Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the address of the host for which the alarm is generated and the resource name.

Step 2 Log in to the active management node as user **root**.

Step 3 Run the following command, go to the **${BIGDATA_HOME}/om-server/om/sbin/** directory.

su - omm

cd ${BIGDATA_HOME}/om-server/om/sbin/

Step 4 Run the **sh status-oms.sh** command, and execute the **status-oms.sh** script to check whether the floating IP address of the active FusionInsight Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

For example:

```
10-10-10-160 floatip Normal Normal Single_active
```

- If it is, go to **Step 8**.
- If it is not, go to **Step 5**.

Step 5 Run the **ifconfig** command to check whether the NIC with the floating IP address exists.

- If it does, go to **Step 8**.
- If it does not, go to **Step 6**.

Step 6 Run the **ifconfig** *NIC name Floating IPaddress* netmask *Subnet mask* command to reconfigure the NIC with the floating IP address. (For example, **ifconfig eth0 10.10.10.102 netmask 255.255.255.0**).

Step 7 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 10 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.13.48 ALM-12073 CEP Resource Is Abnormal

Description

HA checks the cep resources of Manager every 60 seconds. This alarm is generated when HA detects that the cep resources are abnormal for 2 consecutive times.

This alarm is cleared when the CEP resource is normal.

Resource Type of CEP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new CEP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12073	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The CEP process repeatedly restarts, causing monitoring data to be abnormal.

Possible Causes

The CEP process is abnormal.

Procedure

Check whether the CEP process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the CEP resources managed by the HA is normal. In the single-node system, the CEP resource is in the normal state. In the dual-node system, the CEP resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/cep/cep.log** and **vi $BIGDATA_LOG_HOME/omm/oms/cep/scriptlog/cep_ha.log** commands to view the CEP resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.13.49 ALM-12074 FMS Resource Is Abnormal

Description

HA checks the fms resources of Manager every 60 seconds. This alarm is generated when HA detects that the fms resources are abnormal for 2 consecutive times.

This alarm is cleared when the FMS resource is normal.

Resource Type of FMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12074	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The FMS process repeatedly restarts. As a result, alarm information may fail to be reported.

Possible Causes

The FMS process is abnormal.

Procedure

Check whether the FMS process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the FMS resources managed by the HA is normal. In the single-node system, the FMS resource is in the normal state. In the dual-node system, the FMS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/fms/fms.log** and **vi $BIGDATA_LOG_HOME/omm/oms/fms/scriptlog/fms_ha.log** commands to view the FMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 5 minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.13.50 ALM-12075 PMS Resource Is Abnormal

Description

HA checks the pms resources of Manager every 55 seconds. This alarm is generated when HA detects that the pms resources are abnormal for three consecutive times.

This alarm is cleared when the PMS resource is normal.

Resource Type of PMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new PMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12075	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby FusionInsight Manager switchover occurs.
- The PMS process repeatedly restarts, causing monitoring information to be abnormal.

Possible Causes

The PMS process is abnormal.

Procedure

Check whether the PMS process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su -omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the PMS resources managed by the HA is normal. In the single-node system, the PMS resource is in the normal state. In the dual-node system, the PMS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/pms/pms.log** and **vi $BIGDATA_LOG_HOME/omm/oms/pms/scriptlog/pms_ha.log** commands to view the PMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

9.13.51 ALM-12076 GaussDB Resource Is Abnormal

Description

HA checks the Manager database every 10 seconds. This alarm is generated when HA detects that the database is abnormal for 3 consecutive times.

This alarm is cleared when the database is normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12076	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If databases are abnormal, all core services and related service processes, such as alarms and monitoring functions, are affected.

Possible Causes

An exception occurs in the database.

Procedure

Check the database status of the active and standby management nodes.

Step 1 Log in to the active and standby management nodes respectively as user **root**. Run the **su - ommdba** command to switch to user **ommdba**, and then run the **gs_ctl query** command to check whether the following information is displayed in the command output.

Command output of the active management node:

```
Ha state:
      LOCAL_ROLE: Primary
      STATIC_CONNECTIONS           : 1
      DB_STATE                    : Normal
      DETAIL_INFORMATION           : user/password invalid
Senders info:
      No information
Receiver info:
      No information
```

Command output of the standby management node:

```
Ha state:
      LOCAL_ROLE: Standby
```

```
        STATIC_CONNECTIONS            : 1
        DB_STATE                    : Normal
        DETAIL_INFORMATION            : user/password invalid
Senders info:
        No information
Receiver info:
        No information
```

- If it is, go to **Step 3**.
- If it is not, go to **Step 2**.

