocks, that is, <b>(data_blocks + meta_blocks)/total_blocks</b> .

### 12.3.4.7 GS\_SEG\_DATAFILE\_LAYOUT

GS\_SEG\_DATAFILE\_LAYOUT displays the static layout of data files 1 to 5 in segment-page mode. Only the administrator can query the information.

**Table 12-184** GS\_SEG\_DATAFILE\_LAYOUT columns

Name	Type	Description
version	text	Segment-page version. Default value: <b>1.0</b> .
seg_storage_type	text	<ul style="list-style-type: none"> <li>• <b>segment</b> indicates common segment-page data.</li> <li>• <b>hashbucket</b> indicates hash bucket data.</li> </ul>
file_id	integer	Data file ID.
section_id	integer	Data section ID of a data file.
section_type	text	Type of the data file section. Value range: <ul style="list-style-type: none"> <li>• <b>file_header</b> indicates the file header.</li> <li>• <b>spc_header</b> indicates the space header.</li> <li>• <b>map_header</b> indicates the mapping header.</li> <li>• <b>map_pages</b> indicates the mapping page.</li> <li>• <b>ip_pages(inverse pointer pages)</b> indicates the reverse pointer page.</li> <li>• <b>data_pages</b> indicates the data page.</li> </ul>
page_start	bigint	Start page number of the data section.
page_end	bigint	End page number of the data section.
page_count	bigint	Number of pages in the data section.

Name	Type	Description
total_size	bigint	Size of the data section. The unit is byte.

### 12.3.4.8 GS\_SEG\_EXTENTS

GS\_SEG\_EXTENTS displays extent information about all tablespaces. This view displays all extents of user segments, including segment heads, fork heads, and level-1 pages in file 1 and data extents in files 2 to 5. Only an administrator can query the information.

**Table 12-185** GS\_SEG\_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace to which a segment object belongs.
bucketnode	integer	<ul style="list-style-type: none"> <li>• <b>0</b> to <b>1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>• <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>• <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>• <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>• <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
head_block_id	bigint	Page number of the segment header.
extent_id	integer	Logical extent number.
file_id	integer	ID of the data file where the extent is located.
forknum	integer	Fork type of a segment object. Value range: <ul style="list-style-type: none"> <li>• <b>0</b>: main fork.</li> <li>• <b>1</b>: fsm fork.</li> <li>• <b>2</b>: vm fork.</li> </ul>
block_id	bigint	Start page number in the data file where the extent is located.

Name	Type	Description
blocks	integer	Extent size. The value can be <b>1</b> , <b>8</b> , <b>128</b> , <b>1024</b> , or <b>4096</b> .
usage_type	text	Usage type of the extension. Value range: <ul style="list-style-type: none"> <li>• <b>segment head</b>: segment header.</li> <li>• <b>fork head</b>: fork header.</li> <li>• <b>level1 page</b>: level-1 page.</li> <li>• <b>data extent</b>: data extents.</li> </ul>

### 12.3.4.9 GS\_SEG\_SEGMENTS

GS\_SEG\_SEGMENTS displays information about segments in all tablespaces, including tables, indexes, TOAST, TOAST INDEX segments, and fsm fork and vm fork segments. Only an administrator can query the information.

**Table 12-186** GS\_SEG\_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
schema_name	name	Namespace to which a segment belongs.
segment_name	name	Part object name, which is obtained from pg_class and <b>relname</b> in pg_partition.
partition_name	name	Partition name of the segment object ( <b>NULL</b> if the segment object is not partitioned). Source: pg_partition.relname.
forknum	integer	Fork type of a segment object. Value range: <ul style="list-style-type: none"> <li>• <b>0</b>: main fork.</li> <li>• <b>1</b>: fsm fork.</li> <li>• <b>2</b>: vm fork.</li> </ul>

Name	Type	Description
segment_type	text	Segment object type. Value range: <ul style="list-style-type: none"> <li>● <b>table</b>: segment-page ordinary table.</li> <li>● <b>table partition</b>: segment-page partitioned table (main table and child table) and segment-page level-2 partitioned table (level-1 partitioned table).</li> <li>● <b>table subpartition</b>: segment-page level-2 partitioned table (top node table and level-2 partitioned table).</li> <li>● <b>index</b>: index of a segment-page ordinary table.</li> <li>● <b>index partition</b>: index of a segment-page partitioned table or level-2 partitioned table.</li> <li>● <b>global partition index</b>: global index for segment-page partitioned tables and level-2 partitioned tables.</li> <li>● <b>toast</b>: segment-page TOAST table.</li> <li>● <b>toast index</b>: index of a segment-page TOAST table.</li> </ul>
tablespace_name	name	Tablespace to which a segment object belongs.
bucketnode	integer	<ul style="list-style-type: none"> <li>● <b>0 to 1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>● <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>● <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>● <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>● <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
head_block_id	bigint	Page number of the segment header.
contents	text	Storage content of a data file. Value range: <ul style="list-style-type: none"> <li>● <b>permanent</b>: permanent.</li> <li>● <b>unlogged</b>: no log.</li> <li>● <b>temporary</b>: global temporary.</li> <li>● <b>temporary2</b>: local temporary.</li> </ul>
table_name	name	Name of the base table to which a segment belongs.
blocks	bigint	Number of logical pages of a segment.
total_blocks	bigint	Number of physical pages of a segment.

Name	Type	Description
extents	integer	Number of logical extents of a segment.
total_extents	integer	Number of physical extents of a segment.
head_lsn	text	Segment header LSN.
level0_slots	bigint[]	Level-0 slot array of segment extent mapping.
level1_slots	bigint[]	Level-1 slot array of segment extent mapping.
fork_head	bigint[]	Fork head array of a segment.

### 12.3.4.10 GS\_SEG\_SEGMENT\_LAYOUT

GS\_SEG\_SEGMENT\_LAYOUT displays the static layout of segment-page files. Only the administrator can query the information.

**Table 12-187** GS\_SEG\_SEGMENT\_LAYOUT columns

Name	Type	Description
version	text	Segment-page version. Default value: <b>1.0</b> .
section_id	integer	ID of the data section divided by a segment.
section_type	text	Extent type of the segment data section. Value range: <ul style="list-style-type: none"> <li>• <b>meta</b>: segment header.</li> <li>• <b>data</b>: data.</li> </ul>
extent_size	integer	Extent size. The unit is byte.
extent_page_count	integer	Number of extent pages.
extent_count_start	bigint	Start extent number.
extent_count_end	bigint	End extent number.
total_size	bigint	Size of the segment data section. The unit is byte.

### 12.3.4.11 GS\_SEG\_SPC\_EXTENTS

GS\_SEG\_SPC\_EXTENTS displays information about the used extents of all tablespaces. The output contains segment heads, fork heads, level-1 pages, data extents. Only an administrator can query the information.

**Table 12-188** GS\_SEG\_SPC\_EXTENTS

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	<ul style="list-style-type: none"> <li>• <b>0</b> to <b>1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>• <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>• <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>• <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>• <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
forknum	integer	Data file fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be <b>1</b> , <b>8</b> , <b>128</b> , <b>1024</b> , or <b>4096</b> .
contents	text	Storage content of a data file. The options are as follows: <ul style="list-style-type: none"> <li>• <b>permanent</b>: permanent.</li> <li>• <b>unlogged</b>: no log.</li> <li>• <b>temporary</b>: global temporary.</li> <li>• <b>temporary2</b>: local temporary.</li> </ul>
in_used	text	Specifies whether a resource has been allocated. The value can be <b>Y</b> or <b>N</b> .
mapblock_location	text	Position of the extension in the map block. The format is ( <i>page_id</i> , <i>offset</i> ).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: <ul style="list-style-type: none"> <li>• <b>segment head</b>: segment header.</li> <li>• <b>fork head</b>: fork header.</li> <li>• <b>level1 page</b>: level-1 page.</li> <li>• <b>data extent</b>: data extents.</li> </ul>

Name	Type	Description
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be <b>Y</b> or <b>N</b> .
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is ( <i>block_id, offset</i> ).

### 12.3.4.12 GS\_SEG\_SPC\_SEGMENTS

GS\_SEG\_SPC\_SEGMENTS displays information about used segments in all tablespaces. Only an administrator can query the information.

**Table 12-189** GS\_SEG\_SPC\_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	<ul style="list-style-type: none"> <li>• <b>0</b> to <b>1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>• <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>• <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>• <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>• <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
forknum	integer	Fork type of a segment object. Value range: <ul style="list-style-type: none"> <li>• <b>0</b>: main fork.</li> <li>• <b>1</b>: fsm fork.</li> <li>• <b>2</b>: vm fork.</li> </ul>
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be <b>1, 8, 128, 1024, or 4096</b> .

Name	Type	Description
contents	text	Storage content of a data file. Value range: <ul style="list-style-type: none"> <li>• <b>permanent</b>: permanent.</li> <li>• <b>unlogged</b>: no log.</li> <li>• <b>temporary</b>: global temporary.</li> <li>• <b>temporary2</b>: local temporary.</li> </ul>
in_used	text	Specifies whether a resource has been allocated. The value can be <b>Y</b> or <b>N</b> .
mapblock_location	text	Position of the extension in the map block. The format is <i>(page_id, offset)</i> .
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: <ul style="list-style-type: none"> <li>• <b>segment head</b>: segment header.</li> <li>• <b>fork head</b>: fork header.</li> <li>• <b>level1 page</b>: level-1 page.</li> <li>• <b>data extent</b>: data extents.</li> </ul>
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be <b>Y</b> or <b>N</b> .
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is <i>(block_id, offset)</i> .

### 12.3.4.13 GS\_SEG\_SPC\_REMAIN\_EXTENTS

GS\_SEG\_SPC\_REMAIN\_EXTENTS displays the residual isolated extent information of the index tablespace. The extent information is not included in the residual segment and can be used as an independent clearing unit. Only an administrator can query the information.

**Table 12-190** GS\_SEG\_SPC\_REMAIN\_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.

Name	Type	Description
bucketnode	integer	<ul style="list-style-type: none"> <li>● <b>0</b> to <b>1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>● <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>● <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>● <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>● <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
forknum	integer	Fork type of a segment object. Value range: <ul style="list-style-type: none"> <li>● <b>0</b>: main fork.</li> <li>● <b>1</b>: fsm fork.</li> <li>● <b>2</b>: vm fork.</li> </ul>
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be <b>1</b> , <b>8</b> , <b>128</b> , <b>1024</b> , or <b>4096</b> .
contents	text	Storage content of a data file. Value range: <ul style="list-style-type: none"> <li>● <b>permanent</b>: permanent.</li> <li>● <b>unlogged</b>: no log.</li> <li>● <b>temporary</b>: global temporary.</li> <li>● <b>temporary2</b>: local temporary.</li> </ul>
in_used	text	Specifies whether a resource has been allocated. The value can be <b>Y</b> or <b>N</b> .
mapblock_location	text	Position of the extension in the map block. The format is ( <i>page_id</i> , <i>offset</i> ).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Usage type of the extension. Value range: <ul style="list-style-type: none"> <li>● <b>segment head</b>: segment header.</li> <li>● <b>fork head</b>: fork header.</li> <li>● <b>level1 page</b>: level-1 page.</li> <li>● <b>data extent</b>: data extents.</li> </ul>
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be <b>Y</b> or <b>N</b> .
special_data	integer	Special data section of the reverse pointer corresponding to an extent.

Name	Type	Description
ipblock_location	text	Position of the extended reverse pointer. The format is <i>(block_id, offset)</i> .

#### 12.3.4.14 GS\_SEG\_SPC\_REMAIN\_SEGMENTS

GS\_SEG\_SPC\_REMAIN\_SEGMENTS displays the residual segment information of the index tablespace, including the main fork, fsm fork, and vm fork segments. Only an administrator can query the information.

**Table 12-191** GS\_SEG\_SPC\_REMAIN\_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID.
bucketnode	integer	<ul style="list-style-type: none"> <li>• <b>0</b> to <b>1023</b> indicate the bucket nodes of a hash bucket table.</li> <li>• <b>1024</b> indicates the bucket node of a segment-page ordinary table.</li> <li>• <b>1025</b> indicates the bucket node of a segment-page global temporary table.</li> <li>• <b>1026</b> indicates the bucket node of a segment-page unlogged table.</li> <li>• <b>1027</b> indicates the bucket node of a segment-page local temporary table.</li> </ul>
forknum	integer	Data file fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be <b>1</b> , <b>8</b> , <b>128</b> , <b>1024</b> , or <b>4096</b> .
contents	text	Storage content of a data file. Value range: <ul style="list-style-type: none"> <li>• <b>permanent</b>: permanent.</li> <li>• <b>unlogged</b>: no log.</li> <li>• <b>temporary</b>: global temporary.</li> <li>• <b>temporary2</b>: local temporary.</li> </ul>
in_used	text	Specifies whether a resource has been allocated. The value can be <b>Y</b> or <b>N</b> .
mapblock_location	text	Position of the extension in the map block. The format is <i>(page_id, offset)</i> .

Name	Type	Description
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Usage type of the extension. Value range: <ul style="list-style-type: none"> <li>● <b>segment head</b>: segment header.</li> <li>● <b>fork head</b>: fork header.</li> <li>● <b>level1 page</b>: level-1 page.</li> <li>● <b>data extent</b>: data extents.</li> </ul>
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be <b>Y</b> or <b>N</b> .
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is ( <i>block_id</i> , <i>offset</i> ).

## 12.3.5 SPM

### 12.3.5.1 GS\_SPM\_SQL\_BASELINE

GS\_SPM\_SQL\_BASELINE is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the baseline information of the current user. Users with permissions higher than common users can access this view.

**Table 12-192** GS\_SPM\_SQL\_BASELINE columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.

Name	Type	Description
status	text	Status of a plan. Value range: <ul style="list-style-type: none"> <li>• <b>UNACC</b>: indicates that the plan is not accepted.</li> <li>• <b>ACC</b>: indicates that the plan has been accepted.</li> <li>• <b>FIXED</b>: indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plans.</li> </ul>
gplan	Boolean	Specifies whether the plan corresponding to the current outline is a gplan.
cost	double precision	Total plan cost.
sql_text	text	SQL text string.
param_num	integer	Number of SQL parameters.
source	text	Baseline source.
creation_time	timestamp with time zone	Time when the baseline is created.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

### 12.3.5.2 GS\_SPM\_SQL\_PARAM

GS\_SPM\_SQL\_PARAM is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the SQL parameter information of the current user. Users with permissions higher than common users can access this view.

**Table 12-193** GS\_SPM\_SQL\_PARAM columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
sql_text	text	SQL text string.

Name	Type	Description
position	integer	Position index of a parameter in the SQL statement, starting from 0.
datatype	integer	OID of the parameter type.
datatype_string	text	Character string of a parameter type.
value_string	text	Character string of a parameter value.
is_null	Boolean	Specifies whether a parameter value is <b>NULL</b> .
hash_value	bigint	Hash value of a parameter value.
creation_time	timestamp with time zone	Time when a record is created.

### 12.3.5.3 GS\_SPM\_SQL\_EVOLUTION

GS\_SPM\_SQL\_EVOLUTION is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the planned evolution result of the current user. Users with permissions higher than common users can access this view.

**Table 12-194** GS\_SPM\_SQL\_EVOLUTION columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
better	Boolean	Determines whether it is a positive evolution.
status	text	Specifies whether exceptions occur during the evolution. Value range: <ul style="list-style-type: none"> <li>• <b>SUCCESS</b>: The evolution is successful.</li> <li>• <b>FAILED</b>: The evolution fails.</li> </ul>
refer_plan	bigint	Plan hash used as a reference for report generation.
sql_text	text	SQL text string.
outline	text	Hint string list of the current plan.
reason	text	Content of the evolution report.

Name	Type	Description
gplan	Boolean	Determines whether the plan is a gplan.
creation_time	timestamp with time zone	Time when the evolution result is created.

### 12.3.5.4 GS\_SPM\_SYS\_BASELINE

GS\_SPM\_SYS\_BASELINE is a system view of the SPM feature. This feature is not supported in the distributed system. This view is used to view baseline information in the database. The user with the SYSADMIN permission and initial users can access this view.

**Table 12-195** GS\_SPM\_SYS\_BASELINE columns

Name	Type	Description
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
unique_sql_id	bigint	Unique ID of an SQL statement in the database.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
status	integer	Status of a plan. Value range: <ul style="list-style-type: none"> <li>• 0 (UNACC): plan that is not accepted.</li> <li>• 1 (ACC): plan that has been accepted.</li> <li>• 2 (FIXED): a special ACC plan. The matching priority of this plan is higher than that of other ACC plan.</li> </ul>
gplan	Boolean	Specifies whether the plan corresponding to the current outline is a gplan.
cost	double precision	Total plan cost.
sql_text	text	SQL text string.
param_num	integer	Number of SQL parameters.
source	text	Baseline source.
creation_time	timestamp with time zone	Time when the baseline is created.

Name	Type	Description
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

## 12.3.6 Auditing

### 12.3.6.1 ADM\_AUDIT\_OBJECT

ADM\_AUDIT\_OBJECT displays the audit trail records of all objects in the database. This view exists in both PG\_CATALOG and SYS schemas. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

**Table 12-196** ADM\_AUDIT\_OBJECT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session)
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.

Name	Type	Description
action_name	character varying(28)	Action name corresponding to the numeric code in the <b>ACTION</b> column in DBA_AUDIT_TRAIL  <b>NOTE</b> The <b>action_name</b> column in GaussDB is inconsistent with the audit action of database ORA.
new_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_number	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
transactionid	text	Identifier of the transaction that accesses or modifies an object. <b>NOTE</b> The type of the <b>transactionid</b> column in GaussDB must be the same as that in database ORA.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	nvarchar2(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	character varying	SQL text of the query. <b>NOTE</b> The <b>sql_text</b> column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.6.2 ADM\_AUDIT\_SESSION

ADM\_AUDIT\_SESSION displays all audit trail records concerning CONNECT and DISCONNECT. The audit information of GaussDB is mainly queried through the pg\_query\_audit function. This view exists in both the PG\_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute can view audit information.

**Table 12-197** ADM\_AUDIT\_SESSION columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	date	Date and time when an audit trail entry is created (user login date and time of the entry created by AUDIT SESSION).

Name	Type	Description
action_name	character varying(28)	Action name corresponding to the numeric code in the <b>ACTION</b> column in DBA_AUDIT_TRAIL. <b>NOTE</b> The <b>action_name</b> column in GaussDB is inconsistent with the audit action of database ORA.
logoff_time	date	Not supported. Its value is <b>NULL</b> .
logoff_lread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_pread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_lwrite	numeric	Not supported. Its value is <b>NULL</b> .
logoff_dlock	numeric	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by AUDIT SESSION in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_number	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .

### 12.3.6.3 ADM\_AUDIT\_STATEMENT

ADM\_AUDIT\_STATEMENT displays all grant and revoke audit trail entries. The audit information of GaussDB is mainly queried through the pg\_query\_audit function. This view exists in both PG\_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute can view audit information.

**Table 12-198** ADM\_AUDIT\_STATEMENT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action_name	character varying(28)	Action type corresponding to the code in the action column. <b>NOTE</b> The <b>action_name</b> column in GaussDB is inconsistent with the audit action of database ORA.
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
obj_privilege	character varying(32)	Not supported. Its value is <b>NULL</b> .
sys_privilege	character varying(40)	Not supported. Its value is <b>NULL</b> .
admin_option	character varying(1)	Not supported. Its value is <b>NULL</b> .
grantee	character varying(128)	Not supported. Its value is <b>NULL</b> .
audit_option	character varying(40)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_number	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .
transactionid	text	Identifier of the transaction that accesses or modifies an object. <b>NOTE</b> The type of the <b>transactionid</b> column in GaussDB must be the same as that in database ORA.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	nvarchar2(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	character varying(2000)	SQL text of the query. <b>NOTE</b> The <b>sql_text</b> column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.6.4 ADM\_AUDIT\_TRAIL

ADM\_AUDIT\_TRAIL displays all standard audit trail entries. The audit information of GaussDB is mainly queried through the pg\_query\_audit function. This view exists in both PG\_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission of ADM\_AUDIT\_TRAIL can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information.

**⚠ CAUTION**

In a distributed system, the pg\_query\_audit function can only be used to query the audit information of the current node.

**Table 12-199** ADM\_AUDIT\_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is <b>NULL</b> .
terminal	character varying(255)	Not supported. Its value is <b>NULL</b> .
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session)
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported. Its value is <b>NULL</b> .
action_name	character varying(28)	Action type corresponding to the code in the action column. <b>NOTE</b> The <b>action_name</b> column in GaussDB is inconsistent with the audit action of database ORA.
new_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
new_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
obj_privilege	character varying(32)	Not supported. Its value is <b>NULL</b> .
sys_privilege	character varying(40)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
admin_option	character varying(1)	Not supported. Its value is <b>NULL</b> .
grantee	character varying(128)	Not supported. Its value is <b>NULL</b> .
audit_option	character varying(40)	Not supported. Its value is <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Its value is <b>NULL</b> .
logoff_time	date	Not supported. Its value is <b>NULL</b> .
logoff_lread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_pread	numeric	Not supported. Its value is <b>NULL</b> .
logoff_lwrite	numeric	Not supported. Its value is <b>NULL</b> .
logoff_dlock	character varying(40)	Not supported. Its value is <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
sessionid	numeric	Not supported. Its value is <b>NULL</b> .
entryid	numeric	Not supported. Its value is <b>NULL</b> .
statementid	numeric	Not supported. Its value is <b>NULL</b> .
returncode	numeric	Not supported. Its value is <b>NULL</b> .
priv_used	character varying(40)	Not supported. Its value is <b>NULL</b> .
client_id	character varying(128)	Not supported. Its value is <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Its value is <b>NULL</b> .
session_cpu	numeric	Not supported. Its value is <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(32)	Not supported. Its value is <b>NULL</b> .
instance_number	numeric	Not supported. Its value is <b>NULL</b> .
os_process	character varying(16)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
transactionid	text	Identifier of the transaction that accesses or modifies an object. <b>NOTE</b> The type of the <b>transactionid</b> column in GaussDB must be the same as that in database ORA.
scn	numeric	Not supported. Its value is <b>NULL</b> .
sql_bind	nvarchar2(2000)	Not supported. Its value is <b>NULL</b> .
sql_text	nvarchar2	SQL text of the query. <b>NOTE</b> The <b>sql_text</b> column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
dbid	numeric	Not supported. Its value is <b>NULL</b> .
rls_info	clob	Not supported. Its value is <b>NULL</b> .
current_user	character varying(128)	Not supported. Its value is <b>NULL</b> .

### 12.3.6.5 GS\_AUDITING

GS\_AUDITING displays all audit information about database-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-200** GS\_AUDITING columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value can be <b>access</b> or <b>privilege</b> . <ul style="list-style-type: none"> <li>• <b>access</b>: DML operations are audited.</li> <li>• <b>privilege</b>: DDL operations are audited.</li> </ul>
polenabled	Boolean	Specifies whether the policy is enabled. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled.</li> <li>• <b>f</b> (false): disabled.</li> </ul>
access_type	name	DML database operation types, such as SELECT, INSERT, and DELETE, or DDL database operation types, such as CREATE, ALTER, and DROP.

Name	Type	Description
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.
priv_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion.

### 12.3.6.6 GS\_AUDITING\_ACCESS

GS\_AUDITING\_ACCESS displays all audit information about database DML-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-201** GS\_AUDITING\_ACCESS columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value is 'access', indicating that DML operations are audited.
polenabled	Boolean	Specifies whether the policy is enabled. <ul style="list-style-type: none"><li>• <b>t</b> (true): enabled.</li><li>• <b>f</b> (false): disabled.</li></ul>
access_type	name	DML database operation type. Example: SELECT, INSERT, and DELETE.
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.
access_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion.

### 12.3.6.7 GS\_AUDITING\_PRIVILEGE

GS\_AUDITING\_PRIVILEGE displays all audit information about database DDL-related operations. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-202** GS\_AUDITING\_PRIVILEGE columns

Name	Type	Description
polname	name	Policy name, which must be unique.

Name	Type	Description
pol_type	text	Audit policy type. The value is ' <b>privilege</b> ', indicating that DDL operations are audited.
polenabled	Boolean	Specifies whether to enable a policy. <ul style="list-style-type: none"> <li>• <b>t</b> (true): enabled.</li> <li>• <b>f</b> (false): disabled.</li> </ul>
access_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
label_name	name	Resource label name. This column corresponds to the <b>polname</b> column in the GS_AUDITING_POLICY system catalog.
priv_object	text	Full domain name of a database object.
filter_name	text	Logical character string of a filter criterion.

## 12.3.7 User and Permission Management

### 12.3.7.1 ADM\_COL\_PRIVS

ADM\_COL\_PRIVS displays permission granting information about all columns. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-203** ADM\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.

Name	Type	Description
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"> <li>• <b>YES</b>: The privileges are granted.</li> <li>• <b>NO</b>: The privileges are not granted.</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.2 ADM\_ROLE\_PRIVS

ADM\_ROLE\_PRIVS displays information about roles granted to all users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-204** ADM\_ROLE\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
delegate_option	character varying(3)	Not supported. Its value is <b>NULL</b> .
default_role	character varying(3)	Not supported. Its value is <b>NULL</b> .
os_granted	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.3 ADM\_ROLES

ADM\_ROLES displays information about database roles. This view exists in both the PG\_CATALOG and SYS schemas. By default, only the system administrator can access this view.

**Table 12-205** ADM\_ROLES columns

Name	Type	Description
role	character varying(128)	Role name.
role_id	oid	Role ID
authentication_type	text	Role authentication mechanism. <ul style="list-style-type: none"> <li>• <b>password</b>: Password authentication is required.</li> <li>• <b>null</b>: Authentication is not required.</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .
implicit	character varying(3)	Not supported. Its value is <b>NULL</b> .
external_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.4 ADM\_SYS\_PRIVS

ADM\_SYS\_PRIVS displays information about system permissions granted to users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-206** ADM\_SYS\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.

Name	Type	Description
privilege	character varying(40)	System permissions or ANY permissions of the user. <ul style="list-style-type: none"> <li>System permissions include rolsuper, rolinherit, rolcreateole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin.</li> <li>For details about the value of the ANY permissions, see <a href="#">Table 7-243</a>.</li> </ul>
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li><b>YES</b></li> <li><b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.5 ADM\_TAB\_PRIVS

ADM\_TAB\_PRIVS displays authorization information about all objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-207** ADM\_TAB\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name.
grantor	character varying(128)	Name of the user who grants the permission.

Name	Type	Description
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the <b>GRANT</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
type	character varying(24)	Object types, including NODE GROUP, COLUMN_ENCRYPTION_KEY, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, LARGE OBJECT, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, and TABLESPACE.
hierarchy	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.6 ADM\_USERS

ADM\_USERS displays information about all database users. This view is accessible only to system administrators. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-208** ADM\_USERS columns

Name	Type	Description
username	character varying(128)	Username.
user_id	oid	User ID.

Name	Type	Description
account_status	character varying(32)	Account status. <ul style="list-style-type: none"> <li>• <b>NULL</b>: The account is the initial system administrator with the highest permission.</li> <li>• <b>0</b>: normal.</li> <li>• <b>1</b>: The account is locked for a specific period of time because the number of failed login attempts exceeds the threshold.</li> <li>• <b>2</b>: The account is locked by the administrator.</li> </ul>
lock_date	timestamp with time zone	By default, the creation date of the account is displayed. If the account is locked by the administrator or the account is locked because the number of login failures exceeds the threshold, the date when the account is locked is displayed. The value is <b>NULL</b> for the initial system administrator.
expiry_date	timestamp with time zone	Account expiration date.
default_tablespace	character varying(4000)	Default tablespace for storing data.
temporary_tablespace	character varying(4000)	Name of the default tablespace or tablespace group of a temporary table.
local_temp_tablespace	character varying(30)	Not supported. The default value is <b>NULL</b> .
created	timestamp with time zone	Date when a user is created.
profile	character varying(128)	Not supported. The default value is <b>NULL</b> .
initial_rsrc_consumer_group	character varying(128)	Not supported. The default value is <b>NULL</b> .
external_name	character varying(4000)	Not supported. The default value is <b>NULL</b> .
password_versions	character varying(12)	Encryption mode of the account password. The value can be <b>MD5</b> , <b>SHA256</b> , or <b>SM3</b> .

Name	Type	Description
editions_enabled	character varying(1)	Not supported. The default value is <b>NULL</b> .
authentication_type	text	Authentication mechanism of the user.
proxy_only_connect	character varying(1)	Not supported. The default value is <b>NULL</b> .
common	character varying(3)	Not supported. The default value is <b>NULL</b> .
last_login	timestamp with time zone	Last login.
oracle_maintained	character varying(1)	Not supported. The default value is <b>NULL</b> .
inherited	character varying(3)	Not supported. The default value is <b>NULL</b> .
default_collation	character varying(100)	Default collation of the user schema.
implicit	character varying(3)	Not supported. The default value is <b>NULL</b> .
all_shard	character varying(3)	Not supported. The default value is <b>NULL</b> .
password_change_date	timestamp with time zone	Date when the user set a password last time.

### 12.3.7.7 DB\_COL\_PRIVS

DB\_COL\_PRIVS displays the following granting information:

- Column permission granting information when the current user is the object owner, grantor, or grantee.
- Column permission granting information when the enabled role or PUBLIC role is the grantee.

By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-209** DB\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.8 DB\_DIRECTORIES

DB\_DIRECTORIES is used to view all directories on which the current user has the operation permission. Administrators can query all directories, and common users can query only directories on which the current user has the operation permission. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-210** DB\_DIRECTORIES columns

Name	Type	Description
owner	oid	OID of the owner of a directory object.
directory_name	name	Name of a directory object.
directory_path	text	Directory path represented by a directory object.
origin_container_id	character varying(256)	ID of the container where a directory object is created. Not supported. Its value is <b>NULL</b> .

### 12.3.7.9 DB\_TAB\_PRIVS

DB\_TAB\_PRIVS displays authorization information about all objects accessible to the current user. All users can access this view. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-211** DB\_TAB\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema to which an object belongs.
table_name	character varying(128)	Object name.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the <b>GRANT</b> option. <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>
type	character varying(24)	Object types, including NODE GROUP, COLUMN_ENCRYPTION_KEY, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, LARGE OBJECT, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, and TABLESPACE.
hierarchy	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.10 DB\_USERS

DB\_USERS displays all users of the database visible to the current user. However, it does not describe the users. By default, only the system administrator can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-212** DB\_USERS columns

Name	Type	Description
user_id	oid	OID of a user
username	name	Name of a user

### 12.3.7.11 GS\_DB\_PRIVILEGES

**GS\_DB\_PRIVILEGES** displays the granting of ANY permissions. Each record corresponds to a piece of authorization information.

**Table 12-213** GS\_DB\_PRIVILEGES columns

Name	Type	Description
rolename	name	Username.
privilege_type	text	ANY permission of a user. For details about the value, see <a href="#">Table 7-243</a> .
admin_option	text	Specifies whether the ANY permission recorded in the <b>privilege_type</b> column can be re-granted. <ul style="list-style-type: none"> <li>• <b>yes</b></li> <li>• <b>no</b></li> </ul>

### 12.3.7.12 GS\_LABELS

**GS\_LABELS** displays all configured resource labels. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-214** GS\_LABELS columns

Name	Type	Description
labelname	name	Resource label name
labeltype	name	Resource label type This parameter corresponds to the <b>labeltype</b> column in the <a href="#">GS_POLICY_LABEL</a> system catalog.
fqdtype	name	Database resource type. For example, table, schema, and index.
schemaname	name	Name of the schema to which the database resource belongs

Name	Type	Description
fqdnname	name	Database resource name
columnname	name	Name of the database resource column. If the marked database resource is not a column, this parameter is left blank.

### 12.3.7.13 MY\_COL\_PRIVS

MY\_COL\_PRIVS displays the column permission granting information of the current user as the object owner, grantor, or grantee. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-215** MY\_COL\_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. <ul style="list-style-type: none"> <li>• YES</li> <li>• NO</li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.14 MY\_ROLE\_PRIVS

MY\_ROLE\_PRIVS displays permission information about roles (including the public role) granted to the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-216** MY\_ROLE\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
delegate_option	character varying(3)	Not supported. Its value is <b>NULL</b> .
default_role	character varying(3)	Not supported. Its value is <b>NULL</b> .
os_granted	character varying(3)	Not supported. Its value is <b>NULL</b> .
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.15 MY\_SYS\_PRIVS

MY\_SYS\_PRIVS displays information about system permissions granted to the current user. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-217** MY\_SYS\_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.

Name	Type	Description
privilege	character varying(40)	System permissions or ANY permissions of the user. <ul style="list-style-type: none"> <li>System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin.</li> <li>For details about the value of the ANY permissions, see <a href="#">Table 7-243</a>.</li> </ul>
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li><b>YES</b></li> <li><b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.16 PG\_RLSPOLICIES

PG\_RLSPOLICIES displays information about row-level security policies. The initial user and users with the **sysadmin** attribute can view all policy information. Other users can view only the policy information in their own tables.

**Table 12-218** PG\_RLSPOLICIES columns

Name	Type	Description
schemaname	name	Name of the schema of the table object to which a row-level security policy is applied.
tablename	name	Name of the table object to which a row-level security policy is applied.
policyname	name	Name of a row-level security policy.

Name	Type	Description
policypermissive	text	Expression concatenation mode of a row-level security policy. Value range: <ul style="list-style-type: none"> <li>• <b>PERMISSIVE</b>: permissive policy, which is concatenated using the OR expression.</li> <li>• <b>RESTRICTIVE</b>: restrictive policy, which is concatenated using an AND expression.</li> </ul>
policyroles	name[]	List of users affected by the row-level security policy. If this parameter is not specified, all users are affected.
policycmd	text	SQL operations affected by a row-level security policy.
policyqual	text	Expression of a row-level security policy.

### 12.3.7.17 PG\_ROLES

PG\_ROLES displays information about database roles. Initial users and users with the **sysadmin** or **creatorole** attribute can view information about all roles. Other users can view only their own information.

**Table 12-219** PG\_ROLES columns

Name	Type	Reference	Description
rolname	name	N/A	Role name.
rolsuper	Boolean	N/A	Specifies whether a role is the initial system administrator with the highest permissions. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolinherit	Boolean	N/A	Specifies whether the role inherits the permissions for this type of roles. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolcreatorole	Boolean	N/A	Specifies whether the role can create other roles. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

Name	Type	Reference	Description
rolcreatedb	Boolean	N/A	Specifies whether the role can create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolcatupdate	Boolean	N/A	Specifies whether the role can update system catalogs directly. Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. This permission is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolcanlogin	Boolean	N/A	Specifies whether the role can log in to the database. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolreplication	Boolean	N/A	Specifies whether the role can be replicated. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolauditadmin	Boolean	N/A	Specifies whether the role is an audit administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolsystemadmin	Boolean	N/A	Specifies whether the role is a system administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolconnlimit	integer	N/A	Maximum number of concurrent connections that a role can initiate if this role can log in. The value <b>-1</b> indicates no limit.
rolpassword	text	N/A	Encrypted user password. The value is displayed as <b>*****</b> .
rolvalidbegin	timestamp with time zone	N/A	Start time for account validity ( <b>NULL</b> if the start time is not specified).
rolvaliduntil	timestamp with time zone	N/A	End time for account validity ( <b>NULL</b> if the end time is not specified).

Name	Type	Reference	Description
rolrespool	name	N/A	Resource pool that a user can use
rolparentid	oid	rolparentid in <a href="#">PG_AUTHID</a>	OID of a group user to which the user belongs
roltabspace	text	N/A	Storage space of the user permanent table, in KB.
rolconfig	text[]	<a href="#">setconfig</a> in <a href="#">PG_DB_ROLE_SETTING</a>	Default value of GUC items.
oid	oid	oid in <a href="#">PG_AUTHID</a>	Role ID
roluseft	Boolean	<a href="#">roluseft</a> in <a href="#">PG_AUTHID</a>	Specifies whether the role can perform operations on foreign tables <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolkind	"char"	N/A	Role type <ul style="list-style-type: none"> <li>• <b>n</b>: common user, that is, non-permanent user.</li> <li>• <b>p</b>: permanent user.</li> </ul>
roltempespace	text	N/A	Storage space of the user temporary table, in KB.
rolspillspace	text	N/A	Operator disk spill space of the user, in KB.
rolmonitoradmin	Boolean	N/A	Specifies whether the role is a monitor administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
roloperatoradmin	Boolean	N/A	Specifies whether the role is an O&M administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
rolpolicyadmin	Boolean	N/A	Specifies whether the role is a security policy administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

### 12.3.7.18 PG\_SECLABELS

PG\_SECLABELS provides information about storage security labels.

**Table 12-220** PG\_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to.
classoid	oid	<b>oid</b> in <a href="#">PG_CLASS</a>	OID of the system catalog where the object to which the security label belongs is located.
objsubid	integer	-	<ul style="list-style-type: none"><li>Column number for the security label on a table column (by referring to <b>objoid</b> and <b>classoid</b> in the table).</li><li>For all other object types, this column is set to <b>0</b>.</li></ul>
objtype	text	-	Type of the object to which the label belongs, in text format. Examples: <ul style="list-style-type: none"><li><b>table</b>: table type.</li><li><b>column</b>: column type.</li></ul>
objnamespace	oid	<b>oid</b> in <a href="#">PG_NAMESPACE</a>	OID of the namespace for the object, if applicable; otherwise, <b>NULL</b> .
objname	text	-	Name of the object to which the label belongs, in text format.
provider	text	<b>provider</b> in <a href="#">PG_SECLABEL</a>	Provider of the label.
label	text	<b>label</b> in <a href="#">PG_SECLABEL</a>	Security label name.

### 12.3.7.19 PG\_SHADOW

PG\_SHADOW displays the attributes of all roles marked with rolcanlogin in [PG\\_AUTHID](#). Only the system administrator can access this system view.

The information in this view is basically the same as that in [PG\\_USER](#). The difference is that in [PG\\_USER](#), passwords are sensitive and displayed as **\*\*\*\*\***.

**Table 12-221** PG\_SHADOW columns

Name	Type	Reference	Description
username	name	<b>rolname</b> in <b>PG_AUTHID</b>	Username.
usesysid	oid	<b>oid</b> in <b>PG_AUTHID</b>	ID of this user.
usecreatedb	Boolean	-	Specifies whether this user has the permissions to create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usesuper	Boolean	-	Specifies whether this user is a system administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usecatupd	Boolean	-	Specifies whether this user can update a view. Even the system administrator cannot update the view unless this column is <b>t</b> . <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
userepl	Boolean	-	Specifies whether this user has the permissions to duplicate data streams. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
passwd	text	<b>rolpassword</b> in <b>PG_AUTHID</b>	Password ciphertext. If there is no password, the value is <b>NULL</b> .
valbegin	timestamp with time zone	-	Start time for account validity ( <b>NULL</b> if the start time is not specified).
valuntil	timestamp with time zone	-	End time for account validity ( <b>NULL</b> if the end time is not specified).
respool	name	-	Resource pool where this user is in.
parent	oid	-	Parent user OID.
spacelimit	text	-	Storage space of the permanent table, in KB.

Name	Type	Reference	Description
useconfig	text[]	<b>setconfig</b> in <a href="#">PG_DB_ROLE_SETTING</a>	Default value of GUC items.
tempspacelimit	text	-	Storage space of the temporary table, in KB.
spillspacelimit	text	-	Operator disk flushing space, in KB.
usemonitoradmin	Boolean	-	Specifies whether this user is a monitor administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
useoperatoradmin	Boolean	-	Specifies whether this user is an O&M administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usepolicyadmin	Boolean	-	Specifies whether this user is a security policy administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

### 12.3.7.20 PG\_USER

PG\_USER displays information about database users. By default, only the initial user and users with the sysadmin attribute can view the information. Other users can view the information only after being granted with permissions.

**Table 12-222** PG\_USER columns

Name	Type	Description
username	name	Username.
usesysid	oid	ID of this user.
usecreatedb	Boolean	Specifies whether this user has the permissions to create databases. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

Name	Type	Description
usesuper	Boolean	Specifies whether this user is the initial system administrator with the highest permissions. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usecatupd	Boolean	Specifies whether the user can directly update system catalogs. Only the initial system administrator whose <b>usesysid</b> is <b>10</b> has this permission. This permission is unavailable for other users. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
userepl	Boolean	Specifies whether this user has the permissions to duplicate data streams. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
passwd	text	Encrypted user password. The value is displayed as <b>*****</b> .
valbegin	timestamp with time zone	Start time for account validity ( <b>NULL</b> if the start time is not specified).
valuntil	timestamp with time zone	End time for account validity ( <b>NULL</b> if the end time is not specified).
respool	name	Resource pool where this user is in.
parent	oid	Parent user OID.
spacelimit	text	Storage space of the permanent table, in KB.
useconfig	text[]	Default value of GUC items. For details, see <b>setconfig</b> in <a href="#">PG_DB_ROLE_SETTING</a> .
tempspacelimit	text	Storage space of the temporary table, in KB.
spillspacelimit	text	Operator disk flushing space, in KB.
usemonitoradmin	Boolean	Specifies whether this user is a monitor administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

Name	Type	Description
useoperatoradmin	Boolean	Specifies whether this user is an O&M administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
usepolicyadmin	Boolean	Specifies whether this user is a security policy administrator. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>

### 12.3.7.21 PG\_USER\_MAPPINGS

PG\_USER\_MAPPINGS displays user mapping information. All users can view the information.

**Table 12-223** PG\_USER\_MAPPINGS columns

Name	Type	Reference	Description
umid	oid	<b>oid</b> in <a href="#">PG_USER_MAPPING</a>	OID of the user mapping.
srvid	oid	<b>oid</b> in <a href="#">PG_FOREIGN_SERVER</a>	OID of the foreign server that contains the mapping.
srvname	name	<b>srvname</b> in <a href="#">PG_FOREIGN_SERVER</a>	Name of the foreign server.
umuser	oid	<b>oid</b> in <a href="#">PG_AUTHID</a>	OID of the local role being mapped ( <b>0</b> if the user mapping is public).
username	name	-	Name of the local user to be mapped.
umoptions	text[]	-	User mapping specific options. If the current user is the owner of the foreign server, the value is <b>keyword=value strings</b> . Otherwise, the value is <b>NULL</b> .

### 12.3.7.22 ROLE\_ROLE\_PRIVS

ROLE\_ROLE\_PRIVS displays roles granted to other roles and provides only information about the roles that the user has access to. By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-224** ROLE\_ROLE\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.23 ROLE\_SYS\_PRIVS

ROLE\_SYS\_PRIVS displays information about system privileges granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-225** ROLE\_SYS\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
privilege	character varying(40)	System permissions or ANY permissions of the user. <ul style="list-style-type: none"> <li>• System permissions include rolsuper, rolinherit, rolcreatorole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin.</li> <li>• For details about the value of the ANY permissions, see <a href="#">Table 7-243</a>.</li> </ul>

Name	Type	Description
admin_option	character varying(3)	Specifies whether the grant contains the <b>ADMIN</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.7.24 ROLE\_TAB\_PRIVS

ROLE\_TAB\_PRIVS displays information about object permissions granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG\_CATALOG and SYS schemas.

**Table 12-226** ROLE\_TAB\_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name. Object types include tables, packages, indexes, and sequences.
column_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the <b>GRANT</b> option. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
common	character varying(3)	Not supported. Its value is <b>NULL</b> .
inherited	character varying(3)	Not supported. Its value is <b>NULL</b> .

## 12.3.8 Dynamic Data Masking

### 12.3.8.1 GS\_MASKING

GS\_MASKING displays all configured dynamic masking policies. Only the users with system administrator or security policy administrator permission can access this view.

**Table 12-227** GS\_MASKING columns

Name	Type	Description
polname	name	Name of the masking policy
polenabled	boolean	Specifies whether to enable the masking policy.
maskaction	name	Masking function
labelname	name	Name of the label to which the masking function applies.
masking_object	text	Masking database resource object
filter_name	text	Logical expression of a filter criterion

## 12.3.9 Transparent Encryption

### 12.3.9.1 PG\_TDE\_INFO

PG\_TDE\_INFO displays encryption information of the entire cluster.

**Table 12-228** PG\_TDE\_INFO columns

Name	Type	Description
is_encrypt	boolean	Whether the cluster is an encryption cluster. <ul style="list-style-type: none"><li>● <b>f</b>: Non-encryption cluster</li><li>● <b>t</b>: Encryption cluster</li></ul>
g_tde_algo	text	Encryption algorithm <ul style="list-style-type: none"><li>● SM4-CTR-128</li><li>● AES-CTR-128</li></ul>
remain	text	Reserved

## 12.3.10 DATABASE LINK

### 12.3.10.1 GS\_DB\_LINKS

GS\_DB\_LINKS displays information about DATABASE LINK objects. You can view information about your own DATABASE LINK objects and DATABASE LINK objects at the PUBLIC level.

**Table 12-229** GS\_DB\_LINKS columns

Name	Type	Description
dblinkid	oid	OID of the current DATABASE LINK object.
dlname	name	Name of the current DATABASE LINK object.
downer	oid	Owner ID of the current DATABASE LINK object. If the object owner is <b>public</b> , the value is <b>0</b> .
downername	name	Name of the owner of the current DATABASE LINK object.
options	text[]	Connection information of the current DATABASE LINK object. The value is a character string in the "keyword=value" format.
useroptions	text	User information used by the remote end of the current DATABASE LINK object.
heterogeneous	text	Not supported. Its value is <b>NULL</b> .
protocol	text	Not supported. Its value is <b>NULL</b> .
opencursors	text	Not supported. Its value is <b>NULL</b> .
intransaction	Boolean	Specifies whether the current DATABASE LINK object exists in a transaction.
updatesent	Boolean	Specifies whether the current DATABASE LINK object uses statements for updating data.

### 12.3.10.2 V\$DBLINK

V\$DBLINK displays information about DATABASE LINK objects. You can view information about your own DATABASE LINK objects and DATABASE LINK objects at the PUBLIC level. By default, only administrators can view this view.

 **NOTE**

The data in this view is obtained from [GS\\_DB\\_LINKS](#). This view records only the information about the links that have been used or are being used in the current session. For details about database links, see [DATABASE LINK](#).

**Table 12-230** V\$DBLINK columns

Name	Type	Description
db_link	character varying(128)	Name of the current DATABASE LINK object.
owner_id	numeric	Owner ID of the current DATABASE LINK object. If the owner of the DATABASE LINK object is <b>PUBLIC</b> , the value of <b>owner_id</b> is <b>0</b> .
logged_on	character varying(3)	Not supported. Its value is <b>NULL</b> .
heterogeneous	character varying(3)	Not supported. Its value is <b>NULL</b> .
protocol	character varying(6)	Not supported. Its value is <b>NULL</b> .
open_cursors	numeric	Not supported. Its value is <b>NULL</b> .
in_transaction	character varying(3)	Specifies whether the current DATABASE LINK object exists in a transaction. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
update_sent	character varying(3)	Specifies whether the current DATABASE LINK object uses statements for updating data. <ul style="list-style-type: none"> <li>• <b>YES</b></li> <li>• <b>NO</b></li> </ul>
commit_point_strength	numeric	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .

## 12.3.11 Materialized Views

### 12.3.11.1 GS\_MATVIEWS

GS\_MATVIEWS displays information about each materialized view in the database.

**Table 12-231** GS\_MATVIEWS columns

Name	Type	Reference	Description
schemaname	name	<b>nspname</b> in <b>PG_NAMESPACE</b>	Name of the schema of a materialized view.
matviewname	name	<b>relname</b> in <b>PG_CLASS</b>	Name of a materialized view.
matviewowner	name	<b>rolname</b> in <b>PG_AUTHID</b>	Owner of a materialized view.
tablespace	name	<b>spcname</b> in <b>PG_TABLESPACE</b>	Tablespace name of a materialized view. If the default tablespace of the database is used, the value is null.
hasindexes	Boolean	-	This column is true if a materialized view has (or has recently had) any indexes.
definition	text	-	Definition of a materialized view (a reconstructed SELECT query).

## 12.3.12 Other System Views

### 12.3.12.1 ADM\_ARGUMENTS

ADM\_ARGUMENTS displays parameter information of all stored procedures and functions. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-232** ADM\_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	<i>n</i> th overloaded function of the name.
subprogram_id	numeric	Not supported. The value is <b>NULL</b> .

Name	Type	Description
argument_name	character varying(128)	Parameter name.
position	numeric	Position of a parameter in the parameter list. The value is <b>0</b> for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	The value is fixed at <b>0</b> because only one line is displayed for each parameter.
data_type	character varying(30)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value: <ul style="list-style-type: none"> <li>• <b>Y</b>: yes</li> <li>• <b>N</b>: no</li> </ul>
default_value	text	Not supported. The value is <b>NULL</b> .
default_length	numeric	Not supported. The value is <b>NULL</b> .
in_out	character varying(9)	Input and output attributes of a parameter: <ul style="list-style-type: none"> <li>• <b>IN</b>: input parameter.</li> <li>• <b>OUT</b>: output parameter.</li> <li>• <b>IN_OUT</b>: input and output parameters.</li> <li>• <b>VARIADIC</b>: VARIADIC parameter.</li> </ul>
data_length	numeric	Not supported. The value is <b>NULL</b> .
data_precision	numeric	Not supported. The value is <b>NULL</b> .
data_scale	numeric	Not supported. The value is <b>NULL</b> .
radix	numeric	Radix of a number, which is <b>10</b> when the data type is smallint, integer, bigint, numeric, or float. For other data types, set this column to <b>NULL</b> .
character_set_name	character varying(44)	Not supported. The value is <b>NULL</b> .
type_owner	character varying(128)	Owner of a data type.

Name	Type	Description
type_name	character varying(128)	Parameter type name.
type_subname	character varying(128)	Not supported. The value is <b>NULL</b> .
type_link	character varying(128)	Not supported. The value is <b>NULL</b> .
type_object_type	character varying(7)	Types of types of the <b>type_owner</b> , <b>type_name</b> , and <b>type_subname</b> columns: <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The parameter is of the table type.</li> <li>• <b>VIEW</b>: The parameter is of the view type.</li> <li>• For other data types, the value is <b>NULL</b>.</li> </ul>
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. The value is <b>NULL</b> .
char_used	character varying(1)	Not supported. <ul style="list-style-type: none"> <li>• <b>B</b>: varchar, nvarchar2, bpchar, and char.</li> <li>• <b>NULL</b>: other types.</li> </ul>
origin_con_id	character varying(256)	Not supported. The value is <b>0</b> .

### 12.3.12.2 ADM\_COL\_COMMENTS

ADM\_COL\_COMMENTS displays information about table column comments in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-233** ADM\_COL\_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.

Name	Type	Description
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. Set it to <b>0</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.3 ADM\_COLL\_TYPES

ADM\_COLL\_TYPES displays information about all collection types. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-234** ADM\_COLL\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported. Set it to <b>NULL</b> .
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Set it to <b>NULL</b> .
precision	numeric	Not supported. Set it to <b>NULL</b> .
scale	numeric	Not supported. Set it to <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Set it to <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
nulls_stored	character varying(3)	Not supported. Set it to <b>NULL</b> .
char_used	character varying(1)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.4 ADM\_CONS\_COLUMNS

ADM\_CONS\_COLUMNS displays information about constraint columns in database tables. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-235** ADM\_CONS\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
position	smallint	Position of a column in a table.

### 12.3.12.5 ADM\_CONSTRAINTS

ADM\_CONSTRAINTS displays information about table constraints in database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-236** ADM\_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.

Name	Type	Description
constraint_type	text	Constraint type. <ul style="list-style-type: none"> <li>• <b>c</b>: check constraint.</li> <li>• <b>f</b>: foreign key constraint.</li> <li>• <b>p</b>: primary key constraint.</li> <li>• <b>u</b>: unique constraint.</li> </ul>
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
status	character varying(8)	Constraint status.
generated	character varying(14)	Not supported. Its value is <b>NULL</b> .
search_condition	text	Not supported. Its value is <b>NULL</b> .
search_condition_v c	character varying(4000)	Not supported. Its value is <b>NULL</b> .
r_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
r_constraint_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
delete_rule	character varying(9)	Not supported. Its value is <b>NULL</b> .
con_deferrable	character varying(14)	Not supported. Its value is <b>NULL</b> .
deferred	character varying(9)	Not supported. Its value is <b>NULL</b> .
validated	character varying(13)	Not supported. Its value is <b>NULL</b> .
bad	character varying(3)	Not supported. Its value is <b>NULL</b> .
rely	character varying(4)	Not supported. Its value is <b>NULL</b> .
last_change	date	Not supported. Its value is <b>NULL</b> .
invalid	character varying(7)	Not supported. Its value is <b>NULL</b> .
view_related	character varying(14)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.6 ADM\_DATA\_FILES

ADM\_DATA\_FILES displays the description of database files. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-237** ADM\_DATA\_FILES columns

Name	Type	Description
tablespace_name	name	Name of the tablespace to which a file belongs.
bytes	double precision	Length of the file in bytes.

### 12.3.12.7 ADM\_DEPENDENCIES

ADM\_DEPENDENCIES displays the dependency relationships between types, tables, views, stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-238** ADM\_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
dependency_type	character varying(4)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.8 ADM\_DIRECTORIES

ADM\_DIRECTORIES stores information about all directory objects in the database. By default, only the system administrator can access this view. Common users can

access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-239** ADM\_DIRECTORIES columns

Name	Type	Description
owner	oid	Directory owner.
directory_name	name	Directory name.
directory_path	text	OS path name of a directory.
origin_con_id	character varying(256)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.9 ADM\_HIST\_SNAPSHOT

ADM\_HIST\_SNAPSHOT records the WDR snapshot data stored in the current system. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas. This view can be accessed only when the GUC parameter **enable\_wdr\_snapshot** is set to **on**. To access the PG\_CATALOG.ADM\_HIST\_SNAPSHOT and SYS.ADM\_HIST\_SNAPSHOT views, you must have the permission to access the **snapshot schema**, **snapshot**, and **tables\_snap\_timestamp** tables.

**Table 12-240** ADM\_HIST\_SNAPSHOT columns

Name	Type	Description
snap_id	bigint	Unique snapshot ID.
dbid	oid	Database ID of the snapshot.
instance_number	oid	Not supported. The value is the same as that of <b>DBID</b> .
startup_time	timestamp(3) without time zone	Instance start time.
begin_interval_time	timestamp without time zone	Start time of the snapshot interval (the end time of the last snapshot).
end_interval_time	timestamp without time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot).
flush_elapsed	interval	Amount of time to perform the snapshot.

Name	Type	Description
snap_level	numeric	Not supported. Its value is <b>NULL</b> .
error_count	numeric	Not supported. Its value is <b>NULL</b> .
snap_flag	numeric	Not supported. Its value is <b>NULL</b> .
snap_timezone	interval day to second(0)	Time offset between the snapshot time zone and the coordinated universal time (UTC).
begin_interval_time_tz	timestamp with time zone	Start time of the snapshot interval with the time zone (end time of the last snapshot).
end_interval_time_tz	timestamp with time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot), with the time zone.
con_id	numeric	Not supported. The value is <b>0</b> .

### 12.3.12.10 ADM\_HIST\_SQL\_PLAN

ADM\_HIST\_SQL\_PLAN displays plan information collected by the current user by running the EXPLAIN PLAN statement. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-241** ADM\_HIST\_SQL\_PLAN columns

Name	Type	Description
dbid	text	Database ID
sql_id	character varying(30)	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by <b>NOT NULL</b> .
plan_hash_value	bigint	Query ID.
id	integer	Number assigned to each step in the execution plan
operation	character varying(30)	Operation description
options	character varying(255)	Operation action
object_node	character varying(128)	Not supported. Set it to <b>NULL</b> .
object#	numeric	Not supported. Set it to <b>NULL</b> .
object_owner	name	Object number of a table or an index

Name	Type	Description
object_name	name	Name of an operated object. It is defined by users.
object_alias	character varying(261)	Not supported. Set it to <b>NULL</b> .
object_type	character varying(30)	Object type
optimizer	character varying(20)	Not supported. Set it to <b>NULL</b> .
parent_id	numeric	Not supported. Set it to <b>NULL</b> .
depth	numeric	Not supported. Set it to <b>NULL</b> .
position	numeric	Not supported. Set it to <b>NULL</b> .
search_columns	numeric	Not supported. Set it to <b>NULL</b> .
cost	double precision	Execution cost estimated by the optimizer for an operator
cardinality	double precision	Cardinality estimated by the optimizer for an operator to access table records.
bytes	numeric	Not supported. Set it to <b>NULL</b> .
other_tag	character varying(35)	Not supported. Set it to <b>NULL</b> .
partition_start	character varying(64)	Not supported. Set it to <b>NULL</b> .
partition_stop	character varying(64)	Not supported. Set it to <b>NULL</b> .
partition_id	numeric	Not supported. Set it to <b>NULL</b> .
other	character varying(4000)	Not supported. Set it to <b>NULL</b> .
distribution	character varying(20)	Not supported. Set it to <b>NULL</b> .
cpu_cost	numeric	Not supported. Set it to <b>NULL</b> .
io_cost	numeric	Not supported. Set it to <b>NULL</b> .
temp_space	numeric	Not supported. Set it to <b>NULL</b> .
access_predicates	character varying(4000)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
filter_predicates	character varying(4000)	Not supported. Set it to <b>NULL</b> .
projection	character varying(4000)	Returned column information
time	numeric	Not supported. Set it to <b>NULL</b> .
qblock_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
remarks	character varying(4000)	Not supported. Set it to <b>NULL</b> .
timestamp	date	Not supported. Set it to <b>NULL</b> .
other_xml	clob	Not supported. Set it to <b>NULL</b> .
con_dbid	text	Database ID of a container, which is currently set to a value the same as that of <b>dbid</b> .
con_id	numeric	Container ID. Containers are not supported and this field is set to <b>0</b> .

### 12.3.12.11 ADM\_HIST\_SQLSTAT

ADM\_HIST\_SQLSTAT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable\_wdr\_snapshot** is set to **on**), users can view the data in this view.

**Table 12-242** ADM\_HIST\_SQLSTAT columns

Name	Type	Description
instance_number	integer	Instance ID of a snapshot.
plan_hash_value	integer	ID of the normalized SQL statement.
module	integer	Name of the module that is executing when the SQL statement is first parsed.
apwait_delta	integer	Delta value of the application wait time.
sql_id	bigint	Query ID.

Name	Type	Description
snap_id	bigint	Unique snapshot ID.
elapsed_time_delta	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time_delta	bigint	CPU time (unit: $\mu$ s).
executions_delta	bigint	Increment in the number of executions that have occurred on this object since it was brought into the cache.
iowait_delta	bigint	I/O time (unit: $\mu$ s).
rows_processed_delta	bigint	Number of rows in the result set returned by the SELECT statement.
parsing_schema_name	character varying	Not supported. Its value is <b>NULL</b> .
disk_reads_delta	bigint	Not supported. Its value is <b>NULL</b> .
buffer_reads_delta	bigint	Not supported. Its value is <b>NULL</b> .
clwait_delta	bigint	Not supported. Its value is <b>NULL</b> .

### 12.3.12.12 ADM\_HIST\_SQLTEXT

ADM\_HIST\_SQLTEXT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable\_wdr\_snapshot** is set to **on**), users can view the data in this view.

**Table 12-243** ADM\_HIST\_SQLTEXT columns

Name	Type	Description
dbid	integer	Database ID.
sql_id	bigint	Query ID.
sql_text	clob	Text corresponding to the query.
command_type	integer	Not supported. Set it to <b>0</b> .
con_dbid	integer	Database ID of a container, which is currently set to a value the same as that of <b>dbid</b> .

Name	Type	Description
con_id	integer	Container ID. Containers are not supported and this field is set to <b>0</b> .

### 12.3.12.13 ADM\_IND\_COLUMNS

ADM\_IND\_COLUMNS displays information about index fields in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-244** ADM\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Column length. For the variable-length type, its value is <b>NULL</b> .
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying(4)	Columns sorted in descending ( <b>DESC</b> ) or ascending ( <b>ASC</b> ) order.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.12.14 ADM\_IND\_EXPRESSIONS

ADM\_IND\_EXPRESSIONS displays information about expression indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-245** ADM\_IND\_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

### 12.3.12.15 ADM\_INDEXES

ADM\_INDEXES displays all indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-246** ADM\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Specifies whether the index is unique. <ul style="list-style-type: none"> <li>• <b>UNIQUE</b>: unique index.</li> <li>• <b>NONUNIQUE</b>: non-unique index.</li> </ul>
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. <ul style="list-style-type: none"> <li>• <b>Yes</b>: The index has the property of a partitioned table.</li> <li>• <b>No</b>: The index does not have the property of a partitioned table.</li> </ul>

Name	Type	Description
generated	character varying(1)	Specifies whether the name of the index is generated by the system. <ul style="list-style-type: none"> <li>• <b>y</b>: The index name is generated by the system.</li> <li>• <b>n</b>: The index name is not generated by the system.</li> </ul>
index_type	character varying(27)	Index type <ul style="list-style-type: none"> <li>• <b>NORMAL</b>: Index attributes are simple references, and the expression tree is empty.</li> <li>• <b>FUNCTION-BASED NORMAL</b>: Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of the index object
table_type	character(11)	Type of an index object <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The index object is of the table type.</li> </ul>
tablespace_name	character varying(30)	Name of the tablespace that contains the index
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pk ey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. <ul style="list-style-type: none"> <li>• <b>VISIBLE</b>: The index is visible to the optimizer.</li> <li>• <b>INVISIBLE</b>: The index is visible to the optimizer.</li> </ul>
domidx_manage ment	character varying(14)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.16 ADM\_OBJECTS

ADM\_OBJECTS displays all database objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-247** ADM\_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	OID of the object.
object_type	name	Object type. For example, table, schema, and index.
namespace	oid	Namespace containing the object.

Name	Type	Description
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status. <ul style="list-style-type: none"> <li>● <b>valid</b>: The object is valid.</li> <li>● <b>invalid</b>: The object is invalid.</li> </ul>
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last time when an object was modified.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is <b>NULL</b> .
timestamp	character varying(19)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
sharing	character varying(18)	Not supported. Its value is <b>NULL</b> .
editionable	character varying(1)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
application	character varying(1)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
created_appid	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
modified_appid	numeric	Not supported. Its value is <b>NULL</b> .
created_vsnid	numeric	Not supported. Its value is <b>NULL</b> .
modified_vsnid	numeric	Not supported. Its value is <b>NULL</b> .

**NOTICE**

For details on the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

### 12.3.12.17 ADM\_PROCEDURES

ADM\_PROCEDURES displays information about all stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-248** ADM\_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, trigger, or package.
object_name	character varying(64)	Name of a stored procedure, function, or trigger. This column will be a package name if the object is a function in a package or a stored procedure.
procedure_name	character varying(128)	This column will be the name of a function or stored procedure in a package if <b>object_name</b> is a package name. Otherwise, the column is empty.
object_id	oid	OID of a stored procedure, function, trigger, or package.
subprogram_id	numeric	Location of a function or stored procedure in a package.
overload	character varying(40)	<i>n</i> th overloaded function of the name.
object_type	character varying(13)	Object type.

Name	Type	Description
aggregate	character varying(3)	Specifies whether the function is an aggregate function: <ul style="list-style-type: none"> <li>• <b>YES</b>: yes.</li> <li>• <b>NO</b>: no.</li> </ul>
pipelined	character varying(3)	Not supported. The value is <b>NO</b> .
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. The value is <b>NO</b> .
interface	character varying(3)	Not supported. The value is <b>NO</b> .
deterministic	character varying(3)	Not supported. The value is <b>NO</b> .
authid	character varying(12)	Permission type. <ul style="list-style-type: none"> <li>• <b>DEFINER</b>: The creator permission is used.</li> <li>• <b>CURRENT_USER</b>: The caller permission is used.</li> </ul> This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. The value is <b>0</b> .
polymorphic	character varying(5)	Not supported. Its value is <b>NULL</b> .
argument_number	smallint	Number of input parameters in the stored procedure.

### 12.3.12.18 ADM\_SCHEDULER\_JOB\_ARGS

ADM\_SCHEDULER\_JOB\_ARG displays parameters related to all jobs in the database. By default, only the system administrator can access this view. Common

users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-249** ADM\_SCHEDULER\_JOB\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Set it to <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Set it to <b>NULL</b> .

### 12.3.12.19 ADM\_SCHEDULER\_JOBS

ADM\_SCHEDULER\_JOBS displays information about all DBE\_SCHEDULER scheduler jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-250** ADM\_SCHEDULER\_JOBS columns

Name	Type	Description
owner	name	Owner of a scheduler job.
job_name	text	Name of a scheduler job.
job_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
job_style	text	Action mode of a scheduler job. It is specified during creation. Its value can only be " <b>REGULAR</b> ". If this parameter is not specified, the value is <b>NULL</b> .
job_creator	name	Creator of a scheduler job.
client_id	character varying(65)	Not supported. Its value is <b>NULL</b> .
global_uid	character varying(33)	Not supported. Its value is <b>NULL</b> .
program_owner	character varying(4000)	Owner of a program referenced by a scheduler job.
program_name	text	Name of the program referenced by a scheduler job.
job_type	character varying(16)	Inline program type of a scheduled task. The options are as follows: <ul style="list-style-type: none"> <li>• <b>PLSQL_BLOCK</b>: fast anonymous stored procedure.</li> <li>• <b>STORED_PROCEDURE</b>: stored procedure that is saved.</li> <li>• <b>EXTERNAL_SCRIPT</b>: external script.</li> </ul>
job_action	text	Program content of a scheduler job.
number_of_arguments	text	Number of parameters of a scheduler job.
schedule_owner	character varying(4000)	Not supported. Its value is <b>NULL</b> .
schedule_name	text	Name of the schedule referenced by a scheduler job.
schedule_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
start_date	timestamp without time zone	Start time of a scheduler job.

Name	Type	Description
repeat_interval	text	Period of a scheduler job.
event_queue_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
event_queue_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
event_queue_agent	character varying(523)	Not supported. Its value is <b>NULL</b> .
event_condition	character varying(4000)	Not supported. Its value is <b>NULL</b> .
event_rule	character varying(261)	Not supported. Its value is <b>NULL</b> .
file_watcher_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .
file_watcher_name	character varying(261)	Not supported. Its value is <b>NULL</b> .
end_date	timestamp without time zone	End time of a scheduler job.
job_class	text	Name of the scheduler job class to which a scheduler job belongs.
enabled	boolean	Status of a scheduler job.
auto_drop	text	Status of the automatic deletion function of a scheduler job.
restart_on_recovery	character varying(5)	Not supported. Its value is <b>NULL</b> .
restart_on_failure	character varying(5)	Not supported. Its value is <b>NULL</b> .
state	"char"	Status of a scheduler job.
job_priority	numeric	Not supported. Its value is <b>NULL</b> .
run_count	numeric	Not supported. Its value is <b>NULL</b> .
uptime_run_count	numeric	Not supported. Its value is <b>NULL</b> .
max_runs	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
failure_count	smallint	Number of scheduler job failures.
uptime_failure_count	numeric	Not supported. Its value is <b>NULL</b> .
max_failures	numeric	Maximum number of failures allowed before the status of a scheduler job is marked as broken.
retry_count	numeric	Not supported. Its value is <b>NULL</b> .
last_start_date	timestamp without time zone	Last time when a scheduler job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduler job.
next_run_date	timestamp without time zone	Next execution time of a scheduler job.
schedule_limit	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
max_run_duration	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
logging_level	character varying(11)	Not supported. Its value is <b>NULL</b> .
store_output	character varying(5)	Specifies whether to store the output information of all scheduler jobs.
stop_on_window_close	character varying(5)	Not supported. Its value is <b>NULL</b> .
instance_stickiness	character varying(5)	Not supported. Its value is <b>NULL</b> .
raise_events	character varying(4000)	Not supported. Its value is <b>NULL</b> .
system	character varying(5)	Not supported. Its value is <b>NULL</b> .
job_weight	numeric	Not supported. Its value is <b>NULL</b> .
nls_env	character varying(4000)	Not supported. Its value is <b>NULL</b> .
source	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
number_of_destinations	numeric	Not supported. Its value is <b>NULL</b> .
destination_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .
destination	text	Target name of a scheduler job. If the value of <b>destination</b> is <b>CCN</b> , the task is a CCN job. For details, see <a href="#">DBE_SCHEDULER</a> .
credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
credential_name	text	Certificate name of a scheduler job.
instance_id	oid	OID of the current database.
deferred_drop	character varying(5)	Not supported. Its value is <b>NULL</b> .
allow_runs_in_restricted_mode	character varying(5)	Not supported. Its value is <b>NULL</b> .
comments	text	Comments of a scheduler job.
flags	numeric	Not supported. Its value is <b>NULL</b> .
restartable	character varying(5)	Not supported. Its value is <b>NULL</b> .
has_constraints	character varying(5)	Not supported. Its value is <b>NULL</b> .
connect_credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
connect_credential_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
fail_on_script_error	character varying(5)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.20 ADM\_SCHEDULER\_PROGRAM\_ARGS

ADM\_SCHEDULER\_PROGRAM\_ARG displays parameters related to all programs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-251** ADM\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be user-defined.
metadata_attribute	character varying(19)	Not supported. Its value is <b>NULL</b> .
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Its value is <b>NULL</b> .
out_argument	character varying(5)	Reserved column. The value is <b>NULL</b> .

### 12.3.12.21 ADM\_SCHEDULER\_PROGRAMS

ADM\_SCHEDULER\_PROGRAMS displays information about all programs that can be scheduled in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-252** ADM\_SCHEDULER\_PROGRAMS columns

Name	Type	Description
owner	name	Owner of a scheduler program.
program_name	text	Name of a scheduler program.

Name	Type	Description
program_type	character varying(16)	Type of a scheduler program. The options are as follows: <ul style="list-style-type: none"> <li>• <b>PLSQL_BLOCK</b>: fast anonymous stored procedure.</li> <li>• <b>STORED_PROCEDURE</b>: stored procedure that is saved.</li> <li>• <b>EXTERNAL_SCRIPT</b>: external script.</li> </ul>
program_action	text	Action performed by a scheduler program.
number_of_arguments	numeric	Number of scheduler program parameters.
enabled	character varying(5)	Specifies whether a scheduler program is enabled.
comments	text	Comments of a scheduler program.
detached	character varying(5)	Not supported. Its value is <b>NULL</b> .
schedule_limit	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
priority	numeric	Not supported. Its value is <b>NULL</b> .
weight	numeric	Not supported. Its value is <b>NULL</b> .
max_runs	numeric	Not supported. Its value is <b>NULL</b> .
max_failures	numeric	Not supported. Its value is <b>NULL</b> .
max_run_duration	interval day to second(0)	Not supported. Its value is <b>NULL</b> .
has_constraints	character varying(5)	Not supported. Its value is <b>NULL</b> .
nls_env	character varying(4000)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.22 ADM\_SCHEDULER\_RUNNING\_JOBS

ADM\_SCHEDULER\_RUNNING\_JOBS displays information about all **DBE\_SCHEDULER** jobs that are being executed in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-253** ADM\_SCHEDULER\_RUNNING\_JOBS columns

Name	Type	Description
owner	character varying(128)	Owner of a scheduler job.
job_name	character varying(128)	Name of a scheduler job.
job_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
job_style	character varying(17)	Action mode of a scheduler job. It is specified during creation. Its value can only be <b>"REGULAR"</b> . If this parameter is not specified, the value is <b>NULL</b> .
detached	character varying(5)	Not supported. Its value is <b>NULL</b> .
session_id	numeric	ID of the session that executes a scheduler job
slave_process_id	numeric	Not supported. Its value is <b>NULL</b> .
slave_os_process_id	character varying(12)	ID of the process that executes a scheduler job
running_instance	numeric	Not supported. Its value is <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Its value is <b>NULL</b> .
elapsed_time	interval day to second(2)	Execution duration of a scheduler job
cpu_used	interval day to second(2)	Not supported. Its value is <b>NULL</b> .
destination_owner	character varying(261)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
destination	character varying(261)	Target name of a scheduler job. If the value of <b>destination</b> is <b>CCN</b> , the task is a CCN job. For details, see <a href="#">DBE_SCHEDULER</a> .
credential_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
credential_name	character varying(128)	Certificate name of a scheduler job.
log_id	numeric	Not supported. Its value is <b>NULL</b> .

### 12.3.12.23 ADM\_SEGMENTS

ADM\_SEGMENTS displays the storage space allocated to all segments in the database. It exists in the PG\_CATALOG and SYS schemas. Only the system administrator can access this view. The information cannot be obtained from the system catalog. The view is empty.

**Table 12-254** ADM\_SEGMENTS columns

Name	Type	Description
owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
segment_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
partition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
segment_type	character varying(18)	Not supported. Set it to <b>NULL</b> .
segment_subtype	character varying(10)	Not supported. Set it to <b>NULL</b> .
tablespace_name	character varying(30)	Not supported. Set it to <b>NULL</b> .
header_file	numeric	Not supported. Set it to <b>NULL</b> .
header_block	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
bytes	numeric	Not supported. Set it to <b>NULL</b> .
blocks	numeric	Not supported. Set it to <b>NULL</b> .
extents	numeric	Not supported. Set it to <b>NULL</b> .
initial_extent	numeric	Not supported. Set it to <b>NULL</b> .
next_extent	numeric	Not supported. Set it to <b>NULL</b> .
min_extents	numeric	Not supported. Set it to <b>NULL</b> .
max_extents	numeric	Not supported. Set it to <b>NULL</b> .
max_size	numeric	Not supported. Set it to <b>NULL</b> .
retention	character varying(7)	Not supported. Set it to <b>NULL</b> .
minretention	numeric	Not supported. Set it to <b>NULL</b> .
pct_increase	numeric	Not supported. Set it to <b>NULL</b> .
freelists	numeric	Not supported. Set it to <b>NULL</b> .
freelist_groups	numeric	Not supported. Set it to <b>NULL</b> .
relative_fno	numeric	Not supported. Set it to <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Set it to <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Set it to <b>NULL</b> .
inmemory	character varying(8)	Not supported. Set it to <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
inmemory_distribute	character varying(15)	Not supported. Set it to <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Set it to <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Set it to <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.24 ADM\_SEQUENCES

ADM\_SEQUENCES displays information about all sequences in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-255** ADM\_SEQUENCES columns

Name	Type	Description
sequence_owner	character varying(64)	Owner of a sequence.
sequence_name	character varying(64)	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Increment of a sequence.
last_number	int16	Value of the previous sequence.
cache_size	int16	Size of the sequence disk cache.
cycle_flag	character(1)	Specifies whether a sequence is a cycle sequence. The value can be <b>Y</b> or <b>N</b> . <ul style="list-style-type: none"> <li><b>Y</b>: It is a cyclic sequence.</li> <li><b>N</b>: It is not a cyclic sequence.</li> </ul>

### 12.3.12.25 ADM\_SOURCE

ADM\_SOURCE displays the definition information about all stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-256** ADM\_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. Its value can be <b>function, procedure, or trigger</b> .
line	numeric	Number of the line in the definition information.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. The value is <b>0</b> .

### 12.3.12.26 ADM\_SYNONYMS

ADM\_SYNONYMS displays all synonyms in the database. This view is accessible only to system administrators. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-257** ADM\_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym The owner of the PUBLIC synonym is PUBLIC.
schema_name	text	Name of the schema to which a synonym belongs. The name of the schema to which the PUBLIC synonym belongs is NULL.
synonym_name	text	Synonym name

Name	Type	Description
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

### 12.3.12.27 ADM\_TAB\_COL\_STATISTICS

ADM\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from ADM\_TAB\_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-258** ADM\_TAB\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.

Name	Type	Description
density	numeric	<ul style="list-style-type: none"> <li>If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span fewer than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li> <li>If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <b>1/NUM_DISTINCT</b>.</li> </ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. <ul style="list-style-type: none"> <li><b>NONE</b>: no histogram.</li> <li><b>FREQUENCY</b>: frequency histogram.</li> <li><b>EQUI-WIDTH</b>: equal-width histogram.</li> </ul>
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is <b>SHARED</b> (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.28 ADM\_TAB\_COLS

ADM\_TAB\_COLS displays information about table and view columns. Each column of each table and view in the database has a row of data in ADM\_TAB\_COLS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas. The number of rows displayed in this view is the same as that in the ADM\_TAB\_COLUMNS. Only columns are different.

**Table 12-259** ADM\_TAB\_COLS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(128)	Name of a table or view.
column_name	character varying(128)	Column name.
data_type	character varying(128)	Data type of a column, which can be a user-defined data type.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	numeric	Length of a column, in bytes.
data_precision	numeric	Precision of the data type. It is valid for the numeric data type and <b>NULL</b> for other types.
data_scale	numeric	Number of decimal places. It is valid for the numeric data type and <b>0</b> for other data types.
nullable	character varying(1)	Specifies whether the column can be null. For primary key constraints and NOT NULL constraints, the value is <b>n</b> .
column_id	numeric	Sequence number of a column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.

Name	Type	Description
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. The value is <b>NO</b> .
user_stats	character varying(3)	Not supported. The value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in bytes) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported currently. <ul style="list-style-type: none"> <li>• <b>B</b>: varchar, nvarchar2, bpchar, and char.</li> <li>• <b>NULL</b>: other types.</li> </ul>
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. The value is <b>YES</b> .
hidden_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
virtual_column	character varying	Specifies whether a column is a virtual column (a generated column). <ul style="list-style-type: none"> <li>• <b>YES</b>: yes.</li> <li>• <b>NO</b>: no.</li> </ul>
segment_column_id	numeric	Not supported. Its value is <b>NULL</b> .
internal_column_id	numeric	Internal sequence number of a column. The value is the same as that of <b>COLUMN_ID</b> .

Name	Type	Description
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
qualified_col_name	character varying(64)	Qualified column name, which is the same as <b>COLUMN_NAME</b> .
user_generated	character varying(3)	Not supported. The value is <b>YES</b> .
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
collated_column_id	numeric	Not supported. Its value is <b>NULL</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.29 ADM\_TAB\_COLUMNS

ADM\_TAB\_COLUMNS displays information about the columns of tables and views. Each column of each table and view in the database has a row of data in ADM\_TAB\_COLUMNS. By default, only the system administrator can access this

view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-260** ADM\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. It is valid for the numeric data type and <b>NULL</b> for other types.
data_scale	integer	Number of decimal places. It is valid for the numeric data type and <b>0</b> for other data types.
nullable	bpchar	Specifies whether the column can be null. Value range: <ul style="list-style-type: none"> <li><b>y</b>: yes.</li> <li><b>n</b>: no. For primary key constraints and non-null constraints, the value is <b>n</b>.</li> </ul>
column_id	integer	Sequence number of a column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes. It is null if no default value left.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.

Name	Type	Description
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. The value is <b>NO</b> .
user_stats	character varying(3)	Not supported. The value is <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in the unit of bytes) which is valid only for varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported currently. <ul style="list-style-type: none"> <li>• <b>B</b>: varchar, nvarchar2, bpchar, and char.</li> <li>• <b>NULL</b>: other types.</li> </ul>
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. The value is <b>YES</b> .
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.30 ADM\_TAB\_COMMENTS

ADM\_TAB\_COMMENTS displays comments about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-261** ADM\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of a table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

### 12.3.12.31 ADM\_TAB\_HISTOGRAMS

ADM\_TAB\_HISTOGRAMS displays the histogram information about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-262** ADM\_TAB\_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Set it to <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Set it to <b>NULL</b> .
endpoint_repeat_count	numeric	Not supported. Set it to <b>NULL</b> .
scope	character varying(7)	Not supported. Set it to <b>SHARED</b> .

### 12.3.12.32 ADM\_TAB\_STATISTICS

ADM\_TAB\_STATISTICS displays optimizer statistics for all tables in the database. This view exists in the PG\_CATALOG and SYS schemas. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

**Table 12-263** ADM\_TAB\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
partition_position	numeric	Not supported. Set it to <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
subpartition_position	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
object_type	character varying(12)	Object type. The options are as follows: <ul style="list-style-type: none"> <li>• <b>TABLE</b></li> <li>• <b>PARTITION</b></li> <li>• <b>SUBPARTITION</b></li> </ul>
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. Set it to <b>NULL</b> .
empty_blocks	numeric	Not supported. Set it to <b>NULL</b> .
avg_space	numeric	Not supported. Set it to <b>NULL</b> .
chain_cnt	numeric	Not supported. Set it to <b>NULL</b> .
avg_row_len	integer	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. Set it to <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Set it to <b>NULL</b> .
avg_cached_blocks	numeric	Not supported. Set it to <b>NULL</b> .
avg_cache_hit_ratio	numeric	Not supported. Set it to <b>NULL</b> .
im_imcu_count	numeric	Not supported. Set it to <b>NULL</b> .
im_block_count	numeric	Not supported. Set it to <b>NULL</b> .
im_stat_update_time	timestamp(6) without time zone	Not supported. Set it to <b>NULL</b> .
scan_rate	numeric	Not supported. Set it to <b>NULL</b> .
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
stattype_locked	character varying(5)	Not supported. Set it to <b>NULL</b> .
stale_stats	character varying(7)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
notes	character varying(25)	Not supported. Set it to <b>NULL</b> .
scope	character varying(7)	Not supported. The default value is <b>SHARED</b> .

### 12.3.12.33 ADM\_TAB\_STATS\_HISTORY

ADM\_TAB\_STATS\_HISTORY provides historical statistics about all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-264** ADM\_TAB\_STATS\_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner
table_name	character varying(128)	Table name
partition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

### 12.3.12.34 ADM\_TABLES

ADM\_TABLES displays all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-265** ADM\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name
tablespace_name	character varying(64)	Tablespace name of the table

Name	Type	Description
dropped	character varying	Specifies whether the current table is deleted. <ul style="list-style-type: none"> <li>• <b>YES</b>: deleted.</li> <li>• <b>NO</b>: not deleted.</li> </ul>
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. <ul style="list-style-type: none"> <li>• <b>VALID</b>: The current table is valid.</li> <li>• <b>UNUSABLE</b>: The current table is unavailable.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. <ul style="list-style-type: none"> <li>• <b>Y</b>: The table is a temporary table.</li> <li>• <b>N</b>: The table is not a temporary table.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions
avg_row_len	integer	Average number of bytes in each row
partitioned	character varying(3)	Specifies whether a table is a partitioned table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table is a partitioned table.</li> <li>• <b>NO</b>: The table is not a partitioned table.</li> </ul>
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.

Name	Type	Description
row_movement	character varying(8)	<p>Specifies whether to allow partition row movement.</p> <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> The partition row movement is allowed.</li> <li>• <b>DISABLED:</b> The partition row movement is not allowed.</li> </ul>
compression	character varying(8)	<p>Specifies whether to enable a table compression.</p> <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> A table compression is enabled.</li> <li>• <b>DISABLED:</b> A table compression is disabled.</li> </ul>
duration	character varying(15)	<p>Time elapsed when a temporary table is processed.</p> <ul style="list-style-type: none"> <li>• <b>NULL:</b> The table is not a temporary table.</li> <li>• <b>sys\$session:</b> The table is a temporary session table.</li> <li>• <b>sys\$transaction:</b> The table is a temporary transaction table.</li> </ul>
logical_replication	character varying(8)	<p>Specifies whether logical replication is enabled for a table.</p> <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> Logical replication is enabled.</li> <li>• <b>DISABLED:</b> Logical replication is disabled.</li> </ul>
external	character varying(3)	<p>Specifies whether the table is a foreign table.</p> <ul style="list-style-type: none"> <li>• <b>YES:</b> The table is a foreign table.</li> <li>• <b>NO:</b> The table is not a foreign table.</li> </ul>

Name	Type	Description
logging	character varying(3)	Specifies whether to record logs for table changes. <ul style="list-style-type: none"> <li>• <b>YES:</b> Logs are recorded for table changes.</li> <li>• <b>NO:</b> Logs are not recorded for table changes.</li> </ul>
default_collation	character varying(100)	Default collation of a table. <ul style="list-style-type: none"> <li>• default</li> </ul>
degree	character varying(10)	Number of instances in a scanned table
table_lock	character varying(8)	Specifies whether to enable a table lock. <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> The table lock is enabled.</li> <li>• <b>DISABLED:</b> The table lock is disabled.</li> </ul>
nested	character varying(3)	Specifies whether a table is a nested table. <ul style="list-style-type: none"> <li>• <b>YES:</b> The table is a nested table.</li> <li>• <b>NO:</b> The table is not a nested table.</li> </ul>
buffer_pool	character varying(7)	Default buffer pool of a table
flash_cache	character varying(7)	Smart flash cache hint in database for a table block
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. <ul style="list-style-type: none"> <li>• <b>ENABLED:</b> The corrupted block is skipped.</li> <li>• <b>DISABLED:</b> The corrupted block is not skipped.</li> </ul>

Name	Type	Description
has_identity	character varying(3)	Specifies whether a table has an identifier column. <ul style="list-style-type: none"> <li>• <b>YES:</b> There is an identifier column.</li> <li>• <b>NO:</b> There is no identifier column.</li> </ul>
segment_created	character varying(3)	Specifies whether a table segment has been created. <ul style="list-style-type: none"> <li>• <b>YES:</b> The table segment has been created.</li> <li>• <b>NO:</b> The table segment is not created.</li> </ul>
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. <ul style="list-style-type: none"> <li>• <b>YES:</b> The modification of the table is monitored.</li> <li>• <b>NO:</b> The modification of the table is not monitored.</li> </ul>
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.35 ADM\_TABLESPACES

ADM\_TABLESPACES displays information about available tablespaces. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas. The logical structure features of the GaussDB database are different from those of the ORA database.

**Table 12-266** ADM\_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name.
block_size	numeric	Not supported. The value is <b>NULL</b> .
initial_extent	numeric	Not supported. The value is <b>NULL</b> .
next_extent	numeric	Not supported. The value is <b>NULL</b> .

Name	Type	Description
min_extents	numeric	Not supported. The value is <b>NULL</b> .
max_extents	numeric	Not supported. The value is <b>NULL</b> .
max_size	numeric	Not supported. The value is <b>NULL</b> .
pct_increase	numeric	Not supported. The value is <b>NULL</b> .
min_extlen	numeric	Not supported. The value is <b>NULL</b> .
contents	character varying(9)	Not supported. The value is <b>NULL</b> .
status	character varying(9)	Not supported. The value is <b>ONLINE</b> .
logging	character varying(9)	Not supported. The value is <b>NULL</b> .
force_logging	character varying(3)	Not supported. The value is <b>NULL</b> .
extent_management	character varying(10)	Not supported. The value is <b>NULL</b> .
allocation_type	character varying(9)	Not supported. The value is <b>NULL</b> .
plugged_in	character varying(3)	Not supported. The value is <b>NULL</b> .
segment_space_management	character varying(6)	Not supported. The value is <b>NULL</b> .
def_tab_compression	character varying(8)	Not supported. The value is <b>NULL</b> .
retention	character varying(11)	Not supported. The value is <b>NULL</b> .
bigfile	character varying(3)	Not supported. The value is <b>NULL</b> .
predicate_evaluation	character varying(7)	Not supported. The value is <b>NULL</b> .
encrypted	character varying(3)	Not supported. The value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. The value is <b>NULL</b> .

Name	Type	Description
def_inmemory	character varying(8)	Not supported. The value is <b>NULL</b> .
def_inmemory_priority	character varying(8)	Not supported. The value is <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. The value is <b>NULL</b> .
def_inmemory_compression	character varying(17)	Not supported. The value is <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. The value is <b>NULL</b> .
shared	character varying(12)	Not supported. The value is <b>NULL</b> .
def_index_compression	character varying(8)	Not supported. The value is <b>NULL</b> .
index_compress_for	character varying(13)	Not supported. The value is <b>NULL</b> .
def_cellmemory	character varying(14)	Not supported. The value is <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. The value is <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. The value is <b>NULL</b> .
lost_write_protect	character varying(7)	Not supported. The value is <b>NULL</b> .
chunk_tablespace	character varying(1)	Not supported. The value is <b>NULL</b> .

### 12.3.12.36 ADM\_TRIGGERS

ADM\_TRIGGERS displays information about triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-267** ADM\_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.

Name	Type	Description
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Time when a trigger is triggered. Value range: <b>before statement, before each row, after statement, after each row, and instead of.</b>
triggering_event	character varying	Event that triggers a trigger. Value range: <b>update, insert, delete, and truncate.</b>
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Defines the basic object of a trigger. Its values can be <b>table</b> and <b>view</b> .
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Its value is <b>NULL</b> .
referencing_name	character varying(422)	Not supported. Its value is <b>referencing new as new old as old</b> .
when_clause	character varying(4000)	Content of the WHEN clause. <b>trigger_body</b> can be executed only when the value is <b>true</b> .
status	character varying(64)	Trigger status. <ul style="list-style-type: none"> <li>● <b>O</b>: The trigger is enabled in origin or local mode.</li> <li>● <b>D</b>: The trigger is disabled.</li> <li>● <b>R</b>: The trigger is enabled in replica mode.</li> <li>● <b>A</b>: The trigger is always enabled.</li> </ul>
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports <b>call</b> .
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported. Its value is <b>NULL</b> .
before_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
before_row	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
after_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
after_statement	character varying(3)	Not supported. Its value is <b>NULL</b> .
instead_of_row	character varying(3)	Not supported. Its value is <b>NULL</b> .
fire_once	character varying(3)	Not supported. Its value is <b>NULL</b> .
apply_server_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.37 ADM\_TYPE\_ATTRS

ADM\_TYPE\_ATTRS displays the attributes of the current database object type. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-268** ADM\_TYPE\_ATTRS columns

Name	Type	Description
owner	oid	Owner of the type
type_name	name	Data type name
attr_name	name	Column name
attr_type_mod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be <b>-1</b> for types that do not need ATTTYPMOD.
attr_type_owner	oid	Owner of an attribute of this type
attr_type_name	name	Data type attribute name Currently, this column records the type name after conversion.

Name	Type	Description
length	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. <ul style="list-style-type: none"> <li>The value <b>-1</b> indicates a "varlena" type (one that has a length word).</li> <li>The value <b>-2</b> indicates a null-terminated C string.</li> </ul>
precision	integer	Precision of the numeric type
scale	integer	Range of the numeric type
character_set_name	character(1)	Character set name of an attribute ( <b>c</b> or <b>n</b> )
attr_no	smallint	Attribute number
inherited	character(1)	Whether the attribute is inherited from the super type ( <b>Y</b> or <b>N</b> )
attr_length	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a <b>varchar</b> column). The raw type is not recorded due to kernel implementation.

### 12.3.12.38 ADM\_TYPES

ADM\_TYPES describes all object types in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-269** ADM\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. The value is <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.

Name	Type	Description
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported. Its value is <b>NULL</b> .
instantiable	character varying(3)	Not supported. Its value is <b>NULL</b> .
persistable	character varying(3)	Not supported. Its value is <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
local_attributes	numeric	Not supported. Its value is <b>NULL</b> .
local_methods	numeric	Not supported. Its value is <b>NULL</b> .
typeid	raw	Not supported. Its value is <b>NULL</b> .

### 12.3.12.39 ADM\_VIEWS

ADM\_VIEWS displays views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-270** ADM\_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of the view.
view_name	character varying(64)	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.

Name	Type	Description
type_text_length	numeric	Not supported. Set it to <b>NULL</b> .
type_text	character varying(4000)	Not supported. Set it to <b>NULL</b> .
oid_text_length	numeric	Not supported. Set it to <b>NULL</b> .
oid_text	character varying(4000)	Not supported. Set it to <b>NULL</b> .
view_type_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
view_type	character varying(128)	Not supported. Set it to <b>NULL</b> .
superview_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
editioning_view	character varying(1)	Not supported. Set it to <b>NULL</b> .
read_only	character varying(1)	Not supported. Set it to <b>NULL</b> .
container_data	character varying(1)	Not supported. Set it to <b>NULL</b> .
bequeath	character varying(12)	Not supported. Set it to <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Set it to <b>NULL</b> .
default_collation	character varying(100)	Not supported. Set it to <b>NULL</b> .
containers_default	character varying(3)	Not supported. Set it to <b>NULL</b> .
container_map	character varying(3)	Not supported. Set it to <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Set it to <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Set it to <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Set it to <b>NULL</b> .
admit_null	character varying(3)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
pdb_local_only	character varying(3)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.40 DB\_ARGUMENTS

DB\_ARGUMENTS displays parameter information about stored procedures and functions accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas. This view is accessible to all users and displays all information accessible to the current user.

**Table 12-271** DB\_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	<i>n</i> th overloaded function of the name.
subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
argument_name	character varying(128)	Parameter name.
position	numeric	Position of the parameter in the parameter list. The value is <b>0</b> for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	The value is fixed at <b>0</b> because only one line is displayed for each parameter.
data_type	character varying(30)	Data type of a parameter.
defaulted	character varying(1)	Specifies whether a parameter has a default value: <ul style="list-style-type: none"> <li>• <b>Y</b>: yes.</li> <li>• <b>N</b>: no</li> </ul>
default_value	text	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
default_length	numeric	Not supported. Its value is <b>NULL</b> .
in_out	character varying(9)	Input and output attributes of a parameter: The options are as follows: <ul style="list-style-type: none"> <li>• <b>IN</b>: input parameter.</li> <li>• <b>OUT</b>: output parameter.</li> <li>• <b>IN_OUT</b>: input and output parameters.</li> <li>• <b>VARIADIC</b>: VARIADIC parameter.</li> </ul>
data_length	numeric	Not supported. Its value is <b>NULL</b> .
data_precision	numeric	Not supported. Its value is <b>NULL</b> .
data_scale	numeric	Not supported. Its value is <b>NULL</b> .
radix	numeric	Radix of a number, which is <b>10</b> when the data type is smallint, integer, bigint, numeric, or float. For other data types, set this column to <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
type_owner	character varying(128)	Owner of a data type.
type_name	character varying(128)	Parameter type name.
type_subname	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_link	character varying(128)	Not supported. Its value is <b>NULL</b> .
type_object_type	character varying(7)	Types of types of the <b>type_owner</b> , <b>type_name</b> , and <b>type_subname</b> columns: <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The parameter is of the table type.</li> <li>• <b>VIEW</b>: The parameter is of the view type.</li> <li>• <b>NULL</b>: The parameter is not of the table or view type.</li> </ul>
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
char_used	character varying(1)	Not supported. <ul style="list-style-type: none"> <li>• <b>B</b>: varchar, nvarchar2, bpchar, and char.</li> <li>• <b>NULL</b>: other types.</li> </ul>
origin_con_id	character varying(256)	Not supported. The value is <b>0</b> .

### 12.3.12.41 DB\_ALL\_TABLES

DB\_ALL\_TABLES displays tables or views accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-272** DB\_ALL\_TABLES columns

Name	Type	Description
owner	name	Owner of a table or view.
table_name	name	Name of a table or view.
tablespace_name	name	Tablespace where a table or view is located.

### 12.3.12.42 DB\_COL\_COMMENTS

DB\_COL\_COMMENTS displays comment information about table columns accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-273** DB\_COL\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.43 DB\_COLL\_TYPES

DB\_COLL\_TYPES displays information about collection types that can be accessed by the current user. By default, they are accessible to all users. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-274** DB\_COLL\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported. Set it to <b>NULL</b> .
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Set it to <b>NULL</b> .
precision	numeric	Not supported. Set it to <b>NULL</b> .
scale	numeric	Not supported. Set it to <b>NULL</b> .
character_set_name	character varying(44)	Not supported. Set it to <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Set it to <b>NULL</b> .
nulls_stored	character varying(3)	Not supported. Set it to <b>NULL</b> .
char_used	character varying(1)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.44 DB\_CONS\_COLUMNS

DB\_CONS\_COLUMNS displays information about constraint columns accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-275** DB\_CONS\_COLUMNS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
owner	character varying(64)	Constraint creator.
position	smallint	Position of a column in a table.

### 12.3.12.45 DB\_CONSTRAINTS

DB\_CONSTRAINTS displays information about constraints accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-276** DB\_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. <ul style="list-style-type: none"><li>● <b>c</b>: check constraint</li><li>● <b>f</b>: foreign key constraint</li><li>● <b>p</b>: primary key constraint</li><li>● <b>u</b>: unique constraint</li></ul>
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
owner	character varying(64)	Constraint creator.

### 12.3.12.46 DB\_DEPENDENCIES

DB\_DEPENDENCIES displays the dependency relationship between types, tables, views, stored procedures, functions, and triggers accessible to the current user. It is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-277** DB\_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
dependency_type	character varying(4)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.47 DB\_IND\_COLUMNS

DB\_IND\_COLUMNS displays all index columns accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-278** DB\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Column length.

Name	Type	Description
char_length	numeric	Length of a column (character type).
descend	character varying(4)	Sorting mode of a column. The options are as follows: <ul style="list-style-type: none"> <li>• <b>DESC</b>: descending order.</li> <li>• <b>ASC</b>: ascending order.</li> </ul>
collated_column_id	numeric	Internal serial number of the language sorting columns.

### 12.3.12.48 DB\_IND\_EXPRESSIONS

DB\_IND\_EXPRESSIONS displays information about expression indexes accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-279** DB\_IND\_EXPRESSIONS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

### 12.3.12.49 DB\_INDEXES

DB\_INDEXES displays information about indexes accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-280** DB\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner

Name	Type	Description
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Specifies whether the index is unique. <ul style="list-style-type: none"> <li>• <b>UNIQUE</b>: unique index.</li> <li>• <b>NONUNIQUE</b>: non-unique index.</li> </ul>
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. <ul style="list-style-type: none"> <li>• <b>Yes</b>: The index has the property of a partitioned table.</li> <li>• <b>No</b>: The index does not have the property of a partitioned table.</li> </ul>
generated	character varying(1)	Specifies whether the name of the index is generated by the system. <ul style="list-style-type: none"> <li>• <b>y</b>: The index name is generated by the system.</li> <li>• <b>n</b>: The index name is not generated by the system.</li> </ul>
index_type	character varying(27)	Index type <ul style="list-style-type: none"> <li>• <b>NORMAL</b>: Index attributes are simple references, and the expression tree is empty.</li> <li>• <b>FUNCTION-BASED NORMAL</b>: Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of the index object

Name	Type	Description
table_type	character(11)	Type of an index object <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The index object is of the table type.</li> </ul>
tablespace_name	character varying(30)	Name of the tablespace that contains the index
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. <ul style="list-style-type: none"> <li>● <b>VISIBLE</b>: The index is visible to the optimizer.</li> <li>● <b>INVISIBLE</b>: The index is visible to the optimizer.</li> </ul>
domidx_management	character varying(14)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.50 DB\_OBJECTS

DB\_OBJECTS displays all database objects accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-281** DB\_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	OID of the object.
object_type	name	Object type.
namespace	oid	ID of the namespace where an object resides.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status. <ul style="list-style-type: none"> <li>• <b>valid</b>: The object is valid.</li> <li>• <b>invalid</b>: The object is invalid.</li> </ul>
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last time when an object was modified.

Name	Type	Description
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is <b>NULL</b> .
timestamp	character varying(19)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
edition_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
sharing	character varying(18)	Not supported. Its value is <b>NULL</b> .
editionable	character varying(1)	Not supported. Its value is <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Its value is <b>NULL</b> .
application	character varying(1)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
created_appid	numeric	Not supported. Its value is <b>NULL</b> .
modified_appid	numeric	Not supported. Its value is <b>NULL</b> .
created_vsnid	numeric	Not supported. Its value is <b>NULL</b> .
modified_vsnid	numeric	Not supported. Its value is <b>NULL</b> .

**NOTICE**

For details on the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

### 12.3.12.51 DB\_PROCEDURES

DB\_PROCEDURES displays information about all stored procedures or functions accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-282** DB\_PROCEDURES columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.

### 12.3.12.52 DB\_SCHEDULER\_JOB\_ARGS

DB\_SCHEDULER\_JOB\_ARG displays the parameters related to the tasks accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-283** DB\_SCHEDULER\_JOB\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Set it to <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Set it to <b>NULL</b> .

### 12.3.12.53 DB\_SCHEDULER\_PROGRAM\_ARGS

DB\_SCHEDULER\_PROGRAM\_ARG displays the parameters related to the programs accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-284** DB\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
metadata_attribute	character varying(19)	Not supported. Set it to <b>NULL</b> .
default_value	character varying(4000)	Default parameter value.
anydata_default_value	character varying(4000)	Not supported. Set it to <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Set it to <b>NULL</b> .

### 12.3.12.54 DB\_SEQUENCES

DB\_SEQUENCES displays all sequences accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-285** DB\_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Value by which a sequence is incremented.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. Value range: <ul style="list-style-type: none"> <li>● <b>Y</b>: It is a cycle sequence.</li> <li>● <b>N</b>: It is not a cycle sequence.</li> </ul>

Name	Type	Description
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. Not supported. Its value is <b>NULL</b> .
cache_size	int16	Size of the sequence disk cache.
last_number	int16	Value of the previous sequence.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. Not supported. Its value is <b>NULL</b> .
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported. Its value is <b>NULL</b> .
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported. Its value is <b>NULL</b> .
session_flag	character varying(1)	Specifies whether a sequence is a private session. Not supported. Its value is <b>NULL</b> .
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. Not supported. Its value is <b>NULL</b> .

### 12.3.12.55 DB\_SOURCE

DB\_SOURCE displays the definition information about stored procedures, functions, and triggers accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-286** DB\_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. The value can be <b>function</b> , <b>procedure</b> , or <b>trigger</b> .
line	numeric	Number of the source line.
text	text	Text source of the storage object.

Name	Type	Description
origin_con_id	character varying(256)	Not supported. Set it to 0.

### 12.3.12.56 DB\_SYNONYMS

DB\_SYNONYMS displays all synonyms accessible to the current user.

**Table 12-287** DB\_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym. The owner of the PUBLIC synonym is PUBLIC.
schema_name	text	Name of the schema to which the synonym belongs. The name of the schema to which the PUBLIC synonym belongs is NULL.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. The value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. The value is 0.

### 12.3.12.57 DB\_TAB\_COL\_STATISTICS

DB\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from DB\_TAB\_COLUMNS. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-288** DB\_TAB\_COL\_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	<ul style="list-style-type: none"><li>If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span fewer than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li><li>If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <math>1/\text{NUM\_DISTINCT}</math>.</li></ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI-WIDTH</b>: equal-width histogram.</li> </ul>
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.58 DB\_TAB\_COLUMNS

DB\_TAB\_COLUMNS displays description information about columns of tables and views accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas. This view is accessible to all users and displays all information accessible to the current user.

**Table 12-289** DB\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.

Name	Type	Description
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. It is valid for the numeric data type and <b>NULL</b> for other types.
data_scale	integer	Number of decimal places. It is valid for the numeric data type and <b>0</b> for other data types.
nullable	bpchar	Specifies whether the column can be null. The options are as follows: <ul style="list-style-type: none"> <li>• <b>y</b>: yes.</li> <li>• <b>n</b>: no. For primary key constraints and non-null constraints, the value is <b>n</b>.</li> </ul>
column_id	integer	Sequence number of a column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Its value is <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. The value is <b>NO</b> .
user_stats	character varying(3)	Not supported. The value is <b>NO</b> .

Name	Type	Description
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in the unit of bytes) which is valid only for varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. The value is <b>YES</b> .
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram.</li> <li>• <b>FREQUENCY</b>: frequency histogram.</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram.</li> </ul>
default_on_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
identity_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Its value is <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Its value is <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.59 DB\_TAB\_COMMENTS

DB\_TAB\_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-290** DB\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a table or view.
table_name	character varying(128)	Name of a table or view.
table_type	character varying(11)	Object type.
comments	text	Comments.
origin_con_id	numeric	Not supported. Set it to <b>0</b> .
schema	character varying(64)	Name of the namespace to which the table belongs.

### 12.3.12.60 DB\_TAB\_HISTOGRAMS

DB\_TAB\_HISTOGRAMS displays histogram statistics about the tables and views accessible to the current user, that is, the distribution of data in each column of the table. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-291** DB\_TAB\_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Set it to <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Set it to <b>NULL</b> .
endpoint_repeat_count	numeric	Not supported. Set it to <b>NULL</b> .
scope	character varying(7)	Not supported. Set it to <b>SHARED</b> .

### 12.3.12.61 DB\_TAB\_MODIFICATIONS

DB\_TAB\_MODIFICATIONS displays statistics about modifications to tables accessible to the current user since the last statistics collection on the tables. Currently, this view displays only the statistics data of tables on which INSERT, DELETE, and UPDATE operations have been performed. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-292** DB\_TAB\_MODIFICATIONS columns

Name	Type	Description
table_owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Partition name.
subpartition_name	character varying(128)	Subpartition name.
inserts	numeric	Approximate number of insertions since the last statistics collection.
updates	numeric	Approximate number of updates since the last statistics collection.
deletes	numeric	Approximate number of deletions since the last statistics collection.
timestamp	date	Last modification time. Currently, the modification time of a partitioned table is not supported. The value is <b>NULL</b> .
truncated	character varying(3)	Not supported. Its value is <b>NULL</b> .
drop_segments	numeric	Not supported. Its value is <b>NULL</b> .
schema_name	character varying(128)	Name of the schema to which the table belongs.

### 12.3.12.62 DB\_TAB\_STATS\_HISTORY

DB\_TAB\_STATS\_HISTORY records the tables, partitions, or subpartitions involved in table statistics and the time when table statistics are collected. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-293** DB\_TAB\_STATS\_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

### 12.3.12.63 DB\_TABLES

DB\_TABLES displays all tables accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-294** DB\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. <ul style="list-style-type: none"> <li>• <b>YES</b>: deleted.</li> <li>• <b>NO</b>: not deleted.</li> </ul>
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. <ul style="list-style-type: none"> <li>• <b>VALID</b>: The current table is valid.</li> <li>• <b>UNUSABLE</b>: The current table is unavailable.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.

Name	Type	Description
temporary	character(1)	Specifies whether the table is a temporary table. <ul style="list-style-type: none"> <li>● <b>Y</b>: The table is a temporary table.</li> <li>● <b>N</b>: The table is not a temporary table.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table. <ul style="list-style-type: none"> <li>● <b>YES</b>: The table is a partitioned table.</li> <li>● <b>NO</b>: The table is not a partitioned table.</li> </ul>
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: The partition row movement is allowed.</li> <li>● <b>DISABLED</b>: The partition row movement is not allowed.</li> </ul>
compression	character varying(8)	Specifies whether to enable a table compression. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: A table compression is enabled.</li> <li>● <b>DISABLED</b>: A table compression is disabled.</li> </ul>

Name	Type	Description
duration	character varying(15)	Time elapsed when a temporary table is processed. <ul style="list-style-type: none"> <li>• <b>NULL</b>: The table is not a temporary table.</li> <li>• <b>sys\$session</b>: The table is a temporary session table.</li> <li>• <b>sys\$transaction</b>: The table is a temporary transaction table.</li> </ul>
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. <ul style="list-style-type: none"> <li>• <b>ENABLED</b>: Logical replication is enabled.</li> <li>• <b>DISABLED</b>: Logical replication is disabled.</li> </ul>
external	character varying(3)	Specifies whether the table is a foreign table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table is a foreign table.</li> <li>• <b>NO</b>: The table is not a foreign table.</li> </ul>
logging	character varying(3)	Specifies whether to record logs for table changes. <ul style="list-style-type: none"> <li>• <b>YES</b>: Logs are recorded for table changes.</li> <li>• <b>NO</b>: Logs are not recorded for table changes.</li> </ul>
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. <ul style="list-style-type: none"> <li>• <b>ENABLED</b>: The table lock is enabled.</li> <li>• <b>DISABLED</b>: The table lock is disabled.</li> </ul>

Name	Type	Description
nested	character varying(3)	Specifies whether a table is a nested table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table is a nested table.</li> <li>• <b>NO</b>: The table is not a nested table.</li> </ul>
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. <ul style="list-style-type: none"> <li>• <b>ENABLED</b>: The corrupted block is skipped.</li> <li>• <b>DISABLED</b>: The corrupted block is not skipped.</li> </ul>
has_identity	character varying(3)	Specifies whether a table has an identifier column. <ul style="list-style-type: none"> <li>• <b>YES</b>: There is an identifier column.</li> <li>• <b>NO</b>: There is no identifier column.</li> </ul>
segment_created	character varying(3)	Specifies whether a table segment has been created. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table segment has been created.</li> <li>• <b>NO</b>: The table segment is not created.</li> </ul>
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The modification of the table is monitored.</li> <li>• <b>NO</b>: The modification of the table is not monitored.</li> </ul>
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .
result_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
clustering	character varying(3)	Not supported. Its value is <b>NULL</b> .
activity_tracking	character varying(23)	Not supported. Its value is <b>NULL</b> .
dml_timestamp	character varying(25)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
duplicated	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
hybrid	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
container_map_object	character varying(3)	Not supported. Its value is <b>NULL</b> .

has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_link_dml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
object_id_type	character varying(16)	Not supported. Its value is <b>NULL</b> .
table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.64 DB\_TRIGGERS

DB\_TRIGGERS displays information about triggers accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-295** DB\_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name.
table_name	character varying(64)	Relational table name.
table_owner	character varying(64)	Role name.
status	character varying(64)	Trigger status. <ul style="list-style-type: none"> <li>• <b>O</b>: The trigger is enabled in origin or local mode.</li> <li>• <b>D</b>: The trigger is disabled.</li> <li>• <b>R</b>: The trigger is enabled in replica mode.</li> <li>• <b>A</b>: The trigger is always enabled.</li> </ul>

### 12.3.12.65 DB\_TYPES

DB\_TYPES displays all object types accessible to the current user. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-296** DB\_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. The value is <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported. Its value is <b>NULL</b> .
instantiable	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
persistable	character varying(3)	Not supported. Its value is <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
local_attributes	numeric	Not supported. Its value is <b>NULL</b> .
local_methods	numeric	Not supported. Its value is <b>NULL</b> .
typeid	raw	Not supported. Its value is <b>NULL</b> .

### 12.3.12.66 DB\_VIEWS

DB\_VIEWS displays the description about all views accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-297** DB\_VIEWS columns

Name	Type	Description
owner	name	Owner of the view.
view_name	name	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.
type_text_length	numeric	Not supported. Its value is <b>NULL</b> .
type_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .
oid_text_length	numeric	Not supported. Its value is <b>NULL</b> .
oid_text	character varying(4000)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
view_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
view_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
superview_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
editioning_view	character varying(1)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(1)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(1)	Not supported. Its value is <b>NULL</b> .
bequeath	character varying(12)	Not supported. Its value is <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Its value is <b>NULL</b> .
default_collation	character varying(100)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
pdb_local_only	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.67 DICT

DICT displays the description of data dictionary tables and system views in the database. This view exists in the PG\_CATALOG and SYS schemas and all users can access this view.

**Table 12-298** DICT columns

Name	Type	Description
table_name	character varying(64)	Object name.
comments	character varying(4000)	Comment on an object.

### 12.3.12.68 DICTIONARY

DICTIONARY displays the description of data dictionary tables and system views in the database. This view exists in the PG\_CATALOG and SYS schemas and all users can access this view.

**Table 12-299** DICTIONARY columns

Name	Type	Description
table_name	character varying(64)	Object name.
comments	character varying(4000)	Comment on an object.

### 12.3.12.69 DUAL

DUAL is automatically created by the database based on the data dictionary and is used to save expression calculation results. It is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-300** DUAL columns

Name	Type	Description
DUMMY	text	Expression calculation result.

### 12.3.12.70 DV\_SESSIONS

DV\_SESSIONS displays information about all active backend threads. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

**Table 12-301** DV\_SESSIONS columns

Name	Type	Description
sid	bigint	OID of the active backend thread of the current session.
serial#	integer	Sequence number of the active backend thread, which is <b>0</b> in GaussDB.
user#	oid	OID of the user that has logged in to the backend thread. The OID is <b>0</b> if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend process. <b>username</b> is null if the backend thread is a global auxiliary thread. <b>application_name</b> can be identified by associating with <b>pg_stat_get_activity()</b> . Example: SELECT s.*,a.application_name FROM DV_SESSIONS AS s LEFT JOIN pg_stat_get_activity(NULL) AS a ON s.sid=a.sessionid;

### 12.3.12.71 DV\_SESSION\_LONGOPS

DV\_SESSION\_LONGOPS displays the progress of ongoing operations. Users can access this view only after being authorized.

**Table 12-302** DV\_SESSION\_LONGOPS columns

Name	Type	Description
sid	bigint	OID of the running backend thread.
serial#	integer	Sequence number of the running backend thread, which is <b>0</b> in GaussDB.
sofar	integer	Completed workload, which is empty in GaussDB
totalwork	integer	Total workload, which is empty in GaussDB

### 12.3.12.72 GET\_GLOBAL\_PREPARED\_XACTS

GET\_GLOBAL\_PREPARED\_XACTS displays prepared transactions on all nodes globally.

**Table 12-303** GET\_GLOBAL\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	XID of a prepared transaction

Name	Type	Description
gid	text	GID of the prepared transaction
prepared	timestamp with time zone	Prepared time of the prepared transaction.
owner	name	Owner of the prepared transaction.
database	name	Database to which the prepared transaction belongs.
node_name	text	Name of the node where the prepared transaction resides

### 12.3.12.73 GLOBAL\_BAD\_BLOCK\_INFO

GLOBAL\_BAD\_BLOCK\_INFO is executed on the CN to collect statistics on damaged data pages of all instances. The queried result displays basic information about damaged pages. The execution result on the DN is empty. Based on the information, you can use the page detection and repair function in [Data Damage Detection and Repair Functions](#) to perform further repair operations. By default, only initial users, users with the system administrator permission, users with the O&M administrator permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted with permissions.

**Table 12-304** GLOBAL\_BAD\_BLOCK\_INFO columns

Name	Type	Description
node_name	text	Node information of the damaged page.
spc_node	oid	ID of the tablespace corresponding to the damaged page.
db_node	oid	ID of the database corresponding to the damaged page.
rel_node	oid	relfilenode of the relation corresponding to the damaged page.
bucket_node	integer	Bucket node of the damaged page. This column is used to specify whether a table is a segment-page table during repair. <ul style="list-style-type: none"><li>• -1: non-segment page table.</li><li>• Non-zero value: segment-page table.</li></ul>
block_num	oid	Number of the damaged page.
fork_num	integer	File forknum of the damaged page.

Name	Type	Description
file_path	text	Relative path of the damaged page. The logical path instead of the actual file is displayed for a segment-page table.
check_time	timestamp with time zone	Time when a fault is detected on the damaged page.
repair_time	timestamp with time zone	Time when the damaged page is repaired.

### 12.3.12.74 GLOBAL\_CLEAR\_BAD\_BLOCK\_INFO

GLOBAL\_CLEAR\_BAD\_BLOCK\_INFO is executed on the CN to clear information about repaired pages in all instances. The execution result on DNs is empty. By default, only initial users, users with the system administrator permission, users with the O&M administrator permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted with permissions.

**Table 12-305** GLOBAL\_BAD\_BLOCK\_INFO columns

Name	Type	Description
node_name	text	Information about the node for clearing repaired pages.
result	boolean	Execution result of clearing repaired pages of the current instance.

### 12.3.12.75 GLOBAL\_SQL\_PATCH

GLOBAL\_SQL\_PATCH stores information about all SQL patches. This view is available only in the PG\_CATALOG schema.

**Table 12-306** GLOBAL\_SQL\_PATCH columns

Name	Type	Description
node_name	text	Name of the node where the SQL PATCH is located.
patch_name	name	Name of the SQL PATCH.
unique_sql_id	bigint	Global unique query ID.
owner	oid	ID of the user created using the SQL PATCH.

Name	Type	Description
enable	boolean	Specifies whether the SQL patch takes effect.
status	"char"	SQL patch status (reserved column).
abort	boolean	Specifies whether a hint is discarded.
hint_string	text	Hint text.
description	text	SQL patch description.
parent_unique_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which SQL patch takes effect. <ul style="list-style-type: none"> <li>• Its value is <b>0</b> for statements outside the stored procedure.</li> <li>• For a statement within a stored procedure, the value is the globally unique ID of the statement that calls the stored procedure.</li> </ul>

### 12.3.12.76 GLOBAL\_STAT\_HOTKEYS\_INFO

GLOBAL\_STAT\_HOTKEYS\_INFO queries the statistics of hotspot keys in the entire cluster. The query results are sorted by **count** in descending order.

**Table 12-307** GLOBAL\_STAT\_HOTKEYS\_INFO columns

Name	Type	Description
database_name	text	Name of the database where the hot key is located.
schema_name	text	Name of the mode where the hotspot key is located.
table_name	text	Name of the table where the hotspot key is located.
key_value	text	Value of the hotspot key
hash_value	bigint	Hash value of the hotspot key in the database. If the table is a list or range distributed table, the value of this column is <b>0</b> .
count	numeric	Frequency of accessing the hotspot key.

### 12.3.12.77 GLOBAL\_WAL\_SENDER\_STATUS

GLOBAL\_WAL\_SENDER\_STATUS displays the redo log transfer and replay status of the primary DN in the current cluster. This view can be viewed only by the users with monitor admin and sysadmin permission.

**Table 12-308** GLOBAL\_WAL\_SENDER\_STATUS columns

Name	Type	Description
nodename	text	Name of the primary node
source_ip	text	IP address of the primary node
source_port	integer	Port of the primary node
dest_ip	text	IP address of the standby node
dest_port	integer	Port of the standby node
sender_pid	integer	PID of the sending thread
local_role	text	<p>Type of the primary node</p> <ul style="list-style-type: none"> <li>● <b>UNKNOWN_MODE</b>: The status is unknown.</li> <li>● <b>NORMAL_MODE</b>: single-host node type.</li> <li>● <b>PRIMARY_MODE</b>: The node is a primary node.</li> <li>● <b>STANDBY_MODE</b>: The node is a standby node.</li> <li>● <b>CASCADE_STANDBY_MODE</b>: The node is a cascaded standby node.</li> <li>● <b>PENDING_MODE</b>: The node is in the arbitration phase.</li> <li>● <b>RECOVERY_MODE</b>: The node is in the restoration phase.</li> <li>● <b>STANDBY_CLUSTER_MODE</b>: The node is a standby cluster node.</li> <li>● <b>MAIN_STANDBY_MODE</b>: main standby cluster node.</li> </ul> <p><b>NOTE</b> The expected values of the primary node type are <b>NORMAL_MODE</b>, <b>PRIMARY_MODE</b>, <b>PENDING_MODE</b>, and <b>RECOVERY_MODE</b>. If other node types are displayed, contact Huawei technical support.</p>

Name	Type	Description
peer_role	text	<p>Type of the standby node</p> <ul style="list-style-type: none"> <li>● <b>UNKNOWN_MODE</b>: The status is unknown.</li> <li>● <b>NORMAL_MODE</b>: single-host node type.</li> <li>● <b>PRIMARY_MODE</b>: The node is a primary node.</li> <li>● <b>STANDBY_MODE</b>: The node is a standby node.</li> <li>● <b>CASCADE_STANDBY_MODE</b>: The node is a cascaded standby node.</li> <li>● <b>PENDING_MODE</b>: The node is in the arbitration phase.</li> <li>● <b>RECOVERY_MODE</b>: The node is in the restoration phase.</li> <li>● <b>STANDBY_CLUSTER_MODE</b>: The node is a standby cluster node.</li> <li>● <b>MAIN_STANDBY_MODE</b>: main standby cluster node.</li> </ul> <p><b>NOTE</b> The expected values of the standby node type are <b>NORMAL_MODE</b>, <b>STANDBY_MODE</b>, <b>CASCADE_STANDBY_MODE</b>, <b>PENDING_MODE</b>, <b>RECOVERY_MODE</b>, <b>STANDBY_CLUSTER_MODE</b>, and <b>MAIN_STANDBY_MODE</b>. If other node types are displayed, contact Huawei technical support.</p>

Name	Type	Description
peer_state	text	Status of the standby node <ul style="list-style-type: none"> <li>● <b>UNKNOWN_STATE</b>: The node status is unknown.</li> <li>● <b>NORMAL_STATE</b>: The node is started properly.</li> <li>● <b>NEEDREPAIR_STATE</b>: The current node needs to be repaired.</li> <li>● <b>STARTING_STATE</b>: The node is being started.</li> <li>● <b>WAITING_STATE</b>: The node is waiting to be upgraded.</li> <li>● <b>DEMOTING_STATE</b>: The node is being downgraded.</li> <li>● <b>PROMOTING_STATE</b>: The standby node is being upgraded to the primary node.</li> <li>● <b>BUILDING_STATE</b>: The standby node fails to be started and needs to be rebuilt.</li> <li>● <b>CATCHUP_STATE</b>: The standby node is catching up with the primary node.</li> <li>● <b>COREDUMP_STATE</b>: The node breaks down.</li> </ul>
state	text	WAL sender status <ul style="list-style-type: none"> <li>● <b>WALSNDSTATE_STARTUP</b>: startup state.</li> <li>● <b>WALSNDSTATE_BACKUP</b>: backup state.</li> <li>● <b>WALSNDSTATE_CATCHUP</b>: catch-up state.</li> <li>● <b>WALSNDSTATE_STREAMING</b>: streaming replication state.</li> </ul>
sender_sent_location	text	Sending position of the primary node
sender_write_location	text	Writing position of the primary node
sender_flush_location	text	Location where the master node writes the cache to the disk.
sender_replay_location	text	Redo position of the primary node
receiver_received_location	text	Receiving position of the standby node
receiver_write_location	text	Writing position of the standby node

Name	Type	Description
receiver_flush_location	text	Location where the standby node writes the cache to the disk.
receiver_replay_location	text	Redo location of the standby node

### 12.3.12.78 GS\_ALL\_CONTROL\_GROUP\_INFO

GS\_ALL\_CONTROL\_GROUP\_INFO displays all Cgroup information in a database.

**Table 12-309** GS\_ALL\_CONTROL\_GROUP\_INFO columns

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type. <ul style="list-style-type: none"> <li>● <b>GROUP_NONE</b>: no group.</li> <li>● <b>GROUP_TOP</b>: top group.</li> <li>● <b>GROUP_CLASS</b>: Class Cgroup, which does not control any thread.</li> <li>● <b>GROUP_BAKWD</b>: backend thread Cgroup.</li> <li>● <b>GROUP_DEFWD</b>: default control group, which controls only the query threads at this level.</li> <li>● <b>GROUP_TSWD</b>: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.</li> </ul>
gid	bigint	Cgroup ID.
classgid	bigint	ID of the <b>Class</b> Cgroup to which a <b>Workload</b> Cgroup belongs.
class	text	<b>Class</b> Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	<b>Workload</b> Cgroup level.
cpucores	text	Usage of CPU cores in the Cgroup.

### 12.3.12.79 GS\_ALL\_PREPARED\_STATEMENTS

GS\_ALL\_PREPARED\_STATEMENTS displays information about prepared statements that are available in all sessions. This view is accessible only to system administrators.

**Table 12-310** GS\_ALL\_PREPARED\_STATEMENTS columns

Name	Type	Description
pid	bigint	Backend thread ID. <b>NOTE</b> In thread pool mode, <b>pid</b> indicates the ID of the thread bound to the current session. When a session is executed on different threads, <b>pid</b> changes accordingly. In thread pool mode, statements are associated with <b>sessionid</b> but not <b>pid</b> . You are advised to use <b>sessionid</b> for associated query.
sessionid	bigint	Current session ID.
global_sessionid	text	Global session ID.
name	text	Identifier of the prepared statement.
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter type of the prepared statement in the form of a regtype array. The OID corresponding to this array can be obtained by converting the regtype value.
from_sql	boolean	<ul style="list-style-type: none"> <li>• <b>True</b> if the prepared statement was created through the PREPARE statement.</li> <li>• <b>False</b> if the statement was prepared through the frontend/backend protocol.</li> </ul>

### 12.3.12.80 GS\_BUCKET\_LOCKS

GS\_BUCKET\_LOCKS displays information about locks held by open transactions. Only CNs in distributed mode can be queried.

**Table 12-311** GS\_BUCKET\_LOCKS columns

Name	Type	Reference	Description
node_name	text	-	Node name.
database	oid	OID in <a href="#">PG_DATAB ASE</a>	OID of the database in which the locked target exists.
virtualtransaction	text	-	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.
sessionid	bigint	-	ID of the session that holds or waits for the lock.
mode	text	-	Lock mode held or desired by this thread. The options are <b>AccessShareLock</b> and <b>AccessExclusiveLock</b> .
granted	boolean	-	<ul style="list-style-type: none"> <li>The value is <b>TRUE</b> if the lock is a held lock.</li> <li>The value is <b>FALSE</b> if the lock is an awaited lock.</li> </ul>
fastpath	boolean	-	The value is <b>TRUE</b> if the lock is obtained through fast-path. The value is <b>FALSE</b> if the lock is obtained through library-level lock information or two-phase commit.
global_sessionid	text	-	Global session ID.
bucketlist	text	-	List of locked buckets.

### 12.3.12.81 GS\_GET\_CONTROL\_GROUP\_INFO

GS\_GET\_CONTROL\_GROUP\_INFO displays information about all Cgroups. This view is accessible only to system administrators.

**Table 12-312** GS\_GET\_CONTROL\_GROUP\_INFO columns

Name	Type	Description
group_name	text	Name of a Cgroup.

Name	Type	Description
group_type	text	Type of the Cgroup. <ul style="list-style-type: none"> <li>• <b>GROUP_NONE</b>: no group.</li> <li>• <b>GROUP_TOP</b>: top group.</li> <li>• <b>GROUP_CLASS</b>: class Cgroup, which does not control any thread.</li> <li>• <b>GROUP_BAKWD</b>: backend thread Cgroup.</li> <li>• <b>GROUP_DEFWD</b>: default Cgroup, which controls only the query threads at this level.</li> <li>• <b>GROUP_TSWD</b>: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.</li> </ul>
gid	bigint	Cgroup ID.
classgid	bigint	ID of the <b>Class</b> Cgroup to which a <b>Workload</b> Cgroup belongs.
class	text	<b>Class</b> Cgroup.
group_workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in the Cgroup.
nodegroup	text	Node group name.
group_kind	text	Node group type. The value must be one of the following: <ul style="list-style-type: none"> <li>• <b>i</b>: installation node group</li> <li>• <b>n</b>: node group in a common cluster.</li> <li>• <b>e</b>: elastic cluster</li> </ul>

### 12.3.12.82 GS\_GLOBAL\_ARCHIVE\_STATUS

GS\_GLOBAL\_ARCHIVE\_STATUS describes the archiving progress of CNs and all shards, including the shard name (**node\_name**), archiving location (**restart\_lsn**), name of the primary or standby node (**archive\_node**), and current log location (**current\_xlog\_location**). To query this view, you need to enable the archiving function of the database and query the view from the CN node. The monitor admin and sysadmin permissions are required. For details about the columns, see [Table 12-313](#).

**Table 12-313** GS\_GLOBAL\_ARCHIVE\_STATUS columns

Name	Type	Description
node_name	text	Shard name.
restart_lsn	text	Archiving location.
archive_node	text	Name of the primary or standby node where archiving is performed.
current_xlog_location	text	Current log position.

### 12.3.12.83 GS\_GSC\_MEMORY\_DETAIL

GS\_GSC\_MEMORY\_DETAIL displays the global SysCache memory usage of the current process on the current node. The data is displayed only when Global SysCache is enabled.

Note that the query is separated by the database memory context. Therefore, some memory statistics are missing. The memory context corresponding to the missing memory statistics is **GlobalSysDBCache**.

**Table 12-314** GS\_GSC\_MEMORY\_DETAIL columns

Name	Type	Description
db_id	text	Database ID.
totalsize	numeric	Total size of the shared memory, in bytes.
freesize	numeric	Remaining size of the shared memory, in bytes.
usedsize	numeric	Used size of the shared memory, in bytes.

### 12.3.12.84 GS\_LSC\_MEMORY\_DETAIL

GS\_LSC\_MEMORY\_DETAIL displays the memory usage of the local system cache of all threads based on the MemoryContext node. The data is displayed only when Global SysCache is enabled.

**Table 12-315** GS\_LSC\_MEMORY\_DETAIL columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: <i>timestamp.sessionid</i> ).
tid	bigint	Thread ID.
thrdtype	text	Thread type. It can be any thread type in the system, such as postgresql and wlmmonitor.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Total size of used memory in the memory context, in bytes.

### 12.3.12.85 GS\_MY\_PLAN\_TRACE

GS\_MY\_PLAN\_TRACE is a view of the GS\_PLAN\_TRACE system catalog. This view displays the plan traces of the current user. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

**Table 12-316** GS\_MY\_PLAN\_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request.
query	text	SQL statement of the current request. The value of this column cannot exceed the value of <b>track_activity_query_size</b> .
unique_sql_id	bigint	Unique ID of the SQL statement of the current request.
plan	text	Query plan text corresponding to the SQL statement of the current request. The size of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.

Name	Type	Description
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created).

### 12.3.12.86 GS\_SESSION\_ALL\_SETTINGS

GS\_SESSION\_ALL\_SETTINGS displays the full GUC parameter settings of all sessions on the local node. Only the **sysadmin** and **monadmin** users have the permission to view this view.

**Table 12-317** GS\_SESSION\_ALL\_SETTINGS columns

Name	Type	Description
sessionid	bigint	Session ID.
pid	bigint	Backend thread ID.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of a parameter.

### 12.3.12.87 GS\_SQL\_COUNT

GS\_SQL\_COUNT displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) on the current node of the database.

- When a common user queries the GS\_SQL\_COUNT view, statistics about the current node of the user are displayed. When an administrator queries the GS\_SQL\_COUNT view, statistics about the current node of all users are displayed.
- When the cluster or node is restarted, the statistics are cleared and will be measured again.
- The system counts when a node receives a query, including a query inside the cluster. For example, when a CN receives a query and distributes multiple queries to DNs, the queries are counted accordingly on the DNs.

