# 1 Before You Start

---

## 1.1 Overview

Welcome to *Image Management Service API Reference*. An image is a template used to create a server or disk. Image Management Service (IMS) provides image lifecycle management. You can use a server or an external image file to create a system or data disk image, or use an Elastic Cloud Server (ECS) or Cloud Server Backup Service (CSBS) backup to create a full-ECS image.

This document describes how to use application programming interfaces (APIs) to perform operations on images, such as creating, querying, deleting and updating images. For details about all supported operations, see [API Overview](#).

If you plan to access IMS through an API, ensure that you are familiar with IMS concepts. For details, see section "Overview" in *Image Management Service User Guide*.

## 1.2 API Calling

IMS supports Representational State Transfer (REST) APIs, allowing you to call APIs using HTTPS. For details about API calling, see [Calling APIs](#).

## 1.3 Endpoints

An endpoint is the **request address** for calling an API. Endpoints vary depending on services and regions. For the endpoints of all services, see [Regions and Endpoints](#).

## 1.4 Constraints

- The number of images that you can create is determined by your quota. To view or increase the quota, see section "How Do I Increase the Image Quota?" in *Image Management Service User Guide*.
- For more constraints, see API description.

## 1.5 Concepts

- **Account**  
An account is created upon successful registration. The account has full access permissions for all of its cloud services and resources. It can be used to reset user passwords and grant user permissions. The account is a payment entity, which should not be used directly to perform routine management. For security purposes, create Identity and Access Management (IAM) users and grant them permissions for routine management.
- **User**  
An IAM user is created by an account in IAM to use cloud services. Each IAM user has its own identity credentials (password and access keys).  
API authentication requires information such as the account name, username, and password.
- **Region**  
A region is a geographic area in which cloud resources are deployed. Availability zones (AZs) in the same region can communicate with each other over an intranet, while AZs in different regions are isolated from each other. Deploying cloud resources in different regions can better suit certain user requirements or comply with local laws or regulations.
- **AZ**  
An AZ comprises of one or more physical data centers equipped with independent ventilation, fire, water, and electricity facilities. Computing, network, storage, and other resources in an AZ are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to allow you to build cross-AZ high-availability systems.
- **Project**  
A project corresponds to a region. Default projects are defined to group and physically isolate resources (including computing, storage, and network resources) across regions. Users can be granted permissions in a default project to access all resources under their accounts in the region associated with the project. If you need more refined access control, create subprojects under a default project and create resources in subprojects. Then you can assign users the permissions required to access only the resources in the specific subprojects.

**Figure 1-1** Project isolation model

## 1.6 Selecting an API Type

The following APIs have been abandoned and are not recommended:

- [Deleting an Image \(Native OpenStack API v1.1 - Abandoned and Not Recommended\)](#)
- [Querying Image Metadata \(Native OpenStack API v1 - Abandoned and Not Recommended\)](#)
- [Querying Image Details \(Native OpenStack API v1.1 - Abandoned and Not Recommended\)](#)

# 2 API Overview

IMS APIs include native OpenStack APIs and extension APIs.

A combination of the two types of APIs allows you to use all functions provided by IMS. For example, you can use either native OpenStack APIs or extension APIs to create private images.

**Table 2-1** API description

Type	Subtype	Description
IMS APIs	Image	Create, query, and export images.
	Image tagging	Tag private images, making it easier to manage them.
	Image sharing	Share private images with other tenants.
	Image replication	Replicate an existing image as another one. When replicating an image, you can change the image attributes to meet the requirements of different scenarios.
	Image quota	Query the number of private images in the current region.
	Image jobs	Query the execution status of an asynchronous job.
Native OpenStack API	Image	Create, query, and export images.
	Image tagging	Tag private images, making it easier to manage them.
	Image schema	An image schema is used to display details of an images or image entity, such as the entity's attributes and their data types. With an image schema, you can understand basic information about an image.

Type	Subtype	Description
	Image sharing	Share private images with other tenants.

# 3 Calling APIs

## 3.1 Making an API Request

This section describes the structure of a REST API request, and uses the IAM API for obtaining a user token as an example to demonstrate how to call an API. The obtained token can then be used to authenticate the calling of other APIs.

### Request URI

A request URI is in the following format:

**{URI-scheme}://{Endpoint}/{resource-path}?{query-string}**

Although a request URI is included in the request header, most programming languages or frameworks require the request URI to be transmitted separately.

**Table 3-1** URI parameter description

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server bearing the REST service. The endpoint varies between services in different regions. It can be obtained from <a href="#">Regions and Endpoints</a> .
resource-path	Access path of an API for performing a specified operation. Obtain the path from the URI of an API. For example, the <b>resource-path</b> of the API used to obtain a user token is <b>/v3/auth/tokens</b> .
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of <i>Parameter name=Parameter value</i> . For example, <b>?limit=10</b> indicates that a maximum of 10 data records will be displayed.

 NOTE

To simplify the URI display in this document, each API is provided only with a **resource-path** and a request method. The **URI-scheme** of all APIs is **HTTPS**, and the endpoints of all APIs in the same region are identical.

## Request Methods

The HTTP protocol defines the following request methods that can be used to send a request to the server.

**Table 3-2** HTTP methods

Method	Description
GET	Requests the server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete specified resources, for example, an object.
HEAD	Same as GET except that the server must return only the response header.
PATCH	Requests the server to update partial content of a specified resource. If the resource does not exist, a new resource will be created.

For example, in the case of the API used to obtain a user token, the request method is **POST**. The request is as follows:

```
POST https://{{endpoint}}/v3/auth/tokens
```

## Request Header

You can also add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, to request for the authentication information, add **Content-Type**, which specifies the request body type.

Common request header fields are as follows.

**Table 3-3** Common request header fields

Parameter	Description	Mandatory	Example Value
Host	Specifies the server domain name and port number of the resources being requested. The value can be obtained from the URL of the service API. The value is in the format of <i>Hostname:Port number</i> . If the port number is not specified, the default port is used. The default port number for <b>https</b> is <b>443</b> .	No This field is mandatory for AK/SK authentication.	code.test.com or code.test.com:443
Content-Type	Specifies the type (or format) of the message body. The default value <b>application/json</b> is recommended. Other values of this field will be provided for specific APIs if any.	Yes	application/json
Content-Length	Specifies the length of the request body. The unit is byte.	No	3495
X-Project-Id	Specifies the project ID. Obtain the project ID by following the instructions in <a href="#">Obtaining a Project ID</a> .	No This field is mandatory for requests that use AK/SK authentication in the Dedicated Cloud (DeC) scenario or multi-project scenario.	e9993fc787d94b6c886cbaa340f9c0f4

Parameter	Description	Mandatory	Example Value
X-Auth-Token	<p>Specifies the user token. It is a response to the API for obtaining a user token (This is the only API that does not require authentication).</p> <p>After the request is processed, the value of <b>X-Subject-Token</b> in the response header is the token value.</p>	<p>No</p> <p>This field is mandatory for token authentication.</p>	<p>The following is part of an example token:</p> <p>MIIPAgYJKoZlhvcNAQcCo...ggg1BBIINPXsidG9rZ</p>

 **NOTE**

In addition to supporting authentication using tokens, APIs support authentication using AK/SK, which uses SDKs to sign a request. During the signature, the **Authorization** (signature authentication) and **X-Sdk-Date** (time when a request is sent) headers are automatically added in the request.

For more details, see "Authentication Using AK/SK" in [Authentication](#).

The API used to obtain a user token does not require authentication. Therefore, only the **Content-Type** field needs to be added to requests for calling the API. An example of such requests is as follows:

```
POST https://{{endpoint}}/v3/auth/tokens
Content-Type: application/json
```

## (Optional) Request Body

This part is optional. The body of a request is often sent in a structured format (for example, JSON or XML) as specified in the **Content-Type** header field. The request body transfers content except the request header.

The request body varies between APIs. Some APIs do not require the request body, such as the APIs requested using the GET and DELETE methods.

In the case of the API used to obtain a user token, the request parameters and parameter description can be obtained from the API request. The following provides an example request with a body included. Replace *username*, *domainname*, *\*\*\*\*\** (login password), and *xxxxxxxxxxxxxxxxxxxx* (project name) with the actual values. Obtain a project name from [Regions and Endpoints](#).

 **NOTE**

The **scope** parameter specifies where a token takes effect. You can set **scope** to an account or a project under an account. In the following example, the token takes effect only for the resources in a specified project. For more information about this API, see "Obtaining a User Token".

```
POST https://{{endpoint}}/v3/auth/tokens
Content-Type: application/json
```

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username",
          "password": "*****",
          "domain": {
            "name": "domainname"
          }
        }
      }
    },
    "scope": {
      "project": {
        "name": "xxxxxxxxxxxxxxxxxxxxx"
      }
    }
  }
}
```

If all data required for the API request is available, you can send the request to call the API through [curl](#), [Postman](#), or coding. In the response to the API used to obtain a user token, **X-Subject-Token** is the desired user token. This token can then be used to authenticate the calling of other APIs.

## 3.2 Authentication

Requests for calling an API can be authenticated using either of the following methods:

- Token authentication: Requests are authenticated using tokens.
- AK/SK authentication: Requests are encrypted using AK/SK pairs. AK/SK authentication is recommended because it is more secure than token authentication.

### Token Authentication

#### NOTE

The validity period of a token is 24 hours. When using a token for authentication, cache it to prevent frequently calling the IAM API used to obtain a user token.

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to requests to get permissions for calling the API. You can obtain a token by calling the Obtaining User Token API.

IMS is a project-level service. When you call the API, set **auth.scope** in the request body to **project**.

```
{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username", // IAM user name
        }
      }
    }
  }
}
```

```
"password": "*****", // IAM user password
"domain": {
  "name": "domainname" // Name of the account to which the IAM user belongs
}
},
"scope": {
  "project": {
    "name": "xxxxxxx" // Project name
  }
}
}
```

After a token is obtained, the **X-Auth-Token** header field must be added to requests to specify the token when calling other APIs. For example, if the token is **ABCDEFJ....**, **X-Auth-Token: ABCDEFJ....** can be added to a request as follows:

```
POST https://{{endpoint}}/v3/auth/projects
Content-Type: application/json
X-Auth-Token: ABCDEFJ....
```

## AK/SK Authentication

### NOTE

AK/SK authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, token authentication is recommended.

In AK/SK authentication, AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- AK: access key ID, which is a unique identifier used in conjunction with a secret access key to sign requests cryptographically.
- SK: secret access key, which is used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In AK/SK authentication, you can use an AK/SK to sign requests based on the signature algorithm or using the signing SDK. For details about how to sign requests and use the signing SDK, see [API Request Signing Guide](#).

### NOTE

The signing SDK is only used for signing requests and is different from the SDKs provided by services.

## 3.3 Response

### Status Code

After sending a request, you will receive a response, including a status code, response header, and response body.

A status code is a group of digits, ranging from 1xx to 5xx. It indicates the status of a request. For more information, see [Status Codes](#).

For example, if status code **201** is returned for calling the API used to obtain a user token, the request is successful.

## Response Header

Similar to a request, a response also has a header, for example, **Content-Type**.

**Figure 3-1** shows the response header fields for the API used to obtain a user token. The **X-Subject-Token** header field is the desired user token. This token can then be used to authenticate the calling of other APIs.

### NOTE

For security purposes, you are advised to set the token in ciphertext in configuration files or environment variables and decrypt it when using it.

**Figure 3-1** Header fields of the response to the request for obtaining a user token

```
connection → keep-alive
content-type → application/json
date → Tue, 12 Feb 2019 06:52:13 GMT
server → Web Server
strict-transport-security → max-age=31536000; includeSubdomains;
transfer-encoding → chunked
via → proxy A
x-content-type-options → nosniff
x-download-options → noopen
x-frame-options → SAMEORIGIN
x-iam-trace-id → 218d45ab-d674-4995-af3a-2d0255ba41b5
x-subject-token → [REDACTED]
x-xss-protection → 1; mode=block
```

## (Optional) Response Body

The body of a response is often returned in a structured format (for example, JSON or XML) as specified in the **Content-Type** header field. The response body transfers content except the response header.

The following is part of the response body for the API used to obtain a user token.

```
{
  "token": {
    "expires_at": "2019-02-13T06:52:13.855000Z",
    "methods": [
      "password"
    ],
    "catalog": [
      {
        "endpoints": [
          {
            "region_id": "az-01",
            .....

```

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{  
  "error_msg": "The request message format is invalid.",  
  "error_code": "IMG.0001"  
}
```

In the response body, **error\_code** is an error code, and **error\_msg** provides information about the error.

# 4 Getting Started

This section describes how to make API calls to create a private image from an ECS.

For details about how to call APIs, see [Calling APIs](#).

## NOTE

- Before using an ECS to create a private image, ensure that the ECS is stopped.
- The token obtained from IAM is valid for only 24 hours. If you want to use a token for authentication, you can cache it to avoid frequently calling the IAM API.

## Involved APIs

If you use a token for authentication, you must obtain the token and add **X-Auth-Token** to the request header of the IMS API when making an API call.

- IAM API used to obtain the token
- IMS API used to create a private image

## Procedure

1. Obtain the token by referring to [Authentication](#).
2. Send **POST https://IMS endpoint/v2/cloudimages/action**.
3. Add **X-Auth-Token** to the request header.
4. Specify the following parameters in the request body:

```
{
  "name": "ims_test", //Image name (a mandatory string)
  "description": "Image creation from an ECS", //Image description (an optional string)
  "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a", //ECS ID (a mandatory string)
  "tags": [
    "aaa.111",
    "bbb.333",
    "ccc.444"
  ] //Image tag list (optional, List<String>)
}
```

If the request is successful, a job ID is returned.

If the request fails, an error code and error information are returned. For details, see [Error Codes](#).

5. Query job details using the job ID by referring to [Querying the Status of an Asynchronous Job](#).  
If the job status is **SUCCESS**, the private image is successfully created.  
For details about status codes for request exceptions, see [Status Codes](#).
6. Obtain the image ID from the body of the job and query, delete, and export the private image using the image ID.

# 5 IMS APIs

---

## 5.1 Image

### 5.1.1 Querying Images

#### Function

This API is used to query images using search criteria and to display the images in a list.

#### URI

```
GET /v2/cloudimages{?  
__isregistered,__imagetype,__whole_image,__system__cmkid,protected,visibility,own  
er,id,status,name,container_format,disk_format,min_ram,min_disk,__os_bit,__platfo  
rm,marker,limit,sort_key,sort_dir,__os_type,tag,member_status,__support_kvm,__sup  
port_xen,__support_largememory,__support_diskintensive,__support_highperforman  
ce,__support_xen_gpu_type,__support_kvm_gpu_type,__support_xen_hana,__suppor  
t_kvm_infiniband,virtual_env_type,created_at,updated_at}
```

#### NOTE

You can type a question mark (?) and an ampersand (&) at the end of the URI to define multiple search criteria. For details, see the example request.

**Table 5-1** Parameter description

Parameter	Mandatory	Type	Description
__isregistered	No	String	Specifies whether the image is available. The value can be <b>true</b> . The value is <b>true</b> for all extension APIs by default. Common users can query only the images for which the value of this parameter is <b>true</b> .
__imagetype	No	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>Public image: The value is <b>gold</b>.</li> <li>Private image: The value is <b>private</b>.</li> <li>Shared image: The value is <b>shared</b>.</li> </ul> <b>NOTE</b> The <b>__imagetype</b> of images you share with other tenants or those other tenants share with you and you have accepted is <b>shared</b> . You can use field <b>owner</b> to distinguish the two types of shared images. You can use <b>member_status</b> to filter out shared images you have accepted.
__whole_image	No	Boolean	Specifies whether the image is a full-ECS image. The value can be <b>true</b> or <b>false</b> .
__system_cmkid	No	String	Specifies the ID of the key used to encrypt the image. You can obtain the ID from the IMS console or by calling the <a href="#">Querying Image Details (Native OpenStack API)</a> API.
protected	No	Boolean	Specifies whether the image is protected. The value can be <b>true</b> or <b>false</b> . Set it to <b>true</b> when you query public images. This parameter is optional when you query private images.
visibility	No	String	Specifies whether the image is available to other tenants. Available values include: <ul style="list-style-type: none"> <li><b>public</b>: public image</li> <li><b>private</b>: private image</li> <li><b>shared</b>: shared image</li> </ul>
owner	No	String	Specifies the tenant to which the image belongs.
id	No	String	Specifies the image ID.

Parameter	Mandatory	Type	Description
status	No	String	Specifies the image status. The value can be one of the following: <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
name	No	String	Specifies the image name. Exact matching is used. For detailed description, see <a href="#">Image Attributes</a> .
container_format	No	String	Specifies the container type. The value is <b>bare</b> .
disk_format	No	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
min_ram	No	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is <b>0</b> .
min_disk	No	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.
__os_bit	No	String	Specifies the OS architecture, 32 bit or 64 bit.
__platform	No	String	Specifies the image platform type. The value can be <b>Windows</b> , <b>Ubuntu</b> , <b>Red Hat</b> , <b>SUSE</b> , <b>CentOS</b> , <b>Debian</b> , <b>OpenSUSE</b> , <b>Oracle Linux</b> , <b>Fedora</b> , <b>CoreOS</b> , <b>EulerOS</b> , or <b>Other</b> .
marker	No	String	Specifies the start number from which images are queried. The value is the image ID.

Parameter	Mandatory	Type	Description
limit	No	Integer	Specifies the number of images that will be returned. The value is an integer and is <b>500</b> by default.
sort_key	No	String	Specifies the field for sorting the query results. The value can be an attribute of the image: <b>name</b> , <b>container_format</b> , <b>disk_format</b> , <b>status</b> , <b>id</b> , <b>size</b> , or <b>created_at</b> . The default value is <b>created_at</b> .
sort_dir	No	String	Specifies whether the query results are sorted in ascending or descending order. Its value can be <b>desc</b> (default) or <b>asc</b> . This parameter is used together with parameter <b>sort_key</b> . The default value is <b>desc</b> .
__os_type	No	String	Specifies the image OS type. Available values include: <ul style="list-style-type: none"> <li>• Linux</li> <li>• Windows</li> <li>• Other</li> </ul>
tag	No	String	Specifies a tag added to an image. Tags can be used as a filter to query images.
member_status	No	String	Specifies the member status. The value can be <b>accepted</b> , <b>rejected</b> , or <b>pending</b> . <b>accepted</b> : indicates that the shared image is accepted. <b>rejected</b> indicates that the image shared by others is rejected. <b>pending</b> indicates that the image shared by others needs to be confirmed. To use this parameter, set <b>visibility</b> to <b>shared</b> during the query.
__support_kvm	No	String	Specifies whether the image supports KVM. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen	No	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.

Parameter	Mandatory	Type	Description
__support_largememory	No	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For the supported OSs, see <a href="#">Table 9-4</a> .
__support_diskintensive	No	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_highperformance	No	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See <a href="#">Table 9-2</a> for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_xen_hana	No	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_infiniband	No	String	Specifies whether the image supports ECSs with InfiniBand NICs on the KVM platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> .

Parameter	Mandatory	Type	Description
virtual_environment_type	No	String	<p>Specifies the environment where the image is used. The value can be <b>FusionCompute</b>, <b>Ironic</b>, <b>DataImage</b>, or <b>IsolImage</b>.</p> <ul style="list-style-type: none"> <li>• For an ECS image (system disk image), the value is <b>FusionCompute</b>.</li> <li>• For a data disk image, the value is <b>DataImage</b>.</li> <li>• For a BMS image, the value is <b>Ironic</b>.</li> <li>• For an ISO image, the value is <b>IsolImage</b>.</li> </ul>
created_at	No	String	<p>Specifies the time when the image was created. Images can be queried by time. The value is in the format of <i>Operator:UTC time</i>.</p> <p>The following operators are supported:</p> <ul style="list-style-type: none"> <li>• gt: greater than</li> <li>• gte: greater than or equal to</li> <li>• lt: less than</li> <li>• lte: less than or equal to</li> <li>• eq: equal to</li> <li>• neq: not equal to</li> </ul> <p>The time format is <i>yyyy-MM-ddThh:mm:ssZ</i> or <i>yyyy-MM-dd hh:mm:ss</i>.</p> <p>For example, to query images created before Oct 28, 2018 10:00:00, set the value of <b>created_at</b> as follows: created_at=lt:2018-10-28T10:00:00Z</p>

Parameter	Mandatory	Type	Description
updated_at	No	String	<p>Specifies the time when the image was modified. Images can be queried by time. The value is in the format of <i>Operator:UTC time</i>.</p> <p>The following operators are supported:</p> <ul style="list-style-type: none"> <li>gt: greater than</li> <li>gte: greater than or equal to</li> <li>lt: less than</li> <li>lte: less than or equal to</li> <li>eq: equal to</li> <li>neq: not equal to</li> </ul> <p>The time format is <i>yyyy-MM-ddThh:mm:ssZ</i> or <i>yyyy-MM-dd hh:mm:ss</i>.</p> <p>For example, to query images updated before Oct 28, 2018 10:00:00, set the value of <b>updated_at</b> as follows: updated_at=lt:2018-10-28T10:00:00Z</p>

## Request

Request parameters

None

## Example Request

Querying public images (the results will be sorted by image name and only one image will be returned)

```
GET https://{Endpoint}/v2/cloudimages?__imagetype=gold&sort_key=name&limit=1
```

## Common Query Methods

- Public images  
GET /v2/cloudimages?\_\_imagetype=gold&visibility=public&protected=true
- Private images  
GET /v2/cloudimages?owner={project\_id}
- Available shared images  
GET /v2/cloudimages?  
member\_status=accepted&visibility=shared&\_\_imagetype=shared
- Rejected images  
GET /v2/cloudimages?  
member\_status=rejected&visibility=shared&\_\_imagetype=shared

- Unaccepted images  
GET /v2/cloudimages?  
member\_status=pending&visibility=shared&\_\_imagetype=shared

## Response

- Response parameters

Parameter	Type	Description
images	Array of objects	Specifies image details. For details, see <a href="#">Table 5-2</a> .

**Table 5-2** Data structure description of the images field

Parameter	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.

Parameter	Type	Description
status	String	Specifies the image status. The value can be one of the following: <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way. You can use the image tag API to add different tags to each image and filter images by tag.
visibility	String	Specifies whether the image is available to other tenants. Available values include: <ul style="list-style-type: none"> <li>• <b>private</b>: private image</li> <li>• <b>public</b>: public image</li> <li>• <b>shared</b>: shared image</li> </ul>
name	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
checksum	String	This parameter is unavailable currently.
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be <b>true</b> or <b>false</b> .
container_format	String	Specifies the container type.