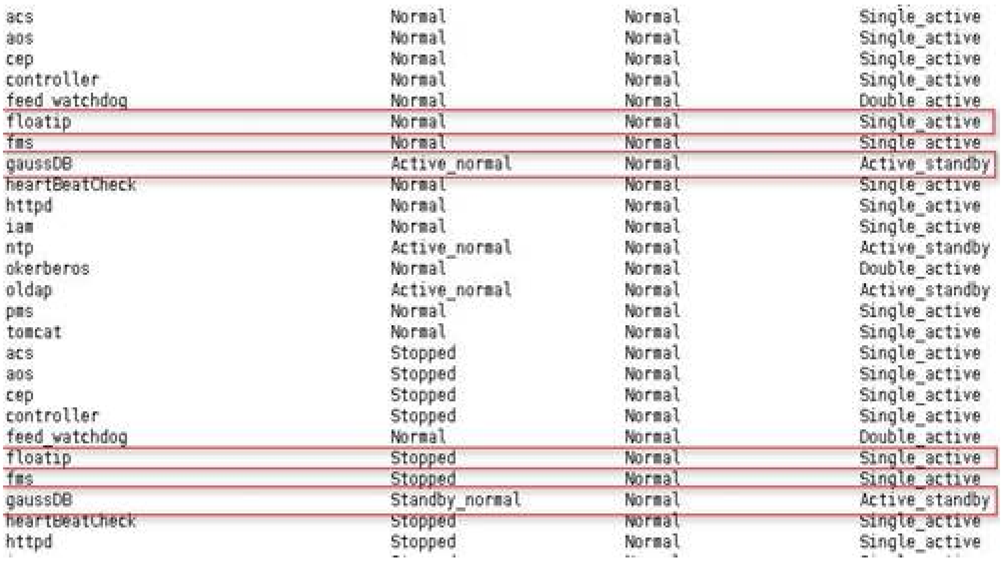
Step 2 Contact the network administrator to check whether the network is faulty.

- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Step 4 Log in to the active and standby management nodes, run the **su -omm** command to switch to user **omm**, go to the **${BIGDATA_HOME} /om-server/om/sbin/** directory, and run the **status-oms.sh** script to check whether the floating IP addresses and GaussDB resources of the active and standby FusionInsight Managers are in the status shown in the following figure.



```
acs                   Normal            Normal            Single_active
aos                   Normal            Normal            Single_active
cep                   Normal            Normal            Single_active
controller            Normal            Normal            Single_active
feed_watchdog         Normal            Normal            Double_active
floatip               Normal            Normal            Single_active
fms                   Normal            Normal            Single_active
gaussDB               Active_normal     Normal            Active_standby
heartBeatCheck        Normal            Normal            Single_active
httpd                 Normal            Normal            Single_active
iam                   Normal            Normal            Single_active
ntp                   Active_normal     Normal            Active_standby
okerberos             Normal            Normal            Double_active
oldap                 Active_normal     Normal            Active_standby
pms                   Normal            Normal            Single_active
tomcat                Normal            Normal            Single_active
acs                   Stopped           Normal            Single_active
aos                   Stopped           Normal            Single_active
cep                   Stopped           Normal            Single_active
controller            Stopped           Normal            Single_active
feed_watchdog         Normal            Normal            Double_active
floatip               Stopped           Normal            Single_active
fms                   Stopped           Normal            Single_active
gaussDB               Standby_normal    Normal            Active_standby

9.13.52 ALM-12077 User omm Expired

Description

The system starts at 00:00 every day to check whether user **omm** has expired every eight hours. This alarm is generated if the user account has expired.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12077	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

User **omm** has expired.

Procedure

Check whether user omm in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm**command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -E 'yyyy-MM-dd' omm** command to set the expiration time of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

9.13.53 ALM-12078 Password of User omm Expired

Description

The system starts at 00:00 every day to check whether the password of user **omm** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **omm** password is changed and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12078	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The password of user **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The password of user **omm** has expired.

Procedure

Check whether the password of user omm in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l omm**command to view the information about the password of user **omm**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -M '*days*' omm** command to set the validity period of the password for user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

9.13.57 ALM-12082 User ommdba Is About to Expire

Description

The system starts at 00:00 every day to check whether user **ommdba** is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **ommdba** is reset and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12082	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The account of user **ommdba** for the host is about to expire.

Procedure

Check whether user ommdba is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about user **ommdba**.

Step 2 View the value of **Account expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

Step 3 Run the **chage -E** *'yyyy-MM-dd'* **ommdba** command to set the validity period of user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.13.58 ALM-12083 Password of User ommdba Is About to Expire

Description

The system starts at 00:00 every day to check whether the password of user **ommdba** is about to expire every 8 hours. This alarm is generated if the password is about to expire no less than 15 days later.

This alarm is cleared when the expiration time of user **ommdba** password is reset and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12083	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The password of user **ommdba** is about to expire.

Procedure

Check whether the password of user ommdba in the system is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Password expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

Step 3 Run the **chage -M** *'days'* **ommdba** command to set the validity period of the password for user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.13.59 ALM-12084 Password of User ommdba Expired

Description

The system starts at 00:00 every day to check whether the password of user **ommdba** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **ommdba** password is reset and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12084	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The password of user **ommdba** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The password of user **ommdba** for the host has expired.

Procedure

Check whether the password of user ommdba in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -M** *'days'* **ommdba** command to set the validity period of the password for user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

9.13.60 ALM-12085 Service Audit Log Dump Failure

Description

The system dumps service audit logs at 03:00 every day and stores them on the OMS node. This alarm is generated when the dump fails. This alarm is cleared when the next dump succeeds.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12085	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The service audit logs may be lost.

Possible Causes

- The service audit logs are oversized.
- The OMS backup storage space is insufficient.
- The storage space of a host where the service is located is insufficient.

Procedure

Check whether the service audit logs are oversized.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host and additional information for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "LOG SIZE is more than 5000MB" can be searched.

- If it can, go to **Step 4**.
- If it cannot, go to **Step 5**.

Step 4 Check whether the oversized service audit logs are caused by exceptions.

The OMS backup storage space is insufficient.

Step 5 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, too many logs on" can be searched.

- If it can, obtain the host IP address following the keyword "Collect log failed, too many logs on", and go to **Step 6**.
- If it cannot, go to **Step 11**.

Step 6 Log in to the host with the IP address obtained in **Step 5** as user **root**.

Step 7 Run the **vi {BIGDATA_LOG_HOME}/nodeagent/scriptlog/collectLog.log** command to check whether the keyword "log size exceeds" can be searched.

- If it can, go to **Step 9**.
- If it cannot, go to **Step 8**.

Step 8 Check whether the alarm additional information contains the keyword "no enough space".

- If yes, go to **Step 9**.
- If no, go to**Step 11**.

Step 9 Perform the following operations to expand the disk capacity or reduce the maximum number of audit log backups:

- Expand the capacity of the OMS node.
- Run the following command to edit the file and decrease the value of **MAX_NUM_BK_AUDITLOG**.

  vi ${CONTROLLER_HOME}/etc/om/componentsauditlog.properties

Step 10 In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 11**.

Check whether the space of the host where the service is located is insufficient.

Step 11 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, no enough space on *hostIp*" can be searched.

- If it can, obtain the IP address of the abnormal host and go to **Step 12**.
- If it cannot, go to **Step 15**.

Step 12 Log in to the host with the IP address obtained as user **root**, and run the **df "$BIGDATA_HOME/tmp" -lP | tail -1 | awk '{print ($4/1024)}'** command to obtain the remaining space of the host log directory. Check whether the value is less than 1000 MB.

- If it is, go to **Step 13**.
- If it is not, go to **Step 15**.

Step 13 Expand the capacity of the node

Step 14 In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 16 Select **Controller** for **Service** and click **OK**.

Step 17 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.13.61 ALM-12087 System Is in the Upgrade Observation Period

Description

The system checks whether it is in the upgrade observation period at 00:00 every day and checks whether the duration that it has been in the upgrade observation state exceeds the preset upgrade observation period, 10 days by default. This alarm is generated when the system is in the upgrade observation period and the duration that the system has been in the upgrade observation state exceeds the preset period (10 days by default). This alarm is automatically cleared if the system exits the upgrade observation period after the user performs a rollback or submission.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12087	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Upgrade Observation Period (Days)	Specifies the days that the system is in the upgrade observation period.

Impact on the System

The next upgrade or patch installation will fail.

Possible Causes

The upgrade task is not submitted a specified period of time (10 days by default) after the system upgrade.

Procedure

Check whether the system is in the upgrade observation period.

Step 1 Log in to the active management node as user **root**.

Step 2 Run the following commands to switch to user **omm** and log in to the **omm** database:

su - omm

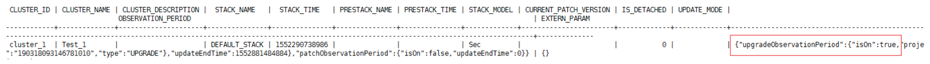
gsql -U omm -W *omm database password* **-p 20015**

Step 3 Run the **select * from OM_CLUSTERS** command to view cluster information.

Step 4 Check whether the value of **upgradObservationPeriod isON** is **true**, as shown in **Figure 9-25**.

- If it is, the system is in the upgrade observation period. Use the UpdateTool to submit the upgrade task. For details, see the upgrade guide of the corresponding version.
- If it is not, go to **Step 6**.

Figure 9-25 Cluster information