**Table 12-318** GS\_SQL\_COUNT columns

Name	Type	Description
node_name	name	Node name.
user_name	name	Username.
select_count	bigint	Statistical result of the SELECT statement.

Name	Type	Description
update_count	bigint	Statistical result of the UPDATE statement.
insert_count	bigint	Statistical result of the INSERT statement.
delete_count	bigint	Statistical result of the DELETE statement.
mergeinto_count	bigint	Statistical result of the MERGE INTO statement
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.
total_select_elapse	bigint	Total response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: $\mu$ s).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: $\mu$ s).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: $\mu$ s).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: $\mu$ s).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: $\mu$ s).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: $\mu$ s).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: $\mu$ s).

Name	Type	Description
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).

### 12.3.12.88 GS\_WORKLOAD\_RULE\_STAT

GS\_WORKLOAD\_RULE\_STAT displays information about SQL concurrency control rules. Only the sysadmin user can access the system view.

**Table 12-319** GS\_WORKLOAD\_RULE\_STAT columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID.
rule_name	name	Name of a concurrency control rule, which is used to search for the concurrency control rule.
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is <b>NULL</b> , the concurrency control rules take effect for all databases.
rule_type	text	Concurrency control rule type. Currently, only " <b>sqlid</b> ", " <b>select</b> ", " <b>insert</b> ", " <b>update</b> ", " <b>delete</b> ", " <b>merge</b> ", and " <b>resource</b> " are supported. Other values are invalid.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value <b>NULL</b> indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value <b>NULL</b> indicates that the rules are always effective.
max_workload	bigint	Maximum number of concurrent rule settings.

Name	Type	Description
option_val	text[]	Parameter values of a concurrency control rule, including SQL ID, keyword list, and resource restriction.  For details, see <a href="#">gs_add_workload_rule(rule_type, rule_name, databases, start_time, end_time, max_workload, option_val)</a> .
is_valid	Boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to <b>false</b> .
validate_count	bigint	Number of SQL statements intercepted by the concurrency control rule.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

### 12.3.12.89 GV\_INSTANCE

GV\_INSTANCE displays information about the current database instance. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-320** GV\_INSTANCE columns

Name	Type	Description
inst_id	oid	OID of the current database.
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Not supported. Set it to <b>NULL</b> .
version	character varying(17)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
version_legacy	character varying(17)	Not supported. Set it to <b>NULL</b> .
version_full	character varying(17)	Not supported. Set it to <b>NULL</b> .
startup_time	date	Not supported. Set it to <b>NULL</b> .
status	character varying(12)	Not supported. Set it to <b>NULL</b> .
parallel	character varying(3)	Not supported. Set it to <b>NULL</b> .
thread#	numeric	Not supported. Set it to <b>NULL</b> .
archiver	character varying(7)	Not supported. Set it to <b>NULL</b> .
log_switch_wait	character varying(15)	Not supported. Set it to <b>NULL</b> .
logins	character varying(10)	Not supported. Set it to <b>NULL</b> .
shutdown_pending	character varying(3)	Not supported. Set it to <b>NULL</b> .
database_status	character varying(17)	Not supported. Set it to <b>NULL</b> .
instance_role	character varying(18)	Not supported. Set it to <b>NULL</b> .
active_state	character varying(9)	Not supported. Set it to <b>NULL</b> .
blocked	character varying(3)	Not supported. Set it to <b>NULL</b> .
con_id	numeric	Not supported. Set it to <b>NULL</b> .
instance_mode	character varying(11)	Not supported. Set it to <b>NULL</b> .
edition	character varying(7)	Not supported. Set it to <b>NULL</b> .
family	character varying(80)	Not supported. Set it to <b>NULL</b> .
database_type	character varying(15)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.90 GV\_SESSION

GV\_SESSION displays information about all current sessions. Only administrators can access this view. Common users can access the view only after being authorized. This view exists in both the PG\_CATALOG and SYS schemas. When the thread pool is enabled (**enable\_thread\_pool** is set to **on**), all session information is displayed. When the thread pool is disabled (**enable\_thread\_pool** is set to **off**), the sessions connected by users are not displayed. For details about the columns, see [Table 12-321](#).

**Table 12-321** GV\_SESSION columns

Name	Type	Description
inst_id	numeric	Not supported. Its value is <b>NULL</b> .
saddr	raw	Not supported. Its value is <b>NULL</b> .
sid	bigint	Session ID.
serial#	integer	Sequence number of the active backend thread, which is <b>0</b> in GaussDB.
audsid	numeric	Not supported. Its value is <b>NULL</b> .
paddr	raw	Not supported. Its value is <b>NULL</b> .
schema#	numeric	Not supported. Its value is <b>NULL</b> .
schemaname	name	Name of the user logged in to the backend.
user#	oid	OID of the user who has logged in to the backend thread. ( <b>0</b> if the background thread is a global auxiliary thread).
username	name	Name of the user logged in to the backend process. <b>username</b> is null if the backend thread is a global auxiliary thread.
command	numeric	Not supported. Its value is <b>NULL</b> .
ownerid	numeric	Not supported. Its value is <b>NULL</b> .
taddr	character varying(16)	Not supported. Its value is <b>NULL</b> .
lockwait	character varying(16)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
sql_id	bigint	ID of a query.
client_info	text	Client information
event	text	Queuing status of a statement. The value must be one of the following: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>
sql_exec_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> .
program	text	Name of the application connected to the backend.
status	text	Overall status of this backend. The value must be one of the following: <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>
server	character varying(9)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session.
process	character varying(24)	Process ID of the current session.
logon_time	date	Login time of the current session
last_call_et	integer	Duration when the status of the current session changes last time.
osuser	text	OS username of the server.
terminal	character varying(30)	Not supported. Its value is <b>NULL</b> .
type	character varying(10)	Not supported. Its value is <b>NULL</b> .
sql_address	raw	Not supported. Its value is <b>NULL</b> .
sql_hash_value	numeric	Not supported. Its value is <b>NULL</b> .
sql_child_number	numeric	Not supported. Its value is <b>NULL</b> .
sql_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_addr	raw	Not supported. Its value is <b>NULL</b> .
prev_hash_value	numeric	Not supported. Its value is <b>NULL</b> .
prev_sql_id	character varying(13)	Not supported. Its value is <b>NULL</b> .
prev_child_number	numeric	Not supported. Its value is <b>NULL</b> .
prev_exec_start	date	Not supported. Its value is <b>NULL</b> .
prev_exec_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_object_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_entry_subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_object_id	numeric	Not supported. Its value is <b>NULL</b> .
plsql_subprogram_id	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
module	text	Name of the running module, which is set by calling DBE_APPLICATION_INFO.SET_MODULE.
module_hash	numeric	Not supported. Its value is <b>NULL</b> .
action	text	Name of the current operation in the current module, which is set by calling DBE_APPLICATION_INFO.SET_MODULE or DBE_APPLICATION_INFO.SET_ACTION.
action_hash	numeric	Not supported. Its value is <b>NULL</b> .
fixed_table_sequence	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_obj#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_file#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_block#	numeric	Not supported. Its value is <b>NULL</b> .
row_wait_row#	numeric	Not supported. Its value is <b>NULL</b> .
top_level_call#	numeric	Not supported. Its value is <b>NULL</b> .
pdml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
failover_type	character varying(13)	Not supported. Its value is <b>NULL</b> .
failover_method	character varying(10)	Not supported. Its value is <b>NULL</b> .
failed_over	character varying(3)	Not supported. Its value is <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Its value is <b>NULL</b> .
pddl_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
pq_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
current_queue_duration	numeric	Not supported. Its value is <b>NULL</b> .
client_identifier	character varying(64)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session_status	character varying(11)	Not supported. Its value is <b>NULL</b> .
final_blocking_instance	numeric	Not supported. Its value is <b>NULL</b> .
final_blocking_session	numeric	Not supported. Its value is <b>NULL</b> .
seq#	numeric	Not supported. Its value is <b>NULL</b> .
event#	numeric	Not supported. Its value is <b>NULL</b> .
p1text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p1	numeric	Not supported. Its value is <b>NULL</b> .
p1raw	raw	Not supported. Its value is <b>NULL</b> .
p2text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p2	numeric	Not supported. Its value is <b>NULL</b> .
p2raw	raw	Not supported. Its value is <b>NULL</b> .
p3text	character varying(64)	Not supported. Its value is <b>NULL</b> .
p3	numeric	Not supported. Its value is <b>NULL</b> .
p3raw	raw	Not supported. Its value is <b>NULL</b> .
wait_class_id	numeric	Not supported. Its value is <b>NULL</b> .
wait_class#	numeric	Not supported. Its value is <b>NULL</b> .
wait_class	character varying(64)	Not supported. Its value is <b>NULL</b> .
wait_time	numeric	Not supported. Its value is <b>NULL</b> .
seconds_in_wait	numeric	Not supported. Its value is <b>NULL</b> .
state	character varying(19)	Not supported. Its value is <b>NULL</b> .
wait_time_micro	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
time_remaining_micro	numeric	Not supported. Its value is <b>NULL</b> .
time_since_last_wait_micro	numeric	Not supported. Its value is <b>NULL</b> .
service_name	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_trace	character varying(8)	Not supported. Its value is <b>NULL</b> .
sql_trace_waits	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_binds	character varying(5)	Not supported. Its value is <b>NULL</b> .
sql_trace_plan_stats	character varying(10)	Not supported. Its value is <b>NULL</b> .
session_edition_id	numeric	Not supported. Its value is <b>NULL</b> .
creator_addr	raw	Not supported. Its value is <b>NULL</b> .
creator_serial#	numeric	Not supported. Its value is <b>NULL</b> .
ecid	character varying(64)	Not supported. Its value is <b>NULL</b> .
sql_translation_profile_id	numeric	Not supported. Its value is <b>NULL</b> .
pga_tunable_mem	numeric	Not supported. Its value is <b>NULL</b> .
shard_ddl_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
con_id	numeric	Not supported. Its value is <b>NULL</b> .
external_name	character varying(1024)	Not supported. Its value is <b>NULL</b> .
plsql_debugger_connected	character varying(5)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.91 MPP\_TABLES

MPP\_TABLES displays information about tables in PGXC\_CLASS.

**Table 12-322** MPP\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Table name.
tableowner	name	Table owner.
tablespace	name	Tablespace containing the table.
pgroup	name	Name of the node.
nodeoids	oidvector_extend	List of distributed table node OIDs.

### 12.3.12.92 MY\_AUDIT\_TRAIL

MY\_AUDIT\_TRAIL displays the standard audit trail entries related to the current user. The GaussDB audit information is mainly obtained through the `pg_query_audit()` function. This view exists in both the PG\_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission on MY\_AUDIT\_TRAIL can view audit information. If separation-of-duty is disabled, users with the SYSADMIN attribute can also view audit information. The **action\_name** field of GaussDB is different from that of the ORA database in terms of the audit actions. The type of the **transactionid** field is the same as that in the ORA database. In GaussDB, the **sql\_text** field is the parsed SQL statement, which is not completely the same as the executed SQL statement.

---

**CAUTION**

In a distributed system, the `pg_query_audit()` function can only be used to query the audit information of the current node.

---

**Table 12-323** MY\_AUDIT\_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. Set it to <b>NULL</b> .
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Set it to <b>NULL</b> .
terminal	character varying(255)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported. Set it to <b>NULL</b> .
action_name	character varying(28)	Action type corresponding to the code in the <b>action</b> column.
new_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
new_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
obj_privilege	character varying(32)	Not supported. Set it to <b>NULL</b> .
sys_privilege	character varying(40)	Not supported. Set it to <b>NULL</b> .
admin_option	character varying(1)	Not supported. Set it to <b>NULL</b> .
grantee	character varying(128)	Not supported. Set it to <b>NULL</b> .
audit_option	character varying(40)	Not supported. Set it to <b>NULL</b> .
ses_actions	character varying(19)	Not supported. Set it to <b>NULL</b> .
logoff_time	date	Not supported. Set it to <b>NULL</b> .
logoff_lread	numeric	Not supported. Set it to <b>NULL</b> .
logoff_pread	numeric	Not supported. Set it to <b>NULL</b> .
logoff_lwrite	numeric	Not supported. Set it to <b>NULL</b> .
logoff_dlock	character varying(40)	Not supported. Set it to <b>NULL</b> .
comment_text	character varying(4000)	Not supported. Set it to <b>NULL</b> .
sessionid	numeric	Not supported. Set it to <b>NULL</b> .
entryid	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
statementid	numeric	Not supported. Set it to <b>NULL</b> .
returncode	numeric	Not supported. Set it to <b>NULL</b> .
priv_used	character varying(40)	Not supported. Set it to <b>NULL</b> .
client_id	character varying(128)	Not supported. Set it to <b>NULL</b> .
econtext_id	character varying(64)	Not supported. Set it to <b>NULL</b> .
session_cpu	numeric	Not supported. Set it to <b>NULL</b> .
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Set it to <b>NULL</b> .
global_uid	character varying(32)	Not supported. Set it to <b>NULL</b> .
instance_number	numeric	Not supported. Set it to <b>NULL</b> .
os_process	character varying(16)	Not supported. Set it to <b>NULL</b> .
transactionid	text	Identifier of the transaction that accesses or modifies an object.
scn	numeric	Not supported. Set it to <b>NULL</b> .
sql_bind	nvarchar2(2000)	Not supported. Set it to <b>NULL</b> .
sql_text	nvarchar2	SQL text of the query.
obj_edition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
dbid	numeric	Not supported. Set it to <b>NULL</b> .
rls_info	clob	Not supported. Set it to <b>NULL</b> .
current_user	character varying(128)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.93 MY\_COL\_COMMENTS

MY\_COL\_COMMENTS displays column comments of the table accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-324 MY\_COL\_COMMENTS** columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. Set it to <b>0</b> .
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.94 MY\_COLL\_TYPES

MY\_COLL\_TYPES displays information about types of collections created by the current user. By default, it is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-325 MY\_COLL\_TYPES** columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported. Set it to <b>NULL</b> .
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Set it to <b>NULL</b> .
precision	numeric	Not supported. Set it to <b>NULL</b> .
scale	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
character_set_name	character varying(44)	Not supported. Set it to <b>NULL</b> .
elem_storage	character varying(7)	Not supported. Set it to <b>NULL</b> .
nulls_stored	character varying(3)	Not supported. Set it to <b>NULL</b> .
char_used	character varying(1)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.95 MY\_CONS\_COLUMNS

MY\_CONS\_COLUMNS displays information about primary key constraint columns in tables accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-326** MY\_CONS\_COLUMNS columns

Name	Type	Description
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
constraint_name	character varying(64)	Constraint name.
owner	character varying(64)	Constraint creator.
position	smallint	Position of a column in a table.

### 12.3.12.96 MY\_CONSTRAINTS

MY\_CONSTRAINTS displays table constraint information accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-327** MY\_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.

Name	Type	Description
constraint_type	text	Constraint type. <ul style="list-style-type: none"> <li>• <b>c</b>: check constraint</li> <li>• <b>f</b>: foreign key constraint</li> <li>• <b>p</b>: primary key constraint</li> <li>• <b>u</b>: unique constraint</li> </ul>
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
owner	character varying(64)	Constraint creator.

### 12.3.12.97 MY\_DEPENDENCIES

MY\_DEPENDENCIES displays the dependencies between objects that are accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas and all users can access this view.

**Table 12-328** MY\_DEPENDENCIES columns

Name	Type	Description
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Name of the link to the parent object (if remote).
dependency_type	character varying(4)	Specifies whether the dependency is an REF dependency.

### 12.3.12.98 MY\_IND\_COLUMNS

MY\_IND\_COLUMNS displays column information about all indexes accessible to the current user. It is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-329** MY\_IND\_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Length of the column. For the variable-length type, the value of this field is <b>NULL</b> .
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying(4)	Specifies whether columns are sorted in descending ( <b>DESC</b> ) or ascending ( <b>ASC</b> ) order.
collated_column_id	numeric	Not supported. Set it to <b>NULL</b> .

### 12.3.12.99 MY\_IND\_EXPRESSIONS

MY\_IND\_EXPRESSIONS displays information about function-based expression indexes accessible to the current user. It is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-330** MY\_IND\_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.

Name	Type	Description
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

### 12.3.12.100 MY\_INDEXES

MY\_INDEXES displays index information about the current user. This view exists in the PG\_CATALOG and SYS schemas. For details about the columns, see [Table 12-331](#).

**Table 12-331** MY\_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Specifies whether the index is a unique index. <ul style="list-style-type: none"> <li>● <b>UNIQUE</b>: unique index.</li> <li>● <b>NONUNIQUE</b>: non-unique index.</li> </ul>
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. <ul style="list-style-type: none"> <li>● <b>Yes</b>: The index has the property of a partitioned table.</li> <li>● <b>No</b>: The index does not have the property of a partitioned table.</li> </ul>
generated	character varying(1)	Specifies whether the index name is generated by the system. <ul style="list-style-type: none"> <li>● <b>y</b>: The index name is generated by the system.</li> <li>● <b>n</b>: The index name is not generated by the system.</li> </ul>

Name	Type	Description
index_type	character varying(27)	Index type <ul style="list-style-type: none"> <li>• <b>NORMAL</b>: Index attributes are simple references, and the expression tree is empty.</li> <li>• <b>FUNCTION-BASED NORMAL</b>: Expression trees are used for index attributes that are not simple column references.</li> </ul>
table_owner	character varying(128)	Owner of the index object
table_type	character(11)	Type of an index object <ul style="list-style-type: none"> <li>• <b>TABLE</b>: The index object is of the table type.</li> </ul>
tablespace_name	character varying(30)	Name of the tablespace that contains the index
status	character varying(8)	Status of a non-partitioned index. <ul style="list-style-type: none"> <li>• <b>VALID</b>: Non-partitioned indexes can be used for query.</li> <li>• <b>UNUSABLE</b>: The non-partitioned index is unavailable.</li> <li>• <b>N/A</b>: The index has the property of a partitioned table.</li> </ul>
compression	character varying(13)	Not supported. Its value is <b>NULL</b> .
prefix_length	numeric	Not supported. Its value is <b>NULL</b> .
ini_trans	numeric	Not supported. Its value is <b>NULL</b> .
max_trans	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .
pct_threshold	numeric	Not supported. Its value is <b>NULL</b> .
include_column	numeric	Not supported. Its value is <b>NULL</b> .
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
pct_free	numeric	Not supported. Its value is <b>NULL</b> .
logging	character varying(3)	Not supported. Its value is <b>NULL</b> .
blevel	numeric	Not supported. Its value is <b>NULL</b> .
leaf_blocks	numeric	Not supported. Its value is <b>NULL</b> .
distinct_keys	numeric	Not supported. Its value is <b>NULL</b> .
avg_leaf_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
avg_data_blocks_per_key	numeric	Not supported. Its value is <b>NULL</b> .
clustering_factor	numeric	Not supported. Its value is <b>NULL</b> .
num_rows	numeric	Not supported. Its value is <b>NULL</b> .
sample_size	numeric	Not supported. Its value is <b>NULL</b> .
last_analyzed	date	Not supported. Its value is <b>NULL</b> .
degree	character varying(40)	Not supported. Its value is <b>NULL</b> .
instances	character varying(40)	Not supported. Its value is <b>NULL</b> .
temporary	character varying(1)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
buffer_pool	character varying(7)	Not supported. Its value is <b>NULL</b> .
flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
cell_flash_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
duration	character varying(15)	Not supported. Its value is <b>NULL</b> .
pct_direct_access	numeric	Not supported. Its value is <b>NULL</b> .
ityp_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
ityp_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
parameters	character varying(1000)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
domidx_status	character varying(12)	Not supported. Its value is <b>NULL</b> .
domidx_opstatus	character varying(6)	Not supported. Its value is <b>NULL</b> .
funcidx_status	character varying(8)	Not supported. Its value is <b>NULL</b> .
join_index	character varying(3)	Not supported. Its value is <b>NULL</b> .
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is <b>NULL</b> .
dropped	character varying(3)	Not supported. Its value is <b>NULL</b> .
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. <ul style="list-style-type: none"><li>● <b>VISIBLE</b>: The index is visible to the optimizer.</li><li>● <b>INVISIBLE</b>: The index is visible to the optimizer.</li></ul>
domidx_management	character varying(14)	Not supported. Its value is <b>NULL</b> .
segment_created	character varying(3)	Not supported. Its value is <b>NULL</b> .
orphaned_entries	character varying(3)	Not supported. Its value is <b>NULL</b> .
indexing	character varying(7)	Not supported. Its value is <b>NULL</b> .
auto	character varying(3)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.101 MY\_JOBS

MY\_JOBS displays details about the scheduled tasks owned by the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-332** MY\_JOBS columns

Name	Type	Description
job	bigint	Job ID
log_user	name	Username of the job creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database where the job is created.
schema_user	name	Default schema name of a scheduler job.
start_date	timestamp without time zone	Job start time.
start_suc	text	Start time of the successful job execution.
last_date	timestamp without time zone	Start time of the last job execution.
last_suc	text	Start time of the last successful job execution.
last_sec	text	Start time of the last successful job execution. Compatibility is supported.
this_date	timestamp without time zone	Start time of the ongoing job execution.
this_suc	text	Start time of the ongoing successful job execution.
this_sec	text	Start time of an ongoing successful job execution. Compatibility is supported.
next_date	timestamp without time zone	Schedule time of the next job execution.
next_suc	text	Schedule time of the next successful job execution.
next_sec	text	Schedule time of the next successful job execution. Compatibility is supported.
total_time	numeric	Latest execution duration of a task.
broken	text	<b>y</b> if the job status is broken and <b>n</b> if otherwise.

Name	Type	Description
status	"char"	Status of the current job. The value can be <b>r</b> , <b>s</b> , <b>f</b> , or <b>d</b> . The default value is <b>r</b> . <ul style="list-style-type: none"> <li>• <b>r</b>: running</li> <li>• <b>s</b>: successful execution</li> <li>• <b>f</b>: failed execution</li> <li>• <b>d</b>: canceling an execution</li> </ul>
interval	text	Time expression used to calculate the next time the job will be executed. If this parameter is set to <b>null</b> , the job will be executed once only.
failures	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
what	text	Executable job.
nls_env	character varying(4000)	Not supported. Set it to <b>NULL</b> .
misc_env	raw	Not supported. Set it to <b>NULL</b> .
instance	numeric	Not supported. Set it to <b>NULL</b> .

### 12.3.12.102 MY\_OBJECTS

MY\_OBJECTS displays database objects accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-333** MY\_OBJECTS columns

Name	Type	Description
object_name	name	Object name.
object_id	oid	OID of the object.
object_type	name	Type of the object ( <b>TABLE</b> , <b>INDEX</b> , <b>SEQUENCE</b> , <b>VIEW</b> , or <b>GLOBAL SECONDARY INDEX</b> ).
namespace	oid	Namespace that an object belongs to.
temporary	character(1)	Specifies whether an object is a temporary object.

Name	Type	Description
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last time when an object was modified.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Set it to <b>NULL</b> .
timestamp	character varying(19)	Not supported. Set it to <b>NULL</b> .
secondary	character varying(1)	Not supported. Set it to <b>NULL</b> .
edition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
sharing	character varying(18)	Not supported. Set it to <b>NULL</b> .
editionable	character varying(1)	Not supported. Set it to <b>NULL</b> .
oracle_maintained	character varying(1)	Not supported. Set it to <b>NULL</b> .
application	character varying(1)	Not supported. Set it to <b>NULL</b> .
duplicated	character varying(1)	Not supported. Set it to <b>NULL</b> .
sharded	character varying(1)	Not supported. Set it to <b>NULL</b> .
created_appid	numeric	Not supported. Set it to <b>NULL</b> .
modified_appid	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
created_vsnid	numeric	Not supported. Set it to <b>NULL</b> .
modified_vsnid	numeric	Not supported. Set it to <b>NULL</b> .

**NOTICE**

For details on the value ranges of **created** and **last\_ddl\_time**, see [PG\\_OBJECT](#).

### 12.3.12.103 MY\_PROCEDURES

MY\_PROCEDURES displays information about stored procedures, functions, or triggers owned by the current user. This view exists in the PG\_CATALOG and SYS schemas. This view can be accessed by all users. Only the information about the current user can be viewed.

**Table 12-334** MY\_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, or trigger.
object_name	character varying(64)	Name of a stored procedure, function, or trigger.
procedure_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
object_id	oid	OID of a stored procedure, function, or trigger.
subprogram_id	numeric	Not supported. Set it to <b>NULL</b> .
overload	character varying(40)	<i>N</i> th overloaded function.
object_type	character varying(13)	Object type.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: <ul style="list-style-type: none"><li>• <b>YES</b></li><li>• <b>NO</b></li></ul>
pipelined	character varying(3)	Not supported. Set it to <b>NO</b> .
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. Set it to <b>NO</b> .

Name	Type	Description
interface	character varying(3)	Not supported. Set it to <b>NO</b> .
deterministic	character varying(3)	Not supported. Set it to <b>NO</b> .
authid	character varying(12)	Specifies whether to use the creator permission or caller permission: <ul style="list-style-type: none"> <li>• <b>DEFINER</b>: The creator permission is used.</li> <li>• <b>CURRENT_USER</b>: The caller permission is used.</li> </ul> This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Set it to <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Set it to <b>0</b> .
polymorphic	character varying(5)	Not supported. Set it to <b>NULL</b> .
argument_number	smallint	Number of input parameters in the stored procedure.

### 12.3.12.104 MY\_SCHEDULER\_JOB\_ARGS

MY\_SCHEDULER\_JOB\_ARG displays the parameters related to the jobs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-335** MY\_SCHEDULER\_JOB\_ARGS columns

Name	Type	Description
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
value	character varying(4000)	Parameter value.

Name	Type	Description
anydata_value	character varying(4000)	Not supported. Set it to <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Set it to <b>NULL</b> .

### 12.3.12.105 MY\_SCHEDULER\_JOBS

MY\_SCHEDULER\_JOBS displays information about all DBE\_SCHEDULER scheduled tasks owned by the current user in the database. By default, this view exists in the PG\_CATALOG and SYS schemas and all users can access this view.

**Table 12-336** MY\_SCHEDULER\_JOBS columns

Name	Type	Description
job_name	text	Name of a scheduler job.
job_subname	character varying(128)	Not supported. Set it to <b>NULL</b> .
job_style	text	Action mode of a scheduler job.
job_creator	name	Creator of a scheduler job.
client_id	character varying(65)	Not supported. Set it to <b>NULL</b> .
global_uid	character varying(33)	Not supported. Set it to <b>NULL</b> .
program_owner	character varying(4000)	Owner of a program referenced by a scheduler job.
program_name	text	Name of the program referenced by a scheduler job.
job_type	character varying(16)	Type of the inline program of a scheduler job.
job_action	text	Program content of a scheduler job.
number_of_arguments	text	Number of parameters of a scheduler job.
schedule_owner	character varying(4000)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
schedule_name	text	Name of the schedule referenced by a scheduler job.
schedule_type	character varying(12)	Not supported. Set it to <b>NULL</b> .
start_date	timestamp without time zone	Start time of a scheduler job.
repeat_interval	text	Period of a scheduler job.
event_queue_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
event_queue_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
event_queue_agent	character varying(523)	Not supported. Set it to <b>NULL</b> .
event_condition	character varying(4000)	Not supported. Set it to <b>NULL</b> .
event_rule	character varying(261)	Not supported. Set it to <b>NULL</b> .
file_watcher_owner	character varying(261)	Not supported. Set it to <b>NULL</b> .
file_watcher_name	character varying(261)	Not supported. Set it to <b>NULL</b> .
end_date	timestamp without time zone	End time of a scheduler job.
job_class	text	Name of the scheduler job class to which a scheduler job belongs.
enabled	boolean	Status of a scheduler job.
auto_drop	text	Status of the automatic deletion function of a scheduler job.
restart_on_recovery	character varying(5)	Not supported. Set it to <b>NULL</b> .
restart_on_failure	character varying(5)	Not supported. Set it to <b>NULL</b> .
state	"char"	Status of a scheduler job.
job_priority	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
run_count	numeric	Not supported. Set it to <b>NULL</b> .
uptime_run_count	numeric	Not supported. Set it to <b>NULL</b> .
max_runs	numeric	Not supported. Set it to <b>NULL</b> .
failure_count	smallint	Number of scheduler job failures.
uptime_failure_count	numeric	Not supported. Set it to <b>NULL</b> .
max_failures	numeric	Maximum number of failures allowed before the status of a scheduler job is marked as broken.
retry_count	numeric	Not supported. Set it to <b>NULL</b> .
last_start_date	timestamp without time zone	Last time when a scheduler job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduler job.
next_run_date	timestamp without time zone	Next execution time of a scheduler job.
schedule_limit	interval day to second(0)	Not supported. Set it to <b>NULL</b> .
max_run_duration	interval day to second(0)	Not supported. Set it to <b>NULL</b> .
logging_level	character varying(11)	Not supported. Set it to <b>NULL</b> .
store_output	character varying(5)	Specifies whether to store the output information of all scheduler jobs.
stop_on_window_close	character varying(5)	Not supported. Set it to <b>NULL</b> .
instance_stickiness	character varying(5)	Not supported. Set it to <b>NULL</b> .
raise_events	character varying(4000)	Not supported. Set it to <b>NULL</b> .
system	character varying(5)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
job_weight	numeric	Not supported. Set it to <b>NULL</b> .
nls_env	character varying(4000)	Not supported. Set it to <b>NULL</b> .
source	character varying(128)	Not supported. Set it to <b>NULL</b> .
number_of_destinations	numeric	Not supported. Set it to <b>NULL</b> .
destination_owner	character varying(261)	Not supported. Set it to <b>NULL</b> .
destination	text	Target name of a scheduler job. If the value of <b>destination</b> is <b>CCN</b> , the task is a CCN job. For details, see <a href="#">DBE_SCHEDULER</a> .
credential_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
credential_name	text	Certificate name of a scheduler job.
instance_id	oid	OID of the current database.
deferred_drop	character varying(5)	Not supported. Set it to <b>NULL</b> .
allow_runs_in_restricted_mode	character varying(5)	Not supported. Set it to <b>NULL</b> .
comments	text	Comments of a scheduler job.
flags	numeric	Not supported. Set it to <b>NULL</b> .
restartable	character varying(5)	Not supported. Set it to <b>NULL</b> .
has_constraints	character varying(5)	Not supported. Set it to <b>NULL</b> .
connect_credential_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
connect_credential_name	character varying(128)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
fail_on_script_error	character varying(5)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.106 MY\_SCHEDULER\_PROGRAM\_ARGS

MY\_SCHEDULER\_PROGRAM\_ARG displays the parameters related to the programs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-337** MY\_SCHEDULER\_PROGRAM\_ARGS columns

Name	Type	Description
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
metadata_attribute	character varying(19)	Not supported. Set it to <b>NULL</b> .
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Set it to <b>NULL</b> .
out_argument	character varying(5)	Reserved column. Set it to <b>NULL</b> .

### 12.3.12.107 MY\_SEQUENCES

MY\_SEQUENCES displays the sequence information about the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-338** MY\_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.

Name	Type	Description
sequence_name	name	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether a sequence is a cycle sequence. The value can be <b>Y</b> or <b>N</b> . <ul style="list-style-type: none"> <li>• <b>Y</b>: It is a cycle sequence.</li> <li>• <b>N</b>: It is not a cycle sequence.</li> </ul>
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. This parameter is not supported. Set it to <b>NULL</b> .
cache_size	int16	Size of the sequence disk cache.
last_number	int16	Value of the previous sequence.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. This parameter is not supported. Set it to <b>NULL</b> .
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported. Set it to <b>NULL</b> .
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported. Set it to <b>NULL</b> .
session_flag	character varying(1)	Specifies whether a sequence has a private session. This parameter is not supported. Set it to <b>NULL</b> .

Name	Type	Description
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. Not supported. Set it to <b>NULL</b> .

### 12.3.12.108 MY\_SOURCE

MY\_SOURCE displays the definition information about stored procedures, functions, and triggers accessible to the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-339** MY\_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. The value can be <b>function</b> , <b>procedure</b> , or <b>trigger</b> .
line	numeric	Number of the source line.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Set it to <b>0</b> .

### 12.3.12.109 MY\_SYNONYMS

MY\_SYNONYMS displays synonyms in the current schema. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-340** MY\_SYNONYMS columns

Name	Type	Description
schema_name	text	Name of the schema to which the synonym belongs.
synonym_name	text	Synonym name.

Name	Type	Description
table_owner	text	Owner of the associated object. Although the column is called <b>table_owner</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called <b>table_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called <b>table_schema_name</b> , the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. Set it to <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Set it to <b>0</b> .

### 12.3.12.110 MY\_TAB\_COL\_STATISTICS

MY\_TAB\_COL\_STATISTICS displays column statistics and histogram information extracted from MY\_TAB\_COLUMNS. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas. For details about the columns, see [Table 12-341](#).

**Table 12-341** MY\_TAB\_COL\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.

Name	Type	Description
high_value	raw	High value in a column.
density	numeric	<ul style="list-style-type: none"> <li>If there is a histogram on <b>COLUMN_NAME</b>, this column displays the selectivity of values in the histogram that span fewer than two endpoints. It does not represent the selectivity of values that span two or more endpoints.</li> <li>If no histogram is available on <b>COLUMN_NAME</b>, the value of this column is <b>1/NUM_DISTINCT</b>.</li> </ul>
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Date when a column was last analyzed. After the database is restarted, data loss will occur.
sample_size	numeric	Sample size used to analyze a column.
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
notes	character varying(99)	Not supported. Its value is <b>NULL</b> .
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	<p>Specifies whether the histogram exists and the type of the histogram if it exists.</p> <ul style="list-style-type: none"> <li><b>NONE</b>: no histogram</li> <li><b>FREQUENCY</b>: frequency histogram</li> <li><b>EQUI-WIDTH</b>: equal-width histogram</li> </ul>
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is <b>SHARED</b> (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.111 MY\_TAB\_COLUMNS

MY\_TAB\_COLUMNS displays the columns of the tables and views owned by the current user. This view exists in the PG\_CATALOG and SYS schemas. All users can access this view. Only the information about the user is displayed.

**Table 12-342** MY\_TAB\_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. Set it to <b>NULL</b> .
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. It is valid for the numeric data type and <b>NULL</b> for other types.
data_scale	integer	Number of decimal places. It is valid for the numeric data type and <b>0</b> for other data types.
nullable	bpchar	Specifies whether a column can be empty ( <b>n</b> for the primary key constraint and non-null constraint).
column_id	integer	Sequence number of a column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.

Name	Type	Description
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. Set it to <b>NULL</b> .
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. Set it to <b>NO</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NO</b> .
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Length of the column, in characters. This parameter is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to <b>B</b> if the data type is varchar, nvarchar2, bpchar, or char, and to <b>NULL</b> for other data types.
v80_fmt_image	character varying(3)	Not supported. Set it to <b>NULL</b> .
data_upgraded	character varying(3)	Not supported. Set it to <b>YES</b> .
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. <ul style="list-style-type: none"> <li>• <b>NONE</b>: no histogram</li> <li>• <b>FREQUENCY</b>: frequency histogram</li> <li>• <b>EQUI_WIDTH</b>: equal-width histogram</li> </ul>
default_on_null	character varying(3)	Not supported. Set it to <b>NULL</b> .
identity_column	character varying(3)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
sensitive_column	character varying(3)	Not supported. Set it to <b>NULL</b> .
evaluation_edition	character varying(128)	Not supported. Set it to <b>NULL</b> .
unusable_before	character varying(128)	Not supported. Set it to <b>NULL</b> .
unusable_beginning	character varying(128)	Not supported. Set it to <b>NULL</b> .
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

### 12.3.12.112 MY\_TAB\_COMMENTS

MY\_TAB\_COMMENTS displays comments on all tables and views owned by the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-343** MY\_TAB\_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of a table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

### 12.3.12.113 MY\_TAB\_HISTOGRAMS

MY\_TAB\_HISTOGRAMS displays histogram information about the tables and views owned by the current user. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-344** MY\_TAB\_HISTOGRAMS columns

Name	Type	Description
table_name	character varying(128)	Table name.

Name	Type	Description
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Set it to <b>NULL</b> .
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Set it to <b>NULL</b> .
endpoint_repeat_count	numeric	Not supported. Set it to <b>NULL</b> .
scope	character varying(7)	Not supported. Set it to <b>SHARED</b> .

### 12.3.12.114 MY\_TAB\_MODIFICATIONS

MY\_TAB\_MODIFICATIONS displays statistics about modifications to tables owned by the current user since the last statistics collection on the tables. Currently, this view displays only tables on which INSERT, DELETE, and UPDATE operations have been performed. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-345** MY\_TAB\_MODIFICATIONS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Partition name.
subpartition_name	character varying(128)	Subpartition name.
inserts	numeric	Approximate number of insertions since the last statistics collection.
updates	numeric	Approximate number of updates since the last statistics collection.
deletes	numeric	Approximate number of deletions since the last statistics collection.

Name	Type	Description
timestamp	date	Last modification time. Currently, the modification time of a partitioned table is not supported. Set this parameter to <b>NULL</b> .
truncated	character varying(3)	Not supported. Set it to <b>NULL</b> .
drop_segments	numeric	Not supported. Set it to <b>NULL</b> .
schema_name	character varying(128)	Name of the schema to which the table belongs.

### 12.3.12.115 MY\_TAB\_STATS\_HISTORY

MY\_TAB\_STATS\_HISTORY provides the table statistics history of the tables owned by the current user. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-346** MY\_TAB\_STATS\_HISTORY columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

### 12.3.12.116 MY\_TAB\_STATISTICS

MY\_TAB\_STATISTICS displays statistics about tables owned by the current user in the database. This view exists in the PG\_CATALOG and SYS schemas and all users can access this view.

**Table 12-347** MY\_TAB\_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
partition_position	numeric	Not supported. Set it to <b>NULL</b> .
subpartition_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
subpartition_position	numeric	Not supported. Set it to <b>NULL</b> .
object_type	character varying(12)	Object type <ul style="list-style-type: none"> <li>• TABLE</li> <li>• PARTITION</li> <li>• SUBPARTITION</li> </ul>
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. Set it to <b>NULL</b> .
empty_blocks	numeric	Not supported. Set it to <b>NULL</b> .
avg_space	numeric	Not supported. Set it to <b>NULL</b> .
chain_cnt	numeric	Not supported. Set it to <b>NULL</b> .
avg_row_len	integer	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. Set it to <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Set it to <b>NULL</b> .
avg_cached_blocks	numeric	Not supported. Set it to <b>NULL</b> .
avg_cache_hit_ratio	numeric	Not supported. Set it to <b>NULL</b> .
im_imcu_count	numeric	Not supported. Set it to <b>NULL</b> .
im_block_count	numeric	Not supported. Set it to <b>NULL</b> .
im_stat_update_time	timestamp(6) without time zone	Not supported. Set it to <b>NULL</b> .
scan_rate	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
user_stats	character varying(3)	Not supported. Set it to <b>NULL</b> .
stattype_locked	character varying(5)	Not supported. Set it to <b>NULL</b> .
stale_stats	character varying(7)	Not supported. Set it to <b>NULL</b> .
notes	character varying(25)	Not supported. Set it to <b>NULL</b> .
scope	character varying(7)	Not supported. The default value is <b>SHARED</b> .

### 12.3.12.117 MY\_TABLES

MY\_TABLES displays information about the tables owned by the current user. This view exists in the PG\_CATALOG and SYS schemas. For details about the columns, see [Table 12-348](#).

**Table 12-348** MY\_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. <ul style="list-style-type: none"> <li>• <b>YES</b>: It is deleted.</li> <li>• <b>NO</b>: It is not deleted.</li> </ul>
num_rows	numeric	Estimated number of rows in the table.

Name	Type	Description
status	character varying(8)	Specifies whether the current table is valid. <ul style="list-style-type: none"> <li>● <b>VALID</b>: The current table is valid.</li> <li>● <b>UNUSABLE</b>: The current table is unavailable.</li> </ul>
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. <ul style="list-style-type: none"> <li>● <b>Y</b>: The table is a temporary table.</li> <li>● <b>N</b>: The table is not a temporary table.</li> </ul>
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table. <ul style="list-style-type: none"> <li>● <b>YES</b>: The table is a partitioned table.</li> <li>● <b>NO</b>: The table is not a partitioned table.</li> </ul>
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: The partition row movement is allowed.</li> <li>● <b>DISABLED</b>: The partition row movement is not allowed.</li> </ul>
compression	character varying(8)	Specifies whether to enable a table compression. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: A table compression is enabled.</li> <li>● <b>DISABLED</b>: A table compression is disabled.</li> </ul>

Name	Type	Description
duration	character varying(15)	Time elapsed when a temporary table is processed. <ul style="list-style-type: none"> <li>● <b>NULL</b>: The table is not a temporary table.</li> <li>● <b>sys\$session</b>: The table is a temporary session table.</li> <li>● <b>sys\$transaction</b>: The table is a temporary transaction table.</li> </ul>
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: Logical replication is enabled.</li> <li>● <b>DISABLED</b>: Logical replication is disabled.</li> </ul>
external	character varying(3)	Specifies whether the table is a foreign table. <ul style="list-style-type: none"> <li>● <b>YES</b>: The table is a foreign table.</li> <li>● <b>NO</b>: The table is not a foreign table.</li> </ul>
logging	character varying(3)	Specifies whether to record logs for table changes. <ul style="list-style-type: none"> <li>● <b>YES</b>: Logs are recorded for table changes.</li> <li>● <b>NO</b>: Logs are not recorded for table changes.</li> </ul>
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. <ul style="list-style-type: none"> <li>● <b>ENABLED</b>: The table lock is enabled.</li> <li>● <b>DISABLED</b>: The table lock is disabled.</li> </ul>
nested	character varying(3)	Specifies whether a table is a nested table. <ul style="list-style-type: none"> <li>● <b>YES</b>: The table is a nested table.</li> <li>● <b>NO</b>: The table is not a nested table.</li> </ul>

Name	Type	Description
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. <ul style="list-style-type: none"> <li>• <b>ENABLED</b>: The corrupted block is skipped.</li> <li>• <b>DISABLED</b>: The corrupted block is not skipped.</li> </ul>
has_identity	character varying(3)	Specifies whether a table has an identifier column. <ul style="list-style-type: none"> <li>• <b>YES</b>: There is an identifier column.</li> <li>• <b>NO</b>: There is no identifier column.</li> </ul>
segment_created	character varying(3)	Specifies whether a table segment has been created. <ul style="list-style-type: none"> <li>• <b>YES</b>: The table segment has been created.</li> <li>• <b>NO</b>: The table segment is not created.</li> </ul>
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. <ul style="list-style-type: none"> <li>• <b>YES</b>: The modification of the table is monitored.</li> <li>• <b>NO</b>: The modification of the table is not monitored.</li> </ul>
cluster_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
iot_name	character varying(128)	Not supported. Its value is <b>NULL</b> .
pct_used	numeric	Not supported. Its value is <b>NULL</b> .
initial_extent	numeric	Not supported. Its value is <b>NULL</b> .
next_extent	numeric	Not supported. Its value is <b>NULL</b> .
min_extents	numeric	Not supported. Its value is <b>NULL</b> .
max_extents	numeric	Not supported. Its value is <b>NULL</b> .
pct_increase	numeric	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
freelists	numeric	Not supported. Its value is <b>NULL</b> .
freelist_groups	numeric	Not supported. Its value is <b>NULL</b> .
backed_up	character varying(1)	Not supported. Its value is <b>NULL</b> .
blocks	numeric	Not supported. Its value is <b>NULL</b> .
empty_blocks	numeric	Not supported. Its value is <b>NULL</b> .
avg_space	numeric	Not supported. Its value is <b>NULL</b> .
chain_cnt	numeric	Not supported. Its value is <b>NULL</b> .
avg_space_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
num_freelist_blocks	numeric	Not supported. Its value is <b>NULL</b> .
instances	character varying(10)	Not supported. Its value is <b>NULL</b> .
cache	character varying(5)	Not supported. Its value is <b>NULL</b> .
iot_type	character varying(12)	Not supported. Its value is <b>NULL</b> .
secondary	character varying(1)	Not supported. Its value is <b>NULL</b> .
global_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
user_stats	character varying(3)	Not supported. Its value is <b>NULL</b> .
cluster_owner	character varying(30)	Not supported. Its value is <b>NULL</b> .
dependencies	character varying(8)	Not supported. Its value is <b>NULL</b> .
compression_for	character varying(30)	Not supported. Its value is <b>NULL</b> .
read_only	character varying(3)	Not supported. Its value is <b>NULL</b> .
result_cache	character varying(7)	Not supported. Its value is <b>NULL</b> .
clustering	character varying(3)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
activity_tracking	character varying(23)	Not supported. Its value is <b>NULL</b> .
dml_timestamp	character varying(25)	Not supported. Its value is <b>NULL</b> .
container_data	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_priority	character varying(8)	Not supported. Its value is <b>NULL</b> .
inmemory_distribute	character varying(15)	Not supported. Its value is <b>NULL</b> .
inmemory_compression	character varying(17)	Not supported. Its value is <b>NULL</b> .
inmemory_duplicate	character varying(13)	Not supported. Its value is <b>NULL</b> .
duplicate	character varying(1)	Not supported. Its value is <b>NULL</b> .
sharded	character varying(1)	Not supported. Its value is <b>NULL</b> .
hybrid	character varying(3)	Not supported. Its value is <b>NULL</b> .
cellmemory	character varying(24)	Not supported. Its value is <b>NULL</b> .
containers_default	character varying(3)	Not supported. Its value is <b>NULL</b> .
container_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Its value is <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Its value is <b>NULL</b> .
inmemory_service	character varying(12)	Not supported. Its value is <b>NULL</b> .
inmemory_service_name	character varying(1000)	Not supported. Its value is <b>NULL</b> .
container_map_object	character varying(3)	Not supported. Its value is <b>NULL</b> .
memoptimize_read	character varying(8)	Not supported. Its value is <b>NULL</b> .

Name	Type	Description
memoptimize_write	character varying(8)	Not supported. Its value is <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Its value is <b>NULL</b> .
admit_null	character varying(3)	Not supported. Its value is <b>NULL</b> .
data_link_dml_enabled	character varying(3)	Not supported. Its value is <b>NULL</b> .
object_id_type	character varying(16)	Not supported. Its value is <b>NULL</b> .
table_type_owner	character varying(128)	Not supported. Its value is <b>NULL</b> .
table_type	character varying(128)	Not supported. Its value is <b>NULL</b> .
compress_for	character varying(30)	Not supported. Its value is <b>NULL</b> .

### 12.3.12.118 MY\_TABLESPACES

MY\_TABLESPACES displays the description of tablespaces that store objects owned by users. By default, it is accessible to all users. This view exists in the PG\_CATALOG and SYS schemas. The logical structure features of GaussDB are different from those of the ORA database.

**Table 12-349** MY\_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name.
block_size	numeric	Not supported. Set it to <b>NULL</b> .
initial_extent	numeric	Not supported. Set it to <b>NULL</b> .
next_extent	numeric	Not supported. Set it to <b>NULL</b> .
min_extents	numeric	Not supported. Set it to <b>NULL</b> .
max_extents	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
max_size	numeric	Not supported. Set it to <b>NULL</b> .
pct_increase	numeric	Not supported. Set it to <b>NULL</b> .
min_extlen	numeric	Not supported. Set it to <b>NULL</b> .
contents	character varying(9)	Not supported. Set it to <b>NULL</b> .
status	character varying(9)	Tablespace status. The default value is <b>ONLINE</b> .
logging	character varying(9)	Not supported. Set it to <b>NULL</b> .
force_logging	character varying(3)	Not supported. Set it to <b>NULL</b> .
extent_management	character varying(10)	Not supported. Set it to <b>NULL</b> .
allocation_type	character varying(9)	Not supported. Set it to <b>NULL</b> .
segment_space_management	character varying(6)	Not supported. Set it to <b>NULL</b> .
def_tab_compression	character varying(8)	Not supported. Set it to <b>NULL</b> .
retention	character varying(11)	Not supported. Set it to <b>NULL</b> .
bigfile	character varying(3)	Not supported. Set it to <b>NULL</b> .
predicate_evaluation	character varying(7)	Not supported. Set it to <b>NULL</b> .
encrypted	character varying(3)	Not supported. Set it to <b>NULL</b> .
compress_for	character varying(30)	Not supported. Set it to <b>NULL</b> .
def_inmemory	character varying(8)	Not supported. Set it to <b>NULL</b> .
def_inmemory_priority	character varying(8)	Not supported. Set it to <b>NULL</b> .
def_inmemory_distribute	character varying(15)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
def_inmemory_compression	character varying(17)	Not supported. Set it to <b>NULL</b> .
def_inmemory_duplicate	character varying(13)	Not supported. Set it to <b>NULL</b> .
shared	character varying(12)	Not supported. Set it to <b>NULL</b> .
def_index_compression	character varying(8)	Not supported. Set it to <b>NULL</b> .
index_compress_for	character varying(13)	Not supported. Set it to <b>NULL</b> .
def_cellmemory	character varying(14)	Not supported. Set it to <b>NULL</b> .
def_inmemory_service	character varying(12)	Not supported. Set it to <b>NULL</b> .
def_inmemory_service_name	character varying(1000)	Not supported. Set it to <b>NULL</b> .
lost_write_protect	character varying(7)	Not supported. Set it to <b>NULL</b> .
chunk_tablespace	character varying(1)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.119 MY\_TRIGGERS

MY\_TRIGGERS displays information about the triggers owned by the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-350** MY\_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Trigger type, which can be <b>before statement</b> , <b>before each row</b> , <b>after statement</b> , <b>after each row</b> , or <b>instead of</b> .
triggering_event	character varying	Event that triggers a trigger. The value can be <b>update</b> , <b>insert</b> , <b>delete</b> , or <b>truncate</b> .

Name	Type	Description
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Basic object type of a trigger, which can be <b>table</b> or <b>view</b> .
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Set it to <b>NULL</b> .
referencing_name	character varying(422)	Not supported. Set it to <b>referencing new as new old as old</b> .
when_clause	character varying(4000)	Content of <b>when</b> . <b>TRUE</b> must be evaluated as <b>TRIGGER_BODY</b> to execute.
status	character varying(64)	<ul style="list-style-type: none"> <li>• <b>O</b>: The trigger is enabled in origin or local mode.</li> <li>• <b>D</b>: The trigger is disabled.</li> <li>• <b>R</b>: The trigger is enabled in replica mode.</li> <li>• <b>A</b>: The trigger is always enabled.</li> </ul>
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports <b>call</b> .
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported. Set it to <b>NULL</b> .
before_statement	character varying(3)	Not supported. Set it to <b>NULL</b> .
before_row	character varying(3)	Not supported. Set it to <b>NULL</b> .
after_row	character varying(3)	Not supported. Set it to <b>NULL</b> .
after_statement	character varying(3)	Not supported. Set it to <b>NULL</b> .
instead_of_row	character varying(3)	Not supported. Set it to <b>NULL</b> .
fire_once	character varying(3)	Not supported. Set it to <b>NULL</b> .
apply_server_only	character varying(3)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.120 MY\_TYPE\_ATTRS

MY\_TYPE\_ATTRS displays all types of attributes owned by the current user in the database. This view exists in the PG\_CATALOG and SYS schemas and all users can access this view.

**Table 12-351** MY\_TYPE\_ATTRS columns

Name	Type	Description
type_name	character varying(128)	Data type name.
attr_name	character varying(128)	Attribute name
attr_type_mod	character varying(7)	Type modifier of an attribute: <ul style="list-style-type: none"><li>• REF</li><li>• POINT</li></ul>
attr_type_owner	character varying(128)	Owner of an attribute type
attr_type_name	character varying(128)	Name of an attribute type
length	numeric	Length of the CHAR attribute, or the maximum length of the VARCHAR and character varying attribute
precision	numeric	Decimal precision of a number or DECIMAL attribute, or binary precision of a FLOAT attribute
scale	numeric	Decimal places for a numeric or DECIMAL attribute
character_set_name	character varying(44)	Character set name of an attribute ( <b>Char_CS</b> or <b>NCHAR_CS</b> )
attr_no	numeric	Syntax order number or location (not used as an ID number) of an attribute specified in the type specification or CREATE TYPE statement
inherited	character varying(3)	Specifies whether an attribute is inherited from a supertype. <ul style="list-style-type: none"><li>• <b>YES</b>: It is inherited from a supertype.</li><li>• <b>NO</b>: It is not inherited from a supertype.</li></ul>

### 12.3.12.121 MY\_TYPES

MY\_TYPES describes all object types owned by the current user. All users can access this view. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-352** MY\_TYPES columns

Name	Type	Description
type_name	character varying(128)	Type name.
type_oid	raw	Type OID
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Set it to <b>0</b> .
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is incomplete.
final	character varying(3)	Not supported. Set it to <b>NULL</b> .
instantiable	character varying(3)	Not supported. Set it to <b>NULL</b> .
persistable	character varying(3)	Not supported. Set it to <b>NULL</b> .
supertype_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
supertype_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
local_attributes	numeric	Not supported. Set it to <b>NULL</b> .
local_methods	numeric	Not supported. Set it to <b>NULL</b> .
typeid	raw	Not supported. Set it to <b>NULL</b> .

### 12.3.12.122 MY\_VIEWS

MY\_VIEWS displays information about all views of the current user. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-353** MY\_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of the view.
view_name	character varying(64)	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the <b>TEXT_VC</b> column in this view.
type_text_length	numeric	Not supported. Set it to <b>NULL</b> .
type_text	character varying(4000)	Not supported. Set it to <b>NULL</b> .
oid_text_length	numeric	Not supported. Set it to <b>NULL</b> .
oid_text	character varying(4000)	Not supported. Set it to <b>NULL</b> .
view_type_owner	character varying(128)	Not supported. Set it to <b>NULL</b> .
view_type	character varying(128)	Not supported. Set it to <b>NULL</b> .
superview_name	character varying(128)	Not supported. Set it to <b>NULL</b> .
editioning_view	character varying(1)	Not supported. Set it to <b>NULL</b> .
read_only	character varying(1)	Not supported. Set it to <b>NULL</b> .
container_data	character varying(1)	Not supported. Set it to <b>NULL</b> .
bequeath	character varying(12)	Not supported. Set it to <b>NULL</b> .
origin_con_id	character varying(256)	Not supported. Set it to <b>NULL</b> .
default_collation	character varying(100)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
containers_default	character varying(3)	Not supported. Set it to <b>NULL</b> .
container_map	character varying(3)	Not supported. Set it to <b>NULL</b> .
extended_data_link	character varying(3)	Not supported. Set it to <b>NULL</b> .
extended_data_link_map	character varying(3)	Not supported. Set it to <b>NULL</b> .
has_sensitive_column	character varying(3)	Not supported. Set it to <b>NULL</b> .
admit_null	character varying(3)	Not supported. Set it to <b>NULL</b> .
pdb_local_only	character varying(3)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.123 NLS\_DATABASE\_PARAMETERS

**NLS\_DATABASE\_PARAMETERS** lists the permanent NLS parameters of the database server. This view exists in both **pg\_catalog** and **sys\_schema**. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in the database may be obviously different from those in the ORA database.

**Table 12-354** NLS\_DATABASE\_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name
value	character varying(64)	Parameter value

### 12.3.12.124 NLS\_INSTANCE\_PARAMETERS

**NLS\_INSTANCE\_PARAMETERS** lists the permanent NLS parameters of the database client. This view exists in both **pg\_catalog** and **sys\_schema**. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in the database may be obviously different from those in the ORA database.

**Table 12-355** NLS\_INSTANCE\_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name
value	character varying(64)	Parameter value

### 12.3.12.125 PG\_AVAILABLE\_EXTENSION\_VERSIONS

PG\_AVAILABLE\_EXTENSION\_VERSIONS displays extension versions of certain database features. This view is for internal use only. You are advised not to use it. For details about the columns, see [Table 12-356](#).

**Table 12-356** PG\_AVAILABLE\_EXTENSION\_VERSIONS columns

Name	Type	Description
name	name	Extension name
version	text	Version name
installed	boolean	Specifies whether this extension version is installed. Otherwise, the value is <b>false</b> .
superuser	boolean	Specifies whether only system administrators are allowed to install the extension. Otherwise, the value is <b>false</b> .
relocatable	boolean	Specifies whether the extension can be relocated to another schema. Otherwise, the value is <b>false</b> .
schema	name	Name of the schema that the extension must be installed into ( <b>NULL</b> if the extension is partially or fully relocatable)
requires	name[]	Names of prerequisite extensions ( <b>NULL</b> if none)
comment	text	Comment from the extension's control file.

### 12.3.12.126 PG\_AVAILABLE\_EXTENSIONS

PG\_AVAILABLE\_EXTENSIONS displays the extension information about certain database features. This view is for internal use only. You are advised not to use it. For details about the columns, see [Table 12-357](#).

**Table 12-357** PG\_AVAILABLE\_EXTENSIONS columns

Name	Type	Description
name	name	Extension name
default_version	text	Name of the default version ( <b>NULL</b> if none is specified)
installed_version	text	Currently installed version of the extension ( <b>NULL</b> if no version is installed)
comment	text	Comment from the extension's control file.

### 12.3.12.127 PG\_CONTROL\_GROUP\_CONFIG

**PG\_CONTROL\_GROUP\_CONFIG** stores Cgroup configuration information in the system. Only the user with sysadmin permission can query this view.

**Table 12-358** PG\_CONTROL\_GROUP\_CONFIG columns

Name	Type	Description
pg_control_group_config	text	Configuration information of the Cgroup

### 12.3.12.128 PG\_CURSORS

**PG\_CURSORS** displays cursors that are currently available.

**Table 12-359** PG\_CURSORS columns

Name	Type	Description
name	text	Cursor name
statement	text	Query statement when the cursor is declared to change
is_holdable	boolean	<b>True</b> if the cursor is holdable (it can be accessed after the transaction that declared the cursor has committed); <b>false</b> otherwise
is_binary	boolean	Whether the cursor was declared BINARY. If it was, the value is <b>true</b> .
is_scrollable	boolean	Whether the cursor is scrollable (it allows rows to be retrieved in a nonsequential manner). If it is, the value is <b>true</b> .

Name	Type	Description
creation_time	timestamp with time zone	Timestamp at which the cursor is declared

### 12.3.12.129 PG\_EXT\_STATS

PG\_EXT\_STATS displays extended statistics stored in [PG\\_STATISTIC\\_EXT](#). The extension statistics means multiple columns of statistics. For details about the columns, see [Table 12-360](#).

**Table 12-360** PG\_EXT\_STATS columns

Name	Type	Reference	Description
schemaname	name	<a href="#">PG_NAMESPACE</a> . nspname	Name of the schema that contains a table.
tablename	name	<b>relname</b> in <a href="#">PG_CLASS</a>	Table name
attname	int2vector	<a href="#">PG_STATISTIC_EXT</a> . stakey	Columns to be combined for collecting statistics
inherited	boolean	-	Inherited tables are not supported currently. The value of this column is <b>false</b> .
null_frac	real	-	Percentage of column combinations that are null to all records
avg_width	integer	-	Average width of column combinations, in byte

Name	Type	Reference	Description
n_distinct	real	-	<ul style="list-style-type: none"> <li>• Estimated number of distinct values in a column combination if the value is greater than 0</li> <li>• Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, <b>-1</b> indicates that the number of distinct values is the same as the number of rows for a column combination.               <ol style="list-style-type: none"> <li>1. The negated form is used when <b>ANALYZE</b> believes that the number of distinct values is likely to increase as the table grows.</li> <li>2. The positive form is used when the column seems to have a fixed number of possible values.</li> </ol> </li> <li>• The number of distinct values is unknown if the value is <b>0</b>.</li> </ul>
n_dndistinct	real	-	<p>Number of not-null distinct values in the <b>dn1</b> column combination.</p> <ul style="list-style-type: none"> <li>• Exact number of distinct values if the value is greater than <b>0</b>.</li> <li>• Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, if a value in a column combination appears twice in average, <b>n_dndistinct</b> equals <b>-0.5</b>.</li> <li>• The number of distinct values is unknown if the value is <b>0</b>.</li> </ul>

Name	Type	Reference	Description
most_common_vals	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be <b>NULL</b> . None of the most common values in the column is <b>NULL</b> .
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of <b>most_common_vals</b> is <b>NULL</b> , the value of this column is <b>NULL</b> .
most_common_vals_null	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be <b>NULL</b> . At least one of the common values in the column is <b>NULL</b> .
most_common_freqs_null	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of <b>most_common_vals_null</b> is <b>NULL</b> , the value of this column is <b>NULL</b> .
histogram_bounds	anyarray	-	Boundary value list of the histogram
partitionname	name	<a href="#">PG_PARTITION</a> .relname	Name of the level-1 partition in the partitioned table. For a non-partitioned table, this field is left blank.
subpartitionname	name	<a href="#">PG_PARTITION</a> .relname	Name of the level-2 partition in the partitioned table. For a distributed system, this field is left blank.

### 12.3.12.130 PG\_GET\_SENDERS\_CATCHUP\_TIME

PG\_GET\_SENDERS\_CATCHUP\_TIME displays catchup information of the currently active primary/standby instance sender thread on the DN. For details about the columns, see [Table 12-361](#).

**Table 12-361** PG\_GET\_SENDERS\_CATCHUP\_TIME columns

Name	Type	Description
pid	bigint	Current sender thread ID
lwpid	integer	Current sender lwpid
local_role	text	Local role
peer_role	text	Peer role
state	text	Current sender's replication status <ul style="list-style-type: none"><li>● <b>Startup</b>: startup state.</li><li>● <b>Backup</b>: backup state.</li><li>● <b>Catchup</b>: catch-up state, which indicates that the standby node is catching up with the primary node.</li><li>● <b>Streaming</b>: streaming replication state. When the standby node catches up with the primary node, the replication remains in this state.</li></ul>
type	text	Current sender type <ul style="list-style-type: none"><li>● <b>Wal</b>: type that logs are written in advance.</li><li>● <b>Data</b>: data type.</li></ul>
catchup_start	timestamp with time zone	Startup time of a catchup task
catchup_end	timestamp with time zone	End time of the catchup task

### 12.3.12.131 PG\_GROUP

PG\_GROUP displays the database role authentication and the relationship between roles.

**Table 12-362** PG\_GROUP columns

Name	Type	Description
groname	name	Group name
grosysid	oid	Group ID
grolist	oid[]	An array, including all the role IDs in this group

### 12.3.12.132 PG\_INDEXES

**PG\_INDEXES** provides access to useful information about each index in the database.

**Table 12-363** PG\_INDEXES columns

Name	Type	Reference	Description
schemaname	name	<a href="#">PG_NAMESPACE.nspname</a>	Name of the schema that contains tables and indexes
tablename	name	<a href="#">PG_CLASS.relname</a>	Name of the table for which the index serves
indexname	name	<a href="#">PG_CLASS.relname</a>	Index name
tablespace	name	<a href="#">PG_TABLESPACE.nspname</a>	Name of the tablespace that contains the index
indexdef	text	-	Index definition (a reconstructed <b>CREATE INDEX</b> command)

### 12.3.12.133 PG\_LOCKS

**PG\_LOCKS** displays information about locks held by open transactions. For details about the columns, see [Table 12-364](#).

**Table 12-364** PG\_LOCKS columns

Name	Type	Reference	Description
locktype	text	-	Type of the locked object. The value can be <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b> .

Name	Type	Reference	Description
database	oid	OID in <a href="#">PG_DATABASE</a>	OID of the database in which the locked target exists. <ul style="list-style-type: none"> <li>The OID is <b>0</b> if the target is a shared object.</li> <li>The OID is <b>NULL</b> if the locked object is a transaction.</li> </ul>
relation	oid	OID in <a href="#">PG_CLASS</a>	OID of the relationship targeted by the lock ( <b>NULL</b> if the object is not a relation or part of a relation).
page	integer	-	Page number targeted by the lock within the relation ( <b>NULL</b> if the object is not a relation page or row page).
tuple	smallint	-	Row number targeted by the lock within the page ( <b>NULL</b> if the object is not a row).
bucket	integer	-	Hash bucket ID.
virtualxid	text	-	ID of the virtual transaction The value is <b>NULL</b> if the object is not a virtual transaction.
transactionid	xid	-	ID of the transaction. The value is <b>NULL</b> if the object is not a transaction.
classid	oid	OID in <a href="#">PG_CLASS</a>	OID of the system catalog that contains the object ( <b>NULL</b> if the object is not a general database object).
objid	oid	-	OID of the lock target within its system catalog ( <b>NULL</b> if the target is not a general database object).
objsubid	smallint	-	Column number for a column in the table. The value is <b>0</b> if the object is some other object type. The value is <b>NULL</b> if the object is not a general database object.
virtualtransaction	text	-	Virtual ID of the virtual transaction holding or awaiting this lock.
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.

Name	Type	Reference	Description
sessionid	bigint	-	ID of the session that holds or waits for the lock.
mode	text	-	Lock mode held or desired by this thread. The value can be <b>AccessShareLock</b> , <b>RowShareLock</b> , <b>RowExclusiveLock</b> , <b>ShareLock</b> , <b>ShareRowExclusiveLock</b> , <b>ExclusiveLock</b> , or <b>AccessExclusiveLock</b> .
granted	boolean	-	<ul style="list-style-type: none"> <li>The value is <b>TRUE</b> if the lock is a held lock.</li> <li>The value is <b>FALSE</b> if the lock is an awaited lock.</li> </ul>
fastpath	boolean	-	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.
locktag	text	-	Lock information that the session waits for. It can be parsed using the locktag_decode() function.
global_sessionid	text	-	Global session ID.

### 12.3.12.134 PG\_NODE\_ENV

**PG\_NODE\_ENV** displays environment variables of the current node. Only the user with system administrator or monitor admin permission can access this system view.

**Table 12-365** PG\_NODE\_ENV columns

Name	Type	Description
node_name	text	Current node name
host	text	Host name of the node
process	integer	Number of the node process
port	integer	Port ID of the node
installpath	text	Installation directory of the node
datapath	text	Data directory of the node

Name	Type	Description
log_directory	text	Log directory of the node

### 12.3.12.135 PG\_OS\_THREADS

**PG\_OS\_THREADS** provides status information about all the threads under the current node.

**Table 12-366** PG\_OS\_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	PID of the thread running under the current node process
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID

### 12.3.12.136 PG\_PREPARED\_STATEMENTS

**PG\_PREPARED\_STATEMENTS** displays all prepared statements that are available in the current session.

**Table 12-367** PG\_PREPARED\_STATEMENTS columns

Name	Type	Description
name	text	Identifier of the prepared statement
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created

Name	Type	Description
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of <b>regtype</b> . The OID corresponding to an element of this array can be obtained by converting the <b>regtype</b> value to <b>oid</b> .
from_sql	boolean	<ul style="list-style-type: none"> <li>• <b>True</b> if the prepared statement was created through the PREPARE statement</li> <li>• <b>False</b> if the statement was prepared through the frontend/backend protocol</li> </ul>

### 12.3.12.137 PG\_PREPARED\_XACTS

**PG\_PREPARED\_XACTS** displays information about transactions that are currently prepared for two-phase commit.

**Table 12-368** PG\_PREPARED\_XACTS columns

Name	Type	Reference	Description
transaction	xid	-	Numeric transaction identifier of the prepared transaction
gid	text	-	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	-	Time at which the transaction is prepared for commit
owner	name	<a href="#">PG_AUTHID</a> .rolname	Name of the user that executes the transaction
database	name	<a href="#">PG_DATABASE</a> .datname	Name of the database in which the transaction is executed

### 12.3.12.138 PG\_REPLICATION\_SLOTS

**PG\_REPLICATION\_SLOTS** displays replication slot information. For details about the columns, see [Table 12-369](#).

**Table 12-371** PG\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM
gxid	xid	Transaction ID
state	tinyint	Transaction status ( <b>3</b> : prepared; <b>0</b> : starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum <ul style="list-style-type: none"><li>• <b>t</b> (true): yes</li><li>• <b>f</b> (false): no</li></ul>
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the <b>prepared</b> state ( <b>0</b> if the state is not <b>prepared</b> )
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent from a CN to a DN

### 12.3.12.141 PG\_SETTINGS

**PG\_SETTINGS** provides information about parameters of the running database.

**Table 12-372** PG\_SETTINGS columns

Name	Type	Description
name	text	Parameter name
setting	text	Current parameter value
unit	text	Implicit unit of the parameter
category	text	Logical group of the parameter
short_desc	text	Brief description of the parameter
extra_desc	text	Detailed description of the parameter
context	text	Context of parameter values, including <b>internal</b> , <b>postmaster</b> , <b>sigup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b>
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b>
source	text	Method of assigning the parameter value

Name	Type	Description
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup
reset_val	text	Default parameter value used upon the database reset
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number of the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

### 12.3.12.142 PG\_SHARED\_MEMORY\_DETAIL

**PG\_SHARED\_MEMORY\_DETAIL** queries usage information about all the shared memory contexts.

**Table 12-373** PG\_SHARED\_MEMORY\_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory, in bytes
freesize	bigint	Remaining size of the shared memory, in bytes
usedsize	bigint	Used size of the shared memory, in bytes

### 12.3.12.143 PG\_STATS

PG\_STATS displays single-column statistics stored in the **pg\_statistic** table. The GUC parameter **autovacuum\_naptime** specifies the interval for updating statistics recorded in the view. For details about the columns, see [Table 12-374](#).

**Table 12-374** PG\_STATS columns

Name	Type	Reference	Description
schemaname	name	<a href="#">PG_NAMESPACE</a> .nspname	Name of the schema that contains a table.
tablename	name	<b>relname</b> in <a href="#">PG_CLASS</a>	Table name
attname	name	<a href="#">PG_ATTRIBUTE</a> .attname	Field name
inherited	boolean	-	Inherited tables are not supported currently. The value of this column is <b>false</b> .
null_frac	real	-	Percentage of column entries that are null
avg_width	integer	-	Average width in bytes of column's entries
n_distinct	real	-	<ul style="list-style-type: none"> <li>Estimated number of distinct values in the column if the value is greater than 0</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, -1 indicates that the number of distinct values is the same as the number of rows for a column combination. <ol style="list-style-type: none"> <li>The negated form is used when ANALYZE believes that the number of distinct values is likely to increase as the table grows.</li> <li>The positive form is used when the column seems to have a fixed number of possible values.</li> </ol> </li> <li>The number of distinct values is unknown if the value is 0.</li> </ul>

Name	Type	Reference	Description
n_dndistinct	real	-	<p>Number of not-null distinct values in the <b>dn1</b> column.</p> <ul style="list-style-type: none"> <li>Exact number of distinct values if the value is greater than <b>0</b>.</li> <li>Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by -1 if the value is less than 0. For example, if the value of a column appears twice in average, set <b>n_dndistinct=-0.5</b>.</li> <li>The number of distinct values is unknown if the value is <b>0</b>.</li> </ul>
most_common_vals	anyarray	-	List of the most common values in a column. If this column does not have the most common value, the value is <b>NULL</b> .
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. ( <b>NULL</b> if <b>most_common_vals</b> is <b>NULL</b> )
histogram_bounds	anyarray	-	Frequency histogram consisting of values excluding null values and MCVs. If a value appears in the value of <b>most_common_vals</b> , it does not appear in the histogram. If the column data type does not have the < operator or the list specified by <b>most_common_vals</b> contains all values of the column, the histogram information of the column is <b>NULL</b> .
correlation	real	-	Correlation between the physical row sequence and logical row sequence of a column value. The value ranges from -1 to +1. When the value is close to -1 or +1, the index scan overhead is less than that when the value is close to 0 because random access to the disk is reduced. This column is <b>NULL</b> if the column data type does not have a < operator.
most_common_elems	anyarray	-	A list of non-null element values most often appearing

Name	Type	Reference	Description
most_common_elem_freqs	real[]	-	List that records the frequency of the most commonly used non-null elements.
elem_count_histogram	real[]	-	A histogram of the counts of distinct non-null element values
partitionname	name	<a href="#">PG_PARTITION.relname</a>	Name of the level-1 partition in the partitioned table. For a non-partitioned table, this field is left blank.
subpartitionname	name	<a href="#">PG_PARTITION.relname</a>	Name of the level-2 partition in the partitioned table. For a distributed system, this field is left blank.

### 12.3.12.144 PG\_STAT\_ACTIVITY

PG\_STAT\_ACTIVITY displays information about the current user's queries. The columns save information about the last query. For details about the columns, see [Table 12-375](#).

**Table 12-375** PG\_STAT\_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
username	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as <b>AUTOVACUUM</b> .

Name	Type	Description
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used).
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started ( <b>NULL</b> if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b> . For a stored procedure and function, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when <b>state</b> was last modified.
waiting	boolean	Specifies whether the backend is currently waiting for a lock. If yes, the value is <b>true</b> . Otherwise, the value is <b>false</b> .
enqueue	text	Queuing status of a statement. The value can be: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>

Name	Type	Description
state	text	<p>Overall status of this backend. The value can be:</p> <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle</b>: The backend is waiting for a new client command.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Common users can view their own session status only. The state information of other accounts is empty. For example, after user <b>judy</b> is connected to the database, the state information of user <b>joe</b> and the initial user <b>omm</b> in <b>pg_stat_activity</b> is empty.</p> <pre>SELECT datname, username, usesysid, state,pid FROM pg_stat_activity;  datname   username   usesysid   state    pid -----+-----+-----+-----+----- +-----+ testdb   omm             10          139968752121616 testdb   omm             10          139968903116560 db_tpcds   judy       16398   active   139968391403280 testdb   omm             10          139968643069712 testdb   omm             10          139968680818448 testdb   joe        16390          139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query statement.

Name	Type	Description
query	text	Text of this backend's most recent query. If the value of <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter <b>connection_info</b> .
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Amount of Xlogs currently used by a transaction, in bytes.

### 12.3.12.145 PG\_STAT\_ALL\_INDEXES

PG\_STAT\_ALL\_INDEXES displays statistics about accesses to a specific index by querying each index row in the current database. For details about the columns, see [Table 12-376](#).

Indexes can be used via either simple index scans or bitmap index scans. In a bitmap scan the output of indexes can be combined via AND or OR rules, so it is difficult to associate individual heap row fetches with specific indexes when a bitmap scan is used. Therefore, each bitmap scan increments the **pg\_stat\_all\_indexes.idx\_tup\_read** count(s) for the index(es) it uses, and it increments the **pg\_stat\_all\_tables.idx\_tup\_fetch** count for the table, but it does not affect **pg\_stat\_all\_indexes.idx\_tup\_fetch**.

**Table 12-376** PG\_STAT\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.

Name	Type	Description
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 12.3.12.146 PG\_STAT\_ALL\_TABLES

PG\_STAT\_ALL\_TABLES queries one row for each table in the current database (including TOAST tables), showing statistics about a specific table. For details about the columns, see [Table 12-377](#).

**Table 12-377** PG\_STAT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated in the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (that is, with no separate index update required).
n_live_tup	bigint	Estimated number of active rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when the table was cleared.
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table is cleared.
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Time when the data in the table changes last time. Operations that cause data changes include insert, update, delete, and truncate on the table and exchange, truncate, and drop on the table partitions (partitions/subpartitions). This field is not recorded in the system catalog. Data in this column is recorded only on the local CN.

### 12.3.12.147 PG\_STAT\_BAD\_BLOCK

PG\_STAT\_BAD\_BLOCK displays statistics about page verification failures after a node is started. For details about the columns, see [Table 12-378](#).

**Table 12-378** PG\_STAT\_BAD\_BLOCK columns

Name	Type	Description
nodename	text	Node name
databaseid	integer	OID of a database
tablespaceid	integer	Tablespace OID
relfilenode	integer	File object ID.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	File type. The options are as follows: <ul style="list-style-type: none"><li>• 0: main data file.</li><li>• 1: FSM file.</li><li>• 2: VM file.</li><li>• 3: BCM file.</li></ul>
error_count	integer	Number of verification failures
first_time	timestamp with time zone	Time of the first verification failure
last_time	timestamp with time zone	Time of the latest verification failure.

### 12.3.12.148 PG\_STAT\_BGWRITER

PG\_STAT\_BGWRITER displays statistics about the activity of the background writer process. For details about the columns, see [Table 12-379](#).

**Table 12-379** PG\_STAT\_BGWRITER columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of checkpoints that have been performed actively.
checkpoint_write_time	double precision	Total time spent in the checkpoint processing portion when writing files to disk, in milliseconds.
checkpoint_sync_time	double precision	Total time spent in the checkpoint processing portion when synchronizing files to disk, in milliseconds.

Name	Type	Description
buffers_checkpoint	bigint	Number of buffers written by checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer process.
maxwritten_clean	bigint	Number of times that cleanup scanning stops because the background writer process writes too many buffers.
buffers_backend	bigint	Number of buffers written directly by the backend.
buffers_backend_fsync	bigint	Number of times that the backend calls fsync (usually, even if the backend executes these write actions, the background writer process processes them again).
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

### 12.3.12.149 PG\_STAT\_DATABASE

**PG\_STAT\_DATABASE** contains database statistics for each database in the cluster.

**Table 12-380** PG\_STAT\_DATABASE columns

Name	Type	Description
datid	oid	OID of a database
datname	name	Name of the database
numbackends	integer	Number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed
xact_rollback	bigint	Number of transactions in this database that have been rolled back
blks_read	bigint	Number of disk blocks read in this database

Name	Type	Description
blks_hit	bigint	Number of times disk blocks were found in the cache (that is, the buffer cache, not the file system cache of the operating system), so that a read is not necessary
tup_returned	bigint	Number of rows returned by queries in this database
tup_fetched	bigint	Number of rows fetched by queries in this database
tup_inserted	bigint	Number of rows inserted by queries in this database
tup_updated	bigint	Number of rows updated by queries in this database
tup_deleted	bigint	Number of rows deleted by queries in this database
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby server). For details, see <a href="#">PG_STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (for example, sorting or hashing), and regardless of the <b>log_temp_files</b> setting.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the <b>log_temp_files</b> setting.
deadlocks	bigint	Number of deadlocks detected in this database
blk_read_time	double precision	Time spent reading data file blocks by backends in this database, in milliseconds
blk_write_time	double precision	Time spent reading data file blocks by backends in this database, in milliseconds
stats_reset	timestamp with time zone	Time at which the current statistics were reset

### 12.3.12.150 PG\_STAT\_DATABASE\_CONFLICTS

**PG\_STAT\_DATABASE\_CONFLICTS** displays statistics about database conflicts.

**Table 12-381** PG\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datid	oid	ID of a database
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

### 12.3.12.151 PG\_STAT\_REPLICATION

**PG\_STAT\_REPLICATION** displays information about the log synchronization thread, such as the locations where the sender sends logs and where the receiver receives logs. For details about the columns, see [Table 12-382](#).

**Table 12-382** PG\_STAT\_REPLICATION columns

Name	Type	Description
pid	bigint	PID of the thread
usesysid	oid	User system ID.
username	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program

Name	Type	Description
state	text	Status of the log synchronization thread: <ul style="list-style-type: none"> <li>● <b>startup</b>: The thread is being started.</li> <li>● <b>catchup</b>: The thread is establishing a connection between the standby node and the primary node.</li> <li>● <b>streaming</b>: The thread has established a connection between the standby node and the primary node and is replicating data streams.</li> <li>● <b>backup</b>: The thread is sending a backup.</li> <li>● <b>stopping</b>: The thread is being stopped.</li> </ul>
sender_sent_location	text	Location where the transmit sends logs
receiver_write_location	text	Location where the receive end writes logs
receiver_flush_location	text	Location where the receive end flushes logs
receiver_replay_location	text	Location where the receive end replays logs
sync_priority	integer	Priority of synchronous duplication ( <b>0</b> indicates asynchronization.)

Name	Type	Description
sync_state	text	<p>Synchronization state:</p> <ul style="list-style-type: none"> <li>• <b>async</b>: asynchronous replication.</li> <li>• <b>sync</b>: synchronous replication.</li> <li>• <b>potential</b>: The standby node is asynchronous currently, but if a current synchronization node fails, the standby node becomes synchronous.</li> <li>• <b>quorum</b>: switches between the synchronous and asynchronous states to ensure that there are more than a certain number of synchronous standby servers. Generally, the number of synchronous standby servers is <math>(n + 1)/2 - 1</math>, where <math>n</math> indicates the total number of copies. Whether the standby server is synchronous depends on whether logs are received first. For details, see the description of the <b>synchronous_standby_names</b> parameter.</li> </ul>

### 12.3.12.152 PG\_STAT\_SYS\_INDEXES

PG\_STAT\_SYS\_INDEXES displays index status information about all the system catalogs in the pg\_catalog and information\_schema schemas. For details about the columns, see [Table 12-383](#).

**Table 12-383** PG\_STAT\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index

Name	Type	Description
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 12.3.12.153 PG\_STAT\_SYS\_TABLES

PG\_STAT\_SYS\_TABLES displays statistics about the system catalogs of all the namespaces in pg\_catalog and information\_schema schemas. For details about the columns, see [Table 12-384](#).

**Table 12-384** PG\_STAT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated in the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding <b>VACUUM FULL</b> )

Name	Type	Description
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Last modification time of the table data.

### 12.3.12.154 PG\_STAT\_USER\_FUNCTIONS

**PG\_STAT\_USER\_FUNCTIONS** shows user-defined function status information in the namespace. (The language of the function is non-internal language.)

**Table 12-385** PG\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it

Name	Type	Description
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

### 12.3.12.155 PG\_STAT\_USER\_INDEXES

PG\_STAT\_USER\_INDEXES displays information about the index status of user-defined ordinary tables and TOAST tables. For details about the columns, see [Table 12-386](#).

**Table 12-386** PG\_STAT\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 12.3.12.156 PG\_STAT\_USER\_TABLES

PG\_STAT\_USER\_TABLES displays information about user-defined ordinary tables and TOAST tables in the namespaces. For details about the columns, see [Table 12-387](#).

**Table 12-387** PG\_STAT\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of the table.

Name	Type	Description
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated in the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding <b>VACUUM FULL</b> )
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times the table has been manually analyzed.

Name	Type	Description
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Last modification time of the table data.

### 12.3.12.157 PG\_STAT\_XACT\_ALL\_TABLES

**PG\_STAT\_XACT\_ALL\_TABLES** displays transaction status information about all ordinary tables and TOAST tables in the namespaces.

**Table 12-388** PG\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

### 12.3.12.158 PG\_STAT\_XACT\_SYS\_TABLES

**PG\_STAT\_XACT\_SYS\_TABLES** displays transaction status information of the system catalog in the namespace.

**Table 12-389** PG\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of the table

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

### 12.3.12.159 PG\_STAT\_XACT\_USER\_FUNCTIONS

**PG\_STAT\_XACT\_USER\_FUNCTIONS** contains statistics on the execution of each function.

**Table 12-390** PG\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times that the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

### 12.3.12.160 PG\_STAT\_XACT\_USER\_TABLES

**PG\_STAT\_XACT\_USER\_TABLES** displays transaction status information of the user table in the namespace.

**Table 12-391** PG\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

### 12.3.12.161 PG\_STATIO\_ALL\_INDEXES

**PG\_STATIO\_ALL\_INDEXES** contains one row for each index in the current database, showing I/O statistics about accesses to that specific index.

**Table 12-392** PG\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 12.3.12.162 PG\_STATIO\_ALL\_SEQUENCES

**PG\_STATIO\_ALL\_SEQUENCES** contains the I/O statistics of each sequence in the current database.

**Table 12-393** PG\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

### 12.3.12.163 PG\_STATIO\_ALL\_TABLES

**PG\_STATIO\_ALL\_TABLES** contains I/O statistics for each table (including the TOAST table) in the current database.

**Table 12-394** PG\_STATIO\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits of all indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table

Name	Type	Description
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 12.3.12.164 PG\_STATIO\_SYS\_INDEXES

**PG\_STATIO\_SYS\_INDEXES** displays I/O status information for all system catalog indexes in a namespace.

**Table 12-395** PG\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 12.3.12.165 PG\_STATIO\_SYS\_SEQUENCES

**PG\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all the sequences in the namespace.

**Table 12-396** PG\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

### 12.3.12.166 PG\_STATIO\_SYS\_TABLES

**PG\_STATIO\_SYS\_TABLES** shows I/O status information about all the system catalogs in the namespace.

**Table 12-397** PG\_STATIO\_SYS\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from the index in the table
idx_blks_hit	bigint	Number of cache hits in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 12.3.12.167 PG\_STATIO\_USER\_INDEXES

**PG\_STATIO\_USER\_INDEXES** displays I/O status information about all the user relationship table indexes in the namespace.

**Table 12-398** PG\_STATIO\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index

Name	Type	Description
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

### 12.3.12.168 PG\_STATIO\_USER\_SEQUENCES

**PG\_STATIO\_USER\_SEQUENCES** shows I/O status information about all the user relationship table sequences in the namespace.

**Table 12-399** PG\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

### 12.3.12.169 PG\_STATIO\_USER\_TABLES

**PG\_STATIO\_USER\_TABLES** displays I/O status information about all the user relationship tables in the namespace.

**Table 12-400** PG\_STATIO\_USER\_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from the index in the table
idx_blks_hit	bigint	Number of cache hits in the table

Name	Type	Description
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

### 12.3.12.170 PG\_TABLES

**PG\_TABLES** provides access to each table in the database.

**Table 12-401** PG\_TABLES columns

Name	Type	Reference	Description
schemaname	name	<a href="#">PG_NAMESPACE.nspname</a>	Name of the schema that contains a table
tablename	name	<a href="#">PG_CLASS.relname</a>	Table name
tableowner	name	pg_get_userbyid( <a href="#">PG_CLASS.relowner</a> )	Table owner
tablespace	name	<a href="#">PG_TABLESPACE.spcname</a>	Tablespace that contains the table (default value: <b>null</b> )
hasindexes	boolean	<a href="#">PG_CLASS.relhasindex</a>	Whether the table has (or recently had) an index. If it does, the value is <b>true</b> . Otherwise, the value is <b>false</b> .
hasrules	boolean	<a href="#">PG_CLASS.relhasrules</a>	Whether the table has rules. If it does, the value is <b>true</b> . Otherwise, the value is <b>false</b> .
hastriggers	boolean	<a href="#">PG_CLASS.RELHASTRIGGERS</a>	The value is <b>true</b> if the table has triggers; otherwise, the value is <b>false</b> .
tablecreator	name	pg_get_userbyid( <a href="#">PG_OBJECT.creator</a> )	Table creator.

Name	Type	Reference	Description
created	timestamp with time zone	<a href="#">PG_OBJECT.ctime</a>	Time when the table is created.
last_ddl_time	timestamp with time zone	<a href="#">PG_OBJECT.mtime</a>	Time when the DDL operation is performed on the table for the last time.

### 12.3.12.171 PG\_THREAD\_WAIT\_STATUS

PG\_THREAD\_WAIT\_STATUS allows you to test the block waiting status about the backend thread and auxiliary thread of the current instance. For details about the columns, see [Table 12-402](#).

**Table 12-402** PG\_THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Current session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent session ID.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table 12-403</a> .

Name	Type	Description
wait_event	text	If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting to obtain.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

**Table 12-403** shows the waiting status in the **wait\_status** column.

**Table 12-403** Waiting state list

Value	Description
none	Waiting for no event.
acquire lock	Waiting for locking until the locking succeeds or times out.
acquire lwlock	Waiting for a lightweight lock.
wait io	Waiting until the I/O is complete
wait cmd	Waiting for reading network communication packets to complete.
wait pooler get conn	Waiting for pooler to obtain connections.
wait pooler abort conn	Waiting for pooler to terminate connections.
wait pooler clean conn	Waiting for pooler to clear connections.
pooler create conn: [nodename], total N	Waiting for the pooler to set up a connection. The connection is being established with the node specified by <i>nodename</i> , and there are <i>N</i> connections waiting to be set up.
get conn	Obtaining the connection to other nodes.

Value	Description
set cmd: [nodename]	Waiting for running the <b>SET</b> , <b>RESET</b> , <b>TRANSACTION BLOCK LEVEL PARA SET</b> , or <b>SESSION LEVEL PARA SET</b> command on the connection. The statement is being executed on the node specified by <i>nodename</i> .
cancel query	Canceling the SQL statement that is being executed through the connection.
stop query	Stopping the query that is being executed through the connection.
wait node: [nodename] (plevel), total N, [phase]	Waiting for receiving data from a connected node. The thread is waiting for data from the plevel thread of the node specified by <i>nodename</i> . The data of <i>N</i> connections is waiting to be returned. If <i>phase</i> is included, the possible phases are as follows: <ul style="list-style-type: none"> <li>• <b>begin</b>: The transaction is being started.</li> <li>• <b>commit</b>: The transaction is being committed.</li> <li>• <b>rollback</b>: The transaction is being rolled back.</li> </ul>
wait transaction sync: xid	Waiting for synchronizing the transaction specified by <i>xid</i> .
wait wal sync	Waiting for the completion of WAL of synchronization from the specified LSN to the standby instance.
wait data sync	Waiting for the completion of data page synchronization to the standby instance.
wait data sync queue	Waiting for putting the data pages that are in the row-store into the synchronization queue.
flush data: [nodename] (plevel), [phase]	Waiting for sending data to the plevel thread of the node specified by <i>nodename</i> . If <i>phase</i> is included, the possible phase is <b>wait quota</b> , indicating that the current communication flow is waiting for the quota value.
stream get conn: [nodename], total N	Waiting for connecting to the consumer object of the node specified by <i>nodename</i> when the stream flow is initialized. There are <i>N</i> consumers waiting to be connected.
wait producer ready: [nodename] (plevel), total N	Waiting for each producer to be ready when the stream flow is initialized. The thread is waiting for the procedure of the plevel thread on the <i>nodename</i> node to be ready. There are <i>N</i> producers waiting to be ready.
synchronize quit	Waiting for the threads in the stream thread group to quit when the stream plan ends.

Value	Description
nodegroup destroy	Waiting for destroying the stream node group when the stream plan ends.
wait active statement	Waiting for job execution under resource and load control.
gtm connect	Waiting for connecting to GTM.
gtm get gxid	Waiting for obtaining <i>xid</i> from GTM.
gtm get snapshot	Waiting for obtaining transaction snapshots from GTM.
gtm begin trans	Waiting for GTM to start a transaction.
gtm commit trans	Waiting for GTM to commit a transaction.
gtm rollback trans	Waiting for GTM to roll back a transaction.
gtm start prepare trans	Waiting for GTM to start the prepare phase of a two-phase transaction.
gtm prepare trans	Waiting for GTM to complete the prepare phase of a two-phase transaction.
gtm open sequence	Waiting for GTM to open a sequence.
gtm close sequence	Waiting for GTM to close a sequence.
gtm create sequence	Waiting for GTM to create a sequence.
gtm alter sequence	Waiting for GTM to modify a sequence.
gtm get sequence val	Waiting for obtaining the next value of a sequence from GTM.
gtm set sequence val	Waiting for GTM to set a sequence value.
gtm drop sequence	Waiting for GTM to delete a sequence.
gtm rename sequence	Waiting for GTM to rename a sequence.
analyze: [relname], [phase]	The thread is running <b>ANALYZE</b> to the <i>relname</i> table. If <i>phase</i> is included, the possible phase is <b>autovacuum</b> , indicating that the database automatically enables the AutoVacuum thread to run <b>ANALYZE</b> .
vacuum: [relname], [phase]	The thread is running <b>VACUUM</b> to the <i>relname</i> table. If <i>phase</i> is included, the possible phase is <b>autovacuum</b> , indicating that the database automatically enables the AutoVacuum thread to run <b>VACUUM</b> .
vacuum full: [relname]	The thread is running <b>VACUUM FULL</b> to the <i>relname</i> table.

Value	Description
create index	Creating an index.
HashJoin - [ build hash   write file ]	<p>The <b>HashJoin</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming.</p> <ul style="list-style-type: none"> <li>• <b>build hash</b>: The <b>HashJoin</b> operator is creating a hash table.</li> <li>• <b>write file</b>: The <b>HashJoin</b> operator is writing data to disks.</li> </ul>
HashAgg - [ build hash   write file ]	<p>The <b>HashAgg</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming.</p> <ul style="list-style-type: none"> <li>• <b>build hash</b>: The <b>HashAgg</b> operator is creating a hash table.</li> <li>• <b>write file</b>: The <b>HashAgg</b> operator is writing data to disks.</li> </ul>
HashSetop - [build hash   write file ]	<p>The <b>HashSetop</b> operator is being executed. In this phase, you need to pay attention to the execution time-consuming.</p> <ul style="list-style-type: none"> <li>• <b>build hash</b>: The <b>HashSetop</b> operator is creating a hash table.</li> <li>• <b>write file</b>: The <b>HashSetop</b> operator is writing data to disks.</li> </ul>
Sort   Sort - [fetch tuple   write file]	<p>The <b>Sort</b> operator is used for sorting. <b>fetch tuple</b> indicates that the <b>Sort</b> operator is obtaining tuples, and <b>write file</b> indicates that the <b>Sort</b> operator is writing data to disks.</p>
Material   Material - write file	<p>The <b>Material</b> operator is being executed. <b>write file</b> indicates that the <b>Material</b> operator is writing data to disks.</p>
standby read recovery conflict	<p>The read-only mode of the standby node conflicts with the log replay mode.</p>
standby get snapshot	<p>The standby node obtains the snapshot in read-only mode.</p>
prune table	<p>Waiting for a heap table to clear historical deleted data.</p>
prune index	<p>Waiting for an index to clear historical deleted data.</p>
vacuum gpi	<p>Waiting for a GPI index to clear historical deleted data.</p>
gtm reset xmin	<p>Waiting for GTM to reset the minimum transaction ID.</p>

Value	Description
gtm get xmin	Waiting for obtaining the minimum transaction ID from GTM.
gtm get csn	Waiting for obtaining the CSN from GTM.
gtm start prepare trans	Waiting for the GTM to start a two-phase transaction.
gtm rename sequence	Waiting for the GTM to rename a sequence.
wait reserve td	Waiting for an Ustore transaction slot allocation.
wait td rollback	Waiting for an Ustore transaction slot to roll back transactions.
wait available td	Waiting for an available transaction slot for Ustore.
wait transaction rollback	Waiting for a transaction to roll back.
gtm set disaster cluster	Waiting for setting the DR cluster information on the GTM.
gtm get disaster cluster	Waiting for obtaining the DR cluster information from the GTM.
gtm del disaster cluster	Waiting for deleting the DR cluster information from the GTM.
gtm set consistency point	Waiting for setting the consistency point in GTM.
wait sync bgworkers	Waiting for an index subthread created in parallel to complete local scanning and sorting.
wait gs_sleep	Waiting for the server thread delay.
wait vacuum delay	Waiting for VACUUM delay.
wait seq scan	Execution time of seq scan.
wait index scan	Execution time of index scan.
wait checkpoint start	Start time of the checkpoint phase.
wait checkpoint done	End time of the checkpoint phase.
wait xact start command	Start time of xact.
wait xact commit command	Commit time of xact.
wait io control	Waiting for job execution under I/O control.
security audit write pipe	Waiting for an audit log to be written to the pipe.

If **wait\_status** is **acquire lwlock**, **acquire lock**, or **wait io**, there is an event performing I/O operations or waiting for obtaining the corresponding lightweight lock or transaction lock.

**Table 12-404** describes the corresponding wait events when **wait\_status** is **acquire lwlock**. If **wait\_event** is **extension**, the lightweight lock is dynamically allocated and is not monitored.

**Table 12-404** List of wait events corresponding to lightweight locks

<b>wait_event</b>	<b>Description</b>
ShmemIndexLock	Used to protect the primary index table, a hash table, in shared memory
OidGenLock	Used to prevent different threads from generating the same OID
XidGenLock	Used to prevent two transactions from obtaining the same XID
ProcArrayLock	Used to prevent concurrent access to or concurrent modification on the ProcArray shared array
SInvalReadLock	Used to prevent concurrent execution with invalid message deletion
SInvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion
WALInsertLock	Used to prevent concurrent execution with WAL insertion
WALWriteLock	Used to prevent concurrent write from a WAL buffer to a disk
ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the <b>pg_control</b> file
CheckpointLock	Used to prevent multi-checkpoint concurrent execution
CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure
SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the subtransaction control data structure
MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode
MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on <b>pg_multixact/offset</b>
MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on <b>pg_multixact/members</b>
RelCacheInitLock	Used to add a lock before any operations are performed on the <b>init</b> file when messages are invalid

<b>wait_event</b>	<b>Description</b>
CheckpointInterCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
TwoPhaseStateLock	Used to prevent concurrent access to or modification on two-phase information sharing arrays
TablespaceCreateLock	Used to check whether a tablespace exists.
BtreeVacuumLock	Used to prevent VACUUM from clearing pages that are being used by B-tree indexes
AlterPortLock	Used to protect the CN's operation of changing the registered port number.
AutovacuumLock	Used to access the autovacuum worker array in serial mode
AutovacuumScheduleLock	Used to distribute tables requiring VACUUM in serial mode
AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution
SyncScanLock	Used to determine the start position of a relfilenode during heap scanning
NodeTableLock	Used to protect a shared structure that stores CN and DN node information.
PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool
RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated
Async Ctl	Used to protect asynchronization buffers.
AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status
AsyncQueueLock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue
SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions
SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions
SerializablePredicateLockListLock	Used to protect a linked list of serializable transactions that have locks
OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts

<b>wait_event</b>	<b>Description</b>
FileStatLock	Used to protect a data structure that stores statistics file information
SyncRepLock	Used to protect Xlog synchronization information during primary-standby replication
DataSyncRepLock	Used to protect data page synchronization information during primary-standby replication
MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out
ExtensionConnectorLibLock	Used to add a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios
SearchServerLibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios
LsnXlogChkFileLock	Used to serially update the Xlog flush points for primary and standby servers recorded in a specific structure
GTMHostInfoLock	Used to prevent concurrent access to or concurrent modification on GTM host information
ReplicationSlotAllocationLock	Used to add a lock when a primary server allocates streaming replication slots during primary-standby replication
ReplicationSlotControlLock	Used to prevent concurrent update of replication slot status during primary-standby replication
ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table
OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path
JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled task where MPP is compatible with Oracle
OBSRuntimeLock	Used to obtain environment variables, for example, GASSHOME
LLVMDumpIRLock	Used to export the assembly language for dynamically generating functions.
LLVMParseIRLock	Used to compile and parse a finished IR function from the IR file at the start position of a query.
CriticalCacheBuildLock	Used to load caches from a shared or local cache initialization file
WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios

<b>wait_event</b>	<b>Description</b>
BufMappingLock	Used to protect operations on a table mapped to shared buffer
LockMgrLock	Used to protect a common lock structure
PredicateLockMgrLock	Used to protect a lock structure that has serializable transactions
OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level
OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level
SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level
SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level
CacheSlotMappingLock	Used to protect global CU cache information
BarrierLock	Used to ensure that only one thread is creating a barrier at a time
GPCCommitLock	Used to protect the addition of the global plan cache hash table.
GPCClearLock	Used to protect the clearing of the global plan cache hash table.
GPCTimelineLock	Used to protect the timeline check of the global plan cache hash table.
GPCMappingLock	Used to manage the global plan cache.
GPCPrepareMappingLock	Used to manage the global plan cache.
GPRCMappingLock	Used to manage the access and modification operations of the global cache hash table of autonomous transactions.
BufFreelistLock	Used to ensure the atomicity of free list operations in the shared buffer.
AddinShmemInitLock	Used to protect the initialization of the shared memory object.
wait active statement	Waiting for job execution under resource and load control.

<b>wait_event</b>	<b>Description</b>
wait memory	Waiting for obtaining the memory.
DnUsedSpaceHashLock	Used to update space usage information corresponding to a session.
InstanceRealTLock	Used to protect the update of the hash table that stores shared instance statistics.
IOStatLock	Used to concurrently maintain the hash table of resource management I/O statistics.
PldebugLock	Used to debug stored procedures and perform concurrent maintenance operations.
StartBlockMappingLock	Used by globalstat to obtain information such as startblockarray from pgstat.
GlobalSeqLock	Used to manage global sequence numbers.
MatviewSeqnoLock	Used to manage the cache of materialized views.
DataFileIdCacheLock	Used to manage the concurrent access and storage of hash table that stores data file descriptor in the shared memory.
GTMHostInfoLock	Used to protect the concurrent access and storage of shared GTM host information.
TwoPhaseStatePartLock	Used to protect the status information of two-phase transactions (in each partition).
WALBufMappingLock	Used to protect the mapping between WAL buffer page and LSN offset.
UndoZoneLock	Used to protect the concurrent access and storage of undo zone.
RollbackReqHashLock	Used to protect the concurrent access and storage of hash table that stores the rollback request in the shared memory.
UHeapStatLock	Used to protect the concurrent access and storage of Ustore statistics.
WALWritePaxosLock	Used to protect the concurrent sequence of WAL log written to the paxos replication component.
SyncPaxosLock	Used to protect the concurrent access and storage of paxos synchronization queue.
BackgroundWorkerLock	Used to protect the concurrent sequence of background workers.
HadrSwitchoverLock	Used to protect the concurrent sequence of DR switchover.
HashUidLock	Used to protect the concurrent sequence of UID allocation.

<b>wait_event</b>	<b>Description</b>
ParallelDecodeLock	Used to protect the concurrent sequence of parallel decoding.
XLogMaxCSNLock	Used to protect the maximum volume of CSNs that can be restored locally in DR mode.
DisasterCacheLock	Used to protect the concurrent access and storage of DR cache information in the shared memory.
MaxCSNArrayLock	Used to protect the restoration progress of standby node CSNs in each shard in the shared memory.
RepairBadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.
DropArchiveSlotLock	Used to protect the concurrent sequence of deleting the archive slot.
ProcXactMappingLock	Used to protect the concurrent access and storage of the hash table that stores the mapping information between transaction IDs and threads.
UndoPerZoneLock	Used to protect the concurrent access and storage of each information in undo zone.
UndoSpaceLock	Used to protect the concurrent access and storage of undo space.
SnapshotBlockLock	Used to control the concurrent sequence of snapshot-based backup and disk flushing.
DWSingleFlushFirstLock	Used to control the concurrent sequence of non-segment-pages and single-page doublewrite files.
DWSingleFlushSecondLock	Used to control the concurrent sequence of segment-pages and single-page doublewrite files.
DWSingleFlushSecondBufTagLock	Used to control the concurrent access and storage of metadata of segment-pages and single-page doublewrite files.
RestartPointQueueLock	Used to control the concurrent access and storage of restart point arrays on the standby node.
UnlinkRelHashTblLock	Used to protect the concurrent access and storage of the hash table that restores files to be deleted.
UnlinkRelForkHashTblLock	Used to protect the concurrent access and storage of the hash table that restores the fork files to be deleted.
WALFlushWait	Used to protect the concurrent sequence of log flushing.
WALConsensusWait	Used to protect the transaction commit or log replay which is performed only when the logs are consistent.

<b>wait_event</b>	<b>Description</b>
WALBufferInitWait	Used to protect the initialization and disk flushing sequence of WAL pages in the shared memory.
WALInitSegment	Used to protect the initialization sequence of WAL segment files.
SegmentHeadPartitionLock	Used to protect the partition lock of metadata in the segment-page header.
PgwrSyncQueueLock	Used to protect the concurrent access and storage of file queues to be flushed to disks.
BarrierHashTblLock	Used to protect the concurrent access and storage of barrier tables in the shared memory.
PageRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired pages.
FileRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired files.
BadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.
BufferIOLock	Used to protect the concurrent I/O for loading or evicting a single page in the shared buffer.
BufferContentLock	Used to protect the concurrent read and write operations on a single page in the shared buffer.
CUSlotListLock	Used to protect the concurrent access and storage of the slot linked list in the shared CU.
DataCacheLock	Used to protect the concurrent access and storage of the read-only cache in the shared CU.
MetaCacheLock	Used to protect the concurrent access and storage of the meta cache in the shared CU.
CBMParseXlogLock	Used to control the concurrent access and storage of CBM files.
CLogBufMappingLock	Used to control the concurrent access and storage of mapping in the shared clog page.
CLOG Ctl	Used to control the concurrent access and storage of each clog partition.
CSNBufMappingLock	Used to control the concurrent access and storage of mapping in the shared cslog page.
CSNLOG Ctl	Used to control the concurrent access and storage of each cslog partition.

<b>wait_event</b>	<b>Description</b>
DelayDDLLock	Used to control the concurrent sequence of DDL and delay backup function of the deletion.
DoubleWriteLock	Used to control the concurrent sequence of double write module.
DfsConnectorCacheLock	Used to control the concurrent access and storage of dfs connection cache.
DfsUserLoginLock	Used to control the concurrent sequence of dfs user login.
DfsSpaceCacheLock	Used to control the concurrent sequence of dfs space management cache.
PGPROCLock	Used to protect the concurrent access and storage of global shared thread array.
RelfilenodeReuseLock	Used to control the concurrent sequence of file name reuse.
ReplicationSlotLock	Used to protect the concurrent access and storage of logical replication slot.
LogicalReplicationSlotPersistentDataLock	Used to control the concurrent access and storage of logical replication slot persistence.
RowPageReplicationLock	Used to control the concurrent sequence of row-store page replication.
MultiXactOffsetCtl	Used to protect the concurrent access and storage of multixact offset document.
MultiXactMemberCtl	Used to protect the concurrent access and storage of multixact member document.
OldSerXid SLRU Ctl	Used to protect the concurrent access and storage of oldser transaction ID cache.
FullBuildXlogCopyStartPtrLock	Used to control the concurrent access and storage of the start point of full build request.
RcvWriteLock	Used to control the concurrent sequence of WAL receiver writer.
XlogRemoveSegLock	Used to control the concurrent access and storage of latest deleted WAL document.
CsnMinLock	Used to control the concurrent access and storage of CSN MIN
HypoIndexLock	Used to create, delete and reset the virtual index by the lightweight lock.
XGBoostLibLock	Used by DB4AI to call the XGBoost library.

wait_event	Description
InstrUserLockId	Used to protect the concurrent modification of the hash table that stores user login and logout records.
GsStackLock	Used to ensure that the gs_stack function is not concurrently invoked.
InstrStmtTrackCtl Lock	Used to protect the concurrent access and storage of the hash table when full SQL statements are dynamically enabled.
CaptureViewFile-HashLock	Used to protect the concurrent access and storage of the hash table when capturing the performance view.
UniqueSqlEvictLock	Used to protect the concurrent access and storage of the hash table when the unique SQL reclamation is enabled.
ASPMappingLock	Used to manage the concurrent access and storage of the ASP hash table.
AuditIndexFileLock	Used to protect concurrent read and write of index files in the audit log.
TDEKeyCacheLock	Used to control the concurrent read and write of cached data keys encrypted transparently.
SQLAdvisorLock	Used to manage the concurrent access and storage of recommended hash tables in distribution key management.
BlockchainVersionLock	Used to control the concurrent read and write of global block numbers in the ledger database.
GlobalPrevHashLock	Used to control the concurrent read and write of global verification hash tables in the ledger database.
LWTRANCHE_AC COUNT_TABLE	Used to control the concurrent read and write of the hash table that stores the account locking status.

**Table 12-405** describes the corresponding wait events when **wait\_status** is **wait io**.

**Table 12-405** List of I/O wait events

wait_event	Description
BufFileRead	Reads data from a temporary file to a specified buffer.
BufFileWrite	Writes the content of a specified buffer to a temporary file.
ControlFileRead	Reads the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.

<b>wait_event</b>	<b>Description</b>
ControlFileSync	Flushes the <b>pg_control</b> file to a disk, mainly during database initialization.
ControlFileSyncUpdate	Flushes the <b>pg_control</b> file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileWrite	Writes the <b>pg_control</b> file, during database initialization.
ControlFileWriteUpdate	Updates the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
CopyFileRead	Reads a file during file copying.
CopyFileWrite	Writes a file during file copying.
DataFileExtend	Writes a file during file name extension.
DataFileFlush	Flushes a table data file to a disk.
DataFileImmediateSync	Flushes a table data file to a disk immediately.
DataFilePrefetch	Reads a table data file asynchronously.
DataFileRead	Reads a table data file synchronously.
DataFileSync	Flushes table data file modifications to a disk.
DataFileTruncate	Truncates a table data file.
DataFileWrite	Writes a table data file.
LockFileAddToDataDirRead	Reads the <b>postmaster.pid</b> file.
LockFileAddToDataDirSync	Flushes the <b>postmaster.pid</b> file to a disk.
LockFileAddToDataDirWrite	Writes PID information into the <b>postmaster.pid</b> file.
LockFileCreateRead	Reads the LockFile file <b>%s.lock</b> .
LockFileCreateSync	Flushes the LockFile file <b>%s.lock</b> to a disk.
LockFileCreateWRITE	Writes PID information into the LockFile file <b>%s.lock</b> .
NgroupDestoryLock	Adds a lock to the concurrent modification of the Node Group hash table.
NGroupMappingLock	Adds a lock to the concurrent modification of a single bucket that protects the NodeGroup hash table.

<b>wait_event</b>	<b>Description</b>
RelationMapRead	Reads the mapping file between system catalogs and storage locations.
RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
ReplicationSlotRead	Reads a streaming replication slot file during a restart.
ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk during a restart.
ReplicationSlotSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.
ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.
SLRUFlushSync	Flushes the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files to a disk, mainly during checkpoint execution and database shutdown.
SLRURead	Reads the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files.
SLRUSync	Writes dirty pages into the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files, and flushes the files to a disk, mainly during checkpoint execution and database shutdown.
SLRUWrite	Writes the <b>pg_clog</b> , <b>pg_subtrans</b> , and <b>pg_multixact</b> files.
TimelineHistoryRead	Reads the timeline history file during database startup.
TimelineHistorySync	Flushes the timeline history file to a disk during database startup.
TimelineHistoryWrite	Writes to the timeline history file during database startup.
TwophaseFileRead	Reads the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
TwophaseFileSync	Flushes the <b>pg_twophase</b> file to a disk, mainly during two-phase transaction commit and restoration.
TwophaseFileWrite	Writes the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.

<b>wait_event</b>	<b>Description</b>
WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WALCopyRead	Reads operation generated when an existing WAL file is read for replication after archiving and restoration.
WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WALCopyWrite	Writes operation generated when an existing WAL file is read for replication after archiving and restoration.
WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WALInitWrite	Initializes a newly created WAL file to 0 during log reclaiming or writing.
WALRead	Reads data from Xlogs during redo operations on two-phase files.
WALSyncMethodAssign	Flushes all open WAL files to a disk.
WALWrite	Writes a WAL file.
DoubleWriteFileRead	Waiting for reading the double-write file.
DoubleWriteFileSync	Waiting for flushing the double-write file to the disk.
DoubleWriteFileWrite	Waiting for writing the double-write file.
PredoProcessPending	Waiting for the replay of the remaining records processing in parallel.
PredoApply	Waiting for the replay of the application in parallel.
DisableConnectFile-Read	Waiting for reading the lock segment file.
DisableConnectFile-Sync	Waiting for flushing lock segment files to the disk.
DisableConnectFile-Write	Waiting for writing the lock segment file.
BufHashTableSearch	Used to search the hash table in the shared buffer (page eviction may be triggered).
StrategyGetBuffer	Used to obtain pages from strategy buffer (page eviction may be triggered).
UndoFileExtend	Used to extend an undo file.
UndoFilePrefetch	Used to prefetch an undo file.
UndoFileRead	Used to read an undo file.

<b>wait_event</b>	<b>Description</b>
UndoFileWrite	Used to write an undo file.
UndoFileSync	Used to flush an undo file to disks.
UndoFileUnlink	Used to delete an undo file.
UndoMetaSync	Used to flush an undo metadata file to disks.
WALBufferAccess	Used to access WAL buffer (To ensure performance, only the number of access times is counted in the kernel code, and the access duration is not counted.).
WALBufferFull	Used to write WAL files when the WAL buffer is full.
DWSingleFlushGet-Pos	Used by a single-page doublewrite file to search for available location.
DWSingleFlushWrite	Used to flush a single-page doublewrite file to disks.
CkptWaitPageWriter-Flush	Used to wait for page refreshing during full checkpoint execution.
CkptWaitPageWriter-Sync	Used to wait for the modified file to be synchronized to the disk before checkpointing.
CkptWaitCommitTransactionFinish	Used to wait until all transactions are committed before checkpointing.
MPFL_INIT	Used to initiate max_page_flush_lsn.
MPFL_READ	Used to read max_page_flush_lsn.
MPFL_WRITE	Used to write max_page_flush_lsn.
OBSList	Used to traverse an OBS directory.
OBSRead	Used to read an OBS object.
OBSWrite	Used to write an OBS object.
LOGCTRL_SLEEP	Waiting for the standby node to catch up with logs.
ShareStorageWal-Read	Used to read log files from the shared disk.
ShareStorageWal-Write	Used to write log files to the shared disk.
ShareStorageCtlInfo-Read	Used to read control information from the shared disk.
ShareStorageCtlInfo-Write	Used to write control information to the shared disk.
SegFileExtend	Used to extend segment-page files.
SegReadDisk	Used to read segment-page files.

wait_event	Description
SegWriteDisk	Used to write segment-page files.
SegSync	Used to flush segment-page files.
SegFileShrink	Used to collapse segment-page files.

**Table 12-406** describes the corresponding wait events when **wait\_status** is **acquire lock**.

**Table 12-406** List of wait events corresponding to transaction locks

wait_event	Description
relation	Adds a lock to a table.
extend	Adds a lock to a table being scaled out.
partition	Adds a lock to a partitioned table.
partition_seq	Adds a lock to a partition of a partitioned table.
page	Adds a lock to a table page.
tuple	Adds a lock to a tuple on a page.
transactionid	Adds a lock to a transaction ID.
virtualxid	Adds a lock to a virtual transaction ID.
object	Adds a lock to an object.
userlock	Adds a lock to a user.
advisory	Adds an advisory lock.
filenode	Used to lock the file name.
subtransacti onid	Used to add a lock to a sub-transaction ID.
tuple_uid	Used to add a lock to the UID hidden field in the tuple header.

### 12.3.12.172 PG\_TIMEZONE\_ABBREVS

**PG\_TIMEZONE\_ABBREVS** displays information about all available time zones.

**Table 12-407** PG\_TIMEZONE\_ABBREVS columns

Name	Type	Description
abbrev	text	Time zone name abbreviation

Name	Type	Description
utc_offset	interval	Offset from UTC
is_dst	boolean	Whether DST is used. If DST is used, the value is <b>true</b> . Otherwise, the value is <b>false</b> .

### 12.3.12.173 PG\_TIMEZONE\_NAMES

**PG\_TIMEZONE\_NAMES** displays all time zone names that can be recognized by **SET TIMEZONE**, along with their abbreviations, UTC offsets, and daylight saving time (DST) statuses.

Table 12-408 PG\_TIMEZONE\_NAMES columns

Name	Type	Description
name	text	Name of the time zone
abbrev	text	Abbreviation of the ime zone name
utc_offset	interval	Offset from UTC
is_dst	boolean	Whether DST is used. If DST is used, the value is <b>true</b> . Otherwise, the value is <b>false</b> .

### 12.3.12.174 PG\_TOTAL\_MEMORY\_DETAIL

**PG\_TOTAL\_MEMORY\_DETAIL** displays memory usage of a node in the database.

Table 12-409 PG\_TOTAL\_MEMORY\_DETAIL columns

Name	Type	Description
nodename	text	Node name
memorytype	text	Memory name
memorybytes	integer	Size of the used memory, in MB

### 12.3.12.175 PG\_TOTAL\_USER\_RESOURCE\_INFO

**PG\_TOTAL\_USER\_RESOURCE\_INFO** displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**. I/O monitoring items are valid only when **enable\_logical\_io\_statistics** is set to **on**.

**Table 12-410** PG\_TOTAL\_USER\_RESOURCE\_INFO columns

Name	Type	Description
username	name	Username
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use. CPU usage data is collected only in complex jobs, and the value is the CPU usage of the related Cgroup.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used permanent table storage space, in KB
total_space	bigint	Available permanent table storage space, in KB (-1 if the storage space is not limited)
used_temp_space	bigint	Used temporary space, in KB
total_temp_space	bigint	Total available temporary space, in KB (-1 if the temporary space is not limited)
used_spill_space	bigint	Size of the used operator flushing space, in KB
total_spill_space	bigint	Total size of the available operator flushing space, in KB (-1 if the space is not limited)
read_kbytes	bigint	CN: total bytes read by the user's complex jobs on all DNs in the last 5 seconds, in KB DN: total bytes read by the user's complex jobs from the instance startup time to the current time, in KB
write_kbytes	bigint	CN: total bytes written by the user's complex jobs on all DNs in the last 5 seconds, in KB DN: total bytes written by the user's complex jobs from the instance startup time to the current time, in KB
read_counts	bigint	CN: total number of read times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of read times of the user's complex jobs from the instance startup time to the current time

Name	Type	Description
write_counts	bigint	CN: total number of write times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of write times of the user's complex jobs from the instance startup time to the current time
read_speed	double precision	CN: average read rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s DN: average read rate of the user's complex jobs on the DN in the last 5 seconds, in KB/s
write_speed	double precision	CN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s DN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s

### 12.3.12.176 PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID

**PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID** displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**.

**Table 12-411** PG\_TOTAL\_USER\_RESOURCE\_INFO\_OID columns

Name	Type	Description
userid	oid	User ID
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space, in KB
total_space	bigint	Available storage space, in KB. The value <b>-1</b> indicates that the space is not limited.
used_temp_space	bigint	Used temporary storage space, in KB

Name	Type	Description
total_temp_space	bigint	Total available temporary space, in KB. The value -1 indicates that the space is not limited.
used_spill_space	bigint	Used disk space for spilling, in KB
total_spill_space	bigint	Total available disk space for spilling, in KB. The value -1 indicates that the space is not limited.
read_kbytes	bigint	Volume of data read from the disk, in KB.
write_kbytes	bigint	Volume of data written to the disk, in KB.
read_counts	bigint	Number of disk read times.
write_counts	bigint	Number of disk write times.
read_speed	double precision	Disk read rate, in B/ms.
write_speed	double precision	Disk write rate, in B/ms.

### 12.3.12.177 PG\_VARIABLE\_INFO

**PGXC\_VARIABLE\_INFO** records information about transaction IDs and OIDs of the current node in a cluster.

**Table 12-412** PG\_VARIABLE\_INFO columns

Name	Type	Description
node_name	text	Node name
next_oid	oid	OID generated next time for the node
next_xid	xid	Transaction ID generated next time for the node
oldest_xid	xid	Oldest transaction ID on the node
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node
last_extend_csn_logpage	xid	Number of the last extended cslog page
start_extend_csn_logpage	xid	Number of the page from which cslog extending starts

Name	Type	Description
next_commit_seqno	xid	CSN generated next time for the node
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback
startup_max_xid	xid	Last transaction ID before the node is powered off

### 12.3.12.178 PG\_VIEWS

**PG\_VIEWS** provides access to basic information about each view in the database.

**Table 12-413** PG\_VIEWS columns

Name	Type	Reference	Description
schemaname	name	<a href="#">PG_NAMESPACE</a> .nspname	Name of the schema that contains the view
viewname	name	<a href="#">PG_CLASS</a> .relname	View name
viewowner	name	<a href="#">PG_AUTHID</a> .Erolname	Owner of the view
definition	text	-	Definition of the view

### 12.3.12.179 PGXC\_GET\_STAT\_ALL\_TABLES

**PGXC\_GET\_STAT\_ALL\_TABLES** obtains information about insertion, update, and deletion operations on tables and the dirty page rate of tables. Before running **VACUUM FULL** to a system catalog with a high dirty page rate, ensure that no user is performing operations on it. This view is a new feature of GaussDB, and will not collect statistics on insertion, update, and deletion operations in earlier versions. You are advised to run **VACUUM FULL** to tables (excluding system catalogs) whose dirty page rate exceeds 30% or run it based on service scenarios. Only users with the system admin or monitor admin permission can view the information.

**Table 12-414** PGXC\_GET\_STAT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID
relname	name	Table name
schemaname	name	Schema name of the table
n_tup_ins	numeric	Number of inserted tuples

Name	Type	Description
n_tup_upd	numeric	Number of updated tuples
n_tup_del	numeric	Number of deleted tuples
n_live_tup	numeric	Number of live tuples
n_dead_tup	numeric	Number of dead tuples
dirty_page_rate	numeric(5,2)	Dirty page rate (%) of a table

### 12.3.12.180 PGXC\_GET\_TABLE\_SKEWNESS

**PGXC\_GET\_TABLE\_SKEWNESS** stores the data skew on tables in the current database. Only the system administrator has the permission to access.

**Table 12-415** PGXC\_GET\_TABLE\_SKEWNESS columns

Name	Type	Description
schemaname	name	Schema name of a table
tablename	name	Table name
totalsize	numeric	Total size of the table, in bytes
avgsiz	numeric(1000,0)	Average table size (total table size divided by the number of DNs), which is the ideal size of tables distributed on each DN
maxratio	numeric(4,3)	Ratio of the maximum table size on a single DN to the total table size
minratio	numeric(4,3)	Ratio of the minimum table size on a single DN to the total table size
skewsize	bigint	Table skew rate (the maximum table size on a single DN minus the minimum table size on a single DN)
skewratio	numeric(4,3)	Table skew rate (skew size divided by total table size)
skewstddev	numeric(1000,0)	Standard deviation of table distribution (For two tables of the same size, a larger deviation indicates a more severe skew.)

### 12.3.12.181 PGXC\_NODE\_ENV

**PGXC\_NODE\_ENV** provides environmental variables of all nodes in a cluster. This view can be viewed only by the monitor admin and sysadmin users.

**Table 12-416** PGXC\_NODE\_ENV columns

Name	Type	Description
node_name1	text	All node names in the cluster
host1	text	Host names of all the nodes in the cluster
process1	integer	Process IDs of all the nodes in the cluster
port1	integer	Port numbers of all the nodes in the cluster
installpath1	text	Installation directory of all the nodes in the cluster
datapath1	text	Data directory of all the nodes in the cluster
log_directory1	text	Log directory of all the nodes in the cluster

### 12.3.12.182 PGXC\_OS\_THREADS

PGXC\_OS\_THREADS provides information about the thread status of all normal nodes in the current cluster. Only the system administrator and monitor administrator can access this view.

**Table 12-417** PGXC\_OS\_THREADS columns

Name	Type	Description
node_name	text	All normal node names in the cluster
pid	bigint	IDs of running threads among all the normal node processes in the current cluster
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID

### 12.3.12.183 PGXC\_PREPARED\_XACTS

PGXC\_PREPARED\_XACTS displays two-phase transactions in the **prepared** phase. Only users with the system admin or monitor admin permission can view the information.

**Table 12-418** PGXC\_PREPARED\_XACTS columns

Name	Type	Description
pgxc_prepared_xact	text	Displays the two-phase transaction in the <b>prepared</b> phase.

### 12.3.12.184 PGXC\_RUNNING\_XACTS

**PGXC\_RUNNING\_XACTS** displays information about running transactions on each node in the cluster. The content is the same as that displayed by **PG\_RUNNING\_XACTS**. Only users with the system admin or monitor admin permission can view the information.

**Table 12-419** PGXC\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM
gxid	xid	Transaction ID
state	tinyint	Transaction status ( <b>3</b> : prepared; <b>0</b> : starting)
node	text	Node name
xmin	xid	Minimum transaction ID on the node
vacuum	boolean	Whether the current transaction is lazy vacuum <ul style="list-style-type: none"> <li>• <b>t (true)</b>: yes.</li> <li>• <b>f (false)</b>: no.</li> </ul>
timeline	bigint	Number of database restarts
prepare_xid	xid	Transaction ID in the <b>prepared</b> state ( <b>0</b> if the state is not <b>prepared</b> )
pid	bigint	Thread ID corresponding to the transaction
next_xid	xid	Transaction ID sent from a CN to a DN

### 12.3.12.185 PGXC\_STAT\_ACTIVITY

**PGXC\_STAT\_ACTIVITY** displays information about the current user's queries on all CNs in the current cluster. Only users with the **monitor admin** or **sysadmin** permission can view the view. Three columns are added to version 505.0.0. During the gray upgrade observation period, an error is reported. You need to use **PG\_STAT\_ACTIVITY** to directly connect to the target node for query. For details about the columns, see [Table 12-420](#).

**Table 12-420** PGXC\_STAT\_ACTIVITY columns

Name	Type	Description
coorname	text	Name of a CN in the current cluster
datid	oid	OID of the database that the user session connects to in the backend
datname	text	Name of the database that the user session connects to in the backend
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend
username	text	Name of the user logged in to the backend
application_name	text	Name of the application connected to the backend
client_addr	inet	IP address of the client connected to the backend. If this column is <b>null</b> , either the client is connected via a Unix socket on the server machine or this is an internal process such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null for IP connections only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used)
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server
xact_start	timestamp with time zone	Time when the current transaction was started ( <b>null</b> if no transaction is active). If the current query is the first of its transaction, this column is equal to the <b>query_start</b> column.
query_start	timestamp with time zone	Time when the currently active query was started, or if <b>state</b> is not <b>active</b> , when the last query was started

Name	Type	Description
state_change	timestamp with time zone	Time when the last <b>status</b> was changed
waiting	boolean	Specifies whether the backend is currently waiting for a lock. If yes, the value is <b>true</b> . Otherwise, the value is <b>false</b> . If a lock is being waited for on a DN, determine the DN based on the <b>wait_status</b> column in the pg_thread_wait_status view and query the <b>waiting</b> column in pg_stat_activity on the DN to check whether a lock wait occurs.
enqueue	text	Queuing status of a statement. Its value can be: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>

Name	Type	Description
state	text	<p>Backend status. Its value can be:</p> <ul style="list-style-type: none"> <li>● <b>active</b>: The backend is executing a query.</li> <li>● <b>idle</b>: The backend is waiting for a new client command.</li> <li>● <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>● <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>● <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>● <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Only system administrators can view the session status of their accounts. The state information of other accounts is empty. For example, after user <b>judy</b> is connected to the database, the state information of user <b>joe</b> and the initial user <b>omm</b> in <b>pgxc_stat_activity</b> is empty.</p> <pre>SELECT datname, username, usesysid, state,pid FROM pgxc_stat_activity;  datname   username   usesysid   state    pid -----+-----+-----+-----+----- +-----+ testdb   omm        10               139968752121616 testdb   omm        10               139968903116560 db_tpcds   judy       16398     active   139968391403280 testdb   omm        10               139968643069712 testdb   omm        10               139968680818448 testdb   joe        16390            139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user
query_id	bigint	ID of a query statement.

Name	Type	Description
query	text	Latest query at the backend. If <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter <b>connection_info</b> .
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Amount of Xlogs currently used by a transaction, in bytes.

### 12.3.12.186 PGXC\_STAT\_BAD\_BLOCK

PGXC\_STAT\_BAD\_BLOCK displays statistics about page verification failures after all nodes in a cluster are started. This view can be viewed only by the monitor admin and sysadmin users. For details about the columns, see [Table 12-421](#).

**Table 12-421** PGXC\_STAT\_BAD\_BLOCK columns

Name	Type	Description
nodename	text	Node name
databaseid	integer	Database OID
tablespaceid	integer	Tablespace OID
relfilenode	integer	File object ID.

Name	Type	Description
forknum	integer	File type. The options are as follows: <ul style="list-style-type: none"> <li>• 0: main data file.</li> <li>• 1: FSM file.</li> <li>• 2: VM file.</li> <li>• 3: BCM file.</li> </ul>
error_count	integer	Number of verification failures
first_time	timestamp with time zone	Time of the first verification failure
last_time	timestamp with time zone	Time of the latest verification failure

### 12.3.12.187 PGXC\_SQL\_COUNT

**PGXC\_SQL\_COUNT** displays node-level and user-level statistical results for the **SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO** statements in real time, identifies query types with heavy load, and measures the capability of a cluster or node to perform a specific type of query. For example, you can calculate QPS based on the quantities of the five types of SQL statements at certain time points. **USER1 SELECT** is counted as **X1** at T1 and as **X2** at T2. The **SELECT** QPS of the user can be calculated as follows:  $(X2 - X1)/(T2 - T1)$ . In this way, the system can draw cluster-user-level QPS curve graphs and determine cluster throughput, tracing changes in the service load of each user. If there are drastic changes, the system can locate the specific statement type (such as **SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**). You can also observe QPS curves to determine the time points when problems occur and then locate the problems using other tools. The curves provide a basis for optimizing cluster performance and locating problems. This view can be viewed only by the monitor admin and sysadmin users. The query can be performed only on the CN. The **execute direct on (dn)'select \* from PGXC\_SQL\_COUNT'**; statement is not supported.

Columns in the **PGXC\_SQL\_COUNT** view are the same as those in the **GS\_SQL\_COUNT** view. For details, see [Table 12-318](#).

#### NOTE

If a **MERGE INTO** statement can be pushed down and a DN receives it, the statement will be counted on the DN and the value of the **mergeinto\_count** column will be incremented by 1. If pushdown is not allowed, the DN will receive an **UPDATE** or **INSERT** statement. In this case, the **update\_count** or **insert\_count** column will be incremented by 1.

### 12.3.12.188 PGXC\_THREAD\_WAIT\_STATUS

In **PGXC\_THREAD\_WAIT\_STATUS**, you can see all the call layer hierarchy relationship between threads of the SQL statements on all the nodes in a cluster, and the waiting status of the block for each thread, so that you can easily locate the causes of process response failures and similar phenomena.

The definitions of **PGXC\_THREAD\_WAIT\_STATUS** view and **PG\_THREAD\_WAIT\_STATUS** view are the same, because the essence of the

**PGXC\_THREAD\_WAIT\_STATUS** view is the query summary of the **PG\_THREAD\_WAIT\_STATUS** view on each node in the cluster.