Parameter	Type	Description
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is <b>0</b> .
max_ram	String	Specifies the maximum memory (MB) of the image. You can set this parameter based on the ECS specifications. Generally, you do not need to set this parameter.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> .
disk_format	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be <b>true</b> or <b>false</b> .
__platform	String	Specifies the image platform type. The value can be <b>Windows</b> , <b>Ubuntu</b> , <b>Red Hat</b> , <b>SUSE</b> , <b>CentOS</b> , <b>Debian</b> , <b>OpenSUSE</b> , <b>Oracle Linux</b> , <b>Fedora</b> , <b>Other</b> , <b>CoreOS</b> , or <b>EulerOS</b> .
__os_type	String	Specifies the OS type. The value can be <b>Linux</b> , <b>Windows</b> , or <b>Other</b> .

Parameter	Type	Description
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.
virtual_env_type	String	Specifies the environment where the image is used. The value can be <b>FusionCompute</b> , <b>Ironic</b> , <b>DataImage</b> , or <b>IsolImage</b> . <ul style="list-style-type: none"> <li>For an ECS image, the value is <b>FusionCompute</b>.</li> <li>For a data disk image, the value is <b>DataImage</b>.</li> <li>For a BMS image, the value is <b>Ironic</b>.</li> <li>For an ISO image, the value is <b>IsolImage</b>.</li> </ul>
__image_source_type	String	Specifies the image backend storage type. Only UDS is supported currently.
__imagetype	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>Public image: The value is <b>gold</b>.</li> <li>Private image: The value is <b>private</b>.</li> <li>Shared image: The value is <b>shared</b>.</li> </ul>
created_at	String	Specifies the time when the image was created. The value is in UTC format.
virtual_size	Integer	This parameter is unavailable currently.
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, this value is left empty.

Parameter	Type	Description
__backup_id	String	Specifies the backup ID. To create an image using a backup, set the value to the backup ID. Otherwise, this value is left empty.
__image_size	String	Specifies the size (bytes) of the image file.
__data_origin	String	Specifies the image source. If the image is a public image, this parameter is left empty.
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be <b>true</b> , <b>false</b> , <b>True</b> , or <b>False</b> .
active_at	String	Specifies the time when the image status became <b>active</b> .
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_largememory	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_diskintensive	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.

Parameter	Type	Description
__support_highperformance	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See <a href="#">Table 9-2</a> for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with InfiniBand NICs on the KVM platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> .

Parameter	Type	Description
__root_origin	String	Specifies that the image is created from an external image file. Value: <b>file</b>
__sequence_num	String	Specifies the ECS system disk slot number of the image. Example value: <b>0</b>
hw_firmware_type	String	Specifies the ECS boot mode. Available values include: <ul style="list-style-type: none"> <li>• <b>bios</b> indicates the BIOS boot mode.</li> <li>• <b>uefi</b> indicates the UEFI boot mode.</li> </ul>
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be <b>true</b> or <b>false</b> .
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be <b>true</b> or <b>false</b> .

- Example response

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.1.2 Updating Image Information

### Function

This API is used to update image information.

 **NOTE**

Only **active** images can be updated.

### URI

PATCH /v2/cloudimages/{image\_id}

[Table 5-3](#) lists the parameters in the URI.

**Table 5-3** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Private image ID For details about how to obtain the image ID, see <a href="#">Querying Images</a> .

### Request

- Request parameters

Parameter	Mandatory	Type	Description
[Array]	Yes	Array of objects	For details, see <a href="#">Table 5-4</a> .

**Table 5-4** Data structure description of the [Array] field

Parameter	Mandatory	Type	Description
op	Yes	String	Specifies the operation. The value can be <b>add</b> , <b>replace</b> , or <b>remove</b> .

Parameter	Mandatory	Type	Description
path	Yes	String	<p>Specifies the name of the attribute to be updated. / needs to be added in front of it.</p> <p>You can update the following attributes:</p> <ul style="list-style-type: none"> <li>● <b>name</b>: specifies the image name.</li> <li>● <b>__description</b>: specifies the image description.</li> <li>● <b>__support_xen</b>: Xen is supported.</li> <li>● <b>__support_largememory</b>: Ultra-large memory is supported.</li> <li>● <b>__support_diskintensive</b>: Intensive storage is supported.</li> <li>● <b>__support_highperformance</b>: High-performance computing (HPC) is supported.</li> <li>● <b>__support_xen_gpu_type</b>: GPU-accelerated ECSs that use Xen for virtualization are supported.</li> <li>● <b>__support_kvm_gpu_type</b>: GPU-accelerated ECSs that use KVM for virtualization are supported.</li> <li>● <b>__support_xen_hana</b>: HANA ECSs that use Xen for virtualization are supported.</li> <li>● <b>__is_config_init</b>: specifies whether initialization configuration is complete.</li> <li>● <b>min_ram</b>: specifies the minimum memory.</li> <li>● <b>hw_vif_multiqueue_enabled</b>: The NIC multi-queue feature is supported.</li> <li>● <b>hw_firmware_type</b>: specifies the boot mode. The value can be <b>bios</b> or <b>uefi</b>.</li> </ul>

Parameter	Mandatory	Type	Description
			You can add or delete extension attributes.
value	Yes	String	Specifies the new value of the attribute. For detailed description, see <a href="#">Image Attributes</a> .

## Example Request

Changing an image name to **ims\_test**

```
PATCH https://{Endpoint}/v2/cloudimages/33ad552d-1149-471c-8190-ff6776174a00
[
  {
    "op": "replace",
    "path": "/name",
    "value": "ims_test"
  }
]
```

## Response

- Response parameters

Parameter	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.

Parameter	Type	Description
status	String	Specifies the image status. The value can be one of the following: <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way. You can use the image tag API to add different tags to each image and filter images by tag.
visibility	String	Specifies whether the image is available to other tenants. The value can be one of the following: <ul style="list-style-type: none"> <li>• <b>private</b>: private image</li> <li>• <b>public</b>: public image</li> <li>• <b>shared</b>: shared image</li> </ul>
name	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
checksum	String	This parameter is unavailable currently.
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be <b>true</b> or <b>false</b> .
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. The default value is <b>0</b> .
max_ram	String	Specifies the maximum memory (MB) of the image. The parameter value depends on the ECS specifications and is not configured by default.

Parameter	Type	Description
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> .
disk_format	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be <b>true</b> or <b>false</b> .
__platform	String	Specifies the image platform type. The value can be <b>Windows</b> , <b>Ubuntu</b> , <b>Red Hat</b> , <b>SUSE</b> , <b>CentOS</b> , <b>Debian</b> , <b>OpenSUSE</b> , <b>Oracle Linux</b> , <b>Fedora</b> , <b>Other</b> , <b>CoreOS</b> , or <b>EulerOS</b> .
__os_type	String	Specifies the OS type. The value can be <b>Linux</b> , <b>Windows</b> , or <b>Other</b> .
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.
virtual_env_type	String	Specifies the environment where the image is used. The value can be <b>FusionCompute</b> , <b>Ironic</b> , <b>DataImage</b> , or <b>IsolImage</b> . <ul style="list-style-type: none"> <li>For an ECS image (system disk image), the value is <b>FusionCompute</b>.</li> <li>For a data disk image, the value is <b>DataImage</b>.</li> <li>For a BMS image, the value is <b>Ironic</b>.</li> <li>For an ISO image, the value is <b>IsolImage</b>.</li> </ul>
__image_source_type	String	Specifies the backend storage of the image. Only UDS is supported currently.

Parameter	Type	Description
__imagetype	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>Public image: The value is <b>gold</b>.</li> <li>Private image: The value is <b>private</b>.</li> <li>Shared image: The value is <b>shared</b>.</li> </ul>
created_at	String	Specifies the time when the image was created. The value is in UTC format.
virtual_size	Integer	This parameter is unavailable currently.
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, this value is left empty.
__backup_id	String	Specifies the backup ID. If the image is created from a backup, set the value to the backup ID. Otherwise, this parameter is not required.
__image_size	String	Specifies the size (bytes) of the image file. The value must be greater than <b>0</b> .
__data_origin	String	Specifies the image source. If the image is a public image, this parameter is left empty.
__root_origin	String	Specifies that the image is created from an external image file. Value: <b>file</b>
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be <b>true</b> , <b>false</b> , <b>True</b> , or <b>False</b> .
active_at	String	Specifies the time when the image status became <b>active</b> .
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__account_code	String	Specifies the charging identifier for the image.

Parameter	Type	Description
hw_firmware_type	String	Specifies the ECS boot mode. The following values are supported: <ul style="list-style-type: none"> <li>• <b>bios</b> indicates the BIOS boot mode. This value will be used by fault if this parameter does not exist in the response.</li> <li>• <b>uefi</b> indicates the UEFI boot mode.</li> </ul>
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be <b>true</b> or <b>false</b> .
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_large_memory	String	Specifies whether the image can be used to create large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For the supported OSs, see <a href="#">Table 9-4</a> .
__support_diskintensive	String	Specifies whether the image can be used to create disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_highperformance	String	Specifies whether the image can be used to create high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See <a href="#">Table 9-2</a> for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .

Parameter	Type	Description
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with InfiniBand NICs on the KVM platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> .
__sequence_num	String	Specifies the ECS system disk slot number of the image. This parameter is unavailable currently.
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be <b>true</b> or <b>false</b> .

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.1.3 Creating an Image

### Function

This API is used to create a private image. The following methods are supported:

- Create a system or data disk image from an ECS.
- Create a system disk image from an external image file uploaded to an OBS bucket.

The API is an asynchronous one. If it is successfully called, the cloud service system receives the request. However, you need to use the asynchronous job query API to query the image creation status. For details, see [Querying the Status of an Asynchronous Job](#).

You cannot export public images (such as Windows, SUSE, Red Hat, Oracle Linux, and Ubuntu) or private images created using these public images.

### URI

POST /v2/cloudimages/action

## Request

- Parameters for creating a system or data disk image from an ECS

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the name of the system disk image. For detailed description, see <a href="#">Image Attributes</a> .
description	No	String	Provides supplementary information about the image. For details, see <a href="#">Image Attributes</a> . The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
instance_id	Yes	String	Specifies the ID of the ECS used to create the image. To obtain the ECS ID, perform the following operations: <ol style="list-style-type: none"><li>1. Log in to management console.</li><li>2. Under <b>Computing</b>, click <b>Elastic Cloud Server</b>.</li><li>3. In the ECS list, click the name of the ECS and view its ID.</li></ol>
data_images	No	Array of objects	Specifies the data disk information to be converted. This parameter is mandatory when the data disk of an ECS is used to create a private data disk image. For details, see <a href="#">Table 5-5</a> . If the ECS data disk is not used to create a data disk image, the parameter is empty by default. <b>NOTE</b> When you create a data disk image using a data disk, if other parameters (such as <b>name</b> , <b>description</b> , and <b>tags</b> ) in this table have values, the system uses the value of <b>data_images</b> . You cannot specify <b>instance_id</b> .

Parameter	Mandatory	Type	Description
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default. Use either <b>tags</b> or <b>image_tags</b> .
image_tags	No	Array of objects	Lists the image tags. This parameter is left blank by default. Use either <b>tags</b> or <b>image_tags</b> .
max_ram	No	Integer	Specifies the maximum memory of the image in the unit of MB.
min_ram	No	Integer	Specifies the minimum memory of the image in the unit of MB. The default value is <b>0</b> , indicating that the memory is not restricted.

**Table 5-5** Data structure description of the data\_images field

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the name of a data disk image.
volume_id	Yes	String	Specifies the data disk ID.
description	No	String	Specifies the data disk description.
tags	No	Array of strings	Specifies the data disk image tag.

- Parameters for creating an image using an image file uploaded to the OBS bucket

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .

Parameter	Mandatory	Type	Description
description	No	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> . The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
os_type	No	String	Specifies the OS type. The value can be <b>Linux</b> , <b>Windows</b> , or <b>Other</b> .
os_version	No	String	Specifies the OS version. This parameter is valid if an external image file uploaded to the OBS bucket is used to create an image. For its value, see <a href="#">Values of Related Parameters</a> . <b>NOTE</b> This parameter is mandatory when the value of <b>is_quick_import</b> is <b>true</b> , that is, a system disk image is imported using the quick import method.

Parameter	Mandatory	Type	Description
image_url	Yes	String	<p>Specifies the URL of the external image file in the OBS bucket.</p> <p>This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The format is <i>OBS bucket name:Image file name</i>.</p> <ul style="list-style-type: none"> <li>• To obtain an OBS bucket name: <ol style="list-style-type: none"> <li>1. Log in to the management console and choose <b>Storage &gt; Object Storage Service</b>. All OBS buckets are displayed in the list.</li> <li>2. Filter the OBS buckets by region and locate the target bucket in the current region.</li> </ol> </li> <li>• To obtain an OBS image file name: <ol style="list-style-type: none"> <li>1. Log in to the management console and choose <b>Storage &gt; Object Storage Service</b>. All OBS buckets are displayed in the list.</li> <li>2. Filter the OBS buckets by region and locate the target bucket in the current region.</li> <li>3. Click the name of the target bucket to go to the bucket details page.</li> <li>4. In the navigation pane on the left, choose <b>Objects</b> to display objects in the OBS bucket and then locate the external image file used to create an image.</li> </ol> </li> </ul> <p><b>NOTE</b> The storage class of the OBS bucket must be <b>Standard</b>.</p>

Parameter	Mandatory	Type	Description
min_disk	Yes	Integer	Specifies the minimum size of the system disk in the unit of GB.  This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The value ranges from 1 GB to 1,024 GB.
is_config	No	Boolean	Specifies whether automatic configuration is enabled.  The value can be <b>true</b> or <b>false</b> .  If automatic configuration is required, set the value to <b>true</b> . Otherwise, set the value to <b>false</b> . The default value is <b>false</b> .  For details about automatic configuration, see <b>Creating a Linux System Disk Image from an External Image File &gt; Registering an External Image File as a Private Image (Linux)</b> in <i>Image Management Service User Guide</i> .
cmk_id	No	String	Specifies a custom key used for encrypting an image. For its value, see the <i>Key Management Service User Guide</i> .
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default.  Use either <b>tags</b> or <b>image_tags</b> .
image_tags	No	Array of objects	Lists the image tags. This parameter is left blank by default. Use either <b>tags</b> or <b>image_tags</b> .
max_ram	No	Integer	Specifies the maximum memory of the image in the unit of MB.

Parameter	Mandatory	Type	Description
min_ram	No	Integer	Specifies the minimum memory required by the image in the unit of MB. The default value is <b>0</b> , indicating that the memory is not restricted.
data_images	No	Array of objects	<p>Specifies the data disk information to be imported.</p> <p>An external image file can contain a maximum of three data disks. In this case, one system disk and three data disks will be created.</p> <p>For details, see <a href="#">Table 5-6</a>.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If a data disk image file is used to create a data disk image, the OS type of the data disk image must be the same as that of the system disk image.</li> <li>• If other parameters (such as <b>name</b>, <b>description</b>, and <b>tags</b>) in <a href="#">Table 5-6</a> are set, the system uses the values in <b>data_images</b>.</li> </ul>
is_quick_import	No	Boolean	<p>Specifies whether to use the quick import method to import a system disk image.</p> <ul style="list-style-type: none"> <li>• If yes, set the value to <b>true</b>.</li> <li>• If no, set the value to <b>false</b>.</li> </ul> <p>For details about the restrictions on quick import of image files, see <a href="#">Importing an Image File Quickly</a>.</p>

**Table 5-6** Data structure description of the images field

Parameter	Mandatory	Type	Description
name	No	String	Specifies the image name. For more details, see <a href="#">Image Attributes</a> .

Parameter	Mandatory	Type	Description
description	No	String	<p>Provides supplementary information about the image. This parameter is left blank by default.</p> <p>The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (&lt; &gt;) are not allowed.</p> <p>For more details, see <a href="#">Image Attributes</a>.</p>
image_url	Yes	String	<p>Specifies the URL of the external image file in the OBS bucket.</p> <p>The format is <i>OBS bucket name.Image file name</i>.</p> <ul style="list-style-type: none"> <li>To obtain an OBS bucket name: <ol style="list-style-type: none"> <li>Log in to the management console and choose <b>Storage &gt; Object Storage Service</b>. All OBS buckets are displayed in the list.</li> <li>Filter the OBS buckets by region and locate the target bucket in the current region.</li> </ol> </li> <li>To obtain an OBS image file name: <ol style="list-style-type: none"> <li>Log in to the management console and choose <b>Storage &gt; Object Storage Service</b>. All OBS buckets are displayed in the list.</li> <li>Filter the OBS buckets by region and locate the target bucket in the current region.</li> <li>Click the name of the target bucket to go to the bucket details page.</li> <li>In the navigation pane on the left, choose <b>Objects</b> to display objects in the OBS bucket and then locate the external image file used to create an image.</li> </ol> </li> </ul> <p><b>NOTE</b> The storage class of the OBS bucket must be <b>Standard</b>.</p>

Parameter	Mandatory	Type	Description
min_disk	Yes	Integer	Specifies the minimum size of the data disk. Unit: GB Value range: 1–2048
is_quick_import	No	Boolean	Specifies whether an image file is imported quickly to create a data disk image. <ul style="list-style-type: none"> <li>If yes, set the value to <b>true</b>.</li> <li>If no, set the value to <b>false</b>.</li> </ul> For details about the restrictions on quick import of image files, see <a href="#">Importing an Image File Quickly</a> .
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default. For detailed parameter descriptions, see <a href="#">Image Tag Data Formats</a> . Use either <b>tags</b> or <b>image_tags</b> .
image_tags	No	Array of objects	Lists the image tags. This parameter is left blank by default. For detailed parameter descriptions, see <a href="#">Image Tag Data Formats</a> . Use either <b>tags</b> or <b>image_tags</b> .

## Example Request

- Creating a system disk image with parameter **tags** using an ECS (ID: 877a2cda-ba63-4e1e-b95f-e67e48b6129a)

```
POST https://{Endpoint}/v2/cloudimages/action
{
  "name": "ims_test",
  "description": "Create a system disk image from an ECS",
  "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
  "tags": [
    "aaa.111",
    "bbb.333",
    "ccc.444"
  ]
}
```
- Creating an image with parameter **tags** using a file in an OBS bucket (file address in the bucket: ims-image:centos70.qcow2)

```
POST https://{Endpoint}/v2/cloudimages/action
{
  "name": "ims_test_file",
  "description": "Create an image from a file in an OBS bucket",
  "image_url": "ims-image:centos70.qcow2",
  "os_version": "CentOS 7.0 64bit",
}
```

```
"min_disk": 40,
"tags": [
  "aaa.111",
  "bbb.333",
  "ccc.444"
]
}
```

- Creating a system disk image with parameter **image\_tags** using an ECS (ID: 877a2cda-ba63-4e1e-b95f-e67e48b6129a)

```
POST https://{Endpoint}/v2/cloudimages/action
{
  "name": "ims_test",
  "description": "Create a system disk image from an ECS",
  "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
  "image_tags": [
    {
      "key": "key2",
      "value": "value2"
    },
    {
      "key": "key1",
      "value": "value1"
    }
  ]
}
```

- Creating an image with parameter **image\_tags** using a file in an OBS bucket (file address in the bucket: ims-image:centos70.qcow2)

```
POST https://{Endpoint}/v2/cloudimages/action
{
  "name": "ims_test_file",
  "description": "Create an image from a file in an OBS bucket",
  "image_url": "ims-image:centos70.qcow2",
  "os_version": "CentOS 7.0 64bit",
  "min_disk": 40,
  "image_tags": [{"key":"key2","value":"value2"}, {"key":"key1","value":"value1"}]
}
```

## Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see <a href="#">Querying the Status of an Asynchronous Job</a> .