```
 CLUSTER_ID | CLUSTER_NAME | CLUSTER_DESCRIPTION |  STACK_NAME   |  STACK_TIME   | PRESTACK_NAME | PRESTACK_TIME | STACK_MODEL | CURRENT_PATCH_VERSION | IS_DETACHED | UPDATE_MODE |

 cluster_1  | Test_1       |                     | DEFAULT_STACK | 1552290738986 |               |               | Sec         |                       |           0 |             | {"upgradeObservationPeriod":{"isOn":true,"proje
":"190318093146781010","type":"UPGRADE"},"updateEndTime":1552881484884},"patchObservationPeriod":{"isOn":false,"updateEndTime":0}} | {}
```

Step 5 In the early morning of the next day, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select **Controller** from the **Service** and click **OK**.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

9.13.62 ALM-12089 Inter-Node Network Is Abnormal

Description

The alarm module checks the network health status of nodes in the cluster every 10 seconds. This alarm is generated when the network between two nodes is unreachable or the network status is unstable.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12089	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Functions of some components, such as HDFS and ZooKeeper, are affected.

Possible Causes

- The node breaks down.
- The network is faulty.

Procedure

Check the network health status.

Step 1 In the alarm list on FusionInsight Manager, click the drop-down button of the alarm and view **Additional Information**. Record the source IP address and destination IP address of the node for which the alarm is reported.

Step 2 Log in to the node for which the alarm is reported. On the node, ping the target node to check whether the network between the two nodes is normal.

- If yes, go to **6**.
- If no, go to **3**.

Check the node status.

Step 3 On FusionInsight Manager, click **Host** and check whether the host list contains the faulty node to determine whether the faulty node has been removed from the cluster.

- If yes, go to **5**.
- If no, go to **4**.

Step 4 Check whether the faulty node is powered off.

- If yes, start the faulty node and go to **Step 2**.
- If no, contact related personnel to find root cause, if need to remove the faulty nodes from the cluster and go to **5**, otherwise go to **6**.

Step 5 Remove the file **$NODE_AGENT_HOME/etc/agent/hosts.ini** of all nodes in the cluster, and clean up the file **/var/log/Bigdata/unreachable/unreachable_ip_info.log**, and then manually clear the alarm.

Step 6 Wait for 30 seconds and checking if the alarm was been cleared.

- If yes, no further action is required.
- If no, go to **7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **OmmAgent** from the **Service** and click **OK**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.63 ALM-12101 AZ Unhealthy

Description

After the AZ DR function is enabled, the system checks the AZ health status every 5 minutes. This alarm is generated when the system detects that the AZ is subhealthy or unhealthy. This alarm is cleared when the AZ becomes healthy.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12101	Major	Yes

Parameters

Parameter	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
AZName	Specifies the AZ for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The health status of an AZ is determined by whether the health status of storage resources (HDFS), computing resources (Yarn), and key roles in the AZ exceeds the configured threshold.

An AZ is subhealthy when:

- The computing resources (Yarn) are unhealthy, but the storage resources (HDFS) are healthy. Tasks cannot be submitted to the local AZ, but data can still be read and written in the local AZ.
- The computing resources (Yarn) are healthy, but some storage resources (HDFS) are unhealthy. Tasks can be submitted to the local AZ, and some data can be read and written in the local AZ. This depends on the locality of data detected by Spark/Hive scheduling.

An AZ is unhealthy when:

- The computing resources (Yarn) are healthy, but the storage resources (HDFS) are unhealthy. Although tasks can be submitted to the local AZ, data cannot be read or written in the local AZ. As a result, the tasks submitted to the local AZ are invalid.

- The computing resources (Yarn) and storage resources (HDFS) are unhealthy. Tasks cannot be submitted to the local AZ, and data cannot be read or written in the local AZ.
- The health status of key roles except Yarn and HDFS is lower than the configured threshold.

Possible Causes

- The computing resources (Yarn) are unhealthy.
- The storage resources (HDFS) are unhealthy.
- Some storage resources (HDFS) are unhealthy.
- Key roles except Yarn and HDFS are unhealthy.

Procedure

Disable the DR drill.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Cross-AZ HA**. The Cross-AZ HA page is displayed.

Step 2 In the AZ DR list, check whether **Perform DR Drill** in the **Operation** column of the AZ whose health status is **Unhealthy** is gray.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Click **Restore** in the **Operation** column of the target AZ. Wait 2 minutes and refresh the page to view the health status of the AZ. Check whether the health status is normal.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 Log in to the active management node as user **root**.

Step 5 View logs of unhealthy services.

- HDFS log files are stored in **/var/log/Bigdata/hdfs/nn/hdfs-az-state.log**.
- Yarn log files are stored in **/var/log/Bigdata/yarn/rm/yarn-az-state.log**.
- For other services, view the service health check logs in the corresponding service log directory.

Step 6 Contact O&M personnel and provide detailed log file information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.64 ALM-12102 AZ HA Component Is Not Deployed Based on DR Requirements

Description

The alarm module checks the deployment status of AZ HA components every 5 minutes. This alarm is generated when the components that support DR are not deployed based on DR requirements after AZ is enabled. This alarm is cleared when the components are deployed based on DR requirements.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12102	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Impact on the System