**Table 12-422** PGXC\_THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Current node name
db_name	text	Database name
thread_name	text	Thread name
query_id	bigint	Query ID. It is equivalent to <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread
sessionid	bigint	Session ID
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent session ID
tlevel	integer	Level of the streaming thread
smpid	integer	Concurrent thread ID
wait_status	text	Detailed information about the waiting status of the current thread
wait_event	text	Event that the current thread is waiting for. For details, see <a href="#">Table 12-403</a> .
locktag	text	Information about the lock that the current thread is waiting for
lockmode	text	Lock mode that the current thread is waiting to obtain
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock
global_sessionid	text	Global session ID

Example:

If you run a statement on coordinator1 and no response is returned after a long period of time, establish another connection to coordinator1 to check the thread status on it.

```
gaussdb=# select * from pg_thread_wait_status where query_id > 0;
-[ RECORD 1 ]-----+
node_name      | cn_5001
db_name        | tpcc_row
thread_name    | PostgreSQL JDBC Driver
query_id       | 72620544050065400
tid            | 140650239031040
sessionid      | 11680
lwtid          | 26762
```

```

pssessionid |
tlevel      | 0
smpid       | 0
wait_status | wait node: dn_6007_6008_6009, total 1
wait_event  | wait node

```

### 12.3.12.189 PGXC\_TOTAL\_MEMORY\_DETAIL

PGXC\_TOTAL\_MEMORY\_DETAIL displays memory usage in the cluster. The query can be performed only on the CN. The EXECUTE DIRECT ON (dn) 'SELECT \* FROM PGXC\_TOTAL\_MEMORY\_DETAIL'; statement is not supported. Only users with the sysadmin and monitor admin permissions can query this view. For details about the columns, see [Table 12-423](#).

**Table 12-423** PGXC\_TOTAL\_MEMORY\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	<p>Memory name.</p> <ul style="list-style-type: none"> <li>• <b>max_process_memory</b>: memory occupied by a GaussDB cluster instance.</li> <li>• <b>process_used_memory</b>: memory occupied by a GaussDB process.</li> <li>• <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>• <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>• <b>dynamic_peak_memory</b>: dynamic memory peak.</li> <li>• <b>dynamic_used_shrctx</b>: maximum dynamic shared memory context.</li> <li>• <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>• <b>max_shared_memory</b>: maximum shared memory.</li> <li>• <b>shared_used_memory</b>: used shared memory.</li> <li>• <b>max_sctpcomm_memory</b>: maximum memory allowed for the communications library.</li> <li>• <b>sctpcomm_used_memory</b>: memory used by the communications library.</li> <li>• <b>sctpcomm_peak_memory</b>: memory peak of the communications library.</li> <li>• <b>other_used_memory</b>: other used memory.</li> </ul>
memorybytes	integer	Size of the used memory (unit: MB).

### 12.3.12.190 PGXC\_VARIABLE\_INFO

**PGXC\_VARIABLE\_INFO** records information about transaction IDs and OIDs of all nodes in a cluster. This view can be viewed only by the monitor admin and sysadmin users. The query can be performed only on the CN. The **execute direct on (dn)'select \* from PGXC\_VARIABLE\_INFO'**; statement is not supported. For details about the columns, see [Table 12-424](#).

**Table 12-424** PGXC\_VARIABLE\_INFO columns

Name	Type	Description
node_name	text	Node name.
next_oid	oid	OID generated next time on the node.
next_xid	xid	Transaction ID generated next time on the node.
oldest_xid	xid	Oldest transaction ID on the node.
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum.
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node.
last_extend_csn_logpage	xid	Number of the last extended cslog page.
start_extend_csn_logpage	xid	Number of the page from which cslog extending starts.
next_commit_seqno	xid	CSN generated next time for the node.
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback.
startup_max_xid	xid	Last transaction ID before the node is powered off.

### 12.3.12.191 PLAN\_TABLE

PLAN\_TABLE displays plan information collected by **EXPLAIN PLAN**. Plan information is in a session-level lifecycle. After a session exits, the data will be deleted. Data is isolated between sessions and between users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-425** PLAN\_TABLE columns

Name	Type	Description
statement_id	character varying(30)	Query tag specified by a user.
plan_id	bigint	Query ID.
id	integer	ID of each operator in a generated plan.

Name	Type	Description
operation	character varying(30)	Operation description of an operator in a plan.
options	character varying(255)	Operation action.
object_name	name	Object name corresponding to the operation, which is not the object alias used in the query. The object name is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.
remarks	character varying(4000)	Not supported. The value is <b>NULL</b> .
timestamp	date	Not supported. The value is <b>NULL</b> .
object_node	character varying(128)	Not supported. The value is <b>NULL</b> .
object_alias	character varying(261)	Not supported. The value is <b>NULL</b> .
object_instance	numeric	Not supported. The value is <b>NULL</b> .
optimizer	character varying(255)	Not supported. The value is <b>NULL</b> .
search_columns	numeric	Not supported. The value is <b>NULL</b> .
parent_id	numeric	Not supported. The value is <b>NULL</b> .
depth	numeric	Not supported. The value is <b>NULL</b> .
position	numeric	Not supported. The value is <b>NULL</b> .
bytes	numeric	Not supported. The value is <b>NULL</b> .
other_tag	character varying(255)	Not supported. The value is <b>NULL</b> .
partition_start	character varying(255)	Not supported. The value is <b>NULL</b> .

Name	Type	Description
partition_stop	character varying(255)	Not supported. The value is <b>NULL</b> .
partition_id	numeric	Not supported. The value is <b>NULL</b> .
other	character varying	Not supported. The value is <b>NULL</b> .
other_xml	clob	Not supported. The value is <b>NULL</b> .
distribution	character varying(20)	Not supported. The value is <b>NULL</b> .
cpu_cost	numeric	Not supported. The value is <b>NULL</b> .
io_cost	numeric	Not supported. The value is <b>NULL</b> .
temp_space	numeric	Not supported. The value is <b>NULL</b> .
access_predicates	character varying(4000)	Not supported. The value is <b>NULL</b> .
filter_predicates	character varying(4000)	Not supported. The value is <b>NULL</b> .
time	numeric	Not supported. The value is <b>NULL</b> .
qblock_name	character varying(128)	Not supported. The value is <b>NULL</b> .

 **NOTE**

- A valid **object\_type** value consists of a relkind type defined in **PG\_CLASS** (**TABLE**, **INDEX**, **SEQUENCE**, **VIEW**, or **TOASTVALUE TOAST**) and the rtekind type used in the plan (**SUBQUERY**, **JOIN**, **FUNCTION**, **VALUES**, **CTE**, or **REMOTE\_QUERY**).
- For RangeTableEntry (RTE), **object\_owner** is the object description used in the plan. Non-user-defined objects do not have **object\_owner**.
- Information in the **statement\_id**, **object\_name**, **object\_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.
- **PLAN\_TABLE** supports only SELECT and DELETE and does not support other DML operations.

### 12.3.12.192 PV\_FILE\_STAT

**PV\_FILE\_STAT** records statistics about data file I/O to indicate I/O performance and detect performance problems such as abnormal I/O operations.

**Table 12-426** PV\_FILE\_STAT columns

Name	Type	Description
filenum	oid	File ID

Name	Type	Description
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading, in microseconds
writetim	bigint	Total duration of writing, in microseconds
avgiotim	bigint	Average duration of reading and writing, in microseconds
lstiotim	bigint	Duration of the last file reading, in microseconds
miniotim	bigint	Minimum duration of reading and writing, in microseconds
maxiowtm	bigint	Maximum duration of reading and writing, in microseconds

### 12.3.12.193 PV\_INSTANCE\_TIME

PV\_INSTANCE\_TIME records time consumption information of the current node. The time consumption information is classified into the following types:

- DB\_TIME: effective time spent by jobs in multi-core scenarios
- CPU\_TIME: CPU time spent
- EXECUTION\_TIME: time spent in executors
- PARSE\_TIME: time spent in parsing SQL statements
- PLAN\_TIME: time spent on generating plans
- REWRITE\_TIME: time spent for SQL rewriting
- PL\_EXECUTION\_TIME: execution time of the PL/SQL stored procedure
- PL\_COMPILATION\_TIME: compilation time of the PL/SQL stored procedure
- NET\_SEND\_TIME: time spent on the network
- DATA\_IO\_TIME: I/O time spent

**Table 12-427** PV\_INSTANCE\_TIME columns

Name	Category	Description
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value, in $\mu$ s

### 12.3.12.194 PV\_OS\_RUN\_INFO

PV\_OS\_RUN\_INFO displays the running status of the OS.

**Table 12-428** PV\_OS\_RUN\_INFO columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

### 12.3.12.195 PV\_REDO\_STAT

PV\_REDO\_STAT displays statistics on the replay of session thread logs.

**Table 12-429** PV\_REDO\_STAT columns

Name	Type	Description
phywrts	bigint	Number of times that data is written during log replay
phyblkwrt	bigint	Number of data blocks written during log replay
writetim	bigint	Total time required for writing data during log replay
avgiotim	bigint	Average time required for writing data during log replay
lstiotim	bigint	Time consumed by the last data write operation during log replay

Name	Type	Description
miniotim	bigint	Minimum time consumed by a single data write operation during log replay
maxiowtm	bigint	Maximum time consumed by a single data write operation during log replay

### 12.3.12.196 PV\_SESSION\_MEMORY

**PV\_SESSION\_MEMORY** collects statistics about memory usage at the session level, including all the memory allocated to Postgres and Stream threads on DNs for jobs currently executed by users.

**Table 12-430** PV\_SESSION\_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID
init_mem	integer	Memory allocated to the currently executed jobs before they enter the executor, in MB
used_mem	integer	Memory allocated to the currently executed jobs, in MB
peak_mem	integer	Peak memory allocated to the currently executed jobs, in MB

### 12.3.12.197 PV\_SESSION\_MEMORY\_CONTEXT

**PV\_SESSION\_MEMORY\_CONTEXT** displays statistics on memory usage of all sessions based on the MemoryContext node. This view is valid only when **enable\_thread\_pool** is set to **on**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

**Table 12-431** PV\_SESSION\_MEMORY\_CONTEXT columns

Name	Type	Description
sessid	text	Session start time + session ID (character string: <i>timestamp.sessionid</i> )
threadid	bigint	ID of the thread bound to a session (-1 if no thread is bound)
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes
freesize	bigint	Total size of released memory in the current memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

 **CAUTION**

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

### 12.3.12.198 PV\_SESSION\_MEMORY\_DETAIL

PV\_SESSION\_MEMORY\_DETAIL displays the memory usage of sessions based on the MemoryContext node. When **enable\_thread\_pool** is set to **on**, this view contains memory usage of all threads and sessions.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

You can run the `SELECT * FROM PV_SESSION_MEMCTX_DETAIL(threadid, '');` statement to record information about all memory contexts of a thread into the *threadid\_timestamp.log* file in the `$GAUSSLOG/gs_log/${node_name}/dumpmem` directory. *threadid* can be obtained from **sessid** in [Table 12-432](#).

**Table 12-432** PV\_SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
sessid	text	<ul style="list-style-type: none"> <li>When the thread pool is disabled (<b>enable_thread_pool = off</b>), this column indicates the thread start time + session ID (string: <b>timestamp.sessionid</b>).</li> <li>When the thread pool is enabled (<b>enable_thread_pool = on</b>): If the memory context is at the thread level, this column indicates the thread start time + thread ID (string: <b>timestamp.threadid</b>). If the memory context is at the session level, the column indicates the thread start time + session ID (string: <b>timestamp.sessionid</b>).</li> </ul>
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

 CAUTION

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

### 12.3.12.199 PV\_SESSION\_STAT

**PV\_SESSION\_STAT** collects statistics about session states based on session threads or the **AutoVacuum** thread.

**Table 12-433** PV\_SESSION\_STAT columns

Name	Type	Description
sessid	text	Thread ID and start time
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

### 12.3.12.200 PV\_SESSION\_TIME

PV\_SESSION\_TIME collects statistics about the running time of session threads and time consumed in each execution phase.

**Table 12-434** PV\_SESSION\_TIME columns

Name	Type	Description
sessid	text	Thread ID and start time
stat_id	integer	Statistics ID
stat_name	text	Name of the session type <ul style="list-style-type: none"> <li>• <b>DB_TIME</b>: effective time spent by jobs in multi-core scenarios</li> <li>• <b>CPU_TIME</b>: CPU time spent</li> <li>• <b>EXECUTION_TIME</b>: time spent within executors</li> <li>• <b>PARSE_TIME</b>: time spent on parsing SQL statements</li> <li>• <b>PLAN_TIME</b>: time spent on generating plans</li> <li>• <b>REWRITE_TIME</b>: time spent on rewriting SQL statements</li> <li>• <b>PL_EXECUTION_TIME</b>: execution time of the PL/pgSQL stored procedure</li> <li>• <b>PL_COMPILATION_TIME</b>: compilation time of the PL/pgSQL stored procedure</li> <li>• <b>NET_SEND_TIME</b>: time spent on the network.</li> <li>• <b>DATA_IO_TIME</b>: I/O time spent</li> </ul>
value	bigint	Session value

### 12.3.12.201 PV\_THREAD\_MEMORY\_CONTEXT

**PV\_THREAD\_MEMORY\_CONTEXT** displays statistics about memory usage of all threads based on MemoryContext nodes. This view is equivalent to the **PV\_SESSION\_MEMORY\_DETAIL** view when **enable\_thread\_pool** is set to **off**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

**Table 12-435** PV\_THREAD\_MEMORY\_CONTEXT columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: <i>timestamp.tsessionid</i> )
tid	bigint	Thread ID
thrdtype	text	Thread type It can be any thread type in the system, such as wlmmonitor.
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes
freesize	bigint	Total size of released memory in the current memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For <b>TempSmallContextGroup</b> , this parameter specifies the number of collected memory contexts.

### 12.3.12.202 PV\_TOTAL\_MEMORY\_DETAIL

**PV\_TOTAL\_MEMORY\_DETAIL** displays statistics about memory usage of the current database node in the unit of MB. For details about the columns, see [Table 12-436](#).

**Table 12-436** PV\_TOTAL\_MEMORY\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	<p>Memory type. The value must be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>max_process_memory</b>: memory occupied by a GaussDB cluster instance.</li> <li>• <b>process_used_memory</b>: memory occupied by a GaussDB process.</li> <li>• <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>• <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>• <b>dynamic_peak_memory</b>: dynamic peak memory.</li> <li>• <b>dynamic_used_shrctx</b>: maximum dynamic shared memory context.</li> <li>• <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>• <b>max_backend_memory</b>: maximum memory that can be used when the HA port is used to execute services.</li> <li>• <b>backend_used_memory</b>: memory that has been used when the HA port is used to execute services.</li> <li>• <b>max_shared_memory</b>: maximum shared memory.</li> <li>• <b>shared_used_memory</b>: used shared memory.</li> <li>• <b>max_sctpcomm_memory</b>: maximum memory allowed for the communications library.</li> <li>• <b>sctpcomm_used_memory</b>: memory used by the communications library.</li> <li>• <b>sctpcomm_peak_memory</b>: memory peak of the communications library.</li> <li>• <b>other_used_memory</b>: other used memory.</li> <li>• <b>llvm_used_memory</b>: memory occupied by the expression IR that is generated by Codegen and is not released.</li> </ul>

Name	Type	Description
memorybytes	integer	Size of allocated memory-typed memory.

### 12.3.12.203 SYS\_DUMMY

**SYS\_DUMMY** is automatically created by the database based on the data dictionary. It has only one text column in only one row for storing expression calculation results. It is accessible to all users. This view exists in both PG\_CATALOG and SYS schema.

**Table 12-437** SYS\_DUMMY columns

Name	Type	Description
DUMMY	text	Expression calculation result

### 12.3.12.204 V\_INSTANCE

**V\_INSTANCE** displays instance information in current database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG\_CATALOG and SYS schemas.

**Table 12-438** V\_INSTANCE columns

Name	Type	Description
instance_number	oid	OID of the current database
instance_name	character varying(16)	Name of the current database
host_name	character varying(64)	Host name
version	character varying(17)	Not supported. Set it to <b>NULL</b> .
version_legacy	character varying(17)	Not supported. Set it to <b>NULL</b> .
version_full	character varying(17)	Not supported. Set it to <b>NULL</b> .
startup_time	date	Not supported. Set it to <b>NULL</b> .
status	character varying(12)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
parallel	character varying(3)	Not supported. Set it to <b>NULL</b> .
thread#	numeric	Not supported. Set it to <b>NULL</b> .
archiver	character varying(7)	Not supported. Set it to <b>NULL</b> .
log_switch_wait	character varying(15)	Not supported. Set it to <b>NULL</b> .
logins	character varying(10)	Not supported. Set it to <b>NULL</b> .
shutdown_pending	character varying(3)	Not supported. Set it to <b>NULL</b> .
database_status	character varying(17)	Not supported. Set it to <b>NULL</b> .
instance_role	character varying(18)	Not supported. Set it to <b>NULL</b> .
active_state	character varying(9)	Not supported. Set it to <b>NULL</b> .
blocked	character varying(3)	Not supported. Set it to <b>NULL</b> .
con_id	numeric	Not supported. Set it to <b>NULL</b> .
instance_mode	character varying(11)	Not supported. Set it to <b>NULL</b> .
edition	character varying(7)	Not supported. Set it to <b>NULL</b> .
family	character varying(80)	Not supported. Set it to <b>NULL</b> .
database_type	character varying(15)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.205 V\_MYSTAT

**V\_MYSTAT** displays statistics information about all sessions in the database. Only system administrators can access this view. Common users can access this view only after being authorized. This view exists in both the **PG\_CATALOG** and **SYS** schemas.

**Table 12-439** V\_MYSTAT columns

Name	Type	Description
sid	numeric	Current session ID
statistic#	numeric	Not supported. Set it to <b>NULL</b> .
value	numeric	Not supported. Set it to <b>NULL</b> .
con_id	numeric	Not supported. Set it to <b>NULL</b> .

### 12.3.12.206 V\_SESSION

**V\_SESSION** describes information about all current sessions. Only administrators can access this view. Common users can access this view only after being authorized. This view exists in both **PG\_CATALOG** and **SYS** schemas.

**Table 12-440** V\_SESSION columns

Name	Type	Description
saddr	raw	Not supported. Set it to <b>NULL</b> .
sid	bigint	Session ID
serial#	integer	Sequence number of the active background thread, which is <b>0</b> in GaussDB
audsid	numeric	Not supported. Set it to <b>NULL</b> .
paddr	raw	Not supported. Set it to <b>NULL</b> .
schema#	numeric	Not supported. Set it to <b>NULL</b> .
schemaname	name	Name of the user logged in to the backend
user#	oid	OID of the user that has logged in to the background thread ( <b>0</b> if the background thread is a global auxiliary thread)
username	name	Username of the user that has logged in to the background thread. (null if the background thread is a global auxiliary thread)
command	numeric	Not supported. Set it to <b>NULL</b> .
ownerid	numeric	Not supported. Set it to <b>NULL</b> .
taddr	character varying(16)	Not supported. Set it to <b>NULL</b> .
lockwait	character varying(16)	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
sql_id	bigint	ID of a query
client_info	text	Client information
event	text	Queuing status of a statement. Its value can be: <ul style="list-style-type: none"> <li>• <b>waiting in queue</b>: The statement is in the queue.</li> <li>• <b>Empty</b>: The statement is running.</li> </ul>
sql_exec_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if the value of <b>state</b> is not <b>active</b>
program	text	Name of the application connected to the backend
status	text	Overall status of this backend. Its value can be: <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but there is no statement being executed in the transaction.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul>
server	character varying(9)	Not supported. Set it to <b>NULL</b> .
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session
process	character varying(24)	Process ID of the current session
logon_time	date	Login time of the current session
last_call_et	integer	Duration when the status of the current session changes last time

Name	Type	Description
osuser	character varying(128)	Not supported. Set it to <b>NULL</b> .
terminal	character varying(30)	Not supported. Set it to <b>NULL</b> .
type	character varying(10)	Not supported. Set it to <b>NULL</b> .
sql_address	raw	Not supported. Set it to <b>NULL</b> .
sql_hash_value	numeric	Not supported. Set it to <b>NULL</b> .
sql_child_number	numeric	Not supported. Set it to <b>NULL</b> .
sql_exec_id	numeric	Not supported. Set it to <b>NULL</b> .
prev_sql_address	raw	Not supported. Set it to <b>NULL</b> .
prev_hash_value	numeric	Not supported. Set it to <b>NULL</b> .
prev_sql_id	character varying(13)	Not supported. Set it to <b>NULL</b> .
prev_child_number	numeric	Not supported. Set it to <b>NULL</b> .
prev_exec_start	date	Not supported. Set it to <b>NULL</b> .
prev_exec_id	numeric	Not supported. Set it to <b>NULL</b> .
plsql_entry_object_id	numeric	Not supported. Set it to <b>NULL</b> .
plsql_entry_subprogram_id	numeric	Not supported. Set it to <b>NULL</b> .
plsql_object_id	numeric	Not supported. Set it to <b>NULL</b> .
plsql_subprogram_id	numeric	Not supported. Set it to <b>NULL</b> .
module	character varying(64)	Not supported. Set it to <b>NULL</b> .
module_hash	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
action	character varying(64)	Not supported. Set it to <b>NULL</b> .
action_hash	numeric	Not supported. Set it to <b>NULL</b> .
fixed_table_sequence	numeric	Not supported. Set it to <b>NULL</b> .
row_wait_obj#	numeric	Not supported. Set it to <b>NULL</b> .
row_wait_file#	numeric	Not supported. Set it to <b>NULL</b> .
row_wait_block#	numeric	Not supported. Set it to <b>NULL</b> .
row_wait_row#	numeric	Not supported. Set it to <b>NULL</b> .
top_level_call#	numeric	Not supported. Set it to <b>NULL</b> .
pdml_enabled	character varying(3)	Not supported. Set it to <b>NULL</b> .
failover_type	character varying(13)	Not supported. Set it to <b>NULL</b> .
failover_method	character varying(10)	Not supported. Set it to <b>NULL</b> .
failed_over	character varying(3)	Not supported. Set it to <b>NULL</b> .
resource_consumer_group	character varying(32)	Not supported. Set it to <b>NULL</b> .
pddl_status	character varying(8)	Not supported. Set it to <b>NULL</b> .
pq_status	character varying(8)	Not supported. Set it to <b>NULL</b> .
current_queue_duration	numeric	Not supported. Set it to <b>NULL</b> .
client_identifier	character varying(64)	Not supported. Set it to <b>NULL</b> .
blocking_session_status	character varying(11)	Not supported. Set it to <b>NULL</b> .
blocking_instance	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
blocking_session	numeric	Not supported. Set it to <b>NULL</b> .
final_blocking_session_status	character varying(11)	Not supported. Set it to <b>NULL</b> .
final_blocking_instance	numeric	Not supported. Set it to <b>NULL</b> .
final_blocking_session	numeric	Not supported. Set it to <b>NULL</b> .
seq#	numeric	Not supported. Set it to <b>NULL</b> .
event#	numeric	Not supported. Set it to <b>NULL</b> .
p1text	character varying(64)	Not supported. Set it to <b>NULL</b> .
p1	numeric	Not supported. Set it to <b>NULL</b> .
p1raw	raw	Not supported. Set it to <b>NULL</b> .
p2text	character varying(64)	Not supported. Set it to <b>NULL</b> .
p2	numeric	Not supported. Set it to <b>NULL</b> .
p2raw	raw	Not supported. Set it to <b>NULL</b> .
p3text	character varying(64)	Not supported. Set it to <b>NULL</b> .
p3	numeric	Not supported. Set it to <b>NULL</b> .
p3raw	raw	Not supported. Set it to <b>NULL</b> .
wait_class_id	numeric	Not supported. Set it to <b>NULL</b> .
wait_class#	numeric	Not supported. Set it to <b>NULL</b> .
wait_class	character varying(64)	Not supported. Set it to <b>NULL</b> .
wait_time	numeric	Not supported. Set it to <b>NULL</b> .
seconds_in_wait	numeric	Not supported. Set it to <b>NULL</b> .
state	character varying(19)	Not supported. Set it to <b>NULL</b> .
wait_time_micro	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
time_remain ing_micro	numeric	Not supported. Set it to <b>NULL</b> .
time_since_l ast_wait_mic ro	numeric	Not supported. Set it to <b>NULL</b> .
service_nam e	character varying(64)	Not supported. Set it to <b>NULL</b> .
sql_trace	character varying(8)	Not supported. Set it to <b>NULL</b> .
sql_trace_wa its	character varying(5)	Not supported. Set it to <b>NULL</b> .
sql_trace_bin ds	character varying(5)	Not supported. Set it to <b>NULL</b> .
sql_trace_pla n_stats	character varying(10)	Not supported. Set it to <b>NULL</b> .
session_editi on_id	numeric	Not supported. Set it to <b>NULL</b> .
creator_addr	raw	Not supported. Set it to <b>NULL</b> .
creator_seria l#	numeric	Not supported. Set it to <b>NULL</b> .
ecid	character varying(64)	Not supported. Set it to <b>NULL</b> .
sql_translati on_profile_id	numeric	Not supported. Set it to <b>NULL</b> .
pga_tunable _mem	numeric	Not supported. Set it to <b>NULL</b> .
shard_ddl_st atus	character varying(8)	Not supported. Set it to <b>NULL</b> .
con_id	numeric	Not supported. Set it to <b>NULL</b> .
external_na me	character varying(102 4)	Not supported. Set it to <b>NULL</b> .
plsql_debug ger_connect ed	character varying(5)	Not supported. Set it to <b>NULL</b> .

### 12.3.12.207 V\$GLOBAL\_OPEN\_CURSOR

V\$GLOBAL\_OPEN\_CURSOR displays information about all opened cursors on all current nodes.

**Table 12-441** V\$GLOBAL\_OPEN\_CURSOR columns

Name	Type	Description
node_name	name	Node name.
saddr	raw	Not supported. Set it to <b>NULL</b> .
sid	numeric	Session ID.
user_name	varchar2(128)	Username.
address	raw	Not supported. Set it to <b>NULL</b> .
hash_value	numeric	Not supported. Set it to <b>NULL</b> .
sql_id	varchar2(13)	Query statement ID.
sql_text	varchar2(60)	First 60 bytes of the SQL text of a cursor.
last_sql_active_time	date	Not supported. Set it to <b>NULL</b> .
sql_exec_id	numeric	Not supported. Set it to <b>NULL</b> .
cursor_type	varchar2(64)	Cursor type. <ul style="list-style-type: none"><li>• <b>OPEN-PL/SQL</b>: opened PL/SQL cursor.</li><li>• <b>OPEN</b>: other open cursors.</li></ul>
child_address	raw	Not supported. Set it to <b>NULL</b> .
con_id	numeric	Not supported. Set it to <b>NULL</b> .

### 12.3.12.208 V\$GLOBAL\_TRANSACTION

V\$GLOBAL\_TRANSACTION displays information about currently active global transactions. By default, only the system administrator can access the system view. Common users must be authorized to access the system view. This view exists in the **PG\_CATALOG** and **SYS** schemas.

**Table 12-442** V\$GLOBAL\_TRANSACTION columns

Name	Type	Description
formatid	numeric	Global transaction format identifier. If this parameter is not supported, set it to <b>NULL</b> .

Name	Type	Description
globalid	raw	Global transaction identifier.
branchid	raw	Global transaction branch identifier. If this parameter is not supported, set it to <b>NULL</b> . Each individual transaction of a global transaction is called a branch.
branches	numeric	Total number of global transaction branches.
refcount	numeric	Number of siblings for the global transaction (must be the same as branches).
preparecount	numeric	Number of prepared global transaction branches. If the value of <b>system_view_version</b> is greater than <b>0</b> and no prepared global transaction branch exists, the value is <b>0</b> . Otherwise, the value is <b>NULL</b> .
state	character varying(38)	Status of the global transaction branch.
flags	numeric	Numeric representation of the status.
coupling	character varying(15)	Specifies whether the branch is free ('FREE'), loosely coupled ('LOOSELY COUPLED'), or tightly coupled (TIGHTLY COUPLED). If this parameter is not supported, set it to <b>NULL</b> .
con_id	numeric	ID of the container related to data. If this parameter is not supported, set it to <b>0</b> .

### 12.3.12.209 V\$LOCK

V\$LOCK displays information about locks held by open transactions. By default, only the system administrator can access the system view. Common users must be authorized to access the system view. This view exists in the **PG\_CATALOG** and **SYS** schemas.

**Table 12-443** V\$LOCK columns

Name	Type	Description
addr	raw	Not supported. Set it to <b>NULL</b> .
kaddr	raw	Not supported. Set it to <b>NULL</b> .
sid	number	ID of the session that owns the lock.

Name	Type	Description
type	varchar(2)	TM or TX. <ul style="list-style-type: none"> <li>TM: corresponding relation lock in pg_locks.</li> <li>TX: other locks.</li> </ul>
id1	number	<ul style="list-style-type: none"> <li>TM lock: <b>relationid</b> corresponding to the object ID.</li> <li>TX lock: not supported. Set to <b>0</b>.</li> </ul>
id2	number	<ul style="list-style-type: none"> <li>TM lock: The default value is <b>0</b>.</li> <li>TX lock: not supported. Set to <b>0</b>.</li> </ul>
lmode	number	For details, see <a href="#">Table 12-444</a> .
request	number	For details, see <a href="#">Table 12-444</a> .
ctime	number	Not supported. Set it to <b>NULL</b> .
block	number	Specifies whether it is blocked by other sessions. The value <b>1</b> indicates yes, and the value <b>0</b> indicates no.
con_id	number	Not supported. Set it to <b>NULL</b> .
blocksid	bigint	ID of another thread blocked by the current thread.

**Table 12-444** Lock mode

Level	GaussDB
-	NULL
0	INVALID
1	AccessShare

### 12.3.12.210 V\$NLS\_PARAMETERS

**V\$NLS\_PARAMETERS** displays the National Language Support (NLS) parameters and parameter values configured for the database. This view exists in the **PG\_CATALOG** and **SYS** schemas and all users can access this view.

**Table 12-445** V\$NLS\_PARAMETERS columns

Name	Type	Description
parameter	character varying(64)	NLS parameter name
value	character varying(64)	NLS parameter value
con_id	numeric	Not supported. Set it to <b>0</b> .

### 12.3.12.211 V\$OPEN\_CURSOR

**V\$OPEN\_CURSOR** displays information about cursors opened by all sessions on the current node. By default, only the system administrator can access the system view. Common users must be authorized to access the system view. This view exists in the **PG\_CATALOG** and **SYS** schemas. For details about the columns, see [Table 12-446](#).

**Table 12-446** V\$OPEN\_CURSOR columns

Name	Type	Description
saddr	raw	Not supported. The value is <b>NULL</b> .
sid	numeric	Session ID.
user_name	character varying(128)	Username.
address	raw	Not supported. The value is <b>NULL</b> .
hash_value	numeric	Not supported. The value is <b>NULL</b> .
sql_id	character varying(13)	ID of a query statement.
sql_text	character varying(60)	First 60 bytes of the SQL text of a cursor.
last_sql_active_time	date	Not supported. The value is <b>NULL</b> .
sql_exec_id	numeric	Not supported. The value is <b>NULL</b> .

Name	Type	Description
cursor_type	character varying(64)	Cursor type. <ul style="list-style-type: none"> <li>● <b>OPEN-PL/SQL</b>: opened PL/SQL cursor.</li> <li>● <b>OPEN</b>: other open cursors.</li> </ul>
child_address	raw	Not supported. The value is <b>NULL</b> .
con_id	numeric	Not supported. The value is <b>NULL</b> .

### 12.3.12.212 V\$SESSION\_WAIT

**V\$SESSION\_WAIT** stores the current wait event or the last wait event of each session of each user. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG\_CATALOG** and **SYS** schemas.

**Table 12-447** V\$SESSION\_WAIT columns

Name	Type	Description
sid	numeric	Session ID, which is mapped to the <b>V\$SESSION.SID</b> column.
seq#	numeric	Not supported. Set it to <b>NULL</b> .
event	character varying(64)	If the session is waiting, the resource or event that is waiting for is displayed. If the session is not waiting, the resource or event that is waiting for the last time is displayed.
p1text	character varying(64)	Not supported. Set it to <b>NULL</b> .
p1	numeric	Not supported. Set it to <b>NULL</b> .
p1raw	raw	Not supported. Set it to <b>NULL</b> .
p2text	character varying(64)	Not supported. Set it to <b>NULL</b> .
p2	numeric	Not supported. Set it to <b>NULL</b> .
p2raw	raw	Not supported. Set it to <b>NULL</b> .
p3text	character varying(64)	Not supported. Set it to <b>NULL</b> .
p3	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
p3raw	raw	Not supported. Set it to <b>NULL</b> .
wait_class_id	numeric	Not supported. Set it to <b>NULL</b> .
wait_class#	numeric	Not supported. Set it to <b>NULL</b> .
wait_class	character varying(64)	Name of a wait event type
wait_time	numeric	<p>If the session is waiting, the value is <b>0</b>. If the session is not waiting, the options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>&gt;0</b>: duration of the last wait (unit: centisecond).</li> <li>• <b>-1</b>: The duration of the last wait is less than a centisecond.</li> <li>• <b>-2</b>: The <b>TIMED_STATISTICS</b> parameter is set to <b>false</b>.</li> </ul> <p>This column has been deprecated and replaced by <b>WAIT_TIME_MICRO</b> and <b>STATE</b>.</p>
seconds_in_wait	numeric	<p>If the session is waiting, the value is the amount of time to wait. If the session is not waiting, the value is the amount of time since the last wait started.</p> <p>This column has been deprecated and replaced by the <b>WAIT_TIME_MICRO</b> and <b>TIME_SINCE_LAST_WAIT_MICRO</b> columns.</p>
state	character varying(19)	<p>Waiting state. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>WAITING</b>: The session is waiting.</li> <li>• <b>WAITED UNKNOWN TIME</b>: The duration of the last wait is unknown. This value is used when <b>TIMED_STATISTICS</b> is set to <b>false</b>.</li> <li>• <b>WAITED SHORT TIME</b>: The duration of the last wait is less than a centisecond.</li> <li>• <b>WAITED KNOWN TIME</b>: duration of the last wait specified in the <b>WAIT_TIME</b> column.</li> </ul>
wait_time_micro	numeric	Wait time, in microseconds. If the session is waiting, the value is the time spent in the current wait. If the session is not waiting, the value is the time spent for the last wait.
time_remaining_micro	numeric	Not supported. Set it to <b>NULL</b> .

Name	Type	Description
time_since_last_wait_micro	numeric	Time elapsed since the last wait ended, in microseconds. If the session is waiting, the value is <b>0</b> .
con_id	numeric	Not supported. Set it to <b>0</b> .

### 12.3.12.213 V\$SYSSTAT

**V\$SYSSTAT** displays the resource usage of the entire database instance since the database instance starts to run. By default, only the initial user or monitoring administrator can access the database. Other users can access the database only after being granted the MONADMIN permission. This view exists in the **PG\_CATALOG** and **SYS** schemas. Contact the administrator to enable the memory resource management function in the Arm environment.

**Table 12-448** V\$SYSSTAT columns

Name	Type	Description
statistic#	numeric	Statistics ID.
name	character varying(64)	Statistical item name.
class	numeric	Not supported. Set it to null.
value	numeric	Statistical item value.
stat_id	numeric	Not supported. Set it to null.
con_id	numeric	Not supported. Set it to <b>0</b> .

### 12.3.12.214 V\$SYSTEM\_EVENT

**V\$SYSTEM\_EVENT** displays information about all the wait events (summary of each wait event since the instance is started). By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG\_CATALOG** and **SYS** schemas.

**Table 12-449** V\$SYSTEM\_EVENT columns

Name	Type	Description
event	character varying(64)	Wait event name
total_waits	numeric	Total number of wait events
total_timeouts	numeric	Total number of timeout events

Name	Type	Description
time_waited	numeric	Total time (in centiseconds) of wait events
average_wait	numeric	Average time (in centiseconds) of wait events
time_waited_micro	numeric	Total time (in microseconds) of wait events
total_waits_fg	numeric	Not supported. Set it to <b>NULL</b> .
total_timeouts_fg	numeric	Not supported. Set it to <b>NULL</b> .
time_waited_fg	numeric	Not supported. Set it to <b>NULL</b> .
average_wait_fg	numeric	Not supported. Set it to <b>NULL</b> .
time_waited_micro_fg	numeric	Not supported. Set it to <b>NULL</b> .
event_id	numeric	Not supported. Set it to <b>NULL</b> .
wait_class_id	numeric	Not supported. Set it to <b>NULL</b> .
wait_class#	numeric	Not supported. Set it to <b>NULL</b> .
wait_class	character varying(64)	Class name of a wait event
con_id	numeric	Not supported. Set it to <b>0</b> .

### 12.3.12.215 V\$VERSION

V\$VERSION displays the version number of the database. This view exists in the PG\_CATALOG and SYS schemas and all users can access this view. For details about the columns, see [Table 12-450](#).

**Table 12-450** V\$VERSION columns

Name	Type	Description
banner	character varying(80)	Component name and version number.
banner_full	character varying(160)	Database version and specific version number.
banner_legacy	character varying(80)	Database version.
con_id	numeric	Not supported. It is always <b>0</b> .

## 12.4 Discarded

The following GaussDB system catalogs and views have been discarded in the latest version.

# 13 Schemas

**Table 13-1** describes the schemas of GaussDB.

 **NOTE**

Do not create service data of users in a schema that provides functional interfaces, including but not limited to tables and functions (such as `dbe_*` and `pkg_*`).

**Table 13-1** Schemas supported in GaussDB

Schema	Description
blockchain	Stores the user history table that is automatically created when a tamper-proof table is created in the ledger database.
dbe_perf	Diagnoses performance issues and is also the data source of WDR snapshots. After a database is installed, only the initial user and monitoring administrator have permission to view views and functions in the <b>DBE_PERF</b> scheme by default.
snapshot	Manages data related to WDR snapshots. By default, the initial user or monitoring administrator can access the data.
sqladvsior	Recommends distribution columns. For details, see <a href="#">Distribution Key Recommendation Functions</a> .
sys	Provides the system information view APIs.
pg_catalog	Maintains system catalog information, including system catalogs and all built-in data types, functions, and operators.
pg_toast	Stores large objects (for internal use).
public	Public schema, which is used to store public objects. If <b>search_path</b> is not specified and a schema with the same name exists, new tables (and other objects) are created in the schema by default. If no schema with the same name exists, new tables (and other objects) are automatically placed in this public schema.

Schema	Description
dbe_raw	Advanced function package <b>dbe_raw</b> , which is used to convert raw data, obtain substrings, and calculate the length.
dbe_session	Advanced function package <b>dbe_session</b> , which is used to set the value of a specified attribute and support user query and verification.
dbe_lob	Advanced function package <b>dbe_lob</b> , which is used to read, write, and copy large files (CLOB/BLOB).
dbe_match	Advanced function package <b>dbe_match</b> , which is used to compare character string similarity.
dbe_task	Advanced function package <b>dbe_task</b> , which is used to schedule job tasks, including submitting tasks, canceling tasks, synchronizing task status, and updating task information, so that the database can periodically execute specific tasks.
dbe_sql	Advanced function package <b>dbe_sql</b> , which is used to execute dynamic SQL statements and construct query and other commands during application running.
dbe_file	Advanced function package <b>dbe_file</b> , which is used to read, copy, write, delete, and rename external database files.
dbe_output	Advanced function package <b>dbe_output</b> , which is used to print output information.
dbe_random	Advanced function package <b>dbe_random</b> , which is used to generate random seeds and random numbers.
dbe_application_info	Advanced function package <b>dbe_application_info</b> , which is used for recording client information.
dbe_utility	Advanced function package <b>dbe_utility</b> , which is used to invoke the debugging tool in a stored procedure, for example, to print error stacks.
dbe_scheduler	Advanced function package <b>dbe_scheduler</b> , which is used to create scheduled tasks and enable the database to periodically execute specified tasks through programs and schedules. You can also perform external database tasks by authorizing and providing certificates.
information_schema	Stores information about objects defined in the current database.
dbe_sql_util	SQL O&M function, including the O&M interface of SQL patches.
dbe_xmlgen	Advanced function package <b>dbe_xmlgen</b> , which is used to convert query results into XML character strings.
dbe_describe	Advanced function package <b>dbe_describe</b> , which is used to query parameter information about stored procedures or functions.

**Table 13-2** Schemas disabled in GaussDB

Schema	Description
dbe_pldebugger	This view is used to debug PL/SQL functions and stored procedures. Currently, this view is not supported. An error message "unsupported" is displayed when the interface is invoked in this view.
db4ai	Manages data of different versions in AI training.
dbe_pldeveloper	Compiles and debugs user stored procedures.

## 13.1 Information Schema

An information schema named INFORMATION\_SCHEMA automatically exists in all databases. An information schema consists of a group of views that contain information about objects defined in the current database. The owner of this schema is the initial database user. However, all users have only the permission to use this schema and do not have the permission to create objects such as tables and functions.

Information schemas are compatible with PG, including constraint\_table\_usage, domain\_constraints, domain\_udt\_usage, domains, enabled\_roles, key\_column\_usage, parameters, referential\_constraints, applicable\_roles, administrable\_role\_authorizations, attributes, character\_sets, check\_constraint\_routine\_usage, check\_constraints, collations, collation\_character\_set\_applicability, column\_domain\_usage, column\_privileges, column\_udt\_usage, columns, constraint\_column\_usage, role\_column\_grants, routine\_privileges, role\_routine\_grants, routines, schemata, sequences, table\_constraints, table\_privileges, role\_table\_grants, tables, triggered\_update\_columns, triggers, udt\_privileges, role\_udt\_grants, usage\_privileges, role\_usage\_grants, user\_defined\_types, view\_column\_usage, view\_routine\_usage, view\_table\_usage, views, data\_type\_privileges, element\_types, column\_options, foreign\_data\_wrapper\_options, foreign\_data\_wrappers, foreign\_server\_options, foreign\_servers, foreign\_table\_options, foreign\_tables, user\_mapping\_options, user\_mappings, sql\_features, sql\_implementation\_info, sql\_languages, sql\_packages, sql\_parts, sql\_sizing, and sql\_sizing\_profiles.

The following sections display only the views that are not listed in the preceding description.

### 13.1.1 \_PG\_FOREIGN\_DATA\_WRAPPERS

Displays information about a foreign-data wrapper, as described in [Table 13-3](#). Only the sysadmin user has the permission to view this view.

**Table 13-3** \_PG\_FOREIGN\_DATA\_WRAPPERS columns

Name	Type	Description
oid	oid	OID of the foreign-data wrapper.
fdwowner	oid	OID of the owner of the foreign-data wrapper.
fdwoptions	text[]	Foreign-data wrapper specific option, expressed in a string in the format of <i>keyword=value</i> .
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database).
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper.
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign-data wrapper.
foreign_data_wrapper_language	information_schema.character_data	Programming language of the foreign-data wrapper.

## 13.1.2 \_PG\_FOREIGN\_SERVERS

Displays information about a foreign server, as described in [Table 13-4](#). Only the sysadmin user has the permission to view this view.

**Table 13-4** \_PG\_FOREIGN\_SERVERS columns

Name	Type	Description
oid	oid	OID of the foreign server.
srvoptions	text[]	Foreign server specific options, expressed in a string in the format of <i>keyword=value</i> .
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.

Name	Type	Description
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database).
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper.
foreign_server_type	information_schema.character_data	Type of the foreign server.
foreign_server_version	information_schema.character_data	Version of the foreign server.
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign server.

### 13.1.3 \_PG\_FOREIGN\_TABLE\_COLUMNS

Displays column information about a foreign table, as described in [Table 13-5](#). Only the sysadmin user has the permission to view this view.

**Table 13-5** \_PG\_FOREIGN\_TABLE\_COLUMNS columns

Name	Type	Description
nspname	name	Schema name.
relname	name	Table name.
attname	name	Column name.
atfdwoptions	text[]	Attribute-level foreign data wrapper options, expressed in a string in the format of <i>keyword=value</i> .

### 13.1.4 \_PG\_FOREIGN\_TABLES

Stores information about all foreign tables defined in the current database, as described in [Table 13-6](#), whereas displays information about foreign tables accessible to the current user. Only the sysadmin user has the permission to view this view.

**Table 13-6** \_PG\_FOREIGN\_TABLES columns

Name	Type	Description
foreign_table_catalog	information_schema.sql_identifier	Name of the database where the foreign table is located (always the current database).
foreign_table_schema	name	Name of the schema that the foreign table is in.
foreign_table_name	name	Name of the foreign table.
ftoptions	text[]	Foreign table options.
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
authorization_identifier	information_schema.sql_identifier	Role of the owner.

## 13.1.5 \_PG\_USER\_MAPPINGS

Stores mappings from local users to remote users, as described in [Table 13-7](#). Only the sysadmin user has the permission to view this view.

**Table 13-7** \_PG\_USER\_MAPPINGS columns

Name	Type	Description
oid	oid	OID of the mapping from the local user to a remote user.
umoptions	text[]	User mapping specific options, expressed in a string in the format of <i>keyword=value</i> .
umuser	oid	OID of the local user being mapped ( <b>0</b> if the user mapping is public).
authorization_identifier	information_schema.sql_identifier	Role of the local user.

Name	Type	Description
foreign_server_catalog	information_schema.s ql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.s ql_identifier	Name of the foreign server.
srvowner	information_schema.s ql_identifier	Owner of the foreign server.

## 13.1.6 INFORMATION\_SCHEMA\_CATALOG\_NAME

Displays the name of the current database, as described in [Table 13-8](#).

**Table 13-8** INFORMATION\_SCHEMA\_CATALOG\_NAME columns

Name	Type	Description
catalog_name	information_schema.sql_ identifier	Current database name.

## 13.2 DBE\_PERF Schema

In the **DBE\_PERF** schema, views are used to diagnose performance issues and are also the data source of WDR snapshots. After a database is installed, only the initial user and monitoring administrator have permission to view views and functions in the **DBE\_PERF** scheme by default. To ensure forward compatibility, the permission on the `dbe_perf` schema has no change before and after an upgrade. In the current version, all users are not allowed to create operators in this schema. Existing operators are not affected. Organization views are divided based on multiple dimensions, such as OS, instance, and memory. These views comply with the following naming rules:

- A view starting with **GLOBAL\_** requests data from a CN/DN and returns the data without processing the data.
- A view starting with **SUMMARY\_** summarizes data in a cluster. In most cases, data from a CN/DN (sometimes only a CN) is processed, aggregated, and returned.
- A view that does not start with **GLOBAL\_** or **SUMMARY\_** is a local view and does not request data from any other CN/DN.

### 13.2.1 OS

#### 13.2.1.1 OS\_RUNTIME

Displays the running status of the current OS, as described in [Table 13-9](#).

**Table 13-9** OS\_RUNTIME columns

Name	Type	Description
id	integer	ID.
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	Boolean	Specifies whether the value of the OS running status is cumulative.

### 13.2.1.2 GLOBAL\_OS\_RUNTIME

Provides OS running status information about all normal nodes in the entire cluster, as described in [Table 13-10](#).

**Table 13-10** GLOBAL\_OS\_RUNTIME columns

Name	Type	Description
node_name	name	Node name.
id	integer	ID.
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	Boolean	Specifies whether the value of the OS running status is cumulative.

### 13.2.1.3 OS\_THREADS

Provides status information about all threads on the current node, as described in [Table 13-11](#).

**Table 13-11** OS\_THREADS columns

Name	Type	Description
node_name	text	Current node name.
pid	bigint	ID of the thread running within the current node process.

Name	Type	Description
lwpid	integer	Lightweight thread ID corresponding to the PID.
thread_name	text	Thread name corresponding to the PID.
creation_time	timestamp with time zone	Thread creation time corresponding to the PID.

### 13.2.1.4 GLOBAL\_OS\_THREADS

Provides status information about threads on all normal nodes in the entire cluster, as described in [Table 13-12](#).

**Table 13-12** GLOBAL\_OS\_THREADS columns

Name	Type	Description
node_name	text	Current node name.
pid	bigint	ID of the thread running within the current node process.
lwpid	integer	Lightweight thread ID corresponding to the PID.
thread_name	text	Thread name corresponding to the PID.
creation_time	timestamp with time zone	Thread creation time corresponding to the PID.

### 13.2.1.5 PERF\_QUERY

Provides the name, tree structure, and percentage of the stack information collected on the current node, as described in [Table 13-13](#). The sysadmin or monadmin permission is required.

**Table 13-13** PERF\_QUERY columns

Name	Type	Description
backtrace	text	Text of the stack information tree structure.
overhead	double precision	Percentage of the time occupied by the current stack information in the entire stack collection process.

## 13.2.2 Instance

### 13.2.2.1 INSTANCE\_TIME

Provides various time consumption information under the current cluster node, as described in [Table 13-14](#).

**Table 13-14** INSTANCE\_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID.
stat_name	text	Type name. <ul style="list-style-type: none"> <li>DB_TIME: effective time spent by jobs in multi-core scenarios.</li> <li>CPU_TIME: CPU time cost.</li> <li>EXECUTION_TIME: time spent in the executor.</li> <li>PARSE_TIME: time spent on parsing SQL statements.</li> <li>PLAN_TIME: time spent on generating plans.</li> <li>REWRITE_TIME: time spent on rewriting SQL statements.</li> <li>PL_EXECUTION_TIME: execution time of the PL/SQL stored procedure.</li> <li>PL_COMPILATION_TIME: compilation time of the PL/SQL stored procedure.</li> <li>NET_SEND_TIME: time spent on the network.</li> <li>DATA_IO_TIME: I/O time spent.</li> </ul>
value	bigint	Time value (unit: $\mu$ s).

### 13.2.2.2 GLOBAL\_INSTANCE\_TIME

Provides various time consumption information under all normal nodes in the entire cluster, as described in [Table 13-15](#).

**Table 13-15** GLOBAL\_INSTANCE\_TIME columns

Name	Type	Description
node_name	name	Node name.
stat_id	integer	Statistics ID.
stat_name	text	Type name. See the INSTANCE_TIME view.
value	bigint	Time value (unit: $\mu$ s).

## 13.2.3 File

### 13.2.3.1 FILE\_IOSTAT

Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations, as described in [Table 13-16](#).

**Table 13-16** FILE\_IOSTAT columns

Name	Type	Description
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
readtim	bigint	Total duration of reading (unit: $\mu$ s).
writetim	bigint	Total duration of writing (unit: $\mu$ s).
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s).
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s).
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s).

### 13.2.3.2 SUMMARY\_FILE\_IOSTAT

Records the summary of statistics about data file I/Os of each node in the cluster to reflect performance issues such as exceptions in I/O operations, as described in [Table 13-17](#).

The values of **phyrds**, **phywrts**, **phyblkrd**, **phyblkwrt**, **readtim** and **writetim** are summed up based on the data of each node. **avgiotim** is the average value (total

duration/total times) of each node. **lstiotim** and **maxiowtm** are the maximum values of each node. **miniotim** is the minimum value of each node.

**Table 13-17** SUMMARY\_FILE\_IOSTAT columns

Name	Type	Description
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	numeric	Number of times of reading physical files.
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.
readtim	numeric	Total duration of reading (unit: $\mu$ s).
writetim	numeric	Total duration of writing (unit: $\mu$ s).
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s).
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s).
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s).

### 13.2.3.3 GLOBAL\_FILE\_IOSTAT

Displays statistics about data file I/Os on all nodes in the cluster, as described in [Table 13-18](#).

**Table 13-18** GLOBAL\_FILE\_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
filenum	oid	File ID.
dbid	oid	Database ID.

Name	Type	Description
spcid	oid	Tablespace ID.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
readtim	bigint	Total duration of reading (unit: $\mu$ s).
writetim	bigint	Total duration of writing (unit: $\mu$ s).
avgiotim	bigint	Average duration of reading and writing (unit: $\mu$ s).
lstiotim	bigint	Duration of the last file reading (unit: $\mu$ s).
miniotim	bigint	Minimum duration of reading and writing (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of reading and writing (unit: $\mu$ s).

### 13.2.3.4 FILE\_REDO\_IOSTAT

Records statistics about redo logs (WALs) on the current node, as described in [Table 13-19](#).

**Table 13-19** FILE\_REDO\_IOSTAT columns

Name	Type	Description
phywrts	bigint	Number of times writing into the WAL buffer.
phyblkwrt	bigint	Number of blocks written into the WAL buffer.
writetim	bigint	Duration of writing into Xlog files (unit: $\mu$ s).
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). <b>avgiotim = writetim/phywrts.</b>

Name	Type	Description
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s).

### 13.2.3.5 SUMMARY\_FILE\_REDO\_IOSTAT

Records redo log (WAL) statistics of all nodes in the cluster, as described in [Table 13-20](#). The values of the **phywrts**, **phyblkwrt**, and **wrietim** columns are accumulated based on the data of each node. The value of **avgiotim** is the average value of each node (summed up **wrietim** or **phywrts**). The values of **lstiotim** and **maxiowtm** are the maximum values of each node, and the value of **miniotim** is the minimum value of each node.

**Table 13-20** SUMMARY\_FILE\_REDO\_IOSTAT columns

Name	Type	Description
phywrts	numeric	Number of times writing into the WAL buffer.
phyblkwrt	numeric	Number of blocks written into the WAL buffer.
wrietim	numeric	Duration of writing into Xlog files (unit: $\mu$ s).
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). The value is <b>wrietim</b> divided by <b>phywrts</b> .
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s).

### 13.2.3.6 GLOBAL\_FILE\_REDO\_IOSTAT

Displays statistics about redo logs (WALs) on nodes in the cluster, as described in [Table 13-21](#).

**Table 13-21** GLOBAL\_FILE\_REDO\_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
phywrts	bigint	Number of times writing into the WAL buffer.
phyblkwrt	bigint	Number of blocks written into the WAL buffer.
writetim	bigint	Duration of writing into Xlog files (unit: $\mu$ s).
avgiotim	bigint	Average duration of writing into Xlog files (unit: $\mu$ s). The value is <b>writetim</b> divided by <b>phywrts</b> .
lstiotim	bigint	Duration of the last writing into Xlog files (unit: $\mu$ s).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: $\mu$ s).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: $\mu$ s).

### 13.2.3.7 LOCAL\_REL\_IOSTAT

Displays the accumulated I/O status of all data files on the current node, as described in [Table 13-22](#).

**Table 13-22** LOCAL\_REL\_IOSTAT columns

Name	Type	Description
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.

### 13.2.3.8 GLOBAL\_REL\_IOSTAT

Obtains statistics about data file I/Os on all nodes in the cluster, as described in [Table 13-23](#).

**Table 13-23** GLOBAL\_REL\_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.

### 13.2.3.9 SUMMARY\_REL\_IOSTAT

Obtains statistics about data file I/Os on all nodes, as described in [Table 13-24](#).

**Table 13-24** SUMMARY\_REL\_IOSTAT columns

Name	Type	Description
phyrds	numeric	Number of times of reading physical files.
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.

## 13.2.4 Object

### 13.2.4.1 STAT\_USER\_TABLES

Displays the status information about user-defined ordinary tables in all schemas on the current node, as described in [Table 13-25](#).

**Table 13-25** STAT\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.

Name	Type	Description
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.4.2 SUMMARY\_STAT\_USER\_TABLES

Displays the sum of the status information about user-defined ordinary tables in all schemas of a cluster. It is used on the CN. The status information about user-defined ordinary tables on each DN is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in [Table 13-26](#).

**Table 13-26** SUMMARY\_STAT\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding <b>VACUUM FULL</b> ).
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	numeric	Number of times the table has been manually analyzed.
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.4.3 GLOBAL\_STAT\_USER\_TABLES

Displays the status of user-defined ordinary tables in all schemas on each node. It is used on CNs. The status information about user-defined ordinary tables on each DN is displayed but not summed up, as described in [Table 13-27](#).

**Table 13-27** GLOBAL\_STAT\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.

Name	Type	Description
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (excluding <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times that the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.

### 13.2.4.4 STAT\_USER\_INDEXES

Displays the index status information about the user-defined ordinary tables on the current node, as described in [Table 13-28](#).

**Table 13-28** STAT\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.4.5 SUMMARY\_STAT\_USER\_INDEXES

Displays the index status statistics of user-defined ordinary tables in all schemas of a cluster. It applies to CNs only and the index status information about user-defined ordinary tables on each CN is summed up, as described in [Table 13-29](#).

**Table 13-29** SUMMARY\_STAT\_USER\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.

Name	Type	Description
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.4.6 GLOBAL\_STAT\_USER\_INDEXES

Displays the index status information about user-defined ordinary tables in all schemas on each node. The information is about CNs and DNs. It is used on CNs and information is not summed up, as described in [Table 13-30](#).

**Table 13-30** GLOBAL\_STAT\_USER\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.4.7 STAT\_SYS\_TABLES

Displays status information about all the system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas on the current node, as described in [Table 13-31](#).

**Table 13-31** STAT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.

Name	Type	Description
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.

Name	Type	Description
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.4.8 SUMMARY\_STAT\_SYS\_TABLES

Displays the status statistics of all system catalogs in the `pg_catalog`, `information_schema`, and `pg_toast` schemas in the cluster. The statistics are used on CNs and include data on CNs and DN. The status information in the system catalog on each node is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in [Table 13-32](#).

**Table 13-32** SUMMARY\_STAT\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding <b>VACUUM FULL</b> ).
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	numeric	Number of times the table has been manually analyzed.
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.4.9 GLOBAL\_STAT\_SYS\_TABLES

Displays the status information of all system catalogs in `pg_catalog`, `information_schema`, and `pg_toast` modes on each node in the cluster. The status information includes that of CNs and DN. It is used on CNs and is not summed up, as described in [Table 13-33](#).

**Table 13-33** GLOBAL\_STAT\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.

Name	Type	Description
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (not counting <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

### 13.2.4.10 STAT\_SYS\_INDEXES

Displays index status information about all the system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas, as described in [Table 13-34](#).

**Table 13-34** STAT\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.4.11 SUMMARY\_STAT\_SYS\_INDEXES

Displays the index status statistics of all system catalogs in the pg\_catalog, information\_schema, and pg\_toast schemas of all nodes in the cluster. It is used on CNs and the index status information of system catalogs on each node is summed up, as described in [Table 13-35](#).

**Table 13-35** SUMMARY\_STAT\_SYS\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.

Name	Type	Description
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.4.12 GLOBAL\_STAT\_SYS\_INDEXES

Displays the index status information of all system catalogs in pg\_catalog, information\_schema, and pg\_toast schemas on each node. The index status information is about CNs and DNs. It is used on CNs and information is not summed up, as described in [Table 13-36](#).

**Table 13-36** GLOBAL\_STAT\_SYS\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetched	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

### 13.2.4.13 STAT\_ALL\_TABLES

Displays the status of each table (including the TOAST table) of the current node in the database, as described in [Table 13-37](#).

**Table 13-37** STAT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.

Name	Type	Description
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

Name	Type	Description
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.4.14 SUMMARY\_STAT\_ALL\_TABLES

Displays the sum of the status information of each table (including the TOAST table) in the cluster database. It is used on the CN. The status information in the table on each node is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in [Table 13-38](#).

**Table 13-38** SUMMARY\_STAT\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding <b>VACUUM FULL</b> ).

Name	Type	Description
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding <b>VACUUM FULL</b> ).
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	numeric	Number of times the table has been manually analyzed.
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

### 13.2.4.15 GLOBAL\_STAT\_ALL\_TABLES

Displays the status of each table (including the TOAST table) on each node. It is used on CNs and the status of each table on each node is not summed up, as described in [Table 13-39](#).

**Table 13-39** GLOBAL\_STAT\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.

Name	Type	Description
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding <b>VACUUM FULL</b> ).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding <b>VACUUM FULL</b> ).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

### 13.2.4.16 STAT\_ALL\_INDEXES

Displays the access information about each index of the current node in the database, as described in [Table 13-40](#).

**Table 13-40** STAT\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.4.17 SUMMARY\_STAT\_ALL\_INDEXES

Displays the access statistics of each index on each database node in a cluster. It is used on CNs. The access statistics of each node index are summed up. The timestamp column is not summed up, and only the latest value of the column on all nodes is used, as described in [Table 13-41](#).

**Table 13-41** SUMMARY\_STAT\_ALL\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

Name	Type	Description
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

### 13.2.4.18 GLOBAL\_STAT\_ALL\_INDEXES

Displays the access information about each index on each node of the database in the cluster. It is used on the CN. The status information of each index on each node is not summed up, as described in [Table 13-42](#).

**Table 13-42** GLOBAL\_STAT\_ALL\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

### 13.2.4.19 STAT\_DATABASE

Displays the statistics of the current node in the database, as described in [Table 13-43](#).

**Table 13-43** STAT\_DATABASE columns

Name	Type	Description
datid	oid	OID of the database.

Name	Type	Description
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_committed	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).

Name	Type	Description
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

### 13.2.4.20 SUMMARY\_STAT\_DATABASE

Displays the summary of the status information about each database node in the cluster. It is used on CNs. The status information of each node in the database is summed up by database name. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in [Table 13-44](#).

**Table 13-44** SUMMARY\_STAT\_DATABASE columns

Name	Type	Description
datname	name	Database name.
numbackends	bigint	Number of backends currently connected to this database.
xact_commit	numeric	Number of transactions in this database that have been committed.
xact_rollback	numeric	Number of transactions in this database that have been rolled back.
blks_read	numeric	Number of disk blocks read in this database.
blks_hit	numeric	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	numeric	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	numeric	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.

Name	Type	Description
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	numeric	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	numeric	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

### 13.2.4.21 GLOBAL\_STAT\_DATABASE

Displays the statistics of each database node in the cluster, as described in [Table 13-45](#). (It is used on CNs and the status statistics of each database are not summed up.)

**Table 13-45** GLOBAL\_STAT\_DATABASE columns

Name	Type	Description
node_name	name	Node name.
datid	oid	OID of the database.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed.

Name	Type	Description
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see <a href="#">STAT_DATABASE_CONFLICTS</a> .
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter <b>log_temp_files</b> .
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).

Name	Type	Description
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

### 13.2.4.22 STAT\_DATABASE\_CONFLICTS

Displays statistics about the conflict status of the current node in the database, as described in [Table 13-46](#).

**Table 13-46** STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID.
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

### 13.2.4.23 SUMMARY\_STAT\_DATABASE\_CONFLICTS

Displays the conflict status statistics of all database nodes in the cluster. It is used on CNs and the conflict status statistics of each node are summed up by database name, as described in [Table 13-47](#).

**Table 13-47** SUMMARY\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.

Name	Type	Description
confl_deadlock	bigint	Number of conflicting deadlocks.

### 13.2.4.24 GLOBAL\_STAT\_DATABASE\_CONFLICTS

Displays statistics about the conflict status of each database node. It is used on CNs and the status information of each database node is not summed up, as described in [Table 13-48](#).

**Table 13-48** GLOBAL\_STAT\_DATABASE\_CONFLICTS columns

Name	Type	Description
node_name	name	Node name.
datid	oid	Database ID.
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

### 13.2.4.25 STAT\_XACT\_ALL\_TABLES

Displays transaction status information about all ordinary tables and TOAST tables in schemas on the current node, as described in [Table 13-49](#).

**Table 13-49** STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.

Name	Type	Description
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.26 SUMMARY\_STAT\_XACT\_ALL\_TABLES

Displays the transaction status statistics of all ordinary tables and TOAST tables in schemas of all nodes in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name, as described in [Table 13-50](#).

**Table 13-50** SUMMARY\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.27 GLOBAL\_STAT\_XACT\_ALL\_TABLES

Displays the transaction status information of all ordinary tables and TOAST tables in the schemas of each node, as described in [Table 13-51](#). (It is used on CNs. The transaction status information of the same table name on different nodes is not summed up.)

**Table 13-51** GLOBAL\_STAT\_XACT\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetched	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.28 STAT\_XACT\_SYS\_TABLES

Displays transaction status information about the system catalogs in the schemas of the current node, as described in [Table 13-52](#).

**Table 13-52** STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.

Name	Type	Description
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.29 SUMMARY\_STAT\_XACT\_SYS\_TABLES

Displays the transaction status statistics of system catalogs in schemas of all nodes in the cluster. It is used on a CN and the transaction status statistics of tables on each node are summed up by table name, as described in [Table 13-53](#).

**Table 13-53** SUMMARY\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.30 GLOBAL\_STAT\_XACT\_SYS\_TABLES

Displays the transaction status information of the system catalogs in the schemas of each node, as described in [Table 13-54](#). (It is used on CNs. The transaction status information of the same table on different nodes is not summed up.)

**Table 13-54** GLOBAL\_STAT\_XACT\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetched	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.31 STAT\_XACT\_USER\_TABLES

Displays transaction status information about the user tables in schemas on the current node, as described in [Table 13-55](#).

**Table 13-55** STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.

Name	Type	Description
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.32 SUMMARY\_STAT\_XACT\_USER\_TABLES

Displays the transaction status statistics of user tables in schemas of all nodes in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name, as described in [Table 13-56](#).

**Table 13-56** SUMMARY\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.33 GLOBAL\_STAT\_XACT\_USER\_TABLES

Displays the transaction status information of the user tables in the schemas of each node, as described in [Table 13-57](#). (It is used on CNs. The transaction status information of the same table on different nodes is not summed up.)

**Table 13-57** GLOBAL\_STAT\_XACT\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

### 13.2.4.34 STAT\_XACT\_USER\_FUNCTIONS

Displays statistics about function executions in the current transaction on the current database node, as described in [Table 13-58](#).

**Table 13-58** STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.

Name	Type	Description
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

### 13.2.4.35 SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS

Displays the summary of function execution statistics in the current transaction on each node in the cluster, as described in [Table 13-59](#). (It is used on CNs.)

**Table 13-59** SUMMARY\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

### 13.2.4.36 GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS

Displays statistics about function execution in the current transaction on each node in the cluster, as described in [Table 13-60](#). (It is used on CNs.)

**Table 13-60** GLOBAL\_STAT\_XACT\_USER\_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.

Name	Type	Description
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

### 13.2.4.37 STAT\_BAD\_BLOCK

Obtains the information about table and index read failures on the current node, as described in [Table 13-61](#).

**Table 13-61** STAT\_BAD\_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.4.38 SUMMARY\_STAT\_BAD\_BLOCK

Obtains the summary of the table and index read failure information on each node in the cluster, as described in [Table 13-62](#). It is used on CNs. The statistics of different DN is summed up. The value of **first\_time** is the statistics collection start time, and the value of **last\_time** is the statistics collection end time.

**Table 13-62** SUMMARY\_STAT\_BAD\_BLOCK columns

Name	Type	Description
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
forknum	bigint	Fork number.
error_count	bigint	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.4.39 GLOBAL\_STAT\_BAD\_BLOCK

Obtains information about table and index read failures on each node., as described in [Table 13-63](#). It is used on CNs. The read failure information of DN is displayed only, but not summed up.

**Table 13-63** GLOBAL\_STAT\_BAD\_BLOCK columns

Name	Type	Description
node_name	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

### 13.2.4.40 STAT\_USER\_FUNCTIONS

Displays statistics about user-defined functions (the function language is not an internal language) in all the schemas of the current node, as described in [Table 13-64](#).

**Table 13-64** STAT\_USER\_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function.
schemaname	name	Schema name.
funcname	name	UDF name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

#### 13.2.4.41 SUMMARY\_STAT\_USER\_FUNCTIONS

Displays the summary of statistics about user-defined functions on each node in the entire cluster. It is used on CNs and the status information of user-defined functions on each node is summed up by function name, as described in [Table 13-65](#).

**Table 13-65** SUMMARY\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
schemaname	name	Schema name.
funcname	name	UDF name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

#### 13.2.4.42 GLOBAL\_STAT\_USER\_FUNCTIONS

Displays statistics about user-defined functions on each node in the entire cluster, as described in [Table 13-66](#). (It is used on CNs. Status information about functions with the same name on different nodes is not summed up.)

**Table 13-66** GLOBAL\_STAT\_USER\_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	UDF name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

## 13.2.5 Workload

### 13.2.5.1 WORKLOAD\_SQL\_COUNT

Displays the distribution of SQL statements in workloads on the current node, as described in [Table 13-67](#).

**Table 13-67** WORKLOAD\_SQL\_COUNT columns

Name	Type	Description
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.

### 13.2.5.2 SUMMARY\_WORKLOAD\_SQL\_COUNT

Displays the distribution of SQL statements in workloads on each CN in the cluster, as described in [Table 13-68](#).

**Table 13-68** SUMMARY\_WORKLOAD\_SQL\_COUNT columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.
ddl_count	bigint	Number of DDL statements.
dml_count	bigint	Number of DML statements.
dcl_count	bigint	Number of DCL statements.

### 13.2.5.3 WORKLOAD\_TRANSACTION

Displays information about transactions loaded on the current node, as described in [Table 13-69](#).

**Table 13-69** WORKLOAD\_TRANSACTION columns

Name	Type	Description
workload	name	Workload name.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s).
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s).
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s).

Name	Type	Description
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s).
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s).
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s).
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s).

### 13.2.5.4 SUMMARY\_WORKLOAD\_TRANSACTION

Displays the information about transactions in the cluster, as described in [Table 13-70](#).

**Table 13-70** SUMMARY\_WORKLOAD\_TRANSACTION columns

Name	Type	Description
workload	name	Workload name.
commit_counter	numeric	Number of user transactions committed.
rollback_counter	numeric	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s).
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s).
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s).
resp_total	numeric	Total response time of user transactions (unit: $\mu$ s).
bg_commit_counter	numeric	Number of background transactions committed.
bg_rollback_counter	numeric	Number of background transactions rolled back.

Name	Type	Description
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s).
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s).
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s).
bg_resp_total	numeric	Total response time of background transactions (unit: $\mu$ s).

### 13.2.5.5 GLOBAL\_WORKLOAD\_TRANSACTION

Displays load information about workloads on each node, as described in [Table 13-71](#).

**Table 13-71** GLOBAL\_WORKLOAD\_TRANSACTION columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s).
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s).
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s).
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s).
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s).

Name	Type	Description
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s).
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s).

### 13.2.5.6 WORKLOAD\_SQL\_ELAPSE\_TIME

WORKLOAD\_SQL\_ELAPSE\_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics on workloads (services), as described in [Table 13-72](#).

**Table 13-72** WORKLOAD\_SQL\_ELAPSE\_TIME columns

Name	Type	Description
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: $\mu$ s).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: $\mu$ s).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: $\mu$ s).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: $\mu$ s).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: $\mu$ s).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: $\mu$ s).

Name	Type	Description
total_delete_elapse	bigint	Total response time of DELETE statements (unit: $\mu$ s).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: $\mu$ s).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: $\mu$ s).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: $\mu$ s).

### 13.2.5.7 SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME

SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics on workloads (services) of all CNs, as described in [Table 13-73](#).

**Table 13-73** SUMMARY\_WORKLOAD\_SQL\_ELAPSE\_TIME columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: $\mu$ s).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: $\mu$ s).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: $\mu$ s).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: $\mu$ s).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: $\mu$ s).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: $\mu$ s).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: $\mu$ s).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: $\mu$ s).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: $\mu$ s).

Name	Type	Description
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: $\mu$ s).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: $\mu$ s).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: $\mu$ s).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: $\mu$ s).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: $\mu$ s).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: $\mu$ s).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: $\mu$ s).

### 13.2.5.8 USER\_TRANSACTION

USER\_TRANSACTION collects statistics about transactions executed by users, as described in [Table 13-74](#). The monadmin user can view information about transactions executed by all users.

**Table 13-74** USER\_TRANSACTION columns

Name	Type	Description
username	name	Username.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s).
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s).
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s).
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s).
bg_commit_counter	bigint	Number of background transactions committed.

Name	Type	Description
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s).
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s).
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s).
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s).

### 13.2.5.9 GLOBAL\_USER\_TRANSACTION

GLOBAL\_USER\_TRANSACTION collects statistics about transactions executed by all users, as described in [Table 13-75](#).

**Table 13-75** GLOBAL\_USER\_TRANSACTION columns

Name	Type	Description
node_name	name	Node name.
username	name	Username.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: $\mu$ s).
resp_max	bigint	Maximum response time of user transactions (unit: $\mu$ s).
resp_avg	bigint	Average response time of user transactions (unit: $\mu$ s).
resp_total	bigint	Total response time of user transactions (unit: $\mu$ s).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: $\mu$ s).

Name	Type	Description
bg_resp_max	bigint	Maximum response time of background transactions (unit: $\mu$ s).
bg_resp_avg	bigint	Average response time of background transactions (unit: $\mu$ s).
bg_resp_total	bigint	Total response time of background transactions (unit: $\mu$ s).

## 13.2.6 Session and Thread

### 13.2.6.1 SESSION\_STAT

Collects statistics about session status on the current node based on session threads or the AutoVacuum thread, as described in [Table 13-76](#).

**Table 13-76** SESSION\_STAT columns

Name	Type	Description
sessid	text	Thread start time and ID.
statid	integer	Statistics ID.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Session value.

### 13.2.6.2 GLOBAL\_SESSION\_STAT

Collects statistics about session status on each node based on session threads or the AutoVacuum thread, as described in [Table 13-77](#).

**Table 13-77** GLOBAL\_SESSION\_STAT columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
statid	integer	Statistics ID.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.

Name	Type	Description
value	bigint	Session value.

### 13.2.6.3 SESSION\_TIME

Collects statistics about the running time of session threads and time consumed in each execution phase on the current node, as described in [Table 13-78](#).

**Table 13-78** SESSION\_TIME columns

Name	Type	Description
sessid	text	Thread start time and ID.
stat_id	integer	Statistics ID.
stat_name	text	Session type.
value	bigint	Session value.

### 13.2.6.4 GLOBAL\_SESSION\_TIME

Collects statistics about the running time of session threads and time consumed in each execution phase on each node, as described in [Table 13-79](#).

**Table 13-79** GLOBAL\_SESSION\_TIME columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
stat_id	integer	Statistics ID.
stat_name	text	Session type.
value	bigint	Session value.

### 13.2.6.5 SESSION\_MEMORY

Collects statistics about memory usage at the session level in the unit of MB, including all the memory allocated to GaussDB and stream threads on DN for jobs currently executed by users, as described in [Table 13-80](#).

**Table 13-80** SESSION\_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

### 13.2.6.6 GLOBAL\_SESSION\_MEMORY

Collects statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to GaussDB and stream threads on DN for jobs currently executed by users, as described in [Table 13-81](#).

**Table 13-81** GLOBAL\_SESSION\_MEMORY columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

### 13.2.6.7 SESSION\_MEMORY\_DETAIL

Collects statistics on the memory usage of threads on the current node, in the unit specified by **MemoryContext**, as described in [Table 13-82](#).

**Table 13-82** SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
sessid	text	Thread start time and ID.
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Level of memory context importance.

Name	Type	Description
parent	text	Name of the parent memory context.
totalsize	bigint	Size of the applied memory (unit: byte).
freesize	bigint	Size of the idle memory (unit: byte).
usedsize	bigint	Size of the used memory (unit: byte).

### 13.2.6.8 GLOBAL\_SESSION\_MEMORY\_DETAIL

Collects statistics about thread memory usage on each node by **MemoryContext**, as described in [Table 13-83](#).

**Table 13-83** GLOBAL\_SESSION\_MEMORY\_DETAIL columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Level of memory context importance.
parent	text	Name of the parent memory context.
totalsize	bigint	Size of the applied memory (unit: byte).
freesize	bigint	Size of the idle memory (unit: byte).
usedsize	bigint	Size of the used memory (unit: byte).

### 13.2.6.9 SESSION\_STAT\_ACTIVITY

Displays information about threads that are running on the current node, as described in [Table 13-84](#).

**Table 13-84** SESSION\_STAT\_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.

Name	Type	Description
usesysid	oid	OID of the user logged in to the backend.
username	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates either the client is connected via a Unix socket on the server or this is an internal thread, for example, <b>autovacuum</b> is displayed for the thread autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when <b>state</b> was last modified.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If yes, the value is <b>true</b> .

Name	Type	Description
state	text	<p>Overall status of this backend. The value can be:</p> <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but is not currently executing a query.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Common users can view their own session status only. The state information of other accounts is empty. For example, after the <b>judy</b> user is connected to the database, the state information of the <b>joe</b> user and the initial user <b>omm</b> in <b>pg_stat_activity</b> is empty.</p> <pre>gaussdb=# SELECT datname, username, usesysid,state,pid FROM pg_stat_activity; datname   username   usesysid   state   pid -----+-----+-----+-----+----- +-----+-----+-----+-----+----- +-----testdb   omm   10     139968752121616 testdb   omm   10    139968903116560 db_tpcds   judy   16398   active   139968391403280 testdb   omm   10    139968643069712 testdb   omm   10    139968680818448 testdb   joe   16390    139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.

Name	Type	Description
trace_id	text	Trace ID passed by the driver, which is used to identify a request of an application.

### 13.2.6.10 GLOBAL\_SESSION\_STAT\_ACTIVITY

Displays information about threads that are running on each node in the cluster, as described in [Table 13-85](#).

**Table 13-85** GLOBAL\_SESSION\_STAT\_ACTIVITY columns

Name	Type	Description
coorname	text	CN name.
datid	oid	OID of the database that the user session connects to in the backend.
datname	text	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
usesysid	oid	OID of the user logged in to the backend.
username	text	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is <b>NULL</b> , it indicates either the client is connected via a Unix socket on the server or this is an internal thread, for example, <b>autovacuum</b> is displayed for the thread autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of <b>client_addr</b> . This column will be non-null only for IP connections and only when <b>log_hostname</b> is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (-1 if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.

Name	Type	Description
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the <b>query_start</b> column.
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if <b>state</b> is not <b>active</b> . For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when <b>state</b> was last modified.
waiting	Boolean	If the background is waiting for a lock, the value is <b>true</b> . Otherwise, the value is <b>false</b> . If a lock is being waited for on a DN, determine the DN based on the <b>wait_status</b> column in the <code>pg_thread_wait_status</code> view and query the <b>waiting</b> column in <code>pg_stat_activity</code> on the DN to check whether a lock wait occurs.

Name	Type	Description
state	text	<p>Overall status of this backend. The value can be:</p> <ul style="list-style-type: none"> <li>• <b>active</b>: The backend is executing a query.</li> <li>• <b>idle</b>: The backend is waiting for a new client command.</li> <li>• <b>idle in transaction</b>: The backend is in a transaction, but is not currently executing a query.</li> <li>• <b>idle in transaction (aborted)</b>: The backend is in a transaction, but there are statements failed in the transaction.</li> <li>• <b>fastpath function call</b>: The backend is executing a fast-path function.</li> <li>• <b>disabled</b>: This state is reported if <b>track_activities</b> is disabled in this backend.</li> </ul> <p><b>NOTE</b> Common users can view their own session status only. The state information of other accounts is empty. For example, after the <b>judy</b> user is connected to the database, the state information of the <b>joe</b> user and the initial user <b>omm</b> in <b>pg_stat_activity</b> is empty.</p> <pre>gaussdb=# SELECT datname, username, usesysid,state,pid FROM pg_stat_activity; datname   username   usesysid   state   pid -----+-----+-----+-----+----- +-----+-----+-----+-----+----- +-----+-----+-----+-----+----- testdb   omm   10     139968752121616 testdb   omm   10    139968903116560 db_tpcds   judy   16398   active   139968391403280 testdb   omm   10    139968643069712 testdb   omm   10    139968680818448 testdb   joe   16390    139968563377936 (6 rows)</pre>
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If <b>state</b> is <b>active</b> , this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.

Name	Type	Description
trace_id	text	Trace ID passed by the driver, which is used to identify a request of an application.

### 13.2.6.11 THREAD\_WAIT\_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on the current node, as described in [Table 13-86](#). For details about the events, see [Table 13-172](#).

**Table 13-86** THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table Wait event information list</a> .
wait_event	text	If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.

Name	Type	Description
global_sessionid	text	Global session ID.

### 13.2.6.12 GLOBAL\_THREAD\_WAIT\_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on all nodes, as described in [Table GLOBAL\\_THREAD\\_WAIT\\_STATUS columns](#). For details about the events, see [Table Wait event information list](#).

In GLOBAL\_THREAD\_WAIT\_STATUS, you can see all the call hierarchy relationships between threads of the SQL statements on all nodes in the cluster, and the block waiting status for each thread. With this view, you can easily locate the causes of process hang and similar issues.

The definitions of GLOBAL\_THREAD\_WAIT\_STATUS and THREAD\_WAIT\_STATUS are the same, because the essence of the GLOBAL\_THREAD\_WAIT\_STATUS view is the query summary of the THREAD\_WAIT\_STATUS view on each node in the cluster.

**Table 13-87** GLOBAL\_THREAD\_WAIT\_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of <b>debug_query_id</b> .
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see <a href="#">Table Wait event information list</a> .
wait_event	text	If <b>wait_status</b> is <b>acquire lock</b> , <b>acquire lwlock</b> , or <b>wait io</b> , this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.

Name	Type	Description
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

### 13.2.6.13 LOCAL\_THREADPOOL\_STATUS

LOCAL\_THREADPOOL\_STATUS displays the status of worker threads and sessions in a thread pool, as described in [Table 13-88](#). This view is valid only when **enable\_thread\_pool** is set to **on**.

**Table 13-88** LOCAL\_THREADPOOL\_STATUS columns

Name	Type	Description
node_name	text	Node name.
group_id	integer	ID of the thread pool group.
bind_numa_id	integer	NUMA ID to which the thread pool group is bound.
bind_cpu_number	integer	Information about the CPU to which the thread pool group is bound. If no CPUs are bound, the value is <b>NULL</b> .
listener	integer	Number of listener threads in the thread pool group.

Name	Type	Description
worker_info	text	Information about threads in the thread pool, including: <ul style="list-style-type: none"> <li>• <b>default</b>: Number of initial threads in the thread pool group.</li> <li>• <b>new</b>: Number of new threads in the thread pool group.</li> <li>• <b>expect</b>: Expected number of threads in the thread pool group.</li> <li>• <b>actual</b>: Actual number of threads in the thread pool group.</li> <li>• <b>idle</b>: Number of idle threads in the thread pool group.</li> <li>• <b>pending</b>: Number of pending threads in the thread pool group.</li> </ul>
session_info	text	Information about sessions in the thread pool, including: <ul style="list-style-type: none"> <li>• <b>total</b>: Total number of sessions in the thread pool group.</li> <li>• <b>waiting</b>: Number of sessions pending scheduling in the thread pool group.</li> <li>• <b>running</b>: Number of running sessions in the thread pool group.</li> <li>• <b>idle</b>: Number of idle sessions in the thread pool group.</li> </ul>
stream_info	text	Information about streams in the thread pool, including: <ul style="list-style-type: none"> <li>• <b>total</b>: total number of stream threads in the thread pool group.</li> <li>• <b>running</b>: number of running stream threads in the thread pool group.</li> <li>• <b>idle</b>: number of idle stream threads in the thread pool group.</li> </ul>

### 13.2.6.14 GLOBAL\_THREADPOOL\_STATUS

GLOBAL\_THREADPOOL\_STATUS displays the status of worker threads and sessions in thread pools on all nodes. Columns in this view are the same as those in [Table 13-88](#).

### 13.2.6.15 SESSION\_CPU\_RUNTIME

SESSION\_CPU\_RUNTIME displays information about CPU usage of ongoing complex jobs executed by the current user, as described in [Table 13-89](#).

**Table 13-89** SESSION\_CPU\_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
username	name	Name of the user logged in to the backend.
pid	bigint	Backend thread ID.
start_time	timestamp with time zone	Time when the statement execution starts. For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure.
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms).
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms).
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms).
query	text	Statement being executed.
top_cpu_dn	text	Top <i>N</i> CPU usage.

### 13.2.6.16 SESSION\_MEMORY\_RUNTIME

SESSION\_MEMORY\_RUNTIME displays information about memory usage of ongoing complex jobs executed by the current user, as described in [Table 13-90](#).

**Table 13-90** SESSION\_MEMORY\_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
username	name	Name of the user logged in to the backend.
pid	bigint	Backend thread ID.
start_time	timestamp with time zone	Time when the statement execution starts. For a stored procedure or function, the first query time is queried and does not change with the running of statements in the stored procedure.

Name	Type	Description
min_peak_memory	integer	Minimum peak memory of the statement among all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory of the statement among all DNs (unit: MB).
spill_info	text	Statement spill information on all DNs. <ul style="list-style-type: none"> <li>• <b>None:</b> No data has been flushed to disks on all DNs.</li> <li>• <b>All:</b> Data has been flushed to disks on all DNs.</li> <li>• <b>[a:b]:</b> Data has been flushed to disks on <i>a</i> of <i>b</i> DNs.</li> </ul>
query	text	Statement being executed.
top_mem_dn	text	Top <i>N</i> memory usage.

### 13.2.6.17 LOCAL\_ACTIVE\_SESSION

LOCAL\_ACTIVE\_SESSION displays samples in the ACTIVE SESSION PROFILE memory on the current node, as described in [Table 13-91](#).

**Table 13-91** LOCAL\_ACTIVE\_SESSION columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Specified event name.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.

Name	Type	Description
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized UniqueSQL text string.
locktag	text	Information of a lock that the session waits for. It can be parsed using <b>locktag_decode</b> .
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.

Name	Type	Description
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be <b>active</b> , <b>idle in transaction</b> , <b>fastpath function call</b> , <b>idle in transaction (aborted)</b> , <b>disabled</b> , or <b>retrying</b> .
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	Current transaction ID.
top_xid	xid	Top-level transaction ID.

### 13.2.6.18 GLOBAL\_ACTIVE\_SESSION

GLOBAL\_ACTIVE\_SESSION displays a summary of samples in the ACTIVE SESSION PROFILE memory on all nodes, as described in [Table 13-92](#). The **event\_start\_time**, **current\_xid**, and **top\_xid** columns are added to GaussDB Kernel 505.0. After GaussDB Kernel is upgraded to GaussDB Kernel 505.0 or later, the columns cannot be queried during the upgrade observation period.

**Table 13-92** GLOBAL\_ACTIVE\_SESSION columns

Name	Type	Description
node_name	text	Node name.
sampleid	bigint	Sample ID.
sample_time	timestamp without time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be refreshed.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp without time zone	Start time of a session.
event	text	Specified event name.
lwtid	integer	Lightweight thread ID of the current thread.

Name	Type	Description
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized UniqueSQL text string.
locktag	text	Information of a lock that the session waits for. It can be parsed using <b>locktag_decode</b> .
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about the event column.
global_sessionid	text	Global session ID.

Name	Type	Description
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be <b>active</b> , <b>idle in transaction</b> , <b>fastpath function call</b> , <b>idle in transaction (aborted)</b> , <b>disabled</b> , or <b>retrying</b> .
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	Current transaction ID.
top_xid	xid	Top-level transaction ID.

## 13.2.7 Transaction

### 13.2.7.1 TRANSACTIONS\_RUNNING\_XACTS

Displays information about running transactions on the current node, as described in [Table 13-93](#).

**Table 13-93** TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. <ul style="list-style-type: none"> <li>• <b>true</b>: yes.</li> <li>• <b>false</b>: no.</li> </ul>
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the <b>prepared</b> state (the value is <b>0</b> if the state is not <b>prepared</b> ).

Name	Type	Description
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.

### 13.2.7.2 SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS

Displays information about running transactions on each CN in the cluster, as described in [Table 13-94](#).

**Table 13-94** SUMMARY\_TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. <ul style="list-style-type: none"> <li><b>true</b>: yes.</li> <li><b>false</b>: no.</li> </ul>
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the <b>prepared</b> state (the value is <b>0</b> if the state is not <b>prepared</b> ).
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.

### 13.2.7.3 GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS

Displays information about the running transactions on each CN and DN in the cluster, as described in [Table 13-95](#).

**Table 13-95** GLOBAL\_TRANSACTIONS\_RUNNING\_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.

Name	Type	Description
state	tinyint	Transaction status ( <b>3</b> : prepared; <b>0</b> : starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. <ul style="list-style-type: none"> <li>• <b>true</b>: yes</li> <li>• <b>false</b>: no</li> </ul>
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the <b>prepared</b> state (the value is <b>0</b> if the state is not <b>prepared</b> ).
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.

### 13.2.7.4 TRANSACTIONS\_PREPARED\_XACTS

Displays information about transactions that are prepared for two-phase commit, as described in [Table 13-96](#).

**Table 13-96** TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed.

### 13.2.7.5 SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS

Summarizes the information about the transactions that are ready for two-phase commit on each CN in the cluster, as described in [Table 13-97](#).

**Table 13-97** SUMMARY\_TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed.

### 13.2.7.6 GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS

Summarizes the information about the transactions that are ready for two-phase commit on each CN and DN in the cluster, as described in [Table 13-98](#).

**Table 13-98** GLOBAL\_TRANSACTIONS\_PREPARED\_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed.

## 13.2.8 Cache and I/O

### 13.2.8.1 STATIO\_USER\_TABLES

**STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in the namespace, as described in [Table 13-99](#).

**Table 13-99** STATIO\_USER\_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.8.2 SUMMARY\_STATIO\_USER\_TABLES

**SUMMARY\_STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in namespaces in the cluster, as described in [Table 13-100](#).

**Table 13-100** SUMMARY\_STATIO\_USER\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.

Name	Type	Description
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table.

### 13.2.8.3 GLOBAL\_STATIO\_USER\_TABLES

**GLOBAL\_STATIO\_USER\_TABLES** displays I/O status information about all user relationship tables in namespaces on each node, as described in [Table 13-101](#).

**Table 13-101** GLOBAL\_STATIO\_USER\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.

Name	Type	Description
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table.

### 13.2.8.4 STATIO\_USER\_INDEXES

**STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces on the current node, as described in [Table 13-102](#).

**Table 13-102** STATIO\_USER\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.8.5 SUMMARY\_STATIO\_USER\_INDEXES

**SUMMARY\_STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces in the cluster, as described in [Table 13-103](#).

**Table 13-103** SUMMARY\_STATIO\_USER\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.

Name	Type	Description
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

### 13.2.8.6 GLOBAL\_STATIO\_USER\_INDEXES

**GLOBAL\_STATIO\_USER\_INDEXES** displays I/O status information about all user relationship table indexes in namespaces on each node, as described in [Table 13-104](#).

**Table 13-104** GLOBAL\_STATIO\_USER\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

### 13.2.8.7 STATIO\_USER\_SEQUENCES

**STATIO\_USER\_SEQUENCE** displays I/O status information about all user relationship table sequences in namespaces on the current node, as described in [Table 13-105](#).

**Table 13-105** STATIO\_USER\_SEQUENCE columns

Name	Type	Description
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.

Name	Type	Description
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

### 13.2.8.8 SUMMARY\_STATIO\_USER\_SEQUENCES

**SUMMARY\_STATIO\_USER\_SEQUENCES** displays I/O status information about all user relationship table sequences in namespaces in the cluster, as described in [Table 13-106](#).

**Table 13-106** SUMMARY\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

### 13.2.8.9 GLOBAL\_STATIO\_USER\_SEQUENCES

**GLOBAL\_STATIO\_USER\_SEQUENCES** displays I/O status information about all user relationship table sequences in namespaces on each node, as described in [Table 13-107](#).

**Table 13-107** GLOBAL\_STATIO\_USER\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

### 13.2.8.10 STATIO\_SYS\_TABLES

**STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in the current namespace, as described in [Table 13-108](#).

**Table 13-108** STATIO\_SYS\_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.8.11 SUMMARY\_STATIO\_SYS\_TABLES

**SUMMARY\_STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in namespaces in the cluster, as described in [Table 13-109](#).

**Table 13-109** SUMMARY\_STATIO\_SYS\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.

Name	Type	Description
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table.

### 13.2.8.12 GLOBAL\_STATIO\_SYS\_TABLES

**GLOBAL\_STATIO\_SYS\_TABLES** displays I/O status information about all system catalogs in namespaces on each node, as described in [Table 13-110](#).

**Table 13-110** GLOBAL\_STATIO\_SYS\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.

Name	Type	Description
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.

### 13.2.8.13 STATIO\_SYS\_INDEXES

**STATIO\_SYS\_INDEXES** displays the I/O status information about all system catalog indexes in the current namespace, as described in [Table 13-111](#).

**Table 13-111** STATIO\_SYS\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.8.14 SUMMARY\_STATIO\_SYS\_INDEXES

**SUMMARY\_STATIO\_SYS\_INDEXES** displays I/O status information about all system catalog indexes in namespaces in the cluster, as described in [Table 13-112](#).

**Table 13-112** SUMMARY\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.

Name	Type	Description
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

### 13.2.8.15 GLOBAL\_STATIO\_SYS\_INDEXES

**GLOBAL\_STATIO\_SYS\_INDEXES** displays I/O status information about all system catalog indexes in namespaces on each node, as described in [Table 13-113](#).

**Table 13-113** GLOBAL\_STATIO\_SYS\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

### 13.2.8.16 STATIO\_SYS\_SEQUENCES

**STATIO\_SYS\_SEQUENCES** shows the I/O status information about all the system sequences in the current namespace, as described in [Table 13-114](#).

**Table 13-114** STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.

Name	Type	Description
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

### 13.2.8.17 SUMMARY\_STATIO\_SYS\_SEQUENCES

**SUMMARY\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all system sequences in namespaces in the cluster, as described in [Table 13-115](#).

**Table 13-115** SUMMARY\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

### 13.2.8.18 GLOBAL\_STATIO\_SYS\_SEQUENCES

**GLOBAL\_STATIO\_SYS\_SEQUENCES** displays I/O status information about all system sequences in namespaces on each node, as described in [Table 13-116](#).

**Table 13-116** GLOBAL\_STATIO\_SYS\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

### 13.2.8.19 STATIO\_ALL\_TABLES

**STATIO\_ALL\_TABLES** contains one row for each table (including TOAST tables) in the current database, showing I/O statistics about specific tables, as described in [Table 13-117](#).

**Table 13-117** STATIO\_ALL\_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.8.20 SUMMARY\_STATIO\_ALL\_TABLES

**SUMMARY\_STATIO\_ALL\_TABLES** contains I/O statistics about each table (including TOAST tables) in databases in the cluster, as described in [Table 13-118](#).

**Table 13-118** SUMMARY\_STATIO\_ALL\_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.

Name	Type	Description
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

### 13.2.8.21 GLOBAL\_STATIO\_ALL\_TABLES

**GLOBAL\_STATIO\_ALL\_TABLES** contains I/O statistics about each table (including TOAST tables) in databases on each node, as described in [Table 13-119](#).

**Table 13-119** GLOBAL\_STATIO\_ALL\_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.

Name	Type	Description
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

### 13.2.8.22 STATIO\_ALL\_INDEXES

**STATIO\_ALL\_INDEXES** contains one row for each index in the current database, showing I/O statistics about specific indexes, as described in [Table 13-120](#).

**Table 13-120** STATIO\_ALL\_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.8.23 SUMMARY\_STATIO\_ALL\_INDEXES

SUMMARY\_STATIO\_ALL\_INDEXES contains I/O statistics about each index row in databases in the cluster, as described in [Table 13-121](#).

**Table 13-121** SUMMARY\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

### 13.2.8.24 GLOBAL\_STATIO\_ALL\_INDEXES

GLOBAL\_STATIO\_ALL\_INDEXES contains one row for each index in databases on each node, showing I/O statistics about specific indexes, as described in [Table 13-122](#).

**Table 13-122** GLOBAL\_STATIO\_ALL\_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

Name	Type	Description
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

### 13.2.8.25 STATIO\_ALL\_SEQUENCES

**STATIO\_ALL\_SEQUENCES** contains one row for each sequence in the current database, showing I/O statistics about specific sequences, as described in [Table 13-123](#).

**Table 13-123** STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

### 13.2.8.26 SUMMARY\_STATIO\_ALL\_SEQUENCES

**SUMMARY\_STATIO\_ALL\_SEQUENCES** contains I/O statistics about one row of each sequence in databases in the cluster, as described in [Table 13-124](#).

**Table 13-124** SUMMARY\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

### 13.2.8.27 GLOBAL\_STATIO\_ALL\_SEQUENCES

**GLOBAL\_STATIO\_ALL\_SEQUENCES** contains every row of each sequence in databases on each node, showing I/O statistics about specific sequences, as described in [Table 13-125](#).

**Table 13-125** GLOBAL\_STATIO\_ALL\_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

## 13.2.9 Communication Library

### 13.2.9.1 COMM\_DELAY

**COMM\_DELAY** displays the TCP proxy communications library status for a single DN, as described in [Table 13-126](#).

**Table 13-126** COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node.
stream_num	integer	Number of logical stream connections used by the current physical connection.
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: $\mu$ s). <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: $\mu$ s).
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: $\mu$ s).

### 13.2.9.2 GLOBAL\_COMM\_DELAY

**GLOBAL\_COMM\_DELAY** displays the TCP proxy communications library status for all the DNs, as described in [Table 13-127](#).

**Table 13-127** GLOBAL\_COMM\_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node.
stream_num	integer	Number of logical stream connections used by the current physical connection.
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: $\mu$ s). <b>NOTE</b> A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: $\mu$ s).
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: $\mu$ s).

### 13.2.9.3 COMM\_RECV\_STREAM

**COMM\_RECV\_STREAM** displays the receiving stream status of all TCP proxy communications libraries on a single DN, as described in [Table 13-128](#).

**Table 13-128** COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	<b>debug_query_id</b> corresponding to the stream.
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream.

Name	Type	Description
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream.
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average receiving rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
buff_usize	bigint	Current size of the data cache of the stream (unit: byte).

### 13.2.9.4 GLOBAL\_COMM\_RECV\_STREAM

**GLOBAL\_COMM\_RECV\_STREAM** displays the receiving stream status of all TCP proxy communications libraries on all the DN, as described in [Table 13-129](#).

**Table 13-129** GLOBAL\_COMM\_RECV\_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	<b>debug_query_id</b> corresponding to the stream.
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream.
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream.

Name	Type	Description
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average receiving rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
buff_usize	bigint	Current size of the data cache of the stream (unit: byte).

### 13.2.9.5 COMM\_SEND\_STREAM

**COMM\_SEND\_STREAM** displays the sending stream status of all TCP proxy communications libraries on a single DN, as described in [Table 13-130](#).

**Table 13-130** COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	<b>debug_query_id</b> corresponding to the stream.
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream.
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream.
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream.

Name	Type	Description
send_bytes	bigint	Total data volume sent by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average sending rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms).

### 13.2.9.6 GLOBAL\_COMM\_SEND\_STREAM

**GLOBAL\_COMM\_SEND\_STREAM** displays the sending stream status of all TCP proxy communications libraries on all the DNs, as described in [Table 13-131](#).

**Table 13-131** GLOBAL\_COMM\_SEND\_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	<b>debug_query_id</b> corresponding to the stream.
pn_id	integer	<b>plan_node_id</b> of the query executed by the stream.
send_smp	integer	<b>smpid</b> of the sender of the query executed by the stream.
recv_smp	integer	<b>smpid</b> of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).

Name	Type	Description
speed	bigint	Average sending rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms).

### 13.2.9.7 COMM\_STATUS

**COMM\_STATUS** displays the TCP proxy communications library status on a single DN, as described in [Table 13-132](#).

**Table 13-132** COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in Kbyte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in Kbyte/s.
buffer	bigint	Size of the buffer of the Cmailbox.
memkbyte_l ibcomm	bigint	Communication memory size of the <b>libcomm</b> thread, in bytes.
memkbyte_l ibpq	bigint	Communication memory size of the <b>libpq</b> thread, in bytes.
used_pm	integer	Real-time usage of the <b>postmaster</b> thread.
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread.
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread.
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads.
stream	integer	Total number of used logical connections.

### 13.2.9.8 GLOBAL\_COMM\_STATUS

GLOBAL\_COMM\_STATUS displays the TCP proxy communications library status on all the DNs, as described in [Table 13-133](#).

**Table 13-133** GLOBAL\_COMM\_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in Kbyte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in Kbyte/s.
buffer	bigint	Size of the buffer of the Cmailbox.
memkbyte_l libcomm	bigint	Communication memory size of the <b>libcomm</b> thread, in bytes.
memkbyte_l libpq	bigint	Communication memory size of the <b>libpq</b> thread, in bytes.
used_pm	integer	Real-time usage of the <b>postmaster</b> thread.
used_sflow	integer	Real-time usage of the <b>gs_sender_flow_controller</b> thread.
used_rflow	integer	Real-time usage of the <b>gs_receiver_flow_controller</b> thread.
used_rloop	integer	Highest real-time usage among multiple <b>gs_receivers_loop</b> threads.
stream	integer	Total number of used logical connections.

## 13.2.10 Utility

### 13.2.10.1 REPLICATION\_STAT

REPLICATION\_STAT describes information about log synchronization status, such as the locations where the sender sends logs and where the receiver receives logs, as described in [Table 13-134](#).

**Table 13-134** REPLICATION\_STAT columns

Name	Type	Description
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
username	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.
backend_start	timestamp with time zone	Start time of the program.
state	text	Log replication state: <ul style="list-style-type: none"><li>• Catch-up state.</li><li>• Consistent streaming state.</li></ul>
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receiver flushes logs.
receiver_replay_location	text	Location where the receiver replays logs.
sync_priority	integer	Priority of synchronous duplication. (0 indicates asynchronization.)
sync_state	text	Synchronization state: <ul style="list-style-type: none"><li>• Asynchronous replication.</li><li>• Synchronous replication.</li><li>• Potential synchronization.</li></ul>

### 13.2.10.2 GLOBAL\_REPLICATION\_STAT

**GLOBAL\_REPLICATION\_STAT** displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs, as described in [Table 13-135](#).

**Table 13-135** GLOBAL\_REPLICATION\_STAT columns

Name	Type	Description
node_name	name	Node name.
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
username	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.
backend_start	timestamp with time zone	Start time of the program.
state	text	Log replication state: <ul style="list-style-type: none"> <li>• Catch-up state.</li> <li>• Consistent streaming state.</li> </ul>
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receiver flushes logs.
receiver_replay_location	text	Location where the receiver replays logs.
sync_priority	integer	Priority of synchronous duplication. (0 indicates asynchronization.)
sync_state	text	Synchronization state: <ul style="list-style-type: none"> <li>• Asynchronous replication.</li> <li>• Synchronous replication.</li> <li>• Potential synchronization.</li> </ul>

### 13.2.10.3 REPLICATION\_SLOTS

**REPLICATION\_SLOTS** displays replication slot information, as described in [Table 13-136](#).

**Table 13-136** REPLICATION\_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. <ul style="list-style-type: none"><li>• <b>physical</b>: physical replication slot.</li><li>• <b>logical</b>: logical replication slot.</li></ul>
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. <ul style="list-style-type: none"><li>• <b>t</b> (true): yes.</li><li>• <b>f</b> (false): no.</li></ul>
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.

#### 13.2.10.4 GLOBAL\_REPLICATION\_SLOTS

GLOBAL\_REPLICATION\_SLOTS displays information about replicated slots on each node in the cluster, as described in [Table 13-137](#).

**Table 13-137** GLOBAL\_REPLICATION\_SLOTS columns

Name	Type	Description
node_name	name	Node name.
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.

Name	Type	Description
slot_type	text	Replication slot type. <ul style="list-style-type: none"> <li>• <b>physical</b>: physical replication slot.</li> <li>• <b>logical</b>: logical replication slot.</li> </ul>
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. <ul style="list-style-type: none"> <li>• <b>t</b> (true): yes.</li> <li>• <b>f</b> (false): no.</li> </ul>
x_min	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.

### 13.2.10.5 BGWRITER\_STAT

**BGWRITER\_STAT** displays statistics about the background writer thread's activities, as described in [Table 13-138](#).

**Table 13-138** BGWRITER\_STAT columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of requested checkpoints that have been performed.
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms).
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms).

Name	Type	Description
buffers_checkpoint	bigint	Number of buffers written during checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer thread.
maxwritten_clean	bigint	Number of times the background writer thread stopped a cleaning scan because it had written too many buffers.
buffers_backend	bigint	Number of buffers written directly by a backend.
buffers_backend_fsync	bigint	Number of times a backend had to execute its own fsync call (normally the background writer thread handles those even when the backend does its own write).
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

### 13.2.10.6 GLOBAL\_BGWRITER\_STAT

**GLOBAL\_BGWRITER\_STAT** displays statistics about the background writer thread's activities on each node, as described in [Table 13-139](#).

**Table 13-139** GLOBAL\_BGWRITER\_STAT columns

Name	Type	Description
node_name	name	Node name.
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of requested checkpoints that have been performed.
checkpoint_write_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are written to disk (unit: ms).
checkpoint_sync_time	double precision	Total time that has been spent in the portion of checkpoint processing where files are synchronized to disk (unit: ms).

Name	Type	Description
buffers_checkpoint	bigint	Number of buffers written during checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer thread.
maxwritten_clean	bigint	Number of times the background writer thread stopped a cleaning scan because it had written too many buffers.
buffers_backend	bigint	Number of buffers written directly by a backend.
buffers_backend_fsync	bigint	Number of times a backend had to execute its own fsync call (normally the background writer thread handles those even when the backend does its own write).
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

### 13.2.10.7 POOLER\_STATUS

POOLER\_STATUS is used to query the cache connection status of the pooler module on the local CN, as described in [Table 13-140](#).

**Table 13-140** POOLER\_STATUS columns

Name	Type	Description
database	text	Database name.
user_name	text	Username.
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected.
node_name	name	Name of the node connected.

Name	Type	Description
in_use	boolean	Specifies whether the connection is currently used. <ul style="list-style-type: none"> <li>• <b>t</b> (true): The connection is in use.</li> <li>• <b>f</b> (false): The connection is not in use.</li> </ul>
local_host	text	Local IP address.
local_port	bigint	Local port number.
remote_host	text	IP address of the node connected.
node_port	integer	Port number of the node connected.
fdsock	bigint	Port file descriptor.
remote_pid	bigint	If the peer site is not in the thread pool logic, the value is the thread ID of the peer site. If the peer site is in the thread pool logic, the value is the session ID of the peer site.
session_params	text	Session parameter.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

### 13.2.10.8 GLOBAL\_COMM\_CHECK\_CONNECTION\_STATUS

**GLOBAL\_COMM\_CHECK\_CONNECTION\_STATUS** displays the connection status of all CNs and all active nodes (CNs and primary DN). The permission control is inherited from the **DBE\_PERF** schema, as described in [Table 13-141](#).

**Table 13-141** GLOBAL\_COMM\_CHECK\_CONNECTION\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
remote_name	text	Name of the peer instance.
remote_host	text	IP address of the peer instance.
remote_port	integer	Port number of the peer instance.

Name	Type	Description
is_connected	boolean	Detection result of the connection between the current instance and the peer instance. <ul style="list-style-type: none"> <li>• <b>t</b> (true) indicates that the connection is normal.</li> <li>• <b>f</b> (false) indicates that the connection is abnormal.</li> </ul>
no_error_occur	boolean	Pooler connection result between the current instance and the peer instance. <ul style="list-style-type: none"> <li>• <b>t</b> (true) indicates that the pooler connection is normal.</li> <li>• <b>f</b> (false) indicates that the pooler connection is abnormal.</li> </ul>

### 13.2.10.9 GLOBAL\_CKPT\_STATUS

**GLOBAL\_CKPT\_STATUS** displays the information about checkpoints and flushing pages of all instances in the entire cluster, as described in [Table 13-142](#).

**Table 13-142** GLOBAL\_CKPT\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
ckpt_redo_point	text	Checkpoint of the current instance.
ckpt_clog_flush_num	bigint	Number of Clog flushing pages from the startup time to the current time.
ckpt_csnlog_flush_num	bigint	Number of CSN log flushing pages from the startup time to the current time.
ckpt_multixact_flush_num	bigint	Number of MultiXact flushing pages from the startup time to the current time.
ckpt_predicate_flush_num	bigint	Number of predicate flushing pages from the startup time to the current time.
ckpt_twophase_flush_num	bigint	Number of two-phase flushing pages from the startup time to the current time.

### 13.2.10.10 GLOBAL\_DOUBLE\_WRITE\_STATUS

**GLOBAL\_DOUBLE\_WRITE\_STATUS** displays the information about doublewrite files of all instances in the entire cluster, as described in [Table 13-143](#).

**Table 13-143** GLOBAL\_DOUBLE\_WRITE\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
curr_dwn	bigint	Sequence number of the doublewrite file.
curr_start_page	bigint	Start page for restoring the doublewrite file.
file_trunc_num	bigint	Number of times that the doublewrite file is reused.
file_reset_num	bigint	Number of reset times after the doublewrite file is full.
total_writes	bigint	Total number of I/Os of the doublewrite file.
low_threshold_writes	bigint	Number of I/Os for writing doublewrite files with low efficiency (the number of I/O flushing pages at a time is less than 16).
high_threshold_writes	bigint	Number of I/Os for writing doublewrite files with high efficiency (the number of I/O flushing pages at a time is more than 421).
total_pages	bigint	Total number of pages that are flushed to the doublewrite file area.
low_threshold_pages	bigint	Number of pages that are flushed with low efficiency.
high_threshold_pages	bigint	Number of pages that are flushed with high efficiency.
file_id	bigint	ID of the current doublewrite file.

### 13.2.10.11 GLOBAL\_PAGEWRITER\_STATUS

**GLOBAL\_PAGEWRITER\_STATUS** displays the information about checkpoints and flushing pages of all instances in the entire cluster, as described in [Table 13-144](#).

**Table 13-144** GLOBAL\_PAGEWRITER\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
pgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed from the startup to the current time.

Name	Type	Description
pgwr_last_flush_num	integer	Number of dirty pages flushed in the previous batch.
remain_dirty_page_num	bigint	Estimated number of remaining dirty pages.
queue_head_page_rec_lsn	text	<b>recovery_lsn</b> of the first dirty page in the dirty page queue of the current instance.
queue_rec_lsn	text	<b>recovery_lsn</b> of the dirty page queue of the current instance.
current_xlog_insert_lsn	text	The write position of Xlogs in the current instance.
ckpt_redo_point	text	Checkpoint of the current instance.

### 13.2.10.12 GLOBAL\_POOLER\_STATUS

GLOBAL\_POOLER\_STATUS is used to query the cache connection status of the pooler modules on all CNs, as described in [Table 13-145](#).

**Table 13-145** GLOBAL\_POOLER\_STATUS columns

Name	Type	Description
source_node_name	name	Source node name.
database	text	Database name.
user_name	text	Username.
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected.
node_name	name	Name of the node connected.
in_use	boolean	Specifies whether the connection is currently used. <ul style="list-style-type: none"><li>• <b>t</b> (true): The connection is in use.</li><li>• <b>f</b> (false): The connection is not in use.</li></ul>
local_host	text	Local IP address.
local_port	bigint	Local port number.
remote_host	text	IP address of the connected node.
node_port	integer	Port number of the node connected.

Name	Type	Description
fdsock	bigint	Port file descriptor.
remote_pid	bigint	Thread ID of the remote node connected.
session_params	text	Session parameter.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

### 13.2.10.13 GLOBAL\_RECORD\_RESET\_TIME

**GLOBAL\_RECORD\_RESET\_TIME** is used to reset the time for aggregating cluster statistics (restarts, switchovers, and database deletions), as described in [Table 13-146](#).

**Table 13-146** GLOBAL\_RECORD\_RESET\_TIME columns

Name	Type	Description
node_name	text	Node name.
reset_time	timestamp with time zone	Time to be reset.

### 13.2.10.14 GLOBAL\_REDO\_STATUS

**GLOBAL\_REDO\_STATUS** displays the replaying of logs about instances in the entire cluster, as described in [Table 13-147](#).

**Table 13-147** GLOBAL\_REDO\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
redo_start_ptr	bigint	Start point for replaying the instance logs.
redo_start_time	bigint	Start time (UTC) when the instance logs are replayed.
redo_done_time	bigint	End time (UTC) when the instance logs are replayed.
curr_time	bigint	Current time (UTC) of the instance.

Name	Type	Description
min_recovery_point	bigint	Position of the minimum consistency point for the instance logs.
read_ptr	bigint	Position for reading the instance logs.
last_replayed_read_ptr	bigint	Position for replaying the instance logs.
recovery_done_ptr	bigint	Replay position after the instance is started.
read_xlog_io_counter	bigint	Number of I/Os when the instance reads and replays logs.
read_xlog_io_total_dur	bigint	Total I/O latency when the instance reads and replays logs.
read_data_io_counter	bigint	Number of data page I/O reads during replay in the instance.
read_data_io_total_dur	bigint	Total I/O latency of data page reads during replay in the instance.
write_data_io_counter	bigint	Number of data page I/O writes during replay in the instance.
write_data_io_total_dur	bigint	Total I/O latency of data page writes during replay in the instance.
process_pending_counter	bigint	Number of synchronization times of log distribution threads during replay in the instance.
process_pending_total_dur	bigint	Total synchronization latency of log distribution threads during replay in the instance.
apply_counter	bigint	Number of synchronization times of replay threads during replay in the instance.
apply_total_dur	bigint	Total synchronization latency of replay threads during replay in the instance.
speed	bigint	Log replay rate of the current instance. The value is updated every time when 256-MB logs are replayed. The unit is byte/s.  In a cluster environment, you are advised to run the <b>cm_ctl query -rv</b> command to obtain a more accurate replay speed of the standby node. For details about the <b>cm_ctl</b> command, see "Unified Cluster Management Tool" in <i>Tool Reference</i> .
local_max_ptr	bigint	Maximum number of replay logs received by the local host after the instance is started.

Name	Type	Description
primary_flush_ptr	bigint	Log point where the host flushes logs to a disk.
worker_info	text	Replay thread information of the instance. If concurrent replay is not enabled, the value is <b>NULL</b> .

### 13.2.10.15 GLOBAL\_RECOVERY\_STATUS

**GLOBAL\_RECOVERY\_STATUS** displays log flow control information about the primary and standby nodes, as described in [Table 13-148](#).

**Table 13-148** GLOBAL\_RECOVERY\_STATUS columns

Name	Type	Description
node_name	text	Node name (including the primary and standby nodes).
standby_node_name	text	Name of the standby node.
source_ip	text	IP address of the primary node.
source_port	integer	Port number of the primary node.
dest_ip	text	IP address of the standby node.
dest_port	integer	Port number of the standby node.
current_rto	bigint	Current log flow control time of the standby node (unit: s).
target_rto	bigint	Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s).
current_sleep_time	bigint	Sleep time required to achieve the expected flow control time (unit: $\mu$ s).

### 13.2.10.16 CLASS\_VITAL\_INFO

**CLASS\_VITAL\_INFO** is used to check whether the OIDs of the same table or index are consistent for WDR snapshots, as described in [Table 13-149](#).

**Table 13-149** CLASS\_VITAL\_INFO columns

Name	Type	Description
relid	oid	Table OID.

Name	Type	Description
schemaname	name	Schema name.
relname	name	Table name.
relkind	"char"	Object type. Its value can be: <ul style="list-style-type: none"> <li>• <b>r</b>: ordinary table.</li> <li>• <b>t</b>: TOAST table.</li> <li>• <b>i</b>: index.</li> <li>• <b>G</b>: global secondary index.</li> </ul>
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

### 13.2.10.17 USER\_LOGIN

**USER\_LOGIN** records the number of user logins and logouts, as described in [Table 13-150](#).

**Table 13-150** USER\_LOGIN columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
user_id	integer	User OID (Its value is the same as that of <b>oid</b> in <b>pg_authid</b> .)
login_counter	bigint	Number of logins.
logout_counter	bigint	Number of logouts.

### 13.2.10.18 SUMMARY\_USER\_LOGIN

**SUMMARY\_USER\_LOGIN** records information about user logins and logouts on all CNs, as described in [Table 13-151](#).

**Table 13-151** SUMMARY\_USER\_LOGIN columns

Name	Type	Description
node_name	text	Node name.

Name	Type	Description
user_name	text	Username.
user_id	integer	User OID. (Its value is the same as that of <b>oid</b> in <b>pg_authid</b> .)
login_counter	bigint	Number of logins.
logout_counter	bigint	Number of logouts.

### 13.2.10.19 GLOBAL\_GET\_BGWRITER\_STATUS

**GLOBAL\_GET\_BGWRITER\_STATUS** displays the information about pages flushed by the bgwriter threads of all instances in the entire cluster, number of pages in the candidate buffer chain, and buffer eviction information, as described in [Table 13-152](#).

**Table 13-152** GLOBAL\_GET\_BGWRITER\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
bgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed by the bgwriter thread from the startup time to the current time.
bgwr_last_flush_num	integer	Number of dirty pages flushed by the bgwriter thread in the previous batch.
candidate_slots	integer	Number of pages in the current candidate buffer chain.
get_buffer_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction.
get_buffer_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction.

### 13.2.10.20 GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS

**GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS** displays information about doublewrite files eliminated on a single page of all instances in the entire cluster, as described in [Table 13-153](#). In the displayed information, the information before the slash (/) indicates the page flushing status of the first version, and the information after the slash (/) indicates the page flushing status of the second version. The doublewrite page flushing status of the first version refers to performing single-page eviction doublewrite on a non-segment-page page, and the doublewrite

page flushing case of the second version refers to performing single-page eviction doublewrite on a segment-page page.

**Table 13-153** GLOBAL\_SINGLE\_FLUSH\_DW\_STATUS columns

Name	Type	Description
node_name	text	Instance name.
curr_dwn	text	Sequence number of the doublewrite file.
curr_start_page	text	Start position of the current doublewrite file.
total_writes	text	Total number of data write pages in the current doublewrite file.
file_trunc_num	text	Number of times that the doublewrite file is reused.
file_reset_num	text	Number of reset times after the doublewrite file is full.

### 13.2.10.21 GLOBAL\_CANDIDATE\_STATUS

**GLOBAL\_CANDIDATE\_STATUS** displays the number of candidate buffers and buffer eviction information of all instances in the database, as described in [Table 13-154](#).

**Table 13-154** GLOBAL\_GET\_BGWRITER\_STATUS columns

Name	Type	Description
node_name	text	Node name.
candidate_slots	integer	Number of pages in the candidate buffer chain of the current normal buffer pool.
get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool.
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool.
seg_candidate_slots	integer	Number of pages in the candidate buffer chain of the current segment buffer pool.
seg_get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool.

Name	Type	Description
seg_get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool.

### 13.2.10.22 PARALLEL\_DECODE\_STATUS

**PARALLEL\_DECODE\_STATUS** displays parallel decoding information about replication slots on the current node, as described in [Table 13-155](#). This view needs to be queried on DNs. If it is queried on CNs, no information is returned.

**Table 13-155** PARALLEL\_DECODE\_STATUS columns

Name	Type	Description
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestampz	Specifies the time of the latest WAL decoded by the replication slot.

### 13.2.10.23 GLOBAL\_PARALLEL\_DECODE\_STATUS

**GLOBAL\_PARALLEL\_DECODE\_STATUS** displays parallel decoding information about replication slots on each primary DN in a cluster, as described in [Table 13-156](#). The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

**Table 13-156** GLOBAL\_PARALLEL\_DECODE\_STATUS columns

Name	Type	Description
node_name	name	Node name.
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestampz	Specifies the time of the latest WAL decoded by the replication slot.

### 13.2.10.24 PARALLEL\_DECODE\_THREAD\_INFO

**PARALLEL\_DECODE\_THREAD\_INFO** displays information about threads that perform parallel decoding on the current node, as described in [Table 13-157](#). This view needs to be queried on DNs. If it is queried on CNs, no information is returned.

**Table 13-157** PARALLEL\_DECODE\_THREAD\_INFO columns

Name	Type	Description
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).

Name	Type	Description
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

### 13.2.10.25 GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO

GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO displays information about threads that perform parallel decoding on each primary DN in a cluster, as described in [Table 13-158](#). The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

**Table 13-158** GLOBAL\_PARALLEL\_DECODE\_THREAD\_INFO columns

Name	Type	Description
node_name	name	Node name.
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

### 13.2.10.26 GLOBAL\_ADIO\_COMPLETER\_STATUS

GLOBAL\_ADIO\_COMPLETER\_STATUS displays statistics about the AIO Completer thread in all cluster instances, as described in [Table 13-159](#). The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

**Table 13-159** GLOBAL\_ADIO\_COMPLETER\_STATUS columns

Parameter	Type	Description
node_name	text	Instance name.
tid	bigint	ID of the AIO Completer thread.
thread_type	text	AIO Completer thread type (read or write).
aio_submitted_num	bigint	Number of committed asynchronous I/O requests of the AIO Completer thread.
aio_completed_num	bigint	Number of completed asynchronous I/O requests of the AIO Completer thread.

Parameter	Type	Description
aio_incompleted_num	bigint	Number of asynchronous I/O requests that are not completed of the AIO Completer thread.
slot_count_left	bigint	Indicates the number of idle slots.

### 13.2.10.27 GLOBAL\_AIO\_SLOT\_USAGE\_STATUS

**GLOBAL\_AIO\_SLOT\_USAGE\_STATUS** displays statistics about asynchronous I/O commit slots in all cluster instances, as described in [Table 13-160](#). The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

**Table 13-160** GLOBAL\_AIO\_SLOT\_USAGE\_STATUS columns

Parameter	Type	Description
node_name	text	Instance name.
slot_id	integer	Slot ID.
slot_type	"char"	Slot type. The value can be <b>r</b> (read) or <b>w</b> (write).
status	boolean	Slot usage status.
buffer_id	bigint	Buffer ID corresponding to the slot.
relfilenode_blocknum	text	Position of the physical page where the buffer corresponding to the slot is located.
lsn	bigint	LSN corresponding to the page.
submitted_time	bigint	Time when a page is committed asynchronously.
elapsed_time	bigint	Waiting time of the page.

## 13.2.11 Lock

### 13.2.11.1 LOCKS

**LOCKS** displays information about locks held by each open transaction, as described in [Table 13-161](#).

**Table 13-161** LOCKS columns

Name	Type	Description
locktype	text	Type of the locked object: <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b> .
database	oid	OID of the database in which the locked object exists. <ul style="list-style-type: none"><li>• The OID is <b>0</b> if the object is a shared object.</li><li>• The OID is <b>NULL</b> if the object is a transaction ID.</li></ul>
relation	oid	OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is <b>NULL</b> if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is <b>NULL</b> if the object is not a row.
bucket	integer	Hash bucket number.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is <b>NULL</b> if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is <b>0</b> if the object is some other object type. The value is <b>NULL</b> if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.

Name	Type	Description
sessionid	bigint	ID of the session holding or awaiting this lock The value is <b>NULL</b> if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread.
granted	boolean	<ul style="list-style-type: none"> <li>The value is <b>TRUE</b> if the lock is a held lock.</li> <li>The value is <b>FALSE</b> if the lock is an awaited lock.</li> </ul>
fastpath	boolean	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the <b>locktag_decode()</b> function.
global_sessionid	text	Global session ID.

### 13.2.11.2 GLOBAL\_LOCKS

**GLOBAL\_LOCKS** displays information about locks held by open transactions on each node, as described in [Table 13-162](#).

**Table 13-162** GLOBAL\_LOCKS columns

Name	Type	Description
node_name	name	Node name.
locktype	text	Type of the locked object: <b>relation</b> , <b>extend</b> , <b>page</b> , <b>tuple</b> , <b>transactionid</b> , <b>virtualxid</b> , <b>object</b> , <b>userlock</b> , or <b>advisory</b> .
database	oid	OID of the database in which the locked object exists. <ul style="list-style-type: none"> <li>The OID is <b>0</b> if the object is a shared object.</li> <li>The OID is <b>NULL</b> if the object is a transaction ID.</li> </ul>
relation	oid	OID of the relationship targeted by the lock. The value is <b>NULL</b> if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is <b>NULL</b> if the object is not a relationship page or row page.

Name	Type	Description
tuple	smallint	Row number targeted by the lock within the page. The value is <b>NULL</b> if the object is not a row.
bucket	integer	Hash bucket ID.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is <b>NULL</b> if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is <b>NULL</b> if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is <b>NULL</b> if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is <b>0</b> if the object is some other object type. The value is <b>NULL</b> if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.
sessionid	bigint	ID of the session holding or awaiting this lock. The value is <b>NULL</b> if the lock is held by a prepared transaction.
global_sessionid	text	Global session ID.
mode	text	Lock mode held or desired by this thread.
granted	boolean	<ul style="list-style-type: none"> <li>The value is <b>TRUE</b> if the lock is a held lock.</li> <li>The value is <b>FALSE</b> if the lock is an awaited lock.</li> </ul>
fastpath	boolean	The value is <b>TRUE</b> if the lock is obtained through <b>fast-path</b> , and is <b>FALSE</b> if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the <b>locktag_decode()</b> function.

## 13.2.11.3 Memory

### 13.2.11.3.1 MEMORY\_NODE\_DETAIL

Displays memory usage of a node in the database, as described in [Table 13-163](#).

**Table 13-163** MEMORY\_NODE\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	Memory name. <ul style="list-style-type: none"> <li>● <b>max_process_memory</b>: maximum available memory of the database node.</li> <li>● <b>process_used_memory</b>: memory occupied by a process.</li> <li>● <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>● <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>● <b>dynamic_peak_memory</b>: dynamic peak memory.</li> <li>● <b>dynamic_used_shrctx</b>: context of the used dynamic shared memory.</li> <li>● <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>● <b>max_shared_memory</b>: maximum shared memory.</li> <li>● <b>shared_used_memory</b>: used shared memory.</li> <li>● <b>max_sctpcomm_memory</b>: maximum memory allowed for TCP proxy communication.</li> <li>● <b>sctpcomm_used_memory</b>: used memory for TCP proxy communication.</li> <li>● <b>sctpcomm_peak_memory</b>: peak memory of TCP proxy communication.</li> <li>● <b>other_used_memory</b>: other used memory.</li> <li>● <b>gpu_max_dynamic_memory</b>: maximum dynamic GPU memory.</li> <li>● <b>gpu_dynamic_used_memory</b>: used dynamic GPU memory.</li> <li>● <b>gpu_dynamic_peak_memory</b>: dynamic peak GPU memory.</li> <li>● <b>pooler_conn_memory</b>: memory allocated to the connection pool.</li> <li>● <b>pooler_freeconn_memory</b>: memory occupied by idle connections in the connection pool.</li> <li>● <b>storage_compress_memory</b>: memory used by the storage module for compression.</li> <li>● <b>udf_reserved_memory</b>: reserved memory for UDFs.</li> </ul>
memorybytes	integer	Size of the used memory in the unit of MB.

### 13.2.11.3.2 GLOBAL\_MEMORY\_NODE\_DETAIL

Displays the memory usage on all normal nodes in the cluster, as described in [Table 13-164](#).

**Table 13-164** GLOBAL\_MEMORY\_NODE\_DETAIL columns

Name	Type	Description
nodename	text	Node name.

Name	Type	Description
memorytype	text	Memory name. <ul style="list-style-type: none"> <li>● <b>max_process_memory</b>: maximum available memory of the database node.</li> <li>● <b>process_used_memory</b>: memory occupied by a process.</li> <li>● <b>max_dynamic_memory</b>: maximum dynamic memory.</li> <li>● <b>dynamic_used_memory</b>: used dynamic memory.</li> <li>● <b>dynamic_peak_memory</b>: dynamic peak memory.</li> <li>● <b>dynamic_used_shrctx</b>: context of the used dynamic shared memory.</li> <li>● <b>dynamic_peak_shrctx</b>: dynamic peak value of the shared memory context.</li> <li>● <b>max_shared_memory</b>: maximum shared memory.</li> <li>● <b>shared_used_memory</b>: used shared memory.</li> <li>● <b>max_sctpcomm_memory</b>: maximum memory allowed for TCP proxy communication.</li> <li>● <b>sctpcomm_used_memory</b>: used memory for TCP proxy communication.</li> <li>● <b>sctpcomm_peak_memory</b>: peak memory of TCP proxy communication.</li> <li>● <b>other_used_memory</b>: other used memory.</li> <li>● <b>gpu_max_dynamic_memory</b>: maximum dynamic GPU memory.</li> <li>● <b>gpu_dynamic_used_memory</b>: used dynamic GPU memory.</li> <li>● <b>gpu_dynamic_peak_memory</b>: dynamic peak GPU memory.</li> <li>● <b>pooler_conn_memory</b>: applied memory in the connection pool.</li> <li>● <b>pooler_freeconn_memory</b>: memory occupied by idle connections in the connection pool.</li> <li>● <b>storage_compress_memory</b>: memory used by the storage module for compression.</li> <li>● <b>udf_reserved_memory</b>: reserved memory for the UDF.</li> </ul>
memorybytes	integer	Size of the used memory in the unit of MB.

### 13.2.11.3.3 MEMORY\_NODE\_NG\_DETAIL

[Table 13-165](#) describes the memory usage of a node group.

**Table 13-165** MEMORY\_NODE\_NG\_DETAIL columns

Name	Type	Description
ngname	text	Node group name.
memorytype	text	Memory name. <ul style="list-style-type: none"> <li>• <b>ng_total_memory</b>: total memory configured in the node group.</li> <li>• <b>ng_used_memory</b>: used memory.</li> <li>• <b>ng_estimate_memory</b>: memory used by the optimizer for evaluation.</li> <li>• <b>ng_foreignrp_memsize</b>: memory configured in the foreign resource pool.</li> <li>• <b>ng_foreignrp_usedsize</b>: memory used by the foreign resource pool.</li> <li>• <b>ng_foreignrp_peaksize</b>: peak memory used by the foreign resource pool.</li> <li>• <b>ng_foreignrp_mempct</b>: percentage of the system memory configured in attributes of the foreign resource pool.</li> <li>• <b>ng_foreignrp_estmsize</b>: memory used by the optimizer for job evaluation in the foreign resource pool.</li> </ul>
memorybytes	integer	Size of the used memory in the unit of MB.

#### 13.2.11.3.4 SHARED\_MEMORY\_DETAIL

Displays the usage information about shared memory contexts on the current node, as shown in [Table 13-166](#).

**Table 13-166** SHARED\_MEMORY\_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context.
level	smallint	Level of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory (unit: byte).
freesize	bigint	Remaining size of the shared memory (unit: byte).

Name	Type	Description
usedsize	bigint	Used size of the shared memory (unit: byte).