- Example response

```
STATUS CODE 200
{
  "job_id": "8a12fc664fb4daa3014fb4e581380005"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.1.4 Importing an Image File Quickly

### Function

This API is used to quickly create a private image from an oversized external image file that has uploaded to the OBS bucket. Currently, only ZVHD2 and RAW image files are supported, and the size of an image file cannot exceed 1 TB.

The fast image creation function is only available for image files in RAW or ZVHD2 format. For other formats of image files that are smaller than 128 GB, you are advised to import these files with the common method.

The API is an asynchronous one. If it is successfully called, the cloud service system receives the request. However, you need to use the asynchronous job query API to query the image creation status. For details, see [Querying the Status of an Asynchronous Job](#).

### Constraints

Before importing image files, ensure that the file format is RAW or ZVHD2 and the following have been done:

- RAW image files have been optimized, and bitmap files have been generated.
- ZVHD2 image files have been optimized as required.

#### NOTE

For how to convert image file formats and generate a bitmap file, see section "Quickly Importing an Image File" in the *Image Management Service User Guide*.

### URI

POST /v2/cloudimages/quickimport/action

### Request

- Parameters in the request body when an image file is used to create a system disk image

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
description	No	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> . The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
os_version	Yes	String	Specifies the OS version. This parameter is valid if an external image file uploaded to the OBS bucket is used to create an image. For its value, see <a href="#">Values of Related Parameters</a> .
image_url	Yes	String	Specifies the URL of the external image file in the OBS bucket. This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The format is <i>OBS bucket name.Image file name</i> . <b>NOTE</b> The storage class of the OBS bucket must be <b>Standard</b> .
min_disk	Yes	Integer	Specifies the minimum size (GB) of the system disk. <ul style="list-style-type: none"> <li>This parameter is mandatory if an external image file in the OBS bucket is used to create an image.</li> <li>The value ranges from 1 to 1024 and must be greater than the size of the selected image file.</li> </ul>

Parameter	Mandatory	Type	Description
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default. Set either <b>tags</b> or <b>image_tags</b> .
image_tags	No	Array of objects	Lists the image tags. This parameter is left blank by default. Set either <b>tags</b> or <b>image_tags</b> .
type	No	String	Specifies the image type. The parameter value is ECS/BMS for system disk images. The default value is <b>ECS</b> .
architecture	No	String	Specifies the image architecture type. Available values include: <ul style="list-style-type: none"> <li>• x86</li> <li>• arm</li> </ul> The default value is <b>x86</b> . <b>NOTE</b> If the image architecture is ARM, the boot mode is automatically changed to UEFI.

- Parameters description when an image file uploaded to the OBS bucket is used to create an image

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .

Parameter	Mandatory	Type	Description
description	No	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> . The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
os_type	No	String	Specifies the OS version. When a data disk image created, the value can be <b>Linux</b> or <b>Windows</b> . The default is <b>Linux</b> .
image_url	Yes	String	Specifies the URL of the external image file in the OBS bucket.  This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The format is <i>OBS bucket name.Image file name</i> .  <b>NOTE</b> The storage class of the OBS bucket must be <b>Standard</b> .
min_disk	Yes	Integer	Specifies the minimum size of the system disk in the unit of GB.  This parameter is mandatory if an external image file in the OBS bucket is used to create an image. The value ranges from 1 to 1024.
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default.  Set either <b>tags</b> or <b>image_tags</b> .

Parameter	Mandatory	Type	Description
image_tags	No	Array of objects	Lists the image tags. This parameter is left blank by default. Set either <b>tags</b> or <b>image_tags</b> .
type	Yes	String	Specifies the image type. The parameter value is DataImage for data disk images.

## Example Request

- Creating a system disk image with parameter **tags** using a file in an OBS bucket (file address in the bucket: ims-image:centos70.zvhd2)

POST https://{Endpoint}/v2/cloudimages/quickimport/action

```
{
  "name": "ims_test_file",
  "description": "Create an image using a file in the OBS bucket.",
  "image_url": "ims-image:centos70.zvhd2",
  "os_version": "CentOS 7.0 64bit",
  "min_disk": 40,
  "type": "ECS",
  "tags": [
    "aaa.111",
    "bbb.333",
    "ccc.444"
  ]
}
```

- Creating a system disk image with parameter **image\_tags** using a file in an OBS bucket (file address in the bucket: ims-image:centos70.zvhd2)

POST https://{Endpoint}/v2/cloudimages/quickimport/action

```
{
  "name": "ims_test_file",
  "description": "Create an image using a file in the OBS bucket.",
  "image_url": "ims-image:centos70.zvhd2",
  "os_version": "CentOS 7.0 64bit",
  "min_disk": 40,
  "type": "ECS",
  "image_tags": [{"key": "key2", "value": "value2"}, {"key": "key1", "value": "value1"}]
}
```

- Creating a data disk image with parameter **tags** using a file in an OBS bucket (file address in the bucket: ims-image:centos70.zvhd2)

POST https://{Endpoint}/v2/cloudimages/quickimport/action

```
{
  "name": "ims_test_file",
  "description": "Create an image using a file in the OBS bucket.",
  "image_url": "ims-image:centos70.zvhd2",
  "os_type": "Linux",
  "min_disk": 40,
  "type": "DataImage",
  "tags": [
    "aaa.111",
    "bbb.333",
    "ccc.444"
  ]
}
```

- Creating a data disk image with parameter **image\_tags** using a file in an OBS bucket (file address in the bucket: ims-image:centos70.zvhd2)

```
POST https://{Endpoint}/v2/cloudimages/quickimport/action
{
  "name": "ims_test_file",
  "description": "Create an image using a file in the OBS bucket.",
  "image_url": "ims-image:centos70.zvhd2",
  "os_type": "Linux",
  "min_disk": 40,
  "type": "DataImage",
  "image_tags": [{"key":"key2","value":"value2"}, {"key":"key1","value":"value1"}]
}
```

## Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see <a href="#">Querying the Status of an Asynchronous Job</a> .

- Example response

```
STATUS CODE 200
{
  "job_id": "8a12fc664fb4daa3014fb4e581380005"
}
```

## Returned Values

- Normal  
200
- Abnormal

Return Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.1.5 Creating a Full-ECS Image

### Function

This API is used to create a full-ECS image from an ECS or a Cloud Server Backup Service (CSBS) backup. The API is an asynchronous one. If it is successfully called,

the cloud system receives the request to create a full-ECS image. However, you need to use the asynchronous job query API to query the image creation status. For details, see [Querying the Status of an Asynchronous Job](#).

## Constraints (Creating a Full-ECS Image Using an ECS)

- When creating a full-ECS image from an ECS, ensure that the ECS has been properly configured, or the image creation may fail.
- A Windows ECS used to create a full-ECS image cannot have a spanned volume, or data may be lost when ECSs are created from that image.
- A Linux ECS used to create a full-ECS image cannot have a disk group or logical disk that contains multiple physical disks, or data may be lost when ECSs are created from that image.
- An ECS used to create a full-ECS image cannot contain a Dedicated Storage Service disk.
- A full-ECS image cannot be exported, replicated, or shared.
- When creating a full-ECS image from a Windows ECS, you need to change the SAN policy of the ECS to OnlineAll. Otherwise, EVS disks attached to the ECSs created from the image may be offline.

Windows has three types of SAN policies: **OnlineAll**, **OfflineShared**, and **OfflineInternal**.

**Table 5-7** SAN policies in Windows

Type	Description
OnlineAll	All newly detected disks are automatically brought online.
OfflineShared	All disks on sharable buses, such as iSCSI and FC, are left offline by default, while disks on non-sharable buses are kept online.
OfflineInternal	All newly detected disks are left offline.

- Execute **cmd.exe** and run the following command to query the current SAN policy of the ECS:  
**diskpart**
- Run the following command to view the SAN policy of the ECS:  
**san**
  - If the SAN policy is **OnlineAll**, run the **exit** command to exit DiskPart.
  - If the SAN policy is not **OnlineAll**, go to **c**.
- Run the following command to change the SAN policy of the ECS to **OnlineAll**:  
**san policy=onlineall**

## Constraints (Creating a Full-ECS Image Using a CSBS Backup)

- When creating a full-ECS image from a CSBS backup, ensure that the source ECS of the CSBS backup has been properly configured, or the image creation may fail.
- If an ECS is in **Stopped** state, do not start it when you are using it to create a full-ECS image.
- A CSBS backup used to create a full-ECS image cannot have shared disks.
- Only an available CSBS backup can be used to create a full-ECS image. A CSBS backup can be used to create only one full-ECS image.
- A full-ECS image cannot be exported, replicated, or shared.

## URI

POST /v1/cloudimages/wholeimages/action

## Request

- Parameters for creating a full-ECS image using an ECS

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
description	No	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> .
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default. Use either <b>tags</b> or <b>image_tags</b> .
image_tags	No	Array of objects	Lists the image tags. This parameter is left blank by default. Use either <b>tags</b> or <b>image_tags</b> .
instance_id	Yes	String	Specifies the ECS ID. This parameter is required when an ECS is used to create a full-ECS image.  To obtain the ECS ID, perform the following operations: <ol style="list-style-type: none"> <li>1. Log in to management console.</li> <li>2. Under <b>Computing</b>, click <b>Elastic Cloud Server</b>.</li> <li>3. In the ECS list, click the name of the ECS and view its ID.</li> </ol>

Parameter	Mandatory	Type	Description
max_ram	No	Integer	Specifies the maximum memory of the image in the unit of MB. This parameter is not configured by default.
min_ram	No	Integer	Specifies the minimum memory of the image in the unit of MB. The default value is 0.

- Parameters in the request body when a CSBS backup is used to create a full-ECS image

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
description	No	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> .
tags	No	Array of strings	Lists the image tags. This parameter is left blank by default. Use either <b>tags</b> or <b>image_tags</b> .
image_tags	No	Array of objects	Lists the image tags. This parameter is left blank by default. Use either <b>tags</b> or <b>image_tags</b> .
backup_id	Yes	String	Specifies the CSBS backup ID. To obtain the CSBS backup ID, perform the following operations: <ol style="list-style-type: none"> <li>Log in to the management console.</li> <li>Under <b>Storage</b>, click <b>Cloud Server Backup Service</b>.</li> <li>In the backup list, expand details of the backup to obtain its ID.</li> </ol>
max_ram	No	Integer	Specifies the maximum memory of the image in the unit of MB. This parameter is not configured by default.

Parameter	Mandatory	Type	Description
min_ram	No	Integer	Specifies the minimum memory of the image in the unit of MB. The default value is <b>0</b> , indicating that the memory is not restricted.

## Example Request

- Creating a full-ECS image with parameter **tags** using an ECS (ID: 877a2cda-ba63-4e1e-b95f-e67e48b6129a)

```
POST https://{Endpoint}/v1/cloudimages/wholeimages/action
{
  "name": "instance_whole_image",
  "description": "creating an image from an ECS",
  "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
  "tags": [
    "aaa.111",
    "bbb.333",
    "ccc.444"
  ]
}
```

- Creating a full-ECS image with parameter **image\_tags** using an ECS (ID: 877a2cda-ba63-4e1e-b95f-e67e48b6129a)

```
POST https://{Endpoint}/v1/cloudimages/wholeimages/action
{
  "name": "instance_whole_image",
  "description": "creating an image from an ECS",
  "instance_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a",
  "image_tags": [{"key":"key2","value":"value2"}, {"key":"key1","value":"value1"}]
}
```

- Creating a full-ECS image with parameter **tags** using aCSBS backup (ID: 9b27efab-4a17-4c06-bfa2-3e0cf021d3c3)

```
POST https://{Endpoint}/v1/cloudimages/wholeimages/action
{
  "name": "backup_whole_image",
  "description": "Creating a full-ECS image from a CSBS backup",
  "backup_id": "9b27efab-4a17-4c06-bfa2-3e0cf021d3c3",
  "tags": [
    "aaa.111",
    "bbb.333",
    "ccc.444"
  ]
}
```

- Creating a full-ECS image with parameter **image\_tags** using aCSBS backup (ID: 9b27efab-4a17-4c06-bfa2-3e0cf021d3c3)

```
POST https://{Endpoint}/v1/cloudimages/wholeimages/action
{
  "name": "backup_whole_image",
  "description": "Creating a full-ECS image from a CSBS backup",
  "backup_id": "9b27efab-4a17-4c06-bfa2-3e0cf021d3c3",
  "image_tags": [{"key":"key2","value":"value2"}, {"key":"key1","value":"value1"}]
}
```

## Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see <a href="#">Querying the Status of an Asynchronous Job</a> .

- Example response

```
STATUS CODE 200
{
  "job_id": "4010a32b5f909853015f90aaa24b0015"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.1.6 Registering an Image

### Function

This API is used to register an image file as an uninitialized private image on the cloud platform.

The following describes how to use this API:

1. Upload the image file to an OBS bucket. For details, see "Object Storage Service User Guide".
2. Use the image metadata creation API to create image metadata. After the API is invoked successfully, save the image ID. For how to create image metadata, see [Creating Image Metadata \(Native OpenStack API\)](#).
3. Use the API for registering images and the image ID obtained in [2](#) to register the image file as a private image.
4. After the API is successfully invoked as an asynchronous one, the cloud service system receives a request. Query the image status using the image ID and

check whether the image file is successfully registered. When the image status changes to **active**, the image file is successfully registered as a private image.

For details about how to query the status of an asynchronous task, see [Querying the Status of an Asynchronous Job](#).

 **NOTE**

Before registering an image file, ensure that you have the Tenant Administrator permission for OBS.

## URI

PUT /v1/cloudimages/{image\_id}/upload

[Table 5-8](#) lists the parameters in the URI.

**Table 5-8** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. <ul style="list-style-type: none"><li>• <b>image_id</b> is the ID of the image you created by invoking the API for creating image metadata. Registration may fail if you use other image IDs.</li><li>• After this API is invoked, you can check the image status with the image ID. When the image status changes to <b>active</b>, the image file is successfully registered. For details, see <a href="#">Querying Image Details (Native OpenStack API)</a>.</li></ul>

## Request

- Request parameters

Parameter	Mandatory	Type	Description
image_url	Yes	String	<p>Specifies the URL of the image file in the format of <i>Bucket name:File name</i>.</p> <p>Image files in the bucket can be in ZVHD, QCOW2, VHD, RAW, VHDX, QED, VDI, QCOW, ZVHD2, ISO, or VMDK format.</p> <p><b>NOTE</b> The storage class of the OBS bucket must be <b>Standard</b>.</p>

## Example Request

Registering an image (URL of the image file: bucketname:Centos6.5-disk1.vmdk)

```
PUT https://{Endpoint}/v1/cloudimages/4ca46bf1-5c61-48ff-b4f3-0ad4e5e3ba86/upload
{
  "image_url": "bucketname:Centos6.5-disk1.vmdk"
}
```

## Response

- Response parameters

Parameter	Type	Description
job_id	String	<p>Specifies the asynchronous job ID.</p> <p>For details, see <a href="#">Querying the Status of an Asynchronous Job</a>.</p>

- Example response

```
HTTP/1.1 200
{
  "job_id": "b912fb4a4c464b568ecfca1071b21b10"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.

Returned Value	Description
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.

## 5.1.7 Exporting an Image

### Function

This is an extension API and used to export a private image to an OBS bucket.

#### NOTE

Before exporting an image, ensure that you have the Tenant Administrator permission for OBS.

### Constraints

- An image can only be exported to a Standard bucket that is in the same region as the image.
- The following private images cannot be exported:
  - Full-ECS images
  - ISO images
  - Private images created from a Windows, SUSE, Red Hat, Ubuntu, or Oracle Linux public image
- The image size must be less than 1 TB. Images larger than 128 GB support only fast export.

### URI

POST /v1/cloudimages/{image\_id}/file

[Table 5-9](#) lists the parameters in the URI.

**Table 5-9** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. For details about how to obtain the image ID, see <a href="#">Querying Images</a> .

### Request

- Request parameters

Parameter	Mandatory	Type	Description
bucket_url	Yes	String	Specifies the URL of the image file in the format of <i>Bucket name.File name</i> . <b>NOTE</b> The storage class of the OBS bucket must be <b>Standard</b> .
file_format	Yes	String	Specifies the file format. The value can be <b>qcow2</b> , <b>vhd</b> , <b>zvhd</b> , or <b>vmdk</b> .
is_quick_export	No	Boolean	Whether to enable fast export. The value can be <b>true</b> or <b>false</b> . <b>NOTE</b> If fast export is enabled, <b>file_format</b> cannot be specified.

## Example Request

```
POST https://{Endpoint}/v1/cloudimages/d164b5df-1bc3-4c3f-893e-3e471fd16e64/file
{
  "bucket_url": "ims-image:centos7_5.qcow2",
  "file_format": "qcow2"
}
POST https://{Endpoint}/v1/cloudimages/d164b5df-1bc3-4c3f-893e-3e471fd16e64/file
{
  "bucket_url": "ims-image:centos7_5.qcow2",
  "file_format": "qcow2",
  "is_quick_export": false
}
```

## Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see <a href="#">Querying the Status of an Asynchronous Job</a> .

- Example response

```
STATUS CODE 200
{
  "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.2 Image Tagging

### 5.2.1 Adding or Modifying a Tag

#### Function

This API is used to add a tag to an image or modify a tag of an image. With tags, you can manage easily the images.

#### URI

PUT /v1/cloudimages/tags

#### Request

- Request parameters

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. For details about how to obtain the image ID, see <a href="#">Querying Images</a> .
tag	No	String	Specifies the tag. Use either <b>tag</b> or <b>image_tag</b> .

Parameter	Mandatory	Type	Description
image_tag	No	Object	Lists the image tags. For detailed description, see <a href="#">Image Tag Data Formats</a> . This parameter is left blank by default. Use either <b>tag</b> or <b>image_tag</b> .

**Table 5-10** Data structure description of the image\_tag field

Parameter	Mandatory	Type	Description
key	Yes	String	Specifies the tag key.
value	Yes	String	Specifies the tag value.

## Example Request

- Adding or modifying a tag (parameter: **tags**)

PUT https://{Endpoint}/v1/cloudimages/tags

```
{
  "image_id": "62a15f6c-9197-44d2-89c7-708981c1bec1",
  "tag": "aaaa.1111"
}
```

- Adding or modifying a tag (parameter: **image\_tag**)

PUT https://{Endpoint}/v1/cloudimages/tags

```
{
  "image_id": "67437ebd-2563-46e0-887e-ad1923977fa1",
  "image_tag": {"key":"key1","value":"value1"}
}
```

## Response

- Response parameters

None

- Example response

STATUS CODE 204

## Returned Values

- Normal  
204
- Abnormal

Returned Value	Description
400 Bad Request	Request error.

Returned Value	Description
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.2.2 Querying Tags

### Function

This API is used to query image tags using search criteria and display them in a list.

### URI

GET /v1/cloudimages/tags{?  
\_\_isregistered,\_\_imagetype,\_\_whole\_image,\_\_system\_cmkid,protected,visibility,owner,id,status,name,container\_format,disk\_format,min\_ram,min\_disk,\_\_os\_bit,\_\_platform,marker,limit,sort\_key,sort\_dir,\_\_os\_type,tag,member\_status,\_\_support\_kvm,\_\_support\_xen,\_\_support\_largememory,\_\_support\_diskintensive,\_\_support\_highperformance,\_\_support\_xen\_gpu\_type,\_\_support\_kvm\_gpu\_type,\_\_support\_xen\_hana,\_\_support\_kvm\_infiniband,virtual\_env\_type,created\_at,updated\_at}

#### NOTE

You can type a question mark (?) and an ampersand (&) at the end of the URI to define multiple search criteria. For details, see the example request.

**Table 5-11** Parameter description

Parameter	Mandatory	Type	Description
__isregistered	No	String	Specifies whether the image is available. The value can be <b>true</b> . The value is <b>true</b> for all extension APIs by default. Common users can query only the images for which the value of this parameter is <b>true</b> .

Parameter	Mandatory	Type	Description
<code>__imagetype</code>	No	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>Public image: The value is <b>gold</b>.</li> <li>Private image: The value is <b>private</b>.</li> <li>Shared image: The value is <b>shared</b>.</li> </ul> <b>NOTE</b> The <b>__imagetype</b> of images you share with other tenants or those other tenants share with you and you have accepted is <b>shared</b> . You can use field <b>owner</b> to distinguish the two types of shared images. You can use <b>member_status</b> to filter out shared images you have accepted.
<code>__whole_image</code>	No	Boolean	Specifies whether the image is a full-ECS image. The value can be <b>true</b> or <b>false</b> .
<code>__system_cmkid</code>	No	String	Specifies the ID of the key used to encrypt the image. You can obtain the ID from the IMS console or by calling the <a href="#">Querying Image Details (Native OpenStack API)</a> API.
<code>protected</code>	No	Boolean	Specifies whether the image is protected. The value can be <b>true</b> or <b>false</b> . Set it to <b>true</b> when you query public images. This parameter is optional when you query private images.
<code>visibility</code>	No	String	Specifies whether the image is available to other tenants. Available values include: <ul style="list-style-type: none"> <li><b>public</b>: public image</li> <li><b>private</b>: private image</li> <li><b>shared</b>: shared image</li> </ul>
<code>owner</code>	No	String	Specifies the tenant to which the image belongs.
<code>id</code>	No	String	Specifies the image ID.

Parameter	Mandatory	Type	Description
status	No	String	Specifies the image status. The value can be: <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
name	No	String	Specifies the image name. Exact matching is used. For detailed description, see <a href="#">Image Attributes</a> .
container_format	No	String	Specifies the container type. The value is <b>bare</b> .
disk_format	No	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
min_ram	No	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is <b>0</b> .
min_disk	No	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.
__os_bit	No	String	Specifies the OS architecture, 32 bit or 64 bit.
__platform	No	String	Specifies the image platform type. The value can be <b>Windows</b> , <b>Ubuntu</b> , <b>Red Hat</b> , <b>SUSE</b> , <b>CentOS</b> , <b>Debian</b> , <b>OpenSUSE</b> , <b>Oracle Linux</b> , <b>Fedora</b> , <b>Other</b> , <b>CoreOS</b> , or <b>EulerOS</b> .
marker	No	String	Specifies the start number from which images are queried. The value is the image ID.

Parameter	Mandatory	Type	Description
limit	No	Integer	Specifies the number of images to be queried. The value is an integer and is <b>500</b> by default.
sort_key	No	String	Specifies the field for sorting the query results. The value can be an attribute of the image: <b>name</b> , <b>container_format</b> , <b>disk_format</b> , <b>status</b> , <b>id</b> , <b>size</b> , or <b>created_at</b> . The default value is <b>created_at</b> .
sort_dir	No	String	Specifies whether the query results are sorted in ascending or descending order. Its value can be <b>desc</b> (default) or <b>asc</b> . This parameter is used together with parameter <b>sort_key</b> . The default value is <b>desc</b> .
__os_type	No	String	Specifies the image OS type. Available values include: <ul style="list-style-type: none"> <li>• Linux</li> <li>• Windows</li> <li>• Other</li> </ul>
tag	No	String	Specifies a tag added to an image. Tags can be used as a filter to query images.
member_status	No	String	Specifies the member status. The value can be <b>accepted</b> , <b>rejected</b> , or <b>pending</b> . <b>accepted</b> : indicates that the shared image is accepted. <b>rejected</b> indicates that the image shared by others is rejected. <b>pending</b> indicates that the image shared by others needs to be confirmed. To use this parameter, set <b>visibility</b> to <b>shared</b> during the query.
__support_kvm	No	String	Specifies whether the image supports KVM. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen	No	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.

Parameter	Mandatory	Type	Description
__support_largememory	No	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For the supported OSs, see <a href="#">Table 9-4</a> .
__support_diskintensive	No	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_highperformance	No	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See <a href="#">Table 9-2</a> for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_xen_hana	No	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_infiniband	No	String	Specifies whether the image supports ECSs with InfiniBand NICs on the KVM platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> .

Parameter	Mandatory	Type	Description
virtual_environment_type	No	String	<p>Specifies the environment where the image is used. The value can be <b>FusionCompute</b>, <b>Ironic</b>, <b>DataImage</b>, or <b>IsolImage</b>.</p> <ul style="list-style-type: none"> <li>For an ECS system disk image, the value is <b>FusionCompute</b>.</li> <li>For an ECS data disk image, the value is <b>DataImage</b>.</li> <li>For a BMS image, the value is <b>Ironic</b>.</li> <li>For an ISO image, the value is <b>IsolImage</b>.</li> </ul>
created_at	No	String	<p>Specifies the time when the image was created. Images can be queried by time. The value is in the format of <i>Operator:UTC time</i>.</p> <p>The following operators are supported:</p> <ul style="list-style-type: none"> <li>gt: greater than</li> <li>gte: greater than or equal to</li> <li>lt: less than</li> <li>lte: less than or equal to</li> <li>eq: equal to</li> <li>neq: not equal to</li> </ul> <p>The time format is <i>yyyy-MM-ddThh:mm:ssZ</i> or <i>yyyy-MM-dd hh:mm:ss</i>.</p> <p>For example, to query images created before Oct 28, 2018 10:00:00, set the value of <b>created_at</b> as follows: created_at=lt:2018-10-28T10:00:00Z</p>

Parameter	Mandatory	Type	Description
updated_at	No	String	<p>Specifies the time when the image was modified. Images can be queried by time. The value is in the format of <i>Operator:UTC time</i>.</p> <p>The following operators are supported:</p> <ul style="list-style-type: none"> <li>gt: greater than</li> <li>gte: greater than or equal to</li> <li>lt: less than</li> <li>lte: less than or equal to</li> <li>eq: equal to</li> <li>neq: not equal to</li> </ul> <p>The time format is <i>yyyy-MM-ddThh:mm:ssZ</i> or <i>yyyy-MM-dd hh:mm:ss</i>.</p> <p>For example, to query images updated before Oct 28, 2018 10:00:00, set the value of <b>updated_at</b> as follows: updated_at=lt:2018-10-28T10:00:00Z</p>

## Request

Request parameters

None

## Example Request

Querying image tags

```
GET https://{Endpoint}/v1/cloudimages/tags?limit=5&page=1
```

## Response

- Response parameters

Parameter	Type	Description
tags	Array of strings	Lists the tags.