The cross-AZ HA capability of a single cluster is affected.

Possible Causes

The roles of the components that support DR are not deployed based on DR requirements.

Procedure

Obtain alarm information.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, click ⌄ in the row that contains the alarm and view the roles that are not deployed based on DR requirements in **Additional Information**.

Redeploy the role instance.

Step 3 Choose **Cluster** > **Services** > *Name of the desired service* > **Instance**. On the instance page, redeploy or adjust the role instance.

Step 4 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.65 ALM-12103 Executor Resource Exception

Description

HA checks the Executor resources of Manager every 30 seconds. This alarm is generated when HA detects that the Executor resources are abnormal for two consecutive times.

This alarm is cleared when the Executor resources are normal.

Resource Type of Executor is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Executor resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12103	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby Manager switchover occurs.
- The Executor process keeps restarting. As a result, the cluster page may fail to be accessed.

Possible Causes

The Executor process is abnormal.

Procedure

Check whether the Executor process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the Executor resources managed by the HA is normal. In the single-node system, the Executor resource is in the normal state. In the dual-node system, the Executor resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/executor.log** command to check whether the Executor resource log of HA contains the keyword **ERROR**. If yes, analyze the log to locate the resource exception cause and fix the exception.

Step 6 After 5 minutes, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

9.13.66 ALM-12104 Abnormal Knox Resources

Description

HA checks the Knox resources of Manager every 70 seconds. This alarm is generated when HA detects that the Knox resources are abnormal for three consecutive times.

This alarm is cleared when HA detects that the Knox resources are normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12104	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Requests sent by upper-layer services by using Knox cannot be properly processed.

Possible Causes

The Knox process is abnormal.

Procedure

Check whether the Knox process is normal.

Step 1 Log in to FusionInsight Manager. In the alarm list, locate the row that contains the alarm and view the name of the host for which the alarm is generated.

Step 2 Use PuTTY to log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check whether the status of the Knox resources managed by HA is normal. If the status is normal, the Knox resources are normal. Otherwise, the Knox resources are abnormal.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/knox.log** command to check whether the Knox resource log of HA contains the keyword **ERROR**. If yes, analyze the log to locate the resource exception cause and fix the exception.

Step 6 After 5 minutes, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

9.13.67 ALM-12110 Failed to get ECS temporary AK/SK

Description

The meta service periodically obtains the temporary AK/SK of the ECS. This alarm is generated when the meta service fails to obtain the temporary AK/SK.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12110	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

In storage-compute decoupling scenarios, the cluster cannot obtain the latest temporary AK/SK, which may lead to failure access to OBS.

Possible Causes

- The meta role of the MRS cluster is abnormal.
- The cluster has been bound to an agency and accessed OBS but has been unbound from the agency. As a result, the cluster has not been bound to any agency.

Procedure

Check the status of the meta role.

Step 1 On FusionInsight Manager of the cluster, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and determine the IP address of the host for which the alarm is generated.

Step 2 On FusionInsight Manager of the cluster, choose **Cluster** > **Services** > **Meta**. On the page that is displayed, click the **Instance** tab, and check whether the meta role corresponding to the host for which the alarm is generated is normal.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Select the abnormal role and choose **More** > **Restart Instance** to restart the abnormal meta role. After the restart is complete, check whether the alarm is cleared several minutes later.

- If yes, no further action is required.
- If no, go to **Step 4**.

Rebind the cluster to an agency.

Step 4 Log in to the MRS management console.

Step 5 In the navigation pane on the left, choose **Clusters** > **Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an agency in the O&M management area.

- If yes, go to **Step 7**.

- If no, go to **Step 6**.

Step 6 Click **Manage Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 Contact O&M personnel.

----End

9.13.68 ALM-12180 Suspended Disk I/O

Description

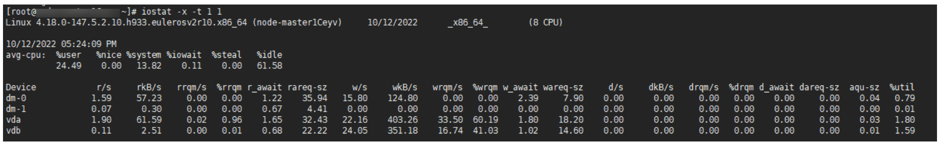
- For HDDs, the alarm is triggered when any of the following conditions is met:
  - The system collects data every 3 seconds, and detects that the **svctm** value exceeds 6s for 10 consecutive periods within 30 seconds.
  - The system collects data every 3 seconds, and detects that the **avgqu-sz** value is greater than 0, the IOPS or bandwidth is 0, and the **ioutil** value is greater than **99%** for 10 consecutive periods within 30 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - The system collects data every 3 seconds, and detects that the **svctm** value exceeds 3s for 10 consecutive periods within 30 seconds.
  - The system collects data every 3 seconds, and detects that the **avgqu-sz** value is greater than 0, the IOPS or bandwidth is 0, and the **ioutil** value is greater than **99%** for 10 consecutive periods within 30 seconds.

This alarm is automatically cleared when the preceding conditions have not been met for 90s.

NOTE

- Run the following command in the OS to collect data:

  iostat -x -t 1 1