### 13.2.11.3.5 GLOBAL\_SHARED\_MEMORY\_DETAIL

Displays the usage information about shared memory contexts on all normal nodes in the entire cluster, as described in [Table 13-167](#).

**Table 13-167** GLOBAL\_SHARED\_MEMORY\_DETAIL columns

Name	Type	Description
node_name	name	Node name.
contextname	text	Name of the memory context.
level	smallint	Level of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory (unit: byte).
freesize	bigint	Remaining size of the shared memory (unit: byte).
usedsize	bigint	Used size of the shared memory (unit: byte).

### 13.2.11.3.6 TRACK\_MEMORY\_CONTEXT\_DETAIL

Queries the detailed memory application information about the memory context set by `DBE_PERF.track_memory_context`, as described in [Table 13-168](#). Only the initial user or a user with the monadmin permission can execute this view.

**Table 13-168** TRACK\_MEMORY\_CONTEXT\_DETAIL columns

Name	Type	Description
context_name	text	Name of the memory context.
file	text	File to which the memory application location belongs.
line	integer	Line number of the memory application location.

Name	Type	Description
size	bigint	Total size of memory that is applied for (unit: byte).

## 13.2.12 Wait Event

### 13.2.12.1 WAIT\_EVENTS

**WAIT\_EVENTS** displays statistics about wait events on the current node, as described in [Table 13-169](#). For key events in the kernel, see [Table 13-172](#). Alternatively, view the list of all events in the system in the **wait\_event\_info** view. For details about the impact of each transaction lock on services, see [LOCK](#).

**Table 13-169** WAIT\_EVENTS columns

Name	Type	Description
nodename	text	Node name.
type	text	Event type.
event	text	Event name.
wait	bigint	Number of waiting times.
failed_wait	bigint	Number of waiting failures.
total_wait_time	bigint	Total waiting time (unit: $\mu$ s).
avg_wait_time	bigint	Average waiting time (unit: $\mu$ s).
max_wait_time	bigint	Maximum waiting time (unit: $\mu$ s).
min_wait_time	bigint	Minimum waiting time (unit: $\mu$ s).
last_updated	timestamp with time zone	Last time when the event was updated.

### 13.2.12.2 GLOBAL\_WAIT\_EVENTS

**GLOBAL\_WAIT\_EVENTS** displays statistics about wait events on each node, as described in [Table 13-170](#).

**Table 13-170** GLOBAL\_WAIT\_EVENTS columns

Name	Type	Description
nodename	text	Node name.
type	text	Event type.
event	text	Event name.
wait	bigint	Number of waiting times.
failed_wait	bigint	Number of waiting failures.
total_wait_time	bigint	Total waiting time (unit: $\mu$ s).
avg_wait_time	bigint	Average waiting time (unit: $\mu$ s).
max_wait_time	bigint	Maximum waiting time (unit: $\mu$ s).
min_wait_time	bigint	Minimum waiting time (unit: $\mu$ s).
last_updated	timestamp with time zone	Last time when the event was updated.

### 13.2.12.3 WAIT\_EVENT\_INFO

WAIT\_EVENT\_INFO displays the details about wait events, as described in [Table 13-171](#) and [Table 13-172](#).

**Table 13-171** WAIT\_EVENT\_INFO columns

Name	Type	Description
module	text	Name of the module an event belongs to.
type	text	Event type.
event	text	Event name.

**Table 13-172** Wait event information list

Module Category	Event Category	Event	Description
Lock	Wait event	acquire lock	Waits for locking until the locking succeeds or times out.
SharedMemory	LWLock event	ShmemIndex Lock	Protects the primary index table, a hash table, in shared memory.

Module Category	Event Category	Event	Description
Shared buffer	LWLock event	BufMappingLock	Protects operations on a shared-buffer mapping table.
Lmgr	LWLock event	LockMgrLock	Protects the information about a common lock structure.
LWLock	Wait event	acquire lwlock	Waiting for a lightweight lock.
I/O	Wait event	wait io	Waiting for I/O completion.
COMM	Wait event	wait cmd	Waiting for reading network communication packets to complete.
COMM	Wait event	wait pooler get conn	Waiting for pooler to obtain connections.
COMM	Wait event	wait pooler abort conn	Waiting for pooler to terminate connections.
COMM	Wait event	wait pooler clean conn	Waiting for pooler to clear connections.
COMM	Wait event	get conn	Obtaining the connection to other nodes.
COMM	Wait event	set cmd	Waiting for running the <b>SET</b> , <b>RESET</b> , or <b>TRANSACTION BLOCK LEVEL</b> statement on the connection.
COMM	Wait event	cancel query	Canceling the SQL statement that is being executed through the connection.
COMM	Wait event	stop query	Stopping the query that is being executed through the connection.
COMM	Wait event	wait node	Waiting for receiving data through the connection to an instance.
COMM	Wait event	flush data	Waiting for sending data to other nodes in the network.
COMM	Wait event	stream get conn	Waits for establishing connections to consumer nodes when the stream flow is initialized.
COMM	Wait event	wait producer ready	Waits for every producer to get ready when the stream flow is initialized.
Stream	Wait event	synchronize quit	Waits for the threads in the stream thread group to quit when the stream plan ends.

Module Category	Event Category	Event	Description
Stream	Wait event	wait stream group destroy	Waits for destroying the stream node group when the stream plan ends.
Transaction	Wait event	wait transaction sync	Waiting for transaction synchronization.
Transaction	Wait event	wait data sync	Waiting for the completion of data page synchronization to the standby instance.
Transaction	Wait event	wait data sync queue	Waiting for putting the data pages that are in the row-store into the synchronization queue.
Transaction	LWLock event	OidGenLock	Prevents different threads from generating the same OID.
Transaction	LWLock event	XidGenLock	Prevents two transactions from obtaining the same transaction ID.
Transaction	LWLock event	ProcArrayLock	Prevents concurrent access to or concurrent modification on ProcArray shared arrays.
Transaction	LWLock event	SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the subtransaction control data structure.
Transaction	LWLock event	MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode.
Transaction	LWLock event	TwoPhaseStateLock	Used to prevent concurrent access to or modification on two-phase information sharing arrays.
Transaction	LWLock event	SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.
Transaction	LWLock event	SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
Transaction	LWLock event	SerializablePredicateLockListLock	Used to protect a linked list of serializable transactions that have locks.
Transaction	LWLock event	PredicateLockMgrLock	Used to protect the information about a lock structure that has serializable transactions.

Module Category	Event Category	Event	Description
Transaction	LWLock event	OldSerXidSLRUlwlock	Used to protect SLRU buffers of old transaction IDs.
Transaction	LWLock event	OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts.
Transaction	Lock event	transactionid	Adds a lock to a transaction ID.
Transaction	Lock event	virtualxid	Adds a lock to a virtual transaction ID.
Checkpoint	LWLock event	CheckpointLock	Used to prevent multi-checkpoint concurrent execution.
Checkpoint	LWLock event	CheckpointCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
Analyze	LWLock event	AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution.
Vacuum	LWLock event	BtreeVacuumLock	Used to prevent <b>VACUUM</b> from clearing pages that are being used by B-tree indexes.
Vacuum	LWLock event	AutovacuumLock	Used to access the autovacuum worker array in serial mode.
Vacuum	LWLock event	AutovacuumScheduleLock	Used to distribute tables requiring <b>VACUUM</b> in serial mode.
Autovacuum	LWLock event	AutovacuumLock	Protects the autovacuum shared memory structure.
Autovacuum	LWLock event	AutovacuumScheduleLock	Used to protect the information about autovacuum workers.
Autoanalyze	LWLock event	AutoanalyzeLock	Used to protect the <i>autoAnalyzeFreeProcess</i> variable and ensure that no more than 10 autoanalyze threads are running at the same time.
WAL	Wait event	wait wal sync	Waiting for the completion of WAL of synchronization from the specified LSN to the standby instance.
WAL	I/O event	WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.

Module Category	Event Category	Event	Description
WAL	I/O event	WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WAL	I/O event	WALCopyRead	Read operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WAL	I/O event	WALCopyWrite	Write operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WAL	I/O event	WALInitWrite	Initializes a newly created WAL file to 0 during log reclaiming or writing.
WAL	I/O event	WALRead	Reads data from Xlogs during redo operations on two-phase files.
WAL	I/O event	WALSyncMethodAssign	Flushes all open WAL files to a disk.
WAL	I/O event	WALWrite	Writes a WAL file.
WAL	I/O event	LOGCTRL_SLEEP	Collects statistics on the number of stream control times and the sleep time of log stream control.
WAL	LWLock event	RcvWriteLock	Used to prevent concurrent call of <b>WalDataRcvWrite</b> .
WAL	LWLock event	WALBufMappingLock	An exclusive (X) lock needs to be added when the next page of an Xlog buffer is initialized.
WAL	LWLock event	WALInsertLock	Used to prevent multiple programs from writing data to the same Xlog buffer at the same time.
WAL	LWLock event	WALWriteLock	Used to prevent concurrent WAL write.
Relation	LWLock event	SinvalReadLock	Used to prevent concurrent execution with invalid message deletion.
Relation	LWLock event	SinvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion.

Module Category	Event Category	Event	Description
Relation	LWLock event	RelCacheInitLock	Used to add a lock before any operations are performed on the <b>init</b> file when messages are invalid.
Relation	LWLock event	TablespaceCreateLock	Used to check whether a tablespace already exists.
Relation	LWLock event	RelfilenodeReuseLock	Used to prevent the link to a reused column attribute file from being canceled by mistake.
Relation	Lock event	relation	Adds a lock to a table.
Relation	Lock event	extend	Adds a lock to a table being scaled out.
Relation	Lock event	partition	Adds a lock to a partitioned table.
Relation	Lock event	partition_seq	Adds a lock to a partition of a partitioned table.
WLM	Wait event	wait active statement	Waits for active statements.
WLM	Wait event	wait memory	Waits for free memory.
DDL/DCL	Wait event	create index	Waits for the completion of index creation.
DDL/DCL	Wait event	analyze	Waits for analysis completion.
DDL/DCL	Wait event	vacuum	Waits for the completion of the <b>VACUUM</b> operation.
DDL/DCL	LWLock event	DelayDDLlock	Used to prevent concurrent DDL operations.
DDL/DCL	Wait event	vacuum full	Waits for the completion of the <b>VACUUM FULL</b> operation.
Executor	Wait event	Sort	Waits for the completion of tuple sorting.
Executor	Wait event	Sort - write file	Writes sorted data to a file temporarily since the memory is limited during merge sort.
Executor	Wait event	Material	Waits for tuple materialization.

Module Category	Event Category	Event	Description
Executor	Wait event	Material - write file	Waits for writing a materialized tuple to a file.
Executor	Wait event	HashJoin - build hash	Waits until a hash table is created when a hash join is executed.
Executor	Wait event	HashJoin - write file	Waits for writing the hash result of a tuple to a disk when a hash join is executed.
Executor	Wait event	HashAgg - build hash	Waits until a hash table is created when a hash aggregate is executed.
Executor	Wait event	HashAgg - write file	Waits for writing the hash result of a tuple to a disk when a hash aggregate is executed.
Executor	Wait event	HashSetop - build hash	Waits until a hash table is created when an OP operation is performed using the hash algorithm.
Executor	Wait event	HashSetop - write file	Waits for writing the hash result of a tuple to a disk when an OP operation is performed using the hash algorithm.
Executor	Wait event	wait sync consumer next step	Waits for the stream consumer to perform the next step.
Executor	Wait event	wait sync producer next step	Waits for the stream producer to perform the next step.
GTM	Wait event	gtm connect	Waits for connecting to GTM.
GTM	Wait event	gtm reset xmin	Waits for GTM to reset the minimum transaction ID.
GTM	Wait event	gtm get xmin	Waits for obtaining the minimum transaction ID from GTM.
GTM	Wait event	gtm get gxid	Waits for obtaining the global transaction ID from GTM during transaction startup.
GTM	Wait event	gtm get csn	Waits for obtaining the CSN from GTM during transaction startup.
GTM	Wait event	gtm get snapshot	Waits for obtaining snapshots from GTM during transaction startup.
GTM	Wait event	gtm begin trans	Waits for GTM to start a transaction.

Module Category	Event Category	Event	Description
GTM	Wait event	gtm commit trans	Waits for GTM to commit a transaction.
GTM	Wait event	gtm rollback trans	Waits for GTM to roll back transactions.
GTM	Wait event	gtm start prepare trans	Waits for GTM to complete the first phase during two-phase commit.
GTM	Wait event	gtm prepare trans	Waits for GTM to complete the second phase during two-phase commit.
GTM	Wait event	gtm open sequence	Waits for GTM to create a sequence.
GTM	Wait event	gtm close sequence	Waits for GTM to complete the <b>ALTER SEQUENCE</b> operation.
GTM	Wait event	gtm set sequence val	Waits for GTM to set a sequence value.
GTM	Wait event	gtm drop sequence	Waits for GTM to delete a sequence.
GTM	Wait event	gtm rename sequence	Waits for GTM to rename a sequence.
GTM	LWLock event	GTMHostInfo Lock	Used to protect GTM information.
Temp File	I/O event	BufFileRead	Reads data from a temporary file to a specified buffer.
Temp File	I/O event	BufFileWrite	Writes the content of a specified buffer to a temporary file.
Pg_control	I/O event	ControlFileRead	Reads the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileSync	Flushes the <b>pg_control</b> file to a disk, mainly during database initialization.
Pg_control	I/O event	ControlFileSyncUpdate	Flushes the <b>pg_control</b> file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileWrite	Writes the <b>pg_control</b> file, mainly during database initialization.

Module Category	Event Category	Event	Description
Pg_control	I/O event	ControlFileWriteUpdate	Updates the <b>pg_control</b> file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	LWLock event	ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the <b>pg_control</b> file.
File operation	I/O event	CopyFileRead	Reads a file during file copying.
File operation	I/O event	CopyFileWrite	Writes a file during file copying.
File operation	I/O event	DataFileExtend	Writes a file during file name extension.
Table data file	I/O event	DataFileImmediateSync	Flushes a table data file to a disk immediately.
Table data file	I/O event	DataFilePrefetch	Reads a table data file asynchronously.
Table data file	I/O event	DataFileRead	Reads a table data file synchronously.
Table data file	I/O event	DataFileSync	Synchronizes a table data file to a disk.
Table data file	I/O event	DataFileTruncate	Truncates a table data file.
Table data file	I/O event	DataFileWrite	Writes a table data file.
Table data file	LWLock event	SyncScanLock	Used to determine the start position of a relfilenode during heap scanning
Table data file	LWLock event	RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated.
metadata	LWLock event	MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out.
postmaster.pid	I/O event	LockFileAddToDataDirRead	Reads the <b>postmaster.pid</b> file.
postmaster.pid	I/O event	LockFileAddToDataDirSync	Flushes the <b>postmaster.pid</b> file to a disk.

Module Category	Event Category	Event	Description
postmaster.pid	I/O event	LockFileAddToDataDirWrite	Writes PID information into the <b>postmaster.pid</b> file.
Pid File	I/O event	LockFileCreateRead	Reads the LockFile file <b>%s.lock</b> .
Pid File	I/O event	LockFileCreateSync	Flushes the LockFile file <b>%s.lock</b> to a disk.
Pid File	I/O event	LockFileCreateWrite	Writes PID information into the LockFile file <b>%s.lock</b> .
System catalog mapping file	I/O event	RelationMapRead	Reads the mapping file between system catalogs and storage locations.
System catalog mapping file	I/O event	RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
System catalog mapping file	I/O event	RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
Streaming replication	I/O event	ReplicationSlotRead	Reads a streaming replication slot file This operation is performed during a restart.
Streaming replication	I/O event	ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk.
Streaming replication	I/O event	ReplicationSlotSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.
Streaming replication	I/O event	ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.
Streaming replication	LWLock event	ReplicationSlotAllocationLock	Used to allocate a replication slot.
Streaming replication	LWLock event	ReplicationSlotControlLock	Used to detect replication slot name conflicts and identify replication slots that can be allocated.

Module Category	Event Category	Event	Description
Clog	I/O event	SLRUFlushSync	Flushes the <b>pg_clog</b> file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRURead	Reads the <b>pg_clog</b> file.
Clog	I/O event	SLRUSync	Writes dirty pages into the <b>pg_clog</b> file, and flushes the file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRUWrite	Writes the <b>pg_clog</b> file.
Clog	LWLock event	CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
Clog	LWLock event	MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on <b>pg_multixact/offset</b> .
Clog	LWLock event	MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on <b>pg_multixact/members</b> .
timelinehistory	I/O event	TimelineHistoryRead	Reads the <b>timelinehistory</b> file, during database startup.
timelinehistory	I/O event	TimelineHistorySync	Flushes the <b>timelinehistory</b> file to a disk, during database startup.
timelinehistory	I/O event	TimelineHistoryWrite	Writes the <b>timelinehistory</b> file.
pg_twophase	I/O event	TwophaseFileRead	Reads the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileSync	Flushes the <b>pg_twophase</b> file to a disk, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileWrite	Writes the <b>pg_twophase</b> file, mainly during two-phase transaction commit and restoration.
Cluster	LWLock event	NodeTableLock	Used to protect a shared structure that stores CNs and DN information.
Concurrency	LWLock event	PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool.

Module Category	Event Category	Event	Description
Concurren- cy	LWLock event	AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status.
Concurren- cy	LWLock event	AsyncQueueL ock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue.
Double write	I/O event	DoubleWriteF ileWrite	Writes pages to a doublewrite file during the doublewrite process.
Double write	I/O event	DoubleWriteF ileRead	Reads a doublewrite file during restoration for a halfwrite.
Statistics file	LWLock event	FileStatLock	Used to protect a data structure that stores statistics file information.
Master- slave replicatio n	LWLock event	SyncRepLock	Used to protect Xlog synchronization information during primary/standby replication.
Master- slave replicatio n	LWLock event	ReplicationSl otAllocationL ock	Used to add a lock when a primary server allocates streaming replication slots during primary/standby replication.
Master- slave replicatio n	LWLock event	ReplicationSl otControlLoc k	Used to prevent concurrent update of streaming replication slot status during primary/standby replication.
Master- slave replicatio n	LWLock event	LsnXlogChkFil eLock	Used to serially update the Xlog flush points for primary and standby servers recorded in a specific structure.
Master- slave replicatio n	LWLock event	DataSyncRep Lock	Used to protect data page synchronization information during primary/standby replication.
Speed up the cluster	LWLock event	SearchServer LibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
Resource manage	LWLock event	ResourcePool HashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table.

Module Category	Event Category	Event	Description
OBS	LWLock event	OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path.
OBS	LWLock event	OBSRuntimeLock	Used to obtain environment variables, for example, <i>GASSHOME</i> .
LLVM	LWLock event	LLVMDumpIRLock	Used to export the assembly language for dynamically generating functions.
LLVM	LWLock event	LLVMParseIRLock	Used to compile and parse a finished IR function from the IR file at the start position of a query.
MPP is compatible with ORACLE scheduled task function	LWLock event	JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled task where MPP is compatible with Oracle.
Operator history information statistics	LWLock event	OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.
Operator history information statistics	LWLock event	OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
query history information statistics	LWLock event	SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.
query history information statistics	LWLock event	SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
query history information statistics	LWLock event	WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios.

Module Category	Event Category	Event	Description
barrier	LWLock event	BarrierLock	Used to ensure that only one thread is creating a barrier at a time.
CSN	LWLock event	CSNBufMappingLock	Used to protect CSN pages.
instrumentation	LWLock event	UniqueSQLMappingLock	Used to protect a unique SQL hash table.
instrumentation	LWLock event	InstrUserLock	Used to protect a user hash table.
instrumentation	LWLock event	PercentileLock	Used to protect global percentile buffers.
instrumentation	LWLock event	InstrWorkloadLock	Used to protect a workload transaction hash table.
Pgproc	LWLock event	Pgproclwlock	Used to protect the PGPROC structure.
Async buffer	LWLock event	AsyncCtlLock	Used to protect asynchronization buffers.
MultiXact	LWLock event	MultiXactOffsetlwlock	Used to protect SLRU buffers of a MultiXact offset.
MultiXact	LWLock event	MultiXactMemberlwlock	Used to protect SLRU buffer of a MultiXact member.
CBM	LWLock event	CBMParseXlogLock	Used to protect the lock used when CBM parses Xlogs.
BadBlock	LWLock event	BadBlockStatHashLock	Used to protect the hash table <b>global_bad_block_stat</b> .
Page	Lock event	page	Adds a lock to a table page.
Tuple	Lock event	tuple	Adds a lock to a tuple on a page.
object	Lock event	object	Adds a lock to an object.
user	Lock event	userlock	Adds a lock to a user.
advisor	Lock event	advisory	Adds an advisory lock.
ODBC	LWLock event	ExtensionConnectorLibLock	Adds a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.

Module Category	Event Category	Event	Description
COMM	Wait event	Accept client conn - Total Time	(After the GaussDB receives a connection request from a client) Total duration from the time when a connection is established to the time when the connection is successful.
COMM	Wait event	Accept client conn - ThrdPool - add epoll	(After the GaussDB receives a connection request from a client) Duration from the time when a connection is established to the time when the thread pool adds the session handle to the epoll in thread pool mode.
COMM	Wait event	Accept client conn - ThrdPool - wait worker	(After the GaussDB receives a connection request from a client) Duration from the time when the thread pool adds the session handle to the epoll to the time when the working thread pool starts to work in thread pool mode.
COMM	Wait event	Accept client conn - ThrdPool - init session	(After the GaussDB receives a connection request from a client) Duration from the time when the working thread pool starts to work to the time the session initialization ends in thread pool mode.
COMM	Wait event	Accept client conn - Worker - init proc	(After the GaussDB receives a connection request from a client) Duration from the time when a connection is established to the time when the thread initialization ends in non-thread pool mode.
COMM	Wait event	Accept client conn - Worker - init session	(After the GaussDB receives a connection request from a client) Duration from the time when the thread initialization ends to the time when the session initialization ends in non-thread pool mode.

## 13.2.13 Configuration

### 13.2.13.1 CONFIG\_SETTINGS

**CONFIG\_SETTINGS** displays information about parameters of the running database, as described in [Table 13-173](#).

**Table 13-173** CONFIG\_SETTINGS columns

Name	Type	Description
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of the parameter.
category	text	Logical group of the parameter.
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>sighup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b> .
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b> .
source	text	Method of assigning the parameter value.
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

### 13.2.13.2 GLOBAL\_CONFIG\_SETTINGS

**GLOBAL\_CONFIG\_SETTINGS** displays information about parameters of running databases on each node, as described in [Table 13-174](#).

**Table 13-174** GLOBAL\_CONFIG\_SETTINGS columns

Name	Type	Description
node_name	text	Node name.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of the parameter.
category	text	Logical group of the parameter.
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including <b>internal</b> , <b>postmaster</b> , <b>sighup</b> , <b>backend</b> , <b>superuser</b> , and <b>user</b> .
vartype	text	Parameter type, including <b>bool</b> , <b>enum</b> , <b>integer</b> , <b>real</b> , or <b>string</b> .
source	text	Method of assigning the parameter value.
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is <b>null</b> .
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is <b>null</b> .
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is <b>null</b> .

## 13.2.14 Operator

### 13.2.14.1 OPERATOR\_HISTORY\_TABLE

OPERATOR\_HISTORY\_TABLE displays records about operators of completed jobs. Data is dumped from the kernel to this system catalog, as described in [Table 13-175](#).

**Table 13-175** OPERATOR\_HISTORY\_TABLE columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DN's (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DN's (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DN's (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DN's when a spill occurs (unit: MB; default value: 0).
max_spill_size	integer	Maximum spilled data among all DN's when a spill occurs (unit: MB; default value: 0).
average_spill_size	integer	Average spilled data among all DN's when a spill occurs (unit: MB; default value: 0).
spill_skew_percent	integer	DN spill skew when a spill occurs.

Name	Type	Description
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"> <li>• Sort/SetOp/HashAgg/HashJoin spill</li> <li>• Spill file size large than 256MB</li> <li>• Broadcast size large than 100MB</li> <li>• Early spill</li> <li>• Spill times is greater than 3</li> <li>• Spill on memory adaptive</li> <li>• Hash table conflict</li> </ul>

### 13.2.14.2 OPERATOR\_HISTORY

OPERATOR\_HISTORY displays information about operators of the jobs that are executed by the current user on the current CN. Data in the kernel is cleared every 3 minutes.

### 13.2.14.3 OPERATOR\_RUNTIME

OPERATOR\_RUNTIME displays information about operators of the jobs that are being executed by the current user, as described in [Table 13-176](#).

**Table 13-176** OPERATOR\_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.

Name	Type	Description
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
status	text	Execution status of the current operator. Its value can be <b>finished</b> or <b>running</b> .
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.

Name	Type	Description
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"> <li>• Sort/SetOp/HashAgg/HashJoin spill</li> <li>• Spill file size large than 256MB</li> <li>• Broadcast size large than 100MB</li> <li>• Early spill</li> <li>• Spill times is greater than 3</li> <li>• Spill on memory adaptive</li> <li>• Hash table conflict</li> </ul>

### 13.2.14.4 GLOBAL\_OPERATOR\_HISTORY

**GLOBAL\_OPERATOR\_HISTORY** displays the records about operators after jobs are executed by the current user on all CNs, as described in [Table 13-177](#).

**Table 13-177** GLOBAL\_OPERATOR\_HISTORY columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DN's (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DN's (unit: MB).

Name	Type	Description
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: <ol style="list-style-type: none"> <li>1. Sort/SetOp/HashAgg/HashJoin spill</li> <li>2. Spill file size large than 256MB</li> <li>3. Broadcast size large than 100MB</li> <li>4. Early spill</li> <li>5. Spill times is greater than 3</li> <li>6. Spill on memory adaptive</li> <li>7. Hash table conflict</li> </ol>

### 13.2.14.5 GLOBAL\_OPERATOR\_HISTORY\_TABLE

GLOBAL\_OPERATOR\_HISTORY\_TABLE displays the records about operators of completed jobs on all CNs. Data is dumped from the kernel to the system catalog GS\_WLM\_OPERATOR\_INFO. This view is an aggregation view for querying the system catalog GS\_WLM\_OPERATOR\_INFO of all CNs. Columns in this view are the same as those in [Table 13-177](#).

### 13.2.14.6 GLOBAL\_OPERATOR\_RUNTIME

**GLOBAL\_OPERATOR\_RUNTIME** displays information about operators of the jobs that are being executed by the current user on all CNs, as described in [Table 13-178](#).

**Table 13-178** GLOBAL\_OPERATOR\_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
status	text	Execution status of the current operator. Its value can be <b>finished</b> or <b>running</b> .
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: <b>0</b> ).

Name	Type	Description
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: <ul style="list-style-type: none"> <li>• Sort/SetOp/HashAgg/HashJoin spill</li> <li>• Spill file size large than 256MB</li> <li>• Broadcast size large than 100MB</li> <li>• Early spill</li> <li>• Spill times is greater than 3</li> <li>• Spill on memory adaptive</li> <li>• Hash table conflict</li> </ul>

## 13.2.15 Workload Manager

### 13.2.15.1 WLM\_CGROUP\_CONFIG

**WLM\_CGROUP\_CONFIG** displays information about a Cgroup for a job that is being executed, as described in [Table 13-179](#).

**Table 13-179** WLM\_CGROUP\_CONFIG columns

Name	Type	Description
cgoup_name	text	Cgroup name.
priority	integer	Job priority.
usage_pencent	integer	Percentage of resources used by the Cgroup.
shares	bigint	CPU quota allocated to a Cgroup.
cpuacct	bigint	Allocated CPU quota.
cpuset	text	Allocated CPU cores.

Name	Type	Description
relpath	text	Relative path of the Cgroup.
valid	text	Specifies whether the Cgroup is valid.

### 13.2.15.2 WLM\_CLUSTER\_RESOURCE\_RUNTIME

**WLM\_CLUSTER\_RESOURCE\_RUNTIME** displays a DN resource summary, as described in [Table 13-180](#).

**Table 13-180** WLM\_CLUSTER\_RESOURCE\_RUNTIME columns

Name	Type	Description
min_mem_util	integer	Minimum memory usage of a DN.
max_mem_util	integer	Maximum memory usage of a DN.
min_cpu_util	integer	Minimum CPU usage of a DN.
max_cpu_util	integer	Maximum CPU usage of a DN.
min_io_util	integer	Minimum I/O usage of a DN.
max_io_util	integer	Maximum I/O usage of a DN.
used_mem_rate	integer	Maximum memory usage of a physical node.

### 13.2.15.3 WLM\_CONTROLGROUP\_CONFIG

**WLM\_CONTROLGROUP\_CONFIG** displays information about all Cgroups in the current database, as described in [Table 13-181](#).

**Table 13-181** WLM\_CONTROLGROUP\_CONFIG columns

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the <b>Class</b> Cgroup to which a <b>Workload</b> Cgroup belongs.
class	text	Class Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to a Cgroup.

Name	Type	Description
limits	bigint	Limit of CPUs allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in a Cgroup.

### 13.2.15.4 WLM\_RESOURCEPOOL\_RUNTIME

**WLM\_RESOURCEPOOL\_RUNTIME** displays statistics about a resource pool, as described in [Table 13-182](#).

**Table 13-182** WLM\_RESOURCEPOOL\_RUNTIME columns

Name	Type	Description
rpoid	oid	OID of the resource pool.
respool	name	Name of the resource pool.
control_group	name	Cgroup associated with the resource pool.
parentid	oid	OID of the parent resource pool.
ref_count	integer	Number of jobs associated with the resource pool.
active_points	integer	Number of used points in the resource pool.
running_count	integer	Number of jobs running in the resource pool.
waiting_count	integer	Number of jobs queuing in the resource pool.
io_limits	integer	IOPS upper limit of the resource pool.
io_priority	integer	I/O priority of the resource pool.

### 13.2.15.5 WLM\_USER\_RESOURCE\_CONFIG

**WLM\_USER\_RESOURCE\_CONFIG** displays the resource configuration information of a user, as described in [Table 13-183](#).

**Table 13-183** WLM\_USER\_RESOURCE\_CONFIG columns

Name	Type	Description
userid	oid	OID of the user.

Name	Type	Description
username	name	Username.
sysadmin	boolean	Specifies whether the user has the sysadmin permission.
rpoid	oid	OID of the resource pool.
respool	name	Name of the resource pool.
parentid	oid	OID of the parent user.
totalspace	bigint	Size of the occupied space.
spacelimit	bigint	Upper limit of the space size.
childcount	integer	Number of child users.
childlist	texto	Child user list.

### 13.2.15.6 WLM\_USER\_RESOURCE\_RUNTIME

**WLM\_USER\_RESOURCE\_RUNTIME** displays resource usage of all users. Only administrators can query this view, as described in [Table 13-184](#). This view is valid only when the GUC parameter **use\_workload\_manager** is set to **on**.

**Table 13-184** WLM\_USER\_RESOURCE\_RUNTIME columns

Name	Type	Description
username	name	Username.
used_memory	integer	Size of the memory being used (unit: MB).
total_memory	integer	Available memory (unit: MB). The value <b>0</b> indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	integer	Number of CPU cores in use.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node.
used_space	bigint	Used storage space (unit: KB).
total_space	bigint	Available storage space (unit: KB). The value <b>-1</b> indicates that the space is not limited.
used_temp_space	bigint	Used temporary space (reserved column; unit: KB).

Name	Type	Description
total_temp_space	bigint	Available temporary space (reserved column; unit: KB). The value -1 indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space for storing spilled data (reserved column; unit: KB).
total_spill_space	bigint	Available space for storing spilled data (reserved column; unit: KB). The value -1 indicates that the maximum space for storing spilled data is not limited.

### 13.2.15.7 WLM\_WORKLOAD\_RUNTIME

**WLM\_WORKLOAD\_RUNTIME** displays the status of jobs being executed by the current user on the current CN, as described in [Table 13-185](#).

**Table 13-185** WLM\_WORKLOAD\_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed.
thread_id	bigint	Backend thread ID.
processid	integer	PID of the backend thread.
time_stamp	bigint	Time when the statement starts to be executed.
username	name	Username for logging in to the backend.
memory	integer	Memory required by the statement.
active_points	integer	Number of resources consumed by the statement in the resource pool.
max_points	integer	Number of resources consumed by the statement in the resource pool.
priority	integer	Job priority.
resource_pool	text	Resource pool to which the job belongs.

Name	Type	Description
status	text	Job execution status. Its value can be: <ul style="list-style-type: none"> <li>● <b>pending</b>: blocked.</li> <li>● <b>running</b>: running.</li> <li>● <b>finished</b>: ended.</li> <li>● <b>aborted</b>: aborted.</li> <li>● <b>unknown</b>: unknown.</li> </ul>
control_group	text	Cgroups used by the job.
enqueue	text	Queue that the job is in. Its value can be: <ul style="list-style-type: none"> <li>● <b>GLOBAL</b>: global queue.</li> <li>● <b>RESPOOL</b>: resource pool queue.</li> <li>● <b>ACTIVE</b>: not in a queue.</li> </ul>
query	text	Statement being executed.

### 13.2.15.8 GLOBAL\_WLM\_WORKLOAD\_RUNTIME

Displays the status of jobs executed by the current user on CNs, as described in [Table 13-186](#). This view is accessible only to users with the monadmin permission.

**Table 13-186** GLOBAL\_WAL\_WORKLOAD\_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed.
thread_id	bigint	Backend thread ID.
processid	integer	LWP ID of the thread.
time_stamp	bigint	Time when the statement starts to be executed.
username	name	Username for logging in to the backend.
memory	integer	Memory required by the statement.
active_points	integer	Number of resources consumed by the statement in the resource pool.
max_points	integer	Maximum number of resources in the resource pool.
priority	integer	Job priority.
resource_pool	text	Resource pool to which the job belongs.

Name	Type	Description
status	text	Job execution status. Its value can be: <ul style="list-style-type: none"> <li>● <b>pending</b>: blocked status.</li> <li>● <b>running</b>: running status.</li> <li>● <b>finished</b>: final status.</li> <li>● <b>aborted</b>: termination status.</li> <li>● <b>unknown</b>: unknown status.</li> </ul>
control_group	name	Cgroups used by the job.
enqueue	text	Queue that the job is in. Its value can be: <ul style="list-style-type: none"> <li>● <b>GLOBAL</b>: global queue.</li> <li>● <b>RESPOOL</b>: resource pool queue.</li> <li>● <b>ACTIVE</b>: not in a queue.</li> </ul>
query	text	Statement being executed.

### 13.2.15.9 LOCAL\_IO\_WAIT\_INFO

Returns the real-time statistics of I/O control on the current node, as described in [Table 13-187](#).

**Table 13-187** LOCAL\_IO\_WAIT\_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	double precision	Number of read completions per second.
write_per_second	double precision	Number of write completions per second.
write_ratio	double precision	Ratio of the disk write I/Os to the total I/Os.
io_util	double precision	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.

Name	Type	Description
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is <b>0</b> , no I/O is under control.

### 13.2.15.10 GLOBAL\_IO\_WAIT\_INFO

Returns the real-time statistics of I/O control on all nodes, as described in [Table 13-188](#).

**Table 13-188** GLOBAL\_IO\_WAIT\_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	double precision	Number of read completions per second.
write_per_second	double precision	Number of write completions per second.
write_ratio	double precision	Ratio of the disk write I/Os to the total I/Os.
io_util	double precision	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is <b>0</b> , no I/O is under control.

## 13.2.16 Global Plan Cache

Global plan cache (GPC) views are valid only when **enable\_global\_plancache** is set to **on**.

### 13.2.16.1 LOCAL\_PLANCACHE\_STATUS

**LOCAL\_PLANCACHE\_STATUS** displays the status of the GPC plan cache on the current node, as described in [Table 13-189](#).

**Table 13-189** LOCAL\_PLANCACHE\_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the plan cache belongs to.
query	text	Text of query statements.
refcount	integer	Number of times that the plan cache is referenced.
valid	bool	Specifies whether the plan cache is valid.
databaseid	oid	ID of the database that the plan cache belongs to.
schema_name	text	Schema that the plan cache belongs to.
params_num	integer	Number of parameters.
func_id	oid	OID of the stored procedure where the plan cache is located. If the plancache does not belong to the stored procedure, the value is <b>0</b> .
stmt_id	integer	Sequence number of the statement plan in the stored procedure.

### 13.2.16.2 GLOBAL\_PLANCACHE\_STATUS

**GLOBAL\_PLANCACHE\_STATUS** displays the status of GPC plan caches on all nodes. For details about the columns, see [LOCAL\\_PLANCACHE\\_STATUS](#).

### 13.2.16.3 LOCAL\_PREPARE\_STATEMENT\_STATUS

**LOCAL\_PREPARE\_STATEMENT\_STATUS** displays the information about prepare statements corresponding to the GPC plan cache on the current node, as described in [Table 13-190](#).

**Table 13-190** LOCAL\_PREPARE\_STATEMENT\_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the statement belongs to.
cn_sess_id	bigint	Session ID of the CN that the statement is sent from.
cn_node_id	integer	Node ID of the CN that the statement is sent from.

Name	Type	Description
cn_time_line	integer	Number of restart times of the CN that the statement is sent from.
statement_name	text	Statement name.
refcount	integer	Number of times that the corresponding plan cache is referenced.
is_shared	bool	Specifies whether the corresponding plan cache is shared.
query	text	Corresponding query statement.

### 13.2.16.4 GLOBAL\_PREPARE\_STATEMENT\_STATUS

GLOBAL\_PREPARE\_STATEMENT\_STATUS displays the information about prepare statements corresponding to GPC plan caches on all nodes. For details about the columns, see [LOCAL\\_PREPARE\\_STATEMENT\\_STATUS](#).

## 13.2.17 RTO & RPO

### 13.2.17.1 global\_rto\_status

global\_rto\_status displays log flow control information about the primary and standby nodes (except the current node and DNs), as described in [Table 13-191](#).

Table 13-191 global\_rto\_status columns

Parameter	Type	Description
node_name	text	Node name (including the primary and standby nodes).
rto_info	text	Flow control information, including the current log flow control time (unit: second) of the standby server, the expected flow control time (unit: second) specified by the GUC parameter, and the primary server sleep time (unit: $\mu$ s) required to reach the expectation.

### 13.2.17.2 global\_streaming\_hadr\_rto\_and\_rpo\_stat

global\_streaming\_hadr\_rto\_and\_rpo\_stat displays the log flow control information about the primary and standby clusters for streaming DR, as described in [Table 13-192](#). (This view can be used only on the CN in the primary cluster and cannot obtain statistics from the DN or standby cluster.)

**Table 13-192** Parameters

Parameter	Type	Description
hadr_sender_node_name	text	Name of the first standby node in the primary and standby clusters.
hadr_receiver_node_name	text	Name of the first standby node in the standby cluster.
current_rto	int	Flow control information, that is, log RTO time of the current primary and standby clusters (unit: second). <b>-1</b> indicates that the majority of the DR cluster is abnormal.
target_rto	int	Flow control information, that is, RTO time between the target primary and standby clusters (unit: second).
current_rpo	int	Flow control information, that is, log RPO time of the current primary and standby clusters (unit: second) <b>-1</b> indicates that the majority of the DR cluster is abnormal.
target_rpo	int	Flow control information, that is, RPO time between the target primary and standby clusters (unit: second).
rto_sleep_time	int	RTO flow control information, that is, expected sleep time (unit: $\mu$ s) required by WAL sender on the host to reach the specified RTO.
rpo_sleep_time	int	RPO flow control information, that is, expected sleep time (unit: $\mu$ s) required by xlogInsert on the host to reach the specified RPO.

## 13.2.18 AI Watchdog

### 13.2.18.1 ai\_watchdog\_monitor\_status

**Table 13-193** ai\_watchdog\_monitor\_status parameters

Parameter	Type	Description
metric_name	text	Metric names: <ul style="list-style-type: none"> <li>• <b>tps</b>: TPS.</li> <li>• <b>tps_hourly</b>: average TPS per hour.</li> <li>• <b>shared_used_mem</b>: the used shared memory (MB).</li> <li>• <b>dynamic_used_shrctx</b>: the used shared memory context (MB).</li> <li>• <b>other_used_mem</b>: other used memory (MB).</li> <li>• <b>process_used_mem</b>: the used resident memory (MB).</li> <li>• <b>dynamic_used_mem</b>: the used dynamic memory (MB).</li> <li>• <b>malloc_failures</b>: the number of memory allocation failures in each collection interval.</li> <li>• <b>D_state_rate</b>: percentage of threads in the D state.</li> <li>• <b>R_state_rate</b>: percentage of threads in the R state.</li> <li>• <b>S_state_rate</b>: ratio of threads in the S state.</li> <li>• <b>db_state</b>: database state (<b>68</b> indicates D, <b>82</b> indicates R, and <b>83</b> indicates S).</li> <li>• <b>cpu_usage</b>: CPU usage. The upper limit is 100.</li> <li>• <b>disk_io</b>: disk I/O delay between two collection intervals.</li> <li>• <b>network_io</b>: network I/O delay between two collection intervals.</li> <li>• <b>threadpool_usage</b>: thread pool usage.</li> <li>• <b>threadpool_hang_rate</b>: percentage of the thread pool group in the hang state.</li> </ul>
max_length	int	Collection queue length.
current_length	int	The number of currently collected samples.
collection_interval	int	Collection interval, in seconds.
latest_value	int	Value collected last time. If no value is collected, the value is <b>null</b> .
last_report	timestamp	The last collection time.

### 13.2.18.2 ai\_watchdog\_detection\_warnings

**Table 13-194** ai\_watchdog\_detection\_warnings parameters

Parameter	Type	Description
event	text	Event name.
cause	text	Event cause.
details	text	Event details.
time	timestamp	Reporting time.
need_to_handle	bool	Determines whether automatic processing is required.

### 13.2.18.3 ai\_watchdog\_parameters

Table 13-195 ai\_watchdog\_parameters parameters

Parameter	Type	Description
name	text	Parameter name. The options are as follows: <ul style="list-style-type: none"> <li>• <b>enable_ai_watchdog</b>: determines whether to enable this function.</li> <li>• <b>ai_watchdog_max_consuming_time_ms</b>: specifies the maximum duration.</li> <li>• <b>ai_watchdog_used_memory_kb</b>: specifies the memory used by this function.</li> <li>• <b>ai_watchdog_detection_times</b>: specifies the number of detection times.</li> <li>• <b>enable_self_healing</b>: determines whether self-healing can be performed after a problem is detected.</li> <li>• <b>oom_detected_times</b>: specifies the number of detected OOMs.</li> <li>• <b>hang_detected_times</b>: specifies the number of detected hang times.</li> <li>• <b>enable_oom_detection</b>: determines whether the OOM detection function is automatically enabled.</li> <li>• <b>in_wait_time</b>: determines whether the system is waiting.</li> <li>• <b>other_used_memory_has_risk</b>: determines whether other memory usage is risky.</li> <li>• <b>shared_used_mem_has_risk</b>: determines whether risks exist when the shared memory context is used.</li> <li>• <b>dynamic_used_shrctx_has_risk</b>: determines whether the dynamic memory usage is risky.</li> </ul>
value	text	Parameter value.

### 13.2.18.4 ai\_watchdog\_ftask\_status

Table 13-196 ai\_watchdog\_ftask\_status parameters

Parameter	Type	Description
name	text	Name of the watchdog feeding task.
timeout_threshold	int	Timeout threshold of the watchdog feeding task.

Parameter	Type	Description
register_time	timestamp	Registration time of the watchdog feeding task.
thread_id	bigint	ID of the thread on which the watchdog feeding task is used.
thread_name	text	Name of the thread on which the watchdog feeding task is used.
last_feed	timestamp	Latest time when the watchdog is fed. The default initial value is <b>register_time</b> .
restart_count	int	Number of times that the same name of watchdog feeding task is repeatedly registered due to the same backend thread exception. This parameter is cleared after the task calls the API for canceling watchdog resetting task registration.
timeout_action	text	Timeout processing action specified during task registration. Currently, the following actions are provided: <ul style="list-style-type: none"><li>• <b>WATCHDOG_REPORT_WARNING</b>: Prompt the timeout locating and demarcation.</li><li>• <b>WATCHDOG_SEND_SIGTERM</b>: Send SIGTERM signals to threads.</li><li>• <b>WATCHDOG_SEND_SIGUSR2</b>: Send SIGUSR2 signals to threads.</li><li>• <b>WATCHDOG_SEND_SIGQUIT</b>: Send SIGQUIT signals to threads.</li><li>• <b>WATCHDOG_EXIT_PROCESS</b>: Exit the process.</li></ul>

## 13.2.19 Discarded

### 13.2.19.1 Query

#### 13.2.19.1.1 GS\_SLOW\_QUERY\_INFO

**GS\_SLOW\_QUERY\_INFO** displays the slow query information that has been dumped on the current node, as described in [Table 13-197](#). Data is dumped from the kernel to this system catalog. If the GUC parameter **enable\_resource\_record** is set to **on**, the system imports the query information from the kernel to **GS\_WLM\_SESSION\_QUERY\_INFO\_ALL** every 3 minutes. This operation occupies storage space and affects performance. You can check **GS\_SLOW\_QUERY\_INFO** to view the slow query information that has been dumped. This view has been discarded in this version.

**Table 13-197** GS\_SLOW\_QUERY\_INFO columns

Name	Type	Description
dbname	text	Database name.
schemaname	text	Schema name.
nodename	text	Node name.
username	text	Username.
queryid	bigint	Normalization ID.
query	text	Query statement.
start_time	timestamp with time zone	Execution start time.
finish_time	timestamp with time zone	Execution end time.
duration	bigint	Execution duration (unit: ms).
query_plan	text	Plan information.
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of cache loading times.
n_blocks_hit	bigint	Cache hits.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: $\mu$ s).
cpu_time	bigint	CPU time (unit: $\mu$ s).
execution_time	bigint	Execution time in the executor (unit: $\mu$ s).

Name	Type	Description
parse_time	bigint	SQL parsing time (unit: $\mu$ s).
plan_time	bigint	SQL plan generation time (unit: $\mu$ s).
rewrite_time	bigint	SQL rewriting time (unit: $\mu$ s).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: $\mu$ s).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: $\mu$ s).
net_send_time	bigint	Network time (unit: $\mu$ s).
data_io_time	bigint	I/O time (unit: $\mu$ s).

### 13.2.19.1.2 GS\_SLOW\_QUERY\_HISTORY

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that is not dumped on the current node. For details, see [18.9.15 GS\\_SLOW\\_QUERY\\_INFO](#). This is discarded in the current version.

### 13.2.19.1.3 GLOBAL\_SLOW\_QUERY\_HISTORY

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that is not dumped on all nodes. This view is discarded in this version. For details, see [18.9.15 GS\\_SLOW\\_QUERY\\_INFO](#).

### 13.2.19.1.4 GLOBAL\_SLOW\_QUERY\_INFO

**GS\_SLOW\_QUERY\_HISTORY** displays the slow query information that has been dumped on all nodes. This view is discarded in this version. For details, see [18.9.15 GS\\_SLOW\\_QUERY\\_INFO](#).

## 13.3 WDR Snapshot Schema

After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), objects are created in the snapshot schema in the postgres database of the **pg\_default** tablespace to persist WDR snapshot data. By default, the initial user or monitor administrator can access and operate objects in the snapshot schema.

You can set the GUC parameter **wdr\_snapshot\_retention\_days** to automatically manage the snapshot lifecycle.

### 13.3.1 Original Information of WDR Snapshots

### 13.3.1.1 SNAPSHOT.SNAPSHOT

SNAPSHOT records the index information, start time, and end time of WDR snapshots stored in the current system. Only the initial user or monitor administrator has the permission to view the information. The result can be queried only in the system database but cannot be queried in the user database, as described in [Table 13-198](#). After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), the table is created.

**Table 13-198** SNAPSHOT attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.423742+08
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:43.67726+08
version	int	Version of a WDR snapshot.	1
snap_flag	bigint	Attribute of the WDR snapshot. <ul style="list-style-type: none"><li>• <b>NULL</b>: The snapshot is of an earlier version.</li><li>• <b>0</b>: The snapshot is a full snapshot.</li><li>• <b>1</b>: The snapshot is an incremental snapshot.</li></ul>	0
base_snapshot_id	bigint	ID of the full snapshot corresponding to the WDR snapshot.	1

### 13.3.1.2 SNAPSHOT.TABLES\_SNAP\_TIMESTAMP

TABLES\_SNAP\_TIMESTAMP records the start time and end time of data collection, as well as corresponding databases, and table objects for all stored WDR snapshots. Only the initialization user or monitor administrator has the permission to view the table, as described in [Table 13-199](#). After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), the table is created.

**Table 13-199** TABLES\_SNAP\_TIMESTAMP attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1
db_name	text	Database corresponding to a WDR snapshot.	tpcc1000
tablename	text	Table corresponding to a WDR snapshot.	snap_xc_statio_all_indexes
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.425849+08
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:27.707398+08

### 13.3.1.3 SNAP\_SEQ

SNAP\_SEQ is an incremental sequence that provides the snapshot IDs for the WDR snapshot. After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), the sequence is created.

## 13.3.2 WDR Snapshot Data Table

The naming rule of a WDR snapshot data table is **snap\_{source data table}**.

The source of WDR snapshot data tables is the view under **DBE\_PERF Schema**. After the WDR snapshot function is enabled (the GUC parameter **enable\_wdr\_snapshot** is set to **on**), the WDR snapshot data table is created.

#### NOTE

The initial user or monitor administrator has the permission to view the WDR snapshot data table.

## 13.4 DBE\_SQL\_UTIL Schema

The **DBE\_SQL\_UTIL** schema stores tools for managing SQL patches, including creating, deleting, enabling, and disabling SQL patches. Common users have only the USAGE permission and do not have the CREATE, ALTER, DROP, and COMMENT permissions.

### 13.4.1 DBE\_SQL\_UTIL.create\_hint\_sql\_patch

**create\_hint\_sql\_patch** creates hint SQL patches on the connected CN and returns whether the execution is successful, as described in **Table 13-200**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

 NOTE

- SQL patches are not shared among CNs and need to be created on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.create\\_remote\\_hint\\_sql\\_patch](#) API to create a CN.

**Table 13-200** DBE\_SQL\_UTIL.create\_hint\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

## 13.4.2 DBE\_SQL\_UTIL.create\_abort\_sql\_patch

**create\_abort\_sql\_patch** creates abort SQL patches on the connected CN and returns whether the execution is successful, as described in [Table 13-201](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

 NOTE

- SQL patches are not shared among CNs and need to be created on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.create\\_remote\\_abort\\_sql\\_patch](#) API to create a CN.

**Table 13-201** DBE\_SQL\_UTIL.create\_abort\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
description	IN text	Patch description. The default value is <b>NULL</b> .

Parameter	Type	Description
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.4.3 DBE\_SQL\_UTIL.drop\_sql\_patch

**drop\_sql\_patch** deletes SQL patches from the connected CN and returns whether the execution is successful, as described in [Table 13-202](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

 **NOTE**

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.drop\\_remote\\_sql\\_patch](#) API to delete a CN.

**Table 13-202** DBE\_SQL\_UTIL.drop\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.4.4 DBE\_SQL\_UTIL.enable\_sql\_patch

**enable\_sql\_patch** enables SQL patches on the connected CN and returns whether the execution is successful, as described in [Table 13-203](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

 **NOTE**

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.enable\\_remote\\_sql\\_patch](#) API to enable SQL patches.

**Table 13-203** DBE\_SQL\_UTIL.enable\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.

Parameter	Type	Description
result	OUT bool	Specifies whether this operation is successful.

### 13.4.5 DBE\_SQL\_UTIL.disable\_sql\_patch

**disable\_sql\_patch** disables SQL patches on the connected CN and returns whether the execution is successful, as described in [Table 13-204](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

 **NOTE**

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the [DBE\\_SQL\\_UTIL.disable\\_remote\\_sql\\_patch](#) API to disable SQL patches.

**Table 13-204** DBE\_SQL\_UTIL.disable\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.4.6 DBE\_SQL\_UTIL.show\_sql\_patch

**show\_sql\_patch** is a function used to display the SQL patch corresponding to a specified patch name and return the running result, as described in [Table 13-205](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

**Table 13-205** DBE\_SQL\_UTIL.show\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	OUT bigint	Global unique ID.
enabled	OUT bool	Determines whether the patch takes effect.
abort	OUT bool	Determines whether the value is <b>AbortHint</b> .
hint_str	OUT text	Hint text.

## 13.4.7 DBE\_SQL\_UTIL.create\_hint\_sql\_patch

**create\_hint\_sql\_patch** creates hint SQL patches and returns whether the execution is successful. This function is an overloaded function of the original function. The value of **parent\_unique\_sql\_id** can be used to limit the effective range of the hint patch, as described in [Table 13-206](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

**Table 13-206** DBE\_SQL\_UTIL.create\_hint\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value <b>0</b> indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

## 13.4.8 DBE\_SQL\_UTIL.create\_abort\_sql\_patch

**create\_abort\_sql\_patch** creates abort SQL patches and returns whether the execution is successful. This function is an overloaded function of the original function. The value of **parent\_unique\_sql\_id** can be used to limit the effective range of the abort patch, as described in [Table 13-207](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

**Table 13-207** DBE\_SQL\_UTIL.create\_abort\_sql\_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.

Parameter	Type	Description
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value <b>0</b> indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.4.9 DBE\_SQL\_UTIL.create\_remote\_hint\_sql\_patch

**create\_remote\_hint\_sql\_patch** creates hint SQL patches on a specified CN and returns whether the execution is successful, as described in [Table 13-208](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

**Table 13-208** DBE\_SQL\_UTIL.create\_remote\_hint\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.4.10 DBE\_SQL\_UTIL.create\_remote\_abort\_sql\_patch

**create\_remote\_abort\_sql\_patch** creates abort SQL patches and returns whether the execution is successful, as described in [Table 13-209](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

**Table 13-209** DBE\_SQL\_UTIL.create\_remote\_abort\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
description	IN text	Patch description. The default value is <b>NULL</b> .
enabled	IN bool	Specifies whether the patch takes effect. The default value is <b>true</b> .
result	OUT bool	Specifies whether this operation is successful.

### 13.4.11 DBE\_SQL\_UTIL.drop\_remote\_sql\_patch

**drop\_remote\_sql\_patch** deletes SQL patches from a specified CN and returns whether the execution is successful, as described in [Table 13-210](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

**Table 13-210** DBE\_SQL\_UTIL.drop\_remote\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.4.12 DBE\_SQL\_UTIL.enable\_remote\_sql\_patch

**enable\_remote\_sql\_patch** enables SQL patches on a specified CN and returns whether the execution is successful, as described in [Table 13-211](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

**Table 13-211** DBE\_SQL\_UTIL.enable\_remote\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

### 13.4.13 DBE\_SQL\_UTIL.disable\_remote\_sql\_patch

**disable\_remote\_sql\_patch** disables SQL patches on a specified CN and returns whether the execution is successful, as described in [Table 13-212](#).

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

**Table 13-212** DBE\_SQL\_UTIL.disable\_remote\_sql\_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

## 13.5 DBE\_PLDEBUGGER Schema

System functions in DBE\_PLDEBUGGER Schema are used to debug stored procedures. Only administrators have the permission to execute these debugging APIs, but do not have the permission to modify or create functions. The following table describes the supported APIs.

**NOTICE**

- When a user is created in the function body, the plaintext password is returned when attach, next, continue, info\_code, step, info\_breakpoint, backtrace, or finish is called. You are advised not to create a user in the function body.
- Stored procedures can be debugged only on CNs, and the debugging end and the debugged end must be connected to the same CN.
- The debugging end and the debugged end must be connected to the same database. Otherwise, the API that uses the function OID to obtain function information is unavailable.
- After you use the dbe\_pldebugger.turn\_on function to enable stored procedure debugging in the current session, all PL/SQL stored procedures of the current session cannot be pushed down to DN. Therefore, after the debugging is complete, use the dbe\_pldebugger.turn\_off function to disable stored procedure debugging in the current session in a timely manner.
- Triggers cannot be directly debugged. EXECUTE DIRECT ON cannot be used to deliver statements to DN to trigger debugging.
- Prepared statements generated before the dbe\_pldebugger.turn\_on function is used to enable stored procedure debugging may fail to be debugged.
- The dbe\_pldebugger.error\_\* functions can be used only when an error is reported.
- During the debugging of a stored procedure, if the stored procedure to be debugged involves lock operations, do not perform operations that may cause deadlocks on the debugging end.

The administrator can run the following command to grant the **gs\_role\_pldebugger** role and debugger permissions to a user:

```
GRANT gs_role_pldebugger to user;
```

Two clients are required to connect to the database. One client is responsible for executing the debugging API as the debug end, and the other client is responsible for executing the debugging function to control the execution of stored procedures on the server. Example:

- Prepare for debugging.  
Use PG\_PROC to find the OID of the stored procedure to be debugged and execute **DBE\_PLDEBUGGER.turn\_on(oid)**. In this case, the client functions as the server.

```
gaussdb=# CREATE OR REPLACE PROCEDURE test_debug ( IN x INT)
AS
BEGIN
    INSERT INTO t1 (a) VALUES (x);
    DELETE FROM t1 WHERE a = x;
END;
/
CREATE PROCEDURE
gaussdb=# SELECT OID FROM PG_PROC WHERE PRONAME='test_debug';
oid
-----
16389
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.turn_on(16389);
nodename | port
-----+-----
```

```
datanode | 0
(1 row)
```

- Start debugging.

When the server executes the stored procedure, the server hangs before the first SQL statement in the stored procedure and waits for the debugging message sent by the debug end. Debugging is supported only by directly executing a stored procedure and cannot be achieved by invoking an executed stored procedure through a trigger.

```
gaussdb=# call test_debug(1);
```

Start another client as the debug end and invoke **DBE\_PLDEBUGGER.attach** to attach with the stored procedure for debugging based on the data returned by **turn\_on**.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.attach('datanode',0);
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 3 | INSERT INTO t1 (a) VALUES (x);
(1 row)
```

Execute the next statement on the client where the attach operation is performed.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.next();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 0 | [EXECUTION FINISHED]
(1 row)
```

Execute the following variable operations on the client where the attach command is performed.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_locals(); -- Print all variables.
varname | vartype | value | isconst
-----+-----+-----+-----
x | int4 | 1 | f
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.set_var('x', 2); -- Assign a value to a variable.
set_var
-----
t
(1 row)
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.print_var('x'); -- Print a single variable.
varname | vartype | value | isconst
-----+-----+-----+-----
x | int4 | 2 | f
(1 row)
```

Directly execute the stored procedure that is being debugged.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 0 | [EXECUTION FINISHED]
(1 row)
```

When the stored procedure reports an error, the following information is displayed. In this case, the suspended process logic is triggered.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 0 | [EXECUTION HAS ERROR OCCURRED!]
(1 row)
```

If the suspended process logic is triggered, you can call the `error_info_locals`, `error_backtrace`, `error_end`, and `print_var` APIs to view information. Other APIs cannot be used anymore. You need to use `error_end` to end the suspended process logic.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.error_end();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 0 | [END HANG ERROR!]
(1 row)
```

Exit the stored procedure that is being debugged (the suspended process logic is unavailable), and do not execute statements that have not been executed before.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.abort();
abort
-----
t
(1 row)
```

View the code information on the client and identify the line number of the breakpoint that can be set.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_code(16389);
lineno | query | canbreak
-----+-----+-----
1 | CREATE OR REPLACE PROCEDURE public.test_debug( IN x INT) | f
2 | AS DECLARE | f
3 | BEGIN | f
4 | INSERT INTO t1 (a) VALUES (x); | t
5 | DELETE FROM t1 WHERE a = x; | t
6 | END; | f
7 | / | f
(7 rows)
```

Sets a breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.add_breakpoint(16389,4);
breakpointno
-----
0
(1 row)
```

View the breakpoint information.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_breakpoints();
breakpointno | funcoid | lineno | query | enable
-----+-----+-----+-----+-----
0 | 16389 | 4 | DELETE FROM t1 WHERE a = x; | t
(1 row)
```

Execute to the breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
funcoid | funcname | lineno | query
-----+-----+-----+-----
16389 | test_debug | 4 | DELETE FROM t1 WHERE a = x;
(1 row)
```

After the stored procedure is executed, the debugging automatically exits. To debug the stored procedure again, you need to attach again. If the server does not need to be debugged, run the **turn\_off** command to disable the debugging or exit the session. [Table 13-213](#) describes the debugging APIs.

**Table 13-213** DBE\_PLDEBUGGER

API	Description
<a href="#">DBE_PLDEBUGGER.turn_on</a>	Called by the server, indicating that the stored procedure can be debugged. After the API is called, the stored procedure is hung to wait for debugging information.

API	Description
<a href="#">DBE_PLDEBUGGER.turn_off</a>	Called by the server, indicating that debugging the stored procedure is disabled.
<a href="#">DBE_PLDEBUGGER.local_debug_server_info</a>	Called by the server to print all stored procedures that have been turned on in the current session.
<a href="#">DBE_PLDEBUGGER.attach</a>	Called by the debug end to attach with the stored procedure that is being debugged.
<a href="#">DBE_PLDEBUGGER.info_locals</a>	Called by the debug end to print the current values of variables in the stored procedure that is being debugged.
<a href="#">DBE_PLDEBUGGER.next</a>	Called by the debug end to execute the next step.
<a href="#">DBE_PLDEBUGGER.continue</a>	Called by the debug end to continue the execution until the breakpoint or stored procedure ends.
<a href="#">DBE_PLDEBUGGER.abort</a>	Called by the debug end to stop debugging. The server reports a long jump error.
<a href="#">DBE_PLDEBUGGER.print_var</a>	Called by the debug end to print the current values of specified variables in the stored procedure that is being debugged.
<a href="#">DBE_PLDEBUGGER.info_code</a>	Called by the debug end or server to print the source statement of a specified stored procedure and the line number corresponding to each line.
<a href="#">DBE_PLDEBUGGER.step</a>	Called by the debug end to execute step by step.
<a href="#">DBE_PLDEBUGGER.add_breakpoint</a>	Called by the debug end to add a breakpoint.
<a href="#">DBE_PLDEBUGGER.delete_breakpoint</a>	Called by the debug end to delete a breakpoint.
<a href="#">DBE_PLDEBUGGER.info_breakpoints</a>	Called by the debug end to view all breakpoints.
<a href="#">DBE_PLDEBUGGER.backtrace</a>	Called by the debug end to check the current call stack.
<a href="#">DBE_PLDEBUGGER.enable_breakpoint</a>	Called by the debug end to enable breakpoints.
<a href="#">DBE_PLDEBUGGER.disable_breakpoint</a>	Called by the debug end to disable breakpoints.
<a href="#">DBE_PLDEBUGGER.finish</a>	Called by the debug end to continue the debugging until the breakpoint is reached or the upper-layer call stack is returned.

API	Description
<a href="#">DBE_PLDEBUGGER.set_var</a>	Called by the debug end to assign a value to a variable.

### 13.5.1 DBE\_PLDEBUGGER.turn\_on

This function is used to mark a stored procedure as debuggable, as described in [Table 13-214](#). After **turn\_on** is executed, the server can execute the stored procedure for debugging. You need to manually obtain the OID of the stored procedure based on the PG\_PROC system catalog and transfer it to the function. After **turn\_on** is executed, the execution of the stored procedure in the current session is hung before the first SQL statement to wait for the debugging instruction from the debug end. This setting is cleared by default after the session is disconnected. Currently, stored procedures and functions with autonomous transactions enabled cannot be debugged. The number of **turn\_on** stored procedures cannot exceed 100.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_on(Oid)
RETURN Record;
```

**Table 13-214** turn\_on input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID.
nodename	OUT text	Node name.
port	OUT integer	Number of the connected port.

### 13.5.2 DBE\_PLDEBUGGER.turn\_off

This function is used only to remove the debugging flag added by **turn\_on** to the current session. The return value indicates success or failure, as described in [Table 13-215](#). You can run the **DBE\_PLDEBUGGER.local\_debug\_server\_info** command to query the OID of the stored procedure that has been turned on.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_off(Oid)
RETURN boolean;
```

**Table 13-215** turn\_off input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID.

Name	Type	Description
turn_off	OUT boolean	Whether turn-off is successful.

### 13.5.3 DBE\_PLDEBUGGER.local\_debug\_server\_info

This function is used to query the OID of the stored procedure that has been turned on in the current connection. You can use **funcoid** and **pg\_proc** together to determine which stored procedures are to be debugged, as described in [Table 13-216](#).

**Table 13-216** local\_debug\_server\_info returned return values

Name	Type	Description
nodename	OUT text	Node name.
port	OUT bigint	Port number.
funcoid	OUT oid	Stored procedure OID.

### 13.5.4 DBE\_PLDEBUGGER.attach

When the server executes a stored procedure, the server hangs the execution before the first statement and waits for attaching with the debug end. The debug end invokes the attach function and transfers node name and port number to attach with the specified stored procedure, as described in [Table 13-217](#).

If an error is reported during debugging, the attach operation automatically becomes invalid. If the debug end is attached to another stored procedure during debugging, the debugging of the attached stored procedure becomes invalid. If the attach operation is performed repeatedly, the current stored procedure is disconnected.

**Table 13-217** attach input parameters and return values

Name	Type	Description
nodename	IN text	Node name.
port	IN integer	Connection port number.
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.

Name	Type	Description
query	OUT text	Source code of the next line of the function that is being debugged.

### 13.5.5 DBE\_PLDEBUGGER.info\_locals

During debugging on the debug end, **info\_locals** is called to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without **frameno**. By default, the top-layer stack variable is queried, as described in [Table 13-218](#).

**Table 13-218** info\_locals input parameters and return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
isconst	OUT boolean	Determines whether the value is a constant.

### 13.5.6 DBE\_PLDEBUGGER.next

This function is used to execute the current SQL statement in a stored procedure and return the number of the next SQL statement and the corresponding query, as described in [Table 13-219](#).

**Table 13-219** next return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.

Name	Type	Description
query	OUT text	Source code of the next line of the function that is being debugged.

### 13.5.7 DBE\_PLDEBUGGER.continue

Executes the current stored procedure until reaching the next breakpoint or end, and returns the line number of the next execution and the corresponding query, as described in [Table 13-220](#).

The function prototype is as follows:

```
DBE_PLDEBUGGER.continue()
RETURN Record;
```

**Table 13-220** continue return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

### 13.5.8 DBE\_PLDEBUGGER.abort

This function is used to abort the stored procedure executed on the server and report an error. The return value indicates whether the abort message is successfully sent, as described in [Table 13-221](#).

The function prototype is as follows:

```
DBE_PLDEBUGGER.abort()
RETURN boolean;
```

**Table 13-221** abort input parameters and return values

Name	Type	Description
abort	OUT boolean	Success or failure.

### 13.5.9 DBE\_PLDEBUGGER.print\_var

During debugging on the debug end, `print_var` is called to print the name and value of the specified variable in the current stored procedure. You can also use this function to print variables when an error is reported. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without **frameno**. By default, the top-layer stack variable is queried, as shown in [Table 13-222](#).

**Table 13-222** print\_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable.
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
isconst	OUT boolean	Determines whether the value is a constant.

### 13.5.10 DBE\_PLDEBUGGER.info\_code

During debugging on the debug end, **info\_code** is called to view the source statement of the specified stored procedure and the line number corresponding to each line. The line number starts from the function body, and the line number in the function header is empty, as described in [Table 13-223](#).

**Table 13-223** info\_code input parameters and return values

Name	Type	Description
funcoid	IN oid	Function ID.
lineno	OUT integer	Line number.
query	OUT text	Source statement.
canbreak	OUT bool	Whether the current line supports breakpoints.

### 13.5.11 DBE\_PLDEBUGGER.step

During debugging on the debug end, if a stored procedure is being executed, the stored procedure continues to be executed and information such as the line

number in the first line of the stored procedure is returned. If the executed object is not a stored procedure, the return is the same as that for **next**. After the SQL statement is executed, information such as the line number in the next line is returned, as described in [Table 13-224](#).

**Table 13-224** step input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

## 13.5.12 DBE\_PLDEBUGGER.add\_breakpoint

During debugging on the debug end, call **add\_breakpoint** to add a breakpoint. If -1 is returned, the specified breakpoint is invalid. Determine a proper breakpoint position by referring to the **canbreak** column. If the outer function does not have a breakpoint before entering the inner function, a breakpoint cannot be added to the outer function when the inner function is executed, as described in [Table 13-225](#).

**Table 13-225** add\_breakpoint input parameters and return values

Name	Type	Description
funcoid	IN text	Function ID.
lineno	IN integer	Line number.
breakpointno	OUT integer	Breakpoint number.

## 13.5.13 DBE\_PLDEBUGGER.delete\_breakpoint

During debugging on the debug end, call **delete\_breakpoint** to delete the existing breakpoint, as described in [Table 13-226](#).

**Table 13-226** delete\_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.

Name	Type	Description
result	OUT bool	Whether the request is successful.

### 13.5.14 DBE\_PLDEBUGGER.info\_breakpoints

During debugging on the debug end, call **info\_breakpoints** to view the current function breakpoint, as described in [Table 13-227](#).

**Table 13-227** info\_breakpoints return values

Name	Type	Description
breakpointno	OUT integer	Breakpoint number.
funcoid	OUT oid	Function ID.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
enable	OUT boolean	Whether the value is valid.

### 13.5.15 DBE\_PLDEBUGGER.backtrace

During debugging on the debug end, call **backtrace** to view the current call stack, as described in [Table 13-228](#).

**Table 13-228** backtrace return values

Name	Type	Description
frameno	OUT integer	Call stack ID.
funcname	OUT text	Function name.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
funcoid	OUT oid	Function OID.

### 13.5.16 DBE\_PLDEBUGGER.enable\_breakpoint

During debugging on the debug end, calls **enable\_breakpoint** to enable breakpoints, as described in [Table 13-229](#).

**Table 13-229** enable\_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Whether the request is successful.

### 13.5.17 DBE\_PLDEBUGGER.disable\_breakpoint

During debugging on the debug end, call disable\_breakpoint to disable breakpoints, as described in [Table 13-230](#).

**Table 13-230** disable\_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Whether the request is successful.

### 13.5.18 DBE\_PLDEBUGGER.finish

Executes the current SQL statement in the stored procedure until the next breakpoint is triggered or the next line of the upper-layer stack is executed, as described in [Table 13-231](#).

**Table 13-231** finish input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

### 13.5.19 DBE\_PLDEBUGGER.set\_var

Changes the variable on the top-layer stack in the specified debugging stored procedure to the value of the input parameter. If a stored procedure contains

variables with the same name, `set_var` supports only the setting of the first variable value, as described in [Table 13-232](#).

**Table 13-232** `set_var` input parameters and return values

Name	Type	Description
<code>var_name</code>	IN text	Variable name.
<code>value</code>	IN text	New value.
<code>result</code>	OUT boolean	Whether the request is successful.

## 13.5.20 DBE\_PLDEBUGGER.backtrace

If the server is suspended due to an error reported by the stored procedure, you can call `error_backtrace` on the debug end to view the current function call stack, as described in [Table 13-233](#). (This function is used only for suspension after an error is reported.)

**Table 13-233** `error_backtrace` return values

Name	Type	Description
<code>frameno</code>	OUT integer	Call stack ID.
<code>funcname</code>	OUT text	Function name.
<code>lineno</code>	OUT integer	Line number.
<code>query</code>	OUT text	Breakpoint content.
<code>funcoid</code>	OUT oid	Function OID.

## 13.5.21 DBE\_PLDEBUGGER.error\_end

If the server is suspended due to an error reported by the stored procedure, you can call `error_end` on the debug end to end the suspended process, end the debugging process, return the ended suspended process, and stop debugging, as described in [Table 13-234](#). (This function is used only for suspension after an error is reported.)

**Table 13-234** `error_end` return values

Name	Type	Description
<code>funcoid</code>	OUT oid	Function ID.
<code>funcname</code>	OUT text	Function name.

Name	Type	Description
lineno	OUT integer	The next debugging line number (fixed value: 0).
query	OUT text	Ends the suspended process and stops debugging.

## 13.5.22 DBE\_PLDEBUGGER.error\_info\_locals

If the server is suspended due to an error reported by the stored procedure, you can call `error_info_locals` on the debug end to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without input parameters. By default, the top-layer stack variable is queried, as described in [Table 13-235](#). (This function is used only for suspension after an error is reported.)

**Table 13-235** error\_info\_locals return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
isconst	OUT boolean	Determines whether the value is a constant.

# 14 Configuring GUC Parameters

## 14.1 Viewing Parameters

GaussDB uses a set of default GUC parameters after it is installed. You can modify the GUC parameters to enable GaussDB to better fit your service scenarios and data volume.

### Procedure

- Step 1** Log in to the host where CN is located as the cluster installation user.
- Step 2** Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.
- Step 3** View the GUC parameter values in the database.
- Method 1: Run the **SHOW** command.
    - View the value of a certain parameter.  
`gaussdb=# SHOW server_version;`  
*server\_version* indicates the database version.
    - View values of all parameters.  
`gaussdb=# SHOW ALL;`
  - Method 2: Query the **pg\_settings** view.
    - View the value of a certain parameter.  
`gaussdb=# SELECT * FROM pg_settings WHERE NAME='server_version';`
    - View values of all parameters.  
`gaussdb=# SELECT * FROM pg_settings;`

----End

### Example

Check the character encoding type of the client.

```
gaussdb=# SHOW client_encoding;
client_encoding
-----
UTF8
(1 row)
```

## 14.2 Setting Parameters

### Context

GaussDB provides multiple methods to set GUC parameters for databases, users, or sessions.

- Parameter names are case-insensitive.
- The parameter values can be integers, floating points, strings, Boolean values, or enumerated values.
  - The Boolean values can be **on/off**, **true/false**, **yes/no**, or **1/0**, and are case-insensitive.
  - The enumerated value range is specified in the **enumvals** column of the `pg_settings` system catalog.
- For parameters using units, specify their units during the setting. Otherwise, default units are used.
  - The default units are specified in the **unit** column of the `pg_settings` system catalog.
  - The unit of memory can be KB, MB, or GB.
  - The unit of time can be ms, s, min, h, or d.
- You can set parameters related to CNs and DNPs at a time, but cannot do the same to other parameters.

For details about parameters, see [GUC Parameters](#).

### Setting GUC Parameters

GaussDB provides six types of GUC parameters. For details about parameter types and their setting methods, see [Table 14-1](#).

**Table 14-1** GUC parameter types

Parameter Type	Description	Setting Method
INTERNAL	Fixed parameters. They are set during database creation and cannot be modified. Users can only view the parameters by running the <b>SHOW</b> command or in the <code>pg_settings</code> view.	None
POSTMASTER	Database server parameters. They can be set when the database is started or in the configuration file.	Method 1 in <a href="#">Table 14-2</a> .
SIGHUP	Global database parameters. They can be set when the database is started or be modified later.	Method 1 or 2 in <a href="#">Table 14-2</a> .

Parameter Type	Description	Setting Method
BACKEND	Session connection parameters. They are specified during session connection creation and cannot be modified after that. The parameter setting becomes invalid when the session is disconnected. The parameters of this type are internal parameters and not recommended for users to set it.	Method 1 or 2 in <a href="#">Table 14-2</a> . <b>NOTE</b> The parameter setting takes effect when the next session is created.
SUSET	Database administrator parameters. They can be set by common users during database startup or after the database is started. They can also be set by database administrators using SQL statements.	Method 1 or 2 by a common user, or method 3 by a database administrator in <a href="#">Table 14-2</a> .
USERSET	Common user parameters. They can be set by any user at any time.	Method 1, 2, or 3 in <a href="#">Table 14-2</a> . <b>NOTE</b> When you set parameters of the USERSET type, the parameter value set using <b>ALTER DATABASE</b> takes precedence over that set using <code>gs_guc</code> . To make the parameter settings of <code>gs_guc</code> take effect, run the <b>alter database xxx reset xxx</b> command to reset the parameters.

You can set GUC parameters in GaussDB using the methods listed in [Table 14-2](#).

**Table 14-2** Methods for setting GUC parameters

No.	Setting Method
Method 1	<p>1. Modify a parameter.  <code>gs_guc set -Z nodetype -D datadir -c "paraname=value"</code></p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If any parameter is a string variable, use <code>-c parameter=""value"</code> or <code>-c "parameter = 'value'"</code>.</li> <li>• If any parameter is a string variable, <code>gs_guc</code> does not check the validity of the parameter. If the database runs abnormally due to invalid parameter settings, view <code>gs_log</code> to locate the fault.</li> <li>• Set a parameter for CNs and DNs at the same time.  <code>gs_guc set -Z coordinator -Z datanode -N all -I all -c "paraname=value"</code></li> <li>• Set a CM Agent parameter for CNs and DNs.  <code>gs_guc set -Z cmagent -c "paraname=value"</code>  <code>gs_guc set -Z cmagent -N all -I all -c "paraname=value"</code></li> <li>• Set a CM Server parameter for CNs and DNs.  <code>gs_guc set -Z cmserver -c "paraname=value"</code>  <code>gs_guc set -Z cmserver -N all -I all -c "paraname=value"</code></li> </ul> <p>2. Restart the database to make the setting take effect.</p> <p><b>NOTE</b>  Restarting the cluster results in operation interruption. Properly plan the restart to avoid affecting users.</p> <code>gs_om -t stop &amp;&amp; gs_om -t start</code>
Method 2	<code>gs_guc reload -Z nodetype -D datadir -c "paraname=value"</code> <p><b>NOTE</b></p> <p>Set a parameter for CNs and DNs at the same time.  <code>gs_guc reload -Z coordinator -Z datanode -N all -I all -c "paraname=value"</code></p> <p>Set a CM Agent parameter for CNs and DNs.  <code>gs_guc reload -Z cmagent -N all -I all -c "paraname=value"</code>  <code>gs_guc reload -Z cmagent -c "paraname=value"</code></p> <p>Set a CM Server parameter for CNs and DNs.  <code>gs_guc reload -Z cmserver -N all -I all -c "paraname=value"</code>  <code>gs_guc reload -Z cmserver -c "paraname=value"</code></p>
Method 3	<p>Modify a session-level parameter.</p> <ul style="list-style-type: none"> <li>• Set a session-level parameter.  <code>gaussdb=# SET paraname TO value;</code>  The parameter value in the current session is changed. After you exit the session, the setting becomes invalid.</li> </ul>

 **CAUTION**

- If you use method 1 or 2 to set a parameter that does not belong to the current node, the database displays a message indicating that the parameter is not supported.
- When you use method 3 to set a parameter, if the parameter value is an integer, leading zeros will be filtered out. For example, `SET paraname TO 008192` and `SET paraname TO 8192` have the same effect.

## Procedure

The following example shows how to set **hot\_standby** on a CN using method 1:

**Step 1** Log in to the host where CN is located as the cluster installation user.

**Step 2** View the value of **hot\_standby**.

```
cat /gaussdb/data/coordinator/gaussdb.conf | grep "hot_standby ="  
hot_standby = on
```

The value **on** indicates that the query operation in the restoration phase is allowed.

**Step 3** Set **hot\_standby** to **off** to disable query operations in the restoration phase.

```
gs_guc set -Z coordinator -D /gaussdb/data/coordinator -c "hot_standby=off"
```

### NOTE

You can set **hot\_standby** to **off** for all CNs and DNs.

```
gs_guc set -Z coordinator -Z datanode -N all -I all -c "hot_standby=off"
```

**Step 4** Restart the database to make the setting take effect.

```
gs_om -t stop && gs_om -t start
```

**Step 5** Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

**Step 6** Check whether the parameter is correctly set.

```
gaussdb=# SHOW hot_standby;  
hot_standby  
-----  
off  
(1 row)
```

----End

The following example shows how to set **authentication\_timeout** on a CN using method 2:

**Step 1** Log in to the host where CN is located as the cluster installation user.

**Step 2** View the value of **authentication\_timeout**.

```
cat /gaussdb/data/coordinator/gaussdb.conf | grep authentication_timeout  
authentication_timeout = 1min
```

**Step 3** Set **authentication\_timeout** to **59s**.

```
gs_guc reload -Z coordinator -N all -I all -c "authentication_timeout = 59s"
```

```
Total instances: 2. Failed instances: 0.  
Success to perform gs_guc!
```

### NOTE

You can set **authentication\_timeout** to **59s** for all CNs and DNs.

```
gs_guc reload -Z coordinator -Z datanode -N all -I all -c "authentication_timeout = 59s"
```

**Step 4** Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

**Step 5** Check whether the parameter is correctly set.

```
gaussdb=# SHOW authentication_timeout;  
authentication_timeout
```

```
-----  
59s  
(1 row)
```

----End

The following example shows how to set **explain\_perf\_mode** using method 3:

- Step 1** Log in to the host where CN is located as the cluster installation user.
- Step 2** Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.
- Step 3** View the value of **explain\_perf\_mode**.

```
gaussdb=# SHOW explain_perf_mode;  
explain_perf_mode  
-----  
normal  
(1 row)
```

- Step 4** Set **explain\_perf\_mode**.

Perform the following operations:

- Set a session-level parameter.  
`gaussdb=# SET explain_perf_mode TO pretty;`

If the following information is displayed, the setting is successful:

```
SET
```

- Step 5** Check whether the parameter is correctly set.

```
gaussdb=# SHOW explain_perf_mode;  
explain_perf_mode  
-----  
pretty  
(1 row)
```

----End

## Examples

- Example 1: modifying the allowed maximum number of connections for all CNs in the cluster using method 1
  - a. Log in to the host where CN is located as the cluster installation user.
  - b. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.
  - c. View the maximum number of connections.

```
gaussdb=# SHOW max_connections;  
max_connections  
-----  
200  
(1 row)
```
  - d. Exit the database.

```
gaussdb=# \q
```
  - e. Modify the maximum number of connections for all CNs in the cluster.

```
gs_guc set -Z coordinator -N all -I all -c "max_connections = 800"
```
  - f. Restart the cluster.

```
gs_om -t stop && gs_om -t start
```

g. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

h. View the maximum number of connections.

```
gaussdb=# SHOW max_connections;
max_connections
-----
800
(1 row)
```

- Example 2: setting **authentication\_timeout** (timeout period for client authentication) for all CNs using method 2

a. Log in to the host where CN is located as the cluster installation user.

b. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

c. View the timeout period for client authentication.

```
gaussdb=# SHOW authentication_timeout;
authentication_timeout
-----
1min
(1 row)
```

d. Exit the database.

```
gaussdb=# \q
```

e. Modify the timeout period for client authentication for all CNs in the cluster.

```
gs_guc reload -Z coordinator -N all -I all -c "authentication_timeout = 59s"
```

f. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

g. View the timeout period for client authentication.

```
gaussdb=# SHOW authentication_timeout;
authentication_timeout
-----
59s
(1 row)
```

- Example 3: modifying the maximum number of connections for all CNs and DNs in the cluster

a. Log in to the host where CN is located as the cluster installation user.

b. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

c. View the maximum number of connections.

```
gaussdb=# SHOW max_connections;
max_connections
-----
200
(1 row)
```

d. Exit the database.

```
gaussdb=# \q
```

e. Modify the allowed maximum number of connections for all CNs and DNs in the cluster.

```
gs_guc set -Z coordinator -Z datanode -N all -I all -c "max_connections = 500"
```

f. Restart the cluster.

```
gs_om -t stop
gs_om -t start
```

- g. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

- h. View the maximum number of connections.

```
gaussdb=# SHOW max_connections;
max_connections
-----
500
(1 row)
```

- Example 4: setting **authentication\_timeout** (timeout period for client authentication) for all CNs and DNPs

- a. Log in to the host where CN is located as the cluster installation user.

- b. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

- c. View the timeout period for client authentication.

```
gaussdb=# SHOW authentication_timeout;
authentication_timeout
-----
1min
(1 row)
```

- d. Exit the database.

```
gaussdb=# \q
```

- e. Modify the timeout period for client authentication for all CNs and DNPs in the cluster.

```
gs_guc reload -Z coordinator -Z datanode -N all -I all -c "authentication_timeout = 30s"
```

- f. Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

- g. View the timeout period for client authentication.

```
gaussdb=# SHOW authentication_timeout;
authentication_timeout
-----
30s
(1 row)
```

## 14.3 GUC Parameters

### 14.3.1 GUC Parameter Usage

A database provides many GUC parameters. Changing these parameters will affect the behavior of the database system. Before modifying these parameters, learn the impact of these parameters on the database. Otherwise, unexpected results may occur.

#### Precautions

- In upgrade scenarios, the default value of this parameter preferentially ensures compatibility. That is, the default value after the upgrade is the same as that in the source version.

- If the value range of a parameter is a string, the string should comply with the path and file naming conventions of the OS running the target database.
- If the maximum value of a parameter is specified by **INT\_MAX** (maximum value of the INT data type, that is, **2147483647**), the maximum parameter value varies by OS.
- If the maximum value of a parameter is specified by **DBL\_MAX** (maximum value of the FLOAT data type), the maximum parameter value varies by OS.
- Some GUC parameters affect the selection of functions and operators, compilation of stored procedures, and generation of execution plans. As a result, views, default values of function parameters, compilation products of stored procedures, and plan cache are affected. Due to these mechanisms, subsequent GUC parameter changes may not affect these behaviors.
  - View: When defining a view, the database generates rewriting rules based on the GUC parameter status. Subsequent operations on the view directly follow the corresponding rules without being affected by GUC parameters (which affect the generation of rewriting rules).
  - Default value of a function parameter: For a function parameter, a function is selected as the default parameter value based on the GUC parameter status when the function parameter is created and the OID of the function that is used as the default value is recorded in the corresponding system catalog (pg\_proc). When this function parameter is executed later, the function OID recorded in the system catalog will be used as the default value, and the value is not affected by GUC parameters.
  - Compilation product of a stored procedure: When compiling a stored procedure, the database generates a compilation product based on the GUC parameter status. When executing the stored procedure, the database directly uses the compilation product without being affected by GUC parameters (which affect the generation of compilation products).
  - Plan cache: When executing an SQL statement, the database generates an execution plan based on the GUC parameter status. If the plan is cached, the SQL statement will be executed according to the plan without being affected by GUC parameters (which affect the generation of execution plans).

The following table lists the GUC parameters that exert influence. You can view the function of each GUC parameter.

GUC Parameter	Enabled	Disabled	Impact	Example
convert_string_to_digit	Character strings are preferentially converted to numbers.	Character strings cannot be preferentially converted to numbers.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	<pre> CREATE or REPLACE FUNCTION test(c numeric) RETURN text package AS BEGIN RETURN 'test(c numeric)'; END; / CREATE or REPLACE FUNCTION test(c varchar2) RETURN text package AS BEGIN RETURN 'test(c varchar2)'; END; / SET convert_string_to_digit=on; CREATE or REPLACE VIEW test_view AS SELECT test('123'::text);  SELECT test('123'::text); test ----- test(c numeric) (1 row)  SELECT * FROM test_view; test ----- test(c numeric) (1 row)  -- Disable the parameter. SET convert_string_to_digit=off;  SELECT test('123'::text); test ----- test(c varchar2) (1 row)  -- The view behavior is inconsistent with the direct function calling behavior. SELECT * FROM test_view; test ----- test(c numeric) (1 row) </pre>

GUC Parameter	Enabled	Disabled	Impact	Example
set behavior_compat_options = 'current_sysdate';	The SYSDATE function obtains the current OS time. (The current_sysdate function is used at the bottom layer.)	The SYSDATE function obtains the current database time. (The sysdate function is used at the bottom layer.)	Views, default values of function parameters, stored procedure compilation products, and plan cache.	<pre> SET behavior_compat_options = 'current_sysdate'; CREATE or REPLACE VIEW test_view_SYSDATE AS SELECT SYSDATE AS test; SELECT * FROM test_view_SYSDATE;-- Returns the current OS time. SELECT SYSDATE;-- Returns the current OS time. -- Disable the parameter. SET behavior_compat_options = ''; -- The view behavior is inconsistent with the direct function calling behavior. <pre>set b_form at_version='5.7'; set b_form at_dev_version='s1';</pre>	<ul style="list-style-type: none"> <li>• CURDATE, CURRENT_TIME, CURRENT_TIMESTAMP, LOCALTIME, and LOCALTIMESTAMP NOW return the statement execution time.</li> <li>• SYSDATE returns the function execution time.</li> </ul>	<p>The functions return the transaction start time.</p>	<p>Views, default values of function parameters, stored procedure compilation products, and plan cache.</p>	<p>-</p>

GUC Parameter	Enabled	Disabled	Impact	Example
<pre>set b_format_version='5.7'; set b_format_dev_version='s1';</pre>	<p>The behaviors of the DB_JSOBJ, LAST_DAY_FUNC, EXTRACT, TIMESTAM PDIFF, and SUBSTRING functions are changed to be the same as those of MySQL.</p>	<p>Restores the default behavior.</p>	<p>Views, default values of function parameters, stored procedure compilation products, and plan cache.</p>	<p>-</p>

GUC Parameter	Enabled	Disabled	Impact	Example
<pre>set behavior_compat_options = 'bind_procedure_searchpath';</pre>	<ul style="list-style-type: none"> <li>Specifies the search path of the database objects in a stored procedure for which no schema name is specified.</li> <li>If no schema name is specified for a stored procedure, the schema to which the stored procedure belongs is searched preferentially.</li> </ul>	Restores the default behavior.	Stored procedure compilation products.	-

GUC Parameter	Enabled	Disabled	Impact	Example
set behavior_compat_options = 'enable_out_param_override';	Determines the overloading of output parameters of a stored procedure.	Restores the default behavior.	Stored procedure compilation products.	-
enable_bitmapscan	The bitmapscan operator is selected.	The bitmapscan operator is not selected.	Plan cache.	<pre> SET enable_auto_explain=true; SET auto_explain_level=notice; CREATE TABLE t1( a int, b int, c int,d varchar)WITH(storage_type=ustore); CREATE TABLE t2( a int, b int, c int,d varchar)WITH(storage_type=ustore); INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'  i from generate_series(1,1000) i; CREATE INDEX index1 ON t1(a);  SET enable_bitmapscan=on; SET enable_seqscan=off; SET enable_indexscan=off; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i int :=1; BEGIN WHILE i &lt; 5 LOOP INSERT INTO t2 SELECT * FROM t1 WHERE a = i ; i:=i+1; END LOOP; END; / CALL proc_while_loop(); SET enable_bitmapscan=off; CALL proc_while_loop(); SET enable_bitmapscan=on; CALL proc_while_loop(); </pre>

GUC Parameter	Enabled	Disabled	Impact	Example
enable_indexscan	The indexscan operator is selected.	The indexscan operator is not selected.	Plan cache.	<pre> SET enable_auto_explain=true; SET auto_explain_level=notice; CREATE TABLE t1( a int, b int, c int,d varchar)WITH(storage_type=ustore); CREATE TABLE t2( a int, b int, c int,d varchar)WITH(storage_type=ustore); INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'  i from generate_series(1,1000) i; CREATE INDEX index1 on t1(a); SET enable_bitmapsca n=off; SET enable_seqscan=off; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i int :=1; BEGIN WHILE i &lt; 5 LOOP insert into t2 select * from t1 where a = i ; i:=i+1; END LOOP; END; / CALL proc_while_loop(); SET enable_indexscan=off; CALL proc_while_loop(); </pre>

GUC Parameter	Enabled	Disabled	Impact	Example
query_Dop	Users can specify the degree of query parallelism. If the SMP function is enabled, the system uses the specified degree of parallelism.	The default value is <b>1</b> , which indicates that parallel query is disabled.	Plan cache.	<pre> SET enable_auto_explain=true; SET auto_explain_level=notice; CREATE TABLE t1( a int, b int, c int,d varchar)WITH(storage_type=ustore); CREATE TABLE t2( a int, b int, c int,d varchar)WITH(storage_type=ustore); INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'  i from generate_series(1,1000) i; CREATE INDEX index1 ON t1(a); SET enable_bitmapscan=f; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i int :=1; BEGIN WHILE i &lt; 5 LOOP INSERT INTO t2 SELECT /*+ indexscan(t1 index1) */* FROM t1 WHERE a = i ; i:=i+1; END LOOP; END; / SET enable_auto_explain=true; SET auto_explain_level=notice; SET client_min_messages=log; SET query_dop=4; SET sql_beta_feature='enable_plsql_smp'; CALL proc_while_loop(); SET enable_force_Smp=on; CALL proc_while_loop(); SET query_Dop=6; CALL proc_while_loop(); </pre>

GUC Parameter	Enabled	Disabled	Impact	Example
set plan_cache_mode = force_generic_plan	In PBE mode, the gplan is forcibly executed.	In PBE mode, the gplan is not forcibly executed.	Plan cache.	<pre> SET enable_auto_explain=true; SET auto_explain_level=notice; CREATE TABLE t1( a int, b int, c int,d varchar)WITH(storage_type=ustore); CREATE TABLE t2( a int, b int, c int,d varchar)WITH(storage_type=ustore); INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'  i from generate_series(1,1000) i; CREATE INDEX index1 ON t1(a); SET enable_bitmapscaon; SET enable_seqscan=off; SET enable_indexscan=off; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i int :=1; BEGIN WHILE i &lt; 5 LOOP insert into t2 select * from t1 where a = i ; i:=i+1; END LOOP; END; / CALL proc_while_loop(); SET plan_cache_mode = force_generic_plan; PREPARE aa AS SELECT proc_while_loop(); EXECUTE aa; SET enable_bitmapscaon; EXECUTE aa; </pre>
a_format_date_timestamp	CURRENT_DATE returns the timestamp when the current SQL statement is started.	CURRENT_DATE returns the date or date and time when the transaction is started.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	<pre> SET a_format_date_timestamp=on; CREATE OR REPLACE PROCEDURE proc_while_loop() AS DECLARE i date; BEGIN i:=current_date; raise info 'step2:%',TO_CHAR(current_date, 'MM-DD-YYYY HH24:MI:SS'); END; / CALL proc_while_loop(); SET a_format_date_timestamp=off; CALL proc_while_loop(); </pre>

GUC Parameter	Enabled	Disabled	Impact	Example
adjust_systemview_priority	Views with the same name preferentially access user-defined views.	Views with the same name preferentially access system views.	Default value of parameters in the views	<pre>CREATE DATABASE database_test DBCOMPATIBILITY = 'ORA'; SELECT datname,datcompatibility,dattimezone FROM pg_database; \c database_test CREATE TABLE t1(c int); CREATE VIEW dual AS SELECT * FROM t1; SHOW adjust_systemview_priority; SELECT * FROM dual; SET adjust_systemview_priority = on; SELECT * FROM dual;</pre>

## 14.3.2 File Location

After a database has been installed, three configuration files (**gaussdb.conf**, **gs\_hba.conf**, and **gs\_ident.conf**) are automatically generated and saved in the data directory. You can use the methods described in this section to change the names and save paths of these configuration files.

When changing the storage directory of a configuration file, set **data\_directory** in **gaussdb.conf** to the actual data directory.

### NOTICE

If a configuration file is incorrectly modified, the database will be seriously affected. Do not modify the configuration files mentioned in this section after installation.

### data\_directory

**Parameter description:** Specifies the GaussDB **data** directory. Only the sysadmin user can access this parameter. You can set this parameter using one of the following methods:

- Set it when you install the GaussDB.
- This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

**Default value:** Specify this parameter during installation. If this parameter is not specified during installation, the database is not initialized by default.

### config\_file

**Parameter description:** Specifies the configuration file (**gaussdb.conf**) of the primary node.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

**Default value:** `gaussdb.conf` (The absolute directory of this file may be displayed in the actual situation.)

## hba\_file

**Parameter description:** Specifies the configuration file (`gs_hba.conf`) for host-based authentication (HBA). This parameter can be specified only in the `gaussdb.conf` file and can be accessed only by the sysadmin user.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** `gs_hba.conf` (The absolute directory of this file may be displayed in the actual situation.)

## ident\_file

**Parameter description:** Specifies the name of the configuration file (`gs_ident.conf`) for client authentication. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** `gs_ident.conf` (The absolute directory of this file may be displayed in the actual situation.)

## external\_pid\_file

**Parameter description:** Specifies the extra PID file that can be used by the server management program. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

This parameter takes effect only after the database restarts.

---

**Value range:** a string.

**Default value:** empty

## 14.3.3 Connection and Authentication

### 14.3.3.1 Connection Settings

This section describes parameters related to client-server connection modes.

#### light\_comm

**Parameter description:** Specifies whether the server uses the lightweight communications mode.

This parameter specifies whether the server uses the communication mode based on lightweight locks and non-blocking sockets.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The lightweight communications mode is used.
- **off:** The lightweight communications mode is not used.

**Default value:** off

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

**Risks and impacts of improper settings:** none

#### listen\_addresses

**Parameter description:** Specifies the TCP/IP address of the client for a server to listen on.

This parameter specifies the IP address used by the GaussDB server for listening, for example, an IPv4 address. Multiple NICs may exist on the host and each NIC can be bound to multiple IP addresses. This parameter specifies the IP addresses to which GaussDB is bound. The client can use the IP addresses specified by this parameter to connect to GaussDB or send requests to GaussDB.

**Parameter type:** string.

**Unit:** none

**Value range:**

- Host name or IP address. Multiple values are separated with commas (,).
- Asterisk (\*) or **0.0.0.0**, indicating that all IP addresses will be listened on, which is not recommended due to potential security risks.
- If the parameter is not specified, the server does not listen on any IP address. In this case, only UDSs can be used for database connections.

**Default value:**

After the cluster is installed, configure different default values based on the IP addresses of different instances in the **public\_cloud.conf** file. The default value of CN is "**localhost,IP address of the mgr.net NIC,IP address of the data.net NIC,IP**

*address of the virtual.net NIC*". The default value of DN is "*IP address of the data.net NIC*".

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

 **NOTE**

**localhost** indicates that only local loopback is allowed.

The **public\_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

If an IPv6 address is used and the IP address is a fe80 address block, add '%zone index' during the configuration.

**Risks and impacts of improper settings:** none

## listen\_address\_ext

**Parameter description:** Specifies the extended TCP/IP address of the client for a server to listen on. This parameter specifies the IP addresses used by the GaussDB server as the extended listening IP address.

**Parameter type:** string.

**Unit:** none

**Value range:** an IPv4 address. Multiple IP addresses are not supported.

**Default value:** "localhost".

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

 **NOTE**

- The setting of the **listen\_address\_ext** parameter involves the network topology and configuration of the extended IP addresses of the entire cluster. Therefore, it must be set and reloaded by using the OM tool.
- **listen\_address\_ext** is a network channel used to extend specific IP addresses. If this parameter is set to "\*", "0.0.0.0", "localhost", or "127.0.0.1", the setting does not take effect. If required, you are advised to set these addresses in **listen\_addresses**.
- **listen\_address\_ext** is used to configure distributed DNs. It does not take effect if it is configured for CNs.

**Risks and impacts of improper settings:** none

## local\_bind\_address

**Parameter description:** Specifies the host IP address bound to the current node for connecting to other nodes in the cluster.

**Parameter type:** string.

**Unit:** none

**Value range:** an IPv4 address. Multiple IP addresses are not supported.

**Default value:**

After the cluster is installed, configure different default values based on the IP addresses of different instances in the **public\_cloud.conf** file. The default value of CN/DN is "*IP address of the data.net NIC*".

 **NOTE**

The **public\_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

**Risks and impact of improper settings:** This parameter is specified in the configuration file during installation. Do not modify this parameter unless necessary. Otherwise, database communications will be affected after the modification.

## port

**Parameter description:** Specifies the TCP port listened on by the GaussDB.

 **NOTE**

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 65535

 **NOTE**

- When setting the port number, ensure that the port number is not in use. When setting the port numbers of multiple instances, ensure that the port numbers do not conflict.
- Ports 1 to 1023 are reserved for the OS. Do not use them.
- When the cluster is installed using the configuration file, pay attention to the ports reserved in the communication matrix in the configuration file. For example, the port specified by the value of **dataPortBase** plus 1 needs to be reserved for internal tools. Therefore, during cluster installation, the maximum value of **port** is **65532** for CNs, **65529** for DN, and **65534** for GTMs. Ensure that the port number does not conflict with each other.

**Default value:** **5432** (The actual value is specified in the configuration file during installation.)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

**Risks and impact of improper settings:** This parameter is specified in the configuration file during installation. Do not modify this parameter unless

necessary. Otherwise, database communications will be affected after the modification.

## max\_connections

**Parameter description:** Specifies the maximum number of concurrent connections to the database. This parameter influences the concurrent processing capability of the cluster.

**Parameter type:** integer.

**Unit:** none

**Value range:** an integer. The minimum value is **10** (greater than the value of **max\_wal\_senders**). The theoretical maximum value is **262143**. The actual maximum value is a dynamic value, which is calculated using the formula:  $262143 - \text{job\_queue\_processes} - \text{autovacuum\_max\_workers} - \text{max\_inner\_tool\_connections} - \text{max\_concurrent\_autonomous\_transactions} - \text{AUXILIARY\_BACKENDS} - \text{AV\_LAUNCHER\_PROCS} - \min(\max(\text{newValue}/4,64),1024)$ . The values of **job\_queue\_processes**, **autovacuum\_max\_workers**, **max\_inner\_tool\_connections**, and **max\_concurrent\_autonomous\_transactions** depend on the settings of the corresponding GUC parameters.

**AUXILIARY\_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV\_LAUNCHER\_PROCS** indicates the number of reserved autovacuum launcher threads, which is fixed to **2**. In  $\min(\max(\text{newValue}/4,64),1024)$ , **newValue** indicates the new value.

For different memory specifications, the value range of this parameter in different instances is as follows:

**Table 14-3** Value ranges of memory specifications for different instances in independent deployment mode

Memory Specifications	Value Range for CNs	Value Range for DNs
< 32 GB	[10,100]	[10,100]
[32GB,64GB)	[10,200]	[10,200]

memory); 3500 (32-core CPU/256 GB memory); 1500 (16-core CPU/128 GB memory); 900 (8-core CPU/64 GB memory)

- Finance edition (data computing):

CN: 5000 (196-core CPU/1536 GB memory); 4000 (128-core CPU/1024 GB memory); 2500 (96-core CPU/768 GB memory); 1000 (72-core CPU/576 GB memory); 500 (64-core CPU/512 GB memory); 200 (32-core CPU/256 GB memory)

DN: 18000 (196-core CPU/1536 GB memory); 12000 (128-core CPU/1024 GB memory); 8000 (96-core CPU/768 GB memory); 5000 (72-core CPU/576 GB memory); 4000 (64-core CPU/512 GB memory); 1000 (32-core CPU/256 GB memory)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value of this parameter in the primary database node file. If this parameter is set to a smaller value, the number of available connections decreases. Before changing the value of this parameter, understand the parameter description and exercise caution to avoid risks caused by misoperations.

#### **Risks and impacts of improper settings:**

If the value of **max\_connections** exceeds the maximum dynamic value, the node fails to be started and the following error message is displayed: "invalid value for parameter "max\_connections"." Alternatively, the memory fails to be allocated during the node startup and the following error message is displayed: "Cannot allocate memory."

If only the value of **max\_connections** is increased but the memory parameter is not adjusted in proportion based on the external egress specifications, when the service pressure is high, the memory may be insufficient, and the error message "memory is temporarily unavailable" is displayed.

In the hybrid deployment scenario, if the value of **max\_connections** on the CN is greater than the value of **max\_connections** divided by the number of CNs on the DN and the total pressure on the client exceeds the value of **max\_connections** on the DN, the CN may fail to connect to the DN, and the error message "pooler... Too many clients already" is displayed.

 NOTE

- If the number of connections of the administrator exceeds the value of **max\_connections**, the administrator can still connect to the database after the connections are used up by common users. If the number of connections exceeds the value of **sysadmin\_reserved\_connections**, an error is reported. That is, the maximum number of connections of the administrator is equal to the value of **max\_connections + sysadmin\_reserved\_connections**.
- For common users, internal jobs use some connections. Therefore, the value of this parameter is slightly less than that of **max\_connections**. The value depends on the number of internal connections.
- After the thread pool is enabled, the maximum number of stream threads is determined by the value of **max\_connections**. If the number of stream threads reaches the upper limit, the error is reported: "Exceed stream thread pool limitation...". In this case, you can increase the value of **max\_connections** to increase the upper limit. This is a POSTMASTER parameter. Therefore, you can estimate the number of stream threads based on service requirements. The formula is as follows: Total number of stream threads = Number of concurrent services x Number of stream threads consumed by each concurrently executed statement (which can be viewed in the execution plan).

## max\_inner\_tool\_connections

**Parameter description:** Specifies the maximum number of concurrent connections of a tool which is allowed to connect to the database. This parameter influences the concurrent connection capability of the GaussDB tool.

**Parameter type:** integer.

**Unit:** none

**Value range:** an integer. The minimum value is 1. The formula for calculating the maximum value is as follows:  $262143 - \text{job\_queue\_processes} - \text{autovacuum\_max\_workers} - \text{max\_connections} - \text{max\_concurrent\_autonomous\_transactions} - \text{AUXILIARY\_BACKENDS} - \text{AV\_LAUNCHER\_PROCS} - \min(\max(\text{max\_connections}/4, 64), 1024)$ . The values of **job\_queue\_processes**, **autovacuum\_max\_workers**, **max\_connections**, and **max\_concurrent\_autonomous\_transactions** are related to the settings of the corresponding GUC parameters. **AUXILIARY\_BACKENDS** indicates the number of reserved auxiliary threads and its value is fixed to 20. **AV\_LAUNCHER\_PROCS** indicates the number of launcher threads reserved for autovacuum and its value is fixed to 2.

**Default value:** 50. If the default value is greater than the maximum value supported by the kernel (determined when the **gs\_initdb** command is executed), an error message is displayed.

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value of this parameter in the primary database node file.

**Risks and impacts of improper settings:** none

## sysadmin\_reserved\_connections

**Parameter description:** Specifies the minimum number of connections reserved for administrators. You are advised not to set this parameter to a large value. This

parameter is used together with the **max\_connections** parameter. The maximum number of connections of the administrator is equal to the value of **max\_connections + sysadmin\_reserved\_connections**.

 **NOTE**

- When the thread pool function is enabled, if the thread pool is fully occupied, a processing bottleneck occurs. As a result, connections reserved by the administrator cannot be established. In this case, you can use `gsql` to establish connections through the port specified by the primary port number plus 1 and clear useless sessions.
- When the reserved connections are used up, new connections will fail. In this case, you can only restart the cluster to restore the connections. Therefore, exercise caution when using the reserved connections.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to  $MIN(262143, max\_connections)$  (the smaller value between **262143** and **max\_connections**). For details about how to calculate the value of **max\_connections**, see [max\\_connections](#).

**Default value:** 3

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

**Risks and impacts of improper settings:** none

## **service\_reserved\_connections**

**Parameter description:** Specifies the minimum number of connections reserved for background O&M users (with the persistence attribute). A large value is not recommended. This parameter is used together with **max\_connections**. The maximum number of connections of an O&M user can be calculated as follows: **max\_connections + service\_reserved\_connections**.

**Parameter type:** integer.

**Unit:** none

**Value range:** an integer ranging from 0 to 262143.

**Default value:** 10

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If this parameter is set to a small value, the O&M user (with the persistence attribute) cannot connect to the database and jobs cannot be executed if **max\_connections** is set to the maximum value.

**Risks and impacts of improper settings:** none

## **extip\_reserved\_connections**

**Parameter description:** Specifies the minimum number of common `gsql` service connections reserved for a user on the extended IP address specified by

**listen\_address\_ext.** This parameter is used together with **max\_connections**. The maximum number of connections of a corresponding service can be calculated as follows: **max\_connections** + **service\_reserved\_connections**.

 **NOTE**

This parameter is valid only when a specific IP address of **listen\_address\_ext** is configured for a distributed DN.

**Parameter type:** integer.

**Unit:** none

**Value range:** an integer ranging from 0 to  $MIN(262143, max\_connections)$  (the smaller value between **262143** and **max\_connections**). For details about how to calculate the value of **max\_connections**, see [max\\_connections](#).

**Default value:** 5

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

**Risks and impacts of improper settings:** none

## unix\_socket\_directory

**Parameter description:** Specifies the UDS directory for the GaussDB server to listen to connections from the client. Only the sysadmin user can access this parameter.

**Parameter type:** string.

**Unit:** none

**Value range:** valid path of a directory.

 **NOTE**

The parameter length limit varies by the maximum length of a path of a directory in the OS. In the Linux OS, the length of a socket path name (combination of a socket directory and a socket file name) cannot exceed 107 bytes, and the length of a directory cannot exceed 92 bytes. If this limit is exceeded, the error "Unix-domain socket path "xxx" is too long" will be reported.

**Default value:** empty. The actual value is specified by **tmpMppdbPath** in the configuration file during installation.

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

**Risks and impact of improper configuration:** If the configuration is incorrect (for example, the length exceeds the limit or the directory is invalid), the process cannot be started properly. You can retrieve the system\_call log in the CM Agent directory to locate configuration issues.

## unix\_socket\_group

**Parameter description:** Specifies the group of the UDS (the user of a socket is the user who starts the server). This parameter can work with [unix\\_socket\\_permissions](#) to control socket access.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. If this parameter is set to an empty string, the default group of the current user is used.

**Default value:** an empty string.

## unix\_socket\_permissions

**Parameter description:** Specifies access permissions on the UDS.

The UDS uses the usual permission set of the Unix file system. The value of this parameter should be a number (acceptable for the **chmod** and **umask** commands). If a user-defined octal format is used, the number must start with 0.

You are advised to set it to **0770** (only allowing access from users connecting to the database and users in the same group as them) or **0700** (only allowing access from users connecting to the database).

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0000 to 0777

**Default value:** 0700

### NOTE

In the Linux OS, a document has one document attribute and nine permission attributes, which are the read (r), write (w), and execute (x) permissions of the **owner**, **group**, and **others** groups.

The r, w, and x permissions are represented by the following numbers:

- r: 4
- w: 2
- x: 1
- -: 0

The three attributes in a group are accumulative.

For example, **-rwxrwx---** indicates the following permissions:

owner = rwx = 4+2+1 = 7

group = rwx = 4+2+1 = 7

others = --- = 0+0+0 = 0

The permission of the file is 0770.

## application\_name

**Parameter description:** Specifies the client name used in the current connection request.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). Note that after the client is connected, this parameter is set to the client name and the client level. Therefore, only the session-level parameters take effect. Other methods do not take effect because they are lower than the client level.

When a standby node requests to replicate logs on the primary node, if this parameter is not an empty string, it is used as the name of the streaming replication slot of the standby node on the primary node. In this case, if the length of this parameter exceeds 61 bytes, only the first 61 bytes are used as the streaming replication slot name.

**Value range:** a string. The actual query result depends on the client used for queries or user configurations.

**Default value:** an empty string.

## connection\_info

**Parameter description:** Specifies the database connection information, including the driver type, driver version, driver deployment path, and process owner.

This is a USERSET parameter used for O&M. You are advised not to set the parameter.

**Value range:** a string.

**Default value:** an empty string.

### NOTE

- An empty string indicates that the driver connected to the database does not support automatic setting of the **connection\_info** parameter or the parameter is not set by users in applications.
- The following is an example of the concatenated value of **connection\_info**:  

```
{ "driver_name": "ODBC", "driver_version": "(GaussDB XXX.XXX.XXX build 290d125f) compiled at 2020-05-08 02:59:43 commit 2143 last mr 131 release", "driver_path": "/usr/local/lib/gsqlodbcw.so", "os_user": "omm" }
```

By default, **driver\_name** and **driver\_version** are displayed. The display of **driver\_path** and **os\_user** is controlled by users. For details, see "Application Development Guide > Development Based on JDBC > Connecting to the Database" in *Developer Guide* and "Application Development Guide > Development Based on ODBC > Configuring a Data Source in the Linux OS" in *Developer Guide*.

## backend\_version

**Parameter description:** Specifies the version number of the synchronous connection between CNs or between a CN and a DN. This parameter involves the version number and cannot be set randomly.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100000.

## check\_disconnect\_query

**Parameter description:** Specifies whether to terminate the execution of statements on the GaussDB server after the client is disconnected abnormally (for example, socketTimeout is triggered by JDBC, rvertimeout is triggered by libpq and

the connection is closed, or the client process is terminated during service running).

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** indicates that the GaussDB server stops running the corresponding statements after the client is disconnected unexpectedly.
- **off:** indicates that the GaussDB server does not stop running the corresponding statements after the client is disconnected unexpectedly.

**Default value:** on

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

### connection\_reject\_nodes

**Parameter description:** This represents an embedded feature. Only this parameter can be set. Use commas (,) to separate values, for example, 'cn\_5001,cn\_5002'.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** an empty string.

### 14.3.3.2 Security and Authentication (gaussdb.conf)

This section describes parameters about client-to-server authentication.

#### authentication\_timeout

**Parameter description:** Specifies the timeout period for client authentication. If a client is not authenticated by the server within the period, the server automatically disconnects from the client so that the client does not occupy connection resources.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 600. The unit is s.

**Default value:** 1min

#### auth\_iteration\_count

**Parameter description:** Specifies the number of iterations during the generation of encryption information for authentication.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 2048 to 134217728.

**Default value:** 10000

---

**NOTICE**

If the number of iterations is too small, the password storage security is compromised. If the number of iterations is too large, the performance deteriorates in scenarios involving password encryption, such as authentication and user creation. Set the number of iterations based on actual hardware conditions. You are advised to retain the default value.

---

## session\_authorization

**Parameter description:** Specifies the user ID of the current session.

This is a USERSET parameter and can be set only by following the instructions provided in "SQL Reference > SQL Syntax > SET SESSION AUTHORIZATION" in *Developer Guide*.

**Value range:** a string.

**Default value:** NULL

## session\_timeout

**Parameter description:** Specifies the longest duration allowed when no operations are performed on a client after it is connected to the server.

**Parameter type:** integer.

**Unit:** second

**Value range:** 0 to 86400 (1d).

- The value **0** indicates that the timeout setting is disabled.
- A positive number indicates the maximum duration in which no operation is performed after the connection to the server is set up. When the value of this parameter is exceeded, the client is disconnected from the server.

**Default value:** 600s

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

---

**NOTICE**

The gsql client of GaussDB has an automatic reconnection mechanism. For local connection of initialized users, the client reconnects to the server if the connection breaks after the timeout.

---

## ssl

**Parameter description:** Specifies whether to enable the SSL connection on the server. Before using this option, read "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the SSL connection is enabled on the server. Whether SSL encrypted transmission is used during actual communication depends on the client configuration.
- **off** indicates that the SSL connection is disabled on the server.

---

**NOTICE**

GaussDB supports SSL when a client connects to a CN. You are advised to enable SSL connections only on CNs. The default value is **off** on DNs. Before setting this parameter to **on**, ensure that the [ssl\\_cert\\_file](#), [ssl\\_key\\_file](#), and [ssl\\_ca\\_file](#) parameters are correctly set. If Chinese cryptographic algorithms are used, ensure that the [ssl\\_enc\\_cert\\_file](#) and [ssl\\_enc\\_key\\_file](#) parameters are correctly set. Incorrect settings may cause cluster startup failures.

---

**Default value:** **on** (for CNs) or **off** (for DNs)

## comm\_ssl

**Parameter description:** Specifies whether to enable the SSL connection between primary DNs. Before using this option, read "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the SSL connection is enabled between primary DNs.
- **off** indicates that the SSL connection is disabled between primary DNs.

---

**NOTICE**

- It is recommended that this parameter be enabled only on DNs. The default value on CNs is **off**.
- To enable SSL connections, you also need to ensure that parameters such as [ssl\\_cert\\_file](#), [ssl\\_key\\_file](#), and [ssl\\_ca\\_file](#) are configured correctly. Incorrect configurations may cause startup failure of the cluster.

---

**Default value:** **off**

## require\_ssl

**Parameter description:** Specifies whether the server requires SSL connections. This parameter is valid only when [ssl](#) is set to **on**. Before using this option, read "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the server requires SSL connections.
- **off** indicates that the server does not require SSL connections.

---

**NOTICE**

GaussDB supports SSL when a client connects to a CN. It is recommended that the SSL connection be enabled only on CNs.

---

**Default value:** off

## ssl\_ciphers

**Parameter description:** Specifies the list of encryption algorithms supported by SSL. Only the sysadmin user can access the list.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. Separate multiple encryption algorithms by semicolons (;).

---

**NOTICE**

If **ssl\_ciphers** is set incorrectly, the cluster cannot be started properly.

---

**Default value:** ALL

## ssl\_renegotiation\_limit

**Parameter description:** Specifies the allowed traffic volume over an SSL-encrypted channel before the session key is renegotiated. The renegotiation mechanism reduces the probability that attackers use the password analysis method to crack the key based on a huge amount of data but causes big performance losses. The traffic indicates the sum of transmitted and received traffic. The SSL renegotiation mechanism has been disabled because of potential risks. This parameter is reserved for version compatibility and does not take effect.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is KB. **0** indicates that the renegotiation mechanism is disabled.

**Default value:** 0

## ssl\_cert\_file

**Parameter description:** Specifies the name of the file that contains the SSL server certificate. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** server.crt

## ssl\_key\_file

**Parameter description:** Specifies the name of the file that contains the SSL private key. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** server.key

## ssl\_enc\_cert\_file

**Parameter description:** Specifies the name of the SSL server certificate file that is encrypted using Chinese cryptographic algorithms. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** an empty string.

## ssl\_enc\_key\_file

**Parameter description:** Specifies the name of the file that contains the SSL private key. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** an empty string.

## ssl\_ca\_file

**Parameter description:** Specifies the name of the root certificate that contains CA information. Its path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. If it is an empty string, no CA file is loaded and client certificate verification is not performed.

**Default value:** cacert.pem

## ssl\_crl\_file

**Parameter description:** Specifies the certificate revocation list (CRL). If a client certificate is in the list, the certificate is invalid. The path is relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that there is no CRL.

**Default value:** an empty string

## ssl\_cert\_notify\_time

**Parameter description:** Specifies the number of days prior to SSL server certificate expiration that a user will receive a reminder. When the SSL certificate is initialized during connection establishment, if the duration from the current time to the certificate expiration time is shorter than the specified value, an expiration notification is recorded in the log.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 7 to 180. The unit is day.

**Default value:** 90

## krb\_server\_keyfile

**Parameter description:** Specifies the location of the main configuration file of the Kerberos service. Only the sysadmin user can access the file.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** an empty string.

## krb\_srvname

**Parameter description:** Specifies the Kerberos service name.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** postgres

## krb\_caseins\_users

**Parameter description:** Specifies whether the Kerberos username is case-sensitive.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the Kerberos username is case-insensitive.
- **off** indicates that the Kerberos username is case-sensitive.

**Default value:** off

## modify\_initial\_password

**Parameter description:** After GaussDB is installed, there is only one initial user account (whose UID is 10) in the database. When a user logs in to the database using this initial account for the first time, this parameter determines whether the password of the initial account needs to be modified.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If the initial user password is not specified during the installation, the initial user password is empty by default after the installation. Before performing other operations, you need to set the initial user password using the `gsql` client. This parameter no longer takes effect and is reserved only for compatibility with upgrade scenarios.

---

**Value range:** Boolean

- **on** indicates that the password of the initial account needs to be modified upon the first login after cluster is installed.
- **off** indicates that the password of the initial account does not need to be modified after cluster is installed.

**Default value:** off

## password\_policy

**Parameter description:** Specifies whether to check the password complexity when you run the **CREATE ROLE/USER** or **ALTER ROLE/USER** command to create or modify the GaussDB account.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

For security purposes, do not disable the password complexity policy.

---

**Value range:** 0 or 1

- **0** indicates that no password complexity policy is enabled.
- **1** indicates that the default password complexity policy is enabled.

**Default value:** 1

## password\_reuse\_time

**Parameter description:** Specifies whether to check the reuse interval of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

When you change the password, the system checks the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#).

- If the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of [password\\_reuse\\_time](#) is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of [password\\_reuse\\_max](#) is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are **0**, password reuse is not restricted.

---

**Value range:** a floating-point number ranging from 0 to 3650. The unit is day.

- **0** indicates that the password reuse interval is not checked.
- A positive number indicates that a new password cannot be chosen from passwords in history that are newer than the specified number of days.

## password\_reuse\_max

**Parameter description:** Specifies whether to check the reuse times of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

When you change the password, the system checks the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#).

- If the values of [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of [password\\_reuse\\_time](#) is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of [password\\_reuse\\_max](#) is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both [password\\_reuse\\_time](#) and [password\\_reuse\\_max](#) are **0**, password reuse is not restricted.

---

**Value range:** an integer ranging from 0 to 1000.

- **0** indicates that the password reuse times are not checked.
- A positive number indicates that the new password cannot be the one whose reuse times exceed the specified number.

**Default value:** 0

## password\_lock\_time

**Parameter description:** Specifies the duration before a locked account is automatically unlocked.

**Parameter type:** floating-point.

**Unit:** day

---

### NOTICE

The locking and unlocking functions take effect only when the values of **password\_lock\_time** and **failed\_login\_attempts** are positive numbers.

---

**Value range:** 0 to 365. The integer part indicates the number of days, and the decimal part can be converted into hours, minutes, and seconds. For example, **password\_lock\_time=1.5** indicates one day and 12 hours.

- 0 indicates that an account is not automatically locked if the password verification fails.
- A positive number indicates the duration after which a locked account is automatically unlocked.

**Default value:** 1

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. Do not set the automatic unlock time to a large value. Set it to a proper value based on the value of **failed\_login\_attempts**. If the value of **failed\_login\_attempts** is too small but the automatic unlock time is too long, the account cannot be used for a long time after the input fails, affecting user experience.

## failed\_login\_attempts

**Parameter description:** If the number of incorrect password attempts reaches the value of **failed\_login\_attempts**, the current account is locked. The account is automatically unlocked after the number of seconds specified by **password\_lock\_time**. During this period, only the sysadmin user can access the account. The automatic account locking policy applies in scenarios such as login and password modification using the **ALTER USER** command.

**Parameter type:** integer.

**Unit:** none

---

### NOTICE

The locking and unlocking functions take effect only when the values of **failed\_login\_attempts** and **password\_lock\_time** are positive numbers.

---

**Value range:** 0 to 1000.

- **0** indicates that the automatic locking function does not take effect.
- A positive number indicates that an account is locked when the number of incorrect password attempts reaches the specified number.

**Default value:** 10

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** You are advised to set it to a value ranging from 5 to 10. If this parameter is set to a large value that allows too many incorrect password attempts (less than the maximum value of 1000), but no security measure is taken, security risk occurs. If this parameter is set to a small value (greater than 0 and less than 10), the account may be locked due to failed password attempts, affecting normal use.

## password\_encryption\_type

**Parameter description:** Specifies the encryption type of a user password. Changing the value of this parameter does not automatically trigger the change of the password encryption type of an existing user. Only the password of a new user or the password changed by an existing user is encrypted using the new encryption type.

**Parameter type:** enumerated type

**Unit:** none

**Value range:** 0, 1, 2, or 3

- **0** indicates that passwords are encrypted with MD5.
- **1** indicates that passwords are encrypted with SHA-256 and MD5.
- **2** indicates that passwords are encrypted with SHA-256.
- **3** indicates that the passwords are encrypted with SM3.

---

### NOTICE

The MD5 encryption algorithm is not recommended because it has lower security and poses security risks.

---

**Default value:** 2

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## password\_min\_length

**Parameter description:** Specifies the minimum length of an account password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 6 to 999.

**Default value:** 8

## password\_max\_length

**Parameter description:** Specifies the maximum length of an account password. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 6 to 999.

**Default value:** 32

## password\_min\_uppercase

**Parameter description:** Specifies the minimum number of uppercase letters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of uppercase letters required in a password when you create an account.

**Default value:** 0

## password\_min\_lowercase

**Parameter description:** Specifies the minimum number of lowercase letters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of lowercase letters required in a password when you create an account.

**Default value:** 0

## password\_min\_digital

**Parameter description:** Specifies the minimum number of digits that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.

- An integer ranging from 1 to 999 indicates the minimum number of digits required in a password when you create an account.

**Default value:** 0

## password\_min\_special

**Parameter description:** Specifies the minimum number of special characters that an account password must contain. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999

- 0 means no limit.
- An integer ranging from 1 to 999 indicates the minimum number of special characters required in a password when you create an account.

**Default value:** 0

## password\_effect\_time

**Parameter description:** Specifies the validity period of an account password.

**Parameter type:** floating-point.

**Unit:** day

**Value range:** 0 to 999. The integer part indicates the number of days, and the decimal part can be converted into hours, minutes, and seconds. For example, **password\_lock\_time=0.5** indicates 0 days and 12 hours.

- 0 indicates that the validity period restriction is disabled.
- A floating-point number from 1 to 999 indicates the number of days for which an account password is valid. When the password is about to expire or has expired, the system prompts the user to change the password.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** For security purposes, you are advised to retain the default value.

## password\_notify\_time

**Parameter description:** Specifies how many days in advance a user is notified before a password expires.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 999. The unit is day.

- 0 indicates that the reminder is disabled.
- An integer ranging from 1 to 999 indicates the number of days prior to password expiration that a user will receive a reminder.

**Default value:** 7

## enable\_innertool\_cert

**Parameter description:** Specifies whether internal tools use certificate-based authentication.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** indicates that internal tools use certificate-based authentication.
- **off:** indicates that internal tools do not use certificate-based authentication.

**Default value:** off

---

### NOTICE

- This parameter takes effect only when both this parameter and **ssl** are enabled.
  - By default, the certificate in the `$GAUSSHOME/share/sslcert/gsql` directory is used. The **Common Name** of the certificate must be the same as the initial user. Otherwise, the authentication fails.
  - After this parameter takes effect, the initial user uses certificate-based authentication, and other users use password-based authentication.
  - If this parameter is enabled, the initial user can remotely connect to the database using certificate-based authentication.
- 

### 14.3.3.3 Communications Library Parameters

This section describes parameter settings and value ranges for communications libraries.

## tcp\_keepalives\_idle

**Parameter description:** Specifies the interval for transmitting keepalive signals on an OS that supports the **TCP\_KEEPIDLE** socket option. If no keepalive signal is transmitted, the connection is in idle mode.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the OS does not support **TCP\_KEEPIDLE**, set this parameter to 0.
  - The parameter is ignored on an OS where connections are established using the UDS.
- 

**Value range:** 0 to 3600. The unit is s.

**Default value:** 1 min

## tcp\_keepalives\_interval

**Parameter description:** Specifies the response time before retransmission on an OS that supports the **TCP\_KEEPINTVL** socket option.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 180. The unit is s.

**Default value:** 30

---

### NOTICE

- If the OS does not support **TCP\_KEEPINTVL**, set this parameter to **0**.
  - The parameter is ignored on an OS where connections are established using the UDS.
- 

## tcp\_keepalives\_count

**Parameter description:** Specifies the number of keepalive signals that can be waited before the GaussDB server is disconnected from the client on an OS that supports the **TCP\_KEEPCNT** socket option.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the OS does not support **TCP\_KEEPCNT**, set this parameter to **0**.
  - The parameter is ignored on an OS where connections are established using the UDS.
- 

**Value range:** 0 to 100. **0** indicates that the connection is immediately broken if GaussDB does not receive a keepalive signal from the client.

**Default value:** 20

## tcp\_user\_timeout

**Parameter description:** Specifies the maximum duration for which the transmitted data can remain in the unacknowledged state before the TCP connection is forcibly closed when the GaussDB sends data on the OS that supports the **TCP\_USER\_TIMEOUT** socket option.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the OS does not support the **TCP\_USER\_TIMEOUT** option, the value of this parameter does not take effect. The default value is **0**.
  - The parameter is ignored on an OS where connections are established using the UDS.
-

**Value Range:** 0 to 3600000. The unit is ms. The value **0** indicates that the value is set based on the OS.

**Default value:** 0

The effect of this parameter varies according to the OS kernel.

- For AArch64 EulerOS (Linux kernel version: 4.19), the timeout interval is the value of this parameter.
- For x86 Euler 2.5 (Linux kernel version: 3.10), the timeout interval is not the value of this parameter but the maximum value in different ranges. That is, the timeout interval is the maximum upper limit of the total Linux TCP retransmission duration to which the value of **tcp\_user\_timeout** belongs. For example, if **tcp\_user\_timeout** is set to **40000**, the total retransmission duration is 51 seconds.

**Table 14-7** Value of tcp\_user\_timeout for x86 Euler 2.5 (Linux kernel version: 3.10)

Number of Linux TCP Retransmission Times	Total Linux TCP Retransmission Duration Range (s)	Example of tcp_user_timeout (ms)	Actual Linux TCP Retransmission Duration (s)
1	(0.2,0.6]	400	0.6
2	(0.6,1.4]	1000	1.4
3	(1.4,3]	2000	3
4	(3,6.2]	4000	6.2
5	(6.2,12.6]	10000	12.6
6	(12.6,25.4]	20000	25.4
7	(25.4,51]	40000	51
8	(51,102.2]	80000	102.2
9	(102.2,204.6]	150000	204.6
10	(204.6,324.6]	260000	324.6
11	(324.6,444.6]	400000	444.6

Note: The duration of each TCP retransmission increases exponentially with the number of retransmission times. When the duration of a TCP retransmission reaches 120 seconds, the duration of each subsequent retransmission does not change.

## tcp\_syn\_retries

**Parameter description:** Specifies the number of SYN packet retransmissions due to SYN packet transmission failures in the three-way handshake for connecting to

other internal nodes on the GaussDB that supports the **TCP\_SYNCNT** socket option.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- If the OS does not support the **TCP\_SYNCNT** option, setting **tcp\_syn\_retries** to any value does not take effect but its value is **0** by default.
- **tcp\_syn\_retries** is ignored on an OS where connections are established using the UDS.

---

**Value range:** 0 to 127. The value **0** indicates that the setting is the same as that in the OS.

**Default value:** 0

## comm\_tcp\_mode

**Parameter description:** Specifies whether the communications library uses the TCP protocol to set up a data channel. The parameter setting takes effect after you restart the cluster.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

SCTP is no longer supported. This parameter is provided for compatibility, but its value is fixed at **on**.

---

**Value range:** Boolean. If this parameter is set to **on** for a CN, it connects to a DN using TCP. If this parameter is set to **on** for a DN, the DN communicates with each other using TCP.

**Default value:** on

## comm\_sctp\_port

**Parameter description:** Specifies the TCP port used to listen on data packet channels by the TCP proxy communications library.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

This port number is automatically allocated during cluster deployment. Do not change the parameter. If the port number is incorrectly configured, the database communication fails.

---

**Value range:** an integer ranging from 0 to 65535.

**Default value:** 25110 (The actual value is the specified value of the **port** GUC parameter plus 2.)

## comm\_control\_port

**Parameter description:** Specifies the TCP listening port used by the TCP proxy communications library.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

This port number is automatically allocated during cluster deployment. Do not change the parameter. If the port number is incorrectly configured, the database communication fails.

---

**Value range:** an integer ranging from 0 to 65535.

**Default value:** 25111 (The actual value is the specified value of the **port** GUC parameter plus 3.)

## comm\_max\_datanode

**Parameter description:** Specifies the maximum number of DNs supported by the TCP proxy communications library.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 8192.

**Default value:** maximum number of primary DNs supported by each node.

**Recommended value:** 256

## comm\_max\_stream

**Parameter description:** Specifies the maximum number of concurrent data streams supported by the TCP proxy communications library. The value of this parameter must be greater than: Number of concurrent data streams x Number of operators in each stream x Square of smp.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 60000.

**Default value:** 1024

---

**NOTICE**

- You are advised not to set this parameter to a large value because this will cause high memory usage (256 bytes x **comm\_max\_stream** x **comm\_max\_datanode**). If the number of concurrent data streams is large, the query is complex and the SMP is large, resulting in insufficient memory.
  - If the process memory is sufficient, you can properly increase the value of **comm\_max\_stream**.
- 

### **comm\_max\_receiver**

**Parameter description:** Specifies the maximum number of receiver threads for the TCP proxy communications library.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 50.

**Default value:** 4

### **comm\_quota\_size**

**Parameter description:** Specifies the maximum size of packets that can be consecutively sent by the TCP proxy communications library. When you use a 1GE NIC, a small value ranging from 20 KB to 40 KB is recommended.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2048000. The default unit is KB.

**Default value:** 1MB

### **comm\_usable\_memory**

**Parameter description:** Specifies the maximum memory available for buffering on the TCP proxy communications library on a DN.

---

**NOTICE**

This parameter must be set based on environment memory and the deployment method. If it is too large, an out-of-memory (OOM) exception may occur. If it is too small, the performance of the TCP proxy communications library may deteriorate.

---

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 x 1024 to 1073741823. The default unit is KB.

**Default value:** 4000MB

## comm\_memory\_pool

**Parameter description:** Specifies the size of the memory pool resources that can be used by the TCP proxy communications library on a DN.

---

### NOTICE

If the memory used by the communications library is small, set this parameter to a small value. Otherwise, set it to a large value.

---

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 100 x 1024 to 1073741823. The default unit is KB.

**Default value:** 2000MB

## comm\_memory\_pool\_percent

**Parameter description:** Specifies the percentage of the memory pool resources that can be used by the TCP proxy communications library on a DN. This parameter is used to adaptively reserve memory used by the communications libraries.

---

### NOTICE

If the memory used by the communications library is small, set this parameter to a small value. Otherwise, set it to a large value.

---

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100.

**Default value:** 0

## comm\_client\_bind

**Parameter description:** Specifies whether to bind the client of the communications library to a specified IP address when the client initiates a connection.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the client is bound to a specified IP address.
- **off** indicates that the client is not bound to any IP addresses.

---

**NOTICE**

If multiple IP addresses of a node in the cluster are on the same network segment, set this parameter to **on**. In this case, the client is bound to the IP address specified by **listen\_addresses**. The concurrency performance of the cluster depends on the number of random ports because a port can be used by only one client at a time.

---

**Default value:** off

## comm\_no\_delay

**Parameter description:** Specifies whether to use the **NO\_DELAY** attribute of a communications library connection.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

---

**NOTICE**

If packet loss occurs in the cluster because a large number of packets are received per second, set this parameter to **off** so that small packets are combined into large packets for transmission to reduce the total number of packets.

---

**Default value:** off

## comm\_debug\_mode

**Parameter description:** Specifies whether to enable the debug mode of the TCP proxy communications library, that is, whether to print logs about the communication layer.

---

**NOTICE**

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

---

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the debug logs of the communications library are printed.
- **off** indicates that the debug logs of the communications library are not printed.

**Default value:** off

## comm\_ackchk\_time

**Parameter description:** Specifies the duration after which the communications library server automatically triggers ACK when no data packet is received.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 20000. The unit is ms. **0:** disabled.

**Default value:** 2000 (2s)

## comm\_timer\_mode

**Parameter description:** Specifies whether to enable the timer mode of the TCP proxy communications library, that is, whether to print timer logs in each phase of the communication layer.

---

### NOTICE

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

---

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the timer logs of the communications library are printed.
- **off** indicates that the timer logs of the communications library are not printed.

**Default value:** off

## comm\_stat\_mode

**Parameter description:** Specifies whether to enable the statistics mode of the TCP proxy communications library, that is, whether to print statistics about the communication layer.

---

### NOTICE

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

---

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics logs of the communications library are printed.
- **off** indicates that the statistics logs of the communications library are not printed.

**Default value:** off

## enable\_stateless\_pooler\_reuse

**Parameter description:** Specifies whether to enable the reuse of the pooler connection pool. After the parameter is enabled, existing idle TCP connections can be reused. The setting takes effect after the cluster is restarted.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that the pooler reuse mode is enabled.
- **off** or **false** indicates that the pooler reuse mode is disabled.

---

### NOTICE

This parameter should be set to a same value on CNs and DN. If this parameter is set to **off** for CNs and **on** for DN, the cluster communication fails. Set this parameter to the same value for CNs and DN. Restart the cluster for the setting to take effect.

---

**Default value:** on

## comm\_cn\_dn\_logic\_conn

**Parameter description:** Specifies whether logical connections are used between CNs and DN. The setting takes effect after the cluster is restarted.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that the connections between CNs and DN are logical, with the libcomm component in use.
- **off** or **false** indicates that the connections between CNs and DN are physical, with the libpq component in use.

---

### NOTICE

Logical connections between CNs and DN are no longer supported. This parameter is provided for compatibility, but its value is fixed at **off**.

---

**Default value:** off

## COMM\_IPC

**Parameter description:** Specifies whether to print the packet sending and receiving status of each communication node.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that the function of logging packet sending and receiving status data is enabled.
- **off** or **false** indicates that the function of logging packet sending and receiving status data is disabled.

---

#### NOTICE