- Example response  
STATUS CODE 200

```
{
  "tags": [
    "jjj.11111",
    "uuuu.22222",
    "234.4",
    "test",
    "image"
  ]
}
```

```
]
}
```

 **NOTE**

In the new specification, equal signs are used as separators.

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.2.3 Querying Images by Tag

### Function

This API is used to filter or count images using tags or other conditions.

### Constraints

To be compatible with remaining tags, the system will not verify the character set of the tag keys and values in the query condition when parameters **tags\_not\_tags**, **tags\_any**, and **not\_tags\_any** are used.

### URI

POST /v2/{project\_id}/images/resource\_instances/action

[Table 5-12](#) lists the parameters in the URI.

**Table 5-12** Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Specifies the project ID.

## Request

- Request parameters

Parameter	Mandatory	Type	Description
action	Yes	String	Identifies the operation. This parameter is case sensitive and its value can be <b>filter</b> or <b>count</b> . <ul style="list-style-type: none"> <li>The value <b>filter</b> indicates pagination query.</li> <li>The value <b>count</b> indicates that the total number of query results meeting the search criteria will be returned.</li> </ul>
tags	No	Array of objects	Includes all specified tags. A maximum of 10 tag keys are allowed for each query operation. Each tag key can contain a maximum of 10 tag values. Both tag keys and values must be unique. The tag keys cannot be left blank. For details, see <a href="#">Table 5-13</a> .
tags_any	No	Array of objects	Includes any of specified tags. A maximum of 10 tag keys are allowed for each query operation. Each tag key can contain a maximum of 10 tag values. Both tag keys and values must be unique. The tag keys cannot be left blank and set to an empty string. For details, see <a href="#">Table 5-14</a> .
not_tags	No	Array of objects	Excludes all specified tags. A maximum of 10 tag keys are allowed for each query operation. Each tag key can contain a maximum of 10 tag values. Both tag keys and values must be unique. The tag keys cannot be left blank. For details, see <a href="#">Table 5-15</a> .

Parameter	Mandatory	Type	Description
not_tags_any	No	Array of objects	Excludes any of specified tags. A maximum of 10 tag keys are allowed for each query operation. Each tag key can contain a maximum of 10 tag values. Both tag keys and values must be unique. The tag keys cannot be left blank. For details, see <a href="#">Table 5-16</a> .
without_any_tag	No	Boolean	If this parameter is set to <b>true</b> , all resources without tags are queried. In this case, the <b>tag</b> , <b>not_tags</b> , <b>tags_any</b> , and <b>not_tags_any</b> fields are ignored.
limit	No	String	Specifies the maximum number of query records. This parameter is invalid when <b>action</b> is set to <b>count</b> . If <b>action</b> is set to <b>filter</b> , the parameter <b>limit</b> takes effect and its default value is <b>10</b> . The value of <b>limit</b> ranges from 1 to 1000.
offset	No	String	Specifies the index position. The query starts from the next image indexed by this parameter. This parameter is not required when data on the first page is queried, and it is invalid when <b>action</b> is set to <b>count</b> . If <b>action</b> is set to <b>filter</b> , the default value of <b>offset</b> is <b>0</b> . The value of <b>offset</b> cannot be a negative number.
matches	No	Array of objects	Specifies the search criteria. The tag key is the field to match, for example, <b>resource_name</b> or <b>resource_id</b> . <b>value</b> indicates the matched value. Keys in this list must be unique. The parameter cannot be left blank and may not be transferred. For details, see <a href="#">Table 5-17</a> .

**Table 5-13** Data structure description of the tags field

Parameter	Mandatory	Type	Description
key	Yes	String	Specifies the tag key. The tag key contains a maximum of 127 Unicode characters and cannot be left blank.
values	Yes	Array of strings	Lists the tag values. Each value can contain a maximum of 255 Unicode characters. If this parameter is left blank, any value is matched. If multiple values are listed, images that have any of the values will be returned.

**Table 5-14** Data structure description of the tags\_any field

Parameter	Mandatory	Type	Description
key	Yes	String	Specifies the tag key. The tag key contains a maximum of 127 Unicode characters and cannot be left blank.
values	Yes	Array of strings	Lists the tag values. Each value can contain a maximum of 255 Unicode characters. If this parameter is left blank, any value is matched. If multiple values are listed, images that have any of the values will be returned.

**Table 5-15** Data structure description of the not\_tags field

Parameter	Mandatory	Type	Description
key	Yes	String	Specifies the tag key. The tag key contains a maximum of 127 Unicode characters and cannot be left blank.

Parameter	Mandatory	Type	Description
values	Yes	Array of strings	Lists the tag values. Each value can contain a maximum of 255 Unicode characters. If this parameter is left blank, any value is matched. If multiple values are listed, images that have any of the values will be returned.

**Table 5-16** Data structure description of the not\_tags\_any field

Parameter	Mandatory	Type	Description
key	Yes	String	Specifies the tag key. The tag key contains a maximum of 127 Unicode characters and cannot be left blank.
values	Yes	Array of strings	Lists the tag values. Each value can contain a maximum of 255 Unicode characters. If this parameter is left blank, any value is matched. When multiple values are specified and the key requirements are met, images that have any of the specified values are queried.

**Table 5-17** Data structure description of the matches field

Parameter	Mandatory	Type	Description
key	Yes	String	Specifies the tag key, that is to say, the field name for the query operation. Valid values include <b>resource_name</b> and <b>resource_id</b> .  If the field name is <b>resource_name</b> and the value is an empty string, exact query is performed. Otherwise, fuzzy query is performed based on the image name. If the field name is <b>resource_id</b> , exact query is performed based on the image ID.
value	Yes	String	Specifies the tag value. It cannot be left blank. Each value can contain a maximum of 255 Unicode characters.

## Example Request

- Counting the total number of images that meet the conditions specified by **tags**

```
POST https://{Endpoint}/v2/fd73a4a14a4a4dfb9771a8475e5198ea/images/resource_instances/action
{
  "action": "count",
  "matches": [{
    "key": "resource_name",
    "value": "test100"
  }],
  "tags": [
    {
      "key": "key3",
      "values": ["valueXX"]
    }
  ],
  "tags_any": [
    {
      "key": "key0",
      "values": ["valueXX"]
    }
  ],
  "not_tags": [
    {
      "key": "key9",
      "values": ["value9"]
    }
  ],
  "not_tags_any": [{
    "key": "key7",
    "values": ["value7"]
  }]
}
```

- Filtering images that meet the conditions specified by **tags**

```
POST https://{Endpoint}/v2/fd73a4a14a4a4dfb9771a8475e5198ea/images/resource_instances/action
{
  "action": "filter",
  "limit": "1",
  "offset": "0",
  "matches": [{
    "key": "resource_name",
    "value": "test100"
  }],
  "tags": [
    {
      "key": "key3",
      "values": ["valueXX"]
    }
  ],
  "tags_any": [
    {
      "key": "key0",
      "values": ["valueXX"]
    }
  ],
  "not_tags": [
    {
      "key": "key9",
      "values": ["value9"]
    }
  ],
  "not_tags_any": [{
    "key": "key7",
    "values": ["value7"]
  }]
}
```

## Response

- Response parameters

Parameter	Type	Description
resources	Array of <b>resource</b> objects	Lists the images.
total_count	Integer	Specifies the total number of query records.

**Table 5-18** Data structure description of the resource field

Parameter	Type	Description
resource_id	String	Specifies the image ID.
resource_detail	<b>ResourceDetail</b> object	Provides image details.
tags	Array of <b>Tags</b> objects	Lists the image tags.
resource_name	String	Specifies the image name.

**Table 5-19** ResourceDetail object

Parameter	Type	Mandatory	Description
status	string	Yes	Specifies the image status.

**Table 5-20** Data structure description of the resource\_tag field

Parameter	Type	Description
key	String	Specifies the key of the tag.
value	String	Specifies the value of the tag.

- Example response

- Example response when **action** is set to **count**

STATUS CODE 200

```
{
  "total_count": 36
}
```

- Example response when **action** is set to **filter**

STATUS CODE 200

```
{
  "total_count": 36,
  "resources": [{
    "resource_name": "test10002",
    "resource_detail": {"status": "active"},
    "tags": [{
      "value": "value4",
      "key": "key4"
    }],
    {
      "value": "valueXX",
      "key": "key3"
    },
    {
      "value": "value2",
      "key": "key2"
    },
    {
      "value": "value5",
      "key": "key5"
    },
    {
      "value": "value8",
      "key": "key8"
    },
    {
      "value": "valueXX",
      "key": "key6"
    },
    {
      "value": "valueXX",
      "key": "key0"
    },
    {
      "value": "value1",
      "key": "key1"
    }
  ]
}
```

```
    },  
    {  
      "value": "value7",  
      "key": "key7"  
    },  
    {  
      "value": "valueXX",  
      "key": "key9"  
    }  
  ],  
  "resource_id": "8693187d-1590-4f9f-ae34-eb9e3037cf68"  
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.2.4 Adding or Deleting Image Tags in Batches

### Function

This API is used to add tags to, update tags of, or delete tags from an image in batches.

### Constraints

- Each tag consists of a key and a value. The key contains at most 36 characters, and the value contains at most 43 characters. The key cannot be left blank or an empty character string. The value cannot be left blank but can be an empty character string.
- An image can have a maximum of 10 tags.
- The keys of multiple tags in the request body must be unique.
- This API is an idempotent one.

If a tag to be added has the same key as an existing tag, but the tag values are different, this tag will be added and overwrite the existing one. If a tag to be added has the same key and value as an existing tag, this tag will not be added.

If the specified tag does not exist, the deletion is considered successful by default.

- Restrictions on tag keys and values during batch deletion

During the deletion, the system will not verify the character set range of the key and value. The key cannot be left blank or an empty character string. The value is optional and will not be not verified. If the tag to be deleted does not exist, the deletion is considered successful and no error is reported. Also, the system will not verify the length of both the key and value. The key can contain a maximum of 127 characters, and the value contains a maximum of 255 characters.

## URI

POST /v2/{project\_id}/images/{image\_id}/tags/action

[Table 5-21](#) lists the parameters in the URI.

**Table 5-21** Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Specifies the project ID.
image_id	Yes	String	Specifies the image ID.

## Request

- Request parameters

Parameter	Mandatory	Type	Description
tags	Yes	Array of objects	Lists the tags to be added or deleted. For details, see <a href="#">Table 5-22</a> .
action	Yes	String	Specifies the tag operation to be performed. The value is case sensitive and can be <b>create</b> or <b>delete</b> . <b>create</b> indicates that tags will be added or updated, while <b>delete</b> indicates that tags will be deleted.

**Table 5-22** Data structure description of the tags field

Parameter	Mandatory	Type	Description
key	Yes	String	Specifies the tag key. The tag key cannot be left blank.
value	Yes	String	Specifies the tag value.

## Example Request

- Adding tags for an image (**key1:value1, key2:value2**)

POST <https://{Endpoint}/v2/fd73a4a14a4a4dfb9771a8475e5198ea/images/67e17426-359e-49fb-aa12-0bd1756ec240/tags/action>

```
{
  "tags": [
    {
      "value": "value1",
      "key": "key1"
    },
    {
      "value": "value2",
      "key": "key2"
    },
    {
      "value": "",
      "key": "key3"
    }
  ],
  "action": "create"
}
```

- Deleting image tags (**key1:value1, key2:value2**)

POST <https://{Endpoint}/v2/fd73a4a14a4a4dfb9771a8475e5198ea/images/67e17426-359e-49fb-aa12-0bd1756ec240/tags/action>

```
{
  "tags": [
    {
      "value": "value1",
      "key": "key1"
    },
    {
      "value": "value2",
      "key": "key2"
    },
    {
      "value": "",
      "key": "key3"
    }
  ],
  "action": "delete"
}
```

## Response

- Response parameters

None

- Example response

STATUS CODE 204

## Returned Values

- Normal

204

- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.2.5 Adding an Image Tag

### Function

This API is used to add a tag to an image or update a tag.

### Constraints

- Each tag consists of a key and a value. The key contains at most 36 characters, and the value contains at most 43 characters. The key cannot be left blank or an empty character string. The value cannot be left blank but can be an empty character string.
- An image can have a maximum of 10 tags.
- This API is an idempotent API. If a tag to be added has the same key as an existing tag, but the tag values are different, this tag will be added and overwrite the existing one. If a tag to be added has the same key and value as an existing tag, this tag will not be added.

### URI

POST /v2/{project\_id}/images/{image\_id}/tags

[Table 5-23](#) lists the parameters in the URI.

**Table 5-23** Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Specifies the project ID.
image_id	Yes	String	Specifies the image ID.

### Request

- Request parameters

Parameter	Mandatory	Type	Description
tag	Yes	Object	Specifies the tag to be added or updated. For details, see <a href="#">Table 5-24</a> .

**Table 5-24** Data structure description of the tag field

Parameter	Mandatory	Type	Description
key	Yes	String	Specifies the tag key. The tag key cannot be left blank.
value	Yes	String	Specifies the tag value.

## Example Request

Adding an image tag (**key1:value1**)

```
POST https://{Endpoint}/v2/fd73a4a14a4a4dfb9771a8475e5198ea/images/67e17426-359e-49fb-aa12-0bd1756ec240/tags
{
  "tag": {
    "value": "value1",
    "key": "key1"
  }
}
```

## Response

- Response parameters  
None
- Example response  
STATUS CODE 204

## Returned Values

- Normal  
204
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.

Returned Value	Description
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.2.6 Deleting an Image Tag

### Function

This API is used to delete a specified tag from an image.

### Constraints

- To be compatible with remaining tags, the system will not verify the character set and length of the keys and values in the query condition.
- This API is a non-idempotent one. If the key to be deleted does not exist, status code 404 is returned.

### URI

DELETE /v2/{project\_id}/images/{image\_id}/tags/{key}

[Table 5-25](#) lists the parameters in the URI.

**Table 5-25** Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Specifies the project ID.
image_id	Yes	String	Specifies the image ID.
key	Yes	String	Specifies the key of the tag to be deleted.

### Request

Request parameters

None

### Example Request

Deleting an image tag

```
DELETE https://{Endpoint}/v2/fd73a4a14a4a4dfb9771a8475e5198ea/images/67e17426-359e-49fb-aa12-0bd1756ec240/tags/key1
```

### Response

- Response parameters

- None
- Example response  
STATUS CODE 204

## Returned Values

- Normal  
204
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.2.7 Querying Tags of an Image

### Function

This API is used to query all the tags of a specified image.

### URI

GET /v2/{project\_id}/images/{image\_id}/tags

[Table 5-26](#) lists the parameters in the URI.

**Table 5-26** Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Specifies the project ID.
image_id	Yes	String	Specifies the image ID.

### Request

Request parameters

None

## Example Request

Querying tags of an image

```
GET https://{Endpoint}/v2/fd73a4a14a4a4dfb9771a8475e5198ea/images/67e17426-359e-49fb-aa12-0bd1756ec240/tags
```

## Response

- Response parameters

Parameter	Type	Description
tags	Array of objects	Lists the returned tags. For details, see <a href="#">Table 5-27</a> .

**Table 5-27** Data structure description of the tags field

Parameter	Type	Description
key	String	Specifies the tag key.
value	String	Specifies the tag value.

- Example response

```
STATUS CODE 200
{
  "tags": [{
    "value": "value0",
    "key": "key0"
  },
  {
    "value": "value0",
    "key": "key1"
  }]
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.

Returned Value	Description
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.2.8 Querying All Image Tags

### Function

This API is used to query all the image tags.

### URI

GET /v2/{project\_id}/images/tags

[Table 5-28](#) lists the parameters in the URI.

**Table 5-28** Parameter description

Parameter	Mandatory	Type	Description
project_id	Yes	String	Specifies the project ID.

### Request

Request parameters

None

### Example Request

Querying all image tags

GET https://{Endpoint}/v2/fd73a4a14a4a4dfb9771a8475e5198ea/images/tags

### Response

- Response parameters

Parameter	Type	Description
tags	Array of objects	Lists tags. For details, see <a href="#">Table 5-29</a> .

**Table 5-29** Data structure description of the tags field

Parameter	Type	Description
key	String	Specifies the tag key.
values	Array of strings	Lists the tag values. If a tag contains the key only, tag values will be empty character strings.

- Example response

STATUS CODE 200

```
{
  "tags": [{
    "values": ["value9"],
    "key": "key9"
  },
  {
    "values": [""],
    "key": "key8"
  },
  {
    "values":
      ["valueXX",
       "value3"],
    "key": "key3"
  }
]
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error
503 Service Unavailable	The service is unavailable.

## 5.3 Image Sharing

## 5.3.1 Deleting Image Sharing Members

### Function

This API is an extension one and used to stop sharing images by deleting tenants the image is shared with.

This API is an asynchronous one. If **job\_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails. For details about how to query the status of an asynchronous task, see [Querying the Status of an Asynchronous Job](#).

### URI

DELETE /v1/cloudimages/members

### Request

Request parameters

Parameter	Mandatory	Type	Description
images	Yes	Array of strings	Specifies the image IDs.
projects	Yes	Array of strings	Specifies the project IDs.

### Example Request

Deleting image recipients who can use shared images (image IDs: d164b5df-1bc3-4c3f-893e-3e471fd16e64, 0b680482-aaaa-4045-b14c-9a8c7dfe9c70; project IDs: 9c61004714024f9586705d090530f9fa, edc89b490d7d4392898e19b2deb34797)

```
DELETE https://{Endpoint}/v1/cloudimages/members
{
  "images": [
    "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
    "0b680482-aaaa-4045-b14c-9a8c7dfe9c70"
  ],
  "projects": [
    "9c61004714024f9586705d090530f9fa",
    "edc89b490d7d4392898e19b2deb34797"
  ]
}
```

### Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see <a href="#">Querying the Status of an Asynchronous Job</a> .

- Example response

```
STATUS CODE 200
{
  "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.3.2 Adding Image Sharing Members

### Function

This API is an extension one and used to share more than one image with multiple tenants.

This API is an asynchronous one. If **job\_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails. For details about how to query the status of an asynchronous task, see [Querying the Status of an Asynchronous Job](#).

### URI

POST /v1/cloudimages/members

## Request

- Request parameters

Parameter	Mandatory	Type	Description
images	Yes	Array of strings	Specifies the image IDs.
projects	Yes	Array of strings	Specifies the project IDs.

## Example Request

Adding tenants who can use shared images (image IDs: d164b5df-1bc3-4c3f-893e-3e471fd16e64, 0b680482-aaaa-4045-b14c-9a8c7dfe9c70; project IDs: 9c61004714024f9586705d090530f9fa, edc89b490d7d4392898e19b2deb34797)

```
POST https://{Endpoint}/v1/cloudimages/members
{
  "images": [
    "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
    "0b680482-aaaa-4045-b14c-9a8c7dfe9c70"
  ],
  "projects": [
    "9c61004714024f9586705d090530f9fa",
    "edc89b490d7d4392898e19b2deb34797"
  ]
}
```

## Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see <a href="#">Querying the Status of an Asynchronous Job</a> .

- Example response

```
STATUS CODE 200
{
  "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

### 5.3.3 Updating the Sharing Status for Images

#### Function

This API is an extension one and used to update the image sharing status after the tenant accepts or rejects the shared images.

This API is an asynchronous one. If **job\_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails. For details about how to query the status of an asynchronous task, see [Querying the Status of an Asynchronous Job](#).

#### URI

PUT /v1/cloudimages/members

#### Request

Request parameters

Parameter	Mandatory	Type	Description
images	Yes	Array of strings	Specifies the image IDs.
project_id	Yes	String	Specifies the project ID.

Parameter	Mandatory	Type	Description
status	Yes	String	<p>Specifies whether a shared image will be accepted or declined.</p> <p>The value can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>accepted:</b> indicates that a shared image is accepted. After an image is accepted, the image is displayed in the image list. You can use the image to create ECSs.</li> <li>• <b>rejected:</b> indicates that a shared image is declined. After an image is declined, the image is not displayed in the image list. However, you can still use the image to create ECSs.</li> </ul>

## Example Request

Updating the sharing status of non-full-ECS images to **accepted** in batches

```
PUT https://{Endpoint}/v1/cloudimages/members
{
  "images": [
    "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
    "0b680482-acaa-4045-b14c-9a8c7dfe9c70"
  ],
  "project_id": "edc89b490d7d4392898e19b2deb34797",
  "status": "accepted"
}
```

## Response

- Response parameters

Parameter	Type	Description
job_id	String	<p>Specifies the asynchronous job ID.</p> <p>For details, see <a href="#">Querying the Status of an Asynchronous Job</a>.</p>

- Example response

```
STATUS CODE 200
{
  "job_id": "edc89b490d7d4392898e19b2deb34797"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.4 Image Replication

### 5.4.1 Replicating an Image Within a Region

#### Function

This API is an extension one and is used to copy an existing image to another image. When replicating an image, you can change the image attributes to meet the requirements of different scenarios.

This API is an asynchronous one. If **job\_id** is returned, the task is successfully delivered. You need to query the status of the asynchronous task. If the status is **success**, the task is successfully executed. If the status is **failed**, the task fails. For details about how to query the status of an asynchronous task, see [Querying the Status of an Asynchronous Job](#).

#### Constraints

- Full-ECS images cannot be replicated within the same region.
- Private images created using ISO files do not support in-region replication.

#### URI

POST /v1/cloudimages/{image\_id}/copy

[Table 5-30](#) lists the parameters in the URI.

**Table 5-30** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. For details about how to obtain the image ID, see <a href="#">Querying Images</a> .

## Request

- Request parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
description	No	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> . The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed. This parameter is left blank by default.
cmk_id	No	String	Specifies the encryption key. This parameter is left blank by default.

## Example Request

Replicating an image (name: ims\_encrypted\_copy3) within a region

```
POST https://{Endpoint}/v1/cloudimages/465076de-dc36-4aec-80f5-ef9d8009428f/copy
{
  "name": "ims_encrypted_copy3",
  "description": "test copy",
  "cmk_id": "bd66288c-9081-460a-8227-4cbd0c814cb4"
}
```

## Response

- Response parameters

Parameter	Type	Description
job_id	String	Specifies the asynchronous job ID. For details, see <a href="#">Querying the Status of an Asynchronous Job</a> .