```
[root@[redacted]~]# iostat -x -t 1 1
Linux 4.18.0-147.5.2.10.h933.eulerosv2r10.x86_64 (node-master1Ceyv)     10/12/2022      _x86_64_        (8 CPU)

  Parameters are as follows:

  avgqu-sz indicates the disk queue depth.

  The sum of **r/s** and **w/s** is the IOPS.

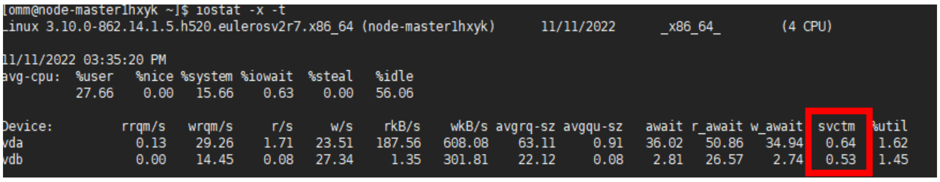
  The sum of **rkB/s** and **wkB/s** is the bandwidth.

  %util is the **ioutil** value.

  The **svctm** value can be obtained as follows:

- MRS 3.1.0:

  Run the **iostat -x -t** command in the OS.

```
[omm@node-master1hxyk ~]$ iostat -x -t
Linux 3.10.0-862.14.1.5.h520.eulerosv2r7.x86_64 (node-master1hxyk)      11/11/2022      _x86_64_        (4 CPU)

11/11/2022 03:35:20 PM
avg-cpu:  %user   %nice %system %iowait  %steal   %idle
          27.66    0.00   15.66    0.63    0.00   56.06

Device:         rrqm/s   wrqm/s     r/s     w/s    rkB/s    wkB/s avgrq-sz avgqu-sz   await r_await w_await  svctm  %util
vda               0.13    29.26    1.71   23.51   187.56   608.08    63.11     0.91   36.02   50.86   34.94   0.64   1.62

```

  In these two commands:

  In the data collected for the first time, the number in the fourth column is the **rd_ios_old** value, the number in the eighth column is the **wr_ios_old** value, and the number in the thirteenth column is the **tot_ticks_old** value.