```
set logging_module='on(COMM_IPC)'; -- Enabled  
set logging_module='off(COMM_IPC)'; -- Disabled  
show logging_module; -- View the setting result.
```

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and set it to **off** after debugging.

---

**Default value:** off

## COMM\_PARAM

**Parameter description:** Specifies whether to print the **session** parameter settings during node communication.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that the function of logging the **session** parameter settings is enabled.
- **off** or **false** indicates that the function of logging the **session** parameter settings is disabled.

---

#### NOTICE

```
set logging_module='on(COMM_PARAM)'; --Enabled  
set logging_module='off(COMM_PARAM)'; --Disabled  
show logging_module; -- View the setting result.
```

If this parameter is set to **on**, a huge number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and set it to **off** after debugging.

---

**Default value:** off

## 14.3.4 Resource Consumption

### 14.3.4.1 Memory

This section describes memory parameters.

---

**NOTICE**

These parameters, except **local\_syscache\_threshold**, take effect only after the database restarts.

---

## memorypool\_enable

**Parameter description:** Specifies whether to enable a memory pool.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the memory pool is enabled.
- **off** indicates that the memory pool is disabled.

**Default value:** off

## memorypool\_size

**Parameter description:** Specifies the memory pool size.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 128 x 1024 to 1073741823. The unit is KB.

**Default value:** 512MB

## enable\_memory\_limit

**Parameter description:** Specifies whether to enable the logical memory management module.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the logical memory management module is enabled.
- **off** indicates that the logical memory management module is disabled.

**Default value:** on

---

 **CAUTION**

- Fixed overhead exists, that is, **shared\_buffers** and metadata (about 200 MB). If **max\_process\_memory** minus the fixed overhead is less than 2 GB, GaussDB forcibly sets **enable\_memory\_limit** to **off**. Metadata is the memory used within GaussDB and is related to some concurrent parameters, such as **max\_connections**, **thread\_pool\_attr** and **max\_prepared\_transactions**.
  - If this parameter is set to **off**, the memory used by the database is not limited. When a large number of concurrent or complex queries are performed, too much memory is used, which may cause OS OOM problems.
-

## max\_process\_memory

**Parameter description:** Specifies the maximum physical memory of a database node.

**Parameter type:** integer.

**Unit:** KB

**Value range:** 2097152 to 2147483647

**Default value:**

Independent deployment: **360GB** (60-core CPU/480 GB memory); **192GB** (32-core CPU/256 GB memory); **96GB** (16-core CPU/128 GB memory); **40GB** (8-core CPU/64 GB memory); **20GB** (4-core CPU/32 GB memory); **10GB** (4-core CPU/16 GB memory)

Finance edition (standard):

CN: **300GB** (196-core CPU/1536 GB memory); 200GB (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, and 96-core CPU/1024 GB memory); **160GB** (96-core CPU/768 GB memory); **130GB** (80-core CPU/640 GB memory); **120GB** (72-core CPU/576 GB memory); **100GB** (64-core CPU/512 GB memory and 60-core CPU/480 GB memory); **50GB** (32-core CPU/256 GB memory); **20GB** (16-core CPU/128 GB memory); **10GB** (8-core CPU/64 GB memory)

---

 **CAUTION**

If this parameter is set to a value greater than the physical memory of the server, the OS OOM problem may occur.

---

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** This parameter is used to prevent node OOM caused by memory bloat, ensuring system reliability. On DNs, the value of this parameter depends on the physical memory of the system and the number of primary DNs deployed on a single server. The recommended formula is as follows: (Physical memory - **vm.min\_free\_kbytes**) x 0.7/(n + Number of DNs). **vm.min\_free\_kbytes** in this formula indicates that the OS memory reserved for the kernel to receive and send data. Its value is at least 5% of the total memory. That is, **max\_process\_memory** = Physical memory size x 0.665/(n + Number of primary DNs). **max\_process\_memory** is calculated based on the following formula: **max\_process\_memory** = Physical memory size x 0.665/(n + Number of primary DNs) When the number of nodes in the cluster is less than or equal to 256, *n* is 1. When the number of nodes in the cluster is greater than 256 and less than 512, *n* is 2. When the number of nodes in the cluster is greater than 512, *n* is 3. When DNs are deployed independently, *n* is 0. You can set this parameter on CNs to the same value as that on DNs.

## local\_syscache\_threshold

**Parameter description:** Specifies the size of system catalog cache in a session. If **enable\_global\_plancache** is enabled, **local\_syscache\_threshold** does not take effect when it is set to a value less than 16 MB to ensure that GPC takes effect. The minimum value is 16 MB. If **enable\_global\_syscache** and **enable\_thread\_pool** are enabled, this parameter indicates the total cache size of the current thread and sessions bound to the current thread.

**Parameter type:** integer.

**Unit:** kB

**Value range:**

- Method 1: Set this parameter to an integer without a unit. The integer ranges from 1 x 1024 to 512 x 1024. You are advised to set this parameter to an integer multiple of 1024. For example, the value **2048** indicates 2048 KB.
- Method 2: Set this parameter to a value with a unit. The value ranges from 1 x 1024 KB to 512 x 1024 KB. For example, the value **32MB** indicates 32 MB. The unit can only be kB, MB, or GB.

**Default value:**

- Independent deployment: **16MB**

- Finance edition (standard):  
**32MB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, and 80-core CPU/640 GB memory); **16MB** (72-core CPU/576 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, and 8-core CPU/64 GB memory)
- Enterprise edition:  
**32MB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 80-core CPU/512 GB memory, 72-core CPU/576 GB memory, and 64-core CPU/512 GB memory); **16MB** (60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, and 8-core CPU/64 GB memory)
- Finance edition (data computing): 16 MB

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## enable\_memory\_context\_control

**Parameter description:** Enables the function of checking whether the number of memory contexts exceeds the specified limit. This parameter applies only to the DEBUG version.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of checking the number of memory contexts is enabled.
- **off** indicates that the function of checking the number of memory contexts is disabled.

**Default value:** off

## uncontrolled\_memory\_context

**Parameter description:** Specifies which memory context will not be checked when the function of checking whether the number of memory contexts exceeds the specified limit is enabled. This parameter applies only to the DEBUG version.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

During the query, the title meaning string "MmgrMemoryController white list:" is added to the beginning of the parameter value.

**Value range:** a string

**Default value:** empty

## shared\_buffers

**Parameter description:** Specifies the size of shared memory used by GaussDB. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

**Parameter type:** integer.

**Unit:** page (8 kB)

**Value range:** 16 to 1073741823. The value of this parameter must be an integer multiple of **BLCKSZ**. Currently, **BLCKSZ** is set to **8kB**. That is, the value of this parameter must be an integer multiple of 8 KB.

### Default value:

Independent deployment:

CN: **4GB** (60-core CPU/480 GB memory); **2GB** (32-core CPU/256 GB memory, 16-core CPU/128 GB memory); **1GB** (8-core CPU/64 GB memory); **512MB** (4-core CPU/32 GB memory) **256MB** (4-core CPU/16 GB memory)

DN: **140GB** (60-core CPU/480 GB memory); **76GB** (32-core CPU/256 GB memory); **40GB** (16-core CPU/128 GB memory); **16GB** (8-core CPU/64 GB memory); **8GB** (4-core CPU/32 GB memory); **4GB** (4-core CPU/16 GB memory)

Finance edition (standard):

CN: **2GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory and 16-core CPU/128 GB memory); **512MB** (8-core CPU/64 GB memory)

DN: **220GB** (196-core CPU/1536 GB memory); **140GB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, and 96-core CPU/1024 GB memory); **100GB** (96-core CPU/768 GB memory); **80GB** (80-core CPU/640 GB memory and 72-core CPU/576 GB memory); **70GB** (64-core CPU/512 GB memory); **60GB** (60-core CPU/480 GB memory); **30GB** (32-core CPU/256 GB memory); **16GB** (16-core CPU/128 GB memory); **8GB** (8-core CPU/64 GB memory)

Enterprise edition:

CN: **2GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 80-core CPU/512 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory and 16-core CPU/128 GB memory); **512MB** (8-core CPU/64 GB memory)

DN: **160GB** (196-core CPU/1536 GB memory); **100GB** (128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, and 96-core CPU/1024 GB memory); **76GB** (96-core CPU/768 GB memory); **64GB** (80-core CPU/640 GB memory); **56GB** (72-core CPU/576 GB memory); **50GB** (80-core CPU/512 GB memory and 64-core CPU/512 GB memory); **48GB** (60-core CPU/480 GB memory); **24GB** (32-core CPU/256 GB memory); **10GB** (16-core CPU/128 GB memory); **6GB** (8-core CPU/64 GB memory)

Finance edition (data computing):

CN: **2GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 96-core CPU/768 GB memory); **1GB** (72-core CPU/576 GB memory, 64-core CPU/512 GB memory); **512MB** (32-core CPU/256 GB memory)

DN: **120GB** (196-core CPU/1536 GB memory); **80GB** (128-core CPU/1024 GB memory); **50GB** (96-core CPU/768 GB memory); **40GB** (72-core CPU/576 GB memory); **30GB** (64-core CPU/512 GB memory); **10GB** (32-core CPU/256 GB memory)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:**

- Set this parameter on DNs to a value greater than that on CNs because most queries in GaussDB are pushed down.
- Set **shared\_buffers** to a value less than 40% of the memory.
- If **shared\_buffers** is set to a larger value, increase the value of **checkpoint\_segments** because a longer period of time is required to write a large amount of new or changed data.
- If the process fails to be restarted after the value of **shared\_buffers** is changed, perform either of the following operations based on the error information:
  - Adjust the **kernel.shmall**, **kernel.shmmax**, and **kernel.shmmin** OS parameters. For details, see "Preparing for Installation > Modifying OS Configuration > Configuring Other OS Parameters" in *Installation Guide*.
  - Run the **free -g** command to check whether the available memory and swap space of the OS are sufficient. If the memory is insufficient, manually stop other user programs that occupy much memory.
  - Set this parameter to the recommended default value for different specifications. Otherwise, the value of **shared\_buffers** may be too large or too small. The following condition must be met:  
**data\_replicate\_buffer\_size + segment\_buffers + shared\_buffers + wal\_buffers + temp\_buffers + maintenance\_work\_mem + work\_mem + query\_mem + (Standby node) wal\_receiver\_buffer\_size < max\_process\_memory < Memory size of the physical machine.** If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because the memory allocated to the database is insufficient.

## page\_version\_check

**Parameter description:** Specifies whether to perform verification for underlying storage faults and pages not marked as dirty based on page version information. **page\_version\_check** is a level-3 switch. The verification for underlying storage faults is to check whether a page read from the underlying storage is of a correct version, which prevents loss of page version information caused by a fault such as a disk power failure. The verification for pages not marked as dirty is to check whether modified pages are not marked as dirty, and is controlled by an independent switch [page\\_missing\\_dirty\\_check](#).

**Value type:** enumerated type.

**Unit:** none

**Value range:**

- **off:** The verification for underlying storage faults and pages not marked as dirty is disabled.
- **memory:** The page version verification function (that is, verification for underlying storage faults and pages not marked as dirty) in pure memory mode is enabled. The page version information is cached only in the memory and will be lost after a restart.
- **persistence:** The persistent page version verification function (that is, verification for underlying storage faults and pages not marked as dirty) is enabled. The page version information is persisted to files and will not be lost after a restart.

**Default value:** memory

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestions:** Set the value of this parameter based on different specifications, that is, **off** (four-core CPU/16 GB memory, four-core CPU/32 GB memory, and eight-core CPU/64 GB memory) or **memory** (16-core CPU/128 GB memory, 32-core CPU/256 GB memory, 60-core CPU/480 GB memory, 64-core CPU/512 GB memory, 72-core CPU/576 GB memory, 80-core CPU/640 GB memory, and 96-core CPU/768 GB memory, 96-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 128-core CPU/1024 GB memory, and 196-core CPU/1536 GB memory). Setting this parameter to **memory** affects the performance of a device, and the one with smaller specifications suffers more. (For example, the performance of a 16-core CPU/128 GB memory device using TPC-C model is about 7%.) If the system needs to restart frequently, you are advised to set this parameter to **persistence** to ensure that the version information on the page is not lost. However, the performance will be affected.

## page\_missing\_dirty\_check

**Parameter description:** Checks whether the modified pages are not marked as dirty. **page\_missing\_dirty\_check** is controlled by [page\\_version\\_check](#). If **page\_version\_check** is set to **off**, setting **page\_missing\_dirty\_check** to **on** does not take effect.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The verification for pages not marked as dirty is performed.
- **off:** The verification for pages not marked as dirty is not performed.

**Default value:** off

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** You are advised to enable this function in test scenarios to detect as many pages not marked as dirty that lead to code bugs in non-

production environments as possible. On the live network, this function is disabled by default to avoid extra overhead and performance deterioration.

## page\_version\_max\_num

**Parameter description:** Specifies the maximum number of page versions that can be cached in the memory. This parameter is valid only when [page\\_version\\_check](#) is not set to **off**. The value of the parameter must be twice to four times the value of [shared\\_buffers](#). Each **page\_version** occupies 36 bytes of memory. Pay attention to the memory usage.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 2147483647.

- **0:** When [page\\_version\\_check](#) is not set to **OFF**, the value of [page\\_version\\_max\\_num](#) is automatically calculated based on the value of [shared\\_buffers](#) using the following formula: [shared\\_buffers](#) x 2. For example, 32 MB of [shared\\_buffers](#) corresponds to 4096 buffers. Therefore, the value of this parameter is set to **8192**.
- Non-zero values: The manually configured value is forcibly used.
- If [page\\_version\\_check](#) is not set to **OFF**, the value cannot be less than 16 times of [page\\_version\\_partitions](#). Otherwise, it is forcibly set to a value calculated based on the following formula: [page\\_version\\_partitions](#) x 16.

**Default value:** 0

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** If high performance is required and the memory is sufficient, you are advised to manually set this parameter to four times the value of [shared\\_buffers](#) and the ratio of this parameter to [page\\_version\\_partitions](#) is [256, 1024].

## page\_version\_partitions

**Parameter description:** Specifies the number of hash table partitions in cached page version information in the memory. This parameter directly affects the hash query efficiency and hash conflict probability.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0-2097152.

- **0:** If [page\\_version\\_check](#) is not set to **OFF**, the value of [page\\_version\\_partitions](#) is automatically calculated based on the value of [page\\_version\\_max\\_num](#) using the following formula: [page\\_version\\_max\\_num](#)/512. If the automatically calculated value is smaller than 4, the parameter is forcibly set to **4**.
- Non-zero values: The manually configured value is forcibly used. If [page\\_version\\_check](#) is not set to **OFF**, the minimum value is **4**. If the value is less than 4, the parameter is forcibly set to **4**.

**Default value:** 0

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** If you have high performance requirements, you are advised to manually set this parameter to a value 1/256 to 1/1024 of the value of [page\\_version\\_max\\_num](#).

## page\_version\_recycler\_thread\_num

**Parameter description:** Specifies the number of threads for recycling and verifying page version information. This parameter is valid only when [page\\_version\\_check](#) is not set to **off**.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0–16

- If [page\\_version\\_check](#) is set to **memory**:
  - **0**: The value is automatically calculated based on the value of [page\\_version\\_partitions](#) using the following formula:  
$$\text{page\_version\_recycler\_thread\_num} = \text{page\_version\_partitions} / 16384$$
. If the automatically calculated value is greater than 4, the parameter is forcibly set to **4**.
  - Non-zero values: The manually configured value is forcibly used.
  - The parameter cannot be set to a value greater than that of [page\\_version\\_partitions](#). Otherwise, it is forcibly set to the value of [page\\_version\\_partitions](#).
- If [page\\_version\\_check](#) is set to **persistence**:  
If the value is less than 2, set this parameter to **2**. If the value is greater than or equal to 2, the manually configured parameter value is forcibly used.

**Default value:** 0

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value **0**.

## verify\_log\_buffers

**Parameter description:** Specifies the size of the verifyLog buffer. This parameter is valid only when [page\\_version\\_check](#) is set to **persistence**. The verifyLog buffer memory is managed by page, and each page is 8 KB.

**Parameter type:** integer.

**Unit:** page (8 KB)

**Value range:** 4-262144

**Default value:** 4 (32 KB)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#). For example, if [verify\\_log\\_buffers](#) is set to **131072**, the size of the

verifyLog buffer is 1 GB, that is, **131072** multiplied by 8 KB; if **verify\_log\_buffers** is set to **131072KB**, the size of the verifyLog buffer is 131072 KB. If the value contains a unit, the value must be **kB**, **MB**, or **GB** and must be an integer multiple of 8 KB.

**Setting suggestion:** Set this parameter based on the system hardware specifications.

**1GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory); **128MB** (4-core CPU/32 GB memory); **16MB** (4-core CPU/16 GB memory)

## segment\_buffers

**Parameter description:** Specifies the memory size of a GaussDB segment-page metadata page.

**Parameter type:** integer.

**Unit:** KB

**Value range:** 16 to 1073741823. The value of this parameter must be an integer multiple of **BLCKSZ**. Currently, **BLCKSZ** is set to **8kB**. That is, the value of this parameter must be an integer multiple of 8 KB.

**Default value:** **8MB**

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestions:** **segment\_buffers** is used to cache the content of segment-page headers, which is key metadata information. To improve performance, it is recommended that the segment headers of ordinary tables be cached in the buffer and not be replaced. You are advised to set this parameter based on the following formula: Number of tables (including indexes and TOAST tables) x Number of partitions x 3 + 128. Multiplying by 3 is because each table (partition) has some extra metadata segments. Generally, a table has three segments. Adding 128 at last is because segment-page tablespace management requires a certain number of buffers. If this parameter is set to a small value, it takes a long time to create a segment-page table for the first time. Therefore, you are advised to retain the default value to avoid setting **segment\_buffers** to an excessively large or small value. The following condition must be met: **data\_replicate\_buffer\_size + segment\_buffers + shared\_buffers + wal\_buffers + temp\_buffers + maintenance\_work\_mem + work\_mem + query\_mem + (Standby node) wal\_receiver\_buffer\_size < max\_process\_memory < Memory size of the physical machine**. If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because the memory allocated to the database is insufficient.

## bulk\_write\_ring\_size

**Parameter description:** Specifies the size of a ring buffer used for parallel data import.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 16384 to 2147483647. The unit is KB.

**Default value:** 2GB

**Setting suggestion:** Increase the value of this parameter on DNs if a huge amount of data will be imported.

## standby\_shared\_buffers\_fraction

**Parameter description:** Specifies the **shared\_buffers** proportion used on the server where a standby instance is deployed.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a double-precision floating-point number ranging from 0.1 to 1.0

**Default value:** 1

## temp\_buffers

**Parameter description:** Specifies the maximum size of local temporary buffers used by a database session.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**temp\_buffers** can be modified only before the first use of temporary tables within each session. Subsequent attempts to change the value of this parameter will not take effect on that session.

A session allocates temporary buffers based on the value of **temp\_buffers**. If a large value is set in a session that does not require many temporary buffers, only the overhead of one buffer descriptor is added. If a buffer is used, additional 8192 bytes will be consumed for it.

**Value range:** an integer ranging from 100 to 1073741823. The unit is 8 KB.

**Default value:** 1MB

## max\_prepared\_transactions

**Parameter description:** Sets the maximum number of transactions that can be in the "prepared" state simultaneously. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

When GaussDB is deployed as an HA system, set this parameter on standby nodes to a value greater than or equal to that on primary nodes. Otherwise, queries will fail on the standby nodes.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 262143

**Default value:**

- Independent deployment:  
**1200** (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); **800** (16-core CPU/128 GB memory); **400** (8-core CPU/64 GB memory); **300** (4-core CPU/32 GB memory); **200** (4-core CPU/16 GB memory)
- Finance edition (standard):  
CN: **1200** (196-core CPU/1536 GB memory); **900** (128-core CPU/1024 GB memory and 104-core CPU/1024 GB memory); **800** (96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **400** (32-core CPU/256 GB memory and 16-core CPU/128 GB memory); **200** (8-core CPU/64 GB memory)

- Finance edition (data computing):  
CN: **1200** (196-core CPU/1536 GB memory); **800** (128-core CPU/1024 GB memory, 96-core CPU/768 GB memory); **400** (72-core CPU/576 GB memory, 64-core CPU/512 GB memory); **200** (32-core CPU/256 GB memory)  
DN: **2400** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, and 96-core CPU/768 GB memory); **1200** (72-core CPU/576 GB memory); **800** (64-core CPU/512 GB memory); **400** (32-core CPU/256 GB memory)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestions:** The default value is recommended. You need to adjust the value only when a two-phase transaction reports an error indicating insufficient slots. To avoid failures in the preparation step, the value of this parameter must be greater than the number of worker threads in **thread\_pool\_attr** in thread pool mode. In non-thread pool mode, the value of this parameter must be greater than or equal to the value of **max\_connections**.

## work\_mem

**Parameter description:** Specifies the amount of memory to be used by internal sort operations and hash tables before they write data into temporary disk files.

Sorts are required for **ORDER BY**, **DISTINCT**, and **merge joins**. Hash tables are used in hash joins, hash-based aggregation, and hash-based processing of **IN** subqueries.

In a complex query, several sort or hash operations may run in parallel; each operation will be allowed to use as much memory as this parameter specifies. If the memory is insufficient, data will be written into temporary files. In addition, several running sessions could be performing such operations concurrently. Therefore, the total memory used may be many times the value of **work\_mem**.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 64 to 2147483647. The unit is KB.

**Default value:**

- Independent deployment:  
**128MB** (60-core CPU/480 GB memory, 32-core CPU/256 GB memory, and 16-core CPU/128 GB memory); **64MB** (8-core CPU/64 GB memory); 32MB (4-core CPU/32 GB memory); **16MB** (4-core CPU/16 GB memory)
- Finance edition (standard):  
CN: **128MB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, and 16-core CPU/128 GB memory); **64MB** (8-core CPU/64 GB memory)  
DN: **256MB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, and 96-core CPU/768 GB memory); **128MB** (80-core CPU/640 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, and 16-core CPU/128 GB memory); **64MB** (8-core CPU/64 GB memory)
- Enterprise edition:  
**128MB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 80-core CPU/512 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, and 16-core CPU/128 GB memory); **64MB** (8-core CPU/64 GB memory)
- Finance edition (data computing):  
**128MB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 72-core CPU/576 GB memory, and 64-core CPU/512 GB memory); **64MB** (32-core CPU/256 GB memory)

**Setting suggestion:** If the physical memory specified by **work\_mem** is insufficient, additional operator calculation data will be written into temporary tables based on query characteristics and the degree of parallelism. This reduces performance by five to ten times, and prolongs the query response time from seconds to minutes.

- For complex serial queries, each query requires five to ten associated operations. Set **work\_mem** using the following formula: **work\_mem** = 50% of the memory/10.

- For simple serial queries, each query requires two to five associated operations. Set **work\_mem** using the following formula: **work\_mem** = 50% of the memory/5.
- For concurrent queries, set **work\_mem** using the following formula: **work\_mem** = **work\_mem** for serial queries/Number of concurrent SQL statements.
- BitmapScan hash tables are also restricted by **work\_mem**, but will not be forcibly flushed to disks. In the case of complete lossify, every 1-MB memory occupied by the hash table corresponds to a 16 GB page of BitmapHeapScan. After the upper limit of **work\_mem** is reached, the memory increases linearly with the data access traffic based on this ratio.

## query\_mem

**Parameter description:** Specifies the memory used by a query.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** 0 or an integer greater than 32 MB. The default unit is KB.

**Default value:** 0

---

### NOTICE

- If the value of **query\_mem** is greater than 0, the optimizer adjusts the memory cost estimate to this value when generating an execution plan.
  - If the value is set to a negative value or a positive integer less than 32 MB, the default value 0 is used. In this case, the optimizer does not adjust the estimated query memory.
- 

## query\_max\_mem

**Parameter description:** Specifies the maximum memory that can be used by a query.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** 0 or an integer greater than 32 MB. The default unit is KB.

**Default value:** 0

---

### NOTICE

- If the value of **query\_max\_mem** is greater than 0, an error is reported when the query memory usage exceeds the value.
  - If the value is set to a negative value or a positive integer less than 32 MB, the default value 0 is used. In this case, the optimizer does not limit the query memory.
-

## **maintenance\_work\_mem**

**Parameter description:** Specifies the maximum amount of memory to be used by maintenance operations, such as **VACUUM** and **CREATE INDEX**. This parameter may affect the execution efficiency of **VACUUM**, **VACUUM FULL**, **CLUSTER**, and **CREATE INDEX**.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1024 to 2147483647. The unit is KB.

**Default value:**

- Independent deployment:  
CN: **1GB** (60-core CPU/480 GB memory); **512MB** (32-core CPU/256 GB memory); **256MB** (16-core CPU/128 GB memory); **128MB** (8-core CPU/64 GB memory); **64MB** (4-core CPU/32 GB memory); **32MB** (4-core CPU/16 GB memory)  
DN: **2GB** (60-core CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory); **128MB** (4-core CPU/32 GB memory); **64MB** (4-core CPU/16 GB memory)
- Finance edition (standard):  
CN: **1GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, and 80-core CPU/640 GB memory); **512MB** (72-core CPU/576 GB memory and 64-core CPU/512 GB memory); **256MB** (60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, and 8-core CPU/64 GB memory)  
DN: **2GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory)
- Enterprise edition:  
CN: **1GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, and 80-core CPU/512 GB memory); **512MB** (72-core CPU/576 GB memory and 64-core CPU/512 GB memory); **256MB** (60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, and 8-core CPU/64 GB memory)  
DN: **2GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 80-core CPU/512 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory)
- Finance edition (data computing):  
CN: **1GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 96-core CPU/768 GB memory); **256MB** (72-core CPU/576 GB memory, 64-core CPU/512 GB memory); **128MB** (32-core CPU/256 GB memory)

DN: **2GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 96-core CPU/768 GB memory); **1GB** (72-core CPU/576 GB memory, 64-core CPU/512 GB memory); **512MB** (32-core CPU/256 GB memory)

**Setting suggestion:**

- The value of this parameter must be greater than that of [work\\_mem](#) so that database dumps can be more quickly cleared or restored. In a database session, only one maintenance operation can be performed at a time. Maintenance is usually performed when there are not many running sessions.
- When the [Autovacuum](#) process is running, up to [autovacuum\\_max\\_workers](#) times this memory may be allocated. In this case, set [maintenance\\_work\\_mem](#) to a value greater than or equal to that of [work\\_mem](#).
- If a large amount of data is to be clustered, increase the value of this parameter in the session.

## max\_stack\_depth

**Parameter description:** Specifies the maximum safe depth of the GaussDB execution stack. The safety margin is required because the stack depth is not checked in every routine in the server, but only in key potentially-recursive routines, such as expression evaluation.

**Parameter type:** integer.

**Unit:** KB

**Value range:** 100 to 2147483647

**Default value:**

- If the value of [ulimit -s](#) minus 640 KB is greater than or equal to 2 MB, the default value of this parameter is **2 MB**.
- If the value of [ulimit -s](#) minus 640 KB is less than 2 MB, the default value of this parameter is the value of [ulimit -s](#) minus 640 KB.

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:**

- The database needs to reserve 640 KB stack depth. Therefore, the maximum value of this parameter is the actual stack size limit enforced by the OS kernel (as set by [ulimit -s](#)) minus 640 KB.
- If the value of this parameter is greater than the value of [ulimit -s](#) minus 640 KB before the database is started, the database fails to be started. During database running, if the value of this parameter is greater than the value of [ulimit -s](#) minus 640 KB, this parameter does not take effect.
- If the value of [ulimit -s](#) minus 640 KB is less than the minimum value of this parameter, the database fails to be started.
- Setting this parameter to a value greater than the actual kernel limit means that a running recursive function may crash an individual backend process.
- Since not all OSs provide this function, you are advised to set a specific value for this parameter.

- The default value is **2 MB**, which is relatively small and does not easily cause system breakdown.

## bulk\_read\_ring\_size

**Parameter description:** Specifies the ring buffer size used for parallel data export.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 256 to 2147483647. The unit is KB.

**Default value:** 16MB

## enable\_early\_free

**Parameter description:** Specifies whether the operator memory can be released in advance.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the operator memory can be released in advance.
- **off** indicates that the operator memory cannot be released in advance.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## memory\_trace\_level

**Parameter description:** Specifies the control level for recording memory allocation information after the dynamic memory usage exceeds 90% of the maximum dynamic memory. This parameter takes effect only when the GUC parameters **use\_workload\_manager** and **enable\_memory\_limit** are enabled. This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated values

- **none:** indicates that memory application information is not recorded.
- **level1:** After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following memory information is recorded and saved in the *\$GAUSSLOG/mem\_log* directory:
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
- **level2:** After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following memory information is recorded and saved in the *\$GAUSSLOG/mem\_log* directory:

- Global memory overview.
- Memory usage of the top 20 memory contexts of the instance, session, and thread types.
- The **totalsize** and **freesize** columns for each memory context.
- Detailed information about all memory applications in each memory context, including the file where the allocated memory is located, line number, and size.

**Default value:** level1

---

#### NOTICE

- If this parameter is set to **level2**, the memory allocation details (file, line, and size) of each memory context are recorded, which greatly affects the performance. Therefore, exercise caution when setting this parameter.
  - You can use the system function `gs_get_history_memory_detail(cstring)` to query the recorded memory snapshot information. For details about the function, see "SQL Reference > Functions and Operators > Statistics Functions" in *Developer Guide*.
  - If the **use\_workload\_manager** parameter is disabled and the **bypass\_workload\_manager** parameter is enabled, this parameter also takes effect. The **bypass\_workload\_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
  - The recorded memory context is obtained after all memory contexts of the same type with the same name are summarized.
- 

## resilience\_memory\_reject\_percent

**Parameter description:** Specifies the dynamic memory usage percentage for escape from memory overload. This parameter takes effect only when the GUC parameters **use\_workload\_manager** and **enable\_memory\_limit** are enabled. This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

This parameter consists of **recover\_memory\_percent** and **overload\_memory\_percent**.

- **recover\_memory\_percent:** Percentage of the dynamic memory usage when the memory recovers from overload to the maximum dynamic memory. When the dynamic memory usage is less than the maximum dynamic memory multiplied by the value of this parameter, the overload escape function is disabled and new connections are allowed. The value ranges from 0 to 100. The value indicates a percentage.
- **overload\_memory\_percent:** Percentage of the dynamic memory usage to the maximum dynamic memory when the memory is overloaded. When the dynamic memory usage is greater than the maximum dynamic memory multiplied by the value of this parameter, the current memory is overloaded. In this case, the overload escape function is triggered to kill sessions and new

connections are prohibited. The value ranges from 0 to 100. The value indicates a percentage.

**Default value:** '0,0', indicating that the escape from memory overload function is disabled.

**Example:**

```
resilience_memory_reject_percent = '70,90'
```

When the memory usage exceeds 90% of the upper limit, new connections are forbidden and stacked sessions are killed. When the memory usage is less than 70% of the upper limit, session killing is stopped and new connections are allowed.

---

**NOTICE**

- You can query the maximum dynamic memory and used dynamic memory in the `pv_total_memory_detail` view. **max\_dynamic\_memory** indicates the maximum dynamic memory, and **dynamic\_used\_memory** indicates the used dynamic memory.
- If this parameter is set to a small value, the escape from memory overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual memory usage.
- If the **use\_workload\_manager** parameter is disabled and the **bypass\_workload\_manager** parameter is enabled, this parameter also takes effect. The **bypass\_workload\_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The values of **recover\_memory\_percent** and **overload\_memory\_percent** can be 0 at the same time. In addition, the value of **recover\_memory\_percent** must be smaller than that of **overload\_memory\_percent**. Otherwise, the setting does not take effect.

---

## resilience\_escape\_user\_permissions

**Parameter description:** Specifies the escape permission of users. You can set it for multiple users and separate users by commas (,). The value **sysadmin** indicates that jobs of the sysadmin user can be canceled by the escape function. The value **monadmin** indicates that jobs of the monadmin user can be canceled by the escape function. By default, this parameter is left blank, indicating that the escape function of the sysadmin and monadmin users is disabled. The value can only be **sysadmin**, **monadmin**, or an empty string. This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

Currently, this parameter supports only three values: **sysadmin**, **monadmin**, and "". The meanings of these values are as follows:

- **sysadmin:** Jobs of the sysadmin user can be canceled by the escape function.

- **monadmin**: Jobs of the monadmin user can be canceled by the escape function.
- **"**: The escape function of the sysadmin and monadmin users is disabled.

**Default value:** "", indicating that the escape function of the sysadmin and monadmin users is disabled.

**Example:**

```
resilience_escape_user_permissions = 'sysadmin,monadmin'
```

The escape function is enabled for both the sysadmin and monadmin users.

---

**NOTICE**

- You can set this parameter to multiple values separated by commas (,), for example, **resilience\_escape\_user\_permissions = 'sysadmin,monadmin'**. You can also set this parameter to only one value, for example, **resilience\_escape\_user\_permissions = 'monadmin'**.
- If this parameter is set for multiple times, the latest setting takes effect.
- If this parameter is set to any value in the value range, common users support the escape function.
- If a user has both the sysadmin and monadmin role permissions, the escape function of the user can be triggered only when **resilience\_escape\_user\_permissions** is set to **'sysadmin,monadmin'**.

### 14.3.4.2 Disk Space

This section describes the disk space parameters, which are used to set limits on the disk space for storing temporary files.

#### sql\_use\_spacelimit

**Parameter description:** Specifies the space size for files to be flushed to disks when a single SQL statement is executed on a single DN. The managed space includes the space occupied by ordinary tables, temporary tables, and intermediate result sets to be flushed to disks. This parameter does not take effect for initial users.

This parameter is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is KB. -1 indicates no limit.

**Default value:** -1

#### temp\_file\_limit

**Parameter description:** Specifies the limit on the size of a temporary file spilled to disk in a session. The temporary file can be a sort or hash temporary file, or the storage file for a held cursor. This is a session-level setting.

**Parameter type:** integer

**Unit:** KB

---

**NOTICE**

This parameter does not apply to disk space used for temporary tables during the SQL query process.

---

**Value range:** -1 to 2147483647. The value -1 indicates that there is no limit.

**Default value:** -1

**Setting method:** This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

### 14.3.4.3 Kernel Resource Usage

This section describes kernel resource parameters. Whether these parameters take effect depends on OS settings.

#### max\_files\_per\_process

**Parameter description:** Specifies the maximum number of simultaneously open files allowed by each server process. If the kernel is enforcing a proper limit, setting this parameter is not required.

However, on some platforms, such as most Berkeley Software Distribution (BSD) systems, the kernel allows individual processes to open many more files than the system can support. If the message "Too many open files" is displayed, set this parameter to a smaller value. Generally, the system must meet this requirement: Number of file descriptors  $\geq$  Maximum number of concurrent requests  $\times$  Number of primary DNS on the current server  $\times$  Value of **max\_files\_per\_process**  $\times$  3. This parameter is set based on the actual situation. If this parameter is set to a small value, valid secure file handles may be insufficient. As a result, the cluster is abnormal.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 25 to 2147483647

**Default value:** 1024

#### shared\_preload\_libraries

**Parameter description:** Specifies one or more shared libraries to be preloaded at server start. If multiple libraries are to be loaded, separate their names using commas (.). Only the sysadmin user can access this parameter. For example, **\$libdir/mylib** will cause **mylib.so** (or on some platforms, **mylib.sl**) to be preloaded before the loading of the standard library directory.

You can preinstall the GaussDB's stored procedure library using the '*\$libdir/plXXX*' syntax as described in the preceding text. *XXX* can only be **pgsql**, **perl**, **tcl**, or **python**.

By preloading a shared library and initializing it as required, the library startup time is avoided when the library is first used. However, the time to start each new server process may increase, even if that process never uses the library. Therefore, set this parameter only for libraries that will be used in most sessions.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- If a specified library is not found, the GaussDB service will fail to start.
  - Each GaussDB-supported library has a special mark that is checked to guarantee compatibility. Therefore, libraries that do not support GaussDB cannot be loaded in this way.
- 

**Value range:** a string

**Default value:** `security_plugin`

#### 14.3.4.4 Cost-based Vacuum Delay

This feature allows administrators to reduce the I/O impact of the VACUUM and ANALYZE statements on concurrent database activities. It is often more important to prevent maintenance statements, such as VACUUM and ANALYZE, from affecting other database operations than to run them quickly. Cost-based vacuum delay provides a way for administrators to achieve this purpose.

---

**NOTICE**

Certain VACUUM operations hold critical locks and should be complete as quickly as possible. In GaussDB, cost-based vacuum delays do not take effect during such operations. To avoid uselessly long delays in such cases, the actual delay is the larger of the two calculated values:

- $\text{vacuum\_cost\_delay} \times \text{accumulated\_balance} / \text{vacuum\_cost\_limit}$
  - $\text{vacuum\_cost\_delay} \times 4$
- 

### Context

During the execution of the ANALYZE | ANALYSE and VACUUM statements, the system maintains an internal counter that keeps tracking the estimated cost of various I/O operations that are performed. For details about ANALYZE | ANALYSE and VACUUM, see "SQL Reference > SQL Syntax" in *Developer Guide*. When the accumulated cost reaches a limit (specified by `vacuum_cost_limit`), the thread performing the operation will sleep for a short period of time (specified by `vacuum_cost_delay`). Then, the counter resets and the operation continues.

By default, this feature is disabled. To enable this feature, set `vacuum_cost_delay` to a positive value.

## vacuum\_cost\_delay

**Parameter description:** Specifies the length of time that the thread will sleep when `vacuum_cost_limit` has been exceeded.

**Parameter type:** integer.

**Unit:** ms

**Value range:** 0 to 100. The value **0** indicates that the cost-based vacuum delay is disabled, and a positive value indicates that the cost-based vacuum delay is enabled. In many systems, the effective resolution of the sleep time is 10 milliseconds. Therefore, setting `vacuum_cost_delay` to a value that is not an integer multiple of 10 has the same effect as setting it to the next higher multiple of 10.

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** This parameter is usually set to a small value, such as **10ms** or **20ms**. Adjusting vacuum's resource consumption is best done by changing other vacuum cost parameters.

## vacuum\_cost\_page\_hit

**Parameter description:** Specifies the estimated cost for vacuuming a buffer found in the shared buffer. It represents the cost to lock the buffer pool, look up the shared hash table, and scan the content of the page.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 1

## vacuum\_cost\_page\_miss

**Parameter description:** Specifies the estimated cost for vacuuming a buffer read from the disk. It represents the cost to lock the buffer pool, look up the shared hash table, read the desired block from the disk, and scan the block.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 10

## vacuum\_cost\_page\_dirty

**Parameter description:** Specifies the estimated cost charged when vacuum modifies a block that was previously clean. It represents the extra cost required to update the dirty block out to the disk again.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 10000

**Default value:** 20

## **vacuum\_cost\_limit**

**Parameter description:** Specifies the cost limit. The vacuum thread will hibernate if this limit is exceeded.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 10000

**Default value:** 1000

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. A larger value indicates a smaller I/O frequency limit of the VACUUM, a lower probability of falling into hibernation, more efficient VACUUM, and a greater impact on service I/Os.

### **14.3.4.5 Background Writer**

This section describes background writer parameters. The background writer thread is used to write dirty data (new or modified data) in shared buffers to disks. This mechanism ensures that database processes seldom or never need to wait for a write action to occur when handling user queries.

It also mitigates performance deterioration caused by checkpoints because the background writer continues to write dirty pages to disks and only several pages need to be written to disks at each checkpoint. This mechanism, however, increases the overall net I/O load because while a repeatedly-dirtied page may otherwise be written only once per checkpoint interval, the background writer may write it several times as it is dirtied in the same interval. In most cases, continuous light loads are preferred, instead of periodic load peaks. The parameters discussed in this section can be set based on actual requirements.

## **bgwriter\_delay**

**Parameter description:** Specifies the interval at which the background writer writes dirty shared buffers. Each time, the background writer initiates write operations for some dirty buffers. In full checkpoint mode, the **bgwriter\_lru\_maxpages** parameter is used to control the amount of data to be written each time, and the process is restarted after the period of hibernation specified by **bgwriter\_delay** (in ms). In incremental checkpoint mode, the number of target idle buffer pages is calculated based on the value of **candidate\_buf\_percent\_target**. If the number of idle buffer pages is insufficient, a batch of pages are flushed to disks at the interval specified by **bgwriter\_delay** (in ms). The number of flushed pages is calculated based on the target difference percentage. The maximum number of flushed pages is limited by **max\_io\_capacity**.

In many systems, the effective resolution of the sleep time is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to a value multiple of 10.

**Parameter type:** integer.

**Unit:** millisecond

**Value range:** 10 to 10000

**Default value:** 2s (that is, 2000 ms)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:**

Incremental checkpoint mode: If the data volume is multiple times the value of **shared\_buffers**, the value of **bgwriter\_delay** cannot be greater than 2s. If the data volume is smaller than the value of **shared\_buffers**, the value of **bgwriter\_delay** can be increased to save I/O resources.

Full checkpoint mode: Retain the default value. If the disk capability is poor, increase the value.

## candidate\_buf\_percent\_target

**Parameter description:** Specifies the expected percentage of available buffers in the candidate buffer chain to **shared\_buffer** when incremental checkpoints are enabled. If the actual percentage is less than the value of this parameter, the background writer thread starts to flush dirty pages that meet the conditions to disks.

**Parameter type:** double-precision floating point

**Unit:** none

**Value range:** 0.1 to 0.85

**Default value:** 0.3

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** This parameter directly affects the number of pages flushed by the background writer thread. If the data volume is greater than the value of **shared\_buffers** and the parameter is set to an excessively small value, the performance is affected. If the data volume is twice or more of the value of **shared\_buffers**, the value of this parameter cannot be smaller than the default value. In other scenarios, to reduce I/Os, set this parameter to a smaller value.

## bgwriter\_lru\_maxpages

**Parameter description:** Specifies the number of dirty buffers the background writer can write in each round.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000

### NOTE

When this parameter is set to **0**, the background writer is disabled. This setting does not affect checkpoints.

**Default value:** 100

## **bgwriter\_lru\_multiplier**

**Parameter description:** Specifies the coefficient used to estimate the number of dirty buffers the background writer can write in the next round.

The number of dirty buffers written in each round depends on the number of buffers used by server processes during recent rounds. The estimated number of buffers required in the next round is calculated using the following formula: Average number of recently used buffers x **bgwriter\_lru\_multiplier**. The background writer writes dirty buffers until sufficient, clean, and reusable buffers are available. The number of buffers the background writer writes in each round is always equal to or less than the value of **bgwriter\_lru\_maxpages**.

Therefore, the value **1.0** of **bgwriter\_lru\_multiplier** represents a just-in-time policy of writing exactly the number of dirty buffers predicted to be required. Larger values provide some cushion against spikes in demand, whereas smaller values intentionally leave more writes to be done by server processes.

Smaller values of **bgwriter\_lru\_maxpages** and **bgwriter\_lru\_multiplier** reduce the extra I/O load caused by the background writer, but make it more likely that server processes will have to issue writes for themselves, delaying response to queries.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0 to 10

**Default value:** 2

## **pagewriter\_thread\_num**

**Parameter description:** Specifies the number of threads for background page flushing after the incremental checkpoint is enabled. Dirty pages are flushed in sequence to disks, updating recovery points.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 16

**Default value:** 4

## **dirty\_page\_percent\_max**

**Parameter description:** Specifies the percentage of dirty pages to **shared\_buffers** after the incremental checkpoint is enabled. When the value of this parameter is reached, the background page flush thread flushes dirty pages based on the maximum value of **max\_io\_capacity**.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0.1 to 1

**Default value:** 0.9

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

## pagewriter\_sleep

**Parameter description:** Specifies the interval for the page writer thread to flush dirty pages to disks after the incremental checkpoint is enabled. When the ratio of dirty pages to **shared\_buffers** reaches **dirty\_page\_percent\_max**, the number of pages in each batch is calculated based on the value of **max\_io\_capacity**. In other cases, the number of pages in each batch decreases proportionally.

**Parameter type:** integer.

**Unit:** millisecond

**Value range:** 0 to 3600000

**Default value:** 2000ms (that is, 2s)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Set this parameter to the default value for CNs. Do not set this parameter to a value greater than 2s for DN. If dirty pages are generated quickly, you are advised to set this parameter to a value ranging from 100 ms to 500 ms. If this parameter is set to a large value, redo points are updated slowly, affecting Xlog recycling.

## max\_io\_capacity

**Parameter description:** Specifies the maximum I/O per second for the background writer to flush pages in batches.

**Parameter type:** integer.

**Unit:** kB

**Value range:** 30720 to 10485760

**Default value:** 512000kB (that is, 500 MB)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#). If the value of the parameter does not contain a unit, the default unit is kB. The unit can also be MB or GB.

**Parameter description:** Set this parameter based on the service scenario and the disk I/O capability. If the RTO is short or the data volume is many times larger than the shared memory and the service access data volume is random, the value of this parameter cannot be too small. A small value of **max\_io\_capacity** reduces the number of pages flushed by the background writer. If a large number of pages are eliminated due to service triggering, the services are affected.

## enable\_consider\_usecount

**Parameter description:** Specifies whether the backend thread considers the page popularity during page replacement. You are advised to enable this parameter in large-capacity scenarios.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on/true:** The page popularity is considered.
- **off/false:** The page popularity is not considered.

**Default value:** off

## dw\_file\_num

**Parameter description:** Specifies the number of doublewrite files to be written in batches. The value is related to **pagewriter\_thread\_num** and cannot be greater than that of **pagewriter\_thread\_num**. If the value is too large, it will be corrected to the value of **pagewriter\_thread\_num**.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 16

**Default value:** 1

## dw\_file\_size

**Parameter description:** Specifies the size of each doublewrite file.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, in the range [32,256]

**Default value:** 256

### 14.3.4.6 Asynchronous I/O

## checkpoint\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the checkpoint thread. If the number of pages exceeds the threshold, the checkpoint thread instructs the OS to asynchronously flush the pages cached in the OS to disks. In GaussDB, the disk page size is 8 KB.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. You can set the number of pages or the size in bytes, for example, **32** or **256KB**. After the checkpoint thread continuously writes 32 disk pages, that is,  $32 \times 8 = 256$  KB disk space, the asynchronous flush is performed.

**Default value:** 256KB (32 pages)

## bgwriter\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the background writer thread. If the number of pages exceeds the threshold,

the background writer thread instructs the OS to asynchronously flush the pages cached in the OS to disks. In GaussDB, the disk page size is 8 KB.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. You can set the number of pages or the size in bytes, for example, **64** or **512KB**. After the background writer thread continuously writes 64 disk pages, that is,  $64 \times 8 = 512$  KB disk space, the asynchronous flush is performed.

**Default value:** 512 KB (64 pages)

## backend\_flush\_after

**Parameter description:** Specifies the threshold for the number of pages flushed by the backend thread. If the number of pages exceeds the threshold, the backend thread instructs the OS to asynchronously flush the pages cached in the OS to disks. In GaussDB, the disk page size is 8 KB.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 256. **0** indicates that the asynchronous flush function is disabled. The size of a single page is 8 KB. You can set the number of pages or the size in bytes, for example, **64** or **512KB**. After the backend thread continuously writes 64 disk pages, that is,  $64 \times 8 = 512$  KB disk space, the asynchronous flush is performed.

**Default value:** 0

## enable\_adio\_function

**Parameter description:** Specifies whether to enable the ADIO mode. For details about the ADIO mode, see "High Performance > ADIO and Doublewrite Removal" in *Feature Description*.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the ADIO mode is enabled.
- **off** indicates that the ADIO mode is disabled.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. You can change the value of this parameter from **off** to **on** by referring to "Method 2" described in [Table 14-2](#). After the setting is complete, you can use the system function `gs_get_io_type()` to check whether the ADIO mode is enabled. For details, see "SQL Reference > Functions and Operators > System Management Functions > Other Functions" in *Developer Guide*. If you want to change the value of this parameter from **on** to **off**, restart the instance. For details, see "Method 1" in [Table 14-2](#).

**Setting suggestion:** If the **candidate\_slots** column in the `DBE_PERF.global_candidate_status` system view is less than 15% of the buffer page

for multiple times in a short period of time, you are advised to set this parameter to **on**.

## 14.3.5 Parallel Data Import

GaussDB provides a parallel data import function that enables a large amount of data to be imported in a fast and efficient manner. This section describes parameters for importing data to GaussDB in parallel.

### **raise\_errors\_if\_no\_files**

**Parameter description:** Specifies whether to distinguish between the problems "the number of imported file records is empty" and "the imported file does not exist." If this parameter is set to **TRUE** and the problem "the imported file does not exist" occurs, GaussDB will report the error message "file does not exist."

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **TRUE** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are distinguished when files are imported.
- **FALSE** indicates that the messages of "the number of imported file records is empty" and "the imported file does not exist" are not distinguished when files are imported.

**Default value:** FALSE

### **gds\_debug\_mod**

**Parameter description:** Specifies whether to enable the debug function of Gauss Data Service (GDS). This parameter is used to better locate and analyze GDS faults. After the debug function is enabled, types of packets received or sent by GDS, peer end of GDS during command interaction, and other interaction information about GDS are written into the logs of corresponding nodes in the cluster. In this way, the state switching on the GaussDB state machine and the current state are recorded. If this function is enabled, additional log I/O resources will be consumed, affecting log performance and validity. You are advised to enable this function only when locating GDS faults.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**

- **on** indicates that the GDS debug function is enabled.
- **off** indicates that the GDS debug function is disabled.

**Default value:** off

### **safe\_data\_path**

**Parameter description:** Specifies the path prefix restriction except for the initial user. Currently, the path prefix restriction applies to the COPY operation and advanced packages.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string of less than 4096 characters

**Default value:** NULL

---

 **CAUTION**

- If a soft link file exists in the **safe\_data\_path** directory, the system processes the file based on the actual file path to which the soft link points. If the actual path is not in the **safe\_data\_path** directory, an error is reported.
  - If a hard link file exists in the **safe\_data\_path** directory, it can be used properly. For security purposes, exercise caution when using hard link files. Do not create hard link files that point to other directories in the **safe\_data\_path** directory. Ensure that the permission on the **safe\_data\_path** directory is minimized.
- 

## enable\_copy\_server\_files

**Parameter description:** Specifies whether to enable the permission to copy server files.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the permission to copy server files is enabled.
- **off** indicates that the permission to copy server files is disabled.

**Default value:** off

---

**NOTICE**

When the **enable\_copy\_server\_files** parameter is disabled, only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement. When the **enable\_copy\_server\_files** parameter is enabled, users with the SYSADMIN permission or users who inherit the **gs\_role\_copy\_files** permission of the built-in role are allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** statement.

---

## support\_binary\_copy\_version

**Parameter description:** Specifies whether the encoding information of the current database server is included when data is exported in BINARY mode using COPY FROM.

**Parameter type:** string

**Unit:** none

**Value range:** " and **header\_encoding**.

**Default value:** **header\_encoding**

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If forward compatibility is required, leave this parameter empty.

**Table 14-8** Compatibility configuration items

Configuration Item	Behavior
header_encoding	When the binary mode of COPY FROM is used for export, the binary file header contains the encoding information of the current database server.
Empty	Forward compatibility configuration is performed and data is exported in the original binary format.

## copy\_special\_character\_version

**Parameter description:** Determines the processing of invalid characters during data import and export using COPY.

**Parameter type:** string

**Unit:** none

**Value range:** "", no\_error, and per\_byte.

**Default value:** ""

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

Use gsql to connect to the database. If you use the set method, the value is case-insensitive. If you use gs\_guc, the value can only be lowercase.

**Setting suggestion:** none

**Table 14-9** Compatibility configuration items

Configuration Item	Behavior
no_error	When COPY is used to import a data file with the same encoding as that on the server, fault tolerance is performed on the data that does not meet the encoding requirements in the data file. The data with the original codes is inserted into the table.

Configuration Item	Behavior
per_byte	Determines how to process files encoded in GBK or ZHS16GBK when COPY is used to export text files. After the parameter is set to <b>per_byte</b> , one byte of data is exported at a time. Otherwise, two bytes of data are exported at a time. (One character occupies two bytes if data is encoded in GBK.)
Empty	The default value, which does not affect any function. Forward compatibility is supported. That is, an error is reported when invalid characters are found during COPY.

**NOTICE**

- To ensure that the data to be imported is valid, its encoding must be validated when it is being copied. If this parameter is enabled, verification against invalid encoding will be masked, which causes invalid characters in the field. Therefore, exercise caution before enabling this parameter.
- Currently, encoding verification is masked only when the server encoding is the same as the data encoding. Client encoding is used by default if not specified.
- To record invalid code fields, you are advised to use the **log errors** or **log errors data** parameter in the COPY syntax.
- In binary mode, **copy\_special\_character\_version** is set to 'no\_error', and it takes effect only for fields of the TEXT, CHAR, VARCHAR, NVARCHAR2, or CLOB type.
- This parameter is valid only in the database with character sets encoded in UTF-8, GB18030, GB18030\_2022, ZHS16GBK, or LATIN1.
- When the encoding of both the client and server is GBK or ZHS16GBK and the database contains data encoded in an invalid format, if **copy\_special\_character\_version** is not set to **per\_byte**, the exported data file may contain unexpected data.
- If **copy\_special\_character\_version** is set to **no\_error**, this parameter cannot be used together with the **COMPATIBLE\_ILLEGAL\_CHARS** parameter in COPY.

## 14.3.6 Write Ahead Log

### 14.3.6.1 Settings

#### wal\_level

**Parameter description:** Specifies the level of information to be written to the WAL. The value cannot be empty or commented out.

#### NOTICE

- To enable WAL archiving and data streaming replication between the primary and standby nodes, set this parameter to **archive**, **hot\_standby**, or **logical**.
- If this parameter is set to **archive** or **minimal**, **hot\_standby** must be set to **off**. In a distributed system, **hot\_standby** cannot be set to **off**, because this setting can affect other features of the HA system. Therefore, you are advised not to set this parameter to **archive** or **minimal**. Otherwise, the database cannot be started.

**Value type:** enumerated type.

**Value range:**

- minimal  
Advantages: Certain bulk operations (including creating tables and indexes, executing cluster operations, and copying tables) are safely skipped in logging, which can make those operations much faster.  
Disadvantages: WALs contain only basic information required for recovery from a database server crash or an emergency shutdown. Data cannot be restored from archived WALs.
- archive  
Adds logging required for WAL archiving, supporting the database restoration from archives.
- hot\_standby
  - Further adds information required to run SQL queries on a standby node and takes effect after the database restarts.
  - To enable read-only queries on a standby node, the **wal\_level** parameter must be set to **hot\_standby** on the primary node and the same value must be set on the standby node. There are few measurable differences in performance between using **hot\_standby** and **archive** levels. However, feedback is welcome if any differences in their impacts on product performance are noticeable.
- logical  
Only when this parameter is set to **logical**, logical logs can be parsed and the primary key information is recorded in Xlogs.

**Default value:** hot\_standby

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Set this parameter to **logical** when the logical replication function is enabled. In other scenarios, set this parameter to **hot\_standby**.

## fsync

**Parameter description:** Specifies whether the GaussDB server uses the fsync() function (see [wal\\_sync\\_method](#)) to ensure that updates can be written to disks in a timely manner.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

**NOTICE**

- Using the `fsync()` function ensures that the data can be recovered to a known state when the OS or hardware crashes.
  - Setting this parameter to **off** may result in unrecoverable data corruption in a system crash.
- 

**Value range:** Boolean

- **on** indicates that the `fsync()` function is used.
- **off** indicates that the `fsync()` function is not used.

**Default value:** on

## synchronous\_commit

**Parameter description:** Specifies the synchronization mode of the current transaction.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

Generally, logs generated by a transaction are synchronized in the following sequence:

1. The primary node writes logs to the local memory.
2. The primary node writes the logs in the local memory to the local file system.
3. The primary node flushes the logs in the local file system to disks.
4. The primary node sends the logs to the standby node.
5. The standby node receives the logs and saves them to the local memory.
6. The standby node writes the logs in the local memory to the local file system.
7. The standby node flushes the logs in the local file system to disks.
8. The standby node replays the logs to complete the incremental update of data files.

**Value range:** enumerated values

- **on (true, yes, 1):** The primary node waits for the standby node to flush logs to disks before committing a transaction.
- **off (false, no, 0):** The primary node commits a transaction without waiting for the primary node to flush logs to disks. This mode is also called asynchronous commit.
- **local:** The primary node waits for the primary node to flush logs to disks before committing a transaction. This mode is also called local commit.
- **remote\_write:** The primary node waits for the standby node to write logs to the file system before committing a transaction. (The logs do not need to be flushed to disks.)
- **remote\_receive:** The primary node waits for the standby node to receive logs before committing a transaction. (The logs do not need to be written to the file system.)
- **remote\_apply:** The primary node waits for the standby node to complete log replay before committing a transaction.

- **true**: same as **on**.
- **false**: same as **off**.
- **yes**: same as **on**.
- **no**: same as **off**.
- **1**: same as **on**.
- **0**: same as **off**.
- **2**: same as **remote\_apply**.

**Default value:** on

---

#### NOTICE

This parameter is maintained by the CM. If it is manually modified, data may be lost. For details, see "Unified Cluster Management Tool > Features > Automatic Copy Addition and Reduction by Shard > Remarks" in *Tool Reference*.

---

## wal\_sync\_method

**Parameter description:** Specifies the method used for forcing WAL updates out to disks.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

#### NOTICE

If **fsync** is set to **off**, the setting of this parameter does not take effect because WAL updates will not be forcibly written to disks.

---

**Value range:** enumerated values.

- **open\_datasync** indicates that WAL files are opened with the **O\_DSYNC** option.
- **fdatasync** indicates that `fdatasync()` is called at each commit (SUSE 10 and SUSE 11 are supported).
- **fsync\_writethrough** indicates that `fsync()` is called at each commit to force data in the buffer to be written to disks.

#### NOTE

**wal\_sync\_method** can be set to **fsync\_writethrough** on a Windows platform, but this setting has the same effect as setting the parameter to **fsync** on the Windows platform.

- **fsync** indicates that `fsync()` is called at each commit (SUSE 10 and SUSE 11 are supported).
- **open\_sync** indicates that `open()` with the **O\_SYNC** option is used to write WAL files (SUSE 10 and SUSE 11 are supported).

#### NOTE

Not all platforms support the preceding parameters.

**Default value:** `fdatasync`

## full\_page\_writes

**Parameter description:** Specifies whether the GaussDB server writes the entire content of each disk page to WALs during the first modification of that page after a checkpoint.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

- This parameter is needed because a page write that is in process during an OS crash might be only partially completed, leading to an on-disk page that contains a mix of old and new data. The row-level change data normally stored in WALs will not be enough to completely restore such a page during post-crash recovery. Storing the full page image guarantees that the page can be correctly restored, but at the price of increasing the amount of data that must be written to WALs.
- Disabling this parameter might lead to unrecoverable data corruption after a system failure. It might be safe to set this parameter to **off** if you have hardware (such as a battery-backed disk controller) or file-system software (such as ReiserFS 4) that reduces the risk of partial page writes to an acceptably low level.

---

**Value range:** Boolean.

- **on** indicates that this feature is enabled.
- **off** indicates that this feature is disabled.

**Default value:** `on`

## wal\_log\_hints

**Parameter description:** Specifies whether to write an entire page to WALs during the first modification of that page after a checkpoint, even for non-critical modifications of so-called hint bits. You are advised not to modify the setting.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the entire page is written to WALs.
- **off** indicates that the entire page is not written to WALs.

**Default value:** `on`

## wal\_buffers

**Parameter description:** Specifies the size of shared memory for storing WALs, in multiples of `XLOG_BLCKSZ` or the actual size. `XLOG_BLCKSZ` indicates the size of an Xlog block, typically 8 KB.

**Parameter type:** integer.

**Unit:** 8 KB (**XLOG\_BLCKSZ**)

**Value range:** **-1**, or 4 to  $2^{18}$ . The minimum value is **-1** and the maximum value is **262144** (number of **XLOG\_BLCKSZ**).

- If this parameter is set to **-1**, the **wal\_buffers** size is dependent on the value of **shared\_buffers**. The default value of **wal\_buffers** is 1/32 of **shared\_buffers**. The minimum value is **XLOG\_BLCKSZ** multiplied by 8 and the maximum value is **XLOG\_BLCKSZ** multiplied by 2048. If the automatically adjusted value is less than the minimum value, the value is forcibly set to the minimum value. If the value is greater than the maximum value, the value is forcibly set to the maximum value.
- If this parameter is set to a value smaller than 4 (that is, **0**, **1**, **2**, or **3**), the value **4** is forcibly used.
- Independent deployment: **1GB** (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory); **128MB** (4-core CPU/32 GB memory); **64MB** (4-core CPU/16 GB memory)
- Finance edition (standard):  
CN: **512MB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, and 80-core CPU/640 GB memory); **256MB** (72-core CPU/576 GB memory, 64-core CPU/512 GB memory, and 60-core CPU/480 GB memory); **128MB** (32-core CPU/256 GB memory and 16-core CPU/128 GB memory); **64MB** (8-core CPU/64 GB memory)  
DN: **2GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, and 96-core CPU/768 GB memory); **1GB** (80-core CPU/640 GB memory, 72-core CPU/576 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, and 32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory)
- Enterprise edition:

- Finance edition (data computing):  
CN: **256MB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, and 96-core CPU/768 GB memory); **125MB** (72-core CPU/576 GB memory, 64-core CPU/512 GB memory); **64MB** (32-core CPU/256 GB memory)

DN: **1GB** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 72-core CPU/576 GB memory, and 64-core CPU/512 GB memory); **512MB** (32-core CPU/256 GB memory)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#). For example, if **wal\_buffers** is set to **2048**, the size of shared memory for storing WALs is **2048** multiplied by 8 KB; if **wal\_buffers** is set to **20480KB**, the size of shared memory for storing WALs is **20480KB**. If the value contains a unit, the value must be KB, MB, or GB and must be an integer multiple of 8 KB.

**Setting suggestion:** The content of the WAL buffer is written to disks at every transaction commit. Therefore, setting an extremely large value is unlikely to bring a significant increase in system performance. However, setting this parameter to a few megabytes can improve the disk write performance on a server where a large number of transactions are immediately committed. According to experience, the default value can meet the requirements of most cases. For different specifications, use the default values in the corresponding suggestions. You are advised to retain the default value. Do not set **wal\_buffers** to an excessively large or small value, and the following condition must be true:

**data\_replicate\_buffer\_size + segment\_buffers + shared\_buffers + wal\_buffers + temp\_buffers + maintenance\_work\_mem + work\_mem + query\_mem + (Standby node) wal\_receiver\_buffer\_size < max\_process\_memory < Memory size of the physical machine.** If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database fails to be started because no sufficient memory can be allocated.

## wal\_writer\_delay

**Parameter description:** Specifies the delay between activity rounds for the WAL writer.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

A longer delay might lead to insufficient WAL buffer and a shorter delay leads to continuously writing of the WALs, thereby increasing the load of disk I/O.

---

**Value range:** an integer ranging from 1 to 10000. The unit is millisecond.

**Default value:** 200ms

## commit\_delay

**Parameter description:** Specifies the duration for committed data to be stored in the WAL buffer.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

#### NOTICE

- When this parameter is set to a non-zero value, the committed transaction is stored in the WAL buffer instead of being written to the WAL immediately. Then the WAL writer flushes the buffer to disks periodically.
- If system load is high, other transactions are probably ready to be committed within the delay. If no other transactions are ready to be committed, the delay is a waste of time.

**Value range:** an integer ranging from 0 to 100000. The unit is  $\mu\text{s}$ . **0** indicates no delay.

**Default value:** 0

### commit\_siblings

**Parameter description:** Specifies a threshold on the number of concurrent open transactions. If the number of concurrent open transactions is greater than the value of this parameter, a transaction that initiates a commit request will wait for a period of time specified by [commit\\_delay](#). Otherwise, this transaction is written into WALs immediately.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000.

**Default value:** 5

### wal\_block\_size

**Parameter description:** Specifies the size of a WAL disk block.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer. The unit is byte.

**Default value:** 8192

### wal\_segment\_size

**Parameter description:** Specifies the size of a WAL segment file.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** An integer. The unit is 8 KB.

**Default value:** 16MB (2048 x 8 KB)

### force\_promote

**Parameter description:** Specifies whether to enable the forcible switchover function on the standby node.

When a cluster is faulty, the forcible switchover enables the cluster to recover services as soon as possible at the cost of losing some data. This is an escape method used when the cluster is unavailable. You are advised not to trigger this

method frequently. You are advised not to use this function if you are not clear about the impact of data loss on services.

To use this function, you need to enable it on the DN and CM Server and restart the cluster for the setting to take effect. For details about how to enable the forcible switchover function on the standby node, see "Emergency Handling > Performing a Forcible Primary/Standby Switchover" in *Troubleshooting*.

**Value range:** an integer. The value can be **0** (disabled) or **1** (enabled).

**Default value:** 0

## wal\_file\_init\_num

**Parameter description:** Specifies the number of Xlog segment files created at a time when the WAL writer thread is started.

**Parameter type:** integer.

**Unit:** none.

**Value range:** 0 to 1000000.

**Default value:** 10

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Setting suggestion:** Retain the default value.

## wal\_file\_preinit\_bounds

**Parameter description:** Specifies the maximum number of WAL segment files that can be pre-expanded by the WAL writer auxiliary thread per second during service running. The WAL segment file size is 16 MB. If this parameter is set to **0**, there is no restriction.

**Parameter type:** integer.

**Unit:** none

**Value range:** [0,1024]

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Setting suggestion:** Retain the default value. Set this parameter to a valid value based on the disk I/O capability. For details, see the value of **max\_io\_capacity**.

- If **max\_io\_capacity** is set to **500MB**, set this parameter to **25**.
- If **max\_io\_capacity** is set to **1GB**, set this parameter to **50**.

## wal\_debug

**Parameter description:** Specifies whether to output WAL-related debugging information. This parameter is available only when **WAL\_DEBUG** is enabled during compilation.

This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean.

**Default value:** false

## walwriter\_sleep\_threshold

**Parameter description:** Specifies the number of times that the idle Xlog is refreshed before the Xlog refresher enters sleep.

**Parameter type:** integer.

**Unit:** none.

**Value range:** 1 to 50000.

**Default value:** 500.

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## wal\_flush\_timeout

**Parameter description:** Specifies the timeout interval for traversing **WalInsertStatusEntryTbl**. It is the maximum wait time for the adaptive Xlog disk flushing I/O to traverse **WalInsertStatusEntryTbl**.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

---

### NOTICE

If the timeout interval is too long, the Xlog flushing frequency may decrease, reducing the Xlog processing performance.

---

**Value range:** an integer ranging from 0 to 90000000 ( $\mu$ s).

**Default value:** 2us

## wal\_flush\_delay

**Parameter description:** Specifies the wait interval when an entry in the **WAL\_NOT\_COPIED** state is encountered during **WalInsertStatusEntryTbl** traversal.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 90000000 ( $\mu$ s).

**Default value:** 1us

## xlog\_file\_path

**Parameter description:** Specifies the path of the Xlog shared disk in dual-cluster shared storage scenarios. This parameter is configured by the OM during database system initialization. You are advised not to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** NULL

## xlog\_file\_size

**Parameter description:** Specifies the size of the Xlog shared disk in dual-cluster shared storage scenarios. This parameter is configured by the OM during database system initialization. You are advised not to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a long integer ranging from 5053733504 to 576460752303423487. The unit is byte.

**Default value:** 549755813888

## xlog\_lock\_file\_path

**Parameter description:** Specifies the path of the lock file preempted by the Xlog shared disk in dual-cluster shared storage scenarios. This parameter is configured by the OM during database system initialization. You are advised not to modify the configuration.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** NULL

## max\_size\_for\_shared\_storage\_xlog\_write

**Parameter description:** Specifies the maximum amount of data that can be written to a shared disk at a time.

**Parameter type:** integer.

**Unit:** KB

**Value range:** 8–131072.

**Default value:** 1024

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none.

## 14.3.6.2 Checkpoints

### checkpoint\_segments

**Parameter description:** Specifies the minimum number of WAL segment files in the period specified by [checkpoint\\_timeout](#). The size of each log file is 16 MB.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483646

Increasing the value of this parameter speeds up the import of a large amount of data. Set this parameter based on [checkpoint\\_timeout](#) and [shared\\_buffers](#). This parameter affects the number of WAL segment files that can be reused. Generally, the maximum number of reused files in the `pg_xlog` folder is twice the number of [checkpoint\\_segments](#). The reused files are not deleted and are renamed to the WAL segment files which will be later used.

**Default value:** 1024

### checkpoint\_timeout

**Parameter description:** Specifies the maximum time between automatic WAL checkpoints.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 30 to 3600. The unit is s.

If the value of [checkpoint\\_segments](#) is increased, you need to increase the value of this parameter. The increase of these two parameters further requires the increase of [shared\\_buffers](#). Consider all these parameters during setting.

**Default value:** 15min

### checkpoint\_completion\_target

**Parameter description:** Specifies the target of checkpoint completion.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a double-precision floating-point number ranging from 0.0 to 1.0

**Default value:** 0.5

#### NOTE

0.5 indicates that each checkpoint should be complete within 50% of the interval between checkpoints.

### checkpoint\_warning

**Parameter description:** Specifies a time in seconds. If the checkpoint interval is close to this time due to filling of checkpoint segment files, a message is sent to the server log to suggest an increase in the [checkpoint\\_segments](#) value.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is s. **0** indicates that the warning is disabled.

**Default value:** 5min

**Recommended value:** 5min

## checkpoint\_wait\_timeout

**Parameter description:** Sets the longest time that the checkpoint waits for the checkpoint thread to start.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 2 to 3600. The unit is s.

**Default value:** 1min

## enable\_incremental\_checkpoint

**Parameter description:** Specifies whether to enable incremental checkpoint.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## enable\_double\_write

**Parameter description:** Specifies whether to enable the doublewrite buffer. When the incremental checkpoint is enabled, the doublewrite buffer instead of **full\_page\_writes** is used to prevent partial page writes.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

## incremental\_checkpoint\_timeout

**Parameter description:** Specifies the maximum interval between automatic WAL checkpoints when the incremental checkpoint is enabled.

**Parameter type:** integer.

**Unit:** second

**Value range:** 1 to 3600

**Default value:** 60

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

## enable\_xlog\_prune

**Parameter description:** Specifies whether the primary node recycles logs if the size of Xlogs exceeds the value of **max\_size\_for\_xlog\_prune** when any standby node is disconnected.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the primary node recycles logs when any standby node is disconnected.
- If this parameter is set to **off**, the primary node does not recycle logs when any standby node is disconnected.

**Default value:** on

## max\_size\_for\_xlog\_prune

**Parameter description:** Specifies the maximum number of Xlogs retained on the primary node when the standby node is faulty. This parameter takes effect when [enable\\_xlog\\_prune](#) is enabled. The mechanism is as follows:

1. If all standby nodes specified by the replconninfo series GUC parameters are connected to the primary node, this parameter does not take effect.
2. This parameter takes effect when one or more standby nodes specified by the replconninfo series GUC parameters are disconnected to the primary node. If the number of Xlogs on the host is greater than the value of this parameter, the Xlogs will be forcibly recycled. Exception: In synchronous commit mode (that is, the **synchronous\_commit** parameter is not set to **local** or **off**), if there are standby nodes connecting to the primary node, the primary node retains the logs after the minimum log receiving location in the majority of standby nodes. In this case, the number of retained logs may be greater than the value of **max\_size\_for\_xlog\_prune**.
3. If a standby node is being built, this parameter does not take effect. All logs on the primary node are retained to prevent failures caused by log recycling during the build operation.

**Parameter type:** integer.

**Unit:** KB

**Value range:** 0 to 2147483647

**Default value:** 256GB

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#). If the value of the parameter does not contain a unit, the default unit is KB. The unit can also be MB or GB.

**Setting suggestion:** If the disk space is small, you are advised to set this parameter to a small value. The maximum value is **256GB**.

## max\_redo\_log\_size

**Parameter description:** On standby DN, this specifies the maximum size of logs between the latest checkpoint and the current log replay location. On the primary

DN, this specifies the maximum size of logs between the recovery point and the latest log location. You are advised not to set this parameter to a large value if the RTO is concerned.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 163840 to 2147483647. The unit is KB.

**Default value:** 1048576. The unit is KB.

### 14.3.6.3 Log Replay

#### recovery\_time\_target

**Parameter description:** Specifies the time for a standby node to write and replay logs.

**Parameter type:** integer.

**Unit:** second

**Value range:** 0 to 3600

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that the standby node can write and replay logs within the period specified by the value, so that the standby node can quickly assume the primary role. If **recovery\_time\_target** is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 60

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

#### recovery\_max\_workers

**Parameter description:** Specifies the maximum number of concurrent replayer threads.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 20

**Default value:** 4

#### recovery\_parallelism

**Parameter description:** Specifies the actual number of replayer threads. This parameter is read-only.

This is a POSTMASTER parameter and is affected by **recovery\_max\_workers** and **recovery\_parse\_workers**. If any value is greater than 0, **recovery\_parallelism** will be recalculated.

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 1

## queue\_item\_size

**Parameter description:** Specifies the maximum length of the task queue of each redo replayer thread.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a value ranging from 1 to 65535.

**Default value:** 560

## recovery\_parse\_workers

**Parameter description:** Specifies the number of **ParseRedoRecord** threads for the ultimate RTO feature.

1. In addition, it must be used together with [recovery\\_redo\\_workers](#). If both [recovery\\_parse\\_workers](#) and [recovery\\_redo\\_workers](#) are greater than 1, ultimate RTO is enabled. If you do not want to enable ultimate RTO, retain the default value 1 of [recovery\\_parse\\_workers](#).
2. Ensure that the value of this parameter [replication\\_type](#) is set to 1 when ultimate RTO is enabled.
3. If both the ultimate RTO and parallel replay are enabled at the same time, the ultimate RTO feature takes effect but the parallel replay feature does not take effect.
4. Ultimate RTO does not support flow control. Flow control is determined by the parameter [recovery\\_time\\_target](#).

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 16

**Default value:** 1

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** For details about the values of [recovery\\_parse\\_workers](#) and [recovery\\_redo\\_workers](#) for different CPUs, memories, and deployment modes, see [Table 1 Parameter settings for different CPUs, memory sizes, and deployment modes](#).

### NOTE

After ultimate RTO is enabled, the total number of extra replayer threads started by the standby node =  $\text{recovery\_parse\_workers} \times (\text{recovery\_redo\_workers} + 2) + 5$ . More replayer threads occupy more CPU, memory, and I/O resources. Set parameters based on the actual hardware configuration. Otherwise, the system may fail to start due to insufficient resources. In hybrid deployment scenarios, host performance may be affected.

## recovery\_redo\_workers

**Parameter description:** Specifies the number of **PageRedoWorker** threads corresponding to each **ParseRedoRecord** thread when the ultimate RTO feature is

enabled. **recovery\_redo\_workers** must be used together with **recovery\_parse\_workers**. The value of **recovery\_redo\_workers** takes effect only when **recovery\_parse\_workers** is greater than 1.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 8

**Default value:** 1

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** For details about the values of **recovery\_parse\_workers** and **recovery\_redo\_workers** for different CPUs, memories, and deployment modes, see [Table 1 Parameter settings for different CPUs, memory sizes, and deployment modes](#).

**Table 14-10** Parameter settings for different CPUs, memory sizes, and deployment modes

No.	Number of CPUs	Memory (GB)	Hybrid Deployment or Not	recovery_parse_workers	recovery_redo_workers	Number of Replayer Threads	Remarks
1	4	-	-	1	1	-	Ultimate RTO is not recommended.
2	8	-	Yes	1	1	-	Ultimate RTO is not recommended.
3	8	64	No	1	1	-	Ultimate RTO is not recommended.
4	16	128	Yes	1	1	-	Ultimate RTO is not recommended.
5	16	128	No	2	3	15	-
6	32	256	Yes	2	2	13	-

N o.	Num ber of CPUs	Memo ry (GB)	Hybrid Deploy ment or Not	recovery_p arse_work ers	recovery_r edo_worke rs	Numb er of Repla yer Threa ds	Remarks
7	32	256	No	2	8	25	-
8	64	512	Yes	2	4	17	-
9	64	512	No	2	8	25	Set the parameter to the recommended value for larger hardware specifications.
10	96	768	-	2	8	25	Set the parameter to the recommended value for larger hardware specifications.

### enable\_page\_lsn\_check

**Parameter description:** Specifies whether to enable the data page LSN check. During replay, the current LSN of the data page is checked to see if it is the expected one.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

**Default value:** on

### recovery\_min\_apply\_delay

**Parameter description:** Specifies the replay delay of the standby node.

**Parameter type:** integer.

**Unit:** millisecond

**Value range:** 0 to *INT\_MAX*

**Default value:** 0 (no delay added)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** See the notes below.

---

**NOTICE**

- This parameter does not take effect on the primary node. It must be set on the standby node that requires a delay. You are advised to set this parameter on the asynchronous standby node. However, if the delay is set on the asynchronous standby node, the RTO will take a long time after the node is promoted to primary.
  - The delay time is calculated based on the transaction commit timestamp on the primary node and the current time on the standby node. Therefore, ensure that the clocks of the primary and standby nodes are synchronized.
  - If the delay time is too long, the disk where the Xlog file is located on the standby node may be full. Therefore, you need to set the delay time based on the disk size.
  - Operations without transactions are not delayed.
  - After the primary/standby switchover, if the original primary node needs to be delayed, you need to manually set this parameter.
  - When **synchronous\_commit** is set to **remote\_apply**, synchronous replication is affected by the delay. Each commit message is returned only after the replay on the standby node is complete.
  - Using this feature also delays **hot\_standby\_feedback**, which may cause the primary node to bloat, so be careful when using both.
  - After a DDL operation (such as DROP or TRUNCATE) that holds an AccessExclusive lock is performed on an object on the primary node, if the object is queried on the standby node during the delayed replay of the record on the standby node, it will be returned only after the lock is released.
- 

## dcf\_truncate\_dump\_info\_level

**Parameter description:** Specifies whether to print the LSN truncated by the DCF and the subsequent LSNs.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 2

- **0:** disabled.
- **1:** prints all LSNs truncated by the DCF (Xlogs whose LSN is greater than or equal to the truncated LSN).
- **2:** prints all LSNs truncated by the DCF and prints warning-level logs when the LSNs flushed to disks are greater than the truncated LSNs.

**Default value:** 0 (disabled)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## redo\_bind\_cpu\_attr

**Parameter description:** Specifies the core binding operation of the replayer thread. Only the sysadmin user can access this parameter. This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string of more than 0 characters. The value is case-insensitive.

- **'nobind'**: The thread is not bound to a core.
- **'nodebind: 1, 2'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads.
- **'cpubind: 0-30'**: Use the CPU cores 0 to 30 to bind threads.
- **'cpuorderbind: 16-32'**: One thread is bound to one CPU core starting from core 16. If the number of cores in the range is insufficient, the remaining threads are not bound. You are advised to set the interval to a value greater than or equal to the value of **recovery\_parallelism** plus 1.

**Default value:** 'nobind'

### NOTE

- This parameter is used for core binding in the Arm environment. You are advised to bind all replayer threads to the same NUMA group for better performance. In hybrid deployment scenarios, you are advised to bind the replayer threads of different nodes on the same host to different NUMA groups.
- The core binding range specified by this parameter must be different from the core binding range specified by the GUC parameter **thread\_pool\_attr** and the CPU core IDs specified by the GUC parameters **wal\_rec\_writer\_bind\_cpu**, **walwriteraux\_bind\_cpu**, and **wal\_receiver\_bind\_cpu**.

## 14.3.6.4 Archiving

### archive\_timeout

**Parameter description:** Specifies the archiving period.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

#### NOTICE

- The server is forced to switch to a new WAL segment file when the period specified by this parameter has elapsed since the last file switch.
- Archived files that are closed early due to a forced switch are still of the same length as full files. Therefore, a very short **archive\_timeout** will bloat the archive storage. You are advised to set **archive\_timeout** to **60s**.

---

**Value range:** an integer ranging from 0 to 1073741823. The unit is second. The value **0** indicates that the function is disabled.

**Default value:** 0

## archive\_interval

**Parameter description:** Specifies the archiving interval.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

- Log files are forcibly archived when the period specified by this parameter has elapsed.
  - Archiving involves I/O operations. Therefore, frequent archiving is not allowed. In addition, the RPO cannot be set to a large value; otherwise, the PITR will be affected. You are advised to use the default value.
- 

**Value range:** an integer ranging from 1 to 1000. The unit is second.

**Default value:** 1

## 14.3.7 HA Replication

### 14.3.7.1 Sending Server

#### max\_wal\_senders

**Parameter description:** Specifies the maximum number of concurrent connections of the transaction log sender. The value must be smaller than that of [max\\_connections](#).

---

### NOTICE

[wal\\_level](#) must be set to **archive**, **hot\_standby**, or **logical** to allow the connection from standby nodes.

---

**Parameter type:** integer.

**Value range:** 0 to 1024. The recommended value range is 8 to 100.

**Default value:**

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestions:** 1. It can be set to **0** only when a single DN is used and there is no primary/standby instance. 2. When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to a value by referring to the following formula: Number of current standby nodes + Number of backup connections + Number of required logical replication connections. If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

## wal\_keep\_segments

**Parameter description:** Specifies the number of Xlog file segments. It specifies the minimum number of transaction log files stored in the **pg\_xlog** directory. The standby node obtains the logs from the primary node to perform streaming replication.

**Parameter type:** integer.

**Value range:** 2 to *INT\_MAX*

**Default value:** 128

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:**

- During WAL archiving or recovery from a checkpoint on the server, the system may retain more log files than the number specified by **wal\_keep\_segments**.
- If this parameter is set to an excessively small value, a transaction log may have been overwritten by a new transaction before requested by the standby node. As a result, the request fails and the connection between the primary and standby nodes is terminated.
- If the HA system uses asynchronous transmission, increase the value of **wal\_keep\_segments** when data greater than 4 GB is continuously imported in COPY mode. Take T6000 board as an example. If the data to be imported reaches 50 GB, you are advised to set this parameter to **1000**. You can dynamically restore the setting of this parameter after data import is complete and the log synchronization is normal.
- If the synchronous\_commit level is lower than LOCAL\_FLUSH, you are advised to set this parameter to **1000** when rebuilding the standby node to prevent rebuilding failures caused by primary node log recycling during the rebuilding.

## wal\_sender\_timeout

**Parameter description:** Specifies the maximum duration that the sender waits for the receiver to receive transaction logs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the data volume on the primary node is huge, the value of this parameter must be increased for rebuilding. For example, if the data volume on the primary node reaches 500 GB, you are advised to set this parameter to 600 seconds.
- This parameter cannot be set to a value larger than the value of **wal\_receiver\_timeout** or the timeout parameter for database rebuilding.

---

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 6s

## max\_replication\_slots

**Parameter description:** Specifies the number of log replication slots on the primary node.

**Parameter type:** integer.

**Value range:** 0 to 1024. The recommended value range is 8 to 100.

**Default value:** 20

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:**

When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to a value by referring to the following formula: Number of current physical streaming replication slots + Number of backup slots + Number of required logical replication slots. If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

Physical streaming replication slots provide an automatic method to ensure that Xlogs are not removed from a primary DN before they are received by all the standby DNs. That is, physical streaming replication slots are used to support cluster HA. The number of physical streaming replication slots required by the cluster is as follows: ratio of the number of standby and secondary DNs to the number of primary DNs in a ring of DNs. If the HA DN has 1 primary cluster and 3 standby clusters, the number of physical streaming replication slots required is 3.

Backup slot records replication information during backup execution. Full backup and incremental backup correspond to two independent backup slots.

Plan the number of logical replication slots as follows:

- A logical replication slot can carry changes of only one database for decoding. If multiple databases are involved, create multiple logical replication slots.
- If logical replication is needed by multiple target databases, create multiple logical replication slots in the source database. Each logical replication slot corresponds to one logical replication link.
- A maximum of 20 logical replication slots can be enabled for decoding on the same instance.

## max\_keep\_log\_seg

**Parameter description:** Stream control parameter. In logical replication, physical logs are parsed and converted into logical logs locally on the DN. When the number of physical log files that are not parsed is greater than the value of this parameter, stream control is triggered. The value 0 indicates that the stream control function is disabled.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## enable\_logicalrepl\_xlog\_prune

**Parameter description:** Specifies whether to enable the function of forcibly invalidating a logical replication slot. When the current GUC parameters **enable\_logicalrepl\_xlog\_prune** is set to **on**, **enable\_xlog\_prune** is set to **on**, and **max\_size\_for\_xlog\_retention** is set to a non-zero value, the number of reserved log segments caused by the backup slot or logical replication slot exceeds the value of **wal\_keep\_segments**, and other replication slots do not cause more reserved log segments, if the value of **max\_size\_for\_xlog\_retention** is greater than 0 and the number of retained log segments (the size of each log segment is 16 MB) caused by the current logical replication slot exceeds the value of **max\_size\_for\_xlog\_retention**, or if the value of **max\_size\_for\_xlog\_retention** is less than 0 and the disk usage reaches the value of  $-\text{max\_size\_for\_xlog\_retention}/100$ , the logical replication slot is forcibly invalidated and **restart\_lsn** is set to **7FFFFFFFF/FFFFFFFF**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **true** indicates that the function of forcibly invalidating a logical replication slot is enabled.
- **false** indicates that the function of forcibly invalidating a logical replication slot is disabled.

**Default value:** false

## enable\_wal\_shipping\_compression

**Parameter description:** Specifies whether to enable cross-cluster log compression in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- This parameter applies only to a pair of WAL senders and WAL receivers for cross-cluster transmission in streaming DR and is configured in the primary cluster.

---

**Value range:** Boolean

- **true** indicates that cross-cluster log compression is enabled in streaming DR mode.
- **false** indicates that cross-cluster log compression is disabled in streaming DR mode.

**Default value:** false

## repl\_auth\_mode

**Parameter description:** Specifies the validation mode for primary/standby replication and standby node rebuilding.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

- If UUID validation is enabled on the primary node and a non-null repl\_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl\_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- It does not support the authentication between the primary and standby nodes across clusters, including the primary/standby Dorado and DR clusters.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

---

**Value range:** enumerated values

- **off:** indicates that UUID validation is disabled.
- **default:** indicates that UUID validation is disabled.
- **uuid:** indicates that UUID validation is enabled.

**Default value:** default

## repl\_uuid

**Parameter description:** Specifies the UUID used for primary/standby UUID validation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

### NOTICE

- If UUID validation is enabled on the primary node and a non-null repl\_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl\_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- It does not support the authentication between the primary and standby nodes across clusters, including the primary/standby Dorado and DR clusters.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

**Value range:** a string. The value contains 0 to 63 characters, including letters and digits. The value is case-insensitive and is converted to lowercase letters for storage. An empty string indicates that UUID validation is disabled.

**Default value:** an empty string

## replconninfo1

**Parameter description:** Specifies the information about the first node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the first node is configured.

**Default value:** information about the first connection listened to by the DN.

### Example:

```
replconninfo1 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX  
remotehost= 127.0.0.1 remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo2

**Parameter description:** Specifies the information about the second node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the second node is configured.

**Default value:** information about the second connection listened to by the DN.

**Example:**

```
replconninfo2 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX  
remotehost= 127.0.0.1 remoteservice=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo3

**Parameter description:** Specifies the information about the third node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the third node is configured.

**Default value:** information about the third connection listened to by the DN.

**Example:**

```
replconninfo3 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX  
remotehost= 127.0.0.1 remoteservice=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo4

**Parameter description:** Specifies the information about the fourth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fourth node is configured.

**Default value:** information about the fourth connection listened to by the DN.

**Example:**

```
replconninfo4 = 'localhost= 127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX  
remotehost= 127.0.0.1 remoteservice=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo5

**Parameter description:** Specifies the information about the fifth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fifth node is configured.

**Default value:** information about the fifth connection listened to by the DN.

**Example:**

```
replconninfo5 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX  
remotehost=127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo6

**Parameter description:** Specifies the information about the sixth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the sixth node is configured.

**Default value:** information about the sixth connection listened to by the DN.

**Example:**

```
replconninfo6 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX  
remotehost=127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## replconninfo7

**Parameter description:** Specifies the information about the seventh node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the seventh node is configured.

**Default value:** information about the seventh connection listened to by the DN.

**Example:**

```
replconninfo7 = 'localhost=127.0.0.1 localport=XXXX localheartbeatport=XXXX localservice=XXXX  
remotehost=127.0.0.1 remoteservice=XXXX remoteheartbeatport=XXXX remoteservice=XXXX'
```

## cross\_cluster\_replconninfo1

**Parameter description:** Specifies the information about the first node to be listened on and authenticated by the current server across clusters.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the first node is configured.

**Default value:** an empty string

## cross\_cluster\_replconninfo2

**Parameter description:** Specifies the information about the second node to be listened on and authenticated by the current server across clusters.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the second node is configured.

**Default value:** an empty string

### **cross\_cluster\_replconninfo3**

**Parameter description:** Specifies the information about the third node to be listened on and authenticated by the current server across clusters.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the third node is configured.

**Default value:** an empty string

### **cross\_cluster\_replconninfo4**

**Parameter description:** Specifies the information about the fourth node to be listened on and authenticated by the current server across clusters.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fourth node is configured.

**Default value:** an empty string

### **cross\_cluster\_replconninfo5**

**Parameter description:** Specifies the information about the fifth node to be listened on and authenticated by the current server across clusters.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the fifth node is configured.

**Default value:** an empty string

### **cross\_cluster\_replconninfo6**

**Parameter description:** Specifies the information about the sixth node to be listened on and authenticated by the current server across clusters.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the sixth node is configured.

**Default value:** an empty string

### **cross\_cluster\_replconninfo7**

**Parameter description:** Specifies the information about the seventh node to be listened on and authenticated by the current server across clusters.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the seventh node is configured.

**Default value:** an empty string

## cross\_cluster\_replconninfo8

**Parameter description:** Specifies the information about the eighth node to be listened on and authenticated by the current server across clusters.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that no information about the eighth node is configured.

**Default value:** an empty string

## enable\_time\_report

**Parameter description:** Specifies whether to record the time consumed by each redo log.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the time when a redo record is generated is recorded.
- **off** indicates that no record is generated.

**Default value:** off

## thread\_top\_level

**Parameter description:** Increases the priority of the WALWRITERAUXILIARY || WALWRITER || STARTUP ||WALRECEIVER || WAL\_NORMAL\_SENDER || PGSTAT threads to the highest.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the priority of the preceding threads is increased to the highest.
- **off** indicates that the priority of the preceding threads is not increased.

**Default value:** off

## page\_work\_queue\_size

**Parameter description:** Specifies the length of the blocking queue of each redo worker.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a value ranging from 1 to 100000.

**Default value:** 4096

### 14.3.7.2 Primary Server

#### synchronous\_standby\_names

**Parameter description:** Specifies a comma-separated list of names of potential standby nodes that support synchronous replication.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

#### NOTICE

- The current synchronous standby node is on the top of the list. If the current synchronous standby node is disconnected, it will be replaced immediately with the next-highest-priority standby node. Name of the next-highest-priority standby node is added to the list.
- The standby node name can be specified by setting the environment variable *PGAPPNAME*.

---

**Value range:** a string. If this parameter is set to \*, the name of any standby node that provides synchronous replication is matched. The value can be configured in the following format:

- *ANY num\_sync (standby\_name [, ...])*
- *[FIRST] num\_sync (standby\_name [, ...])*
- *standby\_name [, ...]*

#### NOTE

- In the preceding command, *num\_sync* indicates the number of standby nodes that need to wait for responses from the transaction, *standby\_name* indicates the name of the standby node, and FIRST and ANY specify the policies for selecting standby nodes for synchronous replication from the listed servers.
- **ANY N (dn\_instanceld1, dn\_instanceld2,...)** indicates that any *N* host names in the brackets are selected as the name list of standby nodes for synchronous replication. For example, **ANY 1 (dn\_instanceld1, dn\_instanceld2)** indicates that either of **dn\_instanceld1** or **dn\_instanceld2** is used as the standby node for synchronous replication.
- **FIRST N (dn\_instanceld1, dn\_instanceld2, ...)** indicates that the first *N* primary node names in the brackets are selected as the standby node name list for synchronous replication based on the priority. For example, **FIRST 1 (dn\_instanceld1, dn\_instanceld2)** indicates that **dn\_instanceld1** is selected as the standby node for synchronous replication.
- The meanings of **dn\_instanceld1, dn\_instanceld2, ...** are the same as those of **FIRST 1 (dn\_instanceld1, dn\_instanceld2, ...)**.

---

**NOTICE**

This parameter is maintained by the CM. If it is manually modified, data may be lost. For details, see "Unified Cluster Management Tool > Features > Automatic Copy Addition and Reduction by Shard > Remarks" in *Tool Reference*.

---

If you use the `gs_guc` tool to set this parameter, perform the following operations:

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY
NODE 1(dn_instancel1, dn_instancel2)";
```

or

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY
1(AZ1, AZ2)";
```

**Default value:** \*

## most\_available\_sync

**Parameter description:** Specifies whether to block the primary node when the primary-standby synchronization fails.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the primary node is not blocked when the synchronization fails.
- **off** indicates that the primary node is blocked when the synchronization fails.

**Default value:** off

## enable\_stream\_replication

**Parameter description:** Specifies whether data and logs are synchronized between the primary and standby nodes.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

**NOTICE**

- This parameter is used for testing performance with standby DNs and without standby DNs. If this parameter is set to **off**, tests on abnormal scenarios, such as switchover and faults, cannot be performed to prevent inconsistency between the primary and standby nodes.
- This is a restricted parameter, and you are advised not to set it to **off** in normal service scenarios.

---

**Value range:** Boolean

- **on** indicates that data and log synchronization between the primary and standby nodes is enabled.
- **off** indicates that data and log synchronization between the primary and standby nodes is disabled.

**Default value:** on

## enable\_mix\_replication

**Parameter description:** Specifies how WAL files and data are replicated between the primary and standby nodes.

This is an INTERNAL parameter. Its default value is **off** and cannot be modified.

---

### NOTICE

This parameter cannot be modified in normal service scenarios. That is, the WAL file and data page mixed replication mode is disabled by default.

---

**Value range:** Boolean

- **on** indicates that the WAL file and data page mixed replication mode is enabled.
- **off** indicates that the WAL file and data page mixed replication mode is disabled.

**Default value:** off

## vacuum\_defer\_cleanup\_age

**Parameter description:** Specifies the number of transactions by which **VACUUM** will defer the cleanup of invalid row-store table records. That is, **VACUUM** and **VACUUM FULL** do not clean up deleted tuples immediately.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000. **0** means no delay.

**Default value:** 0

## data\_replicate\_buffer\_size

**Parameter description:** Specifies the amount of memory used by queues when the sender sends data pages to the receiver. The value of this parameter affects the buffer size used during the replication from the primary node to the standby node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 4096 to 1072693248. The unit is KB.

**Default value:** 128MB (that is, 131072 KB)

**Setting suggestion:** Retain the default value. Do not set **data\_replicate\_buffer\_size** to an excessively large or small value. The following condition must be met: **data\_replicate\_buffer\_size** + **segment\_buffers** + **shared\_buffers** + **wal\_buffers** + **temp\_buffers** + **maintenance\_work\_mem** + **work\_mem** + **query\_mem** + (Standby node) **wal\_receiver\_buffer\_size** < **max\_process\_memory** < Memory size of the physical machine. If the value of the memory parameter is too large and exceeds the upper limit of the physical

memory, the database cannot be started because the memory allocated to the database is insufficient.

## walsender\_max\_send\_size

**Parameter description:** Specifies the size of the log or data sending buffer on the primary node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 8 to 1048575. The unit is KB.

**Default value:** 8MB (that is, 8192 KB)

## enable\_data\_replicate

**Parameter description:** Specifies how data is synchronized between the primary and standby nodes when the data is imported to a row-store table.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the primary and standby nodes synchronize data using data pages when the data is imported to a row-store table. When **replication\_type** is set to **1**, this parameter cannot be set to **on**. If this parameter is set to **on** using the GUC tool, its value will be forcibly changed to **off**.
- **off** indicates that the primary and standby nodes synchronize data using Xlogs when the data is imported to a row-store table.

**Default value:** off

## ha\_module\_debug

**Parameter description:** Specifies the replication status log of a specific data block during data replication.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the status of each data block is recorded in logs during data replication.
- **off** indicates that the status of each data block is not recorded in logs during data replication.

**Default value:** off

## catchup2normal\_wait\_time

**Parameter description:** Specifies the maximum duration that the primary node is blocked during the data catchup on the standby node in the case of a single synchronous standby node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 10000. The unit is ms.

- The value **-1** indicates that the primary node is blocked until the data catchup on the standby node is complete.
- The value **0** indicates that the primary node is not blocked during the data catchup on the standby node.
- Other values indicate the maximum duration that the primary node is blocked during the data catchup on the standby node. For example, if this parameter is set to **5000**, the primary node is blocked until the data catchup on the standby node is complete in 5s.

**Default value:** -1

## sync\_config\_strategy

**Parameter description:** Specifies the policy for synchronizing configuration files between the primary node and standby node, and between the standby node and cascaded standby node.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated values

- **all\_node:** If this parameter is set to **all\_node** for the primary node, the primary node is allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **all\_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **all\_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.
- **only\_sync\_node:** If this parameter is set to **only\_sync\_node** for the primary node, the primary node is only allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **only\_sync\_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is not allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **only\_sync\_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.
- **none\_node:** If this parameter is set to **none\_node** for the primary node, the primary node is not allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **none\_node** for a standby node, the standby node is not allowed to send synchronization requests to its primary node, and the standby node is allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **none\_node** for a cascaded standby node, the current cascaded standby node is not allowed to send synchronization requests to its standby node.

**Default value:** all\_node

**Note:** If this parameter is configured after an upgrade from a version earlier than 503.0.0 to 503.0.0, this parameter cannot be identified after a rollback. Do not set this parameter during the upgrade to 503.0.0.

## hadr\_recovery\_time\_target

**Parameter description:** Specifies whether the standby database instance completes log writing and replay in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is second.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that a standby node can write and replay logs within the period specified by **hadr\_recovery\_time\_target**. This ensures that the logs can be written and replayed within the period specified by **hadr\_recovery\_time\_target** and the standby database instance can be promoted to primary quickly. If **hadr\_recovery\_time\_target** is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 60 (financial edition (data computing))

## hadr\_recovery\_point\_target

**Parameter description:** Specifies the RPO time allowed for the standby database instance to flush logs to disks in streaming DR mode.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is second.

0 indicates that log flow control is disabled. A value from 1 to 3600 indicates that the standby node can flush logs to disks within the period specified by **hadr\_recovery\_point\_target**. This ensures that the log difference between the primary and standby database instances is controlled within the period specified by **hadr\_recovery\_point\_target** during the switchover and the standby database instance can be promoted to primary. If **hadr\_recovery\_point\_target** is set to a small value, the performance of the primary node is affected. If it is set to a large value, the log flow is not effectively controlled.

**Default value:** 10 (financial edition (data computing))

## hadr\_super\_user\_record\_path

**Parameter description:** Specifies the path for storing encrypted files of the **hadr\_disaster** user in the standby cluster in streaming DR mode. This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Modification suggestion:** The value is automatically set by the streaming DR password transfer tool and does not need to be manually added.

**Value range:** a string

**Default value:** NULL

## check\_sync\_standby

**Parameter description:** Specifies whether to enable the standby node check function. After the **synchronous\_standby\_names** parameter is correctly

configured in the primary/standby scenario, if the synchronous standby node is faulty, the write service on the primary node reports a write failure. This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** on or off

- **on** indicates that the standby node check is enabled.
- **off** indicates that the standby node check is disabled.

**Default value:** off

 **NOTE**

- This parameter cannot be synchronized in job work and autonomous transactions. Otherwise, the check may not take effect.
- If the standby node check is not configured for a specified user or session and the standby node is faulty when the forcible synchronization commit mode is enabled, the write operation on a table causes the query on the same table by another user or in another session to hang. In this case, you need to recover the standby node or manually terminate the hung client.
- The standby node check function cannot be enabled in scenarios (such as VACUUM ANALYZE and gs\_clean) where non-write operations trigger log writing. If the standby node does not meet the requirements for synchronizing configurations to the standby node, services will be hung in this scenario. In this case, you need to manually terminate the services.

## enable\_wal\_sender\_crc\_check

**Parameter description:** Specifies whether to enable CRC for the WAL sender thread. CRC is performed before the primary node sends logs. If this parameter is enabled, the performance may deteriorate by less than 5%.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the check function is enabled.
- **off** indicates that the check function is disabled.

**Default value:** on

### 14.3.7.3 Standby Server

#### hot\_standby

**Parameter description:** Specifies whether the standby node is allowed to accept connections and queries after it is restored to the minrecovery point.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

## NOTICE

- If this parameter is set to **on**, **wal\_level** must be set to **hot\_standby** or higher. Otherwise, the database startup fails.
- In a distributed system, **hot\_standby** cannot be set to **off**, because this setting can affect other features of the HA system.
- If the **hot\_standby** parameter was disabled and the **wal\_level** parameter was set to a value smaller than that of **hot\_standby**, perform the following operations to ensure that the logs to be replayed on the standby node can be queried on the standby node before enabling the **hot\_standby** parameter again:
  1. Change the value of **wal\_level** of the primary and standby nodes to the value of **hot\_standby** or a higher value, and restart the instances for the change to take effect.
  2. Perform the checkpoint operation on the primary node and query the **pg\_stat\_get\_wal\_senders()** function to ensure that the value of **receiver\_replay\_location** of each standby node is the same as that of **sender\_flush\_location** of the primary node. Ensure that the value adjustment of **wal\_level** is synchronized to the standby nodes and takes effect, and the standby nodes do not need to replay low-level logs.
  3. Set the **hot\_standby** parameter of the primary and standby nodes to **on**, and restart the instances for the setting to take effect.
- If the read on standby function is enabled, conflicts between replay and query on the standby node may cause the query to cancel. The error information is as follows:
  - ERROR: canceling statement due to conflict with recovery
  - ERROR: terminating connection due to conflict with recovery
- During the standby node read in serial and parallel replay modes, when the primary node rebuilds indexes online, an error may be reported when the standby node is read. Try again later. Error information:
  - could not open relation with OID xxx during recovery delete object, please try again later
  - Catalog is missing xxx attribute(s) for relid xxx
  - cache lookup failed for index xxx, refilenode:xxx, name:"xxx"
  - could not find pg\_class entry for xxx
- During the standby node read in the case of ultimate RTO, the VM with small memory configuration may report an error indicating insufficient memory. You can enable the GUC parameter **exrto\_standby\_read\_opt** (enabled by default) to effectively reduce the memory and I/O overhead.
- The standby node does not support autonomous transactions.
- Use sysbench to test the read performance of the standby node in typical scenarios: The primary node executes 100 concurrent update services. The primary and standby nodes both execute 200 concurrent read services at the same time. When the I/O and CPU are not limited, the read performance of the standby node in serial replay mode is not lower than 80% of that of the primary node, and the read performance of the standby node in ultimate RTO deteriorates by no more than 10% compared with that of the standby node in serial replay mode.

**Value range:** Boolean

- **on:** allowed.
- **off:** not allowed.

**Default value:** on

## max\_standby\_archive\_delay

**Parameter description:** Specifies the wait period before queries on a standby node are canceled when the queries conflict with WAL processing and archiving in hot standby mode. In the current version, the setting does not take effect and is controlled by the **max\_standby\_streaming\_delay** parameter.

**Parameter type:** integer.

**Unit:** millisecond

**Value range:** -1 to 2147483647. The value -1 indicates that the standby node waits until the conflicting queries are complete.

**Default value:** 3s (that is, 3000 ms)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## max\_standby\_streaming\_delay

**Parameter description:** Specifies the wait period before queries on a standby node are canceled when the queries conflict with WAL data receiving through streaming replication in hot standby mode. If this parameter is set to a large value or the service load is heavy, an error may be reported for waiting for transaction replay and flushing to disks.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647. The unit is ms.

---

### NOTICE

-1 indicates that the standby node waits until the conflicting queries are complete. In the scenario where serial or parallel replay is enabled, if the system detects that the query thread and replayer thread are in the deadlock state, the system still cancels the query to prevent replay blocking.

---

**Default value:** 3s (that is, 3000 ms)

## wal\_receiver\_status\_interval

**Parameter description:** Specifies the maximum interval for notifying the primary node of the WAL receiver status.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to  $INT\_MAX/1000$ . The unit is s.

---

**NOTICE**

If this parameter is set to **0**, the standby node does not send information, such as the log receiving location, to the primary node. As a result, the transaction commit on the primary node may be blocked, and the switchover may fail. In normal service scenarios, you are advised not to set this parameter to **0**.

---

**Default value:** 5s

## hot\_standby\_feedback

**Parameter description:** Specifies whether the ID of the oldest transaction active on standby nodes will be sent to the primary node, preventing a query conflict.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the standby node is allowed to send the result of a query performed on it to the primary node.
- **off** indicates that the standby node is not allowed to send the result of a query performed on it to the primary node.

**Default value:** off

## wal\_receiver\_timeout

**Parameter description:** Specifies the maximum wait period for a standby node to receive data from the primary node.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 6000ms (that is, 6s)

## wal\_receiver\_connect\_timeout

**Parameter description:** Specifies the timeout interval for a standby node to connect to the primary node.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 2s

## wal\_receiver\_connect\_retries

**Parameter description:** Specifies the maximum attempts that a standby node connects to the primary node.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647.

**Default value:** 1

## wal\_receiver\_buffer\_size

**Parameter description:** Specifies the memory buffer size for the standby nodes to store the received Xlog files.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 4096 to 1047552. The unit is KB.

**Default value:** 64MB (that is, 65536 KB)

## primary\_slotname

**Parameter description:** Specifies the slot name of the primary node corresponding to a standby node. This parameter is used for the mechanisms to verify the primary-standby relationship and delete WALs.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

**Default value:** an empty string

## enable\_redo\_atomic\_operation

**Parameter description:** Specifies whether to use atomic operations or spinlocks to update the LSN of the current thread when parallel replay is enabled.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that atomic operations are used for update.
- **off** indicates that spinlocks are used for update.

**Default value:** on

## max\_standby\_base\_page\_size

**Parameter description:** Specifies the maximum storage space of base page files on the standby node after the ultimate RTO function is enabled.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a long integer ranging from 1048576 to 562949953421311. The unit is KB.

**Default value:** 268435456 (256 GB)

## max\_standby\_lsn\_info\_size

**Parameter description:** Specifies the maximum size of LSN info files on the standby node after the ultimate RTO function is enabled.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a long integer ranging from 1048576 to 562949953421311. The unit is KB.

**Default value:** 268435456 (256 GB)

## max\_keep\_csn\_info\_size

**Parameter description:** Specifies the maximum size of CSN info linked lists allowed by each DN on the standby node after the ultimate RTO function is enabled.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a long integer ranging from 16384 to 131072. The unit is KB.

**Default value:** 16384 (that is, 16 MB)

## base\_page\_saved\_interval

**Parameter description:** Specifies the interval for generating base pages on the standby node after the ultimate RTO function is enabled. For the same page, a base page is generated each time the value of this parameter is replayed.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 5 to 2000.

**Default value:** 400

## standby\_force\_recycle\_ratio

**Parameter description:** Specifies the percentage of files read by the standby node to trigger forcible recycling after the ultimate RTO function is enabled. When the total size of base page files exceeds the value of **max\_standby\_base\_page\_size** x **standby\_force\_recycle\_ratio** or the total size of LSN info files exceeds the value of **max\_standby\_lsn\_info\_size** x **standby\_force\_recycle\_ratio**, forcible recycling is triggered and some queries are canceled. When the value of **standby\_force\_recycle\_ratio** is 0, forcible recycling is not started, and the setting of **max\_standby\_base\_page\_size** and **max\_standby\_lsn\_info\_size** does not take effect.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a double-precision floating-point number ranging from 0.0 to 1.0.

**Default value:** 0.8

## standby\_recycle\_interval

**Parameter description:** Specifies the interval for the standby node to recycle read files after the ultimate RTO function is enabled. The thread for recycling read resources on the standby node attempts to clear read files on the standby node at the interval specified by this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 86400. The unit is s.

**Default value:** 10

## standby\_max\_query\_time

**Parameter description:** Specifies the maximum query time supported on the standby node after the ultimate RTO function is enabled. If the query time exceeds the value of this parameter, the query will be canceled. Note: The time when the query is canceled is affected by the interval parameter [standby\\_recycle\\_interval](#) of the recycling thread and the time when the snapshot is obtained. Therefore, the actual execution time of the query on the standby node must be greater than the value of this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 86400. The unit is s.

**Default value:** 600

## exrto\_standby\_read\_opt

**Parameter description:** Specifies whether to support read optimization of the standby node with ultimate RTO. This parameter is enabled by default. This parameter is not synchronized between the primary and standby nodes.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean. **on** indicates that the optimization is enabled, and **off** indicates that the optimization is disabled.

**Default value:** on

## walrcv\_writer\_crc\_check\_level

**Parameter description:** Specifies whether to enable Xlog verification on the standby node in the primary/standby clusters in the streaming DR scenario. By default, the parameter is enabled only in the standby cluster for DR.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 3

- **0:** The verification is disabled.
- **1:** The verification takes effect in the standby cluster for DR.
- **2:** The verification on the standby node in the primary cluster takes effect.
- **3:** The verification on all standby nodes in the primary cluster and nodes in the standby cluster for DR take effect.

**Default value:** 1

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

## 14.3.8 Query Planning

This section describes the method configuration, cost constants, planning algorithm, and some configuration parameters for the optimizer.

### NOTE

- Two parameters are involved in the optimizer:
  - *INT\_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
  - *DBL\_MAX* indicates the maximum value of the FLOAT data type.
- In addition to customer services, global query planning parameters also affect database O&M and monitoring services, such as WDR generation, scale-out, redistribution, and data import and export.

### 14.3.8.1 Optimizer Method Configuration

These configuration parameters provide a crude method of influencing the query plans chosen by the query optimizer. If the default plan chosen by the optimizer for a particular query is not optimal, a temporary solution is to use one of these configuration parameters to force the optimizer to choose a different plan. Better ways include adjusting the optimizer cost constants, manually running **ANALYZE**, increasing the value of the **default\_statistics\_target** parameter, and increasing the amount of the statistics collected in specific columns using **ALTER TABLE SET STATISTICS**.

#### **enable\_bitmapscan**

**Parameter description:** Specifies whether the optimizer uses bitmap-scan plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** After this function is disabled, the bitmap scan operator is disabled globally, which may cause performance deterioration in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

#### **force\_bitmapand**

**Parameter description:** Specifies whether the query optimizer forcibly uses BitmapAnd plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_hashagg

**Parameter description:** Specifies whether the optimizer uses hash aggregation plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_hashjoin

**Parameter description:** Specifies whether the optimizer uses hash join plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_indexscan

**Parameter description:** Specifies whether the optimizer uses index-scan plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_gsitablesan

**Parameter description:** Specifies whether the query optimizer uses the global secondary index table scan plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## enable\_indexonlyscan

**Parameter description:** Specifies whether the optimizer uses index-only-scan plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_gscan

**Parameter description:** Specifies whether the query optimizer uses global secondary-index-only scan plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_material

**Parameter description:** Specifies whether the query optimizer uses materialization. It is impossible to suppress materialization entirely, but setting this variable to **off** prevents the optimizer from inserting materialized nodes.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_mergejoin

**Parameter description:** Specifies whether the optimizer uses merge-join plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## enable\_nestloop

**Parameter description:** Specifies whether the query optimizer uses nested-loop join plan types to fully scan internal tables. It is impossible to suppress nested-loop joins entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## enable\_index\_nestloop

**Parameter description:** Specifies whether the optimizer uses the nested-loop join plan type to scan the parameterized indexes of inner tables.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_seqscan

**Parameter description:** Specifies whether the query optimizer uses sequential scan plan types. It is impossible to suppress sequential scans entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: used.
- **off**: not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

**Risks and impacts of improper settings:** none

## enable\_sort

**Parameter description:** Specifies whether the query optimizer uses sort methods. It is impossible to suppress explicit sorts entirely, but setting this variable to **off** encourages the optimizer to choose other methods if available.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: used.
- **off**: not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_tidscan

**Parameter description:** Specifies whether the optimizer uses Tuple ID (TID) scan plan types.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: used.
- **off**: not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_kill\_query

**Parameter description:** In CASCADE mode, when a user is deleted, all the objects belonging to the user are deleted. This parameter specifies whether the queries of the objects belonging to the user can be unlocked when the user is deleted.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the unlocking is allowed.
- **off** indicates that the unlocking is not allowed.

**Default value:** off

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_stream\_concurrent\_update

**Parameter description:** Specifies the optimizer's use of streams in concurrent update scenarios. This parameter is restricted by the [enable\\_stream\\_operator](#) parameter. If concurrent update conflicts occur, an error may be reported. This parameter can be used to control the conflict.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the optimizer can generate stream plans for the UPDATE statement.
- **off** indicates that the optimizer can generate only non-stream plans for the UPDATE statement.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_stream\_operator

**Parameter description:** Specifies whether the optimizer uses stream. When the [enable\\_stream\\_operator](#) parameter is disabled, a large number of logs indicating that the stream plans cannot be pushed down are recorded. If you do not need these logs, you are advised to disable [enable\\_unshipping\\_log](#) when disabling [enable\\_stream\\_operator](#).

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: used.
- **off**: not used.

**Default value:**

- Independent deployment: **off**

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## enable\_stream\_recursive

**Parameter description:** Specifies whether to push **WITH RECURSIVE** join queries to DNs for processing.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that WITH RECURSIVE join queries will be pushed down to DNs.
- **off** indicates that WITH RECURSIVE join queries will not be pushed down.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## max\_recursive\_times

**Parameter description:** Specifies the maximum number of **WITH RECURSIVE** iterations.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 2147483647

**Default value:** 200

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** This parameter is used to prevent an infinite loop of the with recursive statement by using nocycle in hierarchical queries to exit the loop. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

## enable\_broadcast

**Parameter description:** Specifies whether the query optimizer uses broadcast distribution method when it evaluates the cost of stream.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_change\_hjcost

**Parameter description:** Specifies whether the optimizer excludes inner table running costs when selecting the Hash Join cost path. If it is set to **on**, tables with a few records and high running costs are more possible to be selected.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** off

**Setting method:** This is a SUSER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## best\_agg\_plan

**Parameter description:** Specifies the type of hash aggregation plan generated by the optimizer. The optimizer can generate three plans for the aggregation operation in a stream:

- hashagg+gather(redistribute)+hashagg
- redistribute+hashagg(+gather)
- hashagg+redistribute+hashagg(+gather)

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 3.

- **0:** The optimizer generates the optimal plan based on the estimated costs of the three plans.
- **1:** The first plan is forcibly generated.
- **2:** The second plan is forcibly generated if the **group by** column can be redistributed. Otherwise, the first plan is generated.

- **3**: The third plan is forcibly generated if the **group by** column can be redistributed. Otherwise, the first plan is generated.

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## agg\_redistribute\_enhancement

**Parameter description:** When the aggregate operation is performed, which contains multiple **group by** columns and all of the columns are not in the distribution column, you need to select one **group by** column for redistribution. This parameter specifies the policy of selecting a redistribution column.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: The column that can be redistributed with the most distinct value evaluated is selected for redistribution.
- **off**: The first column that can be redistributed is selected for redistribution.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_absolute\_tablespace

**Parameter description:** Specifies whether the tablespace can use the absolute path.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: An absolute path can be used.
- **off**: No absolute path can be used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_valuepartition\_pruning

**Parameter description:** Specifies whether the DFS partitioned table is dynamically or statically optimized.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The DFS partitioned table is dynamically or statically optimized.
- **off:** The DFS partitioned table is not dynamically or statically optimized.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## expected\_computing\_nodegroup

**Parameter description:** Specifies a compute node group or the way to choose such a group. The node group mechanism is internal. You do not need to set it. During join or aggregation operations, a node group can be selected in four modes. In each mode, the specified candidate compute node groups are listed for the optimizer to select the most appropriate one for the current operator.

**Parameter type:** string.

**Unit:** none

**Value range:**

- **optimal:** The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the node group that combines all DNs in the node groups on which the current user has the COMPUTE permission.
- **query:** The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the node group that combines all DNs in the node groups where base tables involved in the query are located.
- *Node group name* (when [enable\\_nodegroup\\_debug](#) is set to **off**): The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the specified node group.
- *Node group name* (when [enable\\_nodegroup\\_debug](#) is set to **on**): A specific node group is used as the compute node group.

**Default value:** query

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_nodegroup\_debug

**Parameter description:** Specifies whether the optimizer assigns computing workloads to a specific node group when multiple node groups exist in an environment. The node group mechanism is internal. You do not need to set it.

This parameter takes effect only when [expected\\_computing\\_nodegroup](#) is set to a specific node group.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** Computing workloads are assigned to the node group specified by [expected\\_computing\\_nodegroup](#).
- **off:** No node group is specified for computing.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_default\_index\_deduplication

**Parameter description:** Specifies whether to deduplicate and compress tuples with duplicate key values for a B-tree index by default. The deduplication and compression functions do not take effect for primary key indexes and unique indexes. When there are a large number of indexes with duplicate key values, the deduplication and compression function can effectively reduce the space occupied by indexes. In scenarios where non-unique indexes are used and index key values are seldom repeated or unique, the deduplication and compression function slightly deteriorates the index insertion performance. If the WITH (**deduplication** set to **on/off**) syntax is used during index creation, the deduplication parameter is preferentially used to determine whether to use deduplication and compression for the index.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **off:** The deduplication and compression function is disabled for B-tree indexes.
- **on:** The deduplication and compression function is enabled for B-tree indexes.

**Default value:** off

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_expr\_fusion

**Parameter description:** Specifies whether to enable the SRF, expression flattening, centralized Seq Scan projection cancellation, transition status of shared aggregate functions, and step number optimization features.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The SRF, expression flattening, centralized Seq Scan projection cancellation, transition status of shared aggregate functions, and step number optimization features are enabled.
- **off:** disabled.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

 **NOTE**

The SRF supports only the scenario where **query\_dop** is set to 1.

## stream\_multiple

**Parameter description:** Specifies the weight used by the optimizer to calculate the final cost of stream operators. The base stream cost is multiplied by this weight to obtain the final cost.

---

**NOTICE**

This parameter is applicable only to Redistribute and Broadcast streams.

---

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0 to *DBL\_MAX*

**Default value:** 1

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## qrw\_inlist2join\_optmode

**Parameter description:** Specifies whether to enable inlist-to-join (inlist2join) query rewriting.

**Parameter type:** string.

**Unit:** none

**Value range:**

- **disable** indicates that the inlist2join query rewriting is disabled.
- **cost\_base** indicates that the cost-based inlist2join query rewriting is enabled.
- **rule\_base** indicates that the forcible rule-based inlist2join query rewriting is enabled.

- A positive integer (1 to 2147483647) indicates the threshold of inlist2join query rewriting. If the number of elements in the list is greater than the threshold, the rewriting is performed.

**Default value:** `cost_base`

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## skew\_option

**Parameter description:** Specifies whether an optimization policy is used.

**Value type:** enumerated type.

**Unit:** none

**Value range:** `off`, `normal`, and `lazy`

- `off` indicates that the policy is disabled.
- `normal` indicates that a radical policy is used. All possible skews are optimized.
- `lazy` indicates that a conservative policy is used. Uncertain skews are ignored.

**Default value:** `normal`

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_dngather

**Parameter description:** Specifies whether to calculate stream plans that meet the threshold on a single DN to reduce the number of planned stream nodes.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- `on`: enable.
- `off`: disabled.

**Default value:** `off`

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## dngather\_min\_rows

**Parameter description:** Specifies the maximum number of rows that control `dngather`. Values less than or equal to this parameter value can be calculated on a single DN. The prerequisite is that `enable_dngather` is enabled.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** -1 to *DBL\_MAX*

**Default value:** 500.0

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## cost\_weight\_index

**Parameter description:** Specifies the cost weight of index\_scan.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 1e-10 to 1e+10.

**Default value:** 1

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## default\_limit\_rows

**Parameter description:** Specifies the default estimated number of limit rows for generating genericplan. If this parameter is set to a non-negative value, the value is used as the estimated number of limit rows. If this parameter is set to a negative value, the value is converted to a percentage and used as default estimated value; for example, -5 indicates 5%.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** -100 to *DBL\_MAX*

**Default value:** -10

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enforce\_a\_behavior

**Parameter description:** Specifies the rule matching modes of regular expressions.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: The A matching rule is used.
- **off**: The POSIX matching rule is used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## check\_implicit\_conversions

**Parameter description:** Specifies whether to check candidate index paths generated for index columns that have implicit type conversion in a query. For details about the application scenarios of this parameter, see "SQL Optimization > Checking the Implicit Conversion Performance" in *Developer Guide*.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: A check will be performed for candidate index paths generated for index columns that have implicit type conversion in a query.
- **off**: No check will be performed.

**Default value:** off

---

### NOTICE

When this parameter is set to **on**, you need to set **enable\_fast\_query\_shipping** to **off** so that the mechanism for identifying implicit data type conversion of index columns can take effect.

---

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_opfusion\_reuse

**Parameter description:** Specifies whether to reuse the opfusion obj memory.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the opfusion obj memory is reused when conditions are met.
- **off**: This function is disabled.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_iud\_fusion

**Parameter description:** Specifies whether to optimize the IUD statements.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The input is optimized during type conversion.
- **off:** This function is disabled.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

### 14.3.8.2 Optimizer Cost Constants

This section describes the optimizer cost constants. The cost variables described here are measured on an arbitrary scale. Only their relative values matter, therefore scaling them all up or down by the same factor will result in no change in the optimizer's choices. By default, they use the cost of fetching sequential pages as the basic unit. That is, **seq\_page\_cost** is set to **1.0** and the other cost variables are set with reference to the parameter. However, you can use a different scale, such as actual execution time in milliseconds.

## seq\_page\_cost

**Parameter description:** Specifies the optimizer's estimated cost of a disk page fetch that is part of a series of sequential fetches.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0 to *DBL\_MAX*

**Default value:** 1

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## random\_page\_cost

**Parameter description:** Specifies the optimizer's estimated cost of an out-of-sequence disk page fetch.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0 to *DBL\_MAX*

**Default value:** 4

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

---

#### NOTICE

Although the server allows you to set **random\_page\_cost** to a value less than that of **seq\_page\_cost**, it is not physically sensitive to do so. However, setting them equal makes sense if the database is entirely cached in RAM, because in that case there is no penalty for fetching pages out of sequence. Also, in a heavily-cached database you should lower both values relative to the CPU parameters, since the cost of fetching a page already in RAM is much smaller than it would normally be.

---

#### NOTE

- This value can be overwritten for tables and indexes in a particular tablespace by setting the tablespace parameter of the same name.
- Reducing this value relative to **seq\_page\_cost** will cause the system to prefer index scans and raising it will make index scans relatively more expensive. You can increase or decrease both values together to change the disk I/O costs relative to CPU costs.

## cpu\_tuple\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each row during a query.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0 to *DBL\_MAX*

**Default value:** 0.01

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## cpu\_index\_tuple\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each index entry during an index scan.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0 to *DBL\_MAX*

**Default value:** 0.005

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## cpu\_operator\_cost

**Parameter description:** Specifies the optimizer's estimated cost of processing each operator or function executed during a query.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0 to *DBL\_MAX*

**Default value:** 0.0025

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## effective\_cache\_size

**Parameter description:** Specifies the optimizer's assumption about the effective size of the disk cache that is available to a single query.

Set this parameter based on the following factors: the GaussDB's shared buffer space, the kernel's disk buffer space, and the estimated number of concurrent queries on different tables that share the available space.

This parameter does not affect the size of the shared memory allocated during actual GaussDB running. It is used only for estimation in the plan generation phase. The value is in the unit of disk page. Usually the size of each page is 8192 bytes.

**Parameter type:** integer.

**Unit:** page (8 KB)

**Value range:**

- Method 1: Set this parameter to an integer without a unit. The integer ranges from 1 to 2147483647. For example, **200** indicates that there are 200 pages, that is, the size of 200 x 8 KB.
- Method 2: Set this parameter to a value with a unit. The value ranges from 1 x 8 KB to 2147483647 x 8 KB. For example, the value **200MB** indicates 200 MB. The unit can only be KB, MB, or GB.

**Default value:**

Independent deployment:

CN: **2GB** (60-core CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory and 16-core CPU/128 GB memory); **512MB** (8-core CPU/64 GB memory); **256MB** (4-core CPU/32 GB memory); **128MB** (4-core CPU/16 GB memory)

DN: **70GB** (60-core CPU/480 GB memory); **38GB** (32-core CPU/256 GB memory); **20GB** (16-core CPU/128 GB memory); **8GB** (8-core CPU/64 GB memory); **4GB** (4-core CPU/32 GB memory); **2GB** (4-core CPU/16 GB memory)

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** A larger value indicates that the optimizer prefers index scan, and a smaller value indicates that the optimizer prefers full table scanning. Generally, the value is half of the value of **shared\_buffers**. More radically, you can set the value to three-fourth of the value of **shared\_buffers**. If the memory is sufficient, a larger value indicates better performance.

## allocate\_mem\_cost

**Parameter description:** Specifies the query optimizer's estimated cost of creating a hash table for memory space using hash join. This parameter is used for optimization when the hash join estimation is inaccurate.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0 to *DBL\_MAX*

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

### 14.3.8.3 Genetic Query Optimizer

This section describes parameters related to genetic query optimizer. The genetic query optimizer (GEQO) is an algorithm that plans queries by using heuristic searching. This algorithm reduces planning time for complex queries and the costs of producing plans are sometimes inferior to those found by the normal exhaustive-search algorithm.

## geqo

**Parameter description:** Specifies whether to enable the genetic query optimization.

---

### NOTICE

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

---

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** used.
- **off:** not used.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** It is best not to turn it off in execution. **geqo\_threshold** provides more subtle control of GEQO.

## geqo\_threshold

**Parameter description:** Specifies the number of **FROM** items. Genetic query optimization is used to plan queries when the number of statements executed is greater than this value.

---

### NOTICE

- For simpler queries it is best to use the regular, exhaustive-search planner, but for queries with many tables it is better to use GEQO to manage the queries.
  - A **FULL OUTER JOIN** construct counts as only one **FROM** item.
- 

**Parameter type:** integer.

**Unit:** none

**Value range:** 2 to 2147483647.

**Default value:** 12

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## geqo\_effort

**Parameter description:** Controls the trade-off between planning time and query plan quality in GEQO.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 10

**Default value:** 5

---

**NOTICE**

- **geqo\_effort** does not perform operations directly. This parameter is only used to compute the default values for the other variables that influence GEQO behavior. If you prefer, you can manually set the other parameters instead.
- Larger values increase the time spent in query planning, but also increase the probability that an efficient query plan is chosen.

---

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## geqo\_pool\_size

**Parameter description:** Controls the pool size used by GEQO, that is, the number of individuals in the genetic population.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 2147483647

**Default value:** 0.

---

**NOTICE**

If this parameter is set to **0**, GaussDB selects a proper value based on **geqo\_effort** and the number of tables. In other cases, the value of the parameter is at least **2**, and the useful value typically ranges from 100 to 1000.

---

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## geqo\_generations

**Parameter description:** Specifies the number of iterations of the GEQO.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 2147483647

**Default value:** 0.

---

**NOTICE**

If it is set to **0**, a suitable value is chosen based on **geqo\_pool\_size**. In other cases, the value of this parameter is at least **1**, and useful values are typically from **100** to **1000**.

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## geqo\_selection\_bias

**Parameter description:** Specifies the selection bias used by GEQO. The selection bias is the selective pressure within the population.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 1.5–2.0

**Default value:** 2

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## geqo\_seed

**Parameter description:** Specifies the initial value of the random number generator used by GEQO to select random paths through the join order search space.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0.0 to 1.0

**Default value:** 0.

---

### NOTICE

Varying the value changes the set of join paths explored, and may result in a better or worse best path being found.

---

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## 14.3.8.4 Other Optimizer Options

### cost\_model\_version

**Parameter description:** Specifies the version of the optimizer cost model. It can be regarded as a protection parameter to disable the latest optimizer cost model and keep consistent with the plan of the earlier version. If the value of this parameter is changed, many SQL plans may be changed. Therefore, exercise caution when changing the value of this parameter.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0, 1, 2, 3, or 4

- **0** indicates that the latest cost estimation model is used. The current version is equivalent to **4**.
- **1** indicates that the original cost estimation model is used.
- **2:** indicates that the enhanced COALESCE expression, hash join cost, and semi/anti join cost are used for estimation on the basis of **1**.
- **3:** indicates that the boundary correction estimator is used to estimate the NDV on the basis of **2**. The hint of indexscan can be applied to indexonlyscan.
- **4:** indicates that partition-level statistics are used for cost estimation on the basis of **3**.

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** When upgrading the database, you are advised to set this parameter the same as that of the source version. When installing a new environment, you are advised to set this parameter to the default value.

## enable\_fast\_query\_shipping

**Parameter description:** Specifies whether to use the distributed framework for a query planner.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the distributed framework is not used. Execution plans are generated on CNs and DNs separately.
- **off** indicates that the distributed framework is used. Execution plans are generated on CNs and then sent to DN for execution.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_trigger\_shipping

**Parameter description:** Specifies whether the trigger can be pushed to DN for execution.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the trigger can be pushed to DNs for execution.
- **off** indicates that the trigger cannot be pushed to DNs. It must be executed on CNs.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## enable\_remotejoin

**Parameter description:** Specifies whether JOIN operation plans can be pushed to DNs for execution.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** JOIN operation plans can be pushed to DNs for execution.
- **off:** JOIN operation plans cannot be pushed to DNs for execution.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_remotegroup

**Parameter description:** Specifies whether the execution plans of GROUP BY and AGGREGATE can be pushed to DNs for execution.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The execution plans of GROUP BY and AGGREGATE can be pushed to DNs for execution.
- **off:** The execution plans of GROUP BY and AGGREGATE cannot be pushed to DNs for execution.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_remotelimit

**Parameter description:** Specifies whether the execution plan specified in the LIMIT clause can be pushed to DNs for execution.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The execution plan specified in the LIMIT clause can be pushed down to DNs for execution.
- **off:** The execution plan specified in the LIMIT clause cannot be pushed to DNs for execution.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_remoresort

**Parameter description:** Specifies whether the execution plan of the ORDER BY clause can be pushed to DNs for execution.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The execution plan of the ORDER BY clause can be pushed to DNs for execution.
- **off:** The execution plan of the ORDER BY clause cannot be pushed to DNs for execution.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## enable\_csqual\_pushdown

**Parameter description:** Specifies whether to push down filter criteria for a rough check during query.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** A rough check is performed with filter criteria pushed down during query.
- **off:** A rough check is performed without filter criteria pushed down during query.

**Default value:** on

**Setting method:** This is a SUSERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## explain\_dna\_file

**Parameter description:** Sets [explain\\_perf\\_mode](#) to **run** to export object files in CSV format.

**Parameter type:** string.

**Unit:** none

**Value range:** absolute path plus the file name in .csv format.

**Default value:** empty

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## analysis\_options

**Parameter description:** Specifies whether to enable function options in the corresponding options to use the corresponding location functions, including data verification and performance statistics. For details, see the options in the value range.

**Parameter type:** string.

**Unit:** none

**Value range:**

- **LLVM\_COMPILE:** The codegen compilation time of each thread is displayed on the explain performance page.
- **HASH\_CONFLICT:** The log file in the **gs\_log** directory of the DN process displays the hash table statistics, including the hash table size, hash chain length, and hash conflict information.
- **STREAM\_DATA\_CHECK:** A CRC check is performed on data before and after network data transmission.

**Default value:**

**ALL,on(),off(LLVM\_COMPILE,HASH\_CONFLICT,STREAM\_DATA\_CHECK)**, which indicates that no location function is enabled.

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## explain\_perf\_mode

**Parameter description:** Specifies the display format of the **explain** command.

**Parameter type:** enumerated type

**Unit:** none

**Value range:** **normal, pretty, summary, and run**

- **normal** indicates that the default printing format is used.
- **pretty** indicates a new format improved by using GaussDB. The new format contains a plan node ID, directly and effectively analyzing performance.
- **summary** indicates that the analysis result on this information is printed in addition to the printed information specified by **pretty**.
- **run** indicates that the system exports the printed information specified by **summary** as a CSV file for further analysis.

**Default value:** pretty

 **NOTE**

The pretty mode supports only plans that contain stream operators and does not support plans that deliver statements to DNs. Therefore, the display format is affected by the **enable\_stream\_operator** parameter. When **enable\_stream\_operator** is set to **off**, the plan containing the stream operator cannot be generated.

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## cost\_param

**Parameter description:** Specifies use of different estimation methods in specific customer scenarios, allowing estimated values approximating to onsite values. This parameter can control various methods simultaneously by performing AND (&) on the bit of each method. A method is selected if the result value is not 0.

- When **cost\_param & 1** is set to a value other than 0, an improved mechanism is used for connecting the selectivity of non-equi-joins. This method is more accurate for estimating the selectivity of joins between two identical tables. At present, if **cost\_param & 1** is set to a value other than 0, the path is not used. That is, a better formula is selected for calculation.
- When **cost\_param & 2** is set to a value other than 0, the selectivity is estimated based on multiple filter criteria. The lowest selectivity among all filter criteria, but not the product of the selectivities for two tables under a specific filter criterion, is used as the total selectivity. This method is more accurate when a close correlation exists between the columns to be filtered.
- When **cost\_param & 4** is not 0, the selected debugging model is not recommended when the stream node is evaluated.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## enable\_partitionwise

**Parameter description:** Specifies whether to select an intelligent algorithm for joining partitioned tables.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that an intelligent algorithm is selected.
- **off** indicates that an intelligent algorithm is not selected.

**Default value:** off

## enable\_fast\_numeric

**Parameter description:** Specifies whether to enable optimization for numeric data calculation. Calculation of numeric data is time-consuming. Numeric data is converted into int64- or int128-type data to improve numeric data calculation performance.

This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that optimization for numeric data calculation is enabled.
- **off** or **false** indicates that optimization for numeric data calculation is disabled.

**Default value:** on

## enable\_partition\_pseudo\_predicate

**Parameter description:** Specifies whether to rewrite pseudo-predicates to calculate the selectivity of query in a specified partition.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that pseudo-predicate rewriting is used.
- **off** indicates that pseudo-predicate rewriting is not used.

**Default value:** off

## rewrite\_rule

**Parameter description:** Specifies the optional query rewriting rules that are enabled. Some query rewriting rules are optional. Enabling them cannot always improve the query efficiency. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter can control the combination of query rewriting rules, for example, there are multiple rewriting rules: rule1, rule2, rule3, and rule4. You can perform the following settings:

```
set rewrite_rule=rule1;      -- Enable query rewriting rule rule1
set rewrite_rule=rule2, rule3; -- Enable query rewriting rules rule2 and rule3
set rewrite_rule=none;      -- Disable all optional query rewriting rules
```

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string

- **none:** No optional query rewriting rules are used.
- **lazyagg:** The Lazy Agg query rewriting rules are used to eliminate aggregation operations in subqueries.

- **magicset**: The Magic Set query rewriting rules are used to associate subqueries which have aggregation operators with the main query in advance to reduce repeated scanning of sublinks.
- **partialpush**: The Partial Push query rewriting rules are used. For statements that cannot be pushed down, push down some subqueries to DN for execution and the rest to CN for execution.
- **uniquecheck**: The Unique Check query rewriting rules are used to optimize the subquery statements in target columns without agg and check whether the number of returned rows is 1.
- **disablerep**: The Disable Replicate query rewriting rules are used. The performance may deteriorate after a replication table is optimized. Therefore, after this rule is enabled, subqueries cannot be optimized.
- **intargetlist**: The In Target List query rewriting rules are used to improve subqueries in the target column.
- **predpushnormal**: The Predicate Push query rewriting rules are used. When predicate conditions are pushed down to subqueries, the BROADCAST operator may be added to support distributed execution.
- **predpushforce**: The Predicate Push query rewriting rules are used to push down predicate conditions to subqueries and use indexes as much as possible for acceleration.
- **predpush**: The optimal plan is selected based on the cost in **predpushnormal** and **predpushforce**.
- **disable\_pullup\_expr\_sublink**: The optimizer is not allowed to pull up sublinks of the expr\_sublink type. For details about sublink classification and pull-up principles, see "SQL Optimization > Typical SQL Optimization Methods > Optimizing Subqueries" in *Developer Guide*.
- **enable\_sublink\_pullup\_enhanced**: Enhanced sublink query rewriting rules are used, including unrelated sublink pull-up of the WHERE and HAVING clauses and WinMagic rewriting optimization.
- **disable\_pullup\_not\_in\_sublink**: The optimizer is not allowed to pull up sublinks related to NOT IN. For details about sublink classification and pull-up principles, see "SQL Optimization > Typical SQL Optimization Methods > Optimizing Subqueries" in *Developer Guide*.
- **disable\_rownum\_pushdown**: The filter criterion ROWNUM in the parent query cannot be pushed down to the subquery.
- **disable\_windowagg\_pushdown**: The filter criterion of the window function in the parent query cannot be pushed down to the subquery.

**Default value:** magicset

## enable\_pbe\_optimization

**Parameter description:** Specifies whether the optimizer optimizes the query plan for statements executed in Parse Bind Execute (PBE) mode.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the optimizer optimizes the query plan for statements executed in PBE mode.
- **off** indicates that the optimization is not performed.

**Default value:** on

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## enable\_light\_proxy

**Parameter description:** Specifies whether the optimizer optimizes the execution of simple queries on CNs. This parameter does not take effect if the character set of the application side does not match that of the kernel side. You are advised to set the character set to UTF8 when creating a database.

This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean.

- **on** indicates that the optimizer optimizes the execution of simple queries on CNs.
- **off** indicates that the optimization is not performed.

**Default value:** on

## enable\_global\_plancache

**Parameter description:** Specifies whether to share the cache for the execution plans of statements in PBE queries and stored procedures. If this parameter is set to **on**, the memory usage of the CNs and DN in high concurrency scenarios can be reduced. In addition, the value of this parameter must be the same on the CN and DN. Otherwise, the packets sent from the CN to the DN do not match and an error is reported.

When **enable\_global\_plancache** is enabled, the default value of **local\_syscache\_threshold** is greater than or equal to 16 MB to ensure that GPC takes effect. If the value of **local\_syscache\_threshold** is less than 16 MB, set it to 16 MB. If the value is greater than 16 MB, the actual value is used.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that cache sharing is enabled for the execution plans of statements in PBE queries and stored procedures.
- **off** indicates no sharing.

**Default value:** off

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

## gpc\_clean\_timeout

**Parameter description:** When **enable\_global\_plancache** is set to **on**, if a plan in the shared plan list is not used within the period specified by **gpc\_clean\_timeout**, the plan will be deleted. This parameter is used to control the retention period of a shared plan that is not used.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 300 to 86400. The unit is s.

**Default value:** 1800, that is, 30 minutes

## enable\_gpc\_grayrelease\_mode

**Parameter description:** Specifies whether to enable GPC in a distributed cluster. The cluster needs to be restarted to enable GPC. If you want to enable GPC without restarting the cluster, use **enable\_gpc\_grayrelease\_mode**.

Operations in a distributed cluster:

- To enable GPC:
  - a. Enable **enable\_gpc\_grayrelease\_mode** on all DNs.
  - b. Enable **enable\_gpc\_grayrelease\_mode** on all CNs.
  - c. Enable the GPC parameter which is a POSTMASTER parameter. You need to reload the parameter and then kill the node in polling mode for GPC on the restarted node to take effect.
- To disable GPC:
  - a. Ensure that **enable\_gpc\_grayrelease\_mode** is set to **on**, reload and then disable the GPC parameter, and kill the node in polling mode for GPC on the restarted node to take effect.
  - b. Disable **enable\_gpc\_grayrelease\_mode** on all CNs.
  - c. Disable **enable\_gpc\_grayrelease\_mode** on all DNs.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- on
- off

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

## enable\_opfusion

**Parameter description:** Specifies whether to optimize simple queries.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

## NOTICE

This parameter is used to optimize the query performance of DNs. You can set **max\_datanode\_for\_plan** to view the execution plan of a query DN. If the execution plan of the DN contains **[Bypass]**, the query can be optimized on the DN.

The restrictions on simple queries are as follows:

- Only index scan and index-only scan are supported, and the filter criteria of all WHERE statements are on indexes.
- Only single tables can be added, deleted, modified, and queried. JOIN and USING operations are not supported.
- Only row-store tables are supported. Partitioned tables and tables with triggers are not supported.
- Information statistics features of active SQL statements and queries per second (QPS) are not supported.
- Tables that are being scaled out or in are not supported.
- System columns cannot be queried or modified.
- Only simple SELECT statements are supported. For example:  

```
SELECT c3 FROM t1 WHERE c1 = ? and c2 =10;
```

Only columns in the target table can be queried. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters. You can use **for update**.

- Only simple INSERT statements are supported. For example:  

```
INSERT INTO t1 VALUES (?,10,?);
```

Only one VALUES is supported. The type in VALUES can be a constant or a parameter. RETURNING is not supported.

- Only simple DELETE statements are supported. For example:  

```
DELETE FROM t1 WHERE c1 = ? and c2 = 10;
```

Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

- Only simple UPDATE statements are supported. For example:  

```
UPDATE t1 SET c3 = c3+? WHERE c1 = ? and c2 = 10;
```

The values modified in column **c3** can be constants, parameters, or a simple expression. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.

**Value range:** Boolean

- **on:** used.
- **off:** not used.

**Default value:** on

## sql\_beta\_feature

**Parameter description:** Specifies the SQL engine's optional beta features to be enabled, including optimization of row count estimation and query equivalence estimation. These optional features provide optimization for specific scenarios, but performance deterioration may occur in some scenarios for which testing is not

performed. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter determines the combination of the SQL engine's beta features, for example, feature1, feature2, feature3, and feature4. You can perform the following settings:

```
set sql_beta_feature=feature1;      --Enable the beta feature 1 of the SQL engine.
set sql_beta_feature=feature2,feature3;  --Enable the beta features 2 and 3 of the SQL engine.
set sql_beta_feature=none;            --Disable all optional SQL engine beta features.
```

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string

- **none:** uses none of the beta optimizer features.
- **sel\_semi\_poisson:** uses Poisson distribution to calibrate the equivalent semi-join and anti-join selectivity.
- **sel\_expr\_instr:** uses the matching row count estimation method to provide more accurate estimation for **instr(col, 'const') > 0, = 0, = 1**.
- **param\_path\_gen:** generates more possible parameterized paths.
- **rand\_cost\_opt:** optimizes the random read cost of tables that have a small amount of data.
- **param\_path\_opt:** uses the bloating ratio of the table to optimize the analysis information of indexes.
- **page\_est\_opt:** optimizes the **relpages** estimation for the analysis information of table indexes.
- **no\_unique\_index\_first:** disables optimization of the primary key index scan path first.
- **join\_sel\_with\_cast\_func:** supports type conversion functions when the number of join rows is estimated.
- **canonical\_pathkey:** The regular path key is generated in advance (**pathkey**: a set of ordered key values of data).

---

**⚠ WARNING**

After this parameter is enabled, the semantics of the output data of statements such as ORDER BY may be different from that of the standard ones in the case of outer join. Contact Huawei engineers to determine whether to enable this parameter.

- 
- **index\_cost\_with\_leaf\_pages\_only:** specifies whether index leaf nodes are included when the index cost is estimated.
  - **a\_style\_coerce:** enables the Decode type conversion rule to be compatible with O. For details, see the part related to case processing in ORA compatibility mode in "SQL Reference > Type Conversion > UNION, CASE, and Related Constructs" in *Developer Guide*.
  - **plpgsql\_stream\_fetchall:** enables the function of obtaining all tuple results when the SQL statements which use streams are executed on the for loop or cursor in a stored procedure.

- **predpush\_same\_level**: enables the **predpush** hint to control parameterized paths at the same layer.
- **disable\_bitmap\_cost\_with\_lossy\_pages**: disables the computation of the cost of lossy pages in the bitmap path cost.
- **enable\_upsert\_execute\_gplan**: allows execution through **gplan** in the PBE scenario, if the UPDATE clause in the ON DUPLICATE KEY UPDATE statement contains parameters.
- **disable\_text\_expr\_flatten**: disables the function of automatically inlining expressions during comparison between text and numeric types (numeric, bigint).

**Default value:**

`"sel_semi_poisson,sel_expr_instr,rand_cost_opt,param_path_opt,page_est_opt"`

## table\_skewness\_warning\_threshold

**Parameter description:** Specifies the threshold for triggering a table skew alarm.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0 to 1

**Default value:** 1

## table\_skewness\_warning\_rows

**Parameter description:** Specifies the minimum number of rows for triggering a table skew alarm.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 100000

## enable\_global\_stats

**Parameter description:** Specifies the current statistics collection mode, which can be global statistics collection or single-node statistics collection. By default, the global statistics collection mode is used. If this parameter is disabled, the statistics of the first node in the cluster are collected by default. In this case, the quality of the generated query plan may be affected. However, the information collection performance is optimal. Therefore, exercise caution when disabling this parameter.

This is a SUSERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates the global statistics mode.
- **off** or **false** indicates the single-DN statistics mode.

**Default value:** on

## default\_statistics\_target

**Parameter description:** Specifies the default statistics target for table columns without a column-specific target set by running **ALTER TABLE SET STATISTICS**. The number of rows sampled during statistics collection is affected.

If this parameter is set to a positive number, the number of rows sampled in the statistics histogram is **default\_statistics\_target** x 300. If the parameter is set to a negative number, it indicates the percentage of statistics collected. The negative number converts to its corresponding percentage, for example, **-5** means 5%. The number of sampled rows is the total number of rows multiplied by 5%. This parameter affects only the target number of sampled rows in the statistics. The actual number of sampled rows is also affected by the memory parameter [maintenance\\_work\\_mem](#).

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from -100 to 10000.

---

### NOTICE

- A larger positive number than the default value increases the time required to do **ANALYZE**, but might improve the quality of the optimizer's estimates.
- Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
  1. Restore to the default statistics.
  2. Use hints to force the optimizer to use the optimal query plan. For details, see "SQL Optimization > Hint-based Tuning" in *Developer Guide*.
- If this GUC parameter is set to a negative value, the number of samples is greater than or equal to 2% of the total data volume, and the number of records in user tables is less than 1.6 million, the time taken by running **ANALYZE** will be longer than that when this parameter uses its default value.
- If this GUC parameter is set to a negative value, the AUTOANALYZE function is disabled.

---

**Default value:** 100

## default\_gsi\_statistics\_target

**Parameter description:** Sets the default statistics target for global secondary indexes. If the parameter is set to a positive number, it indicates the number of samples of statistics information. If the parameter is set to a negative number, it indicates the percentage of statistics collected. The negative number corresponds to a percentage, for example, **-5** means 5%.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer, in the range from -100 to 3000000.

**Default value:** 0

---

**NOTICE**

- The default value **0** indicates that the default sampling rate is used for sampling.
  - Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
    - Restore to the default statistics.
    - Use hints to force the optimizer to use the optimal query plan. For details, see "SQL Optimization > Hint-based Tuning" in *Developer Guide*.
- 

## auto\_statistic\_ext\_columns

**Parameter description:** Collects statistics about multiple columns based on the first *K* columns of the composite index in the data table. This GUC parameter indicates *K*. For example, if a composite index is (a,b,c,d,e) and the GUC parameter is set to **3**, statistics about multiple columns are generated on columns (a,b) and (a,b,c). Multi-column statistics can make the optimizer estimate the cardinality more accurate when querying with combined conditions.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

---

**NOTICE**

- The system catalog does not take effect.
  - The statistics take effect only when the types of all columns support the comparison functions '=' and '<'.
  - System pseudocolumns in indexes, such as **tableoid** and **ctid**, are not collected.
  - By default, distinct values, MCVs without NULL, and MCVs with NULL are collected. If the AI-based cardinality estimation parameter [enable\\_ai\\_stats](#) is enabled, MCVs are not collected. Instead, models for AI-based cardinality estimation are collected.
  - If the index for creating multi-column statistics is deleted and no other index contains the multi-column combination, the multi-column statistics will be deleted in the next ANALYZE operation.
  - If the value of this parameter decreases, the new index generates multi-column statistics based on the value of this parameter. The generated multi-column statistics that exceed the value of this parameter will not be deleted.
  - If you want to disable the multi-column statistics on a specific combination only, you can retain the value of this parameter and run the DDL command **ALTER TABLE *tablename* disable statistics ((*column list*))** to disable the statistics on multiple columns in a specific combination.
- 

**Value range:** an integer ranging from 1 to 4. The value **1** indicates that statistics about multiple columns are not automatically collected.

**Default value:** **1**

## constraint\_exclusion

**Parameter description:** Specifies the query optimizer's use of table constraints to optimize queries.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated values

- **on, true, yes,** and **1** indicate that constraints for all tables are examined.
- **off, false, no,** and **0** indicate that no constraints are examined.
- **partition** indicates that only constraints for inheritance child tables and **UNION ALL** subqueries are examined.

---

### NOTICE

When **constraint\_exclusion** is set to **on**, the optimizer compares query conditions with the table's **CHECK** constraints, and omits scanning tables for which the conditions contradict the constraints.

---

**Default value:** partition

### NOTE

Currently, **constraint\_exclusion** is enabled by default only for cases that are often used to implement table partitioning. If this parameter is enabled for all tables, extra planning is imposed on simple queries, which has no benefits. If you have no partitioned tables, set it to **off**.

## cursor\_tuple\_fraction

**Parameter description:** Specifies the optimizer's estimated fraction of a cursor's rows that are retrieved.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0.0 to 1.0.

---

### NOTICE

Smaller values of this setting bias the optimizer towards using **fast start** plans for cursors, which will retrieve the first few rows quickly while perhaps taking a long time to fetch all rows. Larger values put more emphasis on the total estimated time. At the maximum setting of **1.0**, cursors are planned exactly like regular queries, considering only the total estimated time and how soon the first rows might be delivered.

---

**Default value:** 0.1

## from\_collapse\_limit

**Parameter description:** Specifies whether the optimizer merges sub-queries into upper queries based on the resulting FROM list. The optimizer merges sub-queries

into upper queries if the resulting FROM list would have no more than this many items.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647.

---

**NOTICE**

Smaller values reduce planning time but may lead to inferior execution plans.

---

**Default value:** 8

## join\_collapse\_limit

**Parameter description:** Specifies whether the optimizer rewrites JOIN constructs (except FULL JOINS) into lists of FROM items based on the number of the items in the result list.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647.

---

**NOTICE**

- Setting this parameter to **1** prevents join reordering. As a result, the join order specified in the query will be the actual order in which the relations are joined. The query optimizer does not always choose the optimal join order. Therefore, advanced users can temporarily set this variable to **1**, and then specify the join order they desire explicitly.
  - Smaller values reduce planning time but lead to inferior execution plans.
- 

**Default value:** 8

## plan\_mode\_seed

**Parameter description:** This is a debugging parameter. Currently, it supports only **OPTIMIZE\_PLAN** and **RANDOM\_PLAN**. The value **0** (for **OPTIMIZE\_PLAN**) indicates the optimized plan using the dynamic planning algorithm. Other values are for **RANDOM\_PLAN**, which indicates that the plan is randomly generated. **-1** indicates that users do not specify the value of the seed identifier. In this case, the optimizer generates a random integer from 1 to 2147483647 and a random execution plan based on the generated integer. A GUC parameter value from 1 to 2147483647 is regarded as the seed identifier, based on which the optimizer generates a random execution plan.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

**Default value:** 0

#### NOTICE

- If this parameter is set to **RANDOM\_PLAN**, the optimizer generates a random execution plan that may not be the optimal one. Therefore, to guarantee the query performance, the default value **0** is recommended during upgrade, scale-out, scale-in, and O&M.
- If this parameter is not set to **0**, the specified plan hint will not be used.

## enable\_random\_datanode

**Parameter description:** Specifies whether the query of the replication table is conducted on a random DN. A complete replication table is stored on each each DN for random retrieval to release the pressure on nodes.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of querying the replication table on a random DN is enabled.
- **off** indicates that the function of querying the replication table on a random DN is disabled.

**Default value:** on

## hashagg\_table\_size

**Parameter description:** Specifies the hash table size during the execution of the HASH JOIN operation.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1073741823.

**Default value:** 0

## enable\_codegen

**Parameter description:** Specifies whether code optimization can be enabled. Currently, the code optimization uses the LLVM optimization.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that code optimization is enabled.
- **off** indicates that code optimization is disabled.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## codegen\_compile\_thread\_num

**Parameter description:** Specifies the number of Codegen compilation threads.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 8

**Default value:** 1

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If the number of threads is too large, the system performance may deteriorate. However, when there are a large number of concurrent services, you can increase the number of threads to improve the throughput performance.

## llvm\_max\_memory

**Parameter description:** Specifies the upper limit of the memory used by IRs (including cached and in-use IRs) generated during compilation in Codegen execution mode. The memory used by Codegen is not applied for by preoccupation. It is a part of **max\_dynamic\_memory** and is restricted by the **llvm\_max\_memory** parameter.

**Parameter type:** integer.

**Unit:** KB

**Value range:** 0 to 2147483647. If the value exceeds the specified value, the original recursive execution logic, instead of the Codegen execution logic, is used. When the specified upper limit is reached and a downgrade is triggered, decreasing the value of **llvm\_max\_memory** cannot immediately release the memory occupied by extra IRs. The memory occupied by IRs is released after the corresponding SQL statements are executed.

**Default value:** 131072kB (128 MB)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

- If the parameter is set to an excessively small value, the system does not use the Codegen execution logic, affecting the use of functions.
- If the parameter is set to an excessively large value, LLVM compilation may occupy too many resources of other threads. As a result, the overall system performance deteriorates.

## enable\_codegen\_print

**Parameter description:** Specifies whether the LLVM IR function can be printed in logs.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the IR function can be printed in logs.
- **off** indicates that the IR function cannot be printed in logs.

**Default value:** off

## codegen\_cost\_threshold

**Parameter description:** The LLVM compilation takes some time to generate executable machine code. Therefore, LLVM compilation is beneficial only when the actual execution cost is more than the sum of the code required for generating machine code and the optimized execution cost. Parameter **codegen\_cost\_threshold** specifies a threshold. If the estimated execution cost exceeds the threshold, LLVM optimization is performed. codegen uses **plan\_rows** of the execution operator as the cost to compare with the value of **codegen\_cost\_threshold**. You can run the **explain** command to view the value of **plan\_rows**.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647.

**Default value:** 100000

## enable\_bloom\_filter

**Parameter description:** Specifies whether the BloomFilter optimization can be used. This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the BloomFilter optimization can be used.
- **off** indicates that the BloomFilter optimization cannot be used.

**Default value:** on

## enable\_extrapolation\_stats

**Parameter description:** Specifies whether the extrapolation logic is used for data of DATE type based on historical statistics. The logic can increase the accuracy of estimation for tables whose statistics are not collected in time, but will possibly provide an overlarge estimation due to incorrect extrapolation. Enable the logic only in scenarios where the data of DATE type is periodically inserted. This is a SUSERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the extrapolation logic is used.
- **off** indicates that the extrapolation logic is not used.

**Default value:** off

## autoanalyze

**Parameter description:** Specifies whether to automatically collect statistics on tables that have no statistics when a plan is generated. **autoanalyze** cannot be

used for foreign or temporary tables. To collect statistics, manually perform the ANALYZE operation. If an exception occurs in the database during the execution of autoanalyze on a table, after the database is recovered, the system may still prompt you to collect the statistics of the table when you run the statement again. In this case, manually perform the ANALYZE operation on the table to synchronize statistics.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the table statistics are automatically collected.
- **off** indicates that the table statistics are not automatically collected.

**Default value:** off

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## query\_dop

**Parameter description:** Specifies the user-defined degree of parallelism (DOP). This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from -64 to 64

- A value ranging from 1 to 64 indicates that the fixed SMP is enabled and the system will use the specified DOP.
- **0** indicates that the SMP adaptation is enabled, and the system will dynamically select the optimal DOP based on resource usage and plan characteristics.
- A value ranging from -64 to -1 indicates that the SMP adaptation is enabled, and the system limits the DOP that can be adaptively selected.

### NOTE

- After enabling concurrent queries, ensure you have sufficient CPU, memory, network, and I/O resources to achieve the optimal performance.
- To prevent performance deterioration caused by an overly large value of **query\_dop**, the system calculates the maximum number of available CPU cores for a DN and uses the number as the upper limit for this parameter. If the value of **query\_dop** is greater than 4 and also the upper limit, the system resets **query\_dop** to the upper limit.

**Default value:** 1

## enable\_analyze\_check

**Parameter description:** Specifies whether it is allowed to check whether statistics were collected about tables whose **reltuples** and **relpages** are displayed as **0** in **pg\_class** during plan generation.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the tables will be checked.
- **off** indicates that the tables will not be checked.

**Default value:** off

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## enable\_sonic\_hashagg

**Parameter description:** Specifies whether to use the hash aggregation operator designed for column-oriented hash tables when certain constraints are met.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the hash aggregation operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash aggregation operator designed for column-oriented hash tables is not used.

 **NOTE**

- If **enable\_sonic\_hashagg** is enabled and the hash aggregation operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the memory usage of the hash aggregation operator can be reduced. However, in scenarios where **enable\_codegen** is enabled and the performance is significantly improved, the performance of the operator may deteriorate.
- If **enable\_sonic\_hashagg** is enabled and the hash agg operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Aggregation in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Aggregation. For details, see "SQL Optimization > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

**Default value:** on

## enable\_sonic\_hashjoin

**Parameter description:** Specifies whether to use the hash join operator designed for column-oriented hash tables when certain constraints are met.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the hash join operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash join operator designed for column-oriented hash tables is not used.

 NOTE

- Currently, the parameter can be used only for Inner Join.
- If **enable\_sonic\_hashjoin** is enabled, the memory usage of query using the Hash Inner operator can be reduced. However, in scenarios where the code generation technology can significantly improve performance, the performance of the operator may deteriorate.
- If **enable\_sonic\_hashjoin** is enabled and the hash join operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Join in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Join. For details, see "SQL Optimization > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

**Default value:** on

## enable\_sonic\_optspill

**Parameter description:** Specifies whether to optimize the number of files to be written to disks for the hash join operator designed for column-oriented hash tables. If this parameter is enabled, the number of files written to disks does not increase significantly when the hash join operator writes a large number of files to disks.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the number of files to be written to disks for the hash join operator designed for column-oriented hash tables is optimized.
- **off** indicates that the number of files to be written to disks for the hash join operator designed for column-oriented hash tables is not optimized.

**Default value:** on

## plan\_cache\_mode

**Parameter description:** Specifies the policy for generating an execution plan in the prepared statement.

**Parameter type:** enumerated type

**Unit:** none

**Value range:**

- **auto** indicates that the **custom plan** or **generic plan** is selected by default.
- **force\_generic\_plan** indicates that the generic plan is forcibly used (soft parse). The generic plan is a plan generated after you run a prepared statement. The plan policy binds parameters to the plan when you run the **EXECUTE** statement to execute the plan. The advantage of this scheme is that repeated optimizer overheads can be avoided in each execution. The disadvantage is that the plan may not be optimal when data skew occurs for the bound parameters and may result in poor plan execution performance. The bound parameters bind the types of parameters transferred for the first time. If the type of a parameter transferred into the same placeholder is different from the previous time, an error is reported.

- **force\_custom\_plan** indicates that the custom plan is forcibly used (hard parse). The custom plan is a plan generated after you run a prepared statement where parameters in the EXECUTE statement are embedded. The custom plan generates a plan based on specific parameters in the EXECUTE statement. This scheme generates a preferred plan based on specific parameters each time and has good execution performance. The disadvantage is that the plan needs to be regenerated before each execution, resulting in a large amount of repeated optimizer overhead.

 **NOTE**

This parameter is valid only for prepared statements. It is used when the parameterized field in a prepared statement has severe data skew.

**Default value:** auto

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Set this parameter based on the actual service scenario.

## enable\_router

**Parameter description:** Specifies whether to enable the manual node pushdown function.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on:** used.
- **off:** not used.

**Default value:** off

## router

**Parameter description:** Controls the detailed attributes of the router function. This parameter is valid only when **enable\_router** and **enable\_light\_proxy** are enabled. This parameter is used to calculate the DN where the given distribution key is located based on the hash distribution key of the table. After the router is set, the supported SQL statements are pushed down to the DN for execution. If the router is incorrectly configured, data may be saved to an incorrect DN, causing unpredictable problems. Therefore, be cautious when running this command.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string

This parameter consists of two parts:

'**schema\_name.table\_name,"distribute\_keys"**'. The meanings are as follows:

- **schema\_name.table\_name:** indicates the schema name and table name. If schema\_name is not set, the default value current\_schema is used.
- **distribute\_keys:** Values of all distribution keys in the distributed table are separated by commas (.). The sequence of the values must be the same as that of the distribution keys in the table.

**Default value:** empty

## enable\_auto\_explain

**Parameter description:** Specifies whether to enable the function of automatically printing execution plans. This parameter is used to locate slow stored procedures or slow queries and is valid only for the currently connected CN. It does not affect the execution of other CNs.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** enabled.
- **off:** disabled.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If you want to view the execution plan, enable this parameter. However, this causes the current system performance to deteriorate.

## auto\_explain\_level

**Parameter description:** Specifies the log level for automatically printing execution plans.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated type. The value can be **log** or **notice**.

- **log:** Execution plans are printed as logs.
- **notice:** Execution plans are printed as notices.

**Default value:** log

## auto\_explain\_log\_min\_duration

**Parameter description:** Specifies the minimum duration of execution plans that are automatically printed. Only execution plans whose duration is greater than the value of **auto\_explain\_log\_min\_duration** will be printed. For example, if this parameter is set to **0**, all executed plans are printed. If this parameter is set to **3000**, all executed plans are printed if the execution of a statement takes more than 3000 ms.

**Parameter type:** integer.

**Unit:** millisecond

**Value range:** 0 to 2147483647

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## max\_datanode\_for\_plan

**Parameter description:** Specifies the number of execution plans to be displayed on the DN when an FQS plan is generated. The number of plans that are displayed on the DN is determined by the smaller value between the number of DNs on the cluster and the value of this parameter.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 8192

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

## enable\_inner\_unique\_opt

**Parameter description:** Specifies that Inner Unique is optimized for nested loop join, hash join, and sort merge join. That is, the number of matching times is reduced when the attribute corresponding to the inner table in the join condition meets the uniqueness constraint.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on:** used.
- **off:** not used.

**Default value:** on.

## enable\_indexscan\_optimization

**Parameter description:** Specifies whether to optimize B-tree index scan (IndexScan and IndexOnlyScan) in the Astore.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on:** used.
- **off:** not used.

**Default value:** on.

## create\_gsi\_opt

**Parameter description:** Specifies the GSI creation mode. Other modes except **none** take effect only after the **enable\_stream\_operator** parameter is enabled.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated values

- **none:** PGXC is used.
- **build:** The STREAMING and GSI BUILD operators are used.
- **parallel:** The STREAMING and GSI BUILD operators and the parallel sorting mode are used. (The **parallel\_workers** parameter of the base table needs to be set.)

**Default value:** build

## session\_sequence\_cache

**Parameter description:** Specifies the **sequence** value applied for one-time interaction in the current session. The unused values are automatically discarded after the session ends. When using **sequence** to import data in batches, you can increase the value of this parameter to improve the insertion speed and high concurrency performance. When a single data record is inserted concurrently, set this parameter to **1** to reduce the sequence change. If you have high requirements on continuity, you need to specify the required cache when creating a sequence. If the value of this parameter is greater than that of cache, the value automatically becomes invalid.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647.

**Default value:** 10

### NOTE

The default value is **10**. In high-concurrency scenarios, the performance of single and batch insertion is good.

## enable\_invisible\_indexes

**Parameter description:** Specifies whether the optimizer can use invisible indexes.

### NOTE

After an index is set to invisible, the performance of query statements may be affected. If you do not want to change the index visibility status and want to use invisible indexes, set **enable\_invisible\_indexes** to **on**.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The optimizer can use invisible indexes.
- **off:** The optimizer cannot use invisible indexes.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## default\_statistic\_granularity

**Parameter description:** Specifies which partition-level statistics of a partitioned table are collected by default when **PARTITION\_MODE** is not specified. This parameter does not take effect for non-partitioned tables.

**Parameter type:** enumerated type

**Unit:** none

**Value range:** enumerated values

- **ALL:** indicates that statistics of the entire table and level-1 partition are collected.
- **GLOBAL:** indicates that the statistics of the entire table are collected.
- **PARTITION:** indicates that statistics of the level-1 partition are collected.
- **GLOBAL\_AND\_PARTITION:** indicates that statistics about the entire table and level-1 partitions are collected.
- **ALL\_COMPLETE:** indicates that statistics about the entire table and level-1 partition are collected.

**Default value:** ALL

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If partition-level statistics need to be collected, you can set this parameter as required. However, the **ANALYZE** performance may be affected.

## enable\_dynamic\_samplesize

**Parameter description:** Specifies whether to dynamically adjust the number of sampled rows. For a large table with more than one million rows, the number of sampled rows is dynamically adjusted during statistics collection to improve statistics accuracy.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** indicates that the function is enabled.
- **off:** indicates that the function is disabled.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

 NOTE

The function of dynamically adjusting the number of sampled rows supports only absolute sampling.

## 14.3.9 Error Reporting and Logging

### 14.3.9.1 Logging Destination

#### log\_destination

**Parameter description:** GaussDB supports several methods of logging server messages. Set this parameter to a list of desired log destinations separated by commas. (For example, **log\_destination** can be set to "**stderr, csvlog**".)

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

The valid values are **stderr**, **csvlog**, and **syslog**.

- **stderr** indicates that logs are printed to the screen.
- **csvlog** indicates that logs are output in comma separated value (CSV) format. The prerequisite for generating logs in CSV format is that **logging\_collector** must be set to **on**. For details, see [Using CSV Log Output](#).
- **syslog** indicates that logs are recorded using the syslog of the OS. GaussDB can record logs using syslog from **LOCAL0** to **LOCAL7**. For details, see [syslog facility](#). To record logs using syslog, add the following information to syslog daemon's configuration file:

```
local0.* /var/log/gaussdb
```

**Default value:** **stderr**

#### logging\_collector

**Parameter description:** Specifies whether to enable the logger thread to collect logs. This thread captures log messages sent to **stderr** or **csvlog** and redirects them into log files.

This method is more effective than recording logs to syslog because some types of messages cannot be displayed in syslog output, such as messages indicating the loading failures of dynamic link libraries and error messages generated by scripts.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

---

**NOTICE**

It is possible to log to **stderr** without using the parameter **logging\_collector** and the log messages will go to where the server's **stderr** is directed. However, this method is only suitable for low log volumes due to difficulties in rotating log files.

---

**Value range:** Boolean

- **on** indicates that the log collection is enabled.
- **off** indicates that the log collection is disabled.

**Default value:** on

## log\_directory

**Parameter description:** Specifies the directory for storing log files when **logging\_collector** is set to **on**. The value can be an absolute path, or relative to the data directory. The **log\_directory** parameter can be dynamically modified using the **gs\_guc reload** command. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

- If **log\_directory** is set to an invalid path, the cluster cannot be started.
- If you modify the **log\_directory** parameter using the **gs\_guc reload** command, and the specified path is valid, the log files are output to this new path. If the specified path is invalid, the log files are output to the valid path set last time and the database operation is not affected. The invalid value of **log\_directory** is still written into the configuration file.
- In the sandbox environment, the path cannot contain **/var/chroot**. For example, if the absolute path of log is **/var/chroot/var/lib/log/Ruby/gs\_log/cn\_log**, you only need to set the path to **/var/lib/log/Ruby/gs\_log/cn\_log**.

---

### NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

**Value range:** a string.

**Default value:** specified during installation

## log\_filename

**Parameter description:** Specifies the names of generated log files when **logging\_collector** is set to **on**. The value is treated as a strftime pattern, so %-escapes can be used to specify time-varying file names. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

- You are advised to use %-escapes to specify the log file names for efficient management of log files.
- If **log\_destination** is set to **csvlog**, log files are output in CSV format with timestamped names, for example, **server\_log.1093827753.csv**.

**Value range:** a string.

**Default value:** `gaussdb-%Y-%m-%d_%H%M%S.log`

## log\_file\_mode

**Parameter description:** Specifies the permissions of log files when `logging_collector` is set to `on`. This parameter is invalid on Windows. The value of `log_file_mode` is usually a number in the format acceptable to the `chmod` and `umask` system calls.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

- Before setting this parameter, set `log_directory` to store the logs to a directory other than the data directory.
- Do not make the log files world-readable because they might contain sensitive data.

---

**Value range:** an octal integer ranging from 0000 to 0777 (that is, 0 to 511 in the decimal format).

### NOTE

- `0600` indicates that log files are readable and writable only to the server administrator.
- `0640` indicates that log files are readable and writable to members of the administrator's group.

**Default value:** `0600`

## log\_truncate\_on\_rotation

**Parameter description:** Specifies the writing mode of the log files when `logging_collector` is set to `on`.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

Example:

To keep 7 days of logs, one log file per day named `server_log.Mon`, `server_log.Tue`, etc., and automatically overwrite last week's log with this week's log, set `log_filename` to `server_log.%a`, `log_truncate_on_rotation` to `on`, and `log_rotation_age` to `1440`, indicating that the valid duration of the log file is one day.

**Value range:** Boolean

- `on` indicates that GaussDB overwrites the existing log files of the same name on the server.
- `off` indicates that GaussDB appends the logging messages to the existing log files of the same name on the server.

**Default value:** `off`

## log\_rotation\_age

**Parameter description:** Specifies the interval for creating a log file when **logging\_collector** is set to **on**. If the duration from the time when the last log file was created to the current time is greater than the value of **log\_rotation\_age**, a new log file will be generated.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 35791394. The unit is min. **0** indicates that the time-based creation of new log files is disabled.

**Default value:** 1d (1440 min)

## log\_rotation\_size

**Parameter description:** Specifies the maximum size of a server log file when **logging\_collector** is set to **on**. If the total size of messages in a log file exceeds the specified value, a log file will be generated.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2097151. The unit is KB.

**0** indicates that the capacity-based creation of new log files is disabled.

**Default value:** 20 MB

## syslog\_facility

**Parameter description:** Specifies the syslog facility to be used when **log\_destination** is set to **syslog**.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, and **local7**.

**Default value:** local0

## syslog\_ident

**Parameter description:** Specifies the identifier of GaussDB messages in syslog logs when **log\_destination** is set to **syslog**.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

**Default value:** postgres

## event\_source

**Parameter description:** Specifies the identifier of GaussDB messages in logs when **log\_destination** is set to **eventlog**.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

**Default value:** PostgreSQL

## 14.3.9.2 Logging Time

### client\_min\_messages

**Parameter description:** Specifies which level of messages will be sent to the client. Each level covers all the levels following it. The lower the level is, the fewer messages are sent.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

A same value for **client\_min\_messages** and **log\_min\_messages** does not indicate the same level.

---

**Value range:** enumerated type. The valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal** and **panic**. Among them, **debug** and **debug2** are equivalent. For details about the parameters, see [Table 14-11](#). If the configured level is higher than **error**, for example, **fatal** or **panic**, the system changes the level to **error** by default.

**Default value:** notice

### log\_min\_messages

**Parameter description:** Specifies the level of messages written to CN and DN log files in the server log folder. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

---

#### NOTICE

A same value for **client\_min\_messages** and **log\_min\_messages** does not indicate the same level.

---

**Value type:** enumerated type

**Unit:** none

**Value range:** **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal** and **panic**. Among them, **debug** and **debug2** are equivalent. For details about the parameters, see [Table 14-11](#).

**Default value:** warning

**Setting method:** This is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

### log\_min\_error\_statement

**Parameter description:** Controls which SQL statements that cause an error condition are recorded in the server log.

This is a SUSE parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see [Table 14-11](#).

 **NOTE**

- The default is **error**, indicating that statements causing errors, log messages, fatal errors, or panics will be logged.
- **panic** indicates that this feature is disabled.

**Default value:** **error**

## log\_min\_duration\_statement

**Parameter description:** Specifies the threshold for logging the duration of a completed statement. The duration of each completed statement is logged if the statement ran for at least the specified number of milliseconds.

Setting **log\_min\_duration\_statement** makes it easy to trace query statements that need to be optimized. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

**Parameter type:** integer.

**Unit:** ms

---

**NOTICE**

When you use this option together with [log\\_statement](#), the text of statements that have been logged by **log\_statement** will not be repeatedly logged. If you are not using **syslog**, it is recommended that you log the process ID (PID) or session ID using [16.3.9.3-log\\_line\\_prefix](#) so that you can link the statement message to the latest duration message.

---

**Value range:** -1 to 2147483647

- If this parameter is set to **250**, all SQL statements that run for 250 ms or longer will be logged.
- **0** indicates that the execution durations of all the statements are logged.
- **-1** indicates that the duration logging is disabled.

**Default value:** **3000ms** (that is, 3s)

**Setting method:** This is a SUSE parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## backtrace\_min\_messages

**Parameter description:** Prints the function's stack information to the server's log file if the information generated is greater than or equal to the level specified by this parameter.

This is a SUSE parameter. Set it based on instructions provided in [Table 14-1](#).

**NOTICE**

This parameter is used to locate problems on site. Frequent stack printing will affect the system's overhead and stability. Therefore, set this parameter to a value other than **fatal** or **panic** during problem locating.

**Value range:** enumerated values

Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see [Table 14-11](#).

**Default value:** **panic**

[Table 14-11](#) explains message severities used by GaussDB. If logging output is sent to syslog or eventlog, severity is translated in GaussDB as shown in the table.

**Table 14-11** Message severity levels

Severity	Description	System Log	Event Log
debug[1-5]	Provides detailed debug information.	DEBUG	INFORMATION
log	Reports information of interest to administrators, for example, checkpoint activity.	INFO	INFORMATION
info	Provides information implicitly requested by users, for example, output from <b>VACUUM VERBOSE</b> .	INFO	INFORMATION
notice	Provides information that might be helpful to users, for example, truncation of long identifiers and index created as part of the primary key.	NOTICE	INFORMATION
warning	Provides warnings of likely problems, for example, <b>COMMIT</b> outside a transaction block.	NOTICE	WARNING
error	Reports an error that causes a command to terminate.	WARNING	ERROR
fatal	Reports the reason that causes a session to terminate.	ERR	ERROR

Severity	Description	System Log	Event Log
panic	Reports an error that caused all database sessions to terminate.	CRIT	ERROR

### 14.3.9.3 Logging Content

#### debug\_print\_parse

**Parameter description:** Specifies whether to print parsing tree results.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### debug\_print\_rewritten

**Parameter description:** Specifies whether to print query rewriting results.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### debug\_print\_plan

**Parameter description:** Specifies whether to print the query execution plan to logs.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the printing is enabled.
- **off** indicates that the printing is disabled.

**Default value:** off

#### NOTICE

- Debugging information about **debug\_print\_parse**, **debug\_print\_rewritten**, and **debug\_print\_plan** is printed only when the log level is set to **log** or higher. When these parameters are set to **on**, their debugging information will be recorded in server logs and will not be sent to client logs. You can change the log level by setting **client\_min\_messages** and **log\_min\_messages**.
- Do not call the **gs\_encrypt\_aes128** and **gs\_decrypt\_aes128** functions when **debug\_print\_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the **gs\_encrypt\_aes128** and **gs\_decrypt\_aes128** functions in the log files generated when **debug\_print\_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.

## debug\_pretty\_print

**Parameter description:** Indents the logs produced by **debug\_print\_parse**, **debug\_print\_rewritten**, and **debug\_print\_plan**. The output format is more readable but much longer than that generated when this parameter is set to **off**.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the indentation is enabled.
- **off** indicates that the indentation is disabled.

**Default value:** on

## log\_checkpoints

**Parameter description:** Specifies whether the statistics on checkpoints and restart points are recorded in the server logs. When this parameter is set to **on**, statistics on checkpoints and restart points are recorded in the log messages, including the number of buffers written and the time spent in writing them.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics on checkpoints and restart points are recorded in the server logs.
- **off** indicates that the statistics on checkpoints and restart points are not recorded in the server logs

**Default value:** off

## log\_connections

**Parameter description:** Specifies whether to record logs of connection requests from the client. The log information includes the IP address, port number, username, database name, and duration of key steps in the GaussDB database connection setup process.

**Parameter type:** Boolean.

**Unit:** none

 **NOTE**

Some client programs (such as `gsql`) attempt to connect to the database twice when determining whether a password is required. Therefore, the log message may contain duplicate "connection receive" (indicating that a connection request is received).

**Value range:**

- **on** indicates that the logs are recorded.
- **off** indicates that the logs are not recorded.

**Default value:** **off**

**Setting method:** This is a BACKEND parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## log\_disconnections

**Parameter description:** Specifies whether to record disconnection request information of the client.

This is a BACKEND parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the request information is recorded.
- **off** indicates that the request information is not recorded.

**Default value:** **off**

## log\_duration

**Parameter description:** Specifies whether to record the duration of every completed SQL statement. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **off:** Compared with this option, [log\\_min\\_duration\\_statement](#) forcibly records the query text.
- If this parameter is set to **on** and [log\\_min\\_duration\\_statement](#) is set to a positive value, the duration of each completed statement is logged but the query text is included only for statements exceeding the threshold. This behavior can be used for gathering statistics in high-load situation.

**Default value:** **off**

## log\_error\_verbosity

**Parameter description:** Specifies the content output to the server log for each message that is logged.

This is a SUSE parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated values

- **terse** indicates that the output excludes the DETAIL, HINT, QUERY, and CONTEXT error information.
- **verbose** indicates that the output includes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.
- **default** indicates that the output includes the DETAIL, HINT, QUERY, and CONTEXT error information, and excludes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.

**Default value:** default

## log\_hostname

**Parameter description:** By default, connection log messages only show the IP address of the connecting host. The host name can be recorded when this parameter is set to **on**. It may take some time to parse the host name. Therefore, the database performance may be affected.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the host name is simultaneously recorded.
- **off** indicates that the host name is not simultaneously recorded.

**Default value:** off

## log\_line\_prefix

**Parameter description:** Specifies the prefix format of each log information. A prefix is a printf-style string that is output at the beginning of each line of the log. The "escape sequences" which begin with % are replaced with status information as listed in [Table 14-12](#).

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Table 14-12** Escape characters

Escape Character	Effect
%a	Application name.
%u	Username.
%d	Database name.
%r	Remote host name or IP address and remote port. If <b>log_hostname</b> is set to <b>off</b> , only the IP address and remote port are displayed.

Escape Character	Effect
%h	Remote host name or IP address. If <b>log_hostname</b> is set to <b>off</b> , only the IP address is displayed.
%p	Thread ID.
%t	Timestamp without milliseconds (no time zone in the Windows OS).
%m	Timestamp with milliseconds.
%n	Node to which an error is reported.
%i	Command tag: type of command executed in the current session.
%e	SQLSTATE error code.
%c	Session ID. For details, see the note below the table.
%l	Number of the log line for each session, starting from 1.
%s	Start time of a session.
%v	Virtual transaction ID (backendID/ localXID).
%x	Transaction ID ( <b>0</b> indicates that no transaction ID is assigned).
%q	Produces no output. If the current thread is a backend thread, this escape sequence is ignored and subsequent escape sequences are processed. Otherwise, this escape sequence and subsequent escape sequences are all ignored.
%S	Session ID.
%T	Trace ID.
%%	The character %.

 **NOTE**

The %c escape character prints a unique session ID consisting of two 4-byte hexadecimal numbers separated by a period (.). The numbers are the thread startup time and the thread ID. Therefore, %c can also be used as a space saving way of printing those items. For example, execute the following query to generate the session ID from pg\_stat\_activity:

```
SELECT to_hex(EXTRACT(EPOCH FROM backend_start)::integer) || '.' ||
       to_hex(pid)
FROM pg_stat_activity;
```

- If you set a non-empty value for **log\_line\_prefix**, ensure that its last character is a space, to provide visual separation from the rest of the log line. A punctuation character can be used, too.
- Syslog generates its own timestamp and thread ID information. Therefore, you do not need to include those escape characters when you are logging in to syslog.

**Value range:** a string

**Default value:** '%m %n %u %d %h %p %S %x %a '

 NOTE

`%m %n %u %d %h %p %S %x %a` indicates the session start timestamp, error reporting node, username, database name, remote host name or IP address, thread ID, session ID, transaction ID, and application name.

## log\_lock\_waits

**Parameter description:** If the time for which a session waits to acquire a lock is longer than the value of `deadlock_timeout`, this parameter specifies whether to record this message in the database. This is useful in determining if lock waits are causing poor performance.

This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the information is recorded.
- **off** indicates that the information is not recorded.

**Default value:** off

## log\_statement

**Parameter description:** Specifies which SQL statements are recorded. For clients using extended query protocols, logging occurs when an execute message and values (enclosed by a pair of single quotation marks) of bound parameters are received.

This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

---

**NOTICE**

- Statements that contain simple syntax errors are not logged even if **log\_statement** is set to **all**, because logging occurs only after basic parsing has been completed and the statement type is determined. If an extended query protocol is used, statements that fail before the execution phase (during parsing or planning) are not logged, either. Set **log\_min\_error\_statement** to **ERROR** or lower to log such statements.
- If this parameter is set to a value other than **none**, the statement audit function is enabled. The database administrator can access server logs to view SQL execution records.

---

**Value range:** enumerated values

- **none** indicates that no statement is recorded.
- **ddl** indicates that all data definition statements, such as CREATE, ALTER, and DROP, are recorded.
- **mod** indicates that all DDL statements and data modification statements, such as INSERT, UPDATE, DELETE, TRUNCATE, and COPY FROM, are recorded.
- **all** indicates that all statements, including the PREPARE, EXECUTE, and EXPLAIN ANALYZE statements, are recorded.

**Default value:** none

## log\_temp\_files

**Parameter description:** Records the deletion information of temporary files that meets the requirements. Temporary files can be created for sorting, hashing, and storing temporary querying results. If the recording is enabled, a log entry is generated for each temporary file when it is deleted.

**Parameter type:** integer.

**Unit:** KB

**Value range:** -1 to 2147483647.

- A positive value indicates that the deletion information of temporary files whose size is larger than the value specified by **log\_temp\_files** is recorded.
- **0** indicates that the delete information of all temporary files is recorded.
- **-1** indicates that the delete information of any temporary files is not recorded.

**Default value:** -1

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value **-1** which indicates that no temporary file deletion information is recorded. If this parameter is set, the more temporary files that meet the recording requirements, the more logs are recorded, which affects the system performance.

## log\_timezone

**Parameter description:** Specifies the time zone used for timestamps written in the server log. Different from [TimeZone](#), this parameter takes effect for all sessions in the database.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string. You can query the PG\_TIMEZONE\_NAMES view to obtain the value. For details, see "System Catalogs and System Views > System Views > PG\_TIMEZONE\_NAMES" in *Developer Guide*.

**Default value:** Set this parameter based on the OS time zone.

### NOTE

The default value will be changed when **gs\_initdb** is used to set system environments.

## logging\_module

**Parameter description:** Specifies whether module logs are output on the server. This is a session-level parameter, and you are advised not to use the **gs\_guc** tool to set it.

**Parameter type:** string.

**Unit:** none

**Default value:** none

**Value range:** Logs of this module are generated on the server. Logs of other modules are not generated on the server, but can be viewed by running **SHOW logging\_module**.

```
ALL,on(),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBL
SPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT
_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,SPM,SP

GSPERF,EXEC_REMOTE,UBTREE_PARA,BTREE_PARA,ANTI_CACHE,ANTI_RECYCLER,VERIFYLOG,GS_REPAIR,AUT
HID,CCINDEX)
```

**CN\_RETRY** does not take effect in the current version.

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting method:** Run **SHOW logging\_module** to view which modules are controllable. For example, the query output result is as follows:

```
gaussdb=# show logging_module;
logging_module
-----
ALL,on(),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBL
SPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT
_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,SPM,SP
M_KEY_FLOW,UDF,COOP_ANALYZE,WLMCP,ACCELERATE,MOT,PLANHINT,PARQUET,PGSTAT,CARBONDATA,S
NAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,IN
STR,WDR_SNAPSHOT,WDR_REPORT,ASP_REPORT,INCRE_CKPT,INCRE_BG_WRITER,DBL_WRT,RTO_RPO,HEART

HID,CCINDEX)
(1 row)
```

Controllable modules are identified by uppercase letters, and the special ID **ALL** is used for setting all module logs. You can control the output of module logs by setting the parameter to **on** or **off**. Enable log output for SSL:

```
gaussdb=# set logging_module='on(SSL)';
SET
gaussdb=# show
logging_module;
logging_module
```

```
-----
ALL,on(SSL),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,GDS,TBL
SPC,WLM,OBS,INDEX,EXECUTOR,OPFUSION,GPC,GSC,VEC_EXECUTOR,STREAM,LLVM,OPT,OPT_REWRITE,OPT
_JOIN,OPT_AGG,OPT_CHOICE,OPT_SUBPLAN,OPT_SETOP,OPT_SKEW,OPT_PLANNER,OPT_STAT_EXT,SPM,SP
M_KEY_FLOW,UDF,COOP_ANALYZE,WLMCP,ACCELERATE,MOT,PLANHINT,PARQUET,PGSTAT,CARBONDATA,S
NAPSHOT,XACT,HANDLE,CLOG,EC,REMOTE,CN_RETRY,PLSQL,TEXTSEARCH,SEQ,REDO,FUNCTION,PARSER,IN

,UPDATE_DIST_COL,GS_ILM,GS PERF,EXEC_REMOTE,UBTREE_PARA,BTREE_PARA,ANTI_CACHE,ANTI_RECYCLER
,VERIFYLOG,GS_REPAIR,AUTHID,CCINDEX)
(1 row)
```

SSL log output is enabled.

The **ALL** identifier can be used to quickly enable or disable log output for all modules.

```
gaussdb=# set logging_module='off(ALL)';
SET
gaussdb=# show
logging_module;
      logging_module
```

```
-----
ALL,on(),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBL

(1 row)
```

**Dependency:** The value of this parameter depends on the settings of **log\_min\_message**.

## enable\_unshipping\_log

**Parameter description:** Specifies whether to log statements that are not pushed down. The logs help locate performance issues that may be caused by statements not pushed down. If **enable\_stream\_operator** is disabled and this parameter is set to **on**, a large number of logs indicating that plans cannot be pushed down are recorded. If you do not need these logs, you are advised to disable **enable\_unshipping\_log** when disabling **enable\_stream\_operator**.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that statements not pushed down are logged.
- **off** indicates that statements not pushed down are not logged.

**Default value:** off

## opfusion\_debug\_mode

**Parameter description:** Checks whether simple queries are optimized for debugging. If this parameter is set to **log**, you can view the specific reasons why queries are not optimized in the DN execution plans.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated values

- **off** indicates that reasons why queries are not optimized are not included.
- **log** indicates that reasons why queries are not optimized are included in the DN execution plan.

---

### NOTICE

- You need to set **max\_datanode\_for\_plan** to view the DN execution plans.
- To view the reasons why queries are not optimized in the log, set the parameter to **log**, **log\_min\_messages** to **debug4**, and **logging\_module** to **on(OPFUSION)**. Note that a large number of log messages may be generated. Therefore, execute only a small number of jobs during debugging.

---

**Default value:** off

## enable\_debug\_vacuum

**Parameter description:** Specifies whether to allow output of some VACUUM-related logs for problem locating. This parameter is used only by developers. Common users are advised not to use it.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on/true:** enabled.
- **off/false:** disabled.

**Default value:** off

## resource\_track\_log

**Parameter description:** Specifies the log level of self-diagnosis. Currently, this parameter takes effect only in multi-column statistics.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string

- **summary:** Brief diagnosis information is displayed.
- **detail:** Detailed diagnosis information is displayed.

Currently, the two parameter values differ only when there is an alarm about multi-column statistics not collected. If the parameter is set to **summary**, such an alarm will not be displayed. If it is set to **detail**, such an alarm will be displayed.

**Default value:** summary

### 14.3.9.4 Using CSV Log Output

#### Prerequisites

- The [log\\_destination](#) parameter is set to **csvlog**.
- The [logging\\_collector](#) parameter is set to **on**.

#### Definition of csvlog

Log lines are emitted in comma separated values (CSV) format.

An example table definition for storing CSV-format log output is shown as follows:

```
CREATE TABLE gaussdb_log
(
  log_time timestamp(3) with time zone,
  node_name text,
  user_name text,
  database_name text,
  process_id bigint,
  connection_from text,
  "session_id" text,
  session_line_num bigint,
  command_tag text,
  session_start_time timestamp with time zone,
  virtual_transaction_id text,
  transaction_id bigint,
  query_id bigint,
  module text,
  error_severity text,
  sql_state_code text,
  message text,
  detail text,
  hint text,
```

```
internal_query text,
internal_query_pos integer,
context text,
query text,
query_pos integer,
location text,
application_name text
);
```

For details, see [Table 14-13](#).

**Table 14-13** Meaning of each csvlog field

Field	Description	Field	Description
log_time	Timestamp in milliseconds	module	Log module
node_name	Node name	error_severity	ERRORSTATE code
user_name	Username	sql_state_code	SQLSTATE code
database_name	Database name	message	Error message
process_id	Thread ID	detail	Detailed error message
connection_from	Port number of the client host	hint	Prompt message
session_id	Session ID	internal_query	Internal query (This field is used to query the information leading to errors if any.)
session_line_num	Number of lines in each session	internal_query_pos	Pointer for an internal query
command_tag	Command tag	context	Environment
session_start_time	Start time of a session	query	Character count at the position where errors occur
virtual_transaction_id	Regular transaction	query_pos	Pointer at the position where errors occur

Field	Description	Field	Description
transaction_id	Transaction ID	location	Position where errors occur in the GaussDB source code if <b>log_error_verbosity</b> is set to <b>verbose</b> .
query_id	Query ID	application_name	Application name

Run the **COPY FROM** command to import a log file to this table.