- Example response

STATUS CODE 200

```
{  
  "job_id": "edc89b490d7d4392898e19b2deb34797"  
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.5 Image Quota

### 5.5.1 Querying the Image Quota

#### Function

This extension API is used to query the quota of private images of a tenant in the current region.

#### URI

GET /v1/cloudimages/quota

#### Request

Request parameters

None

## Example Request

Querying the image quota

GET https://{Endpoint}/v1/cloudimages/quota

## Response

- Response parameters

Parameter	Type	Description
quotas	Object	Specifies the quota information. For details, see <a href="#">Table 5-31</a> .

**Table 5-31** Data structure description of the quotas field

Parameter	Type	Description
resources	Array of objects	Specifies the images included in the quota. For details, see <a href="#">Table 5-32</a> .

**Table 5-32** Data structure description of the quotas.resources field

Parameter	Type	Description
type	String	Specifies the type of the resource to be queried.
used	Integer	Specifies the used quota.
quota	Integer	Specifies the total quota.
min	Integer	Specifies the minimum quota.
max	Integer	Specifies the maximum quota.

- Example response

STATUS CODE 200

```
{
  "quotas": {
    "resources": [
      {
        "type": "image",
        "used": 0,
        "quota": 20,
        "min": 1,
        "max": 1000
      }
    ]
  }
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 5.6 Image Jobs

### 5.6.1 Querying the Status of an Asynchronous Job

#### Function

This is an extension API. It is used to query for the execution status of an asynchronous job, for example, querying for the execution status of an image exporting job.

#### URI

GET /v1/{project\_id}/jobs/{job\_id}

[Table 5-33](#) lists the parameters in the URI.

**Table 5-33** Parameter description

Parameter	Mandatory	Description
project_id	Yes	Specifies the project ID.
job_id	Yes	Specifies the asynchronous job ID.

#### Request

Request parameters

None

## Example Request

Querying the status of an asynchronous job

```
GET /v1/ac234de25c6741d2b1273da49eea1b9e/jobs/ff8080814dbd65d7014dbe0d84db0013
```

## Response

- Response parameters

Parameter	Type	Description
status	String	Specifies the job status. The value can be: <ul style="list-style-type: none"><li>• <b>SUCCESS</b>: The job is successfully executed.</li><li>• <b>FAIL</b>: The job failed to be executed.</li><li>• <b>RUNNING</b>: The job is in progress.</li><li>• <b>INIT</b>: The job is being initialized.</li></ul>
job_id	String	Specifies the job ID.

Parameter	Type	Description
job_type	String	<p>Specifies the job type.</p> <ul style="list-style-type: none"> <li>• <b>imsCreateImageByInstance:</b> Creating a system disk image from a cloud server</li> <li>• <b>imsImportImageJob:</b> Creating a system disk image from an external image file</li> <li>• <b>imsImportOvalImageJob:</b> Creating an image from an OVA image file</li> <li>• <b>imsVolumeCreateImageJob:</b> Creating a data disk image from a cloud server</li> <li>• <b>imsImportDataImageJob:</b> Creating a data disk image from an external image file</li> <li>• <b>imsCreateWholeImageByInstanceJob:</b> Creating a full-ECS image from an ECS</li> <li>• <b>imsCreateWholeImageByBackupJob:</b> Creating a full-ECS image from a CBR or CSBS backup</li> <li>• <b>imsNativeImportImageJob:</b> Registering an image</li> <li>• <b>imsNativeExportImageJob:</b> Exporting image</li> <li>• <b>imsAddImageMembersJob:</b> Adding tenants that can use a shared image</li> <li>• <b>imsDelImageMembersJob:</b> Deleting tenants that can use a shared image</li> <li>• <b>imsUpdateImageMembersJob:</b> Updating status of tenants who will accept or reject shared images</li> <li>• <b>imsCopyImageInRegionJob:</b> Replicating images</li> </ul>
begin_time	String	Specifies the start time of the job. The value is in UTC format.
end_time	String	Specifies the end time of the job. The value is in UTC format.
error_code	String	Specifies the error code.
fail_reason	String	Specifies the failure cause.

Parameter	Type	Description
entities	Object	Specifies the custom attributes of the job. If the job status is normal, the image ID will be returned. If the status is abnormal, an error code and details will be returned. For details, see <a href="#">Table 5-34</a> .

**Table 5-34** Data structure description of the entities field

Parameter	Type	Description
image_id	String	Specifies the image ID.
current_task	String	Specifies the job name.
image_name	String	Specifies the image name.
process_percent	Double	Specifies the job progress.
results	Array of result objects	Specifies job execution results. For details, see <a href="#">Table 5-35</a> .
sub_jobs_result	Array of objects	Specifies sub-job execution results. For details, see <a href="#">Table 5-36</a> .
sub_jobs_list	Array of string	Specifies the sub-job IDs.

**Table 5-35** Data structure description of the result field

Parameter	Type	Description
image_id	String	Specifies the image ID.
project_id	String	Specifies the project ID.
status	String	Specifies the job status.

**Table 5-36** Data structure description of the SubJobResult field

Parameter	Type	Description
status	String	Specifies the sub-job status. The value can be: <ul style="list-style-type: none"><li>• <b>SUCCESS</b>: The sub-job is successfully executed.</li><li>• <b>FAIL</b>: The sub-job failed to be executed.</li><li>• <b>RUNNING</b>: The sub-job is in progress.</li><li>• <b>INIT</b>: The sub-job is being initialized.</li></ul>
job_id	String	Specifies a sub-job ID.
job_type	String	Specifies the sub-job type.
begin_time	String	Specifies the start time of the sub-job. The value is in UTC format.
end_time	String	Specifies the end time of the sub-job. The value is in UTC format.
error_code	String	Specifies the error code.
fail_reason	String	Specifies the failure cause.
entities	Object	Specifies the custom attributes of the sub-job. For details, see <a href="#">Table 5-37</a> . <ul style="list-style-type: none"><li>• If a sub-job is properly executed, an image ID is returned.</li><li>• If an exception occurs on the sub-job, an error code and associated information are returned.</li></ul>

**Table 5-37** Data structure description of the SubJobEntities field

Parameter	Type	Description
image_id	String	Specifies the image ID.
image_name	String	Specifies the image name.

- Example response

STATUS CODE 200

```
{
  "status": "SUCCESS",
  "entities": {
    "image_id": "e9e91bff-14b6-4a0b-8377-4ed0813e3360",
    "image_name": "asdfsdfasdfas",
    "process_percent": 0.20,
    "current_task": "CreateImageByInstanceTask",
    "results": [{
      "image_id": "49e9447f-7dff-41e0-8036-f66fe5488c8b",
      "project_id": "089b2f9a3d80d3062f24c00ca4ed5cbd",
```

```
        "status": "success"
      }
    ]
  },
  "job_id": "ff8080814dbd65d7014dbe0d84db0013",
  "job_type": "createImageByInstance",
  "begin_time": "04-Jun-2015 18:11:06:586",
  "end_time": "",
  "error_code": null,
  "fail_reason": null
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

# 6 Native OpenStack APIs

---

## 6.1 Image (Native OpenStack APIs)

### 6.1.1 Querying Images (Native OpenStack API)

#### Function

This API is used to obtain the image list.

This API does not return the complete result at once, but uses pagination.

#### Pagination

Pagination refers to the function of returning a subset of a group of images, a link to obtain the next set of images, and a link of the set of images. By default, a set contains 25 images. You can also use the **limit** and **marker** parameters to paginate through images manually and specify the number of images that can be returned.

The parameter **first** in the response indicates the URL of the first page of images, and parameter **next** indicates the URL of the next page of images. When the last page of images is queried, there is no parameter **next**.

#### URI

GET /v2/images

#### NOTE

- You can type a question mark (?) and an ampersand (&) at the end of the URI to define multiple search criteria. For details, see the example request.

[Table 6-1](#) lists the parameters in the URI.

**Table 6-1** Parameter description

Parameter	Mandatory	Type	Description
__isregistered	No	String	Specifies whether the image is available. The value can be <b>true</b> . The value is <b>true</b> for all extension APIs by default. Common users can query only the images for which the value of this parameter is <b>true</b> .
__imagetype	No	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>• Public image: The value is <b>gold</b>.</li> <li>• Private image: The value is <b>private</b>.</li> <li>• Shared image: The value is <b>shared</b>.</li> </ul>
protected	No	Boolean	Specifies whether the image is protected. The value is <b>true</b> or <b>false</b> . Set it to <b>true</b> when you query public images. This parameter is optional when you query private images.
visibility	No	String	Specifies whether the image is available to other tenants. Available values include: <ul style="list-style-type: none"> <li>• <b>public</b>: public image</li> <li>• <b>private</b>: private image</li> <li>• <b>shared</b>: shared image</li> </ul>
owner	No	String	Specifies the tenant to which the image belongs.
id	No	String	Specifies the image ID.

Parameter	Mandatory	Type	Description
status	No	String	Specifies the image status. The value can be one of the following: <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
name	No	String	Specifies the image name. Exact matching is used. For detailed description, see <a href="#">Image Attributes</a> .
container_format	No	String	Specifies the container type. The default value is <b>bare</b> .
disk_format	No	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
min_ram	No	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is <b>0</b> .
min_disk	No	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.
__os_bit	No	String	Specifies the OS architecture, 32 bit or 64 bit.

Parameter	Mandatory	Type	Description
__platform	No	String	Specifies the image platform type. The value can be <b>Windows, Ubuntu, Red Hat, SUSE, CentOS, Debian, OpenSUSE, Oracle Linux, Fedora, Other, CoreOS, or EulerOS.</b>
marker	No	String	Specifies the start number from which images are queried. The value is the image ID.
limit	No	Integer	Specifies the number of images to be queried. The value is an integer. By default, 25 images can be queried.
sort_key	No	String	Specifies the field for sorting the query results. The value can be an attribute of the image: <b>name, container_format, disk_format, status, id, size, or created_at.</b> The default value is <b>created_at.</b>
sort_dir	No	String	Specifies whether the query results are sorted in ascending or descending order. Its value can be <b>desc</b> (default) or <b>asc.</b> This parameter is used together with parameter <b>sort_key.</b> The default value is <b>desc.</b>
__os_type	No	String	Specifies the image OS type. The value can be <b>Linux, Windows, or Other.</b>
tag	No	String	Specifies a tag added to an image. Tags can be used as a filter to query images.
member_statuses	No	String	Specifies the member status. The value can be <b>accepted, rejected, or pending.</b> <b>accepted:</b> indicates that the shared image is accepted. <b>rejected</b> indicates that the image shared by others is rejected. <b>pending</b> indicates that the image shared by others needs to be confirmed. To use this parameter, set <b>visibility</b> to <b>shared</b> during the query.

Parameter	Mandatory	Type	Description
__support_kvm	No	String	Specifies whether the image supports KVM. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen	No	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_large_memory	No	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For details about the image OSs supported by large-memory ECSs, see <a href="#">Table 9-4</a> .
__support_disk_intensive	No	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For details about the image OSs supported by disk-intensive ECSs, see <a href="#">Table 9-4</a> .
__support_high_performance	No	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For details about the image OSs supported by high-performance computing ECSs, see <a href="#">Table 9-4</a> .
__support_xen_gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. For details about the image OSs supported by GPU-accelerated ECSs, see <a href="#">Table 9-2</a> . If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .

Parameter	Mandatory	Type	Description
__support_kvm _gpu_type	No	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_xen _hana	No	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.  This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm _infiniband	No	String	Specifies whether the image supports ECSs with InfiniBand NICs on the KVM platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.  This attribute cannot co-exist with <b>__support_xen</b> .

Parameter	Mandatory	Type	Description
created_at	No	String	<p>Specifies the time when the image was created. Images can be queried by time. The value is in the format of <i>Operator:UTC time</i>.</p> <p>The following operators are supported:</p> <ul style="list-style-type: none"> <li>• gt: greater than</li> <li>• gte: greater than or equal to</li> <li>• lt: less than</li> <li>• lte: less than or equal to</li> <li>• eq: equal to</li> <li>• neq: not equal to</li> </ul> <p>The time format is <i>yyyy-MM-ddThh:mm:ssZ</i> or <i>yyyy-MM-dd hh:mm:ss</i>.</p> <p>For example, to query images created before Oct 28, 2018 10:00:00, set the value of <b>created_at</b> to <b>lt:2018-10-28T10:00:00Z</b>.</p>
updated_at	No	String	<p>Specifies the time when the image was modified. Images can be queried by time. The value is in the format of <i>Operator:UTC time</i>.</p> <p>The following operators are supported:</p> <ul style="list-style-type: none"> <li>• gt: greater than</li> <li>• gte: greater than or equal to</li> <li>• lt: less than</li> <li>• lte: less than or equal to</li> <li>• eq: equal to</li> <li>• neq: not equal to</li> </ul> <p>The time format is <i>yyyy-MM-ddThh:mm:ssZ</i> or <i>yyyy-MM-dd hh:mm:ss</i>.</p> <p>For example, to query images updated before Oct 28, 2018 10:00:00, set the value of <b>updated_at</b> to <b>lt:2018-10-28T10:00:00Z</b>.</p>

## Common Query Methods

- Public images  
GET /v2/images?\_\_imagetype=gold&visibility=public&protected=true
- Private images  
GET /v2/images?owner={project\_id}
- Available shared images  
GET /v2/images?  
member\_status=accepted&visibility=shared&\_\_imagetype=shared
- Rejected images  
GET /v2/images?  
member\_status=rejected&visibility=shared&\_\_imagetype=shared
- Unaccepted images  
GET /v2/images?  
member\_status=pending&visibility=shared&\_\_imagetype=shared

## Request

Request parameters

None

## Example Request

Querying images

```
GET https://{Endpoint}/v2/images
```

## Response

- Response parameters

Parameter	Type	Description
first	String	Specifies the URL of the first page of images.
next	String	Specifies the URL of the next page of images. When the last page of images is queried, there is no parameter <b>next</b> .
schema	String	Specifies the URL for the schema describing a list of images.
images	Array of objects	Specifies the resource type. For details, see <a href="#">Table 6-2</a> .

**Table 6-2** Data structure description of the images field

Parameter	Type	Description
__backup_id	String	Specifies the backup ID. If the image is created from a backup, set the value to the backup ID. Otherwise, this parameter is not required.
__data_origin	String	Specifies the image source. If the image is a public image, the value is left empty.
__description	String	Specifies the image description.
__image_location	String	Specifies the location where the image is stored.
__image_size	String	Specifies the size (bytes) of the image file. The value is greater than 0.
__image_source_type	String	Specifies the backend storage of the image. Only UDS is supported currently.
__is_config_init	String	Specifies whether initial configuration is complete. The value can be <b>true</b> or <b>false</b> .
__isregistered	String	Specifies whether the image is available. The value can be <b>true</b> . The value is <b>true</b> for all extension APIs by default. Common users can query only the images for which the value of this parameter is <b>true</b> .
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be <b>true</b> , <b>false</b> , <b>True</b> , or <b>False</b> .
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, the value is left empty.

Parameter	Type	Description
__imagetype	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>Public image: The value is <b>gold</b>.</li> <li>Private image: The value is <b>private</b>.</li> <li>Shared image: The value is <b>shared</b>.</li> </ul>
protected	Boolean	Specifies whether the image is protected. Set it to <b>true</b> when you query public images. This parameter is optional when you query private images.
virtual_env_type	String	Specifies the environment where the image is used. The value can be <b>FusionCompute</b> , <b>Ironic</b> , <b>Datalmage</b> , or <b>Isolmage</b> . <ul style="list-style-type: none"> <li>For an ECS image (system disk image), the value is <b>FusionCompute</b>.</li> <li>For a data disk image, the value is <b>Datalmage</b>.</li> <li>For a BMS image, the value is <b>Ironic</b>.</li> <li>For an ISO image, the value is <b>Isolmage</b>.</li> </ul>
virtual_size	Integer	This parameter is unavailable currently.
visibility	String	Specifies whether the image is available to other tenants. The value can be one of the following: <ul style="list-style-type: none"> <li><b>public</b>: public image</li> <li><b>private</b>: private image</li> <li><b>shared</b>: shared image</li> </ul>
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.

Parameter	Type	Description
status	String	Specifies the image status. The value can be one of the following: <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
name	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
container_format	String	Specifies the container type.
disk_format	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is <b>0</b> .
max_ram	String	Specifies the maximum memory (MB) of the image.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.

Parameter	Type	Description
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__platform	String	Specifies the image platform type. The value can be <b>Windows, Ubuntu, Red Hat, SUSE, CentOS, Debian, OpenSUSE, Oracle Linux, Fedora, Other, CoreOS, or EulerOS</b> .
schema	String	Specifies the image schema.
self	String	Specifies the image URL.
size	Integer	This parameter is unavailable currently.
__os_type	String	Specifies the image OS type. The value can be <b>Linux, Windows, or Other</b> .
__os_version	String	Specifies the OS version.
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way.
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_largememory	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For details about the image OSs supported by large-memory ECSs, see <a href="#">Table 9-4</a> .

Parameter	Type	Description
__support_diskintensive	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For details about the image OSs supported by disk-intensive ECSs, see <a href="#">Table 9-4</a> .
__support_highperformance	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For details about the image OSs supported by high-performance computing ECSs, see <a href="#">Table 9-4</a> .
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. For details about the image OSs supported by GPU-accelerated ECSs, see <a href="#">Table 9-2</a> . If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .

Parameter	Type	Description
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with InfiniBand NICs on the KVM platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> .
__root_origin	String	Specifies that the image is created from an external image file. Value: <b>file</b>
__sequence_num	String	Specifies the ECS system disk slot number of the image. Example value: <b>0</b>
created_at	String	Specifies the time when the image was created. The value is in UTC format.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
active_at	String	Specifies the time when the image status became <b>active</b> .
checksum	String	This parameter is unavailable currently.
hw_firmware_type	String	Specifies the ECS boot mode. Available values include: <ul style="list-style-type: none"> <li>• <b>bios</b> indicates the BIOS boot mode.</li> <li>• <b>uefi</b> indicates the UEFI boot mode.</li> </ul>
file	String	Specifies the URL for uploading and downloading the image file.

Parameter	Type	Description
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be <b>true</b> or <b>false</b> .
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be <b>true</b> or <b>false</b> .

- Example response

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details about the returned error code, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.1.2 Querying Image Details (Native OpenStack API)

### Function

This API is used to query details about a public or private image.

### URI

GET /v2/images/{image\_id}

[Table 6-3](#) lists the parameters in the URI.

**Table 6-3** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

## Request

Request parameters

None

## Example Request

Querying details of an image

GET <https://{{Endpoint}}/v2/images/33ad552d-1149-471c-8190-ff6776174a00>

## Response

- Response parameters

Parameter	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.

Parameter	Type	Description
status	String	<p>Specifies the image status. The value can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
tags	Array of strings	<p>Specifies tags of the image, through which you can manage private images in your own way. You can use the image tag API to add different tags to each image and filter images by tag.</p>
visibility	String	<p>Specifies whether the image is available to other tenants. Available values include:</p> <ul style="list-style-type: none"> <li>• <b>private</b>: private image</li> <li>• <b>public</b>: public image</li> <li>• <b>shared</b>: shared image</li> </ul>
name	String	<p>Specifies the image name. For detailed description, see <a href="#">Image Attributes</a>.</p>
checksum	String	<p>This parameter is unavailable currently.</p>

Parameter	Type	Description
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be <b>true</b> or <b>false</b> .
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. Generally, the value is <b>0</b> .
max_ram	String	Specifies the maximum memory (MB) of the image. You can set this parameter based on the ECS specifications. Generally, you do not need to set this parameter.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Specifies the image description. For detailed description, see <a href="#">Image Attributes</a> .
disk_format	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be <b>true</b> or <b>false</b> .

Parameter	Type	Description
__platform	String	Specifies the image platform type. The value can be <b>Windows</b> , <b>Ubuntu</b> , <b>Red Hat</b> , <b>SUSE</b> , <b>CentOS</b> , <b>Debian</b> , <b>OpenSUSE</b> , <b>Oracle Linux</b> , <b>Fedora</b> , <b>Other</b> , <b>CoreOS</b> , or <b>EulerOS</b> .
__os_type	String	Specifies the OS type. The value can be <b>Linux</b> , <b>Windows</b> , or <b>Other</b> .
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.
virtual_env_type	String	Specifies the environment where the image is used. The value can be <b>FusionCompute</b> , <b>Ironic</b> , <b>DataImage</b> , or <b>IsolImage</b> . <ul style="list-style-type: none"> <li>• For an ECS image (system disk image), the value is <b>FusionCompute</b>.</li> <li>• For a data disk image, the value is <b>DataImage</b>.</li> <li>• For a BMS image, the value is <b>Ironic</b>.</li> <li>• For an ISO image, the value is <b>IsolImage</b>.</li> </ul>
__image_source_type	String	Specifies the backend storage of the image. Only UDS is supported currently.

Parameter	Type	Description
__imagetype	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>• Public image: The value is <b>gold</b>.</li> <li>• Private image: The value is <b>private</b>.</li> <li>• Shared image: The value is <b>shared</b>.</li> </ul>
created_at	String	Specifies the time when the image was created. The value is in UTC format.
virtual_size	Integer	This parameter is unavailable currently.
__originalimagename	String	Specifies the parent image ID. If the image is a public image or created from an image file, this value is left empty.
__backup_id	String	Specifies the backup ID. To create an image using a backup, set the value to the backup ID. Otherwise, this value is left empty.
__image_size	String	Specifies the size (bytes) of the image file. The value is greater than 0.
__data_origin	String	Specifies the image source. If the image is a public image, this parameter is left empty.
__root_origin	String	Specifies that the image is created from an external image file. Value: <b>file</b>
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be <b>true</b> , <b>false</b> , <b>True</b> , or <b>False</b> .

Parameter	Type	Description
active_at	String	Specifies the time when the image status became <b>active</b> .
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__sequence_num	String	This parameter is unavailable currently.
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_largememory	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For the supported OSs, see <a href="#">Table 9-4</a> .
__support_diskintensive	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_highperformance	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.

Parameter	Type	Description
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See <a href="#">Table 9-2</a> for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with InfiniBand NICs on the KVM platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> .

Parameter	Type	Description
hw_firmware_type	String	Specifies the ECS boot mode. Available values include: <ul style="list-style-type: none"> <li>• <b>bios</b> indicates the BIOS boot mode.</li> <li>• <b>uefi</b> indicates the UEFI boot mode.</li> </ul>
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be <b>true</b> or <b>false</b> .
__image_location	String	Specifies the location where the image is stored.
__is_config_init	String	Specifies whether initial configuration is complete. The value can be <b>true</b> or <b>false</b> .
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be <b>true</b> or <b>false</b> .

## 6.1.3 Updating Image Information (Native OpenStack API)

### Function

This API is used to modify image information.

### Constraints

Only customized attributes, image name, and image description can be modified.

### URI

PATCH /v2/images/{image\_id}

[Table 6-4](#) lists the parameters in the URI.

**Table 6-4** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID. For details about how to obtain the image ID, see <a href="#">Querying Images</a> .

### Request

- Request parameters

Glance has two methods of updating image information. The method is specified by **Content-Type** in the HTTP header. **application/openstack-images-v2.0-json-patch** and **application/openstack-images-v2.1-json-patch** are supported. Content types differ only in the format of the request message body.

**Table 6-5** v2.1 request message body

Parameter	Mandatory	Type	Description
[Array]	Yes	Array of objects	For details, see <a href="#">Table 6-6</a> .

**Table 6-6** Data structure description of the [Array] field

Parameter	Type	Mandatory	Description
op	String	Yes	Indicates the type of the update operation, including replacing, adding, and deleting an attribute. The value can be <b>replace</b> , <b>add</b> , or <b>remove</b> .
path	String	Yes	Indicates the name of the target attribute. For <b>replace</b> and <b>remove</b> , the value can only be an existing attribute of the image. For <b>add</b> , the value can be an existing or a new attribute. If the value is an existing attribute, <b>add</b> takes the same effect as <b>replace</b> . If the value is a new attribute, the <b>add</b> operation is performed. Add a slash (/) before the attribute name.
value	String	No	Indicates the value of the attribute to be updated or added. Mandatory for <b>replace</b> and <b>add</b> , and not for <b>remove</b>

**Table 6-7** v2.0 request message body

Parameter	Mandatory	Type	Description
[Array]	Yes	Array of objects	For details, see <a href="#">Table 6-8</a> .

**Table 6-8** Data structure description of the [Array] field

Parameter	Type	Mandatory	Description
replace	String	Mandatory for any of the three values	Indicates that an image attribute will be replaced. The value is the attribute to be replaced and a slash (/) must be added in front of the attribute name.
add	String		Indicates that an image attribute will be added. The value is the attribute to be added and a slash (/) must be added in front of the attribute name.
remove	String		Indicates that an image attribute will be deleted. The value is the attribute to be deleted and a slash (/) must be added in front of the attribute name.
value	String	Mandatory for <b>replace</b> and <b>add</b> , and not for <b>remove</b>	Indicates the value of the attribute to be updated or added. For detailed description, see <a href="#">Image Attributes</a> .

## Example Request

- Changing the name of an image to `ims_test01` (V2.1 request)