  In the data collected for the second time, the number in the fourth column is the **rd_ios_new** value, the number in the eighth column is the **wr_ios_new** value, and the number in the thirteenth column is the **tot_ticks_new** value.

  In this case, the value of **svctm** is as follows:

  (19571460 - 19569526)/(1101553 + 28747977 - 1101553 - 28744856) = 0.6197

Attribute

Alarm ID	Alarm Severity	Auto Clear
12180	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskName	Specifies the disk for which the alarm is generated.

Impact on the System

A continuously high I/O usage may adversely affect service operations and result in service loss.

Possible Causes

The disk is aged.

Procedure

Replace the disk.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 3 Replace the hard disk.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Select **OMS** for **Service** and click **OK**.

Step 7 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.69 ALM-13000 ZooKeeper Service Unavailable

Description

The system checks the ZooKeeper service status every 60 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

ZooKeeper cannot provide coordination services for upper layer components and the components that depend on ZooKeeper may not run properly.

Possible Causes

- The DNS is installed on the ZooKeeper node.
- The network is faulty.
- The KrbServer service is abnormal.
- The ZooKeeper instance is abnormal.
- The disk capacity is insufficient.

Procedure

Check the DNS.

Step 1 Check whether the DNS is installed on the node where the ZooKeeper instance is located. On the Linux node where the ZooKeeper instance is located, run the **cat /etc/resolv.conf** command to check whether the file is empty.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Run the **service named status** command to check whether the DNS is started.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the **service named stop** command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in **/etc/resolv.conf**.

Step 4 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the network status.

Step 5 On the Linux node where the ZooKeeper instance is located, run the **ping** command to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Modify the IP addresses in **/etc/hosts** and add the host name and IP address mapping.

Step 7 Run the **ping** command again to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to **Step 8**.
- If no, go to **Step 23**.

Step 8 On the **O&M** > **Alarm** > **Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the KrbServer service status (Skip this step if the normal mode is used).

Step 9 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 10 Check whether the KrbServer service is normal.

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Perform operations based on "ALM-25500 KrbServer Service Unavailable" and check whether the KrbServer service is recovered.

- If yes, go to **Step 12**.
- If no, go to **Step 23**.

Step 12 On the **O&M** > **Alarm** > **Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check the ZooKeeper service instance status.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **quorumpeer**.

Step 14 Check whether the ZooKeeper instances are normal.

- If yes, go to **Step 18**.
- If no, go to **Step 15**.

Step 15 Select instances whose status is not good, and choose **More** > **Restart Instance**.

Step 16 Check whether the instance status is good after restart.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 On the **O&M** > **Alarm** > **Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check disk status.

Step 18 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **ZooKeeper** > **quorumpeer**, and check the node host information of the ZooKeeper instance.

Step 19 On FusionInsight Manager, click **Host**.

Step 20 In the **Disk** column, check whether the disk space of each node where ZooKeeper instances are located is insufficient (disk usage exceeds 80%).

- If yes, go to **Step 21**.

- If no, go to **Step 23**.

Step 21 Expand disk capacity. For details, see "ALM-12017 Insufficient Disk Capacity".

Step 22 On the **O&M** > **Alarm** > **Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Collect fault information.

Step 23 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 24 Select the following nodes in the required cluster from the **Service**: (KrbServer logs do not need to be downloaded in normal mode.)

- ZooKeeper
- KrbServer

Step 25 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.70 ALM-13001 Available ZooKeeper Connections Are Insufficient

Description

The system checks ZooKeeper connections every 60 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold (80% of the maximum connections).

When the **Trigger Count** is 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, external connections cannot be handled.

Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not comply with the actual scenario.

Procedure

Check connection status.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Connections Are Insufficient** and confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 Obtain the PID of the ZooKeeper process. Log in to the node involved in this alarm as user **root** and run the **pgrep -f proc_zookeeper** command.

Step 3 Check whether the PID can be correctly obtained.

- If yes, go to **Step 4**.
- If no, go to **Step 15**.

Step 4 Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the following command based on the obtained PID: **lsof -i|grep** *$pid* **| awk '{print $9}' | cut -d :**

-f 2 | cut -d \>-f 2 | awk '{a[$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10. (The PID obtained in the preceding step is used.)

Step 5 Check whether node IP addresses and number of connections are successfully obtained.

- If yes, go to **Step 6**.
- If no, go to **Step 15**.

Step 6 Obtain the ID of the port connected to the process. Run the following command based on the obtained PID and IP address: **lsof -i|grep** *$pid* **| awk '{print $9}'|cut -d \> -f 2 |grep** *$IP***| cut -d : -f 2**. (The PID and IP address obtained in the preceding step are used.)

Step 7 Check whether the port ID is successfully obtained.

- If yes, go to **Step 8**.
- If no, go to **Step 15**.