```
COPY postgres_log FROM '/opt/data/gs_log/logfile.csv' WITH csv;
```

 **NOTE**

The log name (**logfile.csv**) here needs to be replaced with the name of a log generated.

## Simplifying Input

Simplify importing CSV log files by performing the following operations:

- Set **log\_filename** and **log\_rotation\_age** to provide a consistent, predictable naming solution for log files. By doing this, you can predict when an individual log file is complete and ready to be imported.
- Set **log\_rotation\_size** to **0** to disable size-based log rollback, as it makes the log file name difficult to predict.
- Set **log\_truncate\_on\_rotation** to **on** so that old log data cannot be mixed with the new one in the same file.

### 14.3.10 Alarm Detection

During the running of cluster, error scenarios can be detected and informed to users in a timely manner. You can view system\_alarm logs in *\$GAUSSLOG/cm*, *\$GAUSSLOG/gs\_log/gtm*, *\$GAUSSLOG/gs\_log*, or *\$GAUSSLOG/roach/agent*.

#### enable\_alarm

**Parameter description:** Specifies whether to enable the alarm detector thread to detect fault scenarios that may occur in the database.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the alarm detector thread is enabled.
- **off** indicates that the alarm detector thread is disabled.

**Default value:** on

 **NOTE**

This parameter takes effect only on CNs and DN.

## connection\_alarm\_rate

**Parameter description:** Specifies the ratio restriction on the maximum number of allowed parallel connections to the database. The maximum number of concurrent connections to the database is `max_connections` x `connection_alarm_rate`.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a floating-point number ranging from 0.0 to 1.0

**Default value:** 0.9

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. The unit is s.

**Default value:** 10

## alarm\_component

**Parameter description:** Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by `alarm_report_interval`. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- If `--alarm-type` in the `gs_preinstall` script is set to **5**, no third-party component is connected and alarms are written into `system_alarm` logs. In this case, the value of `alarm_component` is `/opt/huawei/snas/bin/snas_cm_cmd`.
- If `--alarm-type` in the `gs_preinstall` script is set to **1**, a third-party component is connected. In this case, the value of `alarm_component` is the absolute path of the executable program of the third-party component.

**Default value:** `/opt/huawei/snas/bin/snas_cm_cmd`

## 14.3.11 Statistics During the Database Running

### 14.3.11.1 Query and Index Statistics Collector

The query and index statistics collector is used to collect statistics during database running. The statistics include the times of inserting and updating a table and index, the number of disk blocks and tuples, and the time required for the last cleanup and analysis on each table. The statistics can be viewed by querying system views `pg_stats` and `pg_statistic`. The parameters below are used to set the statistics collection feature in the server scope.

## track\_activities

**Parameter description:** Collects statistics about the commands that are being executed in each session. For a stored procedure, if this parameter is enabled, you can view the PERFORM statement, stored procedure calling statement, SQL statement, and OPEN CURSOR statement that are being executed in the stored procedure in the pg\_stat\_activity view.

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** on

---

 **CAUTION**

If this parameter is set to **off**, the memory recycling capability of the storage engine is affected, causing space expansion.

---

## track\_counts

**Parameter description:** Collects statistics about database activities.

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

 **NOTE**

When the database to be cleaned up is selected from the **AutoVacuum** automatic cleanup process, the database statistics are required. In this case, the default value is set to **on**.

**Default value:** on

---

 **CAUTION**

If this parameter is set to **off**, the memory recycling capability of the storage engine is affected, causing space expansion.

---

## track\_procedure\_sql

**Parameter description:** Specifies whether the SQL statements that are being executed in the stored procedure are printed in the query column in the pg\_stat\_activity system catalog.

**Parameter type:** Boolean

**Unit:** none

**Value range:** on or off

- **on:** indicates that when a stored procedure is invoked, the statements that are being executed by the stored procedure are printed in the query column of **pg\_stat\_activity**.
- **off:** indicates that when a stored procedure is invoked, only statements for invoking the stored procedure are printed in the query column of **pg\_stat\_activity**.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

## track\_io\_timing

**Parameter description:** Collects statistics about I/O timing in the database. The I/O timing statistics can be queried by using the **pg\_stat\_database** parameter.

This is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- If this parameter is set to **on**, the collection function is enabled. In this case, the collector repeatedly queries the OS at the current time. As a result, large number of costs may occur on some platforms. Therefore, the default value is set to **off**.
- **off** indicates that the statistics collection function is disabled.

**Default value:** off

## track\_functions

**Parameter description:** Collects statistics of the number and duration of function invocations.

This is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

When the SQL functions are set to inline functions queried by the invoking, these SQL functions cannot be traced no matter these functions are set or not.

---

**Value range:** enumerated values

- **pl** indicates that only procedural language functions are traced.
- **none** indicates that the function tracing function is disabled.

**Default value:** none

## track\_activity\_query\_size

**Parameter description:** Specifies byte counts of the current running commands used to trace each active session. If the actual number of bytes in a command is greater than the value of this parameter, the command is truncated.

**Parameter type:** integer.

**Unit:** byte

**Value range:** 100 to 102400

**Default value:** 1024

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Set this parameter based on the actual service scenario.

## update\_process\_title

**Parameter description:** Collects statistics updated with a thread name each time the server receives a new SQL statement.

The thread name can be viewed on Windows task manager by running the **ps** command.

This is an INTERNAL parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** off

## stats\_temp\_directory

**Parameter description:** Specifies the directory for storing temporary statistics. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

If a RAM-based file system directory is used, the actual I/O cost can be lowered and the performance can be improved.

---

**Value range:** a string

**Default value:** pg\_stat\_tmp

## track\_thread\_wait\_status\_interval

**Parameter description:** Specifies the interval of collecting the thread status information.

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1440. The unit is min.

**Default value:** 30min

## enable\_save\_datachanged\_timestamp

**Parameter description:** Specifies whether to record the time when **INSERT**, **UPDATE**, **DELETE**, or **EXCHANGE/TRUNCATE/DROP PARTITION** is performed on table data.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the time when an operation is performed on table data will be recorded.
- **off** indicates that the time when an operation is performed on table data will not be recorded.

**Default value:** on

## plan\_collect\_thresh

**Parameter description:** Collects statistics about the plans that are being executed in each session.

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

- **-1:** Plans that are being executed are not collected.
- **0:** Plans that are being executed are collected before plan execution.
- A value greater than **0** indicates that when the total number of tuples incrementally returned by all operators in a plan is greater than or equal to the value of this parameter, plans that are being executed are collected once.

**Default value:** 0

## track\_sql\_count

**Parameter description:** Collects statistics on the statements (**SELECT**, **INSERT**, **UPDATE**, **MERGE INTO**, and **DELETE**) that are being executed in a session.

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the statistics collection function is disabled.

**Default value:** on

### NOTE

If this parameter is disabled, the query result is 0.

### 14.3.11.2 Hotspot Key Statistics

In the distributed architecture, if applications access a node in a short period of time, the resource usage of the node is too high, affecting the normal running of the database. GaussDB provides the function of quickly detecting hotspot keys to quickly determine whether there are hotspot keys and the distribution of hotspot keys.

#### `enable_hotkeys_collection`

**Parameter description:** Specifies whether to automatically collect statistics on the accessed key values in the database.

 **NOTE**

If you set parameters using `gs_guc` set, you need to restart the database for the GUC parameters to take effect. During the restart, hotspot key information is cleared.

When the GUC parameter is disabled, the query result of the hotspot key is empty and a message is displayed indicating that the GUC parameter is disabled. However, when the function is disabled, the hotspot key clearance API can still be used.

**Parameter type:** Boolean

**Unit:** none

**Value range:**

- **on** indicates that the statistics collection function is enabled.
- **off** indicates that the auditing function is disabled.

**Default value:** **off**

**Setting method:** This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Enable this parameter when the hotspot detection function is required. After this parameter is enabled, the TPC-C performance deteriorates by less than 5%, and each instance occupies 500 MB memory resources.

### 14.3.12 Autovacuum

The autovacuum thread automatically runs the **VACUUM** and **ANALYZE** statements to recycle the record space marked as deleted and update statistics about the table.

An autovacuum thread contains the VACUUM and ANALYZE processes. The **autovacuum\_naptime** parameter specifies the interval between them. The default interval is 10 minutes. You can set the interval based on the actual situation. The interval cannot be completely accurate. It depends on the hardware conditions and load of the environment. If a large amount of data needs to be vacuumed, the heavy load may delay the ANALYZE process. It also depends on the values of **autovacuum\_naptime** and **autovacuum\_max\_workers**. **autovacuum\_naptime** specifies the execution interval. A smaller value indicates a shorter execution interval. However, data vacuuming and statistics calculation involved increase the CPU usage, memory usage, and I/O overhead. **autovacuum\_max\_workers** specifies the maximum number of concurrent automatic cleanup threads. A larger

value makes the parameter more compatible with **autovacuum\_naptime**, but the CPU usage, memory usage, and I/O overhead also increase.

## autovacuum

**Parameter description:** Specifies whether to start the autovacuum thread in the database. Ensure that the **track\_counts** parameter is set to **on** before starting the autovacuum thread.

### NOTE

- Set **autovacuum** to **on** if you expect the system to automatically clean up two-phase transactions after recovering from faults.
- If **autovacuum** is set to **on** and **autovacuum\_max\_workers** to **0**, the system does not automatically perform autovacuum. Instead, the system automatically cleans up two-phase transactions after recovering from faults.
- If **autovacuum** is set to **on** and **autovacuum\_max\_workers** to a value greater than **0**, the system not only automatically cleans up two-phase transactions but also automatically performs autovacuum after recovering from faults.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the autovacuum thread is started.
- **off** indicates that the autovacuum thread is not started.

**Default value:** on

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

## autovacuum\_mode

**Parameter description:** Specifies whether the autoanalyze and autovacuum function are enabled. This parameter is valid only when **autovacuum** is set to **on**.

**Value type:** enumerated type

**Unit:** none

**Value range:** **analyze**, **vacuum**, **mix**, and **none**

- **analyze** indicates that only autoanalyze is performed.
- **vacuum** indicates that only autovacuum is performed.
- **mix** indicates that both autoanalyze and autovacuum are performed.
- **none** indicates that neither autoanalyze nor autovacuum is performed.

**Default value:** mix

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## autoanalyze\_timeout

**Parameter description:** Specifies the timeout interval of autoanalyze. If the duration of autoanalyze on a table exceeds the value of **autoanalyze\_timeout**, the autoanalyze operation is automatically canceled.

The timeout check cannot be completely accurate. In principle, the statistics on each CN must be consistent. Therefore, the synchronization between CNs will not be interrupted even if the synchronization times out. As a result, the actual execution time may exceed the user-defined time.

**Parameter type:** integer.

**Unit:** second

**Value range:** 0 to 2147483. The value **0** indicates that no timeout occurs.

**Default value:** 300

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## autovacuum\_io\_limits

**Parameter description:** Specifies the upper limit of I/Os triggered by the autovacuum thread per second.

**Parameter type:** integer.

**Unit:** none

**Value range:** -1 to 1073741823. -1 indicates that the default Cgroup is used.

**Default value:** -1

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

## log\_autovacuum\_min\_duration

**Parameter description:** Records each step performed by the autovacuum process to the server log when the execution time of the autovacuum process is greater than or equal to a certain value. This parameter helps track the autovacuum behavior.

For example, set the **log\_autovacuum\_min\_duration** parameter to **250ms** to record the information about the autovacuum commands running longer than or equal to 250 ms.

**Parameter type:** integer.

**Unit:** millisecond

**Value range:** -1 to 2147483647.

- **0** indicates that all autovacuum actions are recorded in the log.
- **-1** indicates that all autovacuum actions are not recorded in the log.

- A value other than **-1** indicates that a message is recorded when an autovacuum action is skipped due to a lock conflict. (The reason for skipping autovacuum is recorded for audit.)

**Default value:** **-1**

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** The default value is **-1**. If the autovacuum operation needs to be recorded in logs, set this parameter to a value other than **-1**.

## autovacuum\_max\_workers

**Parameter description:** Specifies the maximum number of autovacuum worker threads that can run at the same time. The upper limit of this parameter is related to the values of **max\_connections** and **job\_queue\_processes**.

**Parameter type:** integer.

**Unit:** none

**Value range:** The minimum value is **0**, indicating that autovacuum is not enabled. The theoretical maximum value is **262143**, but the actual maximum value is a dynamic value calculated by the following formula:  $262143 - \text{Value of } \mathbf{max\_inner\_tool\_connections} - \text{Value of } \mathbf{max\_connections} - \text{Value of } \mathbf{max\_concurrent\_autonomous\_transactions} - \text{Value of } \mathbf{job\_queue\_processes} - \text{Number of auxiliary threads} - \text{Number of autovacuum launcher threads} - 1$ . The number of auxiliary threads and the number of autovacuum launcher threads are specified by two macros. Their default values are **20** and **2** respectively.

**Default value:** **3**

**Adjustment suggestion:** If this parameter is set to a larger value, more autovacuum processes are created and more CPU and memory resources are occupied. Therefore, you are advised not to set this parameter to a large value. Otherwise, memory cannot be allocated or too many CPU resources are occupied, causing database startup errors or affecting services.

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

## autovacuum\_naptime

**Parameter description:** Specifies the interval between activity rounds for the autovacuum process.

**Parameter type:** integer.

**Unit:** second

**Value range:** 1 to 2147483.

**Default value:** **10min** (that is, 600s)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#). For example, if the value is **600** without a unit, **autovacuum\_naptime** indicates 600s. If the value is **10min**, **autovacuum\_naptime** indicates 10 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

**Setting suggestion:** Retain the default value.

## autovacuum\_vacuum\_threshold

**Parameter description:** Used to calculate the threshold for triggering VACUUM. The formula is as follows: **autovacuum\_vacuum\_threshold** + **reltuples** (number of tuples in a table) x **autovacuum\_vacuum\_scale\_factor**. When the number of deleted or updated records in a table exceeds the threshold, the VACUUM operation is executed on this table.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 2147483647

**Default value:** 50

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## autovacuum\_analyze\_threshold

**Parameter description:** Used to calculate the threshold for triggering the ANALYZE operation. The formula is as follows: **autovacuum\_analyze\_threshold** + **reltuples** (number of tuples in a table) x **autovacuum\_analyze\_scale\_factor**. When the number of deleted, inserted, or updated records in a table exceeds the threshold, the ANALYZE operation is executed on this table. If a global secondary index exists in a table, the ANALYZE operation is performed on the global secondary index only when the number of deleted, inserted, and updated records in the table exceeds the threshold 20 times.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 2147483647

**Default value:** 50

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## autovacuum\_vacuum\_scale\_factor

**Parameter description:** The scale factor for vacuuming a table, which is used to calculate the threshold for triggering VACUUM. The formula is as follows: **autovacuum\_vacuum\_threshold** + **reltuples** (number of tuples in a table) x **autovacuum\_vacuum\_scale\_factor**. When the number of deleted or updated records in a table exceeds the threshold, the VACUUM operation is executed on this table.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0.0 to 100.0

**Default value:** 0.2

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** A larger value makes it harder to trigger VACUUM, which has less impact on performance.

## autovacuum\_analyze\_scale\_factor

**Parameter description:** Specifies the scale factor for analyzing a table, which is used to calculate the threshold for executing ANALYZE. The formula is as follows: **autovacuum\_analyze\_threshold + reltuples** (number of tuples in the table) x **autovacuum\_analyze\_scale\_factor**. When the number of deleted, inserted, or updated records in a table exceeds the threshold, the ANALYZE operation is executed on this table.

**Parameter type:** floating-point.

**Unit:** none

**Value range:** 0.0 to 100.0

**Default value:** 0.1

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** A larger value makes it harder to trigger ANALYZE, which has less impact on performance.

## autovacuum\_freeze\_max\_age

**Parameter description:** Specifies the maximum age (in transactions) that an Astore table's **pg\_class.relfrozensid** field can retain before a VACUUM operation is forcibly performed.

- The old files under the subdirectory of **pg\_clog/** can also be deleted by the VACUUM operation.
- Even if the autovacuum thread is not started, the system will call the thread.

**Parameter type:** long integer

**Unit:** none

**Value range:** 100000 to 576460752303423487

**Default value:** 4000000000

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

## autovacuum\_vacuum\_cost\_delay

**Parameter description:** Specifies the value of the cost delay used in the autovacuum operation.

**Parameter type:** integer.

**Unit:** ms

**Value range:** -1 to 100. -1 indicates that the regular vacuum cost delay is used.

**Default value:** 20

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

### autovacuum\_vacuum\_cost\_limit

**Parameter description:** Sets the value of the cost limit used in the autovacuum operation.

**Parameter type:** integer.

**Unit:** none

**Value range:** -1 to 10000. -1 indicates that the regular vacuum cost limit is used.

**Default value:** -1

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

### twophase\_clean\_workers

**Parameter description:** Specifies the maximum number of concurrent cleanup operations that can be performed by the gs\_clean tool.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 10

**Default value:** 3

### defer\_csn\_cleanup\_time

**Parameter description:** Specifies the local recycling interval.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 5s (5000 ms)

## 14.3.13 Default Settings of Client Connection

### 14.3.13.1 Statement Behavior

This section describes related default parameters involved in the execution of SQL statements.

### search\_path

**Parameter description:** Specifies the order in which schemas are searched when an object is referenced with no schema specified. The value of this parameter

consists of one or more schema names. Different schema names are separated by commas (,).

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

- If the schema of temporary tables exists in the current session, the schemas can be listed in **search\_path** by using the alias **pg\_temp**, for example, '**pg\_temp,public**'. The schema of temporary tables has the highest search priority and is always searched before all the other schemas specified in **pg\_catalog** and **search\_path**. Therefore, do not explicitly specify **pg\_temp** to be searched after other schemas in **search\_path**. This setting will not take effect and an error message will be displayed. If the alias **pg\_temp** is used, the temporary schema will be searched only for tables, views, and data types, and not for functions or operators.
- The system catalog schema, **pg\_catalog**, has the second highest search priority and is the first to be searched among all the schemas, excluding **pg\_temp**, specified in **search\_path**. Therefore, do not explicitly specify **pg\_catalog** to be searched after other schemas in **search\_path**. This setting will not take effect and an error message will be displayed.
- When an object is created without a specific target schema, the object will be placed in the first valid schema listed in **search\_path**. An error is reported if the search path is empty.
- The current effective value of the search path can be examined through the SQL function **current\_schema**. This is different from examining the value of **search\_path**, because the **current\_schema** function displays the first valid schema name in **search\_path**.

**Value range:** a string

 **NOTE**

- When this parameter is set to "**\$user**", **public**, shared use of a database (where no users have private schemas, and all share use of public), private per-user schemas and combinations of them are supported. Other effects can be obtained by modifying the default search path setting, either globally or per-user.
- When this parameter is set to a null string (""), the system automatically converts it into a pair of double quotation marks ("").
- If the content contains double quotation marks, the system considers them as insecure characters and converts each double quotation mark into a pair of double quotation marks.

**Default value:** "**\$user**",**public**

 **NOTE**

**\$user** indicates the name of the schema with the same name as the current session user. If the schema does not exist, **\$user** will be ignored.

## current\_schema

**Parameter description:** Specifies the current schema.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** "**\$user**",**public**

 NOTE

**\$user** indicates the name of the schema with the same name as the current session user. If the schema does not exist, **\$user** will be ignored.

If you need to obtain a schema during kernel development, use the value of **search\_path** because the schema is determined by **search\_path**. For compatibility, **current\_schema** is used only to modify the value of **search\_path**.

## default\_tablespace

**Parameter description:** Specifies the default tablespace of the created objects (tables and indexes) when a **CREATE** command does not explicitly specify a tablespace.

- The value of this parameter is either the name of a tablespace, or an empty string that indicates the use of the default tablespace of the current database. If a non-default tablespace is specified, users must have CREATE privilege for it. Otherwise, creation attempts will fail.
- This parameter is not used for temporary tables. For them, the [temp\\_tablespaces](#) is used instead.
- This parameter is not used when users create databases. By default, a new database inherits its tablespace setting from the template database.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that the default tablespace is used.

**Default value:** empty

## default\_storage\_nodegroup

**Parameter description:** Specifies the node group where a table is created by default. This parameter takes effect only for ordinary tables.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

- **installation** indicates that tables will be created in the node group created during database installation.
- A value other than **installation** indicates that tables will be created in the node group specified by this parameter.

**Value range:** a string

**Default value:** installation

## temp\_tablespaces

**Parameter description:** Specifies one or more tablespaces to which temporary objects (temporary tables and their indexes) will be created when a CREATE command does not explicitly specify a tablespace. Temporary files for sorting large data sets are created in these tablespaces.

The value of this parameter can be a list of names of tablespaces. When there is more than one name in the list, GaussDB chooses a random tablespace from the

list upon the creation of a temporary object each time. However, within a transaction, successively created temporary objects are placed in successive tablespaces in the list. If the element selected from the list is an empty string, GaussDB will automatically use the default tablespace of the current database instead.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. An empty string indicates that all temporary objects are created only in the default tablespace of the current database. For details, see [default\\_tablespace](#).

**Default value:** empty

## check\_function\_bodies

**Parameter description:** Specifies whether to enable validation of the function body string during the execution of **CREATE FUNCTION**. Verification is occasionally disabled to avoid problems, such as forward references when you restore function definitions from a dump. After the function is enabled, the word syntax of the PL/SQL in the stored procedure is verified, including the data type, statement, and expression. The SQL statements in the stored procedure are not checked in the CREATE phase. Instead, they are checked during running.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that validation of the function body string is enabled during the execution of **CREATE FUNCTION**.
- **off** indicates that validation of the function body string is disabled during the execution of **CREATE FUNCTION**.

**Default value:** on

## default\_transaction\_isolation

**Parameter description:** Specifies the default isolation level of each transaction.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

### NOTE

The current version does not support the setting of the default transaction isolation level. The default value is **read committed**. Do not change the value.

**Value range:** enumerated values

- **read committed** indicates that the data read by a transaction is committed at the moment it is read.
- **repeatable read** indicates that the transaction can be repeatedly read.
- **serializable:** Currently, this isolation level is not supported in GaussDB. It is equivalent to **repeatable read**.

**Default value:** read committed

## default\_transaction\_read\_only

**Parameter description:** Specifies whether each new transaction is in read-only state.

---

 **CAUTION**

If this parameter is set to **on**, the DML and write transactions cannot be executed.

---

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the transaction is in read-only state.
- **off** indicates that the transaction is not in read-only state.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

## default\_transaction\_deferrable

**Parameter description:** Specifies the default deferrable status of each new transaction. It currently has no effect on read-only transactions or those running at isolation levels lower than serializable.

GaussDB does not support the serializable isolation level. Therefore, the parameter takes no effect.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a transaction is delayed by default.
- **off** indicates that a transaction is not delayed by default.

**Default value:** off

## session\_replication\_role

**Parameter description:** Specifies the behavior of replication-related triggers and rules for the current session.

This is a SUSERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

**NOTICE**

Setting this parameter will discard all the cached execution plans.

---

**Value range:** enumerated values

- **origin** indicates that the system copies operations such as insert, delete, and update from the current session.
- **replica** indicates that the system copies operations such as insert, delete, and update from other places to the current session.
- **local** indicates that the system will detect the role that has logged in to the database when using the function to copy operations and will perform related operations.

**Default value:** origin

## statement\_timeout

**Parameter description:** If the statement execution time (starting from the time the server receives the command) is longer than the duration specified by the parameter, error information is displayed and the statement exits.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). The default value is 0, indicating that the parameter does not take effect.

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 0

## vacuum\_freeze\_min\_age

**Parameter description:** Specifies whether VACUUM replaces the **xmin** column of a record with **FrozenXID** when scanning a table (in the same transaction).

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 576460752303423487

### NOTE

Although you can set this parameter to any value, VACUUM will limit the effective value to 50% of [autovacuum\\_freeze\\_max\\_age](#) by default.

**Default value:** 2000000000

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

## vacuum\_freeze\_table\_age

**Parameter description:** Specifies when VACUUM scans the whole table and freezes old tuples. VACUUM performs a full table scan if the difference between the current transaction ID and the value of **pg\_class.relfrozensid64** is greater than the specified time.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 576460752303423487

 NOTE

Although you can set this parameter to any value, **VACUUM** will limit the effective value to 95% of **autovacuum\_freeze\_max\_age** by default. Therefore, a periodic manual VACUUM has a chance to run before an anti-wraparound autovacuum is launched for the table.

**Default value:** 400000000

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

## bytea\_output

**Parameter description:** Specifies the output format for values of the bytea type.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **hex** indicates that the binary data is converted to hexadecimal format.
- **escape** uses ASCII character sequences to represent binary strings, and converts those binary strings that cannot be represented as ASCII characters into special escape sequences.

**Default value:** hex

## xmlbinary

**Parameter description:** Specifies how binary values are to be encoded in XML.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

 NOTE

Currently, this parameter does not support data of the XML type.

**Value range:** enumerated values

- base64
- hex

**Default value:** base64

## xmloption

**Parameter description:** Specifies whether DOCUMENT or CONTENT is implicit when converting between XML and string values.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

 NOTE

Currently, this parameter does not support data of the XML type.

**Value range:** enumerated values

- **document** indicates an HTML document.
- **content** indicates a common string.

**Default value:** content

## max\_compile\_functions

**Parameter description:** Specifies the maximum number of function compilation results stored in the server.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 2147483647.

**Default value:** 1000

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Excessive functions and compilation results of stored procedures may occupy large memory space. Setting this parameter to a proper value can reduce the memory usage and improve system performance.

### 14.3.13.2 Locale and Formatting

This section describes parameters related to the time format setting.

#### DateStyle

**Parameter description:** Specifies the display format for date and time values, as well as the rules for interpreting ambiguous date input values.

This variable contains two independent components: the output format declaration (ISO, Postgres, SQL, or German) and the input/output order of year/month/day (DMY, MDY, YMD, Euro, European, US, NonEuro, NonEuropean, or Default). The two components can be set separately or together. The keywords Euro and European are synonyms for DMY; the keywords US, NonEuro, and NonEuropean are synonyms for MDY.

**Parameter type:** string.

**Unit:** none

**Value range:** combination of the output format declaration and the input/output order of year/month/day. (The two components can be set separately.)

- Output format declaration: ISO, Postgres, SQL, or German
- Input/Output order of year/month/day: DMY (Euro, European), MDY (US, NonEuro, NonEuropean), or YMD

**Default value:** "ISO, MDY"

 NOTE

**gs\_initdb** will initialize this parameter so that its value is the same as that of **lc\_time**.

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** The ISO format is recommended.

## IntervalStyle

**Parameter description:** Specifies the display format for interval values.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **sql\_standard** indicates that output matching SQL standards will be generated.
- **postgres** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **ISO**.
- **postgres\_verbose** indicates that output matching PostgreSQL 8.4 will be generated when the **DateStyle** parameter is set to **non\_ISO**.
- **iso\_8601** indicates that output matching the time interval "format with designators" defined in ISO 8601 will be generated.
- **oracle** indicates the output that matches the numtodsinterval function in the Oracle Database. For details, see "SQL Reference > Functions and Operators > Date and Time Processing Functions and Operators > numtodsinterval" in *Developer Guide*.

---

**NOTICE**

The **IntervalStyle** parameter also affects the interpretation of ambiguous interval input.

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

---

**Default value:** postgres

## TimeZone

**Parameter description:** Specifies the time zone for displaying and interpreting timestamps.

**Parameter type:** string.

**Unit:** none

**Value range:** You can query the PG\_TIMEZONE\_NAMES view to obtain the value. For details, see "System Catalogs and System Views > System Views > PG\_TIMEZONE\_NAMES" in *Developer Guide*.

**Default value:**

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

 NOTE

**gs\_initdb** will set a time zone value that is consistent with the system environment.

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

## timezone\_abbreviations

**Parameter description:** Specifies the time zone abbreviations that will be accepted by the server.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. **India**, **Australia**, or **Default**.

**Default value:** **Default**

 NOTE

**Default** indicates abbreviations that work in most of the world. There are also other abbreviations, such as '**Australia**' and '**India**' that can be defined for a particular installation.

## extra\_float\_digits

**Parameter description:** Adjusts the number of digits displayed for floating-point values, including float4, float8, and geometric data types. The parameter value is added to the standard number of digits (FLT\_DIG or DBL\_DIG as appropriate).

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -15 to 3

 NOTE

- This parameter can be set to **3** to include partially-significant digits. It is especially useful for dumping float data that needs to be restored exactly.
- This parameter can also be set to a negative value to suppress unwanted digits.

**Default value:** **0**

## client\_encoding

**Parameter description:** Specifies the client-side encoding (character set).

Set this parameter based on the situation of the front-end services. Try to keep the encoding consistent on the client and server to improve efficiency.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** encoding compatible with PostgreSQL. **UTF8** indicates that the database encoding is used.

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required. The sorting rules may vary according to OSs or versions of the same OS. When application services are logically migrated between these OSs, differences and changes in OS sorting rules may cause differences in database functions such as indexes, partitions, and sorting operators. For example, data result sets returned by a same range query statement are different, or query results returned by a same sorting query statement are different. The application service needs to check whether the service data contains related characters based on the locale differences released by the OS.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- To use consistent encoding for communication within the cluster, you are advised to retain the default value of **client\_encoding**. Modification to this parameter in the **gaussdb.conf** file (by using the **gs\_guc** tool, for example) does not take effect.
- **client\_encoding** can be set to **GB18030\_2022**. When **client\_encoding** is set to **gb18030\_2022**, ensure that the GB18030 character set supported by the client OS has been upgraded to version 2022.
- If the encoding format of the database character set is UTF8, the encoding format of the region supported by the current system is GB18030, the GB18030 character set supported by the client OS has been upgraded to version 2022, and the database contains historical data stored before the GB18030 character set is upgraded, the following situations may occur:
  1. When **client\_encoding** is set to **gb18030**, the character encoding of historical data in the UTF8 database returned to the client is the same as that before the client character set is upgraded. However, the font of 38 characters whose mapping changes during the character set upgrade is the same as that in version 2022.
  2. When **client\_encoding** is set to **gb18030\_2022**, the character encoding of historical data in the UTF8 database returned to the client are the same as that after the upgrade of the client character set and the font of characters are the same as that before the upgrade. This is because the versions of the GB18030 character set are not completely compatible, which may cause data inconsistency. Therefore, if the GB18030 character set needs to be upgraded on the client and historical data exists, you need to convert the historical data before the upgrade.
- **client\_encoding** can be set to **ZHS16GBK**. The following table lists the setting methods of **server\_encoding** and **client\_encoding** corresponding to all ways that ZHS16GBK, GB18030, and GB18030\_2022 character sets can be transformed.

server_encoding	server_encoding	locale	Setting Method
zhs16gbk	utf8	utf8	The database automatically obtains the value of <b>locale</b> .
utf8	zhs16gbk	gbk	<ul style="list-style-type: none"> <li>• Users use <code>gsq</code> to manually set <b>client_encoding</b> to <b>zhs16gbk</b>.</li> <li>• When <code>JDBC</code> is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>zhs16gbk</b>.</li> </ul>
zhs16gbk	zhs16gbk	gbk	<ul style="list-style-type: none"> <li>• When <code>gsq</code> is used for connection, the database automatically obtains the value of <b>locale</b>. After internal processing, <b>client_encoding</b> is automatically set to <b>zhs16gbk</b>.</li> <li>• When <code>JDBC</code> is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>zhs16gbk</b>.</li> </ul>

server_encoding	server_encoding	locale	Setting Method
zhs16gbk	gb18030	gb18030	<ul style="list-style-type: none"> <li>When gsql is used for connection, the database automatically obtains the value of <b>locale</b>.</li> <li>When JDBC is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>gb18030</b>.</li> </ul>
gb18030	zhs16gbk	gbk	<ul style="list-style-type: none"> <li>gsql does not support this setting.</li> <li>When JDBC is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>zhs16gbk</b>.</li> </ul>
zhs16gbk	gb18030-2022	gb18030	<ul style="list-style-type: none"> <li>When gsql is used for connection, users manually set <b>client_encoding</b> to <b>gb18030_2022</b>.</li> <li>When JDBC is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>gb18030_2022</b>.</li> </ul>

server_encoding	server_encoding	locale	Setting Method
gb18030-2022	zhs16gbk	gbk	<ul style="list-style-type: none"> <li>• gsql does not support this setting.</li> <li>• When JDBC is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>zhs16gbk</b>.</li> </ul>
gb18030	utf8	utf8	The database automatically obtains the value of <b>locale</b> .
utf8	gb18030	gb18030	<ul style="list-style-type: none"> <li>• The database automatically obtains the value of <b>locale</b>.</li> <li>• When JDBC is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>gb18030</b>.</li> </ul>
gb18030_2022	utf8	utf8	The database automatically obtains the value of <b>locale</b> .

server_encoding	server_encoding	locale	Setting Method
utf8	gb18030_2022	gb18030	<ul style="list-style-type: none"> <li>• When <code>gsql</code> is used for connection, users manually set <b>client_encoding</b> to <b>gb18030_2022</b>.</li> <li>• When <code>JDBC</code> is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>gb18030_2022</b>.</li> </ul>
gb18030	gb18030	gb18030	<ul style="list-style-type: none"> <li>• The database automatically obtains the value of <b>locale</b>.</li> <li>• When <code>JDBC</code> is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>gb18030</b>.</li> </ul>

server_encoding	server_encoding	locale	Setting Method
gb18030_2022	gb18030_2022	gb18030	<ul style="list-style-type: none"> <li>When <code>gsql</code> is used for connection, the database automatically obtains the value of <b>locale</b>. After internal processing, <b>client_encoding</b> is automatically set to <b>gb18030_2022</b>.</li> <li>When <code>JDBC</code> is used for connection, the URL parameter is used to set <b>characterEncoding</b> to <b>gb18030_2022</b>.</li> </ul>

**Default value:** UTF8

**Recommended value:** SQL\_ASCII or UTF8

## lc\_messages

**Parameter description:** Specifies the language in which messages are displayed.

- Acceptable values are system-related.
- On some systems, this locale category does not exist. Setting this variable will still work, but there will be no effect. In addition, translated messages for the desired language may not exist. In this case, you can still see the English messages.

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

**Default value:** C

## lc\_monetary

**Parameter description:** Specifies the display format of monetary values. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

**Default value:** C

## lc\_numeric

**Parameter description:** Specifies the display format of numbers. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

### NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

**Default value:** C

## lc\_time

**Parameter description:** Specifies the display format of time and locale. It affects the output of functions such as **to\_char**. Acceptable values are system-related.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**NOTE**

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs\_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

**Default value:** C**lc\_time\_names**

**Parameter description:** Specifies the language used to display names and abbreviations of dates and months. The output of the DATE\_FORMAT(), DAYNAME(), and MONTHNAME() functions is affected. The performance of STR\_TO\_DATE() and GET\_FORMAT() is not affected.

**Parameter type:** string.**Unit:** none**Value range:** IETF language tags in simple format, such as **en\_US** or **zh\_CN**.**Default value:** en\_US**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Setting Parameters](#).**Setting suggestion:** Switch the language based on service requirements.**default\_week\_format**

**Parameter description:** Specifies the default **mode** value of the week() function. The following table lists the value range and description.

default_week_format	First Day of a Week	Range	First Week Definition
0	Sunday	0 to 53	The first week that contains a Sunday in this year.
1	Monday	0 to 53	The first week that contains four or more days in this year.
2	Sunday	1 to 53	The first week that contains a Sunday in this year.

default_week_for_mat	First Day of a Week	Range	First Week Definition
3	Monday	1 to 53	The first week that contains four or more days in this year.
4	Sunday	0 to 53	The first week that contains four or more days in this year.
5	Monday	0 to 53	The first week that contains a Monday in this year.
6	Sunday	1 to 53	The first week that contains four or more days in this year.
7	Monday	1 to 53	The first week that contains a Monday in this year.

**NOTE**

For week 1 of a year, the number 1 indicates a week number. The week number of the first week of a year may be 0, depending on the value of **week\_format**, as shown in the third column.

**Parameter type:** integer.

**Unit:** none

**Value range:** [0,7]

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Setting Parameters](#).

**Setting suggestion:** Select a mode based on service requirements.

### 14.3.13.3 Other Default Parameters

This section describes the default database loading parameters.

#### dynamic\_library\_path

**Parameter description:** Specifies the path that the system will search for a shared database file that is dynamically loadable. When a dynamically loadable module needs to be opened and the file name specified in the **CREATE FUNCTION** or **LOAD** command does not contain a directory, the system will search this path for the required file. Only the sysadmin user can access this parameter.

The value of **dynamic\_library\_path** must be a list of absolute paths separated by colons (:) or by semi-colons (;) on the Windows OS. When the name of a path

starts with the special variable `$libdir`, the variable will be replaced with the directory in which the module provided by the GaussDB is installed. For example:  
`dynamic_library_path = '/usr/local/lib/gaussdb:/opt/testgs/lib:$libdir'`

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** string

 **NOTE**

If the value of this parameter is set to an empty character string, the automatic path search is turned off. The dynamic library search paths specified by **local\_preload\_libraries** and **shared\_preload\_libraries** also depend on this parameter. If this parameter is left blank or set to an invalid path, the dynamic libraries fail to be loaded, which will result in abnormal database services.

**Default value:** `$libdir`

## local\_preload\_libraries

**Parameter description:** Specifies one or more shared libraries that are to be preloaded at connection start. If multiple libraries are to be loaded, separate their names with commas (,). All library names are converted to lower case unless double-quoted.

- Any user can change this option. Therefore, library files that can be loaded are restricted to those saved in the **plugins** subdirectory of the standard library installation directory. It is the database administrator's responsibility to ensure that libraries in this directory are all safe. Entries in **local\_preload\_libraries** can specify the library directory explicitly, for example, `$libdir/plugins/mylib`, or just specify the library name, for example, `mylib`. (`mylib` is equivalent to `$libdir/plugins/mylib`.)
- Unlike **shared\_preload\_libraries**, there are no differences in performance between loading a module at session start or doing this during the session. The intent of this feature is to allow debugging or performance-measurement libraries to be loaded into specific sessions without an explicit `LOAD` command. For example, debugging can be enabled under a given user name by setting this parameter to **ALTER USER SET**.
- If a specified library is not found, the connection attempt will fail. If the configuration is incorrect (for example, the length exceeds the limit or the directory is invalid), the process cannot be started properly.
- Every GaussDB-supported library has a "magic block" that is checked to guarantee compatibility. For this reason, non-GaussDB-supported libraries cannot be loaded in this way.

This is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** string

**Default value:** empty

## 14.3.14 Lock Management

In GaussDB, a deadlock may occur when concurrently executed transactions compete for resources. This section describes parameters used for managing transaction locks.

## deadlock\_timeout

**Parameter description:** Specifies the deadlock timeout interval. When the applied lock exceeds the preset value, the system will check whether a deadlock occurs. This parameter takes effect only for common locks.

**Parameter type:** integer.

**Unit:** ms

**Value range:** 1 to 2147483647.

**Default value:** 1s

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:**

- The check for deadlock is relatively expensive. Therefore, the server does not check it when waiting for a lock every time. Deadlocks seldom occur when the system is running. Therefore, the system just needs to wait on the lock for a while before checking for deadlocks. Increasing the value of **deadlock\_timeout** reduces the time wasted in deadlock check, but slows down reporting of real deadlock errors. On a heavily loaded server, you may need to set **deadlock\_timeout** to a larger value. It is recommended that this value exceed the transaction time to avoid deadlock check before locks are released.
- When [log\\_lock\\_waits](#) is set to **on**, **deadlock\_timeout** determines a waiting time to write the lock waiting time information during query execution to logs. To study the lock delay, you can set **deadlock\_timeout** to a value smaller than the normal value.

## lockwait\_timeout

**Parameter description:** Specifies the timeout for attempts to acquire a lock. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

**Parameter type:** integer.

**Unit:** ms

**Value range:** 0 to 2147483647

**Default value:** 20min

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#). For example, if the value is **900** without a unit, **lockwait\_timeout** indicates 900 ms. If the value is **20min**, **lockwait\_timeout** indicates 20 minutes. If the unit is required, the value must be **ms**, **s**, **min**, **h**, or **d**.

**Setting suggestion:** Retain the default value. Alternatively, set this parameter based on the service requirements.

## update\_lockwait\_timeout

**Parameter description:** Specifies the maximum duration that a lock waits for concurrent updates on a row to complete when the concurrent update feature is

enabled. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

**Parameter type:** integer.

**Unit:** ms

**Value range:** 0 to 2147483647

**Default value:** 2min (120000 ms)

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 14-1](#). For example, if the value is **900** without a unit, **update\_lockwait\_timeout** indicates 900 ms. If the value is **2min**, **update\_lockwait\_timeout** indicates 2 minutes. If the unit is required, the value must be **ms**, **s**, **min**, **h**, or **d**.

**Setting suggestion:** Observe the workload of transactions that concurrently update the same row. For common TP services, the execution time is less than two minutes. In this case, the probability of false positives is low. If a large number of transactions concurrently update the same row and the execution time exceeds two minutes, you can increase the value of this parameter to prevent false positives due to lock timeout.

## max\_locks\_per\_transaction

**Parameter description:** Determines the average number of object locks allocated to each transaction.

**Parameter type:** integer.

**Unit:** none

**Value range:** 10 to 2147483647

**Default value:** 256

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:**

- The maximum number of hash tables that can be locked by a shared lock at any time is calculated based on an assumption: **max\_locks\_per\_transaction** × (**max\_connections** + **max\_prepared\_transactions**) and **max\_locks\_per\_transaction** ≥ Number of concurrent service transactions × Number of object locks added by each service transaction / (**max\_connections** + **max\_prepared\_transactions**). In this case an upper limit is determined for this parameter.
- Within the specified range, objects can be locked simultaneously at any time. You may need to increase the value of this parameter if many different tables are modified in a single transaction.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows, leading to database startup failure.
- When running a standby node, you must set this parameter to a value that is no less than that on the primary node. Otherwise, queries will not be allowed on the standby node.

## max\_pred\_locks\_per\_transaction

**Parameter description:** Specifies the average number of predicate locks allocated for each transaction.

- The size of the shared predicate lock table is calculated under the condition that a maximum of  $N$  independent objects need to be locked at any time.  $N = \text{max\_pred\_locks\_per\_transaction} \times (\text{max\_connections} + \text{max\_prepared\_transactions})$ . Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at server start.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 2147483647

**Default value:** 64

## gs\_clean\_timeout

**Parameter description:** Controls the average interval between `gs_clean` callings by the Coordinator.

- Transactions in GaussDB are committed in two phases. An unfinished two-phase transaction may hold a table-level lock, keeping tables from being locked by other connections. In this case, the database needs to call the `gs_clean` tool to clean unfinished two-phase transactions in cluster. **gs\_clean\_timeout** is used to control the interval for the Coordinator to call the `gs_clean` tool.
- A larger value of this parameter indicates a low frequency of calling `gs_clean` in GaussDB to clean unfinished two-phase transactions.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 1min

## partition\_lock\_upgrade\_timeout

**Parameter description:** Specifies the timeout for attempts to upgrade an exclusive lock (read allowed) to an access exclusive lock (read/write blocked) on a partitioned table during the execution of some query statements. If there are concurrent read transactions running, the lock upgrade will need to wait.

**partition\_lock\_upgrade\_timeout** sets the waiting timeout for lock upgrade attempts.

- When you do **MERGE PARTITION** and **CLUSTER PARTITION** on a partitioned table, temporary tables are used for data rearrangement and file exchange. To concurrently perform as many operations as possible on the partitions, exclusive locks are acquired for the partitions during data rearrangement and access exclusive locks are acquired during file exchange.

- Generally, a partition waits until it acquires a lock, or a timeout occurs if the partition waits for a period longer than the value specified by the **lockwait\_timeout** parameter.
- When doing **MERGE PARTITION** or **CLUSTER PARTITION** on a partitioned table, an access exclusive lock needs to be acquired during file exchange. If the lock fails to be acquired, the acquisition is retried at an interval of 50 ms until timeout occurs. The **partition\_lock\_upgrade\_timeout** parameter specifies the time to wait before the lock acquisition attempt times out.
- If **partition\_lock\_upgrade\_timeout** is set to **-1**, the lock upgrade never times out. The lock upgrade is continuously retried until it succeeds.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 3000. The unit is s.

**Default value:** 1800

## fault\_mon\_timeout

**Parameter description:** Specifies the period for detecting lightweight deadlocks. This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1440. The unit is minute.

**Default value:** 5min

## enable\_online\_ddl\_waitlock

**Parameter description:** Specifies whether to block DDL operations to wait for the release of cluster locks, such as **pg\_advisory\_lock** and **pgxc\_lock\_for\_backup**. This parameter is mainly used in online OM operations and you are advised not to modify the settings.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## xloginsert\_locks

**Parameter description:** Specifies the number of locks on concurrent write-ahead logging. This parameter is used to improve the efficiency of writing write-ahead logs.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 1000. If the CPU uses the NUMA architecture, the value must be an integer multiple of the number of NUMA nodes.

**Default value:** 16

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** When the concurrency pressure of the Arm CPU architecture is high, performance jitter may occur due to atomic operation competition. You can decrease the value of this parameter for stable running performance.

## num\_internal\_lock\_partitions

**Parameter description:** Specifies the number of internal lightweight lock partitions. It is mainly used for performance optimization in various scenarios. The content is organized in the KV format of keywords and numbers. Different types of locks are separated by commas (.). The sequence does not affect the setting result. For example, **CLOG\_PART=256,CSNLOG\_PART=512** is equivalent to **CSNLOG\_PART=512,CLOG\_PART=256**. If you set the same keyword multiple times, only the latest setting takes effect. For example, if you set **CLOG\_PART** to **256** and **CLOG\_PART** to **2**, the value of **CLOG\_PART** is **2**. If no keyword is set, the default value is used. The usage description, maximum value, minimum value, and default value of each lock type are as follows:

- **CLOG\_PART:** number of Clog file controllers. Increasing the value of this parameter improves the Clog writing efficiency and transaction commit performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing Clogs and affect the performance. The value ranges from 1 to 256.
- **CSNLOG\_PART:** number of CSNLOG file controllers. Increasing the value of this parameter improves the CSNLOG writing efficiency and transaction commit performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing CSNLOGs and affect the performance. The value ranges from 1 to 512.
- **LOG2\_LOCKTABLE\_PART:** two logarithms of the number of ordinary table lock partitions. Increasing the value can improve the concurrency of obtaining locks in the normal process, but may increase the time required for transferring and clearing locks. When wait events occur in **LockMgrLock**, you can increase the value to improve the performance. The minimum value is 4, that is, the number of lock partitions is 16. The maximum value is 16, that is, the number of lock partitions is 65536.
- **TWOPHASE\_PART:** number of partitions of the two-phase transaction lock. Increasing the value can increase the number of concurrent two-phase transaction commits. The value ranges from 1 to 64.
- **FASTPATH\_PART:** maximum number of locks that each thread can obtain without using the main lock table. When a partitioned table is read, updated, inserted, or deleted and the wait event is **LockMgrLock**, you can increase the value of this parameter to prevent **LockMgrLock** from being obtained and improve performance. It is recommended that the value be greater than or equal to that calculated using the following formula: Number of partitions x (1 + Number of local indexes) + Number of global indexes + 10. Increasing the value will increase the memory usage. The value ranges from 20 to 10000.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

**Default value:**

- **CLOG\_PART:** 256
- **CSNLOG\_PART:** 512
- **LOG2\_LOCKTABLE\_PART:** 4
- **TWOPHASE\_PART:** 1
- **FASTPATH\_PART:** 20

## **enable\_wait\_exclusive\_lock**

**Parameter description:** Specifies whether to enable the hang detection and cure function for the exclusive lock of ProcArrayLock.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## **barrier\_lock\_timeout**

**Parameter description:** Specifies the timeout interval for holding a barrier lock.

**Parameter type:** integer.

**Unit:** second

**Value range:** 0 to 3600

**Default value:** 30s

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## **enable\_xid\_abort\_check**

**Parameter description:** Specifies whether to verify transaction ID rollback is enabled when a transaction is committed.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** enabled.
- **off:** disabled.

**Default value:** on

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## 14.3.15 Version and Platform Compatibility

### 14.3.15.1 Compatibility with Earlier Versions

This section describes the parameters that control the backward compatibility and external compatibility of GaussDB. A backward compatible database supports applications of earlier versions. This section describes parameters used for controlling backward compatibility of a database.

#### array\_nulls

**Parameter description:** Determines whether the array input parser recognizes unquoted NULL as a null array element.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that null values can be entered in arrays.
- **off** indicates backward compatibility with the old behavior. Arrays containing the value **NULL** can still be created when this parameter is set to **off**.

**Default value:** on

#### backslash\_quote

**Parameter description:** Determines whether a single quotation mark can be represented by \ in a string text.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

---

#### NOTICE

When the string text meets the SQL standards, \ has no other meanings. This parameter only affects the handling of non-standard-conforming string texts, including escape string syntax (E'...').

---

**Value range:** enumerated values

- **on** indicates that the use of \ is always allowed.
- **off** indicates that the use of \ is rejected.
- **safe\_encoding** indicates that the use of \ is allowed only when client encoding does not allow ASCII \ within a multibyte character.

**Default value:** safe\_encoding

#### default\_with\_oids

**Parameter description:** Specifies whether **CREATE TABLE** and **CREATE TABLE AS** include an **OID** field in newly-created tables if neither **WITH OIDS** nor **WITHOUT OIDS** is specified. It also determines whether OIDs will be included in tables created by **SELECT INTO**.

It is not recommended that OIDs be used in user tables. Therefore, this parameter is set to **off** by default. When OIDs are required for a particular table, **WITH OIDS** needs to be specified during the table creation.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that **CREATE TABLE** and **CREATE TABLE AS** can include an **OID** field in newly-created tables.
- **off** indicates that **CREATE TABLE** and **CREATE TABLE AS** cannot include any **OID** field in newly-created tables.

**Default value:** **off**

## escape\_string\_warning

**Parameter description:** Specifies whether to issue a warning when a backslash (\) is used as an escape in an ordinary character string.

- Applications that wish to use a backslash (\) as an escape need to be modified to use escape string syntax (E'...'). This is because the default behavior of ordinary character strings treats the backslash as an ordinary character in each SQL standard.
- This variable can be enabled to help locate codes that need to be changed.
- If E'...' is used as an escape, logs may be incomplete in some scenarios.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

**Default value:** **on**

## lo\_compat\_privileges

**Parameter description:** Specifies whether to enable backward compatibility for the privilege check of large objects.

This is a SUSERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

**on** indicates that the privilege check is disabled when large objects are read or modified.

**off** indicates that privilege check is enabled for large objects.

**Default value:** **off**

## quote\_all\_identifiers

**Parameter description:** Specifies whether to forcibly quote all identifiers even if they are not keywords when the database generates SQL. This will affect the output of **EXPLAIN** and the results of functions, such as `pg_get_viewdef`. For details, see the `--quote-all-identifiers` parameter of `gs_dump`.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the forcible quoting is enabled.
- **off** indicates that the forcible quoting is disabled.

**Default value:** off

## sql\_inheritance

**Parameter description:** Controls the inheritance semantics. This parameter specifies the access policy of descendant tables. **off** indicates that subtables cannot be accessed by commands. That is, the ONLY keyword is used by default. It is set for compatibility with versions earlier than 7.1.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that subtables can be accessed.
- **off** indicates that subtables cannot be accessed.

**Default value:** on

## standard\_conforming\_strings

**Parameter description:** Controls whether ordinary string texts ('...') treat backslashes as ordinary texts as specified in the SQL standard.

- Applications can check this parameter to determine how string texts will be processed.
- It is recommended that characters be escaped by using the escape string syntax (E'...').

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** on

## synchronize\_seqscans

**Parameter description:** Determines sequential scans of tables to synchronize with each other, so that concurrent scans read the same data block at about the same time and share the I/O load.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that a scan may start in the middle of the table and then "wrap around" the end to cover all rows to synchronize with the activity of scans already in progress. This may result in unpredictable changes in the row ordering returned by queries that have no ORDER BY clause.

- **off** indicates that the scan always starts from the table heading.

**Default value:** on

## enable\_beta\_features

**Parameter description:** Specifies whether to enable some features that are not officially released and are used only for POC verification, such as GDS table join. Exercise caution when enabling these extended features because they may cause errors in some scenarios.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the features are enabled for forward compatibility. Note that enabling them may cause errors in certain scenarios.
- **off** indicates that the features are disabled.

**Default value:** off

## system\_view\_version

**Parameter description:** Determines the version of the system view. For details, see [Table 1 System view version parameters](#). All versions are backward compatible. For example, when **system\_view\_version** is set to **3**, all features of version 2 and version 1 are also supported.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 9999

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** In the upgrade scenario, do not change the value. In the installation scenario, set this parameter to the latest version listed in [Table 1 System view version parameters](#).

**Table 14-14** System view version parameters

Value	Description
0	Default behavior
1	The value of <b>PREPARECOUNT</b> in the V \$GLOBAL_TRANSACTION view changes from <b>NULL</b> to <b>0</b> when no prepared transaction exists in GaussDB.

### 14.3.15.2 Platform and Client Compatibility

Many platforms use the database system. External compatibility of the database system provides great convenience for platforms.

#### `a_format_date_timestamp`

**Parameter description:** Specifies whether to return the date and time.

In ORA-compatible mode, when a transaction is started, the functions `current_date`, `current_timestamp`, and `localtimestamp` return the timestamp when the current SQL statement is started.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** Returns the timestamp when the current SQL statement is started.
- **off:** Returns the date or date and time when the transaction is started.

**Default value:** **off**

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value. This parameter can be enabled when the system time needs to be returned when a transaction is started.

#### `transform_null_equals`

**Parameter description:** Specifies whether expressions of the form `expr = NULL` (or `NULL = expr`) are treated as `expr IS NULL`. They return true if `expr` evaluates to the **NULL** value, and false otherwise.

- The correct SQL-standard-compliant behavior of `expr = NULL` is to always return **NULL** (unknown).
- Filtered forms in Microsoft Access generate queries that appear to use `expr = NULL` to test for null values. If you enable this option, you can use this API to access the database.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that expressions of the form `expr = NULL` (or `NULL = expr`) are treated as `expr IS NULL`.
- **off** indicates that `expr = NULL` always returns **NULL** (unknown).

**Default value:** **off**

#### NOTE

New users are always confused about the semantics of expressions involving **NULL** values. Therefore, **off** is used as the default value.

## support\_extended\_features

**Parameter description:** Specifies whether extended database features are supported.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that extended database features are supported.
- **off** indicates that extended database features are not supported.

**Default value:** off

## character\_set\_connection

**Parameter description:** Specifies the character set of constant strings. If this parameter is modified, **collation\_connection** is changed to the default collation of the character set. This parameter takes effect when **sql\_compatibility** is set to 'MySQL', **b\_format\_version** is set to '5.7', and **b\_format\_dev\_version** is set to 's2'.

**Parameter type:** character

**Unit:** none

**Value range:** character sets supported when **sql\_compatibility** is set to 'MySQL'. For details, see "COLLATE collation" in "SQL Reference > SQL Syntax > C > CREATE TABLE" in *Developer Guide*. Currently, the value cannot be different from that of the current database character set.

**Default value:** same as the value of **server\_encoding**.

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#). However, it cannot be set using the GUC tools.

**Setting suggestion:** none.

## collation\_connection

**Parameter description:** Specifies the collation of a constant string. If this parameter is modified, **character\_set\_connection** is changed to the default character set of the collation. This parameter takes effect when **sql\_compatibility** is set to 'MySQL', **b\_format\_version** is set to '5.7', and **b\_format\_dev\_version** is set to 's2'.

**Parameter type:** character

**Unit:** none

**Value range:** collations supported when **sql\_compatibility** is set to 'MySQL'. For details, see "COLLATE collation" in "SQL Reference > SQL Syntax > C > CREATE TABLE" in *Developer Guide*. Currently, this parameter cannot be set to a value other than the collation corresponding to the current database character set.

**Default value:** default collation of the current **server\_encoding**. If it has no default collation, the value is **default**.

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#). However, it cannot be set using the GUC tools.

**Setting suggestion:** none.

## character\_set\_results

**Parameter description:** Specifies the character set of the returned result. This parameter takes effect when **sql\_compatibility** is set to 'MySQL', **b\_format\_version** is set to '5.7', and **b\_format\_dev\_version** is set to 's2'.

**Parameter type:** character

**Unit:** none

**Value range:** character sets supported when **sql\_compatibility** is set to 'MySQL'. For details, see "COLLATE collation" in "SQL Reference > SQL Syntax > C > CREATE TABLE" in *Developer Guide*. You can also set this parameter to **null** or **"**. In this case, the character set of the database is output.

**Default value:** same as the value of **server\_encoding**.

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#). However, it cannot be set using the GUC tools.

**Setting suggestion:** none.

## lastval\_supported

**Parameter description:** Specifies whether the lastval function can be used.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the lastval function can be used and the nextval function cannot be pushed down.
- **off** indicates that the lastval function cannot be used and the nextval function can be pushed down.

**Default value:** off

## group\_concat\_max\_len

**Parameter description:** This parameter is used together with the **GROUP\_CONCAT** function to limit the length of the return value. If the length exceeds the limit, the exceeded part of the return value is truncated.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 9223372036854775807. Currently, the maximum length that takes effect is 1073741823. If the length exceeds this limit, the out of memory error is reported.

**Default value:** 1024

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## sql\_compatibility

**Parameter description:** Specifies the type of mainstream database with which the SQL syntax and statement behavior of the database is compatible. This is an INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** enumerated values

- **ORA** indicates that the database is compatible with the Oracle Database.
- **TD** indicates that the database is compatible with the Teradata database.
- **MYSQL** indicates that the database is compatible with the MySQL database.
- **PG** indicates that the database is compatible with the PostgreSQL database.

**Default value:** **MYSQL**

---

### NOTICE

- This parameter can be set only when you run the **CREATE DATABASE** command to create a database. For details, see "SQL Reference > SQL Syntax > CREATE DATABASE" in *Developer Guide*.
  - In the database, this parameter must be set to a specific value. It can be set to **ORA** or **TD** and cannot be changed randomly. Otherwise, the setting is not consistent with the database behavior.
- 

## b\_format\_behavior\_compat\_options

**Parameter description:** Specifies a MySQL-compatible database configuration item.

**Parameter type:** string.

**Unit:** none

**Value range:** Currently, only B-compatible configuration items listed in [Table 1](#) are supported. Use commas (,) to separate multiple compatibility configuration items.

**Default value:** ""

### NOTE

If **b\_format\_version** is not set to "", **b\_format\_behavior\_compat\_options** will be set to "all" and cannot be modified.

**Table 14-15** MySQL-compatible configuration items

Configuration Item	Behavior
default_collation	<p>Specifies whether to enable forward compatibility of the default collation.</p> <ul style="list-style-type: none"> <li>• If this item is not specified, the character set or collation of a column of the character type is not explicitly specified, and the collation of a table is empty, the column uses the default collation.</li> <li>• If this item is set, the collation of a column of the character type inherits the collation of a table (if it is not empty). If the collation of a table is empty, the default collation corresponding to the database is used.</li> </ul>
all	<p>Determines whether to enable all syntax.</p> <p><b>all</b> cannot be specified together with other configuration items. In the table, specifying all configuration items except <b>all</b> that are separated by commas is equivalent to specifying <b>all</b>.</p>

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Determines whether some MySQL-compatible features are available. If you want to modify this parameter, make sure you understand its meaning and modify it with caution to avoid risks caused by misoperations.

## behavior\_compat\_options

**Parameter description:** Specifies the database compatibility configuration item.

**Parameter type:** string.

**Unit:** none

**Value range:** Currently, only compatibility configuration items listed in [Table 14-16](#) are supported. Use commas (,) to separate multiple compatibility configuration items, for example, **set behavior\_compat\_options='end\_month\_calculate,display\_leading\_zero'**.

**Default value:**  
"enable\_bpcharlikebpchar\_compare,enable\_crosstype\_integer\_operator"

**Table 14-16** Compatibility configuration items

Configuration Item	Behavior
display_leading_zero	<p>Specifies how floating-point numbers are displayed. It controls the display of zeros before the decimal point of all character string types (such as char, character, nchar, varchar, character varying, varchar2, nvarchar2, text, and clob) and arbitrary-precision types (such as float4, float8, and numeric) in the numeric type. The length of the number is calculated by <b>length</b> and displayed synchronously.</p> <ul style="list-style-type: none"> <li>• If this item is not specified, for a non-zero decimal number between -1 and +1, the 0 before the decimal point is not displayed. For example:  <pre>gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;  a   b   c   d -----+-----+-----+--- .1231243   .1231243   .123   8 (1 row)</pre> </li> <li>• If this item is specified, for a non-zero decimal number between -1 and +1, the 0 before the decimal point is displayed. For example:  <pre>gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;  a   b   c   d -----+-----+-----+--- 0.1231243   0.1231243   0.123   9 (1 row)</pre> </li> </ul>
end_month_calculate	<p>Specifies the calculation logic of the <b>add_months</b> function. Assume that the two parameters of the <b>add_months</b> function are <b>param1</b> and <b>param2</b>, and that the month of <b>param1</b> and <b>param2</b> is <b>result</b>.</p> <ul style="list-style-type: none"> <li>• If this item is not specified, and the <b>Day</b> of <b>param1</b> indicates the last day of a month shorter than <b>result</b>, the <b>Day</b> in the calculation result will equal that in <b>param1</b>. For example:  <pre>gaussdb=# select add_months('2018-02-28',3) from sys_dummy; add_months ----- 2018-05-28 00:00:00 (1 row)</pre> </li> <li>• If this item is specified, and the <b>Day</b> of <b>param1</b> indicates the last day of a month shorter than <b>result</b>, the <b>Day</b> in the calculation result will equal that in <b>result</b>. For example:  <pre>gaussdb=# select add_months('2018-02-28',3) from sys_dummy; add_months ----- 2018-05-31 00:00:00 (1 row)</pre> </li> </ul>

Configuration Item	Behavior
compat_analyze_sample	<p>Specifies the sampling behavior of the ANALYZE operation. If this item is specified, the sample collected by the ANALYZE operation will be limited to around 30,000 records, controlling CN memory consumption and maintaining the stability of ANALYZE.</p>
bind_schema_tablespace	<p>Binds a schema with the tablespace with the same name. If a tablespace name is the same as <i>sche_name</i>, <b>default_tablespace</b> will also be set to <i>sche_name</i> if <b>search_path</b> is set to <i>sche_name</i>.</p>
bind_procedure_searchpath	<p>Specifies the search path of the database objects in a stored procedure for which no schema name is specified. If no schema name is specified for a stored procedure, the schema to which the stored procedure belongs is searched preferentially. If the stored procedure is not found, the following operations are performed:</p> <ul style="list-style-type: none"> <li>• If this item is not specified, the system reports an error and exits.</li> <li>• If this item is specified, the search continues based on the settings of <b>search_path</b>. If the issue persists, the system reports an error and exits.</li> </ul>
correct_to_number	<p>Specifies the compatibility of the to_number() result.</p> <ul style="list-style-type: none"> <li>• If this item is not set, the result of the to_number() function is the same as that in the ORA database by default.  <pre>gaussdb=# select " AS to_number_14, to_number('34,50','999,99'); ERROR:  invalid data. CONTEXT:  referenced column: to_number</pre> </li> <li>• If this item is specified, the result of the to_number() function is the same as that of pg11.  <pre>gaussdb=# select " AS to_number_14, to_number('34,50','999,99'); to_number_14   to_number -----+-----                 3450 (1 row)</pre> </li> </ul>

Configuration Item	Behavior
<p>unbind_divide_bound</p>	<p>Specifies the range check on the result of integer division.</p> <ul style="list-style-type: none"> <li>If this item is not specified, the range of the division result is verified. For example, an out-of-bounds error is reported because the output result of <i>INT_MIN/(-1)</i> is greater than <i>INT_MAX</i>.  <pre>gaussdb=# select (-2147483648)::int4 / (-1)::int4; ERROR: integer out of range</pre> </li> <li>If this item is specified, the range of the division result does not need to be verified. For example, the output result of <i>INT_MIN/(-1)</i> is <i>INT_MAX+1</i>.  <pre>gaussdb=# select (-2147483648)::int4 / (-1)::int4; ?column? ----- 2147483648 (1 row)</pre> </li> </ul>
<p>convert_string_digit_to_numeric</p>	<p>Determines whether to convert numeric constants of the character string type to those of the numeric type before these two types are compared.</p> <ul style="list-style-type: none"> <li>If this item is not specified, the numeric constants of the character string type are not converted to those of the numeric type.</li> <li>If this item is specified, the numeric constants of the character string type are converted to those of the numeric type.</li> </ul> <pre>gaussdb=# create table test1 (c1 int, c2 varchar); gaussdb=# insert into test1 values (2, '1.1'); gaussdb=# set behavior_compat_options=""; gaussdb=# select * from test1 where c2 &gt; 1; ERROR: invalid input syntax for type bigint: "1.1"  gaussdb=# set behavior_compat_options='convert_string_digit_to_numeric'; gaussdb=# select * from test1 where c2 &gt; 1;  c1   c2 -----+-----   2   1.1 (1 row)</pre>
<p>return_null_string</p>	<p>Specifies how to display the empty result (empty string '') of the <i>lpad()</i> and <i>rpadd()</i> functions.</p> <ul style="list-style-type: none"> <li>If this item is not specified, the empty string is displayed as <b>NULL</b>.  <pre>gaussdb=# select length(lpad('123',0,'*')) from sys_dummy, length ----- NULL (1 row)</pre> </li> <li>If this item is specified, the empty string is displayed as single quotation marks ('').  <pre>gaussdb=# select length(lpad('123',0,'*')) from sys_dummy, length ----- 0 (1 row)</pre> </li> </ul>

Configuration Item	Behavior
<p>compat_concat_variadic</p>	<p>Specifies the compatibility of variadic results of the concat() and concat_ws() functions. The MySQL database does not have the variadic type. Therefore, this option has no impact on the MySQL database.</p> <ul style="list-style-type: none"> <li>• If this item is not set and the concat function parameter is of the variadic type, the results of the Oracle and Teradata databases in compatibility mode are the same by default.  <pre>gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- t (1 row)</pre> </li> <li>• If this item is set and the concat function parameter is of the variadic type, different result formats of the ORA and TD databases in compatibility mode are retained.  <pre>-- In the ORA database: gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- t (1 row) -- In the TD database: gaussdb=# select concat(variadic NULL::int[]) is NULL; ?column? ----- f (1 row)</pre> </li> </ul>
<p>merge_update_multi</p>	<p>When MERGE INTO ... WHEN MATCHED THEN UPDATE (see "SQL Reference &gt; SQL Syntax &gt; MERGE INTO" in <i>Developer Guide</i>) and INSERT ... ON DUPLICATE KEY UPDATE (see "SQL Reference &gt; SQL Syntax &gt; INSERT" in <i>Developer Guide</i>) are used, it controls the UPDATE behavior if a piece of target data in the target table conflicts with multiple pieces of source data.</p> <ul style="list-style-type: none"> <li>• If this item is specified and the preceding scenario exists, the system performs multiple UPDATE operations on the conflicting row.</li> <li>• If this item is not specified (the default value is retained), an error is reported, indicating that the MERGE or INSERT operation fails.</li> </ul>
<p>plstmt_implicit_savepoint</p>	<p>Determines whether the execution of an UPDATE statement in a stored procedure has an independent subtransaction. If this parameter is set, the implicit savepoint is enabled before executing each UPDATE statement in the stored procedure, and the subtransaction is rolled back to the latest savepoint in the EXCEPTION block by default, ensuring that only the modification of failed statements is rolled back. This option is used to be compatible with the EXCEPTION behavior of the ORA database.</p>

Configuration Item	Behavior
hide_tailing_zero	<p>Configuration item for numeric display.</p> <ul style="list-style-type: none"> <li>• If this item is specified, the trailing zeros after the decimal point are hidden in all scenarios where numeric values are output, even if the precision format is specified.</li> <li>• If this item is not specified, numeric data is displayed in the specified precision.</li> </ul> <p>For example:</p> <pre>gaussdb=# set behavior_compat_options='hide_tailing_zero'; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');  a   to_char -----+----- 123.123   123.123 (1 row) gaussdb=# set behavior_compat_options=""; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');  a   to_char -----+----- 123.1230000000   123.123000 (1 row)</pre>
plsql_security_definer	<p>After this parameter is enabled, the definer permission is used by default when a stored procedure is created.</p>

Configuration Item	Behavior
char_coerce_compat	<p>Specifies the behavior when the char(n) type is converted to other variable-length string types. This parameter is valid only when the <b>sql_compatibility</b> parameter is set to <b>ORA</b>. After this parameter is enabled, spaces at the end are not omitted in implicit conversion, explicit conversion, or conversion by calling the text(bpchar) function.</p> <ul style="list-style-type: none"> <li>• If this item is specified, spaces at the end are not omitted in conversion. In addition, if the length of the char(n) type exceeds that of other variable-length string types, an error is reported.</li> <li>• If this item is not specified, spaces at the end are omitted when the char(n) type is converted to another variable-length string type.</li> </ul> <pre> gaussdb=# set behavior_compat_options=""; gaussdb=# create table tab_1(col1 varchar(3)); gaussdb=# create table tab_2(col2 char(3)); gaussdb=# insert into tab_2 values(' '); gaussdb=# insert into tab_1 select col2 from tab_2; gaussdb=# select * from tab_1 where col1 is null;  col1 ----- (1 row) gaussdb=# select * from tab_1 where col1=' ';  col1 ----- (0 rows) gaussdb=# delete from tab_1; gaussdb=# set behavior_compat_options = 'char_coerce_compat'; gaussdb=# insert into tab_1 select col2 from tab_2; gaussdb=# select * from tab_1 where col1 is null;  col1 ----- (0 rows) gaussdb=# select * from tab_1 where col1=' ';  col1 ----- (1 row) </pre>

Configuration Item	Behavior
truncate_numeric_tail_zero	<p>Configuration item for numeric display.</p> <ul style="list-style-type: none"> <li>• If this item is specified, the trailing zeros after the decimal point are hidden in all numeric output scenarios except to_char(numeric, format).</li> <li>• If this item is not specified, numeric data is displayed in the default precision.</li> </ul> <p>For example:</p> <pre>gaussdb=# set behavior_compat_options='truncate_numeric_tail_zero'; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');  a   to_char -----+----- 123.123   123.123000 (1 row) gaussdb=# set behavior_compat_options=""; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');  a   to_char -----+----- 123.1230000000   123.123000 (1 row)</pre>
plpgsql_dependency	Discarded.
disable_rewrite_nesttable	The distributed mode does not support this parameter.
proc_outparam_override	<p>Determines the overloading of output parameters of a stored procedure. After this parameter is enabled, the stored procedure can be properly created and called even if only the output parameters of the stored procedure are different. Currently, this parameter can be used only when gsql and JDBC are used to connect to the database. If this parameter is enabled for other tools to connect to the database, stored procedures with the <b>out</b> parameter cannot be called.</p> <p>It supports values to be assigned to <b>out</b> parameters.</p>

Configuration Item	Behavior
aformat_regex_match	<p>Determines the matching behavior of regular expression functions.</p> <p>When this parameter is set and <b>sql_compatibility</b> is set to <b>ORA</b> or <b>MYSQL</b>, the meanings of the options supported by the <b>flags</b> parameter of the regular expression are as follows:</p> <ol style="list-style-type: none"> <li>1. By default, the character '\n' cannot be matched.</li> <li>2. If <b>flags</b> contains the <b>n</b> option, the period (.) can match the character '\n'.</li> <li>3. The <code>regexp_replace(source, pattern replacement)</code> function replaces all matching substrings.</li> <li>4. <code>regexp_replace(source, pattern, replacement, flags)</code> returns <b>null</b> when the value of <b>flags</b> is '' or <b>null</b>.</li> </ol> <p>Otherwise, the meanings of the options supported by the <b>flags</b> parameter of the regular expression are as follows:</p> <ol style="list-style-type: none"> <li>1. By default, the character '\n' can be matched.</li> <li>2. The <b>n</b> option in <b>flags</b> indicates that the multi-line matching mode is used.</li> <li>3. The <code>regexp_replace(source, pattern replacement)</code> function replaces only the first matched substring.</li> <li>4. <code>regexp_replace(source, pattern, replacement, flags)</code> returns the character string after replacement when the value of <b>flags</b> is '' or <b>null</b>.</li> </ol>
disable_emptystr2null	<p>In the A-compatible parameter binding scenario, if this parameter is enabled, the function of converting the values of parameters of the character type from an empty string to <b>null</b> by default, if any, is disabled. The types include text, clob, blob, raw, bytea, varchar, nvarchar2, bpchar, char, name, byteawithoutorderwithqualcol, and byteawithoutordercol. This parameter is reserved for emergency. Do not set it unless necessary.</p>
select_into_return_null	<p>This parameter is invalid in distributed mode.</p>

Configuration Item	Behavior
<p>proc_uncheck_default_param</p>	<p>When a function is called, the system does not check whether the default parameter is omitted.</p> <ul style="list-style-type: none"> <li> <p>If this item is not specified and a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported. Configuration Item	Behavior
	<p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• This parameter takes effect only when <b>sql_compatibility</b> is set to <b>ORA</b>.</li> <li>• If this parameter is enabled, the execution plan of operators involved in the following scenarios will be affected: <ul style="list-style-type: none"> <li>• (int1 op int2)</li> <li>• (int1 op int4)</li> <li>• (int1 op int8)</li> <li>• (int1 op int16)</li> <li>• (int1 op numeric)</li> <li>• (int2 op int1)</li> <li>• (int2 op int16)</li> <li>• (int2 op numeric)</li> <li>• (int4 op int1)</li> <li>• (int4 op int16)</li> <li>• (int4 op numeric)</li> <li>• (int8 op int1)</li> <li>• (int8 op int16)</li> <li>• (int8 op numeric)</li> <li>• (int16 op int1)</li> <li>• (int16 op int2)</li> <li>• (int16 op int4)</li> <li>• (int16 op int8)</li> <li>• (numeric op int1)</li> <li>• (numeric op int2)</li> <li>• (numeric op int4)</li> <li>• (numeric op int8)</li> </ul> </li> </ul>
time_constexpr_compact	<p>If this parameter is enabled, in a scenario where the time expression is executed, the type automatically returned is with timezone or without timezone depending on whether the constant carries the time zone.</p> <p>Currently, the timestamp and time types are supported.</p> <pre> -- Execute a timestamp expression without a time zone. gaussdb=# SELECT timestamp '1999-03-15 8:00:00'; timestamp ----- 1999-03-15 08:00:00 (1 row) -- The type timestamp with time zone is returned after a timestamp expression with a time zone is executed. gaussdb=# SELECT timestamp '1999-03-15 8:00:00 -8:00:00'; timestampz ----- 1999-03-16 00:00:00+08 (1 row) </pre>

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Adjust the parameter value based on the database-compatible objects.

## a\_format\_version

**Parameter description:** Specifies the database platform compatibility configuration item. The value of this parameter is an enumerated string.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

**Default value:** ""

---

### NOTICE

- Currently, only compatibility configuration items are supported, as shown in [Table 14-17](#).
  - Set a character string for the compatibility configuration item, for example, **set a\_format\_version='10c'**.
- 

**Table 14-17** Compatibility configuration items

Configuration Item	Behavior
10c	The ORA platform is compatible with the 10C version.

## a\_format\_dev\_version

**Parameter description:** Specifies the database platform minor version compatibility configuration item. The value of this parameter is an enumerated string.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

**Default value:** ""

---

### NOTICE

- Currently, only compatibility configuration items are supported, as shown in [Table 14-18](#).
  - Set a character string for the compatibility configuration item, for example, **set a\_format\_dev\_version='s1'**.
-

**Table 14-18** Compatibility configuration items

Configuration Item	Behavior
s1	<ul style="list-style-type: none"> <li>Compatible minor version of the ORA platform, which affects functions TRUNC(date, fmt), ROUND(date, fmt), NVL2, LPAD, RPAD, ADD_MONTHS, MONTHS_BETWEEN, REGEXP_REPLACE, REGEXP_COUNT, TREAT, EMPTY_CLOB, INSTRB, trunc(number), greatest, least, mod, round(number), cast, to_date, to_timestamp, chr, rtrim, translate, to_char, to_number, and to_timestamp_tz.</li> <li>Data type conversion: A decimal character string is rounded off when it is converted to an integer (int1/int2/int4/int8/int16).</li> <li>Data type conversion: Implicit conversion from timestamp with time zone to timestamp without time zone is supported.</li> <li>Comparison operators (&gt;, &gt;=, &lt;, &lt;=, =, &lt;&gt;): When comparison operations are performed on integer and string data types, the string data type is implicitly converted to the NUMERIC type before comparison operations are performed.</li> <li>Arithmetic operators (+, -, *, /, %, ^): When arithmetic operations are performed on integer and string data types, the integer and string data types are implicitly converted to the NUMERIC type before arithmetic operations are performed.</li> </ul>
s2	<ul style="list-style-type: none"> <li>Compatible minor version of platform ORA, which affects functions, such as dump, to_single_byte, to_multi_byte, nls_upper, nls_lower, initcap, ascii2, asciistr, unistr, vsize, cosh, remainder, sinh, tanh, nanvl, current_date, current_timestamp, dbtimezone, numtodsinterval, numtoyminterval, new_time, sessiontimezone, sys_extract_utc, tz_offset, to_binary_double, to_binary_float, to_dsinterval, to_yminterval, lnnvl, and ora_hash.</li> <li>Supports all behaviors when the compatibility configuration item is set to <b>s1</b>.</li> </ul>
s3	<ul style="list-style-type: none"> <li>Compatible minor version of platform ORA. If the parameter is enabled, nested calling of functions without parameters is supported.</li> <li>Supports all behaviors when the compatibility configuration item is set to <b>s2</b>.</li> </ul>

Configuration Item	Behavior
s4	<ul style="list-style-type: none"> <li>Compatible minor version of platform ORA, which affects functions such as nchr(cvalue int bigint), to_timestamp_tz, getclobval(xml), and getstringval(xml).</li> <li>Supports all behaviors when the compatibility configuration item is set to <b>s3</b>.</li> </ul>
s5	<ul style="list-style-type: none"> <li>Compatible minor version of platform Oracle. If the parameter is enabled, the composite type with the same name as a function is preferentially parsed. The sys_guid() function is affected.</li> <li>Supports all behaviors when the compatibility configuration item is set to <b>s4</b>.</li> </ul>

## b\_format\_version

**Parameter description:** Specifies the database platform compatibility behavior configuration item that controls the forward compatibility in MySQL-compatible mode.

### NOTE

- b\_format\_version** takes effect only when **sql\_compatibility** is set to **MYSQL**.
- If this parameter is set to a non-empty string, **b\_format\_behavior\_compat\_options** is set to 'ALL' and **bytea\_output** parameter is set to 'escape' simultaneously. If this parameter is set to an empty string and takes effect, the **b\_format\_behavior\_compat\_options** and **bytea\_output** are set to the original values.

**Parameter type:** string.

**Unit:** none

**Value range:** an empty string '' or '5.7'

**Default value:** an empty string ''

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## b\_format\_dev\_version

**Parameter description:** Specifies the database platform minor version compatibility configuration item.

### NOTE

- b\_format\_dev\_version** takes effect only when **sql\_compatibility** is set to **MySQL** and **b\_format\_version** is set to **5.7**.

**Parameter type:** string.

**Unit:** none

**Value range:** an empty string "" or a compatibility configuration item in [Table 14-19](#).

**Table 14-19** Compatibility configuration items

Configuration Item	Behavior
s1	<ol style="list-style-type: none"> <li>1. The following parameters are influenced: If this parameter is enabled, the <b>datetime</b> option in the <b>disable_keyword_options</b> parameter is removed, indicating that DATETIME is used as a non-reserved keyword. <b>datetime</b> can be used as a table name, column name, or alias, but cannot be used as a function name, stored procedure name, or parameter name of a function or stored procedure.</li> <li>2. The following functions are influenced: curdate, from_days, date_format, str_to_date, current_date, datediff, timestampdiff, date_add, subtime, month, time_to_sec, to_days, to_seconds, dayname, monthname, convert_tz, sec_to_time, addtime, adddate, date_sub, timediff, last_day, weekday, from_unixtime, unix_timestamp, subdate, day, year, weekofyear, dayofmonth, dayofyear, week, yearweek, dayofweek, time_format, hour, minute, second, microsecond, quarter, utc_date, get_format, extract, makedate, period_add, timestampadd, period_diff, utc_time, utc_timestamp, sysdate, current_timestamp, maketime, curtime, current_time, localtime, localtimestamp, now, lc_time_names, default_week_format, and json_object.</li> <li>3. The following types are influenced: <ol style="list-style-type: none"> <li>a. Be compatible with the integer type tinyint with the value range changed to -128 to 127.</li> <li>b. Be compatible with the character string types char and varchar. The precision <i>n</i> of char(<i>n</i>) and varchar(<i>n</i>) is changed from the byte length to the character length.</li> <li>c. Be compatible with the text types tinytext, mediumtext, and longtext. These types are mapped to the text type after the parameter is enabled.</li> <li>d. Be compatible with binary types tinyblob, blob, mediumblob, and longblob. These types are mapped to the bytea type after the parameter is enabled.</li> <li>e. Be compatible with floating-point types double, float, and real. Among them, double is mapped to the float8 type, double(<i>p</i>, <i>s</i>) is mapped to the numeric type, float(<i>p</i>, <i>s</i>) is mapped to the numeric type, real is mapped to float8, and real(<i>p</i>, <i>s</i>) is mapped to the numeric type.</li> <li>f. Be compatible with high-precision types numeric, dec, and decimal. If the precision and scale are not specified, the default precision is changed to <b>10</b> and the scale is changed to <b>0</b>.</li> </ol> </li> </ol>

Configuration Item	Behavior
	<ul style="list-style-type: none"><li data-bbox="683 331 1428 562">g. Be compatible with time types <code>datetime</code>, <code>timestamp</code>, <code>time</code>, and <code>date</code>. Replace <code>datetime[(p)]</code> with a <code>timestamp without time zone[(p)]</code>. Replace <code>timestamp[(p)]</code> with a <code>timestamp with time zone[(p)]</code>. The input, output, range, and precision specifications of these types are changed. For details, see "SQL Reference &gt; Data Type" in <i>Developer Guide</i>.</li><li data-bbox="683 577 1417 703">h. Be compatible with integer types <code>tinyint</code>, <code>smallint</code>, <code>int</code>, and <code>bigint</code>. The display width and <code>ZEROFILL</code> attributes of these types take effect after the parameter is enabled.</li></ul> <p data-bbox="644 719 1401 815">4. The following syntax is influenced: The column constraint <code>ON UPDATE update_expr</code> can be specified.</p> <p data-bbox="644 831 1362 981">5. The following operators are influenced: a. An error is reported when the <code>  </code> operator between <code>bytea</code> types is used. b. The <code>REGEXP</code> operator is supported.</p>

Configuration Item	Behavior
s2	<p>The compatibility behavior controlled by s1 is included. In addition, the following impacts are included:</p> <ol style="list-style-type: none"> <li>1. The following syntax is influenced: <ol style="list-style-type: none"> <li>a. The CREATE TABLE table_name LIKE source_table syntax is supported.</li> <li>b. The syntaxes CREATE TABLE table_name LIKE source_table and CREATE TABLE table_name (LIKE source_table) cannot specify <b>INCLUDING</b> and <b>EXCLUDING</b> options. By default, <b>INCLUDING ALL</b> is specified.</li> <li>c. The LOAD DATA syntax is supported. Some syntax functions in gs_loader that are consistent with the LOAD DATA syntax will change.</li> <li>d. The syntaxes for changing table names, such as ALTER TABLE and RENAME TABLE, have impact in the following scenario: If the character string corresponding to the new table name starts with "#MySQL50#" and is followed by other characters, "#MySQL50#" will be ignored. If the old and new table names are the same, no error will be reported.</li> <li>e. The collate clause can be specified by set names.</li> </ol> </li> <li>2. The following parameters are influenced: <ol style="list-style-type: none"> <li>a. When this option is enabled, <b>standard_conforming_strings</b> and <b>escape_string_warning</b> are set to <b>off</b>.</li> <li>b. The <b>collation_connection</b> and <b>character_set_connection</b> parameters take effect only when this option is enabled.</li> </ol> </li> <li>3. The following functions are affected: <ol style="list-style-type: none"> <li>a. The like operator does not report an error when an escape character is at the end of the matching string.</li> <li>b. The sorting rule priorities of character sets and collations will be changed. For details, see section 7.4.7 in <i>Developer Guide(Distributed)</i>.</li> <li>c. After the parameter is enabled, the collation of foreign keys cannot be inconsistent with that of columns.</li> </ol> </li> </ol>

**Default value:** an empty string ""

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## sql\_mode

**Parameter description:** Specifies the SQL behavior control configuration item in MySQL-compatible mode.

 **NOTE**

**sql\_mode** takes effect only when **sql\_compatibility** is set to **MySQL**, **b\_format\_version** is set to '5.7', and **b\_format\_dev\_version** is set to 's1'.

**Parameter type:** string.

**Unit:** none

**Value range:** an empty string '' or a value in the range of 'strict\_trans\_tables,only\_full\_group\_by,no\_zero\_in\_date,no\_zero\_date,error\_for\_division\_by\_zero,no\_auto\_create\_user,no\_engine\_substitution,pad\_char\_to\_full\_length'. The meaning of each option value is described in [Table 14-20](#).

**Table 14-20** Compatibility configuration items

Configuration Item	Behavior	Parameter Configuration
strict_trans_tables	Currently, only data types and system functions in MySQL-compatible databases can be verified.  If this parameter is set, its format and range are strictly verified. If an invalid value is entered or the value exceeds the range, an error is reported during parsing.  If this parameter is not set, the format and range of the input parameter are loosely verified. If an invalid value is entered or the value exceeds the range, a warning is reported during parsing and the value 0 of the corresponding data is returned.	It can be set and canceled independently.
only_full_group_by	Projection columns that contain non-GROUP BY keys and that are not constants and aggregate functions are not allowed.	It can be set and canceled independently, but it does not take effect.
no_zero_in_date	The year, month, and day of the DATE cannot be 0.	It can be set and canceled independently, but it does not take effect.

Configuration Item	Behavior	Parameter Configuration
no_zero_date	The value of DATE cannot be 0 (0000-00-00).	It can be set and canceled independently, but it does not take effect.
error_for_division_by_zero	The value cannot be divided by 0.	It can be set and canceled independently, but it does not take effect.
no_auto_create_user	This item has no actual function. It is used only for compatibility that an error is not reported when the SET SQL_MODE statement contains this option.	It can be set and canceled independently.
no_engine_substitution	This item has no actual function. It is used only for compatibility that an error is not reported when the SET SQL_MODE statement contains this option.	It can be set and canceled independently.
pad_char_to_full_length	Be used for formatted output of CHAR columns in a table. If there are CHAR columns, a string with spaces at the end is output. Otherwise, a string without spaces at the end is output.	It can be set and canceled independently.
no_auto_value_on_zero	If this option is included, the value 0 inserted into the <b>AUTO_INCREMENT</b> column does not trigger auto-increment.	It can be set and canceled independently.

**Default value:**

'strict\_trans\_tables,only\_full\_group\_by,no\_zero\_in\_date,no\_zero\_date,error\_for\_division\_by\_zero,no\_auto\_create\_user,no\_engine\_substitution'

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

## auto\_increment\_increment

**Parameter description:** Specifies the auto-increment step of an auto-increment column. The auto-increment value is calculated by the following formula: **auto\_increment\_offset** +  $N \times$  **auto\_increment\_increment**.  $N$  is a positive integer. If the parameter value is smaller than that of **auto\_increment\_offset**, an error occurs when the values in the auto-increment column automatically increase.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 65535

**Default value:** 1

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none.

## auto\_increment\_offset

**Parameter description:** Specifies the initial value of an auto-increment column. The auto-increment value is calculated by the following formula:  
**auto\_increment\_offset** +  $N \times$  **auto\_increment\_increment**.  $N$  is a positive integer. If the parameter value is greater than that of **auto\_increment\_increment**, an error occurs when the values in the auto-increment column automatically increase.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 65535

**Default value:** 1

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none.

## auto\_increment\_cache

**Parameter description:** Specifies the number of reserved auto-increment cache values when auto-increment is triggered by batch insertion or import of auto-increment columns. When auto-increment values are reserved, the auto-increment counter value is updated to the maximum auto-increment cache value. Before the cache values are used up, the auto-increment counter value remains unchanged, and the triggered auto-increment uses the cache values.

### NOTE

- The reserved cache values are valid only in the statement. If the reserved auto-increment cache values are used up and subsequent INSERT statements trigger auto-increment based on the auto-increment counter, the values in the auto-increment column in the table are discontinuous.
- When auto-increment is triggered by parallel import or insertion of auto-increment columns, the cache value reserved for each parallel thread is used only in the thread. If the cache value is not used up, the values of auto-increment columns in the table are discontinuous.
- When you add an auto-increment column to a table with data or modify a column to an auto-increment column, the existing data triggers auto-increment. The reserved auto-increment cache value is also affected by this parameter.
- This parameter does not affect the auto-increment column in the local temporary table.

**Default value:** 0

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to *INT\_MAX*

- If this parameter is set to **0**, the auto-increment cache values are automatically reserved.
  - When auto-increment is triggered for the first time, if the number of rows to be inserted into the auto-increment column is known, the number is the reserved value.
    - For example, the number of rows to be inserted cannot be obtained as the value of auto-increment that is triggered by `INSERT INTO table SELECT ...` or `COPY FROM`. When the `ALTER TABLE` statement is executed to rewrite table data, if auto-increment is triggered, `reltuples` in the statistics is used as the number of rows to be reserved. `INSERT INTO table VALUES(...),(...),...` is distributed to different DNs. Therefore, in some execution plans, DNs cannot obtain the number of rows to be inserted.
  - If the number of rows is unknown,  $2^n$  values are reserved each time. For example, one value is reserved in the first auto-increment, two values are reserved in the second auto-increment, four values are reserved in the third auto-increment, and eight values are reserved for in fourth auto-increment. However, if the number of reserved values exceeds 65535, 65535 values are reserved.
- If this parameter is not set to **0**, the number of reserved cache values is the value of this parameter.
  - When auto-increment is triggered for the first time, if the number of rows to be inserted into the auto-increment column is known, the number is the reserved value.
  - If the number of rows is unknown, the value of `auto_increment_cache` is the number of auto-increment values reserved each time.

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** The default value is recommended. However, if the auto-increment values are discontinuous in this case, you can adjust the parameter value based on the amount of data to be inserted in batches. Setting this parameter to a larger value improves the batch insertion performance but the auto-increment values are more likely to be discontinuous.

## disable\_keyword\_options

**Parameter description:** Specifies database compatibility behavior. Multiple items are separated by commas (,). An identifier with this parameter set will not be used as a keyword.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string. The following keywords are supported: `auto_increment`, `change`, `charset`, `columns`, `compile`, `completion`, `containing`, `convert`, `csn`, `datetime`,

db4aishot, dbtimezone, discard\_path, distributed, dumpfile, ends, entityescaping, escaped, evalname, event, events, expdp, gsiusable, gvalid, gwaitall, finish, ilm\_pidx\_list, impdp, ifnull, invisible, json\_object, lines, link, lnnvl, load\_discard, locked, mark, nocache, noentityescaping, noextend, noscale, nvl2, ordinality, outfile, pivot, performance, public, recover, regexp\_like, scale, schedule, separator, sessiontimezone, shrink, slave, specification, starting, starts, subpartitions, substr, unpivot, verify, visible, wellformed, xmltype, regexp, rlike, and zerofill.

**Default value:** "datetime", "regexp", "rlike", or "zerofill".

 **NOTE**

If this parameter is enabled, some functions used as keywords will become invalid. Exercise caution when setting this parameter.

## disable\_plsql\_keyword\_options

**Parameter description:** Specifies the database compatibility behavior, that is, whether to use an identifier as a non-keyword. Values of this parameter are separated by commas (,).

**Parameter type:** string.

**Unit:** none

**Value range:**

- PIPE
- PIPELINED
- RANGE
- REPLACE
- SUBTYPE
- "

**Default value:** "

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** none

 **NOTE**

- If this parameter is enabled, some functions used as keywords will become invalid. Exercise caution when setting this parameter.
- To cancel the function of shielding the PL/SQL keyword, leave this parameter empty.

## plpgsql.variable\_conflict

**Parameter description:** Sets the priority of using stored procedure variables and table columns with the same name.

This is a USERSET parameter. Set it based on method 3 provided in [Table 14-1](#).

**Value range:** a string.

- **error** indicates that a compilation error is reported when the name of a stored procedure variable is the same as that of a table column.
- **use\_variable** indicates that if the name of a stored procedure variable is the same as that of a table column, the variable is used preferentially.
- **use\_column** indicates that if the name of a stored procedure variable is the same as that of a table column, the column name is used preferentially.

**Default value:** error

## td\_compatible\_truncation

**Parameter description:** Specifies whether to enable features compatible with a Teradata database. You can set this parameter to **on** when connecting to a database compatible with the Teradata database, so that when you perform the INSERT operation, overlong strings are truncated based on the allowed maximum length before being inserted into char- and varchar-type columns in the target table. This ensures that all data is inserted into the target table without errors reported.

### NOTE

The string truncation function cannot be used if the INSERT statement includes a foreign table.

If inserting multi-byte character data (such as Chinese characters) to database with the character set byte encoding (such as SQL\_ASCII or LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that overlong strings are truncated.
- **off** indicates that overlong strings are not truncated.

**Default value:** off

## nls\_timestamp\_format

**Parameter description:** Specifies the default timestamp format.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

**Default value:** DD-Mon-YYYY HH:MI:SS.FF AM

## nls\_timestamp\_tz\_format

**Parameter description:** Specifies the default timestamp with time zone format.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string. The supported formats are the same as those of **nls\_timestamp\_format**.

**Default value:** DD-Mon-YYYY HH:MI:SS.FF AM

 NOTE

This parameter is valid only when **a\_format\_version** is set to **10c** and **a\_format\_dev\_version** is set to **s1**.

## nls\_nchar\_characterset

**Parameter description:** Sets the national character set, which is used together with the nchr(cvalue int|bigint) system function. The value of this parameter is an enumerated string.

**Parameter type:** string.

**Unit:** none

**Value range:** 'AL16UTF16' and 'UTF8' (case-insensitive)

**Default value:** 'AL16UTF16'

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

 NOTE

- The database does not support the national character set. This parameter is used only to be compatible with the ORA database and obtain the national character set for users.
- This GUC parameter applies only to the nchr(cvalue int|bigint) function.

## max\_function\_args

**Parameter description:** Specifies the maximum number of parameters allowed for a function.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer.

**Default value:** 8192

## max\_subpro\_nested\_layers

**Parameter description:** Specifies the maximum nesting depth of nested subprograms.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 100

 NOTE

When this parameter is set to **0**, nested subprograms are not allowed.

**Default value:** 3

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Set this parameter based on the maximum nesting depth.

## convert\_string\_to\_digit

**Parameter description:** Specifies the implicit conversion priority, which determines whether to preferentially convert strings into numbers.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that strings are preferentially converted into numbers.
- **off** indicates that strings are not preferentially converted into numbers.

**Default value:** on

---

### NOTICE

Adjusting this parameter will change the internal data type conversion rule and cause unexpected behavior. Exercise caution when performing this operation.

---

## enable\_object\_special\_character

**Parameter description:** Determines whether the value of the **schema** parameter in the control file can contain any special characters in ["\$\"] when the CREATE EXTENSION statement is executed and "@extschema@" is used in the script file.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the value can contain any special characters in ["\$\"].
- **off** indicates that the value cannot contain any special characters in ["\$\"].

**Default value:** off

---

### NOTICE

The extended function is for internal use only. You are advised not to use it.

---

## a\_format\_disable\_func

**Parameter description:** Disables a specified system function. The value of this parameter consists of multiple system function OIDs separated by commas (,). The system function for which this parameter is set cannot be called.

When a system function cannot meet user requirements and a user-defined function with the same name is required, you can use this function.

**Parameter type:** string.

**Unit:** none

**Value range:** a string consisting of multiple system function OIDs separated by commas (,).

 **NOTE**

This parameter can only be used to disable added system functions corresponding to the database platform compatibility behavior configuration items (**a\_format\_version** and **a\_format\_dev\_version**). For details, see [Table 14-21](#).

**Table 14-21** System functions that can be disabled

Database Platform Compatibility Configuration Item	System Function That Can Be Disabled
10c,s1	anyarray array_extendnull(anyarray,int4,int4); -- <b>funcoid:</b> 6018 clob empty_clob(); -- <b>funcoid:</b> 3825 int4 instrb(text,text); -- <b>funcoid:</b> 3240 int4 instrb(text,text,int4); -- <b>funcoid:</b> 3241 int4 instrb(text,text,int4,int4); -- <b>funcoid:</b> 3242 numeric months_between(timestamp,timestamp); -- <b>funcoid:</b> 1522 timestamp round(timestamp); -- <b>funcoid:</b> obtains the OID by using the <b>select oid from pg_proc where proname='round' and pronamespace=11 and pronargs=1 and allargtypes[0]=1114</b> query statement. timestamp round(timestamp,text); -- <b>funcoid:</b> 4465 timestamp to_date(text,text,bool); -- <b>funcoid:</b> 1524 timestamp to_date(text,text,text,bool); -- <b>funcoid:</b> 1525 numeric to_number(text,text,bool); -- <b>funcoid:</b> 1787 numeric to_number(text,text,text,bool); -- <b>funcoid:</b> 1788 timestamp to_timestamp(text,text,bool); -- <b>funcoid:</b> 606 timestamp to_timestamp(text,text,text,bool); -- <b>funcoid:</b> 607 timestamptz to_timestamp_tz(text); -- <b>funcoid:</b> 1806 timestamptz to_timestamp_tz(text,text); -- <b>funcoid:</b> 1807 timestamptz to_timestamp_tz(text,text,bool); -- <b>funcoid:</b> 1808 timestamptz to_timestamp_tz(text,text,text,bool); -- <b>funcoid:</b> 1809

Database Platform Compatibility Configuration Item	System Function That Can Be Disabled
10c,s2	text DBTimezone(); -- <b>funcoid</b> : 5562 int8 ascii2(text); -- <b>funcoid</b> : 1625 text asciistr(text); -- <b>funcoid</b> : 1626 text asciistr(blob); -- <b>funcoid</b> : 1629 int4 bit2coding(text); -- <b>funcoid</b> : 9311 int4 bit4coding(text); -- <b>funcoid</b> : 9325 float8 cosh(float8); -- <b>funcoid</b> : 1548 numeric cosh(numeric); -- <b>funcoid</b> : 1549 timestamptz current_timestamp(numeric); -- <b>funcoid</b> : 3257 text dump(any); -- <b>funcoid</b> : 9086 text dump(any,int4); -- <b>funcoid</b> : 9088 text dump(any,int4,int4); -- <b>funcoid</b> : 9089 text dump(any,int4,int4,int4); -- <b>funcoid</b> : 9090 float4 nanvl(float4,float4); -- <b>funcoid</b> : 7112 float4 nanvl(float4,numeric); -- <b>funcoid</b> : 7115 float8 nanvl(float8,float8); -- <b>funcoid</b> : 7113 float4 nanvl(numeric,float4); -- <b>funcoid</b> : 7116 numeric nanvl(numeric,numeric); -- <b>funcoid</b> : 7114 timestamp new_time(timestamp,text,text); -- <b>funcoid</b> : 374 text nls_lower(text); -- <b>funcoid</b> : 4082 text nls_lower(text,text); -- <b>funcoid</b> : 4083 text nls_upper(text); -- <b>funcoid</b> : 4084 text nls_upper(text,text); -- <b>funcoid</b> : 4085 interval numtoyminterval(numeric,text); -- <b>funcoid</b> : 9333 int8 ora_hash(any); -- <b>funcoid</b> : 6127 int8 ora_hash(any,int8); -- <b>funcoid</b> : 6128 text rawtohex2(any); -- <b>funcoid</b> : 9540 numeric remainder(int8,int8); -- <b>funcoid</b> : 9767 numeric remainder(int2,int2); -- <b>funcoid</b> : 9765 numeric remainder(int4,int4); -- <b>funcoid</b> : 9766 float4 remainder(float4,float4); -- <b>funcoid</b> : 9771 float4 remainder(float4,numeric); -- <b>funcoid</b> : 9768 float8 remainder(float8,float8); -- <b>funcoid</b> : 9770 float4 remainder(numeric,float4); -- <b>funcoid</b> : 9769 numeric remainder(numeric,numeric); -- <b>funcoid</b> : 9761

Database Platform Compatibility Configuration Item	System Function That Can Be Disabled
	<p>numeric remainder(int1,int1); -- <b>funcoid</b>: 9764</p> <p>text session_time_zone(); -- <b>funcoid</b>: 9571</p> <p>float8 sinh(float8); -- <b>funcoid</b>: 1546</p> <p>numeric sinh(numeric); -- <b>funcoid</b>: 1547</p> <p>timestamp sys_extract_utc(timestamp); -- <b>funcoid</b>: 5258</p> <p>timestamp sys_extract_utc(timestamptz); -- <b>funcoid</b>: 5259</p> <p>float8 tanh(float8); -- <b>funcoid</b>: 9762</p> <p>numeric tanh(numeric); -- <b>funcoid</b>: 9763</p> <p>float8 to_binary_double(text); -- <b>funcoid</b>: 9669</p> <p>float8 to_binary_double(text,text); -- <b>funcoid</b>: 9670</p> <p>float8 to_binary_double(text,text,bool); -- <b>funcoid</b>: 9671</p> <p>float8 to_binary_double(text,text,text,bool); -- <b>funcoid</b>: 9672</p> <p>float4 to_binary_float(text); -- <b>funcoid</b>: 9673</p> <p>float4 to_binary_float(text,text); -- <b>funcoid</b>: 9674</p> <p>float4 to_binary_float(text,text,bool); -- <b>funcoid</b>: 9675</p> <p>float4 to_binary_float(text,text,text,bool); -- <b>funcoid</b>: 9676</p> <p>blob to_blob(any); -- <b>funcoid</b>: 6990</p> <p>interval to_dsinterval(text); -- <b>funcoid</b>: 9126</p> <p>interval to_dsinterval(text,text,bool); -- <b>funcoid</b>: 9127</p> <p>text to_multi_byte(text); -- <b>funcoid</b>: 9537</p> <p>text to_multi_byte(blob); -- <b>funcoid</b>: 9539</p> <p>varchar to_nchar(int8); -- <b>funcoid</b>: obtains the OID by using the <b>select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=20</b> query statement.</p> <p>varchar to_nchar(int2); -- <b>funcoid</b>: obtains the OID by using the <b>select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=21</b> query statement.</p> <p>varchar to_nchar(int4); -- <b>funcoid</b>: obtains the OID by using the <b>select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=23;</b> query statement.</p> <p>text to_nchar(text); -- <b>funcoid</b>: obtains the OID by using the <b>select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=25</b> query statement.</p> <p>varchar to_nchar(float4); -- <b>funcoid</b>: obtains the OID by using the <b>select oid from pg_proc where proname='to_nchar' and</b></p>

Database Platform Compatibility Configuration Item	System Function That Can Be Disabled
	<p><b>pronamespace=11 and pronargs=1 and allargtypes[0]=700</b> query statement.</p> <p>varchar to_nchar(float8); -- <b>funcoid</b>: obtains the OID by using the <b>select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=701</b> query statement.</p> <p>varchar to_nchar(numeric); -- <b>funcoid</b>: obtains the OID by using the <b>select oid from pg_proc where proname='to_nchar' and pronamespace=11 and pronargs=1 and allargtypes[0]=1700</b> query statement.</p> <p>text to_nchar(timestamp); -- <b>funcoid</b>: 5698</p> <p>text to_nchar(timestamptz); -- <b>funcoid</b>: 5699</p> <p>text to_nchar(anyset); -- <b>funcoid</b>: 5700</p> <p>text to_nchar(int8,text); -- <b>funcoid</b>: 5694</p> <p>text to_nchar(int4,text); -- <b>funcoid</b>: 5693</p> <p>text to_nchar(float4,text); -- <b>funcoid</b>: 5695</p> <p>text to_nchar(float8,text); -- <b>funcoid</b>: 5696</p> <p>text to_nchar(timestamp,text); -- <b>funcoid</b>: 5697</p> <p>text to_nchar(timestamptz,text); -- <b>funcoid</b>: 5691</p> <p>text to_nchar(interval,text); -- <b>funcoid</b>: 5690</p> <p>text to_nchar(numeric,text); -- <b>funcoid</b>: 5692</p> <p>text to_single_byte(text); -- <b>funcoid</b>: 9536</p> <p>text to_single_byte(blob); -- <b>funcoid</b>: 9538</p> <p>interval to_ymininterval(text); -- <b>funcoid</b>: 9124</p> <p>interval to_ymininterval(text,text,bool); -- <b>funcoid</b>: 9125</p> <p>text tz_offset(text); -- <b>funcoid</b>: 706</p> <p>text unistr(text); -- <b>funcoid</b>: 9081</p> <p>text unistr(blob); -- <b>funcoid</b>: 9082</p> <p>int4 vsize(any); -- <b>funcoid</b>: 9083</p>
10c,s4	<p>clob getclobval(xml); -- <b>funcoid</b>: 8011</p> <p>varchar getstringval(xml); -- <b>funcoid</b>: 6976</p> <p>nvarchar2 nchr(int8); -- <b>funcoid</b>: 1694</p> <p>timestamptz to_timestamp_tz(text,text,text); -- <b>funcoid</b>: 1804</p> <p>timestamptz to_timestamp_tz(text,text,text,text,bool); -- <b>funcoid</b>: 1805</p>
10c,s5	<p>sys_guid(); --<b>funcoid</b>: 2974</p>

**Default value:** "

**Setting method:** This is a SUSET parameter. Set it based on instructions in [Table 2 GUC parameter setting methods](#) in section 18.2.

**Setting suggestion:** If the database platform compatibility behavior configuration items (**a\_format\_version** and **a\_format\_dev\_version**) are disabled, the corresponding added system functions are unavailable by default. You do not need to use this parameter to disable the functions.

## enable\_convert\_illegal\_char

**Parameter description:** Specifies whether invalid characters in the command output are not verified and are displayed as placeholders.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The parameter is enabled. Invalid codes will be replaced by the symbols specified by the **convert\_illegal\_char\_mode** parameter.
- **off:** The parameter is disabled. If the query result contains invalid characters, an error is reported after verification.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value. Enable this parameter only when the data contains special characters and errors should not be reported for special characters.

 NOTE

1. When the database character set is utf8, zhs16gbk, gb18030, gb18030-2022, or latin1, **enable\_convert\_illegal\_char = on** takes effect. If the character set of the database client is different from that of the database server, invalid characters are displayed as placeholders.
2. Special character range: The special characters mentioned in this document include only full encoding exceptions and hybrid encoding. The \u0000 character is not supported. If the character code contains the \u0000 character, the character is truncated at \u0000, which affects data integrity.
3. If the character sets of the database client and server are different, when **enable\_convert\_illegal\_char** is set to **off**, the database replaces special characters (excluding \x0000) that exceed the current character set codes with \x3F (displayed as ?) and writes the special characters into the database; when **enable\_convert\_illegal\_char** is set to **on**, only the `db_raw.cast_to_varchar2()` function can be used to insert the original invalid character into the database and display the character as a placeholder.
4. When the GUC parameter is enabled, the behaviors of the special characters in the functions and advanced package functions listed in the following table are as follows:
  - When the character sets of the client and server are the same, no error is reported during the query of special characters. The behavior is the same as that before the GUC parameter is enabled.
  - If the character sets of the client and server are different, special characters are displayed as placeholders, which use question marks (?) by default.
  - You are advised not to use functions to process character strings that contain special characters. The functions listed in the following table do not report errors when processing character strings that contain special characters, and the correctness of the results cannot be ensured.

**Table 14-22** Functions and advanced package functions supporting special characters

No.	Function Name/Advanced Package Function Name
1	<code>bit_length(string)</code>
2	<code>btrim(string text [, characters text])</code>
3	<code>char_length(string)</code> <code>character_length(string)</code>

55	PKG_UTIL.RAW_CAST_TO_VARCHAR2
56	DBE_OUTPUT.PUT
57	DBE_OUTPUT.PUT_LINE

## fix\_func\_selection

**Parameter description:** Specifies whether to optimize the function matching policy.

The catlist sequence issue occurs in this case: If a user-defined function conflicts with a system function, the function selected by the database depends on the registration sequence of the system function in the database system.

**Parameter type:** string.

**Unit:** none

**Value range:** " and catlist.

- "": No optimization is performed. The value is the same as that in versions earlier than 505.1.0.
- **catlist**: The catlist sequence is optimized. (The non-MySQL-compatible mode is optimized. In non-MySQL-compatible mode, system functions are always preferentially selected and executed.) The MySQL-compatible mode is the same as that in versions earlier than 505.1.0. An error message indicating that the function is not unique may be displayed, or a system function may be selected for execution.

**Default value:**

- **catlist**: default value of the newly installed database
- "": default value of the database in versions earlier than 505.1.0 after the database is upgraded.

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

### gs\_format\_behavior\_compat\_options

**Parameter description:** Selects configuration items of GaussDB internal system functions.

**Parameter type:** string.

**Unit:** none

**Value range:** Currently, only the compatibility configuration items listed in [Table 14-23](#) are supported. Compatibility configuration items are separated by commas (,).

**Default value:** 'sqrt\_karatsuba'

**Table 14-23** gs\_format\_behavior compatibility configuration items

Configuration Item	Behavior
'sqrt_karatsuba'	<ul style="list-style-type: none"> <li>• If this parameter is set, the Karatsuba square root algorithm is used when the sqrt function is called. The Karatsuba algorithm has higher performance but its precision may be different from that of the Newton iteration algorithm in rare cases.</li> <li>• If this parameter is not set, the default Newton iteration algorithm is used to calculate the square root for the sqrt algorithm.</li> </ul>

Configuration Item	Behavior
'allow_textconcat_null'	<ul style="list-style-type: none"> <li>If this parameter is set, the value of the corresponding character string is returned when a character string is combined with the <b>null</b> value in PG-compatible mode.  <pre>-- Run the following command in PG-compatible mode: gaussdb=# set gs_format_behavior_compat_options='allow_textconcat_null'; SET gaussdb=# select 'a'    null    'b'; ?column? ----- ab (1 row)</pre> </li> <li>If this parameter is not set, <b>NULL</b> is returned when a character string is combined with the <b>null</b> value in PG-compatible mode.</li> </ul>

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Setting suggestion:** Determines whether some compatibility features are available. If you want to modify this parameter, make sure you understand its meaning and modify it with caution to avoid risks caused by misoperations.

### 14.3.15.3 Product Version of the Cloud Service

This section describes the version parameters of the cloud service.

#### product\_version

**Parameter description:** Specifies the version of a cloud service product.

**Parameter type:** string

**Unit:** none

**Value range:** none

**Default value:** empty

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** The following rules must be met to avoid errors.

- The value can contain a maximum of 50 characters.
- The value cannot contain vertical bars (|), semicolons (;), ampersands (&), dollar signs (\$), ampersands (>), ampersands (<), ampersands (^), backslashes (\), exclamation marks (!), or newline characters.

#### hotpatch\_version

**Parameter description:** Specifies the hot patch version of a cloud service product.

**Parameter type:** string

**Unit:** none

**Value range:** none

**Default value:** empty

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** The following rules must be met to avoid errors.

- The value can contain a maximum of 1500 characters.
- The value cannot contain vertical bars (|), semicolons (;), ampersands (&), dollar signs (\$), ampersands (>), ampersands (<), ampersands (^), backslashes (\), exclamation marks (!), or newline characters.

## 14.3.16 Fault Tolerance

This section describes parameters used for controlling how the server processes an error occurring in the database system.

### exit\_on\_error

**Parameter description:** If this function is enabled, errors of the ERROR level will be escalated to PANIC errors, and core stacks will be generated. It is mainly used to locate problems and test services.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on:** Errors of the ERROR level will be escalated to PANIC errors.
- **off:** Errors of the ERROR level will not be escalated.

**Default value:** off

### restart\_after\_crash

**Parameter description:** If this parameter is set to **on** and a backend thread crashes, GaussDB automatically reinitializes the backend thread.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** maximizes the availability of the database.  
In some circumstances (for example, when a management tool, such as xCAT, is used to manage GaussDB), setting this parameter to **on** maximizes the availability of the database.
- **off** indicates that a management tool is enabled to obtain control permission and take proper measures when a backend thread crashes.

**Default value:** on

## omit\_encoding\_error

**Parameter description:** If this parameter is set to **on** and the client character set of the database is encoded in UTF-8 format, character encoding conversion errors will be recorded in logs. Additionally, converted characters that have conversion errors will be ignored and replaced with question marks (?).

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that characters that have conversion errors will be ignored and replaced with question marks (?), and error information will be recorded in logs.
- **off** indicates that characters that have conversion errors cannot be converted and error information will be directly displayed.

**Default value:** off

### NOTE

If this parameter is modified by running the **gs\_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs\_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

## cn\_send\_buffer\_size

**Parameter description:** Specifies the size of the data buffer used for data transmission on CNs.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 8 to 128. The unit is KB.

**Default value:** 8KB

## data\_sync\_retry

**Parameter description:** Specifies whether to keep running the database when updated data fails to be written into disks by using the **fsync** function. In some OSs, no error is reported even if **fsync** fails after the second attempt. As a result, data is lost.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the database keeps running and **fsync** is executed again after **fsync** fails.
- **off** indicates that a PANIC-level error is reported and the database is stopped after **fsync** fails.

**Default value:** off

## remote\_read\_mode

**Parameter description:** Specifies whether to enable the remote read function. This function allows pages on the standby node to be read when reading pages on the primary node fails.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **off** indicates that the remote read function is disabled.
- **non\_authentication** indicates that the remote read function is enabled but certificate authentication is not required.
- **authentication** indicates that the remote read function is enabled and certificate authentication is required.

**Default value:** authentication

## 14.3.17 Connection Pool Parameters

When a connection pool is used to access the database, database connections are established and then stored in the memory as objects during system running. When you need to access the database, no new connection is established. Instead, an existing idle connection is selected from the connection pool. After you finish accessing the database, the database does not disable the connection but puts it back into the connection pool. The connection can be used for the next access request.

### pooler\_port

**Parameter description:** Specifies the O&M management port of internal tools, such as cm\_agent and cm\_ctl. This port is used by the initial user or system administrator to connect to the database through the client.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** the value of the GUC parameter **port** of a CN or DN plus 1

**Default value:** the default value of the GUC parameter **port** of a CN or DN plus 1. The default value of this parameter is **8001** for CNs and **40001** for DNs.

### pooler\_maximum\_idle\_time

**Parameter description:** Specifies the maximum amount of time that the connections can remain idle in a pool before being removed. After that, the automatic connection clearing mechanism is triggered to reduce the number of connections on each node to the value of **minimum\_pool\_size**.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 2147483647. The smallest unit is s.

**Default value:** 10min (600 seconds)

## minimum\_pool\_size

**Parameter description:** Specifies the minimum number of remaining connections in the pool on each node after the automatic connection clearing is triggered. If this parameter is set to **0**, the automatic connection clearing is disabled.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535

**Default value:** 50

## max\_pool\_size

**Parameter description:** Specifies the maximum number of connections between a CN and another CN/DN in a connection pool. This parameter needs to be modified when the cluster scale changes, for example, nodes are added or deleted.

**Parameter type:** integer

**Unit:** none

**Value range:** 1 to 65535

**Default value:**

- Independent deployment:  
**32768** (60-core CPU/480 GB memory); **16384** (32-core CPU/256 GB memory);  
**8192** (16-core CPU/128 GB memory); **4096** (8-core CPU/64 GB memory);  
**2048** (4-core CPU/32 GB memory); **1000** (4-core CPU/16 GB memory)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Setting suggestion:** Set this parameter based on the default value of different instance specifications. The value of this parameter must be greater than the value of **max\_connections**. During the adjustment, the connections consumed by internal threads must be reserved. When the number of concurrent services is large, the connections from the CN to other CNs/DNs in the connection pool are consumed. If this parameter is set to a small value, an error is reported when the number of connections reaches the upper limit. As a result, services fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

## persistent\_datanode\_connections

**Parameter description:** Specifies whether to release the connection for the current session.

This is a BACKEND parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **off** indicates that the connection for the current session will be released.
- **on** indicates that the connection for the current session will not be released.

---

**NOTICE**

After this parameter is set to **on**, a session may hold a connection but does not run a query. As a result, other query requests fail to be connected.

---

**Default value:** off

## max\_coordinators

**Parameter description:** Specifies the maximum number of CNs in a cluster. This parameter may need to be modified when the cluster scale changes, for example, nodes are added or deleted. During scale-out, ensure that the value of this parameter is greater than the number of CNs in the target cluster. Otherwise, the scale-out will fail. If this parameter is set to a large value during scale-in, more memory resources are consumed when the CN is started. However, in general, the impact on the CN memory is small.

**Parameter type:** integer

**Unit:** none

**Value range:** 2 to 1024

**Default value:** 128

**Setting method:** This is a POSTMASTER parameter. You are advised not to modify it. If you need to modify it, set it based on instructions provided in [Table 14-2](#).

**Setting suggestion:** Set this parameter based on the actual cluster specifications. If the value of this parameter is less than the number of CNs in the cluster, node creation will fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

## max\_datanodes

**Parameter description:** Specifies the maximum number of DN nodes in a cluster. This parameter may need to be modified when the cluster scale changes, for example, nodes are added or deleted. During scale-out, ensure that the value of this parameter is greater than the total number of DN shards in the target cluster. Otherwise, the scale-out will fail. If this parameter is set to a large value during scale-in, more memory resources are consumed when the CN is started. However, in general, the impact on the CN memory is small.

**Parameter type:** integer

**Unit:** none

**Value range:** 2 to 65535

**Default value:** 256

**Setting method:** This is a POSTMASTER parameter. You are advised not to modify it. If you need to modify it, set it based on instructions provided in [Table 14-2](#).

**Setting suggestion:** Set this parameter based on the actual cluster specifications. If the value of this parameter is less than the number of DN nodes in the cluster, node

creation will fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

## cache\_connection

**Parameter description:** Specifies whether to recycle the connections of a connection pool.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the connections of a connection pool will be recycled.
- **off** indicates that the connections of a connection pool will not be recycled.

**Default value:** on

## enable\_force\_reuse\_connections

**Parameter description:** Specifies whether a session forcibly reuses a new connection.

This is a BACKEND parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the new connection is forcibly used.
- **off** indicates that the current connection is used.

**Default value:** off

## pooler\_connect\_max\_loops

**Parameter description:** Specifies whether to enable the connection retries to enhance stability of setting up connections in switchover scenarios. If a service fails to connect to the primary node, it will retry by attempting to connect to the standby node. If the standby node is successfully promoted to primary, the retry attempt will succeed. This parameter specifies the total number of retry attempts. If this parameter is set to **0**, retries are disabled. The service only establishes a connection to the primary node.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 20

**Default value:** 1

## pooler\_connect\_interval\_time

**Parameter description:** Specifies the interval between retries when **pooler\_connect\_max\_loops** is set to a value greater than 1. You are advised to set this parameter to a value slightly greater than the time required for primary/standby switchover in the current cluster.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 7200. The smallest unit is s.

**Default value:** 15s

## pooler\_timeout

**Parameter description:** Specifies the timeout interval of communication between each connection in a CN's connection pool and another CN/DN.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 7200. The smallest unit is s.

**Default value:** 10min

## pooler\_connect\_timeout

**Parameter description:** Specifies the timeout interval of connecting a CN's connection pool to another CN/DN in the same cluster.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 7200. The smallest unit is s.

**Default value:** 1min

## pooler\_cancel\_timeout

**Parameter description:** Specifies the timeout interval of canceling a connection by a CN's connection pool during error processing. If similar timeout occurs when an exception of the subtransaction or stored procedure is captured, the transaction containing the subtransaction or the stored procedure rolls back. If the source data from the COPY FROM operation is not consistent with that of the table structure in the target table, and the parameter value is not 0, an error is reported.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 7200. The smallest unit is s. 0 (not recommended) indicates that the timeout is disabled.

**Default value:** 15s

## 14.3.18 Cluster Transaction Parameters

This section describes the settings and value ranges of transaction parameters for the cluster.

### transaction\_isolation

**Parameter description:** Specifies the isolation level of the current transaction.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string of case-sensitive characters. The values include:

- **serializable:** This value is equivalent to REPEATABLE READ in GaussDB.
- **read committed** indicates that only the data in committed transactions is read.

- **repeatable read** indicates that only the data committed before a transaction starts is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **default:** The value is the same as that of **default\_transaction\_isolation**.

**Default value:** read committed

## transaction\_read\_only

**Parameter description:** Specifies that the current transaction is a read-only transaction.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the current transaction is a read-only transaction.
- **off** indicates that the current transaction can be a read/write transaction.

**Default value:** off

## xc\_maintenance\_mode

**Parameter description:** Specifies whether the system is in maintenance mode.

This is a SUSERSET parameter. Set it based on method 3 provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

---

### NOTICE

Exercise caution when setting this parameter to **on** to avoid data inconsistencies in the cluster.

---

**Default value:** off

## allow\_concurrent\_tuple\_update

**Parameter description:** Specifies whether to allow concurrent update.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** on

## gtm\_host

**Parameter description:** Specifies the IP address of the primary GTM process. This parameter is visible only to the sysadmin user.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** IP address of the primary GTM

## gtm\_port

**Parameter description:** Specifies the listening port of the primary GTM process. This parameter is visible only to the sysadmin user.

This is a POSTMASTER parameter.

### NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Value range:** an integer ranging from 1 to 65535.

**Default value:** specified during installation.

## gtm\_host1

**Parameter description:** Specifies the IP address of the standby GTM process. This parameter is visible only to the sysadmin user.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** IP address of the standby GTM

## gtm\_port1

**Parameter description:** Specifies the listening port of the standby GTM process. This parameter is visible only to the sysadmin user.

This is a POSTMASTER parameter.

### NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Value range:** an integer ranging from 1 to 65535.

**Default value:** The value is specified during installation if the standby node 1 is deployed. Otherwise, the value is **6665**.

## pgxc\_node\_name

**Parameter description:** Specifies the name of a node.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

When a standby node requests to replicate logs on the primary node, if the **application\_name** parameter is not set, the **pgxc\_node\_name** parameter is used as the name of the streaming replication slot of the standby node on the primary node. The streaming replication slot is named in the following format: Value of this parameter\_IP address of the standby node\_Port number of the standby node. The IP address and port number of the standby node are obtained from the IP address and port number of the standby node specified by the **replconninfo** parameter. The maximum length of a streaming replication slot name is 61 characters. If the length of the concatenated string exceeds 61 characters, the truncated **pgxc\_node\_name** will be used for concatenation to ensure that the length of the streaming replication slot name is less than or equal to 61 characters.

---

 **CAUTION**

After this parameter is modified, the cluster will fail to be connected. You are advised not to modify this parameter.

---

**Value range:** a string.

**Default value:** current node name.

## gtm\_backup\_barrier

**Parameter description:** Specifies whether to create a restoration point for the GTM starting point.

This is a SUSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that a restoration point is created.
- **off** indicates that no restoration point is created.

**Default value:** off

## gtm\_conn\_check\_interval

**Parameter description:** Sets the intervals between two consecutive performed checks performed by the CN on the connections between local threads and the primary GTM.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 10s

## transaction\_deferrable

**Parameter description:** Specifies whether to delay the execution of a read-only serial transaction without incurring an execution failure. Assume this parameter is set to **on**. When the server detects that the tuples read by a read-only transaction

are being modified by other transactions, it delays the execution of the read-only transaction until the other transactions finish modifying the tuples. This parameter is reserved and does not take effect in this version. Similar to this parameter, the [default\\_transaction\\_deferrable](#) parameter is used to specify whether to allow delayed execution of a transaction.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on:** allowed.
- **off:** not allowed.

**Default value:** off

## enable\_show\_any\_tuples

**Parameter description:** This parameter is available only in a read-only transaction and is used for analysis. When this parameter is set to **on** or **true**, all versions of tuples in the table are displayed.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** or **true** indicates that all versions of tuples in the table are displayed.
- **off** or **false** indicates that no versions of tuples in the table are displayed.

**Default value:** off

### NOTE

In the TOAST scenario, if DML operations (mainly INSERT+UPDATE or INSERT+DELETE) are performed before and after the REINDEX operation, and the read-only transaction is started and the GUC parameter is enabled after the REINDEX operation, historical data in the TOAST table or TOAST index table can be queried separately in the released version. However, when historical data in the TOAST column is queried in the main table, the error message "missing chunk number xxx" is displayed.

## gtm\_connect\_timeout

**Parameter description:** Specifies the GTM connection timeout. If the connection time of the GTM exceeds its value, the connection times out and exits.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is s.

**Default value:** 2s

## gtm\_connect\_retries

**Parameter description:** Specifies the number of GTM reconnection attempts.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647.

**Default value:** 30

## gtm\_rw\_timeout

**Parameter description:** Specifies the GTM response timeout. If the time spent waiting for GTM responses exceeds its value, the operation times out and exits.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 2147483647. The unit is s.

**Default value:** 1min

## enable\_redistribute

**Parameter description:** Specifies whether unmatched nodes are redistributed.

This is a SUSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that unmatched nodes are redistributed.
- **off** indicates that unmatched nodes are not redistributed.

**Default value:** off

## replication\_type

**Parameter description:** Specifies whether the current database is deployed in standalone or one-primary-multiple-standby mode.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

This parameter is used for CM deployment. Do not set it.

**Value range:** 0 to 2

- **0:** reserved parameter.
- **1:** one-primary-multiple-standby mode, covering all scenarios. This mode is recommended.
- **2:** single primary mode. In this mode, the standby node cannot be expanded.

**Default value:** 1

## enable\_gtm\_free

**Parameter description:** Specifies whether the GTM-free mode is enabled. In large concurrency scenarios, the snapshots delivered by the GTM increase in number and size. The network between the GTM and the CN becomes the performance bottleneck. The GTM-free mode is used to eliminate the bottleneck. In this mode, the CN communicates with DNs instead of the GTM. The CN sends queries to each DN, which locally generates snapshots and XIDs, ensuring external write consistency but not external read consistency.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

 CAUTION

When the GTM-free mode is used, you are advised to set **application\_type** to **perfect\_sharding\_type** so that you can find SQL statements that may cause data inconsistency. Otherwise, the system does not intercept statements that may cause data inconsistency.

**Value range:** Boolean

- **on** indicates that the GTM-free mode is enabled and the cluster ensures eventual read consistency.
- **off** indicates that the GTM-free mode is disabled.

**Default value:** off

## enable\_twophase\_commit

**Parameter description:** Specifies whether to enable distributed two-phase commit in the GTM-free mode adopted to address the replacement issues of SDS in the cloud database. This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that distributed two-phase commit is allowed in the GTM-free mode.
- **off** indicates that distributed two-phase commit is not allowed in the GTM-free mode.

**Default value:** on

## application\_type

**Parameter description:** valid only when **enable\_gtm\_free** is set to **on**. This parameter specifies the service type of a user. This is a USERSET parameter. Set it based on instructions in [Table 14-2](#). This parameter cannot be set using `gs_guc`. Only the following ways are allowed:

1. Use the **gsql** client to perform session-level configuration.
2. When JDBC is used to connect to the database, set the **ApplicationType** parameter for the connection string.

**Value range:** enumerated values

- **not\_perfect\_sharding\_type** indicates a service across nodes. If this value is used, statements across nodes can be executed.
- **perfect\_sharding\_type** indicates a service on a single node. If this value is used and the SQL statement involves multiple nodes, an error is reported. The corresponding SQL statement is recorded in the system log.
  - If this value is used, you can run the **/\*+ multinode \*/ hint** command to allow SQL statements to be executed on multiple nodes. The multinode hint can be added after the select, insert, update, delete, and merge keywords.

## gtm\_host2

**Parameter description:** Specifies the host name or IP address of the standby GTM 2 if the standby GTM 2 is deployed. This parameter is visible only to the sysadmin user.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** the IP address of the standby GTM 2 if the standby GTM 2 is deployed. Otherwise, the value is "".

## gtm\_host3

**Parameter description:** Specifies the host name or IP address of the standby GTM 3 if the standby GTM 3 is deployed. This parameter is visible only to the sysadmin user.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** the IP address of the standby GTM 3 if the standby GTM 3 is deployed. Otherwise, the value is "".

## gtm\_host4

**Parameter description:** Specifies the host name or IP address of the standby GTM 4 if the standby GTM 4 is deployed. This parameter is visible only to the sysadmin user.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** the IP address of the standby GTM 4 if the standby GTM 4 is deployed. Otherwise, the value is "".

## gtm\_host5

**Parameter description:** Specifies the host name or IP address of the standby GTM 5 if the standby GTM 5 is deployed. This parameter is visible only to the sysadmin user.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** the IP address of the standby GTM 5 if the standby GTM 5 is deployed. Otherwise, the value is "".

## gtm\_host6

**Parameter description:** Specifies the host name or IP address of the standby GTM 6 if the standby GTM 6 is deployed. This parameter is visible only to the sysadmin user.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** the IP address of the standby GTM 6 if the standby GTM 6 is deployed. Otherwise, the value is "".

## gtm\_host7

**Parameter description:** Specifies the host name or IP address of the standby GTM 7 if the standby GTM 7 is deployed. This parameter is visible only to the sysadmin user.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a string.

**Default value:** the IP address of the standby GTM 7 if the standby GTM 7 is deployed. Otherwise, the value is "".

## gtm\_port2

**Parameter description:** Specifies the listening port of the standby GTM 2 if the standby GTM 2 is deployed. This parameter is visible only to the sysadmin user.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535.

**Default value:** The value is specified during installation if the standby node 2 is deployed. Otherwise, the value is **6666**.

## gtm\_port3

**Parameter description:** Specifies the listening port of the standby GTM 3 if the standby GTM 3 is deployed. This parameter is visible only to the sysadmin user.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535.

**Default value:** The value is specified during installation if the standby node 3 is deployed. Otherwise, the value is **6666**.

## gtm\_port4

**Parameter description:** Specifies the listening port of the standby GTM 4 if the standby GTM 4 is deployed. This parameter is visible only to the sysadmin user.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535.

**Default value:** The value is specified during installation if the standby node 4 is deployed. Otherwise, the value is **6666**.

## gtm\_port5

**Parameter description:** Specifies the listening port of the standby GTM 5 if the standby GTM 5 is deployed. This parameter is visible only to the sysadmin user.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535.

**Default value:** The value is specified during installation if the standby node 5 is deployed. Otherwise, the value is **6666**.

## gtm\_port6

**Parameter description:** Specifies the listening port of the standby GTM 6 if the standby GTM 6 is deployed. This parameter is visible only to the sysadmin user.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535.

**Default value:** The value is specified during installation if the standby node 6 is deployed. Otherwise, the value is **6666**.

## gtm\_port7

**Parameter description:** Specifies the listening port of the standby GTM 7 if the standby GTM 7 is deployed. This parameter is visible only to the sysadmin user.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 65535.

**Default value:** The value is specified during installation if the standby node 7 is deployed. Otherwise, the value is **6666**.

## enable\_defer\_calculate\_snapshot

**Parameter description:** Specifies the delay in calculating **xmin** and **oldestxmin**. Calculation is triggered only when 1000 transactions are executed or the interval is 1s. If this parameter is set to **on**, the overhead of calculating snapshots can be reduced in heavy-load scenarios, but the progress of updating **oldestxmin** is slow, affecting tuple recycling. If this parameter is set to **off**, **xmin** and **oldestxmin** can be calculated in real time, but the overhead for calculating snapshots increases.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that snapshots **xmin** and **oldestxmin** are calculated with a delay.
- **off** indicates that snapshots **xmin** and **oldestxmin** are calculated in real time.

**Default value:** **on**

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

## seqscan\_csn\_cache\_num

**Parameter description:** Specifies the size of the CSN cache. The cache is used only when the Seq Scan scans the heap table page through the MVCC snapshot to determine the visibility. If this parameter is set to **0**, the CSN cache mechanism is not used.

This is a PGC\_SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000.

**Default value:** 100.

## 14.3.19 Dual-Cluster Replication Parameters

### enable\_roach\_standby\_cluster

**Parameter description:** Sets the instances of the standby cluster to read-only in dual-cluster mode. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that the read-only mode is enabled for the standby cluster.
- **off** indicates that the read-only mode is disabled for the standby cluster. In this case, the standby cluster can be read and written.

**Default value:** off

### enable\_slot\_log

**Parameter description:** Specifies whether to enable primary/standby synchronization for replication slots. Currently, only archive slots and backup slots are involved.

**Parameter type:** Boolean.

**Value range:**

- **on** indicates that primary/standby synchronization is enabled for replication slots.
- **off** indicates that primary/standby synchronization is disabled for replication slots.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#).

**Setting suggestion:** Set this parameter to **on** only in cloud scenarios where logical replication is enabled. In other scenarios, set this parameter to **off**.

### max\_changes\_in\_memory

**Parameter description:** Specifies the maximum number of DML statements cached in memory for a single transaction during logical decoding.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 4096

## max\_cached\_tuplebufs

**Parameter description:** Specifies the upper limit of the total tuple information cached in the memory during logical decoding. You are advised to set this parameter to a value greater than or equal to twice of [max\\_changes\\_in\\_memory](#).

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 2147483647

**Default value:** 8192

## logical\_decode\_options\_default

**Parameter description:** Specifies the global default value for unspecified decoding options when logical decoding starts.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

Currently, the following logical decoding options are supported: **parallel-decode-num**, **parallel-queue-size**, **max-txn-in-memory**, **max-reorderbuffer-in-memory**, **exclude-users**, and **skip-generated-columns**. For details about the options, see "Logical Replication > Logical Decoding > Logical Decoding Options" in *Feature Guide*.

**Value range:** a string of key=value characters separated by commas (,), for example, '**parallel-decode-num=4,parallel-queue-size=128,exclude-users=userA,skip-generated-columns=on**'. An empty string indicates that the default value of the program is used.

**Default value:** ""

---

### NOTICE

- The SIGHUP parameter does not affect the started logic decoding process. The options specified by this parameter are used as the default settings for subsequent logic decoding startup, and the settings specified in the startup command are preferentially used.
  - The **exclude-users** option is different from the logic decoding startup option. You are not allowed to specify multiple blacklisted users.
- 

## logical\_sender\_timeout

**Parameter description:** Specifies the maximum waiting time for the sender to wait for the receiver to receive logical logs.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is ms.

**Default value:** 30s

## RepOriginId

**Parameter description:** This is a session-level GUC parameter. In bidirectional logical replication, set it to a non-zero value to avoid infinite data replication.

This is a USERSET parameter. Set it based on method 3 provided in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0

## auto\_csn\_barrier

**Parameter description:** Specifies whether the barrier logging function is enabled for the primary cluster for streaming DR.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** off

## stream\_cluster\_run\_mode

**Parameter description:** Specifies whether a CN or DN belongs to the primary or standby cluster in a dual-cluster streaming DR scenario. In a single-cluster scenario, the primary cluster is selected by default.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values

- **cluster\_primary** indicates that the node is in the primary cluster.
- **cluster\_standby** indicates that the node is in the standby cluster.

**Default value:** cluster\_primary

## hadr\_process\_type

**Parameter description:** Specifies a process ID of a streaming replication-based remote DR solution or intra-city dual-center HA solution.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** enumerated values.

- **none** indicates that there is no process.
- **failover** indicates that a DR cluster is promoted to primary.
- **switchover\_promote** indicates that a DR cluster is promoted to primary during the cluster switchover.

- **switchover\_demote** indicates that a primary cluster is demoted to a DR cluster during the cluster switchover.
- **dorado\_failover** indicates that a Dorado DR cluster is promoted to primary.
- **dorado\_switchover\_demote** indicates that a primary cluster is demoted to a DR cluster during the Dorado cluster switchover.
- **dorado\_failover\_abnormal** indicates that a DR cluster is process to primary when a shared disk of the Dorado primary cluster is faulty.

**Default value:** none

## 14.3.20 Developer Options

### allow\_system\_table\_mods

**Parameter description:** Specifies whether the structure of a system catalog or the name of a system schema can be modified.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the structure of the system catalog or the name of the system schema can be modified.
- **off** indicates that the structure of the system catalog or the name of the system schema cannot be modified.

**Default value:** off

---

 **CAUTION**

You are advised not to change the default value of this parameter. If this parameter is set to **on**, system catalogs may be damaged and the database may fail to be started.

---

### allow\_create\_sysobject

**Parameter description:** Specifies whether objects such as functions, stored procedures, and synonyms can be created or modified in the system schema. The system schema refers to the schema provided by the database after initialization, excluding the public schema. The OID of the system schema is usually smaller than 16384.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that initial users and system administrators can create or modify objects such as functions, stored procedures, and synonyms in the system schema. The sysadmin user has permissions to create or replace, alter, grant, and revoke system objects by default. For details about whether other users

are allowed to create these objects, see the permission requirements of the corresponding schema.

- **off** indicates that all users are not allowed to create or modify objects such as functions, stored procedures, and synonyms in the system schema. The sysadmin user does not have permissions to create or replace, alter, grant, and revoke system objects by default.

**Default value:** on

## debug\_assertions

**Parameter description:** Specifies whether to enable various assertion checks. It can assist in debugging. When an exception or a crash occurs, enable this parameter to identify programming defects. To use this parameter, the macro USE\_ASSERT\_CHECKING must be defined (through the configure option **--enable-cassert**) during the GaussDB compilation.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that various assertion checks are enabled.
- **off** indicates that various assertion checks are disabled.

### NOTE

If you compile GaussDB with the assertion check enabled, **debug\_assertions** is set to **on** by default.

**Default value:** off

## ignore\_checksum\_failure

**Parameter description:** If this parameter is enabled, the system ignores the failure (but still generates an alarm). Continuing execution may result in breakdown, damaged data being transferred or saved, failure of data recovery from remote nodes, or other serious problems. You are advised not to modify the settings.

This is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that data check errors are ignored.
- **off** indicates that data check errors are reported.

**Default value:** off

## ignore\_system\_indexes

**Parameter description:** Specifies whether to ignore system indexes when reading system catalog (but still update the indexes when modifying the tables).

This is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

### NOTICE

This parameter is useful for recovering data from tables whose system indexes are damaged.

**Value range:** Boolean

- **on** indicates that system indexes are ignored.
- **off** indicates that system indexes are not ignored.

**Default value:** off

## post\_auth\_delay

**Parameter description:** Specifies the delay in the connection to the server after a successful authentication. Developers can attach a debugger to the server startup process.

This is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147. The unit is s.

**Default value:** 0

### NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than **0**, the cluster may be abnormal due to a long authentication delay.

## pre\_auth\_delay

**Parameter description:** Specifies the period of delaying authentication after the connection to the server is started. Developers can attach a debugger to the authentication procedure.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 60. The unit is s.

**Default value:** 0

### NOTE

This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment. If this parameter is set to a value other than **0**, the cluster may be abnormal due to a long authentication delay.

## trace\_notify

**Parameter description:** Specifies whether to enable the function of generating debugging output for the **LISTEN** and **NOTIFY** commands. The level of [client\\_min\\_messages](#) or [log\\_min\\_messages](#) must be **debug1** or lower so that debugging output can be recorded in the client or server logs, respectively.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** off

## trace\_recovery\_messages

**Parameter description:** Specifies whether to enable logging of recovery-related debugging output. This parameter allows users to overwrite the normal setting of [log\\_min\\_messages](#), but only for specific messages. This is intended for the use in debugging the standby node.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values include **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, and **log**. For details about the parameter values, see [log\\_min\\_messages](#).

**Default value:** log

### NOTE

- **log** indicates that recovery-related debugging information will not be logged.
- Except the default value **log**, each of the other values indicates that recovery-related debugging information at the specified level will also be logged. Common settings of [log\\_min\\_messages](#) enable logs to be unconditionally recorded into server logs.

## trace\_sort

**Parameter description:** Specifies whether to print information about resource usage during sorting operations. This parameter is available only when the macro TRACE\_SORT is defined during the GaussDB compilation. However, TRACE\_SORT is currently defined by default.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** off

## zero\_damaged\_pages

**Parameter description:** Specifies whether to detect a damaged page header that causes GaussDB to report an error, aborting the current transaction.

This is a SUSER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- Setting this parameter to **on** causes the system to report a warning, zero out the damaged page, and continue processing. This behavior will destroy data,

including all the rows on the damaged page. However, it allows you to bypass the error and retrieve rows from any undamaged pages that may be present in the table. Therefore, it is useful for restoring data if corruption has occurred due to a hardware or software error. In most cases, you are advised not to set this parameter to **on** if you want to restore data from damaged pages.

- If this parameter is set to **off**, the system does not fill zeros in damaged pages.

**Default value:** off

## string\_hash\_compatible

**Parameter description:** Specifies whether to use the same method to calculate char-type hash values and varchar- or text-type hash values. Based on the setting of this parameter, you can determine whether a redistribution is required when a distribution key is converted from a char-type data distribution into a varchar- or text-type data distribution.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the same calculation method is used and a redistribution is not required.
- **off** indicates that different calculation methods are used and a redistribution is required.

### NOTE

Calculation methods differ in the length of input strings used for calculating hash values. (For a char-type hash value, spaces following a string are not counted as the length. For a text- or varchar-type hash value, the spaces are counted.) The hash value affects the calculation result of queries. To avoid query errors, do not modify this parameter during database running once it is set.

**Default value:** off

## remotetype

**Parameter description:** Specifies the remote connection type.

This is a BACKEND parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are **application**, **coordinator**, **datanode**, **gtm**, **gtmproxy**, **internaltool**, and **gtmtool**.

**Default value:** application

## max\_user\_defined\_exception

**Parameter description:** Specifies the maximum number of exceptions.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer. Currently, only the fixed value **1000** is supported.

**Default value:** 1000

## enable\_compress\_spill

**Parameter description:** Specifies whether to enable the compression function of writing data to disk.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that optimization for writing data to disk is enabled.
- **off** or **false** indicates that optimization for writing data to a disk is disabled.

**Default value:** on

## enable\_parallel\_ddl

**Parameter description:** Specifies whether multiple CNs can concurrently perform DDL operations on the same database object.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** DDL operations can be concurrently performed without distributed deadlocks.
- **off:** DDL operations cannot be concurrently performed as distributed deadlocks may occur.

**Default value:** on

## support\_batch\_bind

**Parameter description:** Specifies whether to batch bind and execute PBE statements through APIs such as JDBC, ODBC, and libpq.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that batch binding and execution are used.
- **off** indicates that batch binding and execution are not used.

**Default value:** on

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## numa\_distribute\_mode

**Parameter description:** Specifies the distribution of some shared data and threads among NUMA nodes. This parameter is used to optimize the performance of large-scale Arm servers with multiple NUMA nodes. Generally, you do not need to set this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. The valid values are **none** and **all**.

- **none** indicates that this function is disabled.
- **all** indicates that some shared data and threads are distributed to different NUMA nodes to reduce the number of remote access times and improve performance. Currently, this function applies only to Arm servers with multiple NUMA nodes. All NUMA nodes must be available for database processes. You cannot select only some NUMA nodes.

 **NOTE**

In the current version, **numa\_distribute\_mode** cannot be set to **all** on the x86 platform.

**Default value:** 'none'

## log\_pagewriter

**Parameter description:** Specifies whether to display the page refresh information of a thread and details about an incremental check point after the incremental check point is enabled. You are advised not to set this parameter to **true** because a large amount of information will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** off

## advance\_xlog\_file\_num

**Parameter description:** Specifies the number of Xlog files that are periodically initialized in advance in the background. This parameter is used to prevent the Xlog file initialization from affecting the performance during transaction commit. However, such a fault may occur only when the system is overloaded. Therefore, you do not need to set this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1000000. The value **0** indicates that initialization is not performed in advance. For example, the value **10** indicates that the background thread periodically initializes 10 Xlog files in advance based on the write location of the current Xlog.

**Default value:** 0

## comm\_sender\_buffer\_size

**Parameter description:** Specifies the size of the buffer for each interaction between CNs and DN and between DNs in the stream plan. In some cases, different values affect the stream performance. After the value is reset, the cluster needs to be restarted for the reset to take effect.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1024. The unit is KB.

**Default value:** 8

## ustore\_attr

**Parameter description:** This parameter is used to control the information statistics of Ustore tables, rollback type, UB-tree index type, and data verification during the running of key modules (including data, indexes, rollback segments, and replay). This parameter helps R&D engineers locate faults.

**Parameter type:** string.

**Unit:** none

**Value range:** This parameter is set in key-value mode. The mapping between keys and values is as follows: If multiple key-value pairs are used, use semicolons (;) to separate them. For example, `ustore_attr='ustore_verify_level=FAST;ustore_verify_module=UPAGE:UBTREE:UNDO:REDO'`.

- **ustore\_verify\_level:** Specifies the verification level.

**Value range:** The value is case-insensitive. For details, see the following table.

**Table 14-24** Parameter value meaning of `ustore_verify_level`

Parameter Value	Description
NONE	<b>NONE</b> indicates that the verification function is disabled. You are advised to enable this function to test performance.
FAST	<b>FAST</b> indicates fast verification. The verification content is small and the impact on performance is minimized.
COMPLETE	<b>COMPLETE</b> indicates complete verification. The verification content is the largest and the performance is greatly affected.

**Default value:** **FAST**

- **ustore\_verify\_module:** Specifies a module that controls verification.

**Value range:** The value is case-insensitive. The value can be one or more of **UPAGE**, **UBTREE**, **UNDO**, **REDO**, and **ROACH**, or it can be **ALL** or **NULL**. When multiple values of **UPAGE**, **UBTREE**, **UNDO**, **REDO**, and **ROACH** are used, separate them with colons (:). For example, `ustore_verify_module=UPAGE:UBTREE:UNDO:REDO`.

When the **ROACH** module is enabled, the value of the **ustore\_verify\_level** parameter is ignored during the **ROACH** backup. By default, the level of verification is the highest and the performance is greatly affected. Therefore, exercise caution when using this parameter.

**Table 14-25** Parameter value meaning of `ustore_verify_module`

Parameter Value	Description
UPAGE	Indicates that data page verification is enabled.
UBTREE	Indicates that UB-tree index verification is enabled.
UNDO	Indicates that rollback segment data verification is enabled.
REDO	Indicates that data page verification for the REDO process is enabled.
ROACH	This parameter is discarded. The verification has been removed from the underlying logic. <b>ustore_verify_module</b> can be set to <b>roach</b> but it does not take effect.
ALL	Indicates that data verification for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules is enabled.
NULL	Indicates that data verification for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules is disabled.

**Default value:** **UPAGE:UBTREE:UNDO**

- **index\_trace\_level:** determines whether to enable index tracing and controls the printing level. After this function is enabled, information about index tuples that meet the conditions is printed based on the printing level during index scan.

**Value range:** The values are described in the following table.

**Default value:** **NO**

**Table 14-26** Parameter value meaning of `index_trace_level`

Parameter Value	Description
NO	No additional information is printed.
NORMAL	Information about visible index tuples is printed, including: <ul style="list-style-type: none"> <li>• ID and offset of the index page where the current index tuple is located</li> <li>• Current tuple status</li> <li>• TID and partOid corresponding to the current tuple</li> <li>• xmin and xmax information corresponding to the current tuple</li> <li>• Current tuple content (if <b>enable_log_tuple</b> is set to <b>on</b>).</li> </ul>

VISIBILITY	On the basis of <b>NORMAL</b> , the information about the index tuples that do not pass the visibility check is printed and whether the index tuples are visible is marked.
SHOWHIKEY	On the basis of <b>VISIBILITY</b> , the system tries to print the information about the HIKEY tuple on the page.
ALL	Information about all tuples on the scanned index page is printed.

- **enable\_log\_tuple**: specifies whether to print the contents of related tuples when printing log-level prompts for troubleshooting and locating.  
**Value range:** **on** or **off** (case-insensitive)  
**Default value:** **off**
- **enable\_ustore\_sync\_rollback**: specifies whether to enable synchronous rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** **true**
- **enable\_ustore\_async\_rollback**: specifies whether to enable asynchronous rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** **true**
- **enable\_ustore\_page\_rollback**: specifies whether to enable page rollback for Ustore tables.  
**Value range:** Boolean  
**Default value:** **true**
- **enable\_ustore\_partial\_seqscan**: specifies whether to enable partial scan for Ustore tables.  
**Value range:** Boolean  
**Default value:** **false**
- **enable\_candidate\_buf\_usage\_count**: specifies whether to enable buffer usage statistics.  
**Value range:** Boolean  
**Default value:** **false**
- **ustats\_tracker\_naptime**: specifies the interval for collecting statistics on Ustore tables.  
**Value range:** [1,INT\_MAX/1000].  
**Default value:** **20**, in seconds.
- **umax\_search\_length\_for\_prune**: specifies the maximum search depth of the prune operation on the Ustore table.  
**Value range:** [1,INT\_MAX/1000]  
**Default value:** **10**

 NOTE

When setting **ustore\_attr**, do not leave spaces or other characters before and after the equal sign (=) between key and value, for example, **ustore\_attr=ustore\_verify\_level = FAST**; If the kernel code verification detects that the parameter is invalid, the output shows success, but the setting does not take effect.

**Default value:** an empty string

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

---

 CAUTION

Exercise caution when setting the **ustore\_attr** parameter. You are advised to modify this parameter with the assistance of engineers.

---

## index\_txntype

**Parameter description:** Determines whether the index type of UB-tree is PCR or RCR. PCR supports flashback query based on indexes, but RCR does not.

**Parameter type:** string.

**Unit:** none

**Value range:** 'PCR' or 'RCR'.

**Default value:** an empty string

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** You are advised to set it to "RCR".

## default\_index\_kind

**Parameter description:** Controls the default behavior of creating indexes.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

Value range: an integer. Currently, only the fixed values **0**, **1**, and **2** are supported.

- **0:** The global partitioned index function is disabled for distributed deployment.
- **1:** A local index is created by default.
- **2:** A global index is created by default.

**Default value:** 2

---

 CAUTION

You are advised not to change the default value of this parameter. Otherwise, the index validity may be affected.

---

## enable\_segment\_remain\_cleanup

**Parameter description:** Specifies which the residual segment-page cleanup feature is to be enabled.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** indicates that the old type of residual segment-page cleanup is enabled.
  - Query APIs: `gs_stat_remain_segment_info` and `gs_local_stat_remain_segment_info`.
  - Cleanup APIs: `gs_free_remain_segment` and `gs_local_free_remain_segment`.
- **off:** indicates that the new type of residual segment-page cleanup is enabled.
  - Query APIs: `GS_SEG_SPC_REMAIN_SEGMENTS` and `GS_SEG_SPC_REMAIN_EXTENTS`.
  - Cleanup APIs: `gs_seg_free_spc_remain_segment` and `gs_seg_free_spc_remain_extent`.

---

 **CAUTION**

Do not change the cleanup mode unless necessary. Otherwise, residual segment-page data may fail to be cleaned up or other exceptions may occur.

---

**Default value:** off

## convert\_illegal\_char\_mode

**Parameter description:** Specifies the placeholders of invalid characters that can be displayed on the client when the **enable\_convert\_illegal\_char** parameter is enabled.

**Parameter type:** string

**Unit:** none

**Value range:** 95 characters whose decimal codes range from 32 to 126 in the ASCII coding table.

**Default value:** '?'

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

## default\_segment

**Parameter description:** Specifies whether to create a segment-page table by default.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** A segment-page table is created by default when the segment field is not specified.
- **off:** A page table is created by default when the segment field is not specified.

**Default value:** off

**Setting method:** This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none.

---

 **CAUTION**

- If `--undostoragetype` is set to 'page' or is not set during database initialization, the data of Ustore is forcibly stored in page mode, but Astore is not affected.
- 

## 14.3.21 Auditing

### 14.3.21.1 Audit Switch

#### `audit_enabled`

**Parameter description:** Specifies whether to enable or disable the audit thread. After the audit thread is enabled, the auditing information written by the background thread can be read from the pipe and written into audit files.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the auditing function is enabled.
- **off** indicates that the auditing function is disabled.

**Default value:** on

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

#### `audit_directory`

**Parameter description:** Specifies the storage directory of audit files. The path can be relative to the `data` directory. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** `pg_audit`. If `om` is used for cluster deployment, audit logs are stored in `$GAUSSLOG/pg_audit/Instance name`.

---

#### NOTICE

- You need to set different audit file directories for different CNs or DNs. Otherwise, audit logs will be abnormal.
- If the value of `audit_directory` in the configuration file is an invalid path, the audit function cannot be used.

---

#### NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

## audit\_data\_format

**Parameter description:** Audits the format of log files. Currently, only the binary format is supported. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** binary

## audit\_rotation\_interval

**Parameter description:** Specifies the interval of creating an audit log file. If the difference between the current time and the time when the previous audit log file is created is greater than the value of this parameter, a new audit log file will be generated.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 35791394. The unit is min.

**Default value:** 1d

---

#### NOTICE

Do not adjust this parameter unless necessary. Otherwise, `audit_resource_policy` may fail to take effect. To control the storage space and time of audit logs, set the [audit\\_resource\\_policy](#), [audit\\_space\\_limit](#), and [audit\\_file\\_remain\\_time](#) parameters.

---

## audit\_rotation\_size

**Parameter description:** Specifies the maximum capacity of an audit log file. If the total number of messages in an audit log exceeds the value of this parameter, the server will generate a new audit log file.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1024 to 1048576. The unit is KB.

**Default value:** 10 MB

---

### NOTICE

- Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.
  - If the space occupied by a single record in an audit log file exceeds the value of this parameter, the log file is regarded as an invalid log file.
- 

## audit\_resource\_policy

**Parameter description:** Specifies the policy for determining whether audit logs are preferentially stored by space or time.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that audit logs are preferentially stored by space. A maximum of **audit\_space\_limit** logs can be stored.
- **off** indicates that audit logs are preferentially stored by time. A minimum duration of **audit\_file\_remain\_time** logs must be stored.

**Default value:** on

## audit\_file\_remain\_time

**Parameter description:** Specifies the minimum duration required for recording audit logs. This parameter is valid only when **audit\_resource\_policy** is set to **off**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 730. The unit is day. **0** indicates that the storage duration is not limited.

**Default value:** 90

## audit\_space\_limit

**Parameter description:** Specifies the total disk space occupied by audit files.

**Parameter type:** integer.

**Unit:** KB

**Value range:** 1024 KB to 1024 GB

**Default value:** 1GB

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

#### NOTICE

- This parameter takes effect only for a single process instance folder in the **pg\_audit** directory. By default, the total disk space occupied by audit files on each CN or DN is 1 GB.
  - In the multi-audit thread scenario, the minimum disk space occupied by audit files is the product of values of **audit\_thread\_num** and **audit\_rotation\_size**. Ensure that the value of **audit\_space\_limit** is greater than the product of values of **audit\_thread\_num** and **audit\_rotation\_size**.
- 

## audit\_file\_remain\_threshold

**Parameter description:** Specifies the maximum number of audit files in the audit directory.

**Parameter type:** integer.

**Unit:** none

**Value range:** an integer ranging from 100 to 1048576

**Default value:** 1048576

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. For details, see the following notice.

---

#### NOTICE

- Ensure that this parameter is set to **1048576**. Do not adjust this parameter unless necessary. Otherwise, **audit\_resource\_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit\_resource\_policy**, **audit\_space\_limit**, and **audit\_file\_remain\_time** parameters.
  - In the multi-audit thread scenario, do not adjust this parameter unless necessary. Ensure that the value of this parameter is greater than or equal to the value of **audit\_thread\_num**. Otherwise, the audit function cannot be used and the database is abnormal.
- 

## audit\_thread\_num

**Parameter description:** Specifies the number of threads used for auditing.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 48

**Default value:** 1

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

- The larger the number of threads, the greater the impact on system performance.
- The larger the number of threads, the more CPU and I/O resources are occupied.

---

#### NOTICE

When **audit\_dml\_state** is enabled and high performance is required, you are advised to increase the value of this parameter to ensure that audit messages can be processed and recorded in a timely manner.

---

### 14.3.21.2 User and Permission Audit

#### audit\_login\_logout

**Parameter description:** Specifies whether to audit users' login (including login success and failure) and logout.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 7

- 0 indicates that the function of auditing users' logins and logouts is disabled.
- 1 indicates that only successful user logins are audited.
- 2 indicates that only failed user logins are audited.
- 3 indicates that successful and failed user logins are audited.
- 4 indicates that only user logouts are audited.
- 5 indicates that successful user logouts and logins are audited.
- 6 indicates that failed user logouts and logins are audited.
- 7 indicates that successful user logins, failed user logins, and logouts are audited.

**Default value:** 7

#### audit\_database\_process

**Parameter description:** Specifies whether to audit the database startup, stop, switchover, and recovery.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, 0 or 1

- **0** indicates that the function of auditing database startup, stop, switchover, and recovery is disabled.
- **1** indicates that the function of auditing database startup, stop, switchover, and recovery is enabled.

**Default value:** 1

## **audit\_user\_locked**

**Parameter description:** Specifies whether to audit the users' locking and unlocking.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**

- **0** indicates that the function of auditing user's locking and unlocking is disabled.
- **1** indicates that the function of auditing user's locking and unlocking is enabled.

**Default value:** 1

## **audit\_user\_violation**

**Parameter description:** Specifies whether to audit the access violation operations of a user.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**

- **0** indicates that the function of auditing the access violation operations of a user is disabled.
- **1** indicates that the function of auditing the access violation operations of a user is enabled.

**Default value:** 0

## **audit\_grant\_revoke**

**Parameter description:** Specifies whether to audit the granting and revoking of user permissions.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**

- **0** indicates that the function of auditing the granting and recycling of a user's permission is disabled.
- **1** indicates that the function of auditing the granting and reclaiming of a user's permission is enabled.

**Default value:** 1

## audit\_security\_label

**Parameter description:** Specifies whether to audit the creation, deletion, and application of user security labels.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 or 1

- **0** indicates that the creation, deletion, and application of user security labels are not audited.
- **1** indicates that the creation, deletion, and application of user security labels are audited.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If this parameter is enabled, the system performance may be affected.

## audit\_internal\_event

**Parameter description:** Specifies whether to audit the logins, logouts, and operations of internal tools `cm_agent`, `gs_clean`, and `WDRXdb`, and whether to audit the logins and logouts from CNs on DNs.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **off:** indicates that the logins, logouts, and operations of internal tools `CM Agent`, `gs_clean`, and `WDRXdb` are not audited, and the logins and logouts from CNs are not audited on DNs.
- **on:** indicates that the logins, logouts, and operations of internal tools `CM Agent`, `gs_clean`, and `WDRXdb` are audited, and logins and logouts from CNs are audited on DNs.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

---

### NOTICE

Communications between internal tools or nodes on the database server also generate audit logs. By default, **audit\_internal\_event** is disabled to reduce space occupied by and improve query performance of audit logs.

---

## full\_audit\_users

**Parameter description:** Specifies the full audit user list. Audit logs are recorded for all auditable operations performed by users in the list.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. Use commas (,) to separate multiple usernames.

**Default value:** an empty string

## no\_audit\_client

**Parameter description:** Specifies the names and IP addresses of clients that do not need to be audited. The parameter format is *client name@IP address*, which is the same as that of the **client\_conninfo** column in the `pg_query_audit` function, for example, **cm\_agent@127.0.0.1** or **gs\_clean@127.0.0.1**.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a character string. Use commas (,) to separate multiple configuration items.

**Default value:** an empty string

---

### NOTICE

- If the executed SQL statement meets the configuration requirements of **full\_audit\_users** and **no\_audit\_client**, the **no\_audit\_client** is preferentially configured.
  - Audit logs are generated for communication among tools or nodes in the database server. To save space occupied by audit logs and improve the query performance of audit logs, the low-risk scenarios cannot be audited by configuring the **no\_audit\_client** parameter.
- 

## 14.3.21.3 Operation Auditing

### audit\_system\_object

**Parameter description:** Specifies whether to audit the operations such as CREATE, DROP, and ALTER on database objects. Database objects include databases, users, schemas, and tables. You can change the value of this parameter to audit only the operations on required database objects. In the scenario where the leader node is forcibly elected, you are advised to set **audit\_system\_object** to the maximum value and audit all DDL objects.

**Parameter type:** integer

**Unit:** none

**Value range:** 0 to 536870911

- **0** indicates that the operations such as CREATE, DROP, and ALTER are not audited.

- A non-zero value indicates that the operations such as CREATE, DROP, and ALTER on a certain or some database objects are audited.

**Value description:**

The value of this parameter is calculated by 29 binary bits. The 29 binary bits represent 29 types of database objects. If the corresponding binary bit is set to **0**, the operations such as CREATE, DROP, and ALTER on corresponding database objects are not audited. If it is set to **1**, the operations such as CREATE, DROP, and ALTER are audited. For details about the audit contents represented by these 29 binary bits, see [Table 14-27](#).

When SQL patches are audited and **audit\_dml\_state\_select** is enabled, an SQL patch operation will be audited twice and recorded as DML and DDL operations in the audit log, respectively. If a remote interface is invoked, the DDL logs are generated on the node corresponding to the input parameter, instead of on the node where the statement is issued.

**Default value:** **67121159** (decimal), corresponding to 0 0100 0000 0000 0011 0000 0000 0111 in binary, indicating that DDL operations on DATABASE, SCHEMA, USER, NODE GROUP, and SQLPatch are audited.

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Set the type of database objects to be audited based on service requirements.

- The more types of objects to be audited, the greater the impact on system performance.
- The more objects to be audited, the more CPU and I/O resources are occupied.

**Table 14-27** Meaning of each value for the **audit\_system\_object** parameter

Binary Bit	Description	Value Range
Bit 0	Specifies whether to audit the CREATE, DROP, and ALTER operations on databases.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 1	Specifies whether to audit the CREATE, DROP, and ALTER operations on schemas.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>

Binary Bit	Description	Value Range
Bit 2	Specifies whether to audit the CREATE, DROP, and ALTER operations on users and user mappings.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 3	Specifies whether to audit the CREATE, DROP, ALTER, and TRUNCATE operations on tables.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are audited.</li> </ul>
Bit 4	Specifies whether to audit the CREATE, DROP, and ALTER operations on indexes.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 5	Specifies whether to audit the CREATE and DROP operations on VIEW and MATVIEW objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE and DROP operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE and DROP operations on these objects are audited.</li> </ul>
Bit 6	Specifies whether to audit the CREATE, DROP, and ALTER operations on triggers.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 7	Specifies whether to audit the CREATE, DROP, and ALTER operations on procedures/functions.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 8	Specifies whether to audit the CREATE, DROP, and ALTER operations on tablespaces.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>

Binary Bit	Description	Value Range
Bit 9	Specifies whether to audit the CREATE, DROP, and ALTER operations on resource pools.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 10	Specifies whether to audit the CREATE, DROP, and ALTER operations on workloads.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 11	Specifies whether to audit the CREATE, DROP, and ALTER operations on server objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 13	Specifies whether to audit the CREATE and DROP operations on node groups.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE and DROP operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE and DROP operations on these objects are audited.</li> </ul>
Bit 14	Specifies whether to audit the CREATE, DROP, and ALTER operations on ROW LEVEL SECURITY objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on these objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on these objects are audited.</li> </ul>
Bit 15	Specifies whether to audit the CREATE, DROP, and ALTER operations on types.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on types are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on types are audited.</li> </ul>
Bit 16	Specifies whether to audit the CREATE, DROP, and ALTER operations on text search objects (CONFIGURATION and DICTIONARY).	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on text search objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on text search objects are audited.</li> </ul>

Binary Bit	Description	Value Range
Bit 17	Specifies whether to audit the CREATE, DROP, and ALTER operations on directories.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on directories are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on directories are audited.</li> </ul>
Bit 18	Specifies whether to audit the CREATE, DROP, and ALTER operations on synonyms.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on synonyms are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on synonyms are audited.</li> </ul>
Bit 19	Specifies whether to audit the CREATE, DROP, and ALTER operations on sequences.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on sequences are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations are audited.</li> </ul>
Bit 20	Specifies whether to audit the CREATE, ALTER, and DROP operations on CMKs and CEKs.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ALTER, and DROP operations on CMKs and CEKs are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ALTER, and DROP operations on CMKs and CEKs are audited.</li> </ul>
Bit 22	Reserved	-
Bit 23	Reserved	-
Bit 24	Specifies whether to audit the ALTER and DROP operations on the <code>gs_global_config</code> objects.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the ALTER and DROP operations on the <b>gs_global_config</b> objects are not audited.</li> <li>• <b>1</b> indicates that the ALTER and DROP operations on the <b>gs_global_config</b> objects are audited.</li> </ul>
Bit 25	Specifies whether to audit the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects. Currently, this function is not supported.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects are not audited.</li> <li>• <b>1</b> indicates that the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects are audited.</li> </ul>

Binary Bit	Description	Value Range
Bit 26	Specifies whether to audit the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are audited.</li> </ul>
Bit 27	Reserved	-
Bit 28	Specifies whether to audit the CREATE, ALTER, and DROP operations on database links. Currently, the database link function is not supported.	<ul style="list-style-type: none"> <li>• <b>0</b> indicates that the CREATE, ALTER, and DROP operations on database links are not audited.</li> <li>• <b>1</b> indicates that the CREATE, ALTER, and DROP operations on database links are audited.</li> </ul>

## audit\_dml\_state

**Parameter description:** Specifies whether to audit the INSERT, UPDATE, DELETE, and MERGE operations on a specific table.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 or 1

- **0** indicates that the INSERT, UPDATE, DELETE, and MERGE operations on a specific table are not audited.
- **1** indicates that the INSERT, UPDATE, DELETE, and MERGE operations on a specific table are audited.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## audit\_dml\_state\_select

**Parameter description:** Specifies whether to audit the SELECT operation.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 or 1

- **0** indicates that the SELECT auditing function is disabled.

- **1** indicates that the SELECT auditing function is enabled.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## audit\_function\_exec

**Parameter description:** Specifies whether to record the audit information during the execution of the stored procedures, anonymous blocks, or user-defined functions (excluding system functions).

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 or 1

- **0** indicates that the stored procedures, anonymous blocks, or user-defined functions (excluding system functions) are not audited.
- **1** indicates that the stored procedures, anonymous blocks, or user-defined functions (excluding system functions) are audited.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## audit\_system\_function\_exec

**Parameter description:** Specifies whether to record audit logs when system functions in the whitelist are executed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, 0 or 1.

- **0** indicates that the function of auditing the execution of system functions is disabled.
- **1** indicates that the function of auditing system function execution is enabled.

**Default value:** 0

The following table lists the whitelist of system functions that can be audited.

set_working_grand_version_num_manually	set_config	pg_terminate_backend	pg_cancel_backend	pg_cancel_session	pg_cancel_invalid_query
pg_reload_conf	pg_rotate_logfile	pg_terminate_session	pg_terminate_backend	pg_start_backup	pg_stop_backup

gs_repair_pa ge	-	-	-	-	-

## audit\_copy\_exec

**Parameter description:** Specifies whether to audit the COPY operation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**.

- **0** indicates that auditing the COPY operation is disabled.
- **1** indicates that auditing the COPY operation is enabled.

**Default value:** 1

## audit\_set\_parameter

**Parameter description:** Specifies whether to audit the SET operation.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 or 1

- **0** indicates that auditing the SET operation is disabled.
- **1** indicates that auditing the SET operation is enabled.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## audit\_xid\_info

**Parameter description:** Specifies whether to record the transaction ID of the SQL statement in the **detail\_info** column of the audit log.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 or 1

- **0** indicates that the function of recording transaction IDs in the audit log is disabled.
- **1** indicates that the function of recording transaction IDs in the audit log is enabled.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

---

### NOTICE

If this function is enabled, the **detail\_info** information in the audit log starts with *xid*. For example:

```
detail_info: xid=14619 , create table t1(id int);
```

If transaction IDs do not exist, **xid=NA** is recorded.

---

## enableSeparationOfDuty

**Parameter description:** Specifies whether the separation of three duties is enabled.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the separation of duties is enabled.
- **off** indicates that the separation of duties is disabled.

**Default value:** off

## enable\_nonsysadmin\_execute\_direct

**Parameter description:** Specifies whether non-system administrators and non-monitor administrator are allowed to execute the EXECUTE DIRECT ON statement.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that any user is allowed to execute the EXECUTE DIRECT ON statement.
- **off** indicates that only the system administrator and monitor administrator are allowed to execute the EXECUTE DIRECT ON statement.

**Default value:** off

## enable\_access\_server\_directory

**Parameter description:** Specifies whether to allow non-initial users to create, modify, and delete directories.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that non-initial users have the permission to create, modify, and delete directories.
- **off** indicates that non-initial users do not have the permission to create, modify, and delete directories.

**Default value:** off

#### NOTICE

To use the advanced package UTL\_FILE to access files on the server, you must have the permissions on the specified directory.

For security purposes, only the initial user can create, modify, and delete directories by default.

If **enable\_access\_server\_directory** is enabled, users with the SYSADMIN permission and users who inherit the `gs_role_directory_create` permission of the built-in role can create directories. A user with the SYSADMIN permission, the owner of a directory, a user who is granted with the DROP permission for the directory, or a user who inherits the `gs_role_directory_drop` permission of the built-in role can delete the directory. A user with the SYSADMIN permission and the owner of a directory object can change the owner of the directory, and the user must be a member of the new owning role.

## 14.3.22 Transaction Monitoring

The automatic rollback transaction can be monitored and its statement problems can be located by setting the transaction timeout warning. In addition, the statements with long execution time can also be monitored.

### transaction\_sync\_naptime

**Parameter description:** For data consistency, when the local transaction's status differs from that in the snapshot of GTM, other transactions will be blocked. You need to wait for a few minutes until the transaction status of the local host is consistent with that of the GTM. The `gs_clean` tool is automatically triggered for cleansing when the waiting period on the CN exceeds that of **transaction\_sync\_naptime**. The tool will shorten the blocking time after it completes the cleansing.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 30s

#### NOTE

If the value of this parameter is set to **0**, `gs_clean` will not be automatically invoked for the cleansing before the blocking arrives the duration. Instead, the `gs_clean` tool is invoked by **gs\_clean\_timeout**. The default value is 5 minutes.

### transaction\_sync\_timeout

**Parameter description:** For data consistency, when the local transaction's status differs from that in the snapshot of GTM, other transactions will be blocked. You need to wait for a few minutes until the transaction status of the local host is consistent with that of the GTM. An exception is reported when the waiting duration on the CN exceeds the value of **transaction\_sync\_timeout**. Roll back the transaction to avoid system blocking due to long time of thread response failures (for example, sync lock).

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483. The unit is s.

**Default value:** 10min

 NOTE

- If the value is **0**, no error is reported when the blocking times out or the transaction is rolled back.
- The value of this parameter must be greater than that of **gs\_clean\_timeout**. Otherwise, unnecessary transaction rollback will probably occur due to a block timeout caused by residual transactions that have not been deleted by **gs\_clean** on the DN.

## 14.3.23 CM Parameters

Modifying CM parameters affects the running mechanism of GaussDB. You are advised to ask GaussDB engineers to do it for you. For details about how to modify the CM parameters, see method 1 in [Table 1 GUC parameter types](#).

You can view CM Agent parameters in the **cm\_agent.conf** file in the CM Agent data directory and CM Server parameters in the **cm\_server.conf** file in the CM Server data directory.

### 14.3.23.1 CM Agent Parameters

#### log\_dir

**Parameter description:** Specifies the directory where CM Agent logs are stored. The value can be an absolute path, or a path relative to the CM Agent data directory.

**Value range:** a string. The modification takes effect after CM Agent is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** "log", indicating that CM Agent logs are generated in the CM Agent data directory.

#### log\_file\_size

**Parameter description:** Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

**Value range:** an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 16MB

#### log\_min\_messages

**Parameter description:** Specifies which message levels are written to the CM Agent log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

**Value range:** enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** warning

## incremental\_build

**Parameter description:** Specifies whether a standby DN is incrementally built. If this parameter is enabled, a standby DN is incrementally built.

**Value range:** Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** on

## alarm\_component

**Parameter description:** Specifies the location of the alarm component that processes alarms.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- If **--alarm-type** in the `gs_preinstall` script is set to **5**, no third-party component is connected and alarms are written into `system_alarm` logs. In this case, the value of **alarm\_component** is `/opt/huawei/snas/bin/snas_cm_cmd`.
- If **--alarm-type** in the `gs_preinstall` script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** `/opt/huawei/snas/bin/snas_cm_cmd`

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Value range:** a non-negative integer (unit: s)

**Default value:** 1

## alarm\_report\_max\_count

**Parameter description:** Specifies the maximum number of times an alarm is reported. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Value range:** a non-negative integer

**Default value:** 1

## agent\_report\_interval

**Parameter description:** Specifies the interval at which CM Agent reports the instance status.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## agent\_phony\_dead\_check\_interval

**Parameter description:** Specifies the interval at which CM Agent checks whether the CN, DN, or GTM process is suspended.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## agent\_check\_interval

**Parameter description:** Specifies the interval at which the CM Agent queries the status of instances, such as the DNs, CN, and GTM.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

## agent\_heartbeat\_timeout

**Parameter description:** Specifies the heartbeat timeout interval for CM Agent to connect to CM Server.

**Value range:** an integer ranging from 2 to  $2^{31} - 1$ . The unit is second. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 8

## agent\_connect\_timeout

**Parameter description:** Specifies the time to wait before the attempt of CM Agent to connect to CM Server times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## agent\_connect\_retries

**Parameter description:** Specifies the number of times CM Agent tries to connect to the CM Server.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 15

## agent\_kill\_instance\_timeout

**Parameter description:** Specifies the interval from the time when CM Agent fails to connect to the primary CM Server to the time when CM Agent terminates all instances on the node.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0, indicating that the operation of terminating all instances on the node is not initiated.

## enable\_gtm\_phony\_dead\_check

**Parameter description:** Specifies whether to enable the GTM zombie check function.

**Value range:** an integer. The value 1 indicates that the zombie check is enabled, and the value 0 indicates that the zombie check is disabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## security\_mode

**Parameter description:** Specifies whether CNs and DNPs are started in secure mode. If this parameter is set to **on**, CNs and DNPs are started in secure mode.

**Value range:** Boolean. The value can be **on** or **off**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** off

## upgrade\_from

**Parameter description:** Specifies the internal version number of the cluster before an in-place upgrade. Do not modify the value of this parameter.

**Value range:** a non-negative integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

The recommended value range is [0, *Version number of the installation package*].

**Default value:** 0

## process\_cpu\_affinity

**Parameter description:** Specifies whether to bind a primary DN process to a CPU core before starting the process. If this parameter is set to 0, core binding will not be performed. If it is set to another value, core binding will be performed, and the number of physical CPU cores is  $2^n$ . Only Arm is supported.

**Value range:** an integer ranging from 0 to 2. The modification takes effect after CM Agent is restarted. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## enable\_xc\_maintenance\_mode

**Parameter description:** Specifies whether the **pgxc\_node** system catalog can be modified when the cluster is in read-only mode.

**Value range:** Boolean. The modification takes effect after CM Agent is restarted. For details about how to modify this parameter, see [Table 14-2](#).

- **on** indicates that the **pgxc\_node** system catalog can be modified.
- **off** indicates that the **pgxc\_node** system catalog cannot be modified.

**Default value:** on

## log\_threshold\_check\_interval

**Parameter description:** Specifies the interval for compressing and clearing logs.

**Parameter type:** integer

**Unit:** second

**Value range:** 0 to  $2^{31} - 1$

**Default value:** 1800

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. You can adjust the value based on the disk space and scenario requirements.

## dilatation\_shard\_count\_for\_disk\_capacity\_alarm

**Parameter description:** Specifies the number of shards to be added in the scale-out scenario. This parameter is used to calculate the threshold for reporting a disk capacity alarm.

### NOTE

The parameter value must be the same as the actual number of shards to be added.

**Value range:** an integer ranging from 0 to  $2^{31} - 1$ . If this parameter is set to **0**, the disk scale-out alarm is not reported. If this parameter is set to a value greater than **0**, the disk scale-out alarm is reported and the threshold is calculated based on the number of shards specified by this parameter. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## log\_max\_size

**Parameter description:** Specifies the maximum size of a log file.

**Parameter type:** integer

**Unit:** MB

**Value range:** 0 to  $2^{31} - 1$

**Default value:** 10240

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. You can adjust the value based on the disk space and scenario requirements.

## log\_max\_count

**Parameter description:** Specifies the maximum number of logs that can be stored on hard disks.

**Parameter type:** integer

**Unit:** none

**Value range:** 0 to 10000

**Default value:** 10000

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. You can adjust the value based on the disk space and scenario requirements.

## log\_saved\_days

**Parameter description:** Specifies the number of days for storing logs.

**Parameter type:** integer

**Unit:** day

**Value range:** 0 to 1000

**Default value:** 90

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. You can adjust the value based on the disk space and scenario requirements.

## enable\_log\_compress

**Parameter description:** Specifies whether to enable log compression.

**Value range:** Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **on** indicates that log compression is enabled.
- **off** indicates that log compression is disabled.

**Default value:** on

## enable\_cn\_auto\_repair

**Parameter description:** Specifies whether to enable automatic CN recovery.

**Parameter type:** Boolean

**Unit:** none

**Value range:**

- **on** indicates that the automatic CN recovery is enabled. That is, after a CN is removed, the agent automatically attempts to recover the CN and add the CN back.
- **off** indicates that automatic CN recovery is disabled.

**Default value:** on

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** This parameter is enabled by default after reloading. After it is disabled, CNs will not be automatically added. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

## agent\_backup\_open

**Parameter description:** Specifies whether to enable the DR cluster. After the DR cluster is enabled, the CM runs in DR cluster mode.

**Value range:** an integer, **0** or **1**. The modification takes effect after CM Agent is restarted. For details about how to modify this parameter, see [Table 14-2](#).

- **0**: disabled.
- **1**: enabled.

**Default value:** 0

## enable\_e2e\_rto

**Parameter description:** Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout interval are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance  $\leq 10s$ ; RTO for combined faults  $\leq 30s$ ).

**Parameter type:** integer.

**Unit:** none

**Value range:**

- **1**: enabled.

- **0**: disabled.

**Default value:**

Independent deployment: **1**

Finance edition (standard), enterprise edition, and finance edition (data computing): **0**

**Setting method:** Refer to the **set cm parameters** table in "Unified Database Management Tool > cm\_ctl Tool Introduction" in *Tool Reference*. Then run the reload command for the settings to take effect.

**Setting suggestion:** Retain the default value. You can adjust the value based on the disk space and scenario requirements.

## enable\_dcf

**Parameter description:** Specifies the status of the DCF mode.

**Value range:** Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **0**: disabled.
- **1**: enabled.

**Default value:** off

## unix\_socket\_directory

**Parameter description:** Specifies the directory location of the Unix socket.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** "

## disaster\_recovery\_type

**Parameter description:** Specifies the type of the DR relationship between the primary and standby clusters.

**Value range:** an integer ranging from 0 to 2. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **0** indicates that no DR relationship is established.
- **1** indicates that the OBS DR relationship is established.
- **2** indicates that the streaming DR relationship is established.

**Default value:** 0

## environment\_threshold

**Parameter description:** Specifies the thresholds for the physical environment and node status monitored by the agent. If the thresholds are exceeded, logs will be printed. The thresholds include the memory usage threshold, CPU usage threshold,

disk usage threshold, instance memory usage threshold, and instance thread pool usage threshold.

**Value range:** a string, in the format of  $(0, 0, 0, 0)$ . The value range for each number is  $[0,100]$ . The unit is %. Value **0** indicates that the detection is disabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** (0,0,0,0)

### 14.3.23.2 CM Server Parameters

#### log\_dir

**Parameter description:** Specifies the directory where CM Server logs are stored. The value can be an absolute path, or a path relative to the CM Server data directory.

**Value range:** a string. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** "log", indicating that CM Server logs are generated in the CM Server data directory.

#### log\_file\_size

**Parameter description:** Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record log information.

**Value range:** an integer ranging from 0 to 2047. The unit is MB. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 16MB

#### log\_min\_messages

**Parameter description:** Specifies the level of messages to be written to the CM Server log. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

**Value range:** enumerated type. Valid values are **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** warning

#### thread\_count

**Parameter description:** Specifies the number of threads in the agent thread pool.

**Parameter type:** string.

**Unit:** none

**Value range:** This parameter consists of two parts: '**worker\_thread\_count**' and **io\_ratio**. The meanings of the two parts are as follows:

- **worker\_thread\_count:** specifies the number of AgentWorker threads. The value ranges from 2 to 1000.
- **io\_ratio:** specifies the ratio of I/O threads to worker threads. The value  $n$  indicates that one AgentIO thread corresponds to  $n$  AgentWorker threads. The value ranges from 1 to 100. At least one AgentIO thread is required.

 **NOTE**

If the value of **worker\_thread\_count**, namely the number of AgentWorker threads, is greater than the sum of the number of cluster nodes and the number of threads for processing `cm_ctl` requests (if the number of cluster nodes is less than 32, one thread is used by default; otherwise, four threads are used), the value that takes effect is the sum of the number of cluster nodes and the number of threads for processing `cm_ctl` requests.

**Default value:** "(1000,1)"

**Setting method:** Refer to the **set cm parameters** table in "Unified Database Management Tool > `cm_ctl` Tool Introduction" in *Tool Reference*. Then run the reload command for the settings to take effect.

**Setting suggestion:** Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

## alarm\_component

**Parameter description:** Specifies the location of the alarm component that processes alarms.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- If **--alarm-type** in the `gs_preinstall` script is set to **5**, no third-party component is connected and alarms are written into `system_alarm` logs. In this case, the value of **alarm\_component** is `/opt/huawei/snas/bin/snas_cm_cmd`.
- If **--alarm-type** in the `gs_preinstall` script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** `/opt/huawei/snas/bin/snas_cm_cmd`

## instance\_failover\_delay\_timeout

**Parameter description:** Specifies the delay in the CM Server failover when the primary CM Server breakdown is detected.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## instance\_heartbeat\_timeout

**Parameter description:** Specifies the time to wait before the instance heartbeat times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

## coordinator\_heartbeat\_timeout

**Parameter description:** Specifies the heartbeat timeout that triggers the automatic removal of faulty CNs. The setting of this parameter takes effect immediately, and you do not need to restart CM Server. If this parameter is set to 0, faulty CNs are not automatically removed.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 25

## cmserver\_ha\_connect\_timeout

**Parameter description:** Specifies the time to wait before the connection between the primary and standby CM Servers times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

## cmserver\_ha\_heartbeat\_timeout

**Parameter description:** Specifies the time to wait before the heartbeat between the primary and standby CM Servers times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

## phony\_dead\_effective\_time

**Parameter description:** Specifies the maximum number of times CN, DN, or GTM processes are detected as zombie. If the number of times a process is detected as zombie is greater than the specified value, the process is considered as a zombie process and will be restarted.

**Value range:** an integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 5

## enable\_transaction\_read\_only

**Parameter description:** Specifies whether to enable the automatic threshold detection function of the CM Server disk. After this function is enabled, CM Server automatically sets the database to read-only when the disk usage is greater than the value of `datastorage_threshold_value_check`.

**Value range:** Boolean values **on**, **off**, **true**, **false**, **yes**, **no**, **1**, and **0**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** on

## datastorage\_threshold\_check\_interval

**Parameter description:** Specifies the interval for checking the disk usage. The system checks the disk usage at the interval specified by the user.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## datastorage\_threshold\_value\_check

**Parameter description:** Specifies the usage threshold of a read-only disk in a database. When the disk usage of the data directory exceeds the specified value, the database is automatically set to read-only mode. In the read-only mode, log replay cannot be restricted. Pay attention to the cluster disk capacity and handle read-only alarms in a timely manner to prevent the disk space from being used up; otherwise, the database cannot be quickly restored.

**Parameter type:** integer.

**Unit:** percentage

**Value range:** 1 to 99

**Default value:** 85

**Setting method:** The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Setting suggestion:** Retain the default value. You can adjust this parameter based on the disk space. When adjusting this parameter, you are advised to adjust the [max\\_size\\_for\\_xlog\\_retention](#) parameter of the DN at the same time to prevent the cluster read-only threshold from being triggered by backup operations.

## max\_datastorage\_threshold\_check

**Parameter description:** Specifies the maximum interval for checking the disk usage. After you modify the read-only mode parameter, the system automatically checks whether the disk usage reaches the threshold at the specified interval.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

Default value: **43200**

## cmserver\_ha\_status\_interval

**Parameter description:** Specifies the interval between synchronizations of primary and standby CM Server status.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## cmserver\_self\_vote\_timeout

**Parameter description:** Specifies the time to wait before the CM Server self-voting times out.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 6

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported.

**Value range:** a non-negative integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

## alarm\_report\_max\_count

**Parameter description:** Specifies the maximum number of times an alarm is reported.

**Value range:** a non-negative integer. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## enable\_az\_auto\_switchover

**Parameter description:** Specifies whether to enable automatic AZ switchover. If it is set to **1**, CM Server automatically switches over services among AZs. Otherwise, when a DN is faulty, services will not be automatically switched to another AZ even if the current AZ is unavailable. You can run the switchover command to manually switch services to another AZ.

**Value range:** a non-negative integer. **0**: disabled; **1**: enabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## **instance\_keep\_heartbeat\_timeout**

**Parameter description:** The CM Agent periodically checks the instance status and reports the status to the CM Server. If the instance status cannot be detected for a long time and the accumulated number of times exceeds the value of this parameter, the CM Server delivers a command to the CM Agent to restart the instance.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 40

## **az\_switchover\_threshold**

**Parameter description:** If the failure rate of a DN shard in an AZ (Number of faulty DN shards/Total number of DN shards x 100%) exceeds the specified value, automatic AZ switchover is triggered.

**Value range:** an integer ranging from 0 to 100. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 100

## **az\_check\_and\_arbitrate\_interval**

**Parameter description:** Specifies the interval for checking the AZ status. If the status of an AZ is abnormal, automatic AZ switchover is triggered.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 2

## **az\_connect\_check\_interval**

**Parameter description:** Specifies the interval at which the network connection between AZs is checked.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 60

## **az\_connect\_check\_delay\_time**

**Parameter description:** Specifies the delay between two retries to check the network connection between AZs.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 150

## cmserver\_demote\_delay\_on\_etcd\_fault

**Parameter description:** Specifies the interval at which CM Server switches from the primary state to the standby state due to unhealthy ETCD.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 8

## instance\_phony\_dead\_restart\_interval

**Parameter description:** Specifies the interval at which the CM Agent process restarts and kills a zombie CN, DN, or GTM instance. The interval between two consecutive kill operations cannot be less than the value of this parameter. Otherwise, the CM Agent process does not deliver commands.

**Value range:** an integer ranging from 1800 to  $2^{31} - 1$ . The unit is second. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 21600

## cm\_auth\_method

**Parameter description:** Specifies the port authentication mode of the CM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the CM cannot communicate properly, affecting the cluster status.

**Value range:** **gss** or **trust**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** **trust**

## cm\_krb\_server\_keyfile

**Parameter description:** Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the `GAUSSHOME/kerberos` directory and ends with `keytab`. The file name is the same as the name of the user who runs the cluster. This parameter is used together with **cm\_auth\_method**. If the **cm\_auth\_method** parameter is changed to **gss**, this parameter must also be configured as the correct path. Otherwise, the cluster status will be affected.

**Value range:** a string. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:**  $\${GAUSSHOME}/\text{kerberos}/\{\text{UserName}\}.\text{keytab}$ . The default value cannot take effect and is used only as a prompt.

## cm\_server\_arbitrate\_delay\_base\_time\_out

**Parameter description:** Specifies the basic delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

**Value range:** an integer. The unit is s. The index should be larger than 0. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## cm\_server\_arbitrate\_delay\_incremental\_time\_out

**Parameter description:** Specifies the incremental delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration

**Value range:** an integer. The unit is s. The index should be larger than 0. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

## force\_promote

**Parameter description:** Specifies whether CM Server enables the forcible startup logic (that is, when the cluster status is unknown, ensure that the basic functions of the cluster are available at the cost of partial data loss). The value **0** indicates that forcible startup is disabled, and the value **1** indicates that forcible startup is enabled. This parameter applies to CNs and DN.

**Value range:** **0** or **1**. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## switch\_rto

**Parameter description:** Specifies the delay for the forcible switchover of CM Server. When **force\_promote** is set to **1** and a shard in the cluster has no primary node, the system starts timing. After the delay, forcible switchover is executed.

**Value range:** an integer ranging from 0 to 2147483647. The unit is second. The minimum value that takes effect is 60. If this parameter is set to a value less than

60, 60s is used. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 600

## enable\_finishredo\_retrieve

**Parameter description:** Specifies whether to retrieve data of Xlogs that have been cut off by redo after a forcible CM Server switchover. If this parameter is set to **on**, data is automatically retrieved after a forcible switchover.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **off:** disabled.
- **on:** enabled.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** If you can accept the loss of some data caused by forcible service (system) switchover, set this parameter to **on** when the service recovery has the highest priority.

## backup\_open

**Parameter description:** Specifies whether to enable the DR cluster. After the DR cluster is enabled, the CM runs in DR cluster mode.

**Value range:** an integer ranging from 0 to 1. Any modification of this parameter takes effect only after CM Server is restarted. This parameter cannot be enabled for non-DR clusters. For details about how to modify this parameter, see [Table 14-2](#).

- **0:** disabled.
- **1:** enabled.

**Default value:** 0

## enable\_e2e\_rto

**Parameter description:** Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout interval are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance  $\leq 10s$ ; RTO for combined faults  $\leq 30s$ ).

**Parameter type:** integer.

**Unit:** none

**Value range:**

- **1**: enabled.
- **0**: disabled.

**Default value:**

Independent deployment: **1**

Finance edition (standard), enterprise edition, and finance edition (data computing): **0**

**Setting method:** Refer to the **set cm parameters** table in "Unified Database Management Tool > cm\_ctl Tool Introduction" in *Tool Reference*. Then run the reload command for the settings to take effect.

**Setting suggestion:** Retain the default value. You can adjust the value based on the disk space and scenario requirements.

## cluster\_starting\_aribt\_delay

**Parameter description:** Specifies the time that CM Server waits for the static primary DN to be promoted to primary during cluster startup.

**Value range:** an integer. The unit is s. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 180

## enable\_dcf

**Parameter description:** Specifies the status of the DCF mode.

**Value range:** Boolean. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

- **0**: disabled.
- **1**: enabled.

**Default value:** off

## ddb\_type

**Parameter description:** Specifies whether to switch between ETCD and DCC modes.

**Value range:** an integer. **0**: ETCD; **1**: DCC. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** 0

## enable\_ssl

**Parameter description:** Specifies whether to enable SSL.

**Value range:** Boolean. After this function is enabled, the SSL certificate is used to encrypt communication. Any modification of this parameter takes effect only after

CM Server is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:**

- **on** indicates that SSL is enabled.
- **off** indicates that SSL is disabled.
- **Default value: off**

---

**NOTICE**

To ensure security, you are advised not to disable it. After this function is disabled, the CM does not use encrypted communication and all information is transmitted in plaintext, which may bring security risks such as eavesdropping, tampering, and spoofing.

---

## ssl\_cert\_expire\_alert\_threshold

**Parameter description:** Specifies the SSL certificate expiration alarm time.

**Value range:** an integer. The unit is day. If the certificate expiration time is less than the value of this parameter, an alarm indicating that the certificate is about to expire is reported. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** 90

## ssl\_cert\_expire\_check\_interval

**Parameter description:** Specifies the period for checking whether the SSL certificate expires.

**Value range:** an integer. The unit is s. Any modification of this parameter takes effect only after CM Server is restarted. For details about how to modify this parameter, see [Table 14-2](#).

**Default value:** 86400

## ddb\_log\_level

**Parameter description:** Sets the DDB log level.

To disable the log function, set this parameter to "**NONE**", which cannot be used together with the following log levels:

To enable the log function, set this parameter to one or a combination of the following log levels: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**. If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty string.

**Value range:** a string containing one or a combination of the following log levels: **RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|**

**PROFILE|OPER.** The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** RUN\_ERR|RUN\_WAR|DEBUG\_ERR|OPER|RUN\_INF|PROFILE

## **ddb\_log\_backup\_file\_count**

**Parameter description:** Specifies the maximum number of log files that can be saved.

**Value range:** an integer ranging from 1 to 100. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10

## **ddb\_max\_log\_file\_size**

**Parameter description:** Specifies the maximum number of bytes in a log.

**Value range:** a string, in the range [1MB,1000MB]. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 10MB

## **ddb\_log\_suppress\_enable**

**Parameter description:** Specifies whether to enable the log suppression function.

**Value range:** an integer. **0:** disabled; **1:** enabled. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 1

## **ddb\_election\_timeout**

**Parameter description:** Specifies the DCC election timeout period.

**Value range:** an integer, in the range [1,600], in seconds. The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 3

## **delay\_arbitrate\_timeout**

**Parameter description:** Specifies the waiting time for a node in the same AZ as the primary DN to be promoted to primary after redo replay.

**Value range:** an integer, in the range [0,21474836] (unit: second). The modification of this parameter takes effect after reloading. For details about how to modify the parameter, see [Table 14-2](#).

**Default value:** 0

## install\_type

**Parameter description:** Specifies the settings related to the DR cluster to distinguish the cluster type.

**Value range:** an integer ranging from 0 to 2. Any modification of this parameter takes effect only after CM Server is restarted. This parameter cannot be enabled for non-DR clusters. For details about how to modify this parameter, see [Table 14-1](#).

**Default value:** 0

- 0 indicates the cluster for which no DR relationship is established.
- 1 indicates a Dorado-based cluster.
- 2 indicates a streaming-based cluster.

## enable\_synclist\_single\_inst

**Parameter description:** Specifies whether to reduce copies to one primary and zero standby.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **off:** This function is disabled.
- **on:** This function is enabled.

**Default value:** off

**Setting method:** Refer to the **set cm parameters** table in "Unified Database Management Tool > cm\_ctl Tool Introduction" in *Tool Reference*. Then run the reload command for the settings to take effect.

**Setting suggestion:** Retain the default value.

## 14.3.24 GTM Parameters

GTM parameters can be set in the **gtm.conf** file or using `gs_guc`.

### nodename

**Parameter description:** Specifies the name of the primary or standby GTM.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which complies with the identifier naming convention

**Default value:** NULL

### port

**Parameter description:** Specifies the host port number listened by the primary or standby GTM.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

**Default value:** 6666

## log\_file

**Parameter description:** Specifies a log file name.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which complies with the identifier naming convention

**Default value:** gtm-%Y-%m-%d\_%H%M%S.log

## active\_host

**Parameter description:** Specifies the IP address of a target GTM. For the primary GTM, it is the IP address of the standby GTM; for the standby GTM, it is the IP address of the primary GTM.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which complies with the identifier naming convention

**Default value:** NULL

## local\_host

**Parameter description:** Specifies the HA local address. Set this parameter based on the cluster configuration file. You do not need to manually set this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which complies with the identifier naming convention

**Default value:** NULL

## active\_port

**Parameter description:** Specifies the port number of the target GTM server.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

### NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Default value:** 0

## local\_port

**Parameter description:** Specifies the local port for HA.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The recommended value range is 1024 to 65535.

### NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

**Default value:** 0

## standby\_connection\_timeout

**Parameter description:** Specifies the timeout interval between the primary and standby GTMs. A larger value enhances the fault tolerance capability of the network between the primary and standby GTMs, but increases the duration for reporting disconnection between them.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 5 to 2147483647. The unit is s.

**Default value:** 5

## keepalives\_count

**Parameter description:** Specifies the number of keepalive signals that can be waited before the GTM server is disconnected from the client on an OS that supports the **TCP\_KEEPCNT** socket option. This parameter takes effect only on the standby GTM.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 0, indicating that the connection is immediately broken if no keepalive signal from the client is received by the GTM.

## keepalives\_idle

**Parameter description:** Specifies the interval for sending keepalive signals.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is s.

**Default value:** 0

## keepalives\_interval

**Parameter description:** Specifies the response time before retransmission on an OS that supports the `TCP_KEEPINTVL` socket option.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647. The unit is s.

**Default value:** 0

## synchronous\_backup

**Parameter description:** Specifies whether to enable synchronization for backing up data to the standby GTM.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** `off`, `on`, or `auto`

- **on:** Synchronization is enabled.
- **off:** Synchronization is disabled.
- **auto:** Automatic synchronization is enabled.

**Default value:** `auto`

## query\_memory\_limit

**Parameter description:** Specifies the limit of memory available for queries. This parameter applies only to the default resource group. For other resource groups, the memory available for queries is not limited.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0.0 to 1.0

**Default value:** 0.25

## wlm\_max\_mem

**Parameter description:** Specifies the maximum memory for GTM execution.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 512 MB to 2147483647 MB.

**Default value:** 2048

## config\_file

**Parameter description:** Specifies the name of a GTM configuration file. Only the `sysadmin` user can access this parameter.

**Value range:** a string Set it based on instructions provided in [Table 14-1](#).

**Default value:** gtm.conf

## data\_dir

**Parameter description:** Specifies the GTM data file directory.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** NULL

## listen\_addresses

**Parameter description:** Specifies the TCP/IP address of the client for a server to listen on.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:**

- Hostname or IP address. Multiple values are separated with commas (,).
- An asterisk (\*), indicating all IP addresses.
- If the parameter is not specified, the server does not listen on any IP address. In this case, only Unix domain sockets can be used for database connections.

**Default value:** \*

## log\_directory

**Parameter description:** Specifies the directory for storing log files when [logging\\_collector](#) is set to **on**. The value can be an absolute path, or relative to the data directory.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### NOTICE

- If the value of **log\_directory** in the configuration file is an invalid path (that is, the user does not have the permission to read or write this path), the cluster cannot be restarted.
- If the value of **log\_directory** is changed to a valid path (that is, the user has the permission to read and write this path), logs are generated in the new path. If the specified path is invalid, log files are generated in the last valid path and the database running is not affected. The invalid value is still written into the configuration file.

---

**Value range:** a string

**Default value:** gtm\_log, indicating that server logs will be generated in the **gtm\_log/** directory under the data directory.

## log\_min\_messages

**Parameter description:** Specifies the level of messages written to GTM log files in the server log folder. Each level covers all the levels following it. The lower the level is, the fewer messages will be written into the log.

---

### NOTICE

If the values of **client\_min\_messages** and **log\_min\_messages** are the same, they indicate different levels.

---

**Valid values:** enumerated values. Valid values are **debug**, **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, **info**, **log**, **notice**, **warning**, **error**, **fatal**, and **panic**. For details about the parameters, see [Table 14-11](#).

**Default value:** warning

## alarm\_component

**Parameter description:** Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm\_report\_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- If **--alarm-type** in the **gs\_preinstall** script is set to **5**, no third-party component is connected and alarms are written into the **system\_alarm** log. In this case, the value of **alarm\_component** is **/opt/huawei/snas/bin/snas\_cm\_cmd**.
- If **--alarm-type** in the **gs\_preinstall** script is set to **1**, a third-party component is connected. In this case, the value of **alarm\_component** is the absolute path of the executable program of the third-party component.

**Default value:** **/opt/huawei/snas/bin/snas\_cm\_cmd**

## alarm\_report\_interval

**Parameter description:** Specifies the interval at which an alarm is reported.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a non-negative integer (unit: s)

**Default value:** **10**

## standby\_only

**Parameter description:** Specifies whether to forcibly synchronize information to standby nodes. In one primary+multiple standbys mode, information is only forcibly synchronized to the ETCD.

**Value range:** 0 or 1. Set this parameter based on instructions provided in [Table 14-1](#).

- 0: Information is not forcibly synchronized to standby nodes.
- 1: Information is forcibly synchronized to standby nodes.

**Default value:** 0

## gtm\_max\_trans

**Parameter description:** Specifies the maximum number of connections accepted by the GTM. You are not advised to change the value. If you have to, set this parameter to a value no less than the maximum number of connections plus 100.

**Value range:** an integer ranging from 256 to 200000. Set it based on instructions provided in [Table 14-1](#).

**Default value:** 8192

## enable\_connect\_control

**Parameter description:** Specifies whether the GTM verifies that a connection IP address is within the cluster.

**Value range:** Boolean. Set it based on instructions provided in [Table 14-1](#).

- **true:** Check whether a connection IP address is within the cluster. If it is not, the access is rejected.
- **false:** Do not check whether a connection IP address is within the cluster.

**Default value:** true

## gtm\_authentication\_type

**Parameter description:** Specifies the port authentication mode of the GTM. **trust** indicates that port authentication is not configured. **gss** indicates that Kerberos port authentication is used. Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the GTM cannot communicate properly, affecting the cluster status.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** gss or trust.

**Default value:** trust

## gtm\_krb\_server\_keyfile

**Parameter description:** Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the  $\$ \{GAUSSHOME\}/\text{kerberos}$  directory and ends with keytab. The file name is the same as the name of the user who runs the cluster. This parameter is used together with **gtm\_authentication\_type**. If **gtm\_authentication\_type** is changed to **gss**, this parameter must be configured as the correct path. Otherwise, the cluster status will be affected.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

**Default value:** ""

## gtm\_option

**Parameter description:** Specifies the GTM mode, which must be set to the same value on all GTMs, CNs, and DNs. There are three GTM modes: GTM, GTM-Lite, and GTM-FREE. For details, see "GTM Mode" in *Feature Guide*. The GTM and GTM-Lite modes take effect only when the **enable\_gtm\_free** parameter is set to **off**. The current version does not support switching between different GTM modes for installed clusters.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2. The value **0** indicates the GTM mode, the value **1** indicates the GTM-Lite mode, and the value **2** indicates the GTM-FREE mode.

**Default value:** 1

## csn\_sync\_interval

**Parameter description:** Specifies the interval for synchronizing CSN between the primary and standby GTMs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647 . The unit is s.

**Default value:** 1

## restore\_duration

**Parameter description:** Specifies the pre-allocation interval of XID or CSN on the GTM.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1000000 to 2147483647.

**Default value:** 1000000

## gtm\_enable\_threadpool

**Parameter description:** Specifies whether to enable the GTM thread pool function. The setting takes effect only after the GTM is restarted.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

**Default value:** true

## gtm\_num\_threads

**Parameter description:** Specifies the number of work threads in the thread pool when the thread pool function **gtm\_enable\_threadpool** is enabled.

The value is related to the size of **gtm\_max\_trans** and cannot exceed the result of (Value of **gtm\_max\_trans** - 1 - Number of auxiliary threads). The number of auxiliary threads is 2 in the current version.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 16384

**Default value:** 1024

## check\_gtm\_primary\_time

**Parameter description:** Specifies the interval for GTM to check whether the current primary node is consistent with the primary node in etcd.

**Parameter type:** integer

**Unit:** second

**Value range:** 0 to 2147483647. The unit is s. Set this parameter based on instructions provided in [Table 14-1](#).

**Default value:** 2

**Setting method:** This parameter does not belong to any type. Set this parameter by referring to method 1 or 2 in [Table 14-1](#).

**Setting suggestion:** Set the value based on service requirements. The value 0 indicates that the detection function is disabled.

## 14.3.25 Upgrade Parameters

### IsInplaceUpgrade

**Parameter description:** Specifies whether an upgrade is ongoing. This parameter is an upgrade parameter and cannot be modified. Only the sysadmin user can access the parameter.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 1 GUC parameter types](#).

**Value range:** Boolean

- **on** indicates an upgrade is ongoing.
- **off** indicates no upgrade is ongoing.

**Default value:** off

## inplace\_upgrade\_next\_system\_object\_oids

**Parameter description:** Indicates the OID of a new system object during the in-place upgrade. This parameter is used for upgrade and cannot be modified by users.

This parameter is a SUSET parameter. Set it based on instructions provided in [Table 1 GUC parameter types](#).

**Value range:** a string

**Default value:** empty

## upgrade\_mode

**Parameter description:** Specifies the upgrade mode. This parameter is used for upgrade. You are advised not to modify it.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer ranging from 0 to 2147483647

- **0:** indicates that the local upgrade and the minor version gray upgrade are not in progress.
- **1:** indicates that the upgrade is in progress. The upgrade command is executed and takes effect after the check is completed.
- **2:** indicates that the major version gray upgrade is in progress. The upgrade command is executed and takes effect after the check is completed.

**Default value:** 0

### NOTE

Execute the precommand on new packages, switch to the cluster user, and use the **source** command to invalidate environment variables. Run the **gs\_upgradectl -t chose-strategy** command to check whether the upgrade is a major version upgrade or minor version upgrade.

If "Upgrade strategy: large-binary-upgrade" is returned, the major version is upgraded.

If "Upgrade strategy: small-binary-upgrade" is returned, the minor version is upgraded.

## 14.3.26 Miscellaneous Parameters

### enable\_default\_ustore\_table

**Parameter description:** Specifies whether to enable the Ustore by default. If this parameter is set to **on**, all created tables are Ustore tables.

**Parameter type:** Boolean.

**Value range:**

- **on** indicates that the Ustore is enabled by default.
- **off** indicates that the Ustore is disabled by default.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). Note that the [track\\_counts](#) and [track\\_activities](#)

parameters must be enabled when the Ustore table is used. Otherwise, space expansion may occur. In upgrade scenarios, the default value of this parameter preferentially ensures compatibility. That is, the default value after the upgrade is the same as that in the source version.

## enable\_ustore

**Parameter description:** Specifies whether to enable the Ustore. If this parameter is set to **on**, Ustore tables can be created. Note that the **track\_counts** and **track\_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloat may occur.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [off,on]

**Default value:** on

## enable\_segment\_datafile\_preallocate

**Parameter description:** Specifies whether to allocate disk space immediately during segment-page file name extension. If this parameter is set to **on**, the system preferentially uses fallocate to allocate disk space immediately during file expansion. If the system does not support fallocate, the system applies for disk space by writing zeros byte by byte. If this parameter is set to **off**, the system does not allocate disk space immediately during file expansion and hole files are created. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [off,on]

**Default value:** on

## reserve\_space\_for\_nullable\_atts

**Parameter description:** Specifies whether to reserve space for the nullable attribute of an Ustore table. If this parameter is set to **on**, space is reserved for the nullable attribute of the Ustore table by default.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** [off,on]

**Default value:** on

## server\_version

**Parameter description:** Specifies the server version number.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified. This parameter is not recommended. You can use the **opengauss\_version()** function to obtain the kernel version.

**Value range:** a string

**Default value:** 9.2.4

## server\_version\_num

**Parameter description:** Specifies the server version number.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer

**Default value:** 90204

## block\_size

**Parameter description:** Specifies the block size of the current database.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** 8192

## segment\_size

**Parameter description:** Specifies the segment file size of the current database.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** 1GB

## max\_index\_keys

**Parameter description:** Specifies the maximum number of index keys supported by the current database.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** 32

## integer\_datetimes

**Parameter description:** Specifies whether the date and time are in the 64-bit integer format.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** Boolean

- **on:** yes.
- **off:** no.

**Default value:** on

## enable\_cluster\_resize

**Parameter description:** If an SQL statement involves tables belonging to different groups, you can enable this parameter to push the execution plan of the statement to improve performance.

This is a SUSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the execution plan of the statement can be pushed.
- **off** indicates that the execution plan of the statement cannot be pushed.

**Default value:** off

 **NOTE**

This parameter is used for internal O&M. Do not set it to **on** unless absolutely necessary.

## lc\_collate

**Parameter description:** Specifies the locale in which sorting of textual data is done.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** Determined by the configuration during the cluster installation and deployment.

## lc\_ctype

**Parameter description:** Specifies the locale that determines character classifications. For example, it specifies what a letter and its upper-case equivalent are.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** Determined by the configuration during the cluster installation and deployment.

## max\_identifier\_length

**Parameter description:** Specifies the maximum identifier length.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** an integer

**Default value:** 63

## server\_encoding

**Parameter description:** Specifies the database encoding (character set).

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Default value:** Determined when the database is created.

## datanode\_heartbeat\_interval

**Parameter description:** Specifies the interval at which heartbeat messages are sent between heartbeat threads. You are advised to set this parameter to a value no more than  $wal\_receiver\_timeout/2$ .

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1000 to 60000. The unit is ms.

**Default value:** 1s

## dfs\_partition\_directory\_length

**Parameter description:** Specifies the maximum directory name length for the partition directory of a table partitioned by VALUE in the HDFS.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 92 to 7999

**Default value:** 512

## max\_concurrent\_autonomous\_transactions

**Parameter description:** Specifies the maximum number of autonomous transaction connections, that is, the maximum number of concurrent autonomous transactions executed at the same time. If this parameter is set to 0, autonomous transactions cannot be executed.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 10000. The theoretical maximum value is 10000, and the actual maximum value is a dynamic value. The calculation formula is:  $262143 - \text{job\_queue\_processes} - \text{autovacuum\_max\_workers} - \text{max\_inner\_tool\_connections} - \text{max\_connections} - \text{AUXILIARY\_BACKENDS} - \text{AV\_LAUNCHER\_PROCS}$ . The values of [job\\_queue\\_processes](#), [autovacuum\\_max\\_workers](#), [max\\_inner\\_tool\\_connections](#), and [max\\_connections](#) depend on the settings of the corresponding GUC parameters.

**AUXILIARY\_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to 20. **AV\_LAUNCHER\_PROCS** indicates the number of reserved launcher threads for autovacuum, which is fixed to 2.

**Default value:**

Independent deployment: **80** (60-core CPU/480 GB memory); **40** (32-core CPU/256 GB memory); **20** (16-core CPU/128 GB memory); **10** (8-core CPU/64 GB memory, 4-core CPU/32 GB memory, 4-core CPU/16 GB memory)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Suggestion:** Set this parameter based on actual service requirements and hardware configurations. It is recommended that this parameter be set to a value less than or equal to 1/10 of **max\_connections**. If you only increase the value of this parameter but do not adjust the memory parameters in the same proportion, the memory may be insufficient and the error message "memory is temporarily unavailable" is displayed when the service load is heavy.

### NOTE

If the value range of this parameter is changed during the upgrade and the value is changed before the commit operation, you need to change the value range to the value allowed before the upgrade if you roll back the upgrade. Otherwise, the database may fail to be started.

## mot\_config\_file

This parameter is unavailable in a distributed system.

## enable\_gpi\_auto\_update

**Parameter description:** Determines whether global indexes are updated by default in partition DDL commands.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#). This parameter must be set to the same value on CNs and DNs. Otherwise, the global index function may be abnormal.

**Value range:** Boolean

- The value **on** indicates that global indexes are updated regardless of whether the partition DDL commands contain the UPDATE GLOBAL INDEX clause.
- The value **off** indicates that global indexes are not updated unless the partition DDL commands contain the UPDATE GLOBAL INDEX clause.

**Default value:** off

## change\_cluster\_mode

**Parameter description:** Specifies whether the cluster is in the mode switchover process. Mode switchover refers to: A cluster with one primary and two standby nodes is switched to a cluster with one primary node, one standby node, and one log; a cluster with one primary node, one standby node, and one log is switched to a cluster with one primary and two standby nodes; standby DNs and log DNs in a cluster with one primary node, one standby node, and one log are switched to each other.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

- The value **0** indicates that the cluster mode is not being switched.
- The value **1** indicates that the cluster mode is being switched.
- Other values are meaningless and have the same effect as the value **0**.

**Default value:** 0

---

### CAUTION

This parameter specifies whether the read function of the standby node in a distributed system is available. If this parameter is set to **1**, the read function of the standby node in a distributed system cannot be used. Exercise caution when setting this parameter.

---

## enable\_partrouting\_optimization

**Parameter description:** Specifies whether to optimize the insertion of partitioned tables.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the insertion of partitioned tables is optimized. For the INSERT SELECT statement, if the SELECT statement contains a constant partition key, partition routing needs to be performed only once for the INSERT statement, improving performance.
- **off** indicates that the insertion of partitioned tables is not optimized. Before inserting each piece of data, you need to perform partition routing to determine the partitioned table to be inserted.

**Default value:** on

 **NOTE**

Constraints for optimizing the insertion of partitioned tables:

- Only the INSERT SELECT statement is supported.
- INSERT INTO ta SELECT FROM tb: For all partition key values inserted to table a, the column values in the corresponding SELECT result set must be constants. (This column is optional because the default values are constants.)
  - INSERT INTO ta SELECT c,d FROM b WHERE tb.c='1' or SELECT '1' as c, d FROM tb: The result column **tb.c** is a constant.
  - INSERT INTO ta SELECT c,d FROM b WHERE tb.c=func('1');: If func() is neither a volatile function nor a stable/immutable function that contains non-constant parameters, **tb.c** can be determined as a constant.
  - If the column value is the return value of an aggregate function, for example, INSERT INTO ta SELECT count(c),d FROM b WHERE tb.c='1' group by c, d;; the count(c) cannot be determined as a constant.
- The UPSERT clause is not supported.
- Tables that contain BEFORE and INSTEAD triggers are not supported because the data to be inserted may be changed.

## cluster\_run\_mode

**Parameter description:** Specifies whether a CN or DN belongs to the primary or standby cluster in a dual-cluster DR scenario. In a single-cluster scenario, the primary cluster is selected by default.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-2](#).

**Value range:** enumerated values

- **cluster\_primary** indicates that the node is in the primary cluster.
- **cluster\_standby** indicates that the node is in the standby cluster.

**Default value:** cluster\_primary

## 14.3.27 Wait Event

### enable\_instr\_track\_wait

**Parameter description:** Specifies whether to enable real-time collection of wait event information.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function of collecting wait event information is enabled.
- **off** indicates that the function of collecting wait event information is disabled.

**Default value:** on

## 14.3.28 Query

### instr\_unique\_sql\_count

**Parameter description:** Specifies the maximum number of unique SQL records to be collected. The value **0** indicates that the function of collecting unique SQL information is disabled.

If the value is changed from a larger one to a smaller one, unique SQL statistics will be reset and re-collected (the standby node does not support this function). There is no impact if the value is changed from a smaller one to a larger one.

When the number of unique SQL records generated in the system (to view the statistics, query **dbperf.statement** or **dbperf.summary\_statement**) is greater than the value of **instr\_unique\_sql\_count**, the extra unique SQL records are not collected.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32U 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647

**Default value:** 200000

### instr\_unique\_sql\_combination\_options

**Parameter description:** Specifies the configuration items of combining unique SQL statements of the same type. The value of this parameter consists of multiple configuration items separated by commas (,).

If this feature is enabled, the IDs of unique SQL statements of the same type are normalized, and the generated unique SQL strings are normalized.

**Parameter type:** string

**Unit:** none

**Value range:** See [Table 14-28](#).

**NOTICE**

- When configuring the combination function, set the character string based on [Table 14-28](#). Use commas (,) to separate multiple configuration items, for example, **set instr\_unique\_sql\_combination\_options='in\_clause'**;
- If this parameter is left blank, this function is disabled, for example, **set instr\_unique\_sql\_combination\_options=""**;

**Table 14-28** Configuration items of the combination function

Configuration Item	Behavior Control
in_clause	<p>Combines only fixed parameters and precompiled binding parameters in the IN clause of the SELECT IN() statement.</p> <p>Example 1: <b>select * from table where column in (1,2,3);</b> Unique SQL string after combination: <b>select * from table where column in (1... n);</b></p> <p>Example 2: <b>select * from table where column in (\$1,\$2,\$3);</b> Unique SQL string after combination: <b>select * from table where column in (1... \$n);</b></p> <p>Example 3: <b>select * from example_table where column in (1,2,\$1,3,\$2);</b> Unique SQL string after combination: <b>select * from example_table where column in (1...n,\$1...\$n);</b></p> <p>Example 4: <b>select * from example_table where (column1, column2) in ((1, 'a'), (2, 'b'), (3, 'c'));</b> Unique SQL string after combination: <b>select * from example_table where (column1, column2) in ((1...n));</b></p>

**Default value:** 'in\_clause'

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** By default, this function is disabled during the upgrade and enabled when a new instance is delivered.

 **CAUTION**

- If this feature is used, the unique SQL IDs of the query statements involved in combination are changed, which affects the SQL statements for which SQL patch has been created.
- For values of the bigint, real, float4, blob, numeric, decimal, number, dec, or integer type, if **in()** contains a single parameter or multiple parameters, two different **unique\_sql\_id** values are generated.

## instr\_unique\_sql\_track\_type

**Parameter description:** Specifies which SQL statements are recorded in Unique SQL.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** enumerated values

- **top:** Only top-level SQL statements are recorded.
- **all:** All SQL statements are recorded.

**Default value:** all

## unique\_sql\_retention\_time

**Parameter description:** Specifies the interval for cleaning the unique SQL hash table. The default value is 30 minutes.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 3650. The unit is minute.

**Default value:** 30min

## enable\_instr\_rt\_percentile

**Parameter description:** Specifies whether to enable the function of calculating the response time of 80% and 95% SQL statements in the system.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

**Default value:** on

## percentile

**Parameter description:** Specifies the percentage of SQL statements whose response time is to be calculated by the background calculation thread.

This is an INTERNAL parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string.

**Default value:** "80,95"

## instr\_rt\_percentile\_interval

**Parameter description:** Specifies the interval at which the background calculation thread calculates the SQL response time.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 3600. The unit is s.

**Default value:** 10s

## enable\_instr\_cpu\_timer

**Parameter description:** Specifies whether to capture the CPU time consumed during SQL statement execution.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32U 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3.5% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the CPU time consumed during SQL statement execution is captured.
- **off** indicates that the CPU time consumed during SQL statement execution is not captured.

**Default value:** on

## enable\_slow\_query\_log (Discarded)

**Parameter description:** Specifies whether to write the slow query information to the log file. This parameter is discarded in this version.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on:** indicates that slow query information needs to be written into log files.
- **off:** indicates that slow query information does not need to be written into log files.

**Default value:** on

## query\_log\_file (Discarded)

**Parameter description:** Specifies the name of a slow query log file on the server. If **enable\_slow\_query\_log** is set to **ON**, slow query records are written into log files. Only the sysadmin user can access this parameter. Generally, log file names are generated in strftime mode. Therefore, the system time can be used to define log file names, which are implemented using the escape character %. This function has been discarded in this version.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

You are advised to use the escape character % to specify the log file names for efficient management of log files.

---

**Value range:** a string

**Default value:** `slow_query_log-%Y-%m-%d_%H%M%S.log`

## query\_log\_directory (Discarded)

**Parameter description:** Specifies the directory for storing low query log files when `enable_slow_query_log` is set to **on**. Only the sysadmin user can access this parameter. It can be an absolute path or a relative path (relative to the data directory), which has been discarded in this version.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

If `query_log_directory` is set to an invalid path, the cluster cannot be started.

---

### NOTE

Valid path: Users have read and write permissions on the path.

Invalid path: Users do not have read or write permission on the path.

**Value range:** a string

**Default value:** specified during installation.

## asp\_log\_directory

**Parameter description:** Specifies the directory for storing ASP log files on the server when `asp_flush_mode` is set to **all** or **file**. The value can be an absolute path, or relative to the **data** directory. Only the sysadmin user can access this parameter.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

---

### NOTICE

If `asp_log_directory` is set to an invalid path, the cluster cannot be started.

---

### NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

**Value range:** a string

**Default value:** specified during installation.

## perf\_directory

**Parameter description:** Specifies the directory of the output file of the performance view dotting task. Only the sysadmin user can access this parameter. The value can be an absolute path, or relative to the data directory.

This is a POSTMASTER parameter. Set it based on instructions in [Table 14-1](#).

 NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

**Value range:** a string

**Default value:** specified during installation.

## enable\_stmt\_track

**Parameter description:** Specifies whether to enable the full/slow SQL statement feature.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32U 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 1.2% by enabling or disabling this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** Boolean

- **on:** Full/Slow SQL capture is enabled.
- **off:** Full/Slow SQL capture is disabled.

**Default value:** on

## track\_stmt\_parameter

**Parameter description:** After **track\_stmt\_parameter** is enabled, the executed statements recorded in **statement\_history** are not normalized. The complete SQL statement information can be displayed to help the database administrator locate faults. For a simple query, the complete statement information is displayed. For a PBE statement, the complete statement information and information about each variable value are displayed. The format is "query string; parameters: \$1=value1,\$2=value2, ...". This parameter is used to display full SQL information for users and is not controlled by the **track\_activity\_query\_size** parameter. When the SQL bypass logic is used for PBE statements, parameters are directly delivered to DNs. Therefore, the number of complete statements cannot be obtained by querying **statement\_history** on CNs. In addition, DNs do not have query character strings. Therefore, complete statement information cannot be obtained by querying **statement\_history** on DNs.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on:** The function of displaying complete SQL statement information is enabled.
- **off:** The function of displaying complete SQL statement information is disabled.

**Default value:** off

## track\_stmt\_session\_slot

**Parameter description:** Specifies the maximum number of full/slow SQL statements that can be cached in a session. If the number of full/slow SQL statements exceeds this value, new statements will not be traced until the flush thread flushes the cached statements to the disk to reserve idle space.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 to 2147483647

**Default value:** 1000

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value, that is, the maximum number of full SQL slots that can be reserved for each session. If the value of this parameter is too large, a large amount of memory is occupied. If the value of this parameter is too small, full SQL statements may be lost.

## track\_stmt\_details\_size

**Parameter description:** Specifies the maximum size of execution events that can be collected by a single statement.

This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 100000000. The unit is byte.

**Default value:** 4096

## track\_stmt\_retention\_time

**Parameter description:** Specifies the retention period of full/slow SQL statement records. This is a combination of parameters. This parameter is read every 60 seconds and records exceeding the retention period are deleted. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string consisting of two parts in the format of 'full sql retention time, slow sql retention time'.

- **full sql retention time** indicates the retention period of full SQL statements. The value ranges from 0 to 86400. The unit is second.
- **slow sql retention time** indicates the retention period of slow SQL statements. The value ranges from 0 to 604800. The unit is second.

**Default value:** 3600,604800

## track\_stmt\_stat\_level

**Parameter description:** Determines the level of statement execution tracing.

**Parameter type:** character

**Unit:** none

**Value range:**

This parameter consists of two parts in the format of 'full sql stat level, slow sql stat level'.

- The first part indicates the tracing level of full SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.
- The second part indicates the tracing level of slow SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.

 **NOTE**

If the tracing level of full SQL statements is not **OFF**, the current SQL statement tracing level is a higher level ( $L2 > L1 > L0$ ) of full and slow SQL statements. For details about the levels, see "System Catalogs and System Views > System Catalogs > STATEMENT\_HISTORY > STATEMENT\_HISTORY columns" in *Developer Guide*.

**Default value:** "OFF,L0"

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If the full SQL tracing function is enabled, the performance is affected and a large amount of disk space may be occupied.

## track\_stmt\_standby\_chain\_size

**Parameter description:** Specifies the maximum memory and disk space occupied by fast/slow SQL statement records on the standby node. This is a combination of parameters. Only the SysAdmin user can access the database.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Value range:** a string

This parameter consists of four parts in the format of 'Full SQL memory size, Full SQL disk size, Slow SQL memory size, Slow SQL disk size'.

Full SQL and slow SQL statements are stored in different locations. Therefore, four additional values are used for control.

- **Full SQL memory size** indicates the maximum memory space reserved for fast SQL statements. The value range is [16,1024], in MB.
- **Full SQL disk size** indicates the maximum disk space occupied by reserved fast SQL statements. The value range is [512,1048576], in MB.
- **Slow SQL memory size** indicates the maximum memory space reserved for slow SQL statements. The value range is [16,1024], in MB.
- **Slow SQL disk size** indicates the maximum disk space reserved for slow SQL statements. The value range is [512,1048576], in MB.

The memory size cannot be greater than the disk size.

**Default value:** 32, 1024, 16, 512

## track\_stmt\_flush\_mode

**Parameter description:** Specifies the storage mode of full SQL statements.

**Parameter type:** character

**Unit:** none

**Value range:**

This parameter consists of two parts in the format of 'full sql flush mode, slow sql flush mode':

- The first part indicates the full SQL tracing mode. The value can be **MEMORY** or **FILE**. If this parameter is set to **MEMORY**, full SQL statements are recorded in the memory. If this parameter is set to **FILE**, full SQL statements are recorded in disk files.
- The second part indicates the slow SQL tracing mode. In the current version, the value can only be **FILE**. If this parameter is set to **FILE**, slow SQL statements are recorded in disk files.

**Default value:** "FILE,FILE"

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** If this parameter is set to "**MEMORY,FILE**", the kernel supports full SQL statements, which occupies certain shared memory. The memory size is specified by the **track\_stmt\_shm\_size** parameter.

## track\_stmt\_shm\_size

**Parameter description:** Specifies the size of the full SQL shared memory.

**Parameter type:** integer.

**Unit:** byte

**Value range:** 134217728 to 1073741824

**Default value:** 134217728

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

## concurrent\_dml\_mode

**Parameter description:** Specifies how to handle concurrent DML execution conflicts (lock conflicts) in a table where the function of updating distribution columns is enabled (that is, the table attribute **enable\_update\_distkey** is set to **on**).

This parameter takes effect only on DNs.

**Parameter type:** integer.

**Unit:** none

**Value range:** 0 and 1

- **0**: loose mode. That is, after a conflict occurs, the DML statement that obtains the lock later does not report an error.
- **1**: strict mode. If a conflict occurs, the DML statement that obtains the lock later terminates and reports an error.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-1](#).

**Setting suggestion:** Set this parameter based on the value range. If the DML statement that obtains the lock later does not report an error after a conflict is expected, set this parameter to **0**. If the DML statement that obtains the lock later terminates and reports an error after a conflict is expected, set this parameter to **1**.

## 14.3.29 System Performance Snapshot

### enable\_wdr\_snapshot

**Parameter description:** Specifies whether to enable the database monitoring snapshot function.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on** indicates that the database monitoring snapshot function is enabled.
- **off** indicates that the database monitoring snapshot function is disabled.

**Default value:** on

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

#### NOTE

You are advised not to enable it in the following scenarios:

- In multi-table and multi-database scenarios, WDR snapshot records snapshots in each database in serial mode, which takes a long time. Therefore, you are advised not to enable it.
- In the multi-table scenario, the query speed of the `pg_stat_all_tables` is slow due to the performance problems of some internal tables. In this case, the WDR snapshot function is slow. Therefore, you are advised not to enable it.
- If WDR snapshot is performed when there are a large number of DDL statements, WDR snapshot may fail. Therefore, you are advised not to enable it.

### wdr\_snapshot\_retention\_days

**Parameter description:** Specifies the number of days database monitoring snapshots are retained. If the number of snapshots generated during database running exceeds the maximum number of snapshots that can be generated within the retention period ( $24 \times 8 = 192$  by default), the system deletes the snapshots

with the smallest ID at an interval specified by the value of **wdr\_snapshot\_interval**.

 NOTE

This parameter is valid only when **enable\_wdr\_snapshot** is set to **on**.

**Parameter type:** integer.

**Unit:** day

**Value range:** 1 to 30

**Default value:** 8

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. A larger parameter value indicates higher disk usage.

## wdr\_snapshot\_query\_timeout

**Parameter description:** Specifies the execution timeout for the SQL statements associated with database monitoring snapshot operations. If the statement execution is not complete and no result is returned within the specified time, the snapshot operation fails.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#). The value **0** indicates that this parameter does not take effect.

**Value range:** an integer ranging from 0 to 2147483647. The unit is s.

**Default value:** 100s

## wdr\_snapshot\_interval

**Parameter description:** Specifies the interval at which the backend thread snapshot automatically takes snapshots of the database monitoring data.

 NOTE

This parameter is valid only when **enable\_wdr\_snapshot** is set to **on**.

**Parameter type:** integer.

**Unit:** minute

**Value range:** 10 to 60

**Default value:** 60

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#). For example, if the value is **60** without a unit, **wdr\_snapshot\_interval** indicates 60 minutes. If the value is **1h**, **wdr\_snapshot\_interval** indicates 1 hour. If the unit is required, the value must be **min**, **h**, or **d**.

**Setting suggestion:** Retain the default value. If the retention period is fixed, a smaller value of this parameter indicates a larger disk usage.

## wdr\_snapshot\_space\_threshold

**Parameter description:** Specifies the threshold at which the space used by snapshots is controlled. When the space used by snapshots reaches 50% of the value of this parameter, the control logic of the database is enabled to stabilize the space used by the snapshots.

### NOTE

- This parameter is valid only when [enable\\_wdr\\_snapshot](#) is set to **on**.
- If this parameter is set to a value smaller than the space used by the snapshots, the space usage does not shrink. Instead, the control logic is enabled to control the snapshot growth and stabilize the space used by the snapshots.

**Parameter type:** integer.

**Unit:** KB

**Value range:** 0–107374182400

**Default value:** 0, indicating that the function of controlling the space used by snapshots based on the space threshold is disabled.

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Set this parameter based on the actual scenario.

## wdr\_snapshot\_full\_backup\_interval

**Parameter description:** Specifies the interval at which a full WDR snapshot is created. The interval specified by this parameter is about a number instead of time. For example, if the parameter is set to **12**, a full snapshot and then 11 incremental snapshots are generated for each group. If the parameter is set to **1**, all snapshots generated are full snapshots.

### NOTE

- This parameter is valid only when [enable\\_wdr\\_snapshot](#) is set to **on**.
- If you change the value of this parameter after multiple snapshots have been generated, the next snapshot will be a full snapshot. For example, after five WDR incremental snapshots have been generated, if the parameter value is changed to **10**, a full snapshot will be generated before a new interval starts.
- When a snapshot is deleted, other snapshots in the same group are deleted. The number of snapshots to be deleted depends on the value of this parameter when the earliest group of snapshots are generated and is irrelevant to the current value.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 24

**Default value:** 12

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Set this parameter based on the actual scenario. If this parameter is set to a smaller value, more full snapshots are generated, but fewer snapshots that can be retained with the same space used.

## enable\_wdr\_snapshot\_standby

**Parameter description:** Specifies whether to enable the WDR function to support distributed standby nodes. If this parameter is enabled, WDR snapshot obtains the performance data of the standby node and stores the data on the primary node.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The WDR function is enabled to support the distributed standby node.
- **off:** The WDR function is disabled to support the distributed standby node.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

## enable\_show\_standby\_name

**Parameter description:** Specifies whether to distinguish primary and standby DNAs by **node\_name** in the performance view that is queried. If this parameter is enabled, different names are returned when **dbe\_perf.node\_name** is queried on different nodes of the same shard.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The function of distinguishing primary and standby node names is enabled.
- **off:** The function of distinguishing primary and standby node names is disabled.

**Default value:** off

## enable\_asp

**Parameter description:** Specifies whether to enable the active session profile function.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The active session profile function is enabled.
- **off:** The active session profile function is disabled.

**Default value:** on

## asp\_sample\_num

**Parameter description:** Specifies the maximum number of samples allowed in the LOCAL\_ACTIVE\_SESSION view. Only the sysadmin user can access this parameter.

**Parameter type:** integer.

**Unit:** none

**Value range:** 10000 to 100000

**Default value:** 100000

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

## asp\_sample\_interval

**Parameter description:** Specifies the sampling interval.

**Parameter type:** integer.

**Unit:** second

**Value range:** 1 to 10

**Default value:** 1

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

## asp\_flush\_rate

**Parameter description:** When the number of samples reaches the value of **asp\_sample\_num**, the samples in the memory are updated to the disk based on a certain proportion. **asp\_flush\_rate** indicates the update proportion. If this parameter is set to **10**, it indicates that the update ratio is 10:1.

**Parameter type:** integer.

**Unit:** none

**Value range:** 1 to 10

**Default value:** 10

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

## asp\_flush\_mode

**Parameter description:** Specifies the mode for the ASP to update data to the disk. The value can be 'file' (default value), 'table' (system catalog), or 'all' (system catalog and file). Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, which can be 'table', 'file', or 'all'.

**Default value:** 'table'

## asp\_retention\_days

**Parameter description:** Specifies the maximum number of days for reserving ASP samples when they are written to the system catalog.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 7. The unit is day.

**Default value:** 2

## asp\_log\_filename

**Parameter description:** Specifies the file name format when writing files using ASP. Only the sysadmin user can access this parameter.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** "asp-%Y-%m-%d\_%H%M%S.log"

## gs\_perf\_interval

**Parameter description:** Specifies the interval at which the stacks are collected automatically. For details about the automatic stack collection function determined by this parameter, see "Maintainability > Built-in perf Tool" in *Feature Description*.

**Parameter type:** integer.

**Unit:** minute

**Value range:** 0 or 5–60. The value 0 indicates that the automatic stack collection function is disabled. The values 5 to 60 indicate the interval at which the stacks are collected automatically.

### NOTE

If you attempt to set this parameter to a value ranging from 1 to 4, this parameter will be automatically adjusted to the default value 5.

**Default value:** 5

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## gs\_perf\_retention\_days

**Parameter description:** Specifies the retention period of flame graph files. For details about the automatic stack collection function determined by this parameter, see "Maintainability > Built-in perf Tool" in *Feature Description*.

**Parameter type:** integer.

**Unit:** day

**Value range:** 1 to 8

**Default value:** 3

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## 14.3.30 Security Configuration

### enable\_security\_policy

**Parameter description:** Specifies whether the unified audit and dynamic data masking policies take effect.

#### NOTE

**Unified audit:** The unified audit mechanism is a technology that implements efficient security audit management by customizing audit policies. After the administrator defines the audit object and audit behaviors, if the task executed by a user is associated with an audit policy, the corresponding audit behavior is generated and the audit log is recorded. For details, see "Database Security > Unified Audit" in *Feature Description*.

**Dynamic data masking:** The dynamic data masking mechanism is a technology that protects privacy data by customizing masking policies. It can effectively prevent unauthorized users from accessing sensitive information while retaining original data. For details, see "Database Security > Dynamic Data Masking" in *Feature Description*.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

**on:** The security policy is enabled.

**off:** The security policy is disabled.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. Set this parameter to **on** when a security policy is required. However, this occupies system resources and affects system performance.

### use\_elastic\_search

**Parameter description:** Specifies whether to send unified audit logs to Elasticsearch. If **enable\_security\_policy** and this parameter are enabled, unified

audit logs are sent to Elasticsearch through HTTP or HTTPS (used by default). After this parameter is enabled, ensure that the Elasticsearch service corresponding to **elastic\_search\_ip\_addr** can be properly connected. Otherwise, the process fails to be started.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean.

**on:** Unified audit logs are sent to Elasticsearch.

**off:** Unified audit logs are not sent to Elasticsearch.

**Default value:** off

## elastic\_search\_ip\_addr

**Parameter description:** Specifies the IP address of the Elasticsearch system. If HTTPS is used, the format is **https://ip:port.username**. If HTTP is used, the format is **http://ip:port**. In the preceding command, *ip* indicates the IP address of the Elasticsearch server. *port* indicates the listening port for Elasticsearch HTTP communication, and the value ranges from 9200 to 9299. *username* indicates the username used for registering an Elasticsearch account. The initial user is **elastic**. If HTTPS is used, related certificates need to be configured. For details, see "Unified Auditing" in the *Security Hardening Guide*.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string.

**Default value:** "

## is\_sysadmin

**Parameter description:** Specifies whether the current user is an initial user.

This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

**Value range:** Boolean.

**on** indicates that the user is an initial user.

**off** indicates that the user is not an initial user.

**Default value:** off

## enable\_tde

**Parameter description:** Specifies whether to enable the TDE function. Before creating an encrypted table, set this parameter to **on** and set the **tde\_key\_info** parameter to configure the key information.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean.

**on:** The TDE function is enabled.

**off:** The TDE function is disabled.

**Default value:** off

---

**NOTICE**

- If this parameter is set to **on**, ensure that the key information in the **tde\_key\_info** parameter is correctly configured and the key service can be accessed properly. Otherwise, the database cannot be started properly.
  - After this parameter is set to **on** and an encrypted table is created, if this parameter is set to **off** again, data in the existing encrypted table cannot be encrypted or decrypted. As a result, the database is abnormal.
- 

## tde\_key\_info

**Parameter description:** If TDE is enabled, transparent data needs to access the external key service to implement key management. This parameter is used to configure information about the key service, such as the service address, identity authentication information, and project information.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. For details, see "Security Management > Configuring TDE" in *Administrator Guide*.

**Default value:** ""

## tde\_index\_default\_encrypt

**Parameter description:** After this parameter is enabled, if you create an index whose base table is an encrypted table, the database automatically sets the index as an encrypted index, copies encryption parameters such as the encryption algorithms and keys of the base table for the index, and encrypts the data of the index before storing it.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

**on:** Encryption parameters are automatically set for indexes of encrypted tables.

**off:** Encryption parameters are not automatically set for indexes in encrypted tables.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value.

## block\_encryption\_mode

**Parameter description:** Specifies the block encryption mode used by the `aes_encrypt` and `aes_decrypt` functions for encryption and decryption.

This is a `USERSET` parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated values. Valid values are `aes-128-cbc`, `aes-192-cbc`, `aes-256-cbc`, `aes-128-cfb1`, `aes-192-cfb1`, `aes-256-cfb1`, `aes-128-cfb8`, `aes-192-cfb8`, `aes-256-cfb8`, `aes-128-cfb128`, `aes-192-cfb128`, `aes-256-cfb128`, `aes-128-ofb`, `aes-192-ofb`, and `aes-256-ofb`. `aes` indicates the encryption or decryption algorithm. `128`, `192`, and `256` indicate the key length (unit: bit). `cbc`, `cfb1`, `cfb8`, `cfb128`, and `ofb` indicate the block encryption or decryption mode.

**Default value:** `aes-128-cbc`

## enable\_mac\_check

**Parameter description:** Specifies whether label-based mandatory access control takes effect.

This is a `SIGHUP` parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean.

`on` indicates that label-based mandatory access control takes effect.

`off` indicates that label-based mandatory access control does not take effect.

**Default value:** `off`

## enable\_rls\_match\_index

**Parameter description:** Specifies whether indexes of a base table can be scanned based on target predicate conditions in row-level security scenarios. Target scenario: The row level security (RLS) policies are set and enabled in the base table, and the query predicate contains the `unleakproof` system function or like operator.

**Value range:** Boolean.

`on`: Base table indexes can be scanned in the target scenario.

`off`: Base table indexes cannot be scanned in the target scenario.

**Default value:** `off`

**Setting method:** This is a `SIGHUP` parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value. If hotspot query statements belong to the target scenario and there are few row-level access policies in the base table, enabling this function significantly improves query performance.

 NOTE

- The modification of this parameter affects the generation of the execution plan in the target scenario. You can manually invalidate the cache plan by reconnecting to the system or creating operators.
- If this parameter is enabled, the generation of the bitmap scanning operator is affected, and the RLS policy predicate is inserted into the Recheck filter condition. Therefore, when the operator is switched to the lossy mode and there are many RLS policies, the performance is affected.

## 14.3.31 HyperLogLog

### hll\_default\_log2m

**Parameter description:** Specifies the number of buckets for HLL data. The number of buckets affects the precision of distinct values calculated by HLL. The more buckets there are, the smaller the deviation is. The deviation range is as follows:  $[-1.04/2^{\log_2 m^{*1/2}}, +1.04/2^{\log_2 m^{*1/2}}]$

**Parameter type:** integer

**Unit:** none

**Value range:** 10–16

**Default value:** 14

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value or adjust the value based on service requirements.

### hll\_default\_log2explicit

**Parameter description:** Specifies the default threshold for switching from the explicit mode to the sparse mode.

**Parameter type:** integer

**Unit:** none

**Value range:** 0–12 The value 0 indicates that the explicit mode is skipped. A value within 1–12 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_log2explicit}}$ .

**Default value:** 10

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value or adjust the value based on service requirements.

### hll\_default\_log2sparse

**Parameter description:** Specifies the default threshold for switching from the sparse mode to the full mode.

**Parameter type:** integer

**Unit:** none

**Value range:** 0–14 The value **0** indicates that the explicit mode is skipped. A value within 1 to 14 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_log2sparse}}$ .

**Default value:** 12

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value or adjust the value based on service requirements.

## hll\_duplicate\_check

**Parameter description:** Specifies whether duplicatecheck is enabled by default.

**Parameter type:** Boolean

**Unit:** none

**Value range:**

- **0:** The function is disabled by default.
- **1:** The function is enabled by default.

**Default value:** 0

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value or adjust the value based on service requirements.

## hll\_default\_regwidth (Discarded)

**Parameter description:** Specifies the number of bits in each bucket for HLL data. A larger value indicates more memory occupied by HLL. **hll\_default\_regwidth** and **hll\_default\_log2m** determine the maximum number of distinct values that can be calculated by HLL. Currently, **regwidth** is set to a fixed value and is no longer used.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 5

**Default value:** 5

## hll\_default\_expthresh (Discarded)

**Parameter description:** Specifies the default threshold for switching from the **explicit** mode to the **sparse** mode. Currently, the **hll\_default\_log2explicit** parameter is used to replace the similar function.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 7 -1 indicates the auto mode; 0 indicates that the **explicit** mode is skipped; a value from 1 to 7 indicates that the mode is switched when the number of distinct values reaches  $2^{\text{hll\_default\_expthresh}}$ .

**Default value:** -1

### hll\_default\_sparseon (Discarded)

**Parameter description:** Specifies whether to enable the **sparse** mode by default. Currently, the **hll\_default\_log2sparse** parameter is used to replace the similar function. When **hll\_default\_log2sparse** is set to 0, the **sparse** mode is disabled.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 or 1 0 indicates that the **sparse** mode is disabled by default. 1 indicates that the **sparse** mode is enabled by default.

**Default value:** 1

### hll\_max\_sparse (Discarded)

**Parameter description:** Specifies the size of **max\_sparse**. Currently, the **hll\_default\_log2sparse** parameter is used to replace the similar function.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to 2147483647

**Default value:** -1

### enable\_compress\_hll (Discarded)

**Parameter description:** Specifies whether to enable memory optimization for HLL. Currently, the HLL memory has been optimized, and this parameter is no longer used.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** or **true** indicates that memory optimization is enabled.
- **off** or **false** indicates that memory optimization is disabled.

**Default value:** off

## 14.3.32 User-defined Functions

### udf\_memory\_limit

**Parameter description:** Specifies the maximum physical memory that can be used when each CN or DN executes UDFs. This parameter does not take effect in the current version. Use **FencedUDFMemoryLimit** and **UDFWorkerMemHardLimit** to control virtual memory used by fenced udf worker.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 200 x 1024 to 2147483647. The unit is KB.

**Default value:** 200MB

## FencedUDFMemoryLimit

**Parameter description:** Specifies the virtual memory used by each fenced udf worker process.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB. **0** indicates that the memory is not limited.

**Default value:** 0

## UDFWorkerMemHardLimit

**Parameter description:** Specifies the maximum value of `fencedUDFMemoryLimit`.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 KB to 2147483647 KB. The unit can also be MB or GB.

**Default value:** 1GB

## 14.3.33 Scheduled Task

### job\_queue\_processes

**Parameter description:** Specifies the number of jobs that can be concurrently executed. This parameter is a POSTMASTER parameter. You can set it using `gs_guc`, and you need to restart `gaussdb` to make the setting take effect.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 0 to 1000

Function:

- Setting `job_queue_processes` to **0** indicates that the scheduled job function is disabled and that no job will be executed. (Enabling scheduled jobs may affect the system performance. At sites where this function is not required, you are advised to disable it.)
- Setting `job_queue_processes` to a value that is greater than **0** indicates that the scheduled job function is enabled and this value is the maximum number of jobs that can be concurrently processed.

After the scheduled job function is enabled, the `job_scheduler` thread polls the `pg_job` system catalog at a scheduled interval. The scheduled job check is performed every second by default.

Too many concurrent jobs consume many system resources, so you need to set the number of concurrent jobs to be processed. If the current number of concurrent

jobs reaches the value of **job\_queue\_processes** and some of them expire, these jobs will be postponed to the next polling period. Therefore, you are advised to set the polling interval (the **Interval** parameter of the **submit** interface) based on the execution duration of each job to avoid the problem that jobs in the next polling period cannot be properly processed because of overlong job execution time.

Note: If the number of concurrent jobs is large and the value is too small, these jobs will wait in queues. However, a large parameter value leads to large resource consumption. You are advised to set this parameter to **100** and change it based on the system resource condition.

**Default value:** 10

## **enable\_prevent\_job\_task\_startup**

**Parameter description:** Specifies whether to start the job thread.

**Parameter type:** Boolean

**Unit:** none

**Value range:**

- **on** indicates that the job thread is not started.
- **off** indicates that the job thread is started.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

## 14.3.34 Thread Pool

### **enable\_thread\_pool**

**Parameter description:** Specifies whether to enable the thread pool function. This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#). You are advised to disable this parameter in performance-sensitive scenarios with low-concurrency and persistent connection and enable this parameter in other scenarios.

**Value range:** Boolean

- **on** indicates that the thread pool function is enabled.
- **off** indicates that the thread pool function is disabled.

**Default value:** on

### **thread\_pool\_attr**

**Parameter description:** Specifies the detailed attributes of the thread pool function. This parameter is valid only when **enable\_thread\_pool** is set to **on**. Only the sysadmin user can access this parameter.

**Parameter type:** string.

**Unit:** none

### Value range:

This parameter consists of three parts: '**thread\_num**', '**group\_num**', and '**cpubind\_info**'. The meanings of the three parts are as follows:

- **thread\_num** is the total number of initial threads in the thread pool, which can be dynamically expanded. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **thread\_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **thread\_num** = Number of CPU cores x 3–5. The maximum value of **thread\_num** is **4096**.
- **group\_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group\_num**.
- **cpubind\_info** specifies whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '**(nobind)**': The thread is not bound to a core. 2. '**(allbind)**': Use all CPU cores that can be queried in the current system to bind threads. 3. '**(nodebind: 1, 2)**': Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. '**(cpubind: 0-30)**': Use CPU cores 0 to 30 to bind threads. 5. '**(numabind: 0-30)**': Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive.

### Default value:

- Independent deployment: '**1024,2,(nobind)**' (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); '**512,2,(nobind)**' (16-core CPU/128 GB memory); '**256,2,(nobind)**' (8-core CPU/64 GB memory); '**128,2,(nobind)**' (4-core CPU/32 GB memory); '**64,2,(nobind)**' (4-core CPU/16 GB memory)

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** When the memory is sufficient and the CPU performance is good, increase the value of this parameter if the service requires more connections.

## static\_thread\_pool\_num

**Parameter description:** Specifies the number of threads used to create a static thread pool (static pool). This parameter takes effect only on distributed CNs after **enable\_thread\_pool** is enabled. This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1024.

**Default value:** 3

**CN default value:** 10% x **group\_num** x **thread\_num**. For details about **group\_num** and **thread\_num**, see [thread\\_pool\\_attr](#). In actual configuration, the sum of **thread\_num** and **static\_thread\_pool\_num** is no more than the value of

**min (4096, max\_connections)** and the value of **static\_thread\_pool\_num** is no less than the number of DN shards multiplied by the value of **group\_num**.

**Example:** **static\_thread\_pool\_num** = 10% x 1024 x 2 = 204

---

#### NOTICE

- A static thread pool is created to prevent DNs from exhausting threads of the CN thread pool and ensure that available threads are connected to DNs to execute services.
- Ensure that the sum of **thread\_pool\_attr** and **static\_thread\_pool\_num** must be no more than the value of **min(4096, max\_connections)**. Otherwise, the static pool cannot be created. Also, the value of **static\_thread\_pool\_num** must be greater than the number of DN shards multiplied by the value of **group\_num**.
- **static\_thread\_pool\_num** is a virtual value and does not take effect immediately after being set. When the CN thread pool is fully loaded or exhausted, the CN creates a number of threads specified by **static\_thread\_pool\_num**. These threads make up a static pool.
- The CN static pool is used for single-DN connection services and evenly allocates threads to each DN shard in the cluster. The calculation formula is as follows: **static\_thread\_pool\_num**/*n* (*n* indicates the number of DN shards). If the number of threads used exceeds the calculated fixed quota, an error is reported.
- If the static pool thread is held by the multi-DN connection service, an error is reported and the threads are returned.
- Non-default thread groups cannot be created in a static pool in multi-tenant mode.
- If **static\_thread\_pool\_num** is set to **0**, the static pool function is disabled. If you do not want the static pool to control multiple DN connections, disable this function.
- Restrictions on creating a static thread pool: The prerequisite is that the thread pool is enabled on the distributed CN. The current function resolves DN shard faults and ensures that the CN has available threads for services to ensure continuous services. If the design does not include the solution for the fully occupied thread pool due to single-CN query, querying services only on a single CN at the same time are not controlled or counted in statistics.

---

## thread\_pool\_stream\_attr

**Parameter description:** Specifies the detailed attributes of the stream thread pool function. This parameter is valid only when **enable\_thread\_pool** is set to **on** and only takes effect on DNs. Only the sysadmin user can access this parameter. This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

This parameter consists of four parts: 'stream\_thread\_num, stream\_proc\_ratio, group\_num, cpubind\_info'. The meanings of the four parts are as follows:

- **stream\_thread\_num** indicates the total number of threads in the stream thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **stream\_thread\_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **stream\_thread\_num** = Number of CPU cores x 3–5. The maximum value of **stream\_thread\_num** is **4096**.
- **stream\_proc\_ratio** indicates the ratio of proc resources reserved for stream threads. The value is a floating-point number. The default value is **0.2**. The reserved proc resources are calculated as follows: Value of **stream\_proc\_ratio** x Value of **stream\_thread\_num**.
- **group\_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group\_num**. The value of **group\_num** in **thread\_pool\_stream\_attr** must be the same as that in **thread\_pool\_attr**. If they are set to different values, the value of **group\_num** in **thread\_pool\_attr** is used.
- **cpubind\_info** specifies whether the thread pool is bound to a core. The available configuration modes are as follows: 1. '**(nobind)**': The thread is not bound to a core. 2. '**(allbind)**': Use all CPU cores that can be queried in the current system to bind threads. 3. '**(nodebind: 1, 2)**': Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. '**(cpubind: 0-30)**': Use CPU cores 0 to 30 to bind threads. 5. '**(numabind: 0-30)**': Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. The value of **cpubind\_info** in **thread\_pool\_stream\_attr** must be the same as that in **thread\_pool\_attr**. If they are set to different values, the value of **cpubind\_info** in **thread\_pool\_attr** is used.

**Default value:**

**stream\_thread\_num:** 16

**stream\_proc\_ratio:** 0.2

**group\_num** and **cpubind\_info:** For details, see [thread\\_pool\\_attr](#).

## resilience\_threadpool\_reject\_cond

**Parameter description:** Specifies the percentage of thread pool usage for escape from overload. This parameter takes effect only when the GUC parameters **enable\_thread\_pool** and **use\_workload\_manager** are enabled. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string, consisting of one or more characters.

This parameter consists of **recover\_threadpool\_percent** and **overload\_threadpool\_percent**. The meanings of the two parts are as follows:

- **recover\_threadpool\_percent:** specifies the thread pool usage when the thread pool recovers to the normal state. When the thread pool usage is less than the value of this parameter, the escape from overload function is

disabled and new connections are allowed. The value ranges from 0 to *INT\_MAX*. The value indicates a percentage.

- **overload\_threadpool\_percent**: specifies thread pool usage when the thread pool is overloaded. If the thread pool usage is greater than the value of this parameter, the current thread pool is overloaded. In this case, the escape from overload function is enabled to kill sessions and forbid new connections. The value ranges from 0 to *INT\_MAX*. The value indicates a percentage.

**Default value:** '0,0', indicating that the thread pool escape function is disabled.

**Example:**

```
resilience_threadpool_reject_cond = '50,90'
```

When the thread pool usage exceeds 90%, new connections are forbidden and stacked sessions are killed. When the thread pool usage decreases to 50%, session killing is stopped and new connections are allowed.

---

**NOTICE**

- The thread pool usage can be queried in the `DBE_PERF.local_threadpool_status` view. The initial number of threads in the thread pool can be obtained by querying the **thread\_pool\_attr** parameter.
- If this parameter is set to a small value, the thread pool escape from overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual thread pool usage.
- If the **use\_workload\_manager** parameter is disabled and the **bypass\_workload\_manager** parameter is enabled, this parameter also takes effect. The **bypass\_workload\_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The values of **recover\_threadpool\_percent** and **overload\_threadpool\_percent** can be 0 at the same time. In addition, the value of **recover\_threadpool\_percent** must be smaller than that of **overload\_threadpool\_percent**. Otherwise, the setting does not take effect.

---

## 14.3.35 Backup and Restoration

### operation\_mode

**Parameter description:** Specifies whether the system enters the backup and restoration mode.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the system is in the backup and restoration mode.
- **off** indicates that the system is not in the backup and restoration mode.

**Default value:** off

## enable\_cbm\_tracking

**Parameter description:** Specifies whether to enable cbm tracking. To perform full or incremental backup for the cluster by using Roach, set this parameter to **on**. Otherwise, the backup will fail.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on:** The cbm tracking is enabled.
- **off:** The cbm tracking is disabled.

**Default value:** off

## max\_size\_for\_xlog\_retention

**Parameter description:** Specifies when to forcibly update the backup replication slot or logical replication slot to prevent the disk from being full and the cluster from being read-only because logs cannot be recycled during backup or logical decoding. It is recommended that the value of this parameter be a little smaller than the value of **datastorage\_threshold\_value\_check** of the CM Server component to prevent the cluster from entering the read-only state.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** -100 to 2147483647

- The value **0** indicates that this function is disabled.
- A negative value indicates that the backup replication slot or logic replication slot is forcibly updated when the disk usage exceeds the threshold and logs are recycled due to blocked backup operation or logic decoding. For example, **-80** indicates that the disk usage exceeds 80% of the threshold.
- A positive value indicates that the backup replication slot or logic replication slot is forcibly updated when the size of stacked logs exceeds the threshold and logs are recycled due to blocked backup operation or logic decoding. For example, **32** indicates that the backup replication slot lags behind the redo location of the current checkpoint by more than 32 log segments. (The size of each log segment is 16 MB.)

**Default value:** -80

## max\_cbm\_retention\_time

**Parameter description:** Specifies the interval at which CBM backup files are forcibly recycled. If CBM files cannot be recycled during backup, the disk will be full and the cluster will be read-only. You are advised to set this parameter based on the full backup interval.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** 86400 to 2147483647

- The unit is second.
- The minimum value is 1 day.

- The default value is 2 weeks.

**Default value:** 1209600

## enable\_standby\_move\_buckets

**Parameter description:** Specifies whether a CN is allowed to connect to a standby node to move buckets. This parameter is used only for cluster-level restoration.

When restoring the backup set generated during hash bucket redistribution, this parameter is used to establish a connection with the standby DN when the CN sends the buckets migration command to the DN. This parameter takes effect only in this connection. In other cases, the value is **off**.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** The standby node can receive connections.
- **off:** The standby node cannot receive connections.

**Default value:** off

**Setting method:** This is a BACKEND parameter and cannot be set or reloaded using `gs_guc`. This parameter does not take effect when written into the configuration file. It is used only as an O&M parameter for data restoration.

**Setting suggestion:** You are advised to retain the default value.

## 14.3.36 AI Features

### enable\_hypo\_index

**Parameter description:** Determines whether the optimizer creates virtual indexes when executing the **EXPLAIN** command.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** A virtual index is created when the **EXPLAIN** command is executed.
- **off:** No virtual index is created when the **EXPLAIN** command is executed.

**Default value:** off

**Setting method:** This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Setting suggestion:** Retain the default value.

### enable\_ai\_stats

**Parameter description:** Specifies whether to create or use intelligent statistics.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that intelligent statistics are created and used.
- **off** indicates that intelligent statistics are not created or used.

**Default value:** off

## multi\_stats\_type

**Parameter description:** Specifies the type of statistics to be created when **enable\_ai\_stats** is set to **on**.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** enumerated values. Valid values include "BAYESNET", "MCV", and "ALL".

- "BAYESNET": Only intelligent statistics are created.
- "MCV": Only traditional statistics are created.
- "ALL": Both traditional statistics and intelligent statistics are created.

**Default value:** "BAYESNET"

## ai\_stats\_cache\_limit

**Parameter description:** Specifies the maximum number of models that can be cached when **enable\_ai\_stats** is set to **on**.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 30 to 1000.

**Default value:** 100

## enable\_operator\_prefer

**Parameter description:** Specifies whether to enable the operator preference rule. If the estimated costs are similar, the parameterized path is preferred for table join.

This is a USERSET parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on** indicates that parameterized path preference is enabled.
- **off** indicates that parameterized path preference is disabled.

**Default value:** off

---

### CAUTION

There are two prerequisites for this parameter to take effect:

- The parameterized path is generated.
  - The estimated cost of the parameterized path is similar to that of other index scan operators.
-

## enable\_ai\_watchdog

**Parameter description:** Enables or disables the AI watchdog function.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## enable\_ai\_watchdog\_forcible\_oom\_detection

**Parameter description:** Forcibly enables or disables the OOM detection function of the AI watchdog. If this parameter is disabled, the system automatically determines whether to enable the OOM detection function based on the current database specifications. In automatic determination mode, the OOM detection function is enabled only when **max\_process\_memory** is set to **64GB** or a larger value. The OOM detection function depends on the information obtained by the memory management module. Therefore, if the memory management module is disabled or invalid, the OOM detection function is not enabled.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** enabled.
- **off:** disabled.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Setting suggestion:** Retain the default value. If this function is enabled, the system performance may be affected.

## enable\_ai\_watchdog\_healing

**Parameter description:** Enables or disables the self-healing function of the AI watchdog.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** Boolean

- **on:** enabled.
- **off:** disabled.

**Default value:** on

## ai\_watchdog\_max\_cpu\_usage

**Parameter description:** Specifies the expected upper limit of the database CPU usage. The value is normalized based on the multi-core situation. If this parameter is set to **0**, the system does not check the CPU usage.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.8

## ai\_watchdog\_oom\_dynamic\_used\_threshold

**Parameter description:** Specifies the expected upper limit of the dynamic memory usage of the database.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.95

## ai\_watchdog\_oom\_growth\_confidence

**Parameter description:** Specifies the confidence level of the OOM detection algorithm.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0.1 to 1.

**Default value:** 0.95

## ai\_watchdog\_oom\_malloc\_failures

**Parameter description:** Specifies the maximum number of consecutive memory allocation failures tolerated. If the number of consecutive memory allocation failures exceeds this value, the OOM detection function may be triggered.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 1 to 32000.

**Default value:** 50

## ai\_watchdog\_oom\_other\_used\_memory\_threshold

**Parameter description:** Specifies the expected upper limit of memory usage of other parts of the database, in MB.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** 1 to 1048576 (integer).

**Default value:** 20480

## ai\_watchdog\_oom\_process\_threshold

**Parameter description:** Specifies the expected percentage of the database process usage to the value of `max_process_memory`. When the threshold is reached, memory leakage determination is triggered. The value can be greater than 1.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0 to 10.

**Default value:** 1.1

## ai\_watchdog\_oom\_shared\_threshold

**Parameter description:** Specifies the expected upper limit of the shared memory usage of the database.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** a floating-point number ranging from 0 to 1.

**Default value:** 0.4

## ai\_watchdog\_rto\_restriction\_time

**Parameter description:** Specifies the RTO threshold of the AI watchdog self-healing function. If the RTO threshold is exceeded, self-healing is not performed. The unit is second.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 36000.

**Default value:** 600

## ai\_watchdog\_tolerance\_times

**Parameter description:** Specifies the maximum number of consecutive abnormal events that can be tolerated by the AI watchdog before self-healing is started. This parameter can be used to avoid incorrect operations.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 100.

**Default value:** 4

## ai\_watchdog\_tps\_threshold

**Parameter description:** Specifies the lower limit of the expected TPS usage of the database instance. If the TPS usage is lower than the value of this parameter, the exception determination logic is triggered.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 32000.

**Default value:** 2

## ai\_watchdog\_wait\_time

**Parameter description:** Adjusts the waiting time, in seconds. To prevent the database from frequently performing self-healing operations, the database waits for a period of time after startup.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 36000.

**Default value:** 1800

## ai\_watchdog\_warning\_retention

**Parameter description:** Specifies the maximum number of alarm records that the AI watchdog can retain in the `dbe_perf.ai_watchdog_detection_warnings` view.

This is a SIGHUP parameter. Set it based on instructions in [Table 14-2](#).

**Value range:** an integer ranging from 0 to 32000.

**Default value:** 20

## 14.3.37 Global SysCache Parameters

### enable\_global\_syscache

**Parameter description:** Specifies whether to enable the global system cache function.

**Parameter type:** Boolean

**Unit:** none

**Value range:**

- **on** indicates that the global system cache function is enabled.
- **off** indicates that the global system cache function is disabled.

**Default value:** on

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Enable this function to reduce the memory usage of the system cache and improve the concurrent expansion capability. You are advised to use this parameter together with the thread pool parameter. After this parameter is enabled, you are advised to set **wal\_level** of the standby node to **hot\_standby** or higher if you need to access the standby node.

### global\_syscache\_threshold

**Parameter description:** Specifies the maximum memory usage of the global system cache. To use this parameter, you need to enable the **enable\_global\_syscache** parameter.

**Parameter type:** integer

**Unit:** KB

**Value range:** 16384 to 1073741824

**Default value:** 163840

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** The smaller value of the number of hot databases and the number of threads x Memory size allocated to each database, that is, **global\_syscache\_threshold = min(count(hot dbs),count(threads)) x memofdb**.

The number of hot databases refers to the number of frequently accessed databases. In thread pool mode, the number of threads is the sum of the number of threads in the thread pool and the number of background threads. In non-thread pool mode, the number of hot databases is used.

**memofdb** indicates the average memory allocated to each database. The background noise memory of each database is 2 MB. Each time a table or index is added, 11 KB memory is added.

If this parameter is set to a small value, memory is frequently evicted, and a large number of memory fragments cannot be recycled. As a result, memory control fails.

## 14.3.38 Read Parameters of the Standby Node in a Distributed System

### enable\_standby\_read

**Parameter description:** Specifies whether to enable the read function of the standby node for a session. This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the read function of the standby node in a distributed system is enabled for the session.
- **off** indicates that the read function of the standby node in a distributed system is disabled for the session.

**Default value:** off

#### NOTE

- This function can be enabled only in GTM-free mode, non-transaction block, and hot-standby mode.
- This parameter can be set only at the session level and cannot be set using `gs_guc`.
- If this parameter is set at a non-session level (for example, manually enabling this parameter in the configuration file), the cluster cannot be started when a parameter conflict occurs. If no parameter conflict occurs, the read function of the standby node in a distributed system is also enabled for background threads such as autovacuum and WorkloadMonitor. As a result, DDL and DML operations are affected and errors are reported.
- This parameter can be set only at the session level and cannot be set using `gs_guc set \reload`. If this parameter is enabled in the configuration file, the restart fails.

## enable\_direct\_standby\_datanodes

**Parameter description:** Specifies whether to enable the EXECUTE DIRECT ON extension capability for a session. After this parameter is set, the EXECUTE DIRECT ON statement can be used to connect to any standby DN or all standby DNs in a shard for query. For details, see the EXECUTE DIRECT ON syntax parameters. This parameter is used to control whether to enable EXECUTE DIRECT ON to perform the connection behavior in the distributed standby node read scenario. This function is mainly used for WDR, database test, and O&M. You are advised not to enable this function in other scenarios.

This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on/true** indicates that EXECUTE DIRECT ON is enabled for the session to support distributed standby node query.
- **off/false** indicates that EXECUTE DIRECT ON is disabled for the session to support distributed standby node query.

**Default value:** off

### NOTE

- This function can be enabled only in GTM-free mode, non-transaction block, and hot-standby mode.
- This parameter can be set only at the session level and cannot be set using `gs_guc set \reload`. If this parameter is enabled in the configuration file, the restart fails.
- In the same session, an error is reported if **set enable\_direct\_standby\_datanodes = on** is set after **set enable\_standby\_read = on** is set. An error is also reported if **set enable\_standby\_read = on** is set after **set enable\_direct\_standby\_datanodes = on** is set.
- After this parameter is enabled, the current session is read-only, and DDL and DML jobs are affected and errors are reported.
- After this parameter is enabled, you can use EXECUTE DIRECT ON to query only system DFX information such as system views, system functions, and system catalogs. Common user tables cannot be queried.
- After the **enable\_direct\_standby\_datanodes** parameter is enabled, EXECUTE DIRECT ON supports distributed standby node query. Before using this function during the upgrade, ensure that the CN and DN instance processes have been replaced with the latest binary files. Otherwise, packet verification fails and an error is reported.

## standby\_read\_delay

**Parameter description:** Specifies the maximum difference between the primary and standby nodes when data is read from the standby node. If the difference exceeds the value of this parameter, data cannot be read from the standby node. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from -1 to `INT_MAX`. The unit is ms. -1 indicates that the difference between the primary and standby nodes does not need to be verified when data is read from the standby node. 0 indicates that data is read from the standby node only when there is no difference between the primary and standby nodes.

**Default value:** 1000000

## standby\_read\_rto

**Parameter description:** Specifies the maximum RTO of the system when data is read from the standby node. If the RTO exceeds the value of this parameter, data cannot be read from the standby node. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from  $-1$  to  $INT\_MAX$ . The unit is ms. The value  $-1$  indicates that the system RTO verification is not required when data is read from the standby node. The value  $0$  indicates that data is read from the standby node only when the RTO of at least one standby node is 0.

**Default value:** 60000.

## 14.3.39 Restoring Data on the Standby Node

### standby\_page\_repair

**Parameter description:** Specifies whether to enable automatic page repair during replay on the standby node. In the current version, only the CRC check failure type can be repaired. Bad blocks in hash bucket tables, heap table FSM files, and VM files cannot be repaired. This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean

- **on** indicates that the standby node automatically detects and repairs pages during replay.
- **off** indicates that the standby node does not automatically detect and repair pages during replay.

**Default value:** on

---

 CAUTION

If a large number of physical bad blocks are continuously injected to the standby node, the replay performance of the standby node is affected, and Xlogs may be stacked on the standby node.

---

## 14.3.40 Undo

### undo\_space\_limit\_size

**Parameter description:** Specifies the threshold for forcibly recycling undo space. When the undo space usage reaches 80% of the threshold, forcible recycling starts. You are advised to set **undo\_space\_limit\_size** to a value greater than or equal to that of **undo\_limit\_size\_per\_transaction**.

**Parameter type:** integer.

**Unit:** page (8 KB)

**Value range:** 102400 to 2147483647. The default unit is page.

**Default value:** 256GB

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#). For example, the value **10000** indicates 10000 pages, and the value **10000KB** indicates 10000 KB. If the value contains a unit, the value can be KB, MB, or GB, but cannot be TB.

**Setting suggestion:** Retain the default value. If the disk space is too small to meet the default value requirements, set this parameter to a smaller value. If long transactions or large transactions exist in your service, set **undo\_space\_limit\_size** to a larger value based on the disk usage. For details about the value setting, see the **info** column of the `gs_stat_undo` system function in "SQL Reference > Functions and Operators > System Administration Functions > Undo System Functions > `gs_stat_undo` parameters" in *Developer Guide*.

## undo\_limit\_size\_per\_transaction

**Parameter description:** Specifies the undo space threshold of a single transaction. If the threshold is reached, the transaction is rolled back due to an error. You are advised to set **undo\_limit\_size\_per\_transaction** to a value less than or equal to that of **undo\_space\_limit\_size**. If the value of **undo\_limit\_size\_per\_transaction** is greater than that of **undo\_space\_limit\_size**, the displayed value is the same as the configured value when you run the **show undo\_limit\_size\_per\_transaction** command to query the parameter value. The only difference is that the smaller value between **undo\_space\_limit\_size** and **undo\_limit\_size\_per\_transaction** is used as the actual undo space threshold of a single transaction.

**Parameter type:** integer.

**Unit:** page (8 KB)

**Value range:** 256 to 2147483647. The default unit is page. If this parameter is set to a value greater than 134217728 (that is, 1 TB), the value **134217728** takes effect.

**Default value:** 32GB

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#). For example, the value **10000** indicates 10000 pages, and the value **10000KB** indicates 10000 KB. If the value contains a unit, the value can be KB, MB, or GB, but cannot be TB.

**Setting suggestion:** Retain the default value. If the disk or memory space is too small to meet the requirements of the default value, set this parameter to a smaller value. If long transactions or large transactions exist in your service, and the number of Undo records generated in a single transaction is greater than the value of this parameter, set **undo\_limit\_size\_per\_transaction** to a larger value based on the disk usage. For details about the value setting, see the **info** column of the `gs_stat_undo` system function in "SQL Reference > Functions and Operators > System Administration Functions > Undo System Functions > `gs_stat_undo` parameters" in *Developer Guide*. If **undo\_limit\_size\_per\_transaction** is set to a value greater than 1 TB, the system performance and stability may be affected. Therefore, if the parameter is set to a value greater than 134217728 (that is, 1 TB), the configured value is displayed when you run the **show undo\_limit\_size\_per\_transaction** command to query the parameter value, but the value **134217728** takes effect.

## 14.3.41 Rollback Parameters

### max\_undo\_workers

**Parameter description:** Specifies the number of undo worker threads invoked during asynchronous rollback. The parameter setting takes effect after the system is restarted.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 1 GUC parameter types](#).

**Value range:** an integer ranging from 1 to 100

**Default value:** 5

## 14.3.42 DCF Parameters Settings

### enable\_dcf

**Parameter description:** Specifies whether to enable the DCF mode.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value can be **on** or **off**. **on** indicates that the current log replication mode is DCF, and **off** indicates that the current log replication mode is not DCF.

**Default value:** off

### dcf\_ssl

**Parameter description:** This parameter is no longer used. The DCF reuses the GUC parameter **ssl**. For details, see section "Security and Authentication."

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** Boolean. The value can be **on** or **off**. The value **on** indicates that SSL is used, and the value **off** indicates that SSL is not used.

**Default value:** on

### dcf\_config

**Parameter description:** Specifies the DCF cluster configuration information, which is configured by the OM during installation and cannot be modified after installation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a character string, which is configured by the OM during installation.

### dcf\_data\_path

**Parameter description:** Specifies the DCF data path, which is configured by the OM during installation and cannot be modified after installation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a string, which is the **dcf\_data** directory under the data directory of the DN.

## dcf\_log\_path

**Parameter description:** Specifies the DCF log path, which is configured by the OM during installation and cannot be modified after installation.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** a string, which is the **dcf\_log** directory under the data directory of the DN.

## dcf\_node\_id

**Parameter description:** Specifies the ID of the DN where the DCF is located. This parameter is defined by the user during installation and mode switching.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Default value:** an integer, which is specified by users during installation.

## dcf\_max\_workers

**Parameter description:** Specifies the largest number of DCF callback function threads. The DCF needs to apply for the shared memory and semaphore before it invokes the function registered by the DN with the DCF through the callback function.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 262143.

**Default value:** 40

## dcf\_truncate\_threshold

**Parameter description:** Specifies the threshold for a DN to truncate DCF logs.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 2147483647.

**Default value:** 100000

## dcf\_election\_timeout

**Parameter description:** Specifies the timeout interval for selecting the DCF leader and follower. The election timeout interval depends on the status of the network between DNs. If the timeout interval is short and the network quality is poor, timeout occurs. After the network recovers, the election becomes normal. You are advised to set a proper timeout interval based on the current network status. Restriction on the DCF node clock: The maximum clock difference between DCF nodes is less than half of the election timeout interval. In DCF manual election

mode, to ensure timely CM arbitration, do not modify this parameter. Instead, use the default election timeout interval.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 600, in seconds.

**Default value:** 3

## dcf\_enable\_auto\_election\_priority

**Parameter description:** Specifies whether the DCF priority can be automatically adjusted. The value **0** indicates that automatic adjustment is not allowed, and the value **1** indicates that automatic adjustment is allowed.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer, **0** or **1**.

**Default value:** 1

## dcf\_election\_switch\_threshold

**Parameter description:** Specifies the DCF threshold for preventing frequent switchover to primary. It is recommended that this parameter be set based on the maximum fault duration acceptable for user services.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in seconds.

**Default value:** 0

## dcf\_run\_mode

**Parameter description:** Specifies the DCF election mode. The value **0** indicates the automatic election mode, the value **1** indicates the manual election mode, and the value **2** indicates that the election mode is disabled. Currently, the election mode can be disabled only in minority restoration scenarios. If the election mode is disabled, the database instance will become unavailable.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

Note: The working mode of a cluster can be switched only when the cluster is running properly. Otherwise, the cluster is still abnormal after the switching. The DCF working mode configured in GUC parameters must be the same as that configured by using `cm_ctl`. That is, both DCF working modes must be set to manual or automatic at the same time.

For example, to set the DCF manual mode, run the following command:

```
cm_ctl set --param --server -k dn_arbitrate_mode=quorum
cm_ctl reload --param --server
gs_guc reload -Z datanode -I all -N all -c "dcf_run_mode=1"
```

To set the DCF automatic mode, run the following command:

```
cm_ctl set --param --server -k dn_arbitrate_mode=paxos
cm_ctl reload --param --server
gs_guc reload -Z datanode -I all -N all -c "dcf_run_mode=0"
```

**Value range:** **0**, **1**, or **2**

**Default value:** 1

## dcf\_log\_level

**Parameter description:** Specifies the DCF log level.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- To disable the log function, set this parameter to "**NONE**", which cannot be used together with the following log levels:
- To enable the log function, set this parameter to one or a combination of the following log levels: "**RUN\_ERR|RUN\_WAR|RUN\_INF|DEBUG\_ERR|DEBUG\_WAR|DEBUG\_INF|TRACE|PROFILE|OPER**".

You can select a string from the preceding strings and use vertical bars (|) to combine the strings. The log level cannot be left blank.

**Default value:** "RUN\_ERR|RUN\_WAR|DEBUG\_ERR|OPER|RUN\_INF|PROFILE"

## dcf\_log\_backup\_file\_count

**Parameter description:** Specifies the number of DCF run log backups.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000.

**Default value:** 100

## dcf\_max\_log\_file\_size

**Parameter description:** Specifies the maximum size of a DCF run log file.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000, in MB.

**Default value:** 10

## dcf\_socket\_timeout

**Parameter description:** Specifies the timeout interval for the DCF communication module to connect to the socket. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, a connection may fail to be set up. In this case, you need to increase the value.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 600000, in ms.

**Default value:** 5000

## dcf\_connect\_timeout

**Parameter description:** Specifies the timeout interval for the DCF communication module to set up a connection. This parameter takes effect upon the system

restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, a connection may fail to be set up. In this case, you need to increase the value.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 10 to 600000, in ms.

**Default value:** 60000

### dcf\_mec\_fragment\_size

**Parameter description:** Specifies the fragment size of the DCF communication module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 10240, in KB.

**Default value:** 64

### dcf\_stg\_pool\_max\_size

**Parameter description:** Specifies the maximum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB.

**Default value:** 2048

### dcf\_stg\_pool\_init\_size

**Parameter description:** Specifies the minimum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB.

**Default value:** 32

### dcf\_mec\_pool\_max\_size

**Parameter description:** Specifies the maximum size of the memory pool of the DCF communication module. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB.

**Default value:** 200

## dcf\_flow\_control\_disk\_rawait\_threshold

**Parameter description:** Specifies the disk waiting threshold for DCF flow control.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in  $\mu$ s.

**Default value:** 100000

## dcf\_flow\_control\_net\_queue\_message\_num\_threshold

**Parameter description:** Specifies the threshold for the number of messages in a network queue for DCF flow control.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647.

**Default value:** 1024

## dcf\_flow\_control\_cpu\_threshold

**Parameter description:** Specifies the threshold for DCF CPU flow control.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 2147483647, in percentage (%).

**Default value:** 100

## dcf\_mec\_batch\_size

**Parameter description:** Specifies the number of batch messages for DCF communication. When the value is 0, the DCF automatically adjusts the value based on the network and the amount of data to be written. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 0 to 1024.

**Default value:** 0

## dcf\_mem\_pool\_max\_size

**Parameter description:** Specifies the maximum DCF memory. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB.

**Default value:** 2048

## dcf\_mem\_pool\_init\_size

**Parameter description:** Specifies the initial size of the DCF memory. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 32 to 2147483647, in MB.

**Default value:** 32

## dcf\_compress\_algorithm

**Parameter description:** Specifies the compression algorithm for DCF run log transmission.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer

- The value **0** indicates no compression.
- **1** indicates the LZ4 compression algorithm.

**Default value:** 0

## dcf\_compress\_level

**Parameter description:** Specifies the compression level for DCF log transmission. Before this parameter takes effect, a valid compression algorithm must be configured, that is, the **dcf\_compress\_algorithm** parameter is set.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 22.

If compression is disabled, the configured compression level does not take effect.

**Default value:** 1

## dcf\_mec\_channel\_num

**Parameter description:** Specifies the number of DCF communication channels. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 64.

**Default value:** 1

## dcf\_rep\_append\_thread\_num

**Parameter description:** Specifies the number of DCF log replication threads. This parameter takes effect upon the system restart.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000.

**Default value:** 2

### dcf\_mec\_agent\_thread\_num

**Parameter description:** Specifies the number of DCF communication working threads. This parameter takes effect upon the system restart. It is recommended that the value of **dcf\_mec\_agent\_thread\_num** be greater than or equal to 2 x Number of nodes x Value of **dcf\_mec\_channel\_num**.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 1000.

**Default value:** 10

### dcf\_mec\_reactor\_thread\_num

**Parameter description:** Specifies the number of reactor threads used by the DCF. This parameter takes effect upon the system restart. It is recommended that the ratio of the value of **dcf\_mec\_reactor\_thread\_num** to the value of **dcf\_mec\_agent\_thread\_num** be 1:40.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** an integer ranging from 1 to 100.

**Default value:** 1

### dcf\_log\_file\_permission

**Parameter description:** Specifies the attribute of the DCF run log file. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access logs, ensure that all parent directories can be accessed by other users in the same group. That is, if **dcf\_log\_path\_permission** is set to **750**, **dcf\_log\_file\_permission** can only be set to **600** or **640**. If **dcf\_log\_path\_permission** is set to **700**, **dcf\_log\_file\_permission** must be set to **600**.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated type. The value can be **600** or **640**.

**Default value:** 600

### dcf\_log\_path\_permission

**Parameter description:** Specifies the attribute of the DCF run log directory. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access the log path, set this parameter to **750**. Otherwise, set this parameter to **700**.

This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** enumerated type. The value can be **700** or **750**.

**Default value:** 700

## dcf\_majority\_groups

**Parameter description:** Sets the DCF policy-based majority function. For a group that requires this parameter, at least one standby node in the group receives logs. That is, there is a synchronous standby node in the group. If nodes are added to or deleted from the DCF instance or the group value of a node in the instance is changed, you need to modify the configuration accordingly. When modifying this parameter, ensure that the value of **group** exists and is valid.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string

- To disable the policy-based majority function, enter an empty string "".
- To enable the function, configure valid group values separated by commas (.). The group values must exist in **dcf\_config**. For example, if the group values 1 and 2 are added to the DCF policy-based majority configuration, you can set this parameter to "1,2". If the group value does not exist in **dcf\_config** or other characters are configured, the DCF considers the configured group invalid.

**Default value:** an empty string

---

### CAUTION

If all nodes in a group are faulty after the parameter is configured, you need to remove the group from the parameter list when performing node build operations (node recovery or node replacement without changing the IP address) on a node. After the node recovers, you can configure the group again.

---

## dcf\_node\_id\_map

**Parameter description:** Specifies the dictionary mapping between standby DN names and DCF node IDs. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. This parameter is used in DCF cluster installation, upgrade, and node replacement scenarios. The value of **standby\_name** configured in the GUC parameter **synchronous\_standby\_names** must be included in this dictionary.

This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Value range:** a string. The configuration format is 'standby\_name1:dcf\_node\_id1,standby\_name2:dcf\_node\_id2'. The values of standby DN names and the corresponding DCF node IDs are separated by commas (.).

**Default value:** an empty string

## dcf\_candidate\_names

**Parameter description:** Specifies the DCF candidate list. That is, names of DNs that may be selected as the primary node. In DCF automatic mode, the election policy is controlled by this parameter. DNs not in the list cannot be elected as a primary node.

**Parameter type:** string.

**Unit:** none

**Value range:** a string in the format of 'dn\_name1,dn\_name2,dn\_name3'. The parameter depends on **dcf\_node\_id\_map**. DN names must be in **dcf\_node\_id\_map** and separated by commas (,).

**Default value:** an empty string

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

## dcf\_thread\_effective\_time

**Parameter description:** Specifies the effective time of the DCF flushing thread. This parameter is used to determine whether the disk I/O hangs. If the DCF control log cannot update and I/O resources cannot be accessed within the period specified by this parameter, the DCF considers that the thread I/O hangs and the switchover is triggered. If this parameter is set to **0**, the I/O hang detection is disabled.

**Parameter type:** integer.

**Unit:** second

**Value range:** 0 to 1000

**Default value:** 160

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

## dcf\_pri\_leader\_timeout

**Parameter description:** Specifies the timeout interval for priority-based leader election. In DCF automatic mode, after priority-based leader election is enabled, the backup node triggers priority-based leader election. If the backup node is not elected as the leader within the timeout interval, the election is canceled. If this parameter is set to **0**, the priority-based selection of the primary node waits until the election is successful.

**Parameter type:** integer.

**Unit:** second

**Value range:** 0 to 3600

**Default value:** 60

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

### dcf\_static\_leader\_timeout

**Parameter description:** Specifies the timeout interval for preferentially electing the old leader. In DCF automatic mode, after the cluster is restarted, the old leader is preferentially elected. If the election fails within the timeout interval, the election is canceled.

**Parameter type:** integer.

**Unit:** second

**Value range:** 0 to 600

**Default value:** 60

**Setting method:** This is a POSTMASTER parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** none

## 14.3.43 Flashback

This section describes parameters related to the flashback function. In this version, only the Ustore engine supports flashback, while the Astore engine does not support flashback.

### enable\_recyclebin

**Parameter description:** Specifies whether the recycle bin is enabled or disabled in real time.

**Parameter type:** Boolean

**Value range:**

- **on** indicates that the recycle bin is enabled in real time.
- **off** indicates that the recycle bin is disabled in real time.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** To use the flashback table function, set **enable\_recyclebin** to **on**.

### recyclebin\_retention\_time

**Parameter description:** Specifies the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

**Parameter type:** integer

**Unit:** s

**Value range:** 1 to 2147483647.

**Default value:** 15 min (900s)

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#). For example, if the value is **900** without a unit, **recyclebin\_retention\_time** indicates 900s. If the value is **15min**, **recyclebin\_retention\_time** indicates 15 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

## undo\_retention\_time

**Parameter description:** Specifies the period for retaining undo logs of earlier versions.

**Parameter type:** integer

**Unit:** s

**Value range:** 0 to 259200.

**Default value:** 0

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

---

### CAUTION

1. If this parameter is set to **0** during the Ustore flashback query, the snapshot information at the flashback point will be cleared. In earlier versions, no flashback query can be performed. When a flashback query is performed, the error message "cannot find the restore point" is displayed.
  2. If the time within which the undo logs of earlier versions need to be retained is time1 and the SQL statement execution time for the flashback query is time2, you need to set **undo\_retention\_time** to a value greater than time1 + time2. That is, set **undo\_retention\_time** to a value greater than time1 + time2 + 3s. You are advised to set **undo\_retention\_time** to a value equal to time1 + 1.5 x time2. For example, if you want to retain the logs of earlier versions within the latest 3 hours, and the SQL statement execution time for the flashback query is 1 hour, set **undo\_retention\_time** to a value equal to 3 hours + 1.5 x 1 hour, that is, 4.5 hours.
- 

## 14.3.44 Ledger Database

### enable\_ledger

**Parameter description:** Specifies whether to enable the ledger database. If this parameter is set to **on**, the ledger database is enabled, and a new tamper-proof mode can be created and the common mode can be changed to the tamper-proof mode.

**Parameter type:** Boolean

**Unit:** none

**Value range:**

- **on** indicates that the ledger database is enabled.
- **off** indicates that the ledger database is disabled.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** The ledger database is disabled by default. To enable it, set `enable_ledger` to **on**.

## ledger\_hist\_level

**Parameter description:** Specifies whether to record SQL statements in the global blockchain table.

**Parameter type:** int

**Unit:** none

**Value range:**

- **0**: SQL statements are not recorded in the global blockchain table.
- **1**: SQL statements are recorded in the global blockchain table.

**Default value:** 1

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** Retain the default value **1**.

## 14.3.45 Creating an Index Online

### delete\_cctmp\_table

**Parameter description:** Specifies whether to delete temporary tables generated during Ustore online index creation or rebuilding.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on**: indicates that the temporary tables are deleted.
- **off**: indicates that the temporary tables are retained.

**Default value:** on

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** This parameter is enabled by default. Set this parameter to **off** if you want to retain temporary tables generated during online index creation or rebuilding.

## 14.3.46 Data Lifecycle Management: OLTP Table Compression

### enable\_ilm

**Parameter description:** Specifies whether to enable the OLTP table compression of data lifecycle management.

**Parameter type:** Boolean.

**Unit:** none

**Value range:**

- **on:** enabled.
- **off:** disabled.

**Default value:** off

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** The default value is **off**. To enable this feature, contact Huawei engineers to purchase a license and then set this parameter to **on**.

## 14.3.47 Session-level Transaction Pushdown and Related Parameters

### session\_type

**Parameter description:** Specifies the type of the current session. The value is case insensitive. An execution plan is generated based on the actual value.

**Value type:** enumerated type

**Unit:** none

**Value range:**

- **single\_node:** single-node session. Read and write operations can be pushed down. Nodes to be pushed down are determined and an execution plan is generated based on the GUC parameter **exec\_target\_node**.
- **global\_read\_only:** cross-node read-only session. A distributed plan is generated normally, but distributed write operations are forbidden. The GUC parameter **exec\_target\_node** does not take effect.
- **normal:** default session, which is the same as the original behavior. The plan is executed based on the original logic of the database.

---

#### NOTICE

When data is inserted in single-node session mode (**session\_type** is set to **single\_node**), correct data distribution is ensured by the application layer. If an incorrect node is specified, data may be inconsistent.

---

**Default value:** normal

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#). Note that this parameter cannot be set globally using `gs_guc`.

## exec\_target\_node

**Parameter description:** Specifies the name of the DN where DML statements and some DDL statements (TRUNCATE and ALTER TABLE...TRUNCATE PARTITION...) of the current session are executed. The name is case sensitive. If the DN name is invalid, an error is reported during the setting.

---

### NOTICE

This parameter is valid only when the GUC parameter `session_type` is set to `single_node`.

---

**Parameter type:** string

**Unit:** none

**Value range:** names of all DNs in the current cluster.

**Default value:** NULL

**Setting method:** This is a USERSET parameter. Set it based on instructions provided in [Table 14-2](#). Note that this parameter cannot be set globally using `gs_guc`.

### NOTE

The single-node session mode has the following restrictions:

- The router function does not take effect in this scenario.
- The DN specified by `node_name hint` does not take effect and is delivered by `exec_target_node`.
- Statements involving row-level security are not supported.
- Reading on the distributed standby node is not supported.
- Advanced package statements are not supported.
- GPC is not supported. When the `enable_global_plancache` parameter is enabled, if PBE is executed, an error is reported.
- In single-node session mode, when the PBE statement is used, the plan type is directly set to **GPlan**. If the single-node session mode is specified after a plan is generated, the original plan type remains unchanged.

## Examples

```
gaussdb=# set log_min_messages = debug2;
gaussdb=# set logging_module = 'on(opt_choice)';
gaussdb=# create table t1(a int ,b int);
gaussdb=# prepare x(int) as select * from t1;
gaussdb=# explain execute x(10);
NOTICE: [Choosing C/G/A Plan]: GPlan, reason: Using pbe optimization.
NOTICE: [Choosing C/G/A Plan]: CPlan, reason: First 5 times using CPlan.
      QUERY PLAN
-----
Data Node Scan (cost=0.00..0.00 rows=0 width=0)
Node/s: All datanodes
```

```
(2 rows)
gaussdb=# DEALLOCATE x;
gaussdb=# prepare x(int) as select * from t1;
gaussdb=# set session_type=single_node;
gaussdb=# set exec_target_node=datanode1;
gaussdb=# explain execute x(10);
NOTICE: [Choosing C/G/A Plan]: GPlan, reason: Using pbe optimization.
NOTICE: [Choosing C/G/A Plan]: GPlan, reason: Using pbe optimization.
      QUERY PLAN
-----
Data Node Scan (cost=0.00..0.00 rows=0 width=0)
  Node/s: datanode1
(2 rows)
gaussdb=# DEALLOCATE x;
gaussdb=# drop table t1;
```

## 14.3.48 Enhanced TOAST

### enable\_enhance\_toast\_table

**Parameter description:** Specifies whether the enhanced TOAST out-of-line storage table is used.

**Parameter type:** Boolean

**Unit:** none

**Value range:**

- **on:** enabled.
- **off:** disabled.

**Default value:** on

**Setting method:** This is a SIGHUP parameter. Set it based on instructions provided in [Table 14-1](#).

**Setting suggestion:** The default value of this parameter is **on**. To disable the enhanced TOAST out-of-line storage function, set this parameter to **off**.

## 14.3.49 Reserved Parameters

### NOTE

The parameters below are reserved and do not take effect in this version.

acce\_min\_datasize\_per\_thread

dfs\_partition\_directory\_length

enable\_fstream

enable\_hdfs\_predicate\_pushdown

enable\_orc\_cache

schedule\_splits\_threshold

enable\_constraint\_optimization

enable\_hadoop\_env

enable\_hypo\_index

undo\_zone\_count  
walwriter\_cpu\_bind

## Discarded Parameters

max\_query\_retry\_times  
enable\_slow\_query\_log  
tde\_cmk\_id  
transparent\_encrypted\_string  
transparent\_encrypt\_kms\_url  
transparent\_encrypt\_kms\_region  
time\_to\_target\_rpo  
prefetch\_quantity  
backwrite\_quantity  
cstore\_prefetch\_quantity  
cstore\_backwrite\_max\_threshold  
cstore\_backwrite\_quantity  
fast\_extend\_file\_size  
enable\_adio\_debug

# 15 Appendix

## 15.1 Exporting WDR and ASP Reports

Contact the administrator for details about how to export the report.

## 15.2 WDRs

The following table describes the main contents of WDRs.

**Table 15-1** Content of WDRs

Item	Description
Database Stat	<ul style="list-style-type: none"><li>Database performance statistics: transactions, read and write operations, row activities, write conflicts, and deadlocks.</li><li>Cluster-wide report, which can be viewed only in cluster mode.</li></ul>
Load Profile	<ul style="list-style-type: none"><li>Cluster performance statistics: CPU time, DB time, logical or physical read operation, I/O performance, login and logout, load strength, and load performance.</li><li>Cluster-wide report, which can be viewed only in cluster mode.</li></ul>
Instance Efficiency Percentages	<ul style="list-style-type: none"><li>Cluster-level or node-level cache hit ratio.</li><li>Cluster- or node-wide report, which can be viewed in cluster or node mode.</li></ul>
Top 10 Events by Total Wait Time	<ul style="list-style-type: none"><li>Most time-consuming event.</li><li>Node-wide report, which can be viewed in node mode.</li></ul>
Wait Classes by Total Wait Time	<ul style="list-style-type: none"><li>Category of the wait time that is most time-consuming.</li><li>Node-wide report, which can be viewed in node mode.</li></ul>

Item	Description
Host CPU	<ul style="list-style-type: none"> <li>• CPU usage of the host.</li> <li>• Node-wide report, which can be viewed in node mode.</li> </ul>
IO Profile	<ul style="list-style-type: none"> <li>• I/O usage in the cluster or node dimension.</li> <li>• Cluster- or node-wide report, which can be viewed in cluster or node mode.</li> </ul>
Memory Statistics	<ul style="list-style-type: none"> <li>• Kernel memory usage distribution.</li> <li>• Node-wide report, which can be viewed in node mode.</li> </ul>
Time Model	<ul style="list-style-type: none"> <li>• Time model data generated by running SQL statements on a node range.</li> <li>• Node-wide report, which can be viewed in node mode.</li> </ul>
SQL Statistics	<ul style="list-style-type: none"> <li>• SQL statement performance statistics are displayed in the following dimensions: total time, average time, CPU duration, lock wait time, number of returned rows, number of scanned rows, number of execution times, logical read, and physical read.</li> <li>• Cluster- or node-wide report, which can be viewed in cluster or node mode.</li> </ul>
Wait Events	<ul style="list-style-type: none"> <li>• Statistics on wait events at the node level.</li> <li>• Node-wide report, which can be viewed in node mode.</li> </ul> <p>For details, see "Waiting state list", "List of wait events corresponding to lightweight locks", "List of wait events corresponding to I/Os", and "List of wait events corresponding to transaction locks" in "System Catalogs and System Views &gt; System Views &gt; Other System Views &gt; PG_THREAD_WAIT_STATUS" in the <i>Developer Guide</i>.</p>
Cache IO Stats	<ul style="list-style-type: none"> <li>• I/O statistics on user tables and indexes.</li> <li>• Cluster- or node-wide report, which can be viewed in cluster or node mode.</li> </ul>
Utility status	<ul style="list-style-type: none"> <li>• Status information about the replication slot and background checkpoint.</li> <li>• Node-wide report, which can be viewed in node mode.</li> </ul>
Object stats	<ul style="list-style-type: none"> <li>• Performance statistics in the index and table dimensions.</li> <li>• Cluster- or node-wide report, which can be viewed in cluster or node mode.</li> </ul>
Configuration settings	<ul style="list-style-type: none"> <li>• Node configuration.</li> <li>• Node-wide report, which can be viewed in node mode.</li> </ul>
SQL Detail	<ul style="list-style-type: none"> <li>• SQL statement text details.</li> <li>• Cluster- or node-wide report, which can be viewed in cluster or node mode.</li> </ul>

## 15.2.1 Database Stat

**Table 15-2** describes columns in the Database Stat report.

**Table 15-2** Columns in the Database Stat report

Column	Description
DB Name	Database name.
Backends	Number of backends connected to this database.
Xact Commit	Number of transactions in this database that have been committed.
Xact Rollback	Number of transactions in this database that have been rolled back.
Blks Read	Number of disk blocks read in this database.
Blks Hit	Number of times that disk blocks have been found in the cache.
Tuple Returned	Number of rows sequentially scanned.
Tuple Fetched	Number of rows randomly scanned.
Tuple Inserted	Number of rows inserted by queries in this database.
Tuple Updated	Number of rows updated by queries in this database.
Tup Deleted	Number of rows deleted by queries in this database.
Conflicts	Number of queries canceled due to conflicts.
Temp Files	Number of temporary files created by queries in this database.
Temp Bytes	Total amount of data written to temporary files by queries in this database.
Deadlocks	Number of deadlocks detected in this database.
Blk Read Time	Time spent reading data file blocks by backends in this database (unit: ms).
Blk Write Time	Time spent in writing data file blocks by backends in this database (unit: ms).
Stats Reset	Time at which the current statistics were reset.

## 15.2.2 Load Profile

[Table 15-3](#) lists metrics in the Load Profile report.

**Table 15-3** Metrics in the Load Profile report

Statistical Item	Description
DB Time(us)	Total elapsed time of a job.
CPU Time(us)	Total CPU time used for job running.
Redo size(blocks)	Size of the generated WAL (blocks).
Logical read (blocks)	Number of logical reads for a table or an index (number of blocks).
Physical read (blocks)	Number of physical reads for a table or an index (number of blocks).
Physical write (blocks)	Number of physical writes (blocks) on a table or an index.
Read IO requests	Number of reads for a table or an index.
Write IO requests	Number of writes for a table or an index.
Read IO (MB)	Size of reads for a table or an index (in MB).
Write IO (MB)	Size of writes for a table or an index (in MB).
Logins	Number of logins.
Executes (SQL)	Number of times SQL statements are executed.
Rollbacks	Number of rolled-back transactions.
Transactions	Number of transactions.
SQL response time P95(us)	Response time of 95% SQL statements.
SQL response time P80(us)	Response time of 80% SQL statements.

## 15.2.3 Instance Efficiency Percentages

[Table 15-4](#) lists metrics in the Instance Efficiency Percentages report.

**Table 15-4** Metrics in the Instance Efficiency Percentages report

Statistical Item	Description
Buffer Hit %	Hit ratio of the buffer pool.
Effective CPU %	Ratio of the CPU time to the database time.
WalWrite NoWait %	Ratio of the number of events that access the WAL buffer to the total number of wait events.
Soft Parse %	Ratio of the number of soft parsing times to the total number of parsing times.
Non-Parse CPU %	Ratio of the non-parse time to the total execution time.

## 15.2.4 Top 10 Events by Total Wait Time

**Table 15-5** lists columns in the Top 10 Events by Total Wait Time report.

**Table 15-5** Contents of the Top 10 Events by Total Wait Time report

Column	Description
Event	Name of a wait event.
Waits	Number of wait times.
Total Wait Time(us)	Total wait time, in microseconds.
Avg Wait Time(us)	Average wait time, in microseconds.
Type	Wait event type.

## 15.2.5 Wait Classes by Total Wait Time

**Table 15-6** lists columns in the Wait Classes by Total Wait Time report.

**Table 15-6** Contents of the Wait Classes by Total Wait Time report

Column	Description
Type	Wait events are classified as follows: <ul style="list-style-type: none"> <li>• <b>STATUS.</b></li> <li>• <b>LWLOCK_EVENT.</b></li> <li>• <b>LOCK_EVENT.</b></li> <li>• <b>IO_EVENT.</b></li> </ul>
Waits	Number of wait times.
Total Wait Time(us)	Total wait time, in microseconds.
Avg Wait Time(us)	Average wait time, in microseconds.

## 15.2.6 Host CPU

**Table 15-7** describes columns in the Host CPU report.

**Table 15-7** Columns in the Host CPU report

Column	Description
Cpus	Number of CPUs.
Cores	Number of CPU cores.
Sockets	Number of CPU sockets.
Load Average Begin	Average load of the start snapshot.
Load Average End	Average load of the end snapshot.
%User	Percentage of CPU time occupied when the system is running in user mode.
%System	Percentage of CPU time occupied when the system is running in kernel mode.
%WIO	Percentage of CPU time occupied when the system is running in wait I/O mode.
%Idle	Percentage of CPU time occupied when the system is running in idle mode.

## 15.2.7 IO Profile

**Table 15-8** lists metrics in the IO Profile report.

**Table 15-8** Metrics in the IO Profile report

Statistical Item	Description
Database requests	Number of database I/O times.
Database (MB)	Database I/O data volume.
Database (blocks)	Number of database I/O data blocks.
Redo requests	Number of redo I/O times.
Redo (MB)	Redo I/O data volume.

## 15.2.8 Memory Statistics

**Table 15-9** lists metrics in the Memory Statistics report.

**Table 15-9** Metrics in the Memory Statistics report

Statistical Item	Description
shared_used_memory	Size of the used shared memory, in MB.
max_shared_memory	Size of the maximum shared memory, in MB.
process_used_memory	Size of the used process memory, in MB.
max_process_memory	Size of the maximum process memory, in MB.

## 15.2.9 Time Model

**Table 15-10** describes metrics in the Time Model report.

**Table 15-10** Contents of the Time Model report

Name	Description
DB_TIME	Total end-to-end wall time consumed by all threads (unit: $\mu$ s).
EXECUTION_TIME	Total time consumed on the executor (unit: $\mu$ s).
PL_EXECUTION_TIME	Total time consumed for executing PL/pgSQL statements (unit: $\mu$ s).
CPU_TIME	Total CPU time consumed by all threads (unit: $\mu$ s).
PLAN_TIME	Total time consumed for generating an execution plan (unit: $\mu$ s).
REWRITE_TIME	Total time consumed for rewriting queries (unit: $\mu$ s).
PL_COMPILATION_TIME	Total time consumed for compiling SQL statements (unit: $\mu$ s).
PARSE_TIME	Total time consumed for parsing SQL statements (unit: $\mu$ s).
NET_SEND_TIME	Total time consumed for sending data over the network (unit: $\mu$ s).
DATA_IO_TIME	Total time consumed for reading and writing data (unit: $\mu$ s).

## 15.2.10 SQL Statistics

**Table 15-11** describes columns in the SQL Statistics report.

**Table 15-11** Columns in the SQL Statistics report

Column	Description
Unique SQL Id	ID of the normalized SQL statement.
Parent Unique SQL Id	Normalized SQL ID of the parent statement. The value is <b>0</b> for non-stored procedure substatements.
Node Name	Node name.
User Name	Username.
Avg Tuples Fetched	Average number of rows randomly scanned.

Column	Description
Avg Tuples Returned	Average number of rows sequentially scanned.
Calls	Number of calls.
Total Elapse Time(us)	Total execution time (unit: us).
Avg Elapse Time(us)	Average execution time (unit: us).
Returned Rows	Number of rows returned by SELECT.
Avg Returned Rows	Average number of rows returned by SELECT.
Tuples Affected	Number of rows affected by INSERT, UPDATE, and DELETE.
Avg Tuples Affected	Average number of rows affected by INSERT, UPDATE, and DELETE.
Logical Read	Number of logical reads on the buffer.
Avg Logical Read	Average number of logical reads on the buffer.
Physical Read	Number of physical reads on the buffer.
Avg Physical Read	Average number of physical reads on the buffer.
CPU Time(us)	CPU time (unit: us).
Avg CPU Time(us)	Average CPU time (unit: us).
Data IO Time(us)	Time spent on I/O (unit: us).
Avg Data IO Time(us)	Average time spent on I/O (unit: us).
Lock Wait Time(us)	Lock waiting time of the SQL statement (unit: $\mu$ s).
Avg Lock Wait Time(us)	Average lock waiting time of each SQL statement (unit: $\mu$ s).
Sort Count	Number of sorting execution times.
Sort Time(us)	Sorting execution time (unit: us).
Sort Mem Used(KB)	Size of work memory used during sorting (unit: KB).

Column	Description
Sort Spill Count	Number of file writes when data is flushed to disks during sorting.
Sort Spill Size(KB)	File size used when data is flushed to disks during sorting (unit: KB).
Hash Count	Number of hashing execution times.
Hash Time(us)	Hashing execution time (unit: us).
Hash Mem Used(KB)	Size of work memory used during hashing (unit: KB).
Hash Spill Count	Number of file writes when data is flushed to disks during hashing.
Hash Spill Size(KB)	File size used when data is flushed to disks during hashing (unit: KB).
SQL Text	Normalized SQL character string.

## 15.2.11 Wait Events

[Table 15-12](#) describes columns in the Wait Events report.

**Table 15-12** Columns in the Wait Events report

Column	Description
Type	Wait events are classified as follows: <ul style="list-style-type: none"> <li>• STATUS.</li> <li>• LWLOCK_EVENT.</li> <li>• LOCK_EVENT.</li> <li>• IO_EVENT.</li> </ul>
Event	Name of a wait event.
Total Wait Time (us)	Total wait time (unit: us).
Waits	Total number of wait times.
Failed Waits	Number of wait failures.
Avg Wait Time (us)	Average wait time (unit: us).
Max Wait Time (us)	Maximum wait time (unit: us).

## 15.2.12 Cache IO Stats

The Cache IO Stats report consists of two tables, namely, **User table IO activity** and **User index IO activity**. Columns in the tables are described in [Table 15-13](#) and [Table 15-14](#).

### User table IO activity

**Table 15-13** Columns in the User table IO activity table

Column	Description
DB Name	Database name.
Schema Name	Schema name.
Table Name	Table name.
%Heap Blks Hit Ratio	Buffer pool hit ratio of the table.
Heap Blks Read	Number of disk blocks read from the table.
Heap Blks Hit	Number of cache hits in the table.
Idx Blks Read	Number of disk blocks read from all indexes in the table.
Idx Blks Hit	Number of cache hits in indexes in the table.
Toast Blks Read	Number of disk blocks read from the TOAST table (if any) in the table.
Toast Blks Hit	Number of buffer hits in the TOAST table (if any) in the table.
Tidx Blks Read	Number of disk blocks read from the TOAST table index (if any) in the table.
Tidx Blks Hit	Number of buffer hits in the TOAST table index (if any) in the table.

### User index IO activity

**Table 15-14** Columns in the User index IO activity table.

Column	Description
DB Name	Database name.

Column	Description
Schema Name	Schema name.
Table Name	Table name.
Index Name	Index name.
%Idx Blks Hit Ratio	Index hit ratio.
Idx Blks Read	Number of disk blocks read from all indexes.
Idx Blks Hit	Number of cache hits of all indexes.

### 15.2.13 Utility status

The Utility status report consists of two tables, namely, **Replication slot** and **Replication stat**. Columns in the tables are described in [Table 15-15](#) and [Table 15-16](#).

#### Replication slot

**Table 15-15** Columns in the Replication slot table

Column	Description
Slot Name	Replication node name.
Slot Type	Type of the replication node.
DB Name	Name of the database on the replication node.
Active	Replication node status.
Xmin	Transaction ID of the replication node.
Restart Lsn	Xlog file information on the replication node.
Dummy Standby	Replication node as a dummy standby.

## Replication stat

**Table 15-16** Columns in the Replication stat table.

Column	Description
Thread Id	PID of the thread.
Usesys Id	User system ID.
Username	Username.
Application Name	Application name.
Client Addr	Client address.
Client Hostname	Client host name.
Client Port	Port of the client.
Backend Start	Start time of an application.
State	Log replication status.
Sender Sent Location	Location where the sender sends logs.
Receiver Write Location	Location where the receiver writes logs.
Receiver Flush Location	Location where the receiver flushes logs.
Receiver Replay Location	Location where the receiver replays logs.
Sync Priority	Synchronization priority.
Sync State	Synchronization status.

### 15.2.14 Object stats

The Object stats report consists of three tables, namely, **User Tables stats**, **User index stats**, and **Bad lock stats**. Columns in the tables are described in [Table 15-17](#), [Table 15-18](#), and [Table 15-19](#).

#### User Tables stats

**Table 15-17** Contents in the User Tables stats table

Column	Description
DB Name	Database name.
Schema	Schema name.

Column	Description
Relname	Relation name.
Seq Scan	Number of sequential scans initiated in the table.
Seq Tup Read	Number of live rows fetched by sequential scans.
Index Scan	Number of index scans initiated in the table.
Index Tup Fetch	Number of live rows fetched by index scans.
Tuple Insert	Number of rows inserted.
Tuple Update	Number of rows updated.
Tuple Delete	Number of rows deleted.
Tuple Hot Update	Number of rows HOT updated (with no separate index update required).
Live Tuple	Estimated number of live rows.
Dead Tuple	Estimated number of rows without responses.
Last Vacuum	Last time at which the table was manually vacuumed (not counting <b>VACUUM FULL</b> ).
Last Autovacuum	Last time when the table was vacuumed by the autovacuum daemon thread.
Last Analyze	Last time at which this table was manually analyzed.
Last Autoanalyze	Last time when the table was analyzed by the autovacuum daemon thread.
Vacuum Count	Number of times that the table has been manually vacuumed (not counting <b>VACUUM FULL</b> ).
Autovacuum Count	Number of times that the table has been vacuumed by the autovacuum daemon.
Analyze Count	Number of times that the table has been manually analyzed.
Autoanalyze Count	Number of times that the table has been analyzed by the autovacuum daemon thread.

## User index stats

**Table 15-18** Contents in the User index stats table

Column	Description
DB Name	Database name.

Column	Description
Schema	Schema name.
Relname	Relation name.
Index Relname	Index name.
Index Scan	Number of index scans initiated on the index.
Index Tuple Read	Number of index entries returned by scans on the index.
Index Tuple Fetch	Number of active rows fetched in the original table by a simple index scan that uses the index.

## Bad lock stats

**Table 15-19** Contents in the Bad lock stats table

Column	Description
DB Id	OID of the database.
Tablespace Id	Tablespace OID.
Relfilenode	File object ID.
Fork Number	File type.
Error Count	Number of failures.
First Time	First occurrence time.
Last Time	Last occurrence time.

## 15.2.15 Configuration settings

**Table 15-20** describes columns in the Configuration settings report.

**Table 15-20** Columns in the Configuration settings report

Column	Description
Name	GUC parameter name.
Abstract	GUC parameter description.
Type	Data type.
Current Value	Current value.

Column	Description
Min Value	Valid minimum value.
Max Value	Valid maximum value.
Category	GUC parameter type.
Enum Values	All enumerated values.
Default Value	Default parameter value used upon the database startup.
Reset Value	Default parameter value used upon the database reset.

## 15.2.16 SQL Detail

[Table 15-21](#) describes columns in the SQL Detail report.

**Table 15-21** Columns in the SQL Detail report

Column	Description
Unique SQL Id	ID of a normalized SQL statement.
Parent Unique SQL Id	Normalized SQL ID of the parent statement. The value is 0 for a statement that is executed independently.
User Name	Username.
Node Name	Node name. This column is not displayed in node mode.
SQL Text	Normalized SQL text.

## 15.3 ASP Report Information

**Table 15-22** Report header

Column	Description
Start Time	Start time.
End Time	End time.
Slot Count	Number of time segments for displaying indicators.

Column	Description
Elapsed Time	Time segment for generating a report.
Sample Count	Total number of samples for generating ASP report.
Slice Count	Total number of samplings.
Average Active Sessions	Average number of active sessions.
Boundary Time	Time point when samples in the memory and disk samples are split.
Data Source	Number of samples from memory and number of samples from disk in the samples for which the ASP report is generated.

**Table 15-23** System load

Column	Description
Host Node Name	Node name.
CPUs	Total number of CPU cores.
Cores	Number of cores per CPU.
Sockets	Number of CPU slots.
Physical Memory	Memory size.
GaussDB Version	GaussDB Kernel version.

**Table 15-24** Top client

Column	Description
Client Addr	Client address.
User Id	User ID.
Application Name	Name of the client connection program.
%Activity	Percentage of activity (Total number of active sessions/Number of samples).
Avg Active Sessions	Average number of active sessions (Total number of active sessions/ Number of aspects).

**Table 15-25** Active sessions

Column	Description
sample_time (x_axis)	Sampling time.
count (y_axis)	Number of sampled events.

**Table 15-26** Top events summary

Column	Description
Wait Status	Wait status name.
Wait Status Count	Number of wait statuses.
%Wait Status	Percentage of wait status (Number of wait status/Number of samples).
Avg Active Session	Average number of active wait status sessions (Number of wait status sessions/Number of aspects).
Event	Name of a wait event.
Event Count	Number of wait events.

**Table 15-27** Top events graph

Column	Description
smample_time (x_axis)	Sampling time.
count (y_axis)	Number of sampled events.

**Table 15-28** Top sessions with top event

Column	Description
Session Id	Session ID.
Session Start	Session start event.
Session Count	Number of active sessions.
%Activity	Percentage of activity (Total number of active sessions/Number of samples).
User Id	User ID.
Application Name	Name of the connection program.

Column	Description
Client Addr	Client address.
Client Port	Client port information.
Event	Active session event.
Event Count	Number of wait events of the session.
%Event	Percentage of session events (Number of events/Number of samples).

**Table 15-29** Top sessions with top event split by slots

Column	Description
Slot time	Slot time.
Session Id	Session ID.
Session Start	Session start event.
Session Count	Number of session events.
%Activity	Percentage of activity (Total number of active sessions/Number of samples).
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
Event	Active session event.
Event Count	Number of wait events of the session.
%Event	Percentage of session events (Number of events/Number of samples).

**Table 15-30** Top sessions with top SQL

Column	Description
Session Id	Session ID.
Session Start	Session start event.
Session Count	Number of session events.
%Activity	Percentage of activity.

Column	Description
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
SQL Id	SQL ID.
Node Id	Node ID.
SQL Text	SQL statement.

**Table 15-31** Top sessions with top SQL split by slots

Column	Description
Slot Time	Slot time.
Session Id	Session ID.
Session Start	Session start event.
Session Count	Number of session events.
%Activity	Percentage of activity (Total number of active sessions/Number of samples).
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
SQL Id	SQL ID.
Node Id	Node ID.
SQLText	SQL statement.

**Table 15-32** Top final blocking sessions with top event split by slots

Column	Description
Slot Time	Slot time.
Final Blocking Session Id	ID of a blocked session.
Session Start	Start time of a session that holds a lock.

Column	Description
Blocked count	Number of sessions blocked by the session.
Blocked%Activity	Percentage of blocked sessions to active sessions (Total number of blocked sessions/Number of samples).
Event Caused	A wait event of final blocking session.
Event Caused Count	Number of wait events of final blocking session.
%Event	Percentage of wait events (Number of wait events/Number of samples).
PID	Thread ID.
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
Xact Start Time	Start time of a transaction that holds a lock.
Global Session Id	Global session ID.

**Table 15-33** Top blocked sessions with top SQL split by slots

Column	Description
Slot Time	Slot time.
Lock Tag	Lock tag.
Lock Mode	Lock mode.
Waiting Session Count	Number of waiting sessions.
Waiting Session Id	ID of a session waiting for a lock.
Session Start	Start time of a session that waits for a lock.
Session Count	Number of sessions that waits for a lock.
Block Session Id	ID of a blocked session.
Final Block Session Id	Session ID in the header of the blocked queue.

Column	Description
PID	Thread ID.
User Id	User ID.
Application Name	Name of the connection program.
Client Addr	Client address.
Client Port	Client port information.
Xact Start Time	Start time of a transaction that holds a lock.
Global Session Id	Global session ID.
SQL Id	SQL ID.
Query Start	Start time of the SQL statement.
SQL Count	Number of SQL statements.
Node Id	Node ID.
SQL Text	SQL statement.

**Table 15-34** Top SQL with top event

Column	Description
SQL Id	SQL ID.
Node Id	Node ID.
User Id	User ID.
Count	Number of session events.
%Activity	Percentage of activity (Total number of SQL sessions/Number of samples).
Event	Active session event.
Event Count	Number of wait events.
%Event	Percentage of session events (Number of SQL events/Number of samples).
SQL Text	SQL statement.

**Table 15-35** Top SQL with top event split by slots

Column	Description
Slot Time	Slot time.
SQL Id	SQL ID.
Node Id	Node ID.
User Id	User ID.
Count	Number of session events.
%Activity	Percentage of activity (Total number of SQL sessions/Number of samples).
Event	Active session event.
Event Count	Number of wait events.
%Event	Percentage of session events (Number of SQL events/Number of samples).
SQL Text	SQL statement.

**Table 15-36** Top SQL text

Column	Description
SQL Id	SQL ID.
Node Id	Node ID.
User Id	User ID.
SQL Text	SQL statement.

# 16 FAQs

---

## 16.1 What is the maximum number of columns in a single GaussDB table?

Answer: 1600. The value varies according to the column type. The column type is not verified during table creation but is verified during data storage. For example, for a column of the bigint type, each column stores 8-byte data. If there are 1600 columns, 12800 bytes need to be stored, which exceeds 8 KB on a page, and an error is reported during insertion.

## 16.2 How do I query the partition and index information of a partitioned table?

Answer: You can use either of the following methods:

- You can use the `pg_get_tabledef()` function to view the definition of a table. The returned information includes table creation SQL statements, comments, indexes, and constraints.

Example:

```
gaussdb=# SELECT pg_get_tabledef('table_name');
```

- You can query the `pg_partition` view for partition information and the `pg_indexes` view for index information.

## 16.3 What is OID?

Answer: Object identifier (OID) is the unique identifier of a database object, which can be a database, table, index, or view.

## 16.4 What is UDF?

Answer: You can define a function and embed the user-defined function (UDF) in GaussDB to implement specific functions to meet different service scenarios.

## 16.5 What wildcards are supported in GaussDB? How do I use them?

Answer: GaussDB supports the following three types of wildcards:

- %: indicates any number of characters, including 0. It is used in the LIKE and NOT LIKE statements.
- \_: indicates a character, which is used in LIKE and NOT LIKE statements.
- \*: indicates any number of characters, including 0. It is used in some meta-commands.

Examples:

```
-- Use wildcards to indicate any number of characters and query the tbl_test table for the data that starts with col1 and ends with ab.
gaussdb=# SELECT * FROM tbl_test WHERE col1 LIKE 'ab%';

-- Use a wildcard to query the data of any single character string starting with a and ending with b in the col1 column of the tbl_test table.
gaussdb=# SELECT * FROM tbl_test WHERE col1 LIKE 'a_b';

-- Query all tables whose names start with tbl.
gaussdb=# \dt tbl*
```

## 16.6 Is there a limit on the length of a database object name?

Answer: When a database object is created, the name cannot exceed 63 bytes. If the name exceeds 63 bytes, the database truncates the last byte (not the character). As a result, half a character may appear.

## 16.7 How do I view the creation time of a table?

Answer: See the value of the **created** column in the PG\_TABLES system view.

```
-- Create a table.
gaussdb=# CREATE TABLE test(id int, name varchar(10));

-- Query the time when the test table is created.
gaussdb=# SELECT tablename,created FROM pg_tables WHERE tablename = 'test';
tablename |          created
-----+-----
test      | 2024-01-12 14:50:59.611988+08
(1 row)
```

## 16.8 How do I create indexes in parallel?

Answer: Refer to the following method:

```
-- Set maintenance_work_mem based on the actual situation.
gaussdb=# SET maintenance_work_mem = '8GB';

-- Create a table.
gaussdb=# CREATE TABLE table_name (col1 int, col2 int);
```

```
-- Change the number of threads for creating indexes for a table based on the actual situation.
gaussdb=# ALTER TABLE table_name SET (parallel_workers=4);

-- Create an index.
gaussdb=# CREATE INDEX index_name ON table_name(col1);

-- Reset the parallel_workers parameter for the table.
gaussdb=# ALTER TABLE table_name RESET (parallel_workers);

-- Delete the index.
DROP INDEX index_name;

-- Drop the table.
gaussdb=# DROP TABLE table_name;
```

## 16.9 How do I create an auto-increment column?

Answer: GaussDB supports the creation of auto-increment columns. You can specify the SERIAL data type when creating a table.

Example:

```
gaussdb=# CREATE TABLE table_name(id serial, name varchar(20));
```

You can also use the following method:

```
--Create a sequence.
gaussdb=# CREATE SEQUENCE tbl_person_id_seq;
-- Create the tbl_person table. The value of the id column is automatically increased based on the
sequence specified by tbl_person_id_seq.
gaussdb=# CREATE TABLE tbl_person(
    id int NOT NULL DEFAULT nextval('tbl_person_id_seq'::regclass),
    name varchar(20));
```

## 16.10 Can I query the GaussDB memory usage through SQL statements?

Answer: You can query the context name, level, total size, and available size of the shared memory in the pg\_shared\_memory\_detail view.

```
gaussdb=# SELECT * FROM pg_shared_memory_detail;
```

## 16.11 What are the differences between LIMIT 2, LIMIT 2,3 and LIMIT 2 OFFSET 3?

Answer: LIMIT and OFFSET are keywords used to limit the number of query results returned in the SELECT statement.

- **LIMIT 2:** Only the first two rows of data are returned.
- **LIMIT 2,3:** A total of three rows of data from the third row are returned.
- **LIMIT 2 OFFSET 3:** A total of two rows of data from the fourth row are returned.

## 16.12 How do I create a column whose default value is the current time?

Answer: When creating a table, set the default value of the column to **CURRENT\_TIMESTAMP**.

```
gaussdb=# CREATE TABLE tbl (id int, modtime date DEFAULT CURRENT_TIMESTAMP);
```

## 16.13 How do I determine whether a column is null?

Answer: Use **IS NULL** and **IS NOT NULL** to determine whether a column is null. For example:

```
gaussdb=# SELECT * FROM tab WHERE col1 IS NULL;
```

## 16.14 How do I obtain the username for connecting to a database?

Answer: Run the following command to query the current username:

```
gaussdb=# SELECT current_user;
```

## 16.15 How do I query the time difference between two time points?

Answer: You can use the following method to calculate the time difference:

- Use the **age()** function to calculate the time difference between two time points.

```
gaussdb=# SELECT age(timestamp '2001-04-10 14:00:00', timestamp '2001-04-06 13:00:00');
 age
-----
4 days 01:00:00
(1 row)
```

- Convert strings to the date type and then subtract them.

```
gaussdb=# SELECT ('2001-04-10 14:00:00'::date - '2001-04-06 13:00:00'::date);
?column?
-----
4
(1 row)
```

- Use the **date\_part()** function to obtain the value of the subdomain in a date or time value.

```
gaussdb=# SELECT date_part('day', '2001-04-10 14:00:00'::timestamp - '2001-04-06 13:00:00'::timestamp);
 date_part
-----
4
(1 row)
```

## 16.16 What are the types of SQL languages?

Answer: SQL languages are classified into the following types:

- Data definition language (DDL) is used to define or modify an object in a database, such as a table, an index, or a view.
- Data manipulation language (DML) is used to perform operations on data in database tables, such as inserting, updating, querying, or deleting data.
- Data control language (DCL) is used to set or change the permissions of database users or roles.

## 16.17 What is the function of a trigger?

Answer: A trigger is a special stored procedure that is triggered and executed by events.

- Constraints can be strengthened to maintain data integrity and consistency.
- Operations in the database can be traced. Unauthorized updates and changes are not allowed.
- Concatenated operations can be performed.

## 16.18 What are the four characteristics of correctly executing database transactions?

Answer: During data write or update, the database management system (DBMS) must meet the following requirements: Atomicity, Consistency, Isolation, and Durability (ACID) to ensure that transactions are correctly executed.

- Atomicity: also called indivisibility. All operations in a transaction are either completed or not completed, and do not end in an intermediate phase. If an error occurs during transaction execution, the transaction is rolled back to the state before the transaction starts, just as if the transaction has never been executed.
- Consistency: The database integrity is not damaged before and after a transaction starts. This means that the written data must fully comply with all preset rules, including the accuracy of the data, the serialization of the data, and the spontaneous completion of the scheduled work by the subsequent database.
- Isolation: also called independence. Transactions are often executed concurrently. Isolation ensures that concurrent execution of transactions leaves the database in the same state that would have been obtained if the transactions were executed sequentially. Transaction isolation is divided into different levels, including read uncommitted, read committed, repeatable read, and serializable.
- Durability: Once a transaction has been committed, it will remain committed even in the case of a system failure.

## 16.19 What are the differences between the DROP, TRUNCATE, and DELETE methods in GaussDB?

Answer: The differences between the DROP, TRUNCATE, and DELETE methods lie in the deletion speed and scope. The details are as follows:

- The DROP statement can be used to delete an entire table, including the table structure, data, indexes, and permissions.
- The deletion speed of the TRUNCATE statement is medium. The TRUNCATE statement can delete all data in a table but does not delete the table structure.
- The deletion speed of the DELETE statement is the slowest. You can delete data from a table based on conditions, excluding the table structure.

## 16.20 How many bytes does a Chinese character occupy in GaussDB?

Answer: It depends on the character set encoding of the database. For the GBK character set, a Chinese character occupies two bytes. For the UTF8 character set, a Chinese character occupies three bytes.