```
PATCH https://{Endpoint}/v2/images/33ad552d-1149-471c-8190-ff6776174a00
"Content-Type:application/openstack-images-v2.1-json-patch"
```

```
[
  {
    "op": "replace",
    "path": "/name",
    "value": "test01"
  }
]
```

- Changing the name of an image to `ims_test01` (V2.0 request)

```
PATCH https://{Endpoint}/v2/images/33ad552d-1149-471c-8190-ff6776174a00
"Content-Type:application/openstack-images-v2.0-json-patch"
```

```
[
  {
    "replace": "/name",
    "value": "test01"
  }
]
```

## Response

- Response parameters

Parameter	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.
status	String	Specifies the image status. The value can be: <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
tags	Array of strings	Specifies tags of the image, through which you can manage private images in your own way. You can use the image tag API to add different tags to each image and filter images by tag.

Parameter	Type	Description
visibility	String	Specifies whether the image is available to other tenants. The value can be: <ul style="list-style-type: none"> <li>• <b>private</b>: private image</li> <li>• <b>public</b>: public image</li> <li>• <b>shared</b>: shared image</li> </ul>
name	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
checksum	String	This parameter is unavailable currently.
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be <b>true</b> or <b>false</b> .
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. The default value is <b>0</b> .
max_ram	String	Specifies the maximum memory (MB) of the image. The parameter value depends on the ECS specifications and is not configured by default.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Provides supplementary information about the image. For detailed description, see <a href="#">Image Attributes</a> .
disk_format	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.

Parameter	Type	Description
__isregistered	String	Specifies whether the image has been registered. The value can be <b>true</b> or <b>false</b> .
__platform	String	Specifies the image platform type. The value can be <b>Windows, Ubuntu, Red Hat, SUSE, CentOS, Debian, OpenSUSE, Oracle Linux, Fedora, Other, CoreOS, or EulerOS</b> .
__os_type	String	Specifies the OS type. The value can be <b>Linux, Windows, or Other</b> .
__system__cmkid	String	Specifies the ID of the key used to encrypt the image.
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.
virtual_env_type	String	Specifies the environment where the image is used. The value can be <b>FusionCompute, Ironic, DataImage, or IsolImage</b> . <ul style="list-style-type: none"> <li>For an ECS image (system disk image), the value is <b>FusionCompute</b>.</li> <li>For a data disk image, the value is <b>DataImage</b>.</li> <li>For a BMS image, the value is <b>Ironic</b>.</li> <li>For an ISO image, the value is <b>IsolImage</b>.</li> </ul>
__image_source_type	String	Specifies the backend storage of the image. Only UDS is supported currently.
__imagetype	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>Public image: The value is <b>gold</b>.</li> <li>Private image: The value is <b>private</b>.</li> <li>Shared image: The value is <b>shared</b>.</li> </ul>
created_at	String	Specifies the time when the image was created. The value is in UTC format.
virtual_size	Integer	This parameter is unavailable currently.

Parameter	Type	Description
__originalimage_name	String	Specifies the parent image ID. If the image is a public image or created from an image file, the value is left empty.
__backup_id	String	Specifies the backup ID. If the image is created from a backup, set the value to the backup ID. Otherwise, this parameter is not required.
__image_size	String	Specifies the size (bytes) of the image file. The value must be greater than <b>0</b> .
__data_origin	String	Specifies the image source. If the image is a public image, the value is left empty.
__root_origin	String	Specifies that the image is created from an external image file. Value: <b>file</b>
__lazyloading	String	Specifies whether the image supports lazy loading. The value can be <b>true</b> , <b>false</b> , <b>True</b> , or <b>False</b> .
active_at	String	Specifies the time when the image status became <b>active</b> .
__os_feature_list	String	Specifies additional attributes of the image. The value is a list (in JSON format) of advanced features supported by the image.
__account_code	String	Specifies the charging identifier for the image.
hw_firmware_type	String	Specifies the ECS boot mode. The value can be: <ul style="list-style-type: none"> <li>• <b>bios</b> indicates the BIOS boot mode. This value will be used by fault if this parameter does not exist in the response.</li> <li>• <b>uefi</b> indicates the UEFI boot mode.</li> </ul>
hw_vif_multiqueue_enabled	String	Specifies whether the image supports NIC multi-queue. The value can be <b>true</b> or <b>false</b> .
__support_kvm	String	Specifies whether the image supports KVM. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.

Parameter	Type	Description
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_large_memory	String	Specifies whether the image can be used to create large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required. For the supported OSs, see <a href="#">Table 9-4</a> .
__support_diskintensive	String	Specifies whether the image can be used to create disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_highperformance	String	Specifies whether the image can be used to create high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. See <a href="#">Table 9-2</a> for its value. If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_xen_hana	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .

Parameter	Type	Description
__support_kvm_infiniband	String	Specifies whether the image supports ECSs with InfiniBand NICs on the KVM platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> .
__sequence_number	String	Specifies the ECS system disk slot number of the image. This parameter is unavailable currently.
__image_location	String	Specifies the location where the image is stored.
__is_config_init	String	Specifies whether initial configuration is complete. The value can be <b>true</b> or <b>false</b> .
__support_amd	String	Specifies whether the image uses AMD's x86 architecture. The value can be <b>true</b> or <b>false</b> .

Parameter	Type	Description
<code>__support_agent_list</code>	String	<p>Specifies the agents configured for the image.</p> <ul style="list-style-type: none"> <li><b>hss:</b> The Host Security Service (HSS) agent is configured for the image. Host Security Service (HSS) is designed to improve the overall security for ECSs. It helps you identify and manage the information on your ECSs, eliminate risks, and defend against intrusions and web page tampering.</li> <li><b>ces:</b> The host monitoring agent is configured for the image. Monitoring is key for ensuring ECS performance, reliability, and availability. Using monitored data, you can determine ECS resource utilization. The cloud platform provides Cloud Eye to help you obtain the running statuses of your ECSs. You can use Cloud Eye to automatically monitor ECSs in real time and manage alarms and notifications to keep track of ECS performance metrics.</li> </ul> <p>Example:  <code>"__support_agent_list": "hss,ces"</code></p> <p><b>NOTE</b>                      If the response does not contain this field, the HSS and host monitoring agents are not configured for the image.</p>

- Example response

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.1.4 Uploading an Image (Native OpenStack API)

### Function

This API is used to upload a local image to the cloud platform. The image to be uploaded must be smaller than 2 GB. To upload an image larger than 2 GB, see [Registering an Image](#).

For more information about how to use external files to create images, see sections "Creating a Private Windows Image Using an External Image File" and "Creating a Private Linux Image Using an External Image File" in *Image Management Service User Guide*.

The following describes how to use this API:

1. Prepare the image to be uploaded. The image can be in QCOW2, VMDK, VHD, RAW, VHDX, QED, VDI, QCOW, ZVHD2, or ZVHD format.

2. Create metadata for the image by performing the operations in [Creating Image Metadata \(Native OpenStack API\)](#). After the API is invoked successfully, save the image ID.
3. Upload the image file with the image ID obtained in 2.

## URI

PUT /v2/images/{image\_id}/file

[Table 6-9](#) lists the parameters in the URI.

**Table 6-9** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	<p>Specifies the image ID.</p> <ul style="list-style-type: none"> <li>• <b>image_id</b> is the ID of the image you created by invoking the API for creating image metadata. Image upload may fail if you use other image IDs.</li> <li>• After this API is invoked, you can check the image status with the image ID. When the image status changes to <b>active</b>, the image is uploaded successfully.</li> </ul>

### NOTE

AK/SK authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, token authentication is recommended.

## Request

- Request parameters

Parameter	Mandatory	Type	Description
<i>image_file</i>	Yes	file	Specifies the local file to be uploaded.

## Example Request

```
PUT https://{Endpoint}/v2/images/84ac7f2b-bf19-4efb-86a0-b5be8771b476/file
```

### NOTE

If you use the curl command to call the API, the example request is as follows:

```
curl -i --insecure 'https://IP/v2/images/84ac7f2b-bf19-4efb-86a0-b5be8771b476/file' -X PUT -H "X-Auth-Token: $mytoken" -H "Content-Type:application/octet-stream" -T /mnt/userdisk/images/suse.zvhd
```

## Response

- Response parameters  
None
- Example response  
HTTP/1.1 204

## Returned Values

- Normal  
204
- Abnormal

Returned Value	Description
400 Bad Request	Request error. For details, see <a href="#">Error Codes</a> .
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
409 Conflict	Request conflict.
500 System Error	System error.

## 6.1.5 Deleting an Image (Native OpenStack API)

### Function

This API is used to delete a private image. You can only delete your own private images.

### URI

DELETE /v2/images/{image\_id}

[Table 6-10](#) lists the parameters in the URI.

**Table 6-10** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

### Request

Request parameters

Parameter	Mandatory	Type	Description
delete_backup	No	Boolean	<p>Specifies whether to delete the CSBS backups associated with a full-ECS image when the image is deleted. The value can be <b>true</b> or <b>false</b>.</p> <ul style="list-style-type: none"> <li><b>true</b>: When a full-ECS image is deleted, its CSBS backups are also deleted.</li> <li><b>false</b>: When a full-ECS image is deleted, its CSBS backups are not deleted.</li> </ul>

## Example Request

Deleting an image

```
DELETE https://{Endpoint}/v2/images/4ca46bf1-5c61-48ff-b4f3-0ad4e5e3ba90
{
  "delete_backup": true
}
```

## Response

- Response parameters  
None
- Example response  
STATUS CODE 204

## Returned Values

- Normal  
204
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.1.6 Creating Image Metadata (Native OpenStack API)

### Function

This API is used to create image metadata.

After the API is successfully invoked, the image metadata is created, but the image file does not exist yet.

### URI

POST /v2/images

### Request

- Request parameters

Parameter	Mandatory	Type	Description
__os_version	No	String	Specifies the image OS version. For the value range, see <a href="#">Values of Related Parameters</a> .  If this parameter is not specified, the value <b>Other Linux(64 bit)</b> will be used. In that case, the ECS creation using this image may fail, and the ECS created using this image may fail to run properly.
visibility	No	String	Specifies whether the image is available to other tenants.  The default value is <b>private</b> . When creating image metadata, the value of <b>visibility</b> can be set to <b>private</b> only.

Parameter	Mandatory	Type	Description
name	No	String	Specifies the image name. If this parameter is not specified, its value is empty by default. In that case, ECS creation using this image will fail. The name contains 1 to 255 characters. For detailed description, see <a href="#">Image Attributes</a> . This parameter is left blank by default.
protected	No	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The default value is <b>false</b> .
container_format	No	String	Specifies the container format. The default value is <b>bare</b> .
disk_format	No	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
tags	No	Array of strings	Lists the image tags. The tag contains 1 to 255 characters. The value is left blank by default. <b>NOTE</b> The tag is a key-value pair. Example: "tagkey=tagvalue"
min_ram	No	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on ECS specifications. The default value is <b>0</b> .

Parameter	Mandatory	Type	Description
min_disk	No	Integer	Specifies the minimum disk space (GB) required for running the image. The value ranges from 1 GB to 1,024 GB.  The value of this parameter must be greater than the image system disk capacity. Otherwise, the ECS creation may fail.

## Example Request

```
POST https://{Endpoint}/v2/images
{
  "_os_version": "Ubuntu 14.04 server 64bit",
  "container_format": "bare",
  "disk_format": "vhd",
  "min_disk": 100,
  "min_ram": 1024,
  "name": "test",
  "tags": [
    "test=testvalue",
    "image=imagevalue"
  ],
  "visibility": "private",
  "protected": false
}
```

## Response

- Response parameters

Parameter	Type	Description
visibility	String	Specifies whether the image is available to other tenants. The value is <b>private</b> .
name	String	Specifies the image name. If this parameter is not specified, its value is empty by default. In that case, ECS creation using this image will fail. The name contains 1 to 128 characters. For detailed description, see <a href="#">Image Attributes</a> .

Parameter	Type	Description
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value is <b>false</b> .
container_format	String	Specifies the container format. The value is <b>bare</b> .
disk_format	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
tags	Array of strings	Lists the image tags. The tag contains 1 to 255 characters.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications limit. The value is generally set to <b>0</b> .
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image. It must be greater than the system disk capacity in the image. Otherwise, the ECS creation will fail. The value ranges from 1 GB to 1,024 GB.

Parameter	Type	Description
status	String	Specifies the image status. The value can be one of the following: <ul style="list-style-type: none"> <li>• <b>queued</b>: indicates that the image metadata has already been created, and it is ready for the image file to upload.</li> <li>• <b>saving</b>: indicates that the image file is being uploaded to the backend storage.</li> <li>• <b>deleted</b>: indicates that the image has been deleted.</li> <li>• <b>killed</b>: indicates that an error occurs on the image uploading.</li> <li>• <b>active</b>: indicates that the image is available for use.</li> </ul>
created_at	String	Specifies the time when the image was created. The value is in UTC format.
updated_at	String	Specifies the time when the image was updated. The value is in UTC format.
self	String	Specifies the image URL.
id	String	Specifies the image ID. After the image creation API is called, the image ID must be saved. The image ID is used to invoke the image uploading API and upload the image.
file	String	Specifies the URL for uploading and downloading the image file.
schema	String	Specifies the URL for accessing the schema.
__image_source_type	String	Specifies the image backend storage type. Only UDS is supported currently.
__image_size	String	Specifies the image size. The unit is byte.

Parameter	Type	Description
__isregistered	String	Specifies whether the image is registered. Only registered images can be queried on the portal. The value is <b>true</b> .
__os_version	String	Specifies the image OS version. For the value range, see <a href="#">Values of Related Parameters</a> .
__os_type	String	Specifies the image OS type. The value of this parameter depends on that of <b>__os_version</b> . The value can be <b>Windows</b> , <b>Linux</b> , or <b>other</b> .
__platform	String	Specifies the OS platform supported by the image. The value of this parameter depends on that of <b>__os_version</b> .
__os_bit	String	Specifies the OS bit. The value of this parameter depends on that of <b>__os_version</b> . The value can be <b>32</b> or <b>64</b> .
__imagetype	String	Specifies the image type. <b>private</b> indicates a private image.
virtual_env_type	String	Specifies the platform type. Specifies the environment where the image is used. The value can be <b>FusionCompute</b> , <b>Ironic</b> , <b>DataImage</b> , or <b>Isolmage</b> . <ul style="list-style-type: none"> <li>For an ECS image, the value is <b>FusionCompute</b>.</li> <li>For an ECS data disk image, the value is <b>DataImage</b>.</li> <li>For a BMS image, the value is <b>Ironic</b>.</li> <li>For an ISO image, the value is <b>Isolmage</b>.</li> </ul>
owner	String	Specifies the ID of the project to which the image belongs.

Parameter	Type	Description
__root_origin	String	Specifies that the image is created from an external image file. Value: <b>file</b>
checksum	String	Specifies the MD5 value of the image file.
size	Long	This parameter is unavailable currently.
virtual_size	Integer	Specifies the virtual size of the image. The unit is byte.
properties	Properties object	Specifies a collection of image attributes instead of a specified attribute.

- Example response

```

## 6.1.7 Deleting an Image (Native OpenStack API v1.1 - Abandoned and Not Recommended)

### Function

This API is used to delete an image. If you soft delete the image with a specified ID, the image persists in the database, but in the **deleted** status.

This API has been discarded. [Deleting an Image \(Native OpenStack API\)](#) is recommended.

### URI

DELETE /v1.1/images/{image\_id}

[Table 6-11](#) lists the parameters in the URI.

**Table 6-11** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

### Request

Request parameters

None

### Example Request

Deleting an image

```
DELETE https://{Endpoint}/v1.1/images/3c3d1d01-b48a-4639-8a88-08be3b9b5d78
```

## Response

- Response parameters

None

- Example response

```
HTTP/1.1 200 OK
Content-Type: text/html; charset=UTF-8
Content-Length: 0
X-Openstack-Request-Id: req-75e9edca-7b43-47da-bdc5-d39be469b72f
Date: Mon, 23 May 2016 02:43:34 GMT
```

## Returned Values

- Normal  
204
- Abnormal

Returned Values	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.1.8 Querying Image Metadata (Native OpenStack API v1 - Abandoned and Not Recommended)

### Function

This API is used to query image metadata.

This API has been discarded. The API for querying image details ([Querying Image Details \(Native OpenStack API\)](#)) is recommended.

### URI

HEAD /v1/images/{image\_id}

[Table 6-12](#) lists the parameters in the URI.

**Table 6-12** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

## Request

Request parameters

None

## Example Request

Querying image metadata

```
HEAD https://{Endpoint}/v1/images/3c3d1d01-b48a-4639-8a88-08be3b9b5d78
```

## Response

- Response parameters

Parameter	Type	Description
Status	String	Image status
Virtual_size	Integer	Virtual size of an image
Name	String	Image name
Deleted	Boolean	Whether an image has been deleted
Container_format	String	Image container type
Created_at	String	Time when an image was created
Disk_format	String	Image file type
Updated_at	String	Time when an image was updated
Property	Object	Image attribute
Owner	String	Tenant to which an image belongs
Protected	Boolean	Whether an image is protected
Min_ram	Integer	Minimum memory (MB) required for running an image
Checksum	String	Image verification sum. This parameter is available after an image file is uploaded.
Min_disk	Integer	Minimum disk capacity (GB) required for running the image

Parameter	Type	Description
Is_public	Boolean	Whether an image is a public one
Deleted_at	String	Time when an image was deleted
Id	String	Image UUID
Size	Integer	Image size. This parameter is available after an image file is uploaded.

These parameters are contained in the header of the HTTP response message.

- Example response

```
HTTP/1.1 200 OK

503 Service Unavailable	The service is unavailable.

## 6.1.9 Querying Image Details (Native OpenStack API v1.1 - Abandoned and Not Recommended)

### Function

This API is used to query details of images.

This API has been discarded. The image query API ([Querying Images \(Native OpenStack API\)](#)) is recommended.

### URI

GET /v1.1/images/detail

### Request

Request parameters

Parameters **name**, **container\_format**, **disk\_format**, **status**, **size\_min**, **size\_max**, and **changes-since** can be used to filter the query result.

Parameter	Mandatory	Type	Description
name	No	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
container_format	No	String	Image container type
disk_format	No	String	Image file format
status	No	String	Image status
size_min	No	String	Minimum size of the image
size_max	No	String	Maximum size of the image
changes-since	No	String	Last update time

### Example Request

Querying image details

```
GET https://{Endpoint}/v1.1/images/detail?disk_format=qcow2
```

## Response

- Response parameters

Parameter	Type	Description
status	String	Image status
virtual_size	Integer	Virtual size of an image
name	String	Specifies the image name. For detailed description, see <a href="#">Image Attributes</a> .
deleted	Boolean	Whether an image has been deleted
container_format	String	Image container type
created_at	String	Time when an image was created
disk_format	String	Image file type
updated_at	String	Time when an image was updated
properties	Object	Image attribute
owner	String	Tenant to which an image belongs
protected	Boolean	Whether an image is protected
min_ram	Integer	Minimum memory (MB) required for running an image
checksum	String	Image verification sum. This parameter is available after an image file is uploaded.
min_disk	Integer	Minimum disk capacity (GB) required for running the image
is_public	Boolean	Whether an image is a public one
deleted_at	String	Time when an image was deleted
id	String	Image UUID

Parameter	Type	Description
size	Integer	Image size. This parameter is available after an image file is uploaded.

- Example response

```

HTTP/1.1 200 OK
Content-Type: application/json; charset=UTF-8

## Returned Values

- Normal  
200
- Abnormal

Returned Values	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.2 Image Tagging (Native OpenStack APIs)

### 6.2.1 Adding a Tag (Native OpenStack API)

#### Function

This API is used to add a custom tag to an image. With tags, you can manage easily the images.

#### URI

PUT /v2/images/{image\_id}/tags/{tag}

**Table 6-13** lists the parameters in the URI.

**Table 6-13** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.
tag	Yes	String	Specifies the tag to be added. The character string cannot contain equal signs (=). <b>NOTE</b> This API can only be used to add a tag key. To add a tag value, use the PUT /v1/cloudimages/tags API. For details, see <a href="#">Adding or Modifying a Tag</a> .

#### Request

Request parameters

None

#### Example Request

Adding an image tag

```
PUT https://{Endpoint}/v2/images/4ca46bf1-5c61-48ff-b4f3-0ad4e5e3ba90/tags/aaaa
```

#### Response

- Response parameters  
None

- Example response  
STATUS CODE 204

## Returned Values

- Normal  
204
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.2.2 Deleting a Tag (Native OpenStack API)

### Function

This API is used to delete a custom tag from a private image.

### URI

DELETE /v2/images/{image\_id}/tags/{tag}

[Table 6-14](#) lists the parameters in the URI.

**Table 6-14** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.
tag	Yes	String	Specifies the image tag. The tag cannot contain equal signs (=).

### Request

Request parameters

None

## Example Request

Deleting an image tag

```
DELETE https://{Endpoint}/v2/images/4ca46bf1-5c61-48ff-b4f3-0ad4e5e3ba90/tags/aaaa
```

## Response

- Response parameters  
None
- Example response  
STATUS CODE 204

## Returned Values

- Normal  
204
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.3 Image Schema (Native OpenStack APIs)

### 6.3.1 Querying an Image Schema (Native OpenStack API)

#### Function

This API is used to query the image schema, which allows you to view image attributes and their data types.