Step 8 Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: **lsof -i|grep** *$port*. (The port ID obtained in the preceding step is used.)

Step 9 Check whether the process ID is successfully obtained.

- If yes, go to **Step 10**.
- If no, go to **Step 15**.

Step 10 Check whether connection leakage occurs on the process based on the obtained process ID.

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Close the process where connection leakage occurs and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **Performance** and increase the value of **maxCnxns** as required.

Step 13 Save the configuration and restart the ZooKeeper service.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **ZooKeeper** in the required cluster from the **Service**:

Step 17 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.71 ALM-13002 ZooKeeper Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the ZooKeeper service every 30 seconds. The alarm is generated when the direct memory usage of a ZooKeeper instance exceeds the threshold (80% of the maximum memory).

When the **Trigger Count** is 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than 80% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the ZooKeeper service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the ZooKeeper instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ZooKeeper Direct Memory Usage Exceeds the Threshold**. Check the IP address of the instance that reports the alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance** > **quorumpeer(the IP address checked)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**.

Step 3 Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, in the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize" and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Save the configuration and restart the ZooKeeper service.

Step 6 Check whether the **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **ZooKeeper** in the required cluster from the **Service**.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.72 ALM-13003 GC Duration of the ZooKeeper Process Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the ZooKeeper process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A long GC duration of the ZooKeeper process may interrupt the services.

Possible Causes

The heap memory of the ZooKeeper process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, click the drop-down list of **GC Duration of the ZooKeeper Process Exceeds the Threshold**. View the IP address of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Instance** > **quorumpeer**. Click the drop-down list in the upper right corner of **Chart**, choose **Customize** > **GC**, select **ZooKeeper GC Duration per Minute**, and click **OK** to check the GC duration statistics of the ZooKeeper process collected every minute.

Step 3 Check whether the GC duration of the ZooKeeper process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 Check whether memory leakage occurs in the application.

Step 5 On the **Home** page of FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper**. On the page that is displayed, click the **Configuration** tab then the **All Configurations** sub-tab, and select **quorumpeer** > **System**. Increase the value of the **GC_OPTS** parameter as required.

NOTE

Generally, **-Xmx** is twice of ZooKeeper data capacity. If the capacity of ZooKeeper reaches 2 GB, set **GC_OPTS** as follows:

-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1

Step 6 Save the configuration and restart the ZooKeeper service.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.73 ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the ZooKeeper service every 60 seconds. The alarm is generated when the heap memory usage of a ZooKeeper instance exceeds the threshold (95% of the maximum memory).

The alarm is cleared when the memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available ZooKeeper heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the ZooKeeper instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, On the displayed interface, click the drop-down button of **ZooKeeper Heap Memory Usage Exceeds the Threshold** and confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance**, click **quorumpeer** in the **Role** column of the corresponding IP address. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**. Check the heap memory usage.

Step 3 Check whether the used heap memory of ZooKeeper reaches 95% of the maximum heap memory specified for ZooKeeper.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** as required. The details are as follows:

1. On the **Instance** tab, click **quorumpeer** in the **Role** column of the corresponding IP address. Choose **Customize** > **CPU and Memory** in the upper right corner, and select **ZooKeeper Heap And Direct Buffer Resource**, click **OK** to check the heap memory used by ZooKeeper.
2. Change the value of **-Xmx** in the **GC_OPTS** parameter based on the actual heap memory usage. Generally, the value is twice the size of the ZooKeeper

data volume. For example, if 2 GB ZooKeeper heap memory is used, the following configurations are recommended: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1

Step 5 Save the configuration and restart the ZooKeeper service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.74 ALM-13005 Failed to Set the Quota of Top Directories of ZooKeeper Components

Description

The system sets quotas for each ZooKeeper top-level directory in the **customized.quota** configuration item and components every 5 hours. This alarm is generated when the system fails to set the quota for a directory.

This alarm is cleared when the setting succeeds after a failure.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13005	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

Components can write a large amount of data to the top-level directory of ZooKeeper. As a result, the ZooKeeper service is unavailable.

Possible Causes

The quota for the alarm directory is inappropriate.

Procedure

Check whether the quota for the alarm directory is appropriate.

Step 1 Log in to FusionInsight Manager, and choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper**. On the displayed page, choose **Configurations** > **All Configurations** > **Quota**. Check whether the directory for which the alarm is reported and its quota exist in the **customized.quota** configuration item.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 Check whether the alarm directory for which the alarm is reported is in the following alarm list.

Table 9-89 Component alarm directory

Component	Alarm Directory
Hbase	/hbase
Hive	/beelinesql
Yarn	/rmstore
Storm	/stormroot
Streaming	/storm
Kafka	/kafka

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 View the component of the alarm directory in the table, open the corresponding service page, and choose **Configurations** > **All Configurations**. On the displayed page, search for **zk.quota** in the upper right corner. The search result is the quota of the alarm directory.

Step 4 Check whether the quota of the alarm directory for which the alarm is reported is appropriate. The quota must be greater than or equal to the actual value, which can be obtained in **Trigger Condition**.

Step 5 Modify the **services.quota** value as prompted and save the configuration.

Step 6 After the time specified by **service.quotas.auto.check.cron.expression**, check whether the alarm is cleared.