#### URI

GET /v2/schemas/image

#### Request

Request parameters  
None

## Example Request

Querying an image schema

```
GET https://{Endpoint}/v2/schemas/image
```

## Response

- Response parameters

Parameter	Type	Description
additionalProperties	Object	Specifies the additional attributes. For details, see <a href="#">Table 6-15</a> .
name	String	Specifies the schema name.
links	Array of objects	Specifies the URL for accessing the schema. For details, see <a href="#">Table 6-16</a> .
properties	Object	Describes basic image attributes, including the type and usage of each attribute. For details about the parameters, see <a href="#">Image Attributes</a> .

**Table 6-15** Data structure description of the additionalProperties field

Parameter	Type	Description
type	String	Type

**Table 6-16** Data structure description of the links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.

Returned Value	Description
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.3.2 Querying an Image List Schema (Native OpenStack API)

### Function

This API is used to query an image list schema, which allows you to know details about and the data structure of the image list.

### URI

GET /v2/schemas/images

### Request

Request parameters

None

### Example Request

Querying an image list schema

```
GET https://{Endpoint}/v2/schemas/images
```

### Response

- Response parameters

Parameter	Type	Description
name	String	Specifies the schema name.
links	Array of objects	Specifies the URL for accessing the schema. For details, see <a href="#">Table 6-17</a> .
properties	Object	Describes basic image attributes, including the type and usage of each attribute. For details about the parameters, see <a href="#">Image Attributes</a> .

**Table 6-17** Data structure description of the links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response

```

STATUS CODE 200

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.3.3 Querying a Schema for an Image Sharing Member (Native OpenStack API)

### Function

This API is used to query an image sharing member schema, which allows you to view image sharing member attributes and their data types.

### URI

GET /v2/schemas/member

### Request

Request parameters

None

### Example Request

Querying a schema for an image sharing member

```
GET https://{Endpoint}/v2/schemas/member
```

### Response

- Response parameters

Parameter	Type	Description
name	String	Specifies the schema name.
properties	Object	Describes basic image attributes, including the type and usage of each attribute.  For details about the parameters, see <a href="#">Image Attributes</a> .

- Example response

```
STATUS CODE 200
{
  "name": "member",

        "rejected"
      ],
      "type": "string",
      "description": "The status of this image member"
    },
    "created_at": {
      "type": "string",
      "description": "Date and time of image member creation"
    },
    "updated_at": {
```

```

        "type": "string",
        "description": "Date and time of last modification of image member"
    },
    "image_id": {
        "pattern": "^[0-9a-fA-F]{8}-([0-9a-fA-F]){4}-([0-9a-fA-F]){4}-([0-9a-fA-F]){4}-([0-9a-fA-F])
{12}$",
        "type": "string",
        "description": "An identifier for the image"
    },
    "member_id": {
        "type": "string",
        "description": "An identifier for the image member (tenantId)"
    },
    "schema": {
        "readOnly": true,
        "type": "string"
    }
}
}

```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.3.4 Querying a Schema for an Image Sharing Member List (Native OpenStack API)

### Function

This API is used to query an image sharing member list schema, which allows you to view image sharing member attributes and their data types.

### URI

GET /v2/schemas/members

### Request

Request parameters

None

## Example Request

Querying a schema for an image sharing member list

```
GET https://{Endpoint}/v2/schemas/members
```

## Response

- Response parameters

Parameter	Type	Description
name	String	Specifies the schema name.
links	Array of objects	Specifies the URL for accessing the schema. For details, see <a href="#">Table 6-18</a> .
properties	Object	Describes basic image attributes, including the type and usage of each attribute. For details about the parameters, see <a href="#">Image Attributes</a> .

**Table 6-18** Data structure description of the links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response

```
STATUS CODE 200
{
  "name": "members",
  "links": [
    {
      "href": "{schema}",
      "rel": "describedby"
    }
  ],
  "properties": {
    "members": {
      "items": {
        "name": "member",
        "properties": {
          "status": {
            "enum": [
              "pending",
              "accepted",
              "rejected"
            ],
            "type": "string",
            "description": "The status of this image member"
          },
          "created_at": {
            "type": "string",
```

```

        "description": "Date and time of image member creation"
    },
    "updated_at": {
        "type": "string",
        "description": "Date and time of last modification of image member"
    },
    "image_id": {
        "pattern": "^[0-9a-fA-F]{8}-([0-9a-fA-F]){4}-([0-9a-fA-F]){4}-([0-9a-fA-F])
{4}-([0-9a-fA-F]){12}$",
        "type": "string",
        "description": "An identifier for the image"
    },
    "member_id": {
        "type": "string",
        "description": "An identifier for the image member (tenantId)"
    },
    "schema": {
        "readOnly": true,
        "type": "string"
    }
}
},
"type": "array"
},
"schema": {
    "type": "string"
}
}
}

```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.4 Image Sharing (Native OpenStack APIs)

## 6.4.1 Adding an Image Sharing Member (Native OpenStack API)

### Function

This API is used to add a project ID of a tenant the image is to be shared with.

### URI

POST /v2/images/{image\_id}/members

### Request

- Request parameters

Parameter	Mandatory	Type	Description
member	Yes	String	Specifies a tenant who will be able to use the shared image. The value is the project ID of the tenant.

### Example Request

Adding a tenant who can use the shared image (project ID: edc89b490d7d4392898e19b2deb34797)

```
POST https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members
{
  "member": "edc89b490d7d4392898e19b2deb34797"
}
```

### Response

- Response parameters

Parameter	Type	Description
status	String	Specifies the image sharing status.
created_at	String	Specifies the time when a shared image was created. The value is in UTC format.
updated_at	String	Specifies the time when a shared image was updated. The value is in UTC format.
image_id	String	Specifies the image ID.
member_id	String	Specifies the project ID of the tenant who is to accept the shared image.
schema	String	Specifies the sharing schema.

- Example response  
STATUS CODE 200  

```
{
  "status": "pending",
  "created_at": "2016-09-01T02:05:14Z",
  "updated_at": "2016-09-01T02:05:14Z",
  "image_id": "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
  "member_id": "edc89b490d7d4392898e19b2deb34797",
  "schema": "/v2/schemas/member"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.4.2 Updating the Image Sharing Status (Native OpenStack API)

### Function

This API is used to update the image sharing status when a tenant accepts or rejects a shared image.

### URI

PUT /v2/images/{image\_id}/members/{member\_id}

**Table 6-19** lists the parameters in the URI.

**Table 6-19** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

Parameter	Mandatory	Type	Description
member_id	Yes	String	Specifies the project ID of the tenant who is to accept or reject a shared image.

## Request

- Request parameters

Parameter	Mandatory	Type	Description
status	Yes	String	<p>Specifies whether a shared image will be accepted or declined.</p> <p>Available values include:</p> <ul style="list-style-type: none"> <li><b>accepted:</b> indicates that a shared image is accepted. After an image is accepted, the image is displayed in the image list. You can use the image to create ECSs.</li> <li><b>rejected:</b> indicates that a shared image is declined. After an image is rejected, the image is not displayed in the image list. However, you can still use the image to create ECSs.</li> </ul>

## Example Request

Updating the image sharing status to **accepted**

```
PUT https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members/
edc89b490d7d4392898e19b2deb34797
{
  "status": "accepted"
}
```

## Response

- Response parameters

Parameter	Type	Description
status	String	Specifies the image sharing status.
created_at	String	Specifies the time when a shared image was created. The value is in UTC format.

Parameter	Type	Description
updated_at	String	Specifies the time when a shared image was updated. The value is in UTC format.
image_id	String	Specifies the image ID.
member_id	String	Specifies the project ID of the tenant who is to accept or reject a shared image.
schema	String	Specifies the sharing schema.

- Example response

STATUS CODE 200

```
{
  "status": "accepted",
  "created_at": "2016-09-01T02:05:14Z",
  "updated_at": "2016-09-01T02:37:11Z",
  "image_id": "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
  "member_id": "edc89b490d7d4392898e19b2deb34797",
  "schema": "/v2/schemas/member"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.4.3 Querying Image Sharing Member Details (Native OpenStack API)

### Function

This API is used to query details about a tenant with whom the image is shared.

### URI

GET /v2/images/{image\_id}/members/{member\_id}

**Table 6-20** lists the parameters in the URI.

**Table 6-20** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.
member_id	Yes	String	Specifies the member ID.

## Request

Request parameters

None

## Example Request

Querying image sharing member details

```
GET https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members/edc89b490d7d4392898e19b2deb34797
```

## Response

- Response parameters

Parameter	Type	Description
status	String	Specifies the image sharing status.
created_at	String	Specifies the time when a shared image was created. The value is in UTC format.
updated_at	String	Specifies the time when a shared image was updated. The value is in UTC format.
image_id	String	Specifies the image ID.
member_id	String	Specifies the member ID.
schema	String	Specifies the sharing schema.

- Example response

```
STATUS CODE 200
{
  "status": "accepted",
  "created_at": "2016-09-01T02:05:14Z",
  "updated_at": "2016-09-01T02:37:11Z",
  "image_id": "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
  "member_id": "edc89b490d7d4392898e19b2deb34797",
  "schema": "/v2/schemas/member"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.4.4 Querying Image Sharing Members (Native OpenStack API)

### Function

This API is used to query the tenants with whom an image is shared using search criteria and to display the tenants in a list.

### URI

GET /v2/images/{image\_id}/members

**Table 6-21** lists the parameters in the URI.

**Table 6-21** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.

### Request

Request parameters

None

### Example Request

Querying image sharing members

GET https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members

## Response

- Response parameters

Parameter	Type	Description
members	Array of objects	Specifies the members. For details, see <a href="#">Table 6-22</a> .
schema	String	Specifies the sharing schema.

**Table 6-22** Data structure description of the members field

Parameter	Type	Description
status	String	Specifies the image sharing status.
created_at	String	Specifies the time when a shared image was created. The value is in UTC format.
updated_at	String	Specifies the time when a shared image was updated. The value is in UTC format.
image_id	String	Specifies the image ID.
member_id	String	Specifies the member ID.
schema	String	Specifies the sharing schema.

- Example response

```
STATUS CODE 200
{
  "members": [
    {
      "status": "accepted",
      "created_at": "2016-09-01T02:05:14Z",
      "updated_at": "2016-09-01T02:37:11Z",
      "image_id": "d164b5df-1bc3-4c3f-893e-3e471fd16e64",
      "member_id": "edc89b490d7d4392898e19b2deb34797",
      "schema": "/v2/schemas/member"
    }
  ],
  "schema": "/v2/schemas/members"
}
```

## Returned Values

- Normal  
200
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.4.5 Deleting an Image Sharing Member (Native OpenStack API)

### Function

This API is used to stop image sharing by deleting the tenant with whom the image is shared.

### URI

DELETE /v2/images/{image\_id}/members/{member\_id}

**Table 6-23** lists the parameters in the URI.

**Table 6-23** Parameter description

Parameter	Mandatory	Type	Description
image_id	Yes	String	Specifies the image ID.
member_id	Yes	String	Specifies the member ID.

### Request

Request parameters

None

### Example Request

Deleting an image sharing member

```
DELETE https://{Endpoint}/v2/images/d164b5df-1bc3-4c3f-893e-3e471fd16e64/members/edc89b490d7d4392898e19b2deb34797
```

## Response

- Response parameters  
None
- Example response  
204 No Content

## Returned Values

- Normal  
204
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.5 API Version Query (Native OpenStack API)

### 6.5.1 Querying API Versions (Native OpenStack API)

#### Function

This API is used to query API versions, such as version compatibility and domain name information of APIs.

#### URI

GET /

#### Request

- Request parameters  
None

#### Example Request

Querying API versions

GET https://{Endpoint}/

## Response

- Response parameters

Parameter	Type	Description
versions	Array of objects	Specifies the versions. For details, see <a href="#">Table 6-24</a> .

**Table 6-24** Data structure description of the versions field

Parameter	Type	Description
status	String	Specifies the API status.
id	String	Specifies the API ID.
links	Array of objects	Specifies the description. For details, see <a href="#">Table 6-25</a> .

**Table 6-25** Data structure description of the versions.links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response

```

STATUS CODE 300
{
  "versions": [
    {
      "status": "CURRENT",
      "id": "v2.2",
      "links": [
        {
          "href": "https://image.az1.dc1.domainname.com/v2/",
          "rel": "self"
        }
      ]
    },
    {
      "status": "SUPPORTED",
      "id": "v2.1",
      "links": [
        {
          "href": "https://image.az1.dc1.domainname.com/v2/",
          "rel": "self"
        }
      ]
    }
  ]
}

```

```

    },
    {
      "status": "SUPPORTED",
      "id": "v2.0",
      "links": [
        {
          "href": "https://image.az1.dc1.domainname.com/v2/",
          "rel": "self"
        }
      ]
    },
    {
      "status": "DEPRECATED",
      "id": "v1.1",
      "links": [
        {
          "href": "https://image.az1.dc1.domainname.com/v1/",
          "rel": "self"
        }
      ]
    },
    {
      "status": "DEPRECATED",
      "id": "v1.0",
      "links": [
        {
          "href": "https://image.az1.dc1.domainname.com/v1/",
          "rel": "self"
        }
      ]
    }
  ]
}

```

## Returned Values

- Normal  
300
- Abnormal

Returned Value	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

## 6.5.2 Querying an API Version (Native OpenStack API)

### Function

This API is used to query a specified API version, such as version compatibility and domain name information of an API.

## URI

GET `/{api_version}`

**Table 6-26** lists the parameters in the URI.

**Table 6-26** Parameter description

Parameter	Mandatory	Type	Description
api_version	Yes	String	Specifies the API version, for example v2.0.

## Request

Request parameters

None

## Example Request

Querying an API version

```
GET https://{Endpoint}/v2.0
```

## Response

- Response parameters

Parameter	Type	Description
versions	Array of objects	Specifies the version. For details, see <a href="#">Table 6-27</a> .

**Table 6-27** Data structure description of the versions field

Parameter	Type	Description
status	String	Specifies the API status.
id	String	Specifies the API ID.
links	Array of objects	Specifies the description. For details, see <a href="#">Table 6-28</a> .

**Table 6-28** Data structure description of the versions.links field

Parameter	Type	Description
href	String	Specifies the domain name.
rel	String	Specifies the domain name description.

- Example response

```
STATUS CODE 300
{
  "versions": [
    {
      "status": "SUPPORTED",
      "id": "v2.0",
      "links": [
        {
          "href": "https://image.az1.dc1.domainname.com/v2/",
          "rel": "self"
        }
      ]
    }
  ]
}
```

## Returned Values

- Normal  
300
- Abnormal

Returned Values	Description
400 Bad Request	Request error.
401 Unauthorized	Authentication failed.
403 Forbidden	You do not have the rights to perform the operation.
404 Not Found	The requested resource was not found.
500 Internal Server Error	Internal service error.
503 Service Unavailable	The service is unavailable.

# 7 Examples

---

## 7.1 Creating an Image from an ISO File

### Scenarios

An ISO file is a disk image of an optical disc. A large number of data files can be compressed into a single ISO file. Likewise, to access the files stored in an ISO, the ISO file needs to be decompressed. For example, you can use a virtual CD-ROM to open an ISO file, or burn the ISO file to a CD or DVD and then use the CD-ROM to read the image.

This section describes how to use APIs to create a private image from an ISO file.

### Involved APIs

If you use a token for authentication, you must obtain the token and add **X-Auth-Token** to the request header of the IMS API when making an API call.

- IAM API used to obtain the token  
URI format: POST `https://IAM endpoint/v3/auth/tokens`
- IMS API used to create a private image using an image file uploaded to the OBS bucket  
URI format: POST `https://IMS endpoint/v2/cloudimages/action`
- ECS API used to create an ECS  
URI format: POST `https://ECS endpoint/v1/project_id/cloudservers`
- IMS API used to create a system disk image from a data disk  
URI format: POST `https://IMS endpoint/v2/cloudimages/action`

### Procedure

1. Obtain the token by referring to [Authentication](#).
2. Create a private image using an ISO image file uploaded to the OBS bucket.
  - a. Send **POST** `https://IMS endpoint/v2/cloudimages/action`.

- b. Add **X-Auth-Token** to the request header.
- c. Set the following parameters in the request body:  
For details about the parameters, see [Creating an Image](#).

```
{
  "name": "ims_test_file", //Image name (mandatory, string)
  "description": "Image creation using an image file uploaded to the OBS bucket", //Image
description (optional, string)
  "image_url": "ims-image:centos70.iso", //Image file address in an OBS bucket (mandatory,
string)
  "os_type": "Linux", //OS type (optional, string)
  "os_version": "CentOS 7.0 64bit", //OS version (mandatory, string)
  "type": "Isolmage", //Image type (mandatory, string)
  "min_disk": 40, //Minimum system disk space (mandatory, integer)
  "image_tags": [{"key":"key2","value":"value2"}, {"key":"key1","value":"value1"}] //Image tags
(optional, array of objects)
}
```

- d. Obtain the image ID by querying job details based on the returned **job\_id**. For details, see [Querying the Status of an Asynchronous Job](#).
3. Create a temporary ECS from the ISO image.

**NOTE**

- You can select only a general-computing flavor with 2 vCPUs, 4 GB or more memory, and KVM virtualization type.
- You need to create a system disk and a data disk for the ECS. The OS will be installed on the data disk by default.

- a. Send **POST** [https://ECS\\_endpoint/v1/project\\_id/cloudservers](https://ECS_endpoint/v1/project_id/cloudservers).
- b. Add **X-Auth-Token** to the request header.
- c. Set the following parameters in the request body:

The following parameters are all mandatory. For details about the parameters, see "Creating an ECS" in *Elastic Cloud Server API Reference*.

```
{
  "server": {
    "imageRef": "fac42d61-ea1e-4271-94ba-6543a852d2c6", //Image ID
    "flavorRef": "rc6.large.2_manage",
    "name": "instance-test",
    "vpcid": "18ec99f0-7159-4d7b-ad27-f32315d5af61",
    "nics": [{
      "subnet_id": "81a4ecb0-0451-4c60-8373-8b923238ec40"
    }],
    "root_volume": {
      "volumetype": "SATA",
      "size": "40"
    },
    "data_volumes": [{
      "volumetype": "SATA",
      "size": "40"
    }],
    "availability_zone": "az-1a",
    "metadata": {
      "virtual_env_type": "Isolmage"
    },
    "extendparam": {
      "diskPrior": "true"
    }
  }
}
```

- d. Obtain the ECS ID by querying job details based on the returned **job\_id**. For details, see "Querying Task Execution Status" in *Elastic Cloud Server API Reference*.

- e. Query ECS details based on the ECS ID to obtain the data disk ID (**volume\_id**) required in 4. For details, see "Querying Details About an ECS" in *Elastic Cloud Server API Reference*.
4. Use the temporary ECS to create a standard private image.
  - a. Send **POST https://IMS endpoint/v2/cloudimages/action**.
  - b. Add **X-Auth-Token** to the request header.
  - c. Set the following parameters in the request body:  
For details about the parameters, see [Creating an Image](#).

```
{
  "name": "ims_test", //Image name (a mandatory string)
  "description": "Creating a system disk image from a data disk", //Image description (optional,
string)
  "volume_id": "877a2cda-ba63-4e1e-b95f-e67e48b6129a", //Data disk ID (mandatory, string)
  "type": "ECS", //Image type (mandatory, string)
  "os_version": "CentOS 7.0 64bit", //OS version (mandatory, string)
  "image_tags": [{"key":"key2","value":"value2"}, {"key":"key1","value":"value1"}] //Image tags
(optional, array of objects)
}
```

- d. Obtain the image ID by querying job details based on the returned **job\_id**. For details, see [Querying the Status of an Asynchronous Job](#).

# 8 API Actions

## 8.1 Image

API	Actions
GET /v2/cloudimages	ims:images:list
GET /v2/images	ims:images:list
GET /v2/images/{image_id}	ims:images:get
PATCH /v2/cloudimages/{image_id}	ims:images:get ims:images:update
PATCH /v2/images/{image_id}	ims:images:get ims:images:update
DELETE /v2/images/{image_id}	ims:images:get ims:images:delete
POST /v2/cloudimages/action	ims:images:get ims:images:update ims:images:upload ims:images:create ims:serverImages:create
POST /v1/cloudimages/ wholeimages/action	ims:images:get ims:images:update ims:images:upload ims:images:create ims:wholeImages:create
POST /v2/images	ims:images:create

API	Actions
PUT /v2/images/{image_id}/file	ims:images:get ims:images:update ims:images:upload
PUT /v1/cloudimages/{image_id}/upload <b>NOTE</b> Before registering an image file, ensure that you have the Tenant Administrator permission for OBS.	ims:images:get ims:images:update ims:images:upload ims:images:create
POST /v1/cloudimages/{image_id}/file <b>NOTE</b> Before exporting an image, ensure that you have the Tenant Administrator permission for OBS.	ims:images:get ims:images:export
GET /	N/A
GET /v1.1/images/detail	ims:images:list
HEAD /v1/images/{image_id}	ims:images:get
DELETE /v1.1/images/{image_id}	ims:images:delete

## 8.2 Image Tag

API	Actions
PUT /v2/images/{image_id}/tags/{tag}	ims:images:get ims:images:update
DELETE /v2/images/{image_id}/tags/{tag}	ims:images:get ims:images:update
PUT /v1/cloudimages/tags	ims:images:get ims:images:update
GET /v1/cloudimages/tags	ims:images:list
POST /v2/{project_id}/images/resource_instances/action	ims:images:list
POST /v2/{project_id}/images/{image_id}/tags/action	ims:images:update
POST /v2/{project_id}/images/{image_id}/tags	ims:images:update

API	Actions
DELETE /v2/{project_id}/images/{image_id}/tags/{key}	ims:images:update
GET /v2/{project_id}/images/{image_id}/tags	ims:images:list
GET /v2/{project_id}/images/tags	ims:images:list

## 8.3 Image Schema

API	Actions
GET /v2/schemas/image	N/A
GET /v2/schemas/images	N/A
GET /v2/schemas/member	N/A
GET /v2/schemas/members	N/A

## 8.4 Image Sharing

API	Actions
POST /v2/images/{image_id}/members	ims:images:get ims:images:share
PUT /v2/images/{image_id}/members/{member_id}	ims:images:get ims:images:share
GET /v2/images/{image_id}/members/{member_id}	ims:images:get ims:images:share
GET /v2/images/{image_id}/members	ims:images:get ims:images:share
DELETE /v2/images/{image_id}/members/{member_id}	ims:images:get ims:images:share
POST /v1/cloudimages/members	ims:images:get ims:images:share
PUT /v1/cloudimages/members	ims:images:get ims:images:share

API	Actions
DELETE /v1/cloudimages/members	ims:images:get ims:images:share

## 8.5 Image Replication

API	Actions
POST /v1/cloudimages/{image_id}/copy	ims:images:get ims:images:update ims:images:upload ims:images:create ims:images:copy

## 8.6 Image Quota

API	Actions
GET /v1/cloudimages/quota	ims:images:list ims:quotas:get

## 8.7 Asynchronous Job

API	Actions
GET /v1/cloudimages/job/{job_id}	ims:imageJobs:getPercentage

# 9 Common Parameters

## 9.1 Image Attributes

### Description

An image is a template containing mandatory software, such as an OS. The template may also contain application software, such as database software, and proprietary software. Image is the core object of IMS.

### Image Attributes

Name	Type	Description
file	String	Specifies the URL for uploading and downloading the image file.
owner	String	Specifies the tenant to which the image belongs.
id	String	Specifies the image ID.
size	Long	This parameter is unavailable currently.
self	String	Specifies the image URL.
schema	String	Specifies the image schema.
status	String	Specifies the image status. The value can be <b>active</b> , <b>queued</b> , <b>saving</b> , <b>deleted</b> , or <b>killed</b> . An image can be used only when it is in the <b>active</b> state.
tags	Array of strings	Lists the image tags.
visibility	String	Specifies whether the image can be seen by other tenants. The value can be <b>private</b> , <b>public</b> , or <b>shared</b> .

Name	Type	Description
name	String	Specifies the image name. <ul style="list-style-type: none"> <li>• The name cannot start or end with a space.</li> <li>• The name contains 1 to 128 characters.</li> <li>• The name contains the following characters: <ul style="list-style-type: none"> <li>- Uppercase letters</li> <li>- Lowercase letters</li> <li>- Digits</li> <li>- Special characters, including hyphens (-), periods (.), underscores (_), and space</li> </ul> </li> </ul>
checksum	String	This parameter is unavailable currently.
deleted	Boolean	Specifies whether the image has been deleted. The value can be <b>true</b> or <b>false</b> .
protected	Boolean	Specifies whether the image is protected. A protected image cannot be deleted. The value can be <b>true</b> or <b>false</b> .
container_format	String	Specifies the container type.
min_ram	Integer	Specifies the minimum memory size (MB) required for running the image. The parameter value depends on the ECS specifications. The default value is <b>0</b> .
update_at	String	Specifies the time when the image was updated.
__os_bit	String	Specifies the OS architecture, 32 bit or 64 bit.
__os_version	String	Specifies the OS version.
__description	String	Provides supplementary information about the image. The value contains a maximum of 1024 characters and consists of only letters and digits. Carriage returns and angle brackets (< >) are not allowed.
disk_format	String	Specifies the image format. The value can be <b>zvhd2</b> , <b>vhd</b> , <b>zvhd</b> , <b>raw</b> , <b>iso</b> , or <b>qcow2</b> . The default value is <b>zvhd2</b> for a non-ISO image.
__isregistered	String	Specifies whether the image has been registered. The value can be <b>true</b> or <b>false</b> .

Name	Type	Description
__platform	String	Specifies the image platform type. The value can be <b>Windows</b> , <b>Ubuntu</b> , <b>Red Hat</b> , <b>SUSE</b> , <b>CentOS</b> , <b>Debian</b> , <b>OpenSUSE</b> , <b>Oracle Linux</b> , <b>Fedora</b> , <b>Other</b> , <b>CoreOS</b> , or <b>EulerOS</b> .
__os_type	String	Specifies the OS type. The value can be <b>Linux</b> , <b>Windows</b> , or <b>Other</b> .
min_disk	Integer	Specifies the minimum disk space (GB) required for running the image.
virtual_env_type	String	Specifies the environment where the image is used. The value can be <b>FusionCompute</b> , <b>Ironic</b> , <b>DataImage</b> , or <b>IsolImage</b> . <ul style="list-style-type: none"> <li>For an ECS image (system disk image), the value is <b>FusionCompute</b>.</li> <li>For a data disk image, the value is <b>DataImage</b>.</li> <li>For a BMS image, the value is <b>Ironic</b>.</li> <li>For an ISO image, the value is <b>IsolImage</b>.</li> </ul>
__image_source_type	String	Specifies the image backend storage type. Only UDS is supported currently.
__imagetype	String	Specifies the image type. The following types are supported: <ul style="list-style-type: none"> <li>Public image: The value is <b>gold</b>.</li> <li>Private image: The value is <b>private</b>.</li> <li>Shared image: The value is <b>shared</b>.</li> </ul>
__whole_image	Boolean	Specifies whether the image is a full-ECS image. The value can be <b>true</b> or <b>false</b> .
create_at	String	Specifies the time when the image was created.
virtual_size	Integer	This parameter is unavailable currently.
deleted_at	String	Specifies the time when the image was deleted.
__originalimage_name	String	Specifies the parent image ID. If the image is a public image or created from an image file, this value is left empty.
__backup_id	String	Specifies the backup ID. To create an image using a backup, set the value to the backup ID. Otherwise, this value is left empty.
__image_location	String	Specifies the location where the image is stored.

Name	Type	Description
__image_size	String	Specifies the size (bytes) of the image file.
__data_origin	String	Specifies the image source. If the image is a public image, this parameter is left empty.
hw_firmware_type	String	Specifies the ECS boot mode. The following values are supported: <ul style="list-style-type: none"> <li>• <b>bios</b> indicates the BIOS boot mode.</li> <li>• <b>uefi</b> indicates the UEFI boot mode.</li> </ul>
__support_xen	String	Specifies whether the image supports Xen. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_large_memory	String	Specifies whether the image supports large-memory ECSs. If the image supports large-memory ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_disk_intensive	String	Specifies whether the image supports disk-intensive ECSs. If the image supports disk-intensive ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_high_performance	String	Specifies whether the image supports high-performance ECSs. If the image supports high-performance ECSs, the value is <b>true</b> . Otherwise, this parameter is not required.
__support_xen_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the Xen platform. For the supported OSs, see <a href="#">Table 9-2</a> . If the image does not support GPU-accelerated ECSs on the Xen platform, this parameter is not required. This parameter cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .
__support_kvm_gpu_type	String	Specifies whether the image supports GPU-accelerated ECSs on the KVM platform. See <a href="#">Table 9-3</a> for its value. If the image does not support GPU-accelerated ECSs on the KVM platform, this parameter is not required. This attribute cannot co-exist with <b>__support_xen</b> and <b>__support_kvm</b> .

Name	Type	Description
<code>__support_xen_hana</code>	String	Specifies whether the image supports HANA ECSs on the Xen platform. If yes, the value is <b>true</b> . Otherwise, this parameter is not required.  This attribute cannot co-exist with <code>__support_xen</code> .
<code>__is_config_init</code>	String	Specifies whether initial configuration is complete. The value can be <b>true</b> or <b>false</b> .  If initial configuration is complete, the value is set to <b>true</b> . Otherwise, the value is set to <b>false</b> . The default value is <b>false</b> .

## 9.2 Image Tag Data Formats

### Description

You can attach a custom tag to a private image to facilitate private image management.

### Image Tag Data Formats

Data format of **tag**

- The data format is *key.value*. If a key is added, a tag is added. In other cases, the tag is modified.
- A tag key consists of up to 36 characters. Character set: A-Z, a-z, 0-9, '-', '\_', and Unicode characters (\u4E00-\u9FFF)
- A tag value consists of 0 to 43 characters, Character set: A-Z, a-z, 0-9, '-', '\_', and Unicode characters (\u4E00-\u9FFF)

Data format of **image\_tags**

- The data format is `{"key": "keyA", "value": "valueA"}`. If the added key A exists, the tag is updated.
- The tag key can contain a maximum of 36 characters, and the tag value can contain a maximum of 43 characters. The tag value can be an empty character string.
- The tag key cannot contain equal signs (=), asterisks (\*), angle brackets (< and >), backslashes (\), commas (,), vertical bars (|), or slashes (/), and the first and last characters cannot be spaces.
- The tag key must be unique and cannot be empty.
- The tag value cannot contain equal signs (=), asterisks (\*), angle brackets (< and >), backslashes (\), commas (,), vertical bars (|), or slashes (/), and the first and last characters cannot be spaces.

## Data Formats (Native OpenStack)

Data format of **tag**

- The data format is *key*. If a key is added, a tag is added. In other cases, the tag is modified.
- The tag key can contain a maximum of 255 characters.
- The character string cannot contain equal signs (=).

## 9.3 Restrictions on Image Sharing

### Description

You can use the image sharing function to share your private images with other users.

### Constraints

- Images can only be shared within a region.
- Each image can be shared with a maximum of 128 tenants.
- You can stop sharing images anytime without notifying the recipient.
- You can delete shared image anytime without notifying the recipient.
- Encrypted images cannot be shared.

## 9.4 Obtaining a Project ID

A project ID is required for some URLs when an API is called. Therefore, you need to obtain a project ID in advance. The steps are as follows:

1. Obtain the token.

For details, see [Token Authentication](#).

2. Obtain a project ID.

The API for obtaining the project ID is **GET https://iam.eu-west-0.myhuaweicloud.com/v3/projects**.

Add **X-Auth-Token** to the request header and set its value to the token obtained in the preceding step.

The following is an example response. The value of **id** is the project ID to be obtained.

```
{
  "links": {},
  "projects": [
    {
      "is_domain": ,
      "description": "",
      "links": {},
      "enabled": true,
      "id": "", // Project ID
      "parent_id": "",
      "domain_id": "",
      "name": ""
    },
    ...
  ]
}
```

```
]
}
```

## 9.5 Values of Related Parameters

### \_\_os\_version Values

**Table 9-1** \_\_os\_version values

OS Type	OS Version (__os_version)
Windows	Windows 10 64bit Windows Server 2016 Standard 64bit Windows Server 2016 Datacenter 64bit Windows Server 2012 R2 Standard 64bit Windows Server 2012 Essentials R2 64bit Windows Server 2012 R2 Datacenter 64bit Windows Server 2012 Datacenter 64bit Windows Server 2012 Standard 64bit Windows Server 2008 R2 WEB 64bit Windows Server 2008 R2 Standard 64bit Windows Server 2008 R2 Enterprise 64bit Windows Server 2008 R2 Datacenter 64bit
SUSE	SUSE Linux Enterprise Server 15 SP1 64bit SUSE Linux Enterprise Server 15 64bit SUSE Linux Enterprise Server 12 SP5 64bit SUSE Linux Enterprise Server 12 SP3 64bit SUSE Linux Enterprise Server 12 SP2 64bit SUSE Linux Enterprise Server 12 SP1 64bit SUSE Linux Enterprise Server 12 64bit SUSE Linux Enterprise Server 11 SP4 64bit SUSE Linux Enterprise Server 11 SP3 64bit SUSE Linux Enterprise Server 11 SP3 32bit SUSE Linux Enterprise Server 11 SP1 64bit

Debian	Debian GNU/Linux 10.0.0 64bit Debian GNU/Linux 9.3.0 64bit Debian GNU/Linux 9.0.0 64bit Debian GNU/Linux 8.8.0 64bit Debian GNU/Linux 8.7.0 64bit Debian GNU/Linux 8.6.0 64bit Debian GNU/Linux 8.5.0 64bit Debian GNU/Linux 8.4.0 64bit Debian GNU/Linux 8.2.0 64bit Debian GNU/Linux 8.1.0 64bit

OS Type	OS Version ( <code>__os_version</code> )
Fedora	Fedora 30 64bit Fedora 28 64bit Fedora 27 64bit Fedora 26 64bit Fedora 25 64bit Fedora 24 64bit Fedora 23 64bit Fedora 22 64bit
EulerOS	EulerOS 2.9 64bit EulerOS 2.5 64bit EulerOS 2.3 64bit EulerOS 2.2 64bit EulerOS 2.1 64bit
CoreOS	CoreOS 1068.10.0 CoreOS 1010.5.0 CoreOS 1298.6.0
openEuler	openEuler 20.03 64bit

**NOTE**

For CoreOS, only the 1010.5.0 and 1068.10.0 versions are supported and it must have `coreos-cloudinit` installed. The automatic system upgrade may make ECSs created using this image unavailable and needs to be disabled.

**`__support_xen_gpu_type` Values****Table 9-2** Supported GPU types

Supported GPU ( <code>__support_xen_gpu_type</code> )	Description
M60_vGPU	The image has a hardware virtualization drive with the M60 video card installed and supports <b>g1.xlarge</b> and <b>g1.2xlarge</b> ECSs.

## **\_\_support\_kvm\_gpu\_type Values**

**Table 9-3** Supported GPU types

<b>Supported GPU (__support_kvm_gpu_type)</b>	<b>Description</b>
M60	The image has a hardware virtualization drive with the M60 video card installed and supports <b>g1.xlarge</b> , <b>g1.2xlarge</b> , and <b>g3.4xlarge.4</b> ECSs.
V100_vGPU	The image has a hardware virtualization drive with the V100 video card installed and supports <b>g5.8xlarge.4</b> ECSs.
P2V_V100	The image has a hardware virtualization drive with the V100 video card installed and supports <b>p2v.2xlarge.8</b> ECSs.
P100	The image has a hardware virtualization drive with the P100 video card installed and supports <b>p1.2xlarge.8</b> and <b>p1.4xlarge.8</b> ECSs.
V100	The image has a hardware virtualization drive with the V100 video card installed and supports <b>p2.2xlarge.8</b> and <b>p2.4xlarge.8</b> ECSs.

## **Special Images and Supported OSs**

**Table 9-4** Special image types and supported OSs

<b>Image Type</b>	<b>Supported OS</b>
Disk-intensive	CentOS 7.2 64bit CentOS 7.3 64bit CentOS 6.8 64bit SUSE Enterprise Linux Server 11 SP3 64bit SUSE Enterprise Linux Server 11 SP4 64bit SUSE Enterprise Linux Server 12 SP1 64bit SUSE Enterprise Linux Server 12 SP2 64bit Red Hat Linux Enterprise 6.8 64bit Red Hat Linux Enterprise 7.3 64bit

# A Status Codes

- Normal

Returned Value	Description
200 OK	The results of GET and PUT operations are returned as expected.
201 Created	The results of the POST operation are returned as expected.
202 Accepted	The request has been accepted for processing.
204 No Content	The results of the DELETE operation are returned as expected.

- Abnormal

Returned Value	Description
400 Bad Request	The server failed to process the request.
401 Unauthorized	You must enter a username and password to access the requested page.
403 Forbidden	You are forbidden to access the requested page.
404 Not Found	The server cannot find the requested page.
405 Method Not Allowed	You are not allowed to use the method specified in the request.
406 Not Acceptable	The response generated by the server cannot be accepted by the client.
407 Proxy Authentication Required	You must use the proxy server for authentication so that the request can be processed.

Returned Value	Description
408 Request Timeout	The request timed out.
409 Conflict	The request could not be processed due to a conflict.
500 Internal Server Error	Failed to complete the request because of a service error.
501 Not Implemented	Failed to complete the request because the server does not support the requested function.
502 Bad Gateway	Failed to complete the request because the request is invalid.
503 Service Unavailable	Failed to complete the request. The service is unavailable.
504 Gateway Timeout	A gateway timeout error occurred.

# B Error Codes

## Function Description

If the returned status code is **400**, a customized error message will be returned. This section describes the meaning of each status code.

## Response Format

```
STATUS CODE 400
{
  "error": {
    "message": "The imagetype is invalid.",
    "code": "IMG.0024"
  }
}
```

## Error Message Description

Table B-1 Error codes

Status Code	Error Code	Message	Description	Handling Measure
400	IMG.0001	The request message format is invalid.	The request message format is invalid.	Use the correct format.
400	IMG.0002	The image name contains more than 128 characters.	The image name contains more than 128 characters.	Reduce the length of the image name.
400	IMG.0003	The image name format is invalid.	The image name format is invalid.	Check whether the image name is valid.

Statu s Code	Error Code	Message	Description	Handling Measure
400	IMG.0004	The description contains more than 1024 characters.	The image name contains more than 1024 characters.	Reduce the length of the image description to within 1024 characters.
400	IMG.0005	The ECS does not exist.	The ECS does not exist.	Check whether the ECS exists.
400	IMG.0006	The ECS system disk cannot be used to create an image.	The system disk of the ECS cannot be used to create an image.	Check the system disk status of the ECS.
400	IMG.0007	The request body is empty.	The message body is empty.	Check whether the message body is valid.
400	IMG.0008	The ECS cannot be used to create images because it is not in stopped state.	The ECS cannot be used to create an image because it is not in the <b>Stopped</b> state.	Stop the ECS and try again.
400	IMG.0009	The image name already exists.	The image name already exists.	Change another image name.
400	IMG.0010	The ECS cannot be used to create an image because it has in-progress tasks.	The ECS cannot be used to create an image because it has in-progress tasks.	Try again after the tasks are complete.
400	IMG.0011	<b>forceCreate</b> must be set to <b>true</b> .	<b>forceCreate</b> must be set to <b>true</b> .	Set <b>forceCreate</b> to <b>true</b> .
400	IMG.0012	The ECS ID is not specified.	The ECS ID is invalid.	Enter a valid ECS ID.
400	IMG.0013	The image name is not specified.	The image name is not specified.	Enter a valid image name.

Statu s Code	Error Code	Message	Description	Handling Measure
400	IMG.0014	An exception occurred when IaaS OpenStack was executing the task.	An exception occurred when IaaS OpenStack was executing the task.	Contact technical support.
400	IMG.0015	The number of private images has reached the maximum allowed.	The number of private images has reached the quota limit.	Increase the quota or delete existing images.
400	IMG.0016	An error occurred when the request body was deleted.	An error occurred when the request body was deleted.	Contact technical support.
400	IMG.0017	The URL format is incorrect.	The URL format is incorrect.	Check whether the URL format is valid.
400	IMG.0018	An error occurred when the job was submitted.	An error occurred when the job was submitted.	Contact technical support.
400	IMG.0019	The backup ID is not specified.	The backup ID is not specified.	Check whether the current backup ID is valid.
400	IMG.0020	The backup does not exist.	The backup does not exist.	Check whether the backup file exists.
400	IMG.0021	The resource type is unknown.	The source type is unknown.	Select a correct source type.
400	IMG.0022	The disk in the current state cannot be used to create images.	A disk in the current state cannot be used to create images.	Check the disk status.
400	IMG.0023	An exception occurred during task query.	An exception occurred during job query.	Contact technical support.
400	IMG.0024	The image type in the request is incorrect.	The image type in the request is incorrect.	Select either BMS or ECS.
400	IMG.0025	The user type in the request is incorrect.	The user type in the request is incorrect.	Check whether the user type is valid.

Statu s Code	Error Code	Message	Description	Handling Measure
403	IMG.00 26	The role is invalid. You need to apply for the required permissions or pass the real-name authentication.	You do not have the rights to perform the operation.	Contact technical support.
400	IMG.00 27	The image ID in the request does not exist.	The image ID in the request does not exist.	Use a valid image ID.
400	IMG.00 28	The image in the request is protected.	The image in the request is protected.	Contact technical support.
400	IMG.00 29	The backup in the request has already been used to create an image.	The backup in the request has already been used to create an image.	Select another backup that has not been used.
400	IMG.00 30	The project ID and token in the request are invalid.	The project ID and token in the request are invalid.	Enter a correct project ID and token.
400	IMG.00 31	The resource ID in the request is incorrect.	The resource ID in the request is incorrect.	Use a valid image ID.
400	IMG.00 32	The backup is unavailable.	The backup is unavailable.	Check whether the backup is available.
400	IMG.00 33	The backup is not a system disk backup.	The backup is not a system disk backup.	Check whether the backup is a system disk backup.
400	IMG.00 34	The number of images cannot be modified.	The number of images cannot be modified.	Contact technical support.

# C Change History

Released On	Description
2023-01-20	<p>This issue is the seventh official release.</p> <p>Modified the following content:</p> <ul style="list-style-type: none"><li>• Modified <b>disk_format</b> description in <a href="#">Querying Images</a>, <a href="#">Querying Images (Native OpenStack API)</a>, <a href="#">Querying Image Details (Native OpenStack API)</a>, <a href="#">Creating Image Metadata (Native OpenStack API)</a>, and <a href="#">Image Attributes</a>.</li><li>• Changed Redhat to Red Hat in <a href="#">Querying Images</a>, <a href="#">Updating Image Information</a>, <a href="#">Creating an Image</a>, <a href="#">Querying Images (Native OpenStack API)</a>, <a href="#">Querying Image Details (Native OpenStack API)</a>, and <a href="#">Updating Image Information (Native OpenStack API)</a>.</li><li>• Added error codes IMG.0238, IMG.0239, IMG.0241, IMG.0242, and IMG.1075 in <a href="#">Error Codes</a>.</li></ul>
2022-12-29	<p>This issue is the sixth official release.</p> <p>Modified the following content:</p> <ul style="list-style-type: none"><li>• Modified the <b>id</b> description in <a href="#">Querying Images</a>. Images can be queried in batches based on their IDs.</li><li>• Deleted <b>is_config_init</b> from the example request in <a href="#">Creating an Image</a>.</li><li>• Added <b>is_quick_export</b> in <a href="#">Exporting an Image</a>.</li><li>• Added the <b>sub_jobs_result</b> and <b>sub_jobs_list</b> response parameters in <a href="#">Querying the Status of an Asynchronous Job</a>.</li><li>• Changed the return value indicating a normal state to <b>300</b> in <a href="#">Querying API Versions (Native OpenStack API)</a> and <a href="#">Querying an API Version (Native OpenStack API)</a>.</li></ul>

Released On	Description
2021-06-30	<p>This issue is the fifth official release.</p> <p>Added the following content:</p> <ul style="list-style-type: none"> <li>• <a href="#">Examples</a></li> <li>• Create private images using ISO files.</li> </ul> <p>Modified the following content:</p> <ul style="list-style-type: none"> <li>• Added the methods of querying OBS bucket names and OBS bucket object names in the description of the <code>image_url</code> parameter in <a href="#">Creating an Image</a>.</li> </ul>
2020-04-30	<p>This issue is the fourth official release.</p> <p>Added the <code>__system_cmkid</code> parameter in <a href="#">Querying Images</a>. Then, you can filter images by key ID.</p>
2019-10-30	<p>This issue is the third official release.</p> <ul style="list-style-type: none"> <li>• Added "Common Query Methods" in <a href="#">Querying Images</a>.</li> <li>• Specified exact matching for <code>name</code> of images in <a href="#">Querying Images</a>, <a href="#">Querying Images (Native OpenStack API)</a>, and <a href="#">Image Attributes</a>.</li> </ul>
2019-08-30	<p>This issue is the second official release.</p> <p>Optimized the whole document, including adjusting the URI format, adding application scenarios of APIs, adding example requests, and optimizing parameter descriptions.</p>
2018-12-26	<p>This issue is the first official release.</p>