- If it is, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.75 ALM-13006 Znode Number or Capacity Exceeds the Threshold

Description

The system periodically detects the status of secondary Znode in the ZooKeeper service data directory every four hours. This alarm is generated when the number or capacity of secondary Znodes exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13006	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide normal services.

Possible Causes

A large amount of data is written to the ZooKeeper data directory. The threshold is not appropriate.

Procedure

Check whether a large amount of data is written to the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Znode Number or Capacity Exceeds the Threshold**. Confirm the Znode for which the alarm is generated in Location Information.

Step 2 Log in to FusionInsight Manager, open the ZooKeeper service interface, and select **Resource**. In the table **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written to the top-level Znode for which the alarm is reported.

- If it is, go to **Step 3**.
- If it is not, go to **Step 4**.

Step 3 Log in to the ZooKeeper client and delete the data in the top-level Znode.

Step 4 Log in to FusionInsight Manager and open the ZooKeeper service interface. On the **Resource** page, choose ◷ > **By Znode quantity** in **Used Resources (By Second-**

Level Znode). **Threshold Configuration of By Znode quantity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referringto the value of **max.Znode.count** by choosing **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations > Quota**.

Step 5 In the **Used Resources (By Second-Level Znode)**, choose > **By capacity**. The **Threshold Settings** page of **By Capacity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.data.size** by choosing **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations** > **Quota**.

Step 6 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.76 ALM-13007 Available ZooKeeper Client Connections Are Insufficient

Description

The system periodically detects the number of active processes between the ZooKeeper client and the ZooKeeper server every 60 seconds. This alarm is generated when the number of connections exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13007	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
ClientIP	Specifies the client IP address.
ServerIP	Specifies the server IP address.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large number of connections to ZooKeeper caused the ZooKeeper to be fully connected and unable to provide normal services.

Possible Causes

A large number of client processes are connected to ZooKeeper. The thresholds are not appropriate.

Procedure

Check whether there are a large number of client processes connected to ZooKeeper.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Client Connections Are Insufficient**. Confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 Open the ZooKeeper service interface, click **Resource** to enter the **Resource** page, and check whether the number of connections of the client with the IP address specified by **Number of Connections (By Client IP Address)** is large.

- If it is, go to **Step 3**.
- If it is not, go to **Step 4**.

Step 3 Check whether connection leakage occurs on the client process.

Step 4 Click in the **Number of Connections (by Client IP Address)** to enter the **Thresholds** page, and click **Modify** under **Operation**. Increase the threshold by referring to the value of **maxClientCnxns** by choosing **Cluster >** *Name of the* *desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations > quorumpeer**.

Step 5 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select **ZooKeeper** in the required cluster from the **Service**.

Step 8 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.77 ALM-13008 ZooKeeper Znode Usage Exceeds the Threshold

Description

The system checks the level-2 Znode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper**, and click **Resource**. Click **By Znode quantity** in **Used Resources (By Second-Level Znode)**, and check whether a large amount of data is written to the top Znode.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select **Location** from the drop-down list box next to **ALM-13008 ZooKeeper Znode Quantity Usage Exceeds Threshold**, and obtain the Znode path in **ServiceDirectory**.

Step 3 Log in to the ZooKeeper client as a cluster user and delete unnecessary data from the Znode corresponding to the alarm.

Step 4 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations**, and search for **max.znode.count**, which is the maximum number of ZooKeeper directories. The alarm threshold is 80% of this parameter. Increase the value of this parameter, click **Save**, and restart the service for the configuration to take effect.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select **ZooKeeper** in the required cluster from the **Service**.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.78 ALM-13009 ZooKeeper Znode Capacity Usage Exceeds the Threshold

Description

The system checks the level-2 ZNode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the capacity usage exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

Possible Causes

- A large volume of data has been written to the ZooKeeper data directory.
- The threshold is improperly defined.

Procedure

Check whether a large volume of data is written to the alarm directory.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. Click the drop-down list in the row containing **ALM-13009 ZooKeeper ZNode Capacity Usage Exceeds the Threshold**, and find the ZNode for which the alarm is generated in the **Location** area.

Step 2 Choose **Cluster** > **Services** > **ZooKeeper**. On the page that is displayed, click the **Resource** tab. In the **Used Resources (By Second-Level ZNode)** area, click **By capacity** and check whether a large amount of data is written to the top-level ZNode directory.

- If yes, record the directory to which a large amount of data is written and go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Check whether data in the directory can be deleted.

NOTICE

Deleting data from ZooKeeper is a high-risk operation. Exercise caution when performing this operation.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Log in to the ZooKeeper client and delete unnecessary data from the directory to which a large amount of data is written.

1. Log in to the ZooKeeper client installation directory, for example, **/opt/client**, and configure environment variables.

   ```
   cd /opt/client
   source bigdata_env
   ```

2. Run the following command to authenticate the user (skip this step for a cluster in normal mode):

   kinit *Component service user*

3. Run the following command to log in to the client tool:

   zkCli.sh -server <*Service IP address of the node where any ZooKeeper instance resides***>:<***Client port***>**

4. Run the following command to delete unnecessary data:

   delete *Path of the file to be deleted*

Step 5 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the page that is displayed, click the **Configuration** tab then the **All Configurations** sub-tab, and search for **max.data.size**. The value of **max.data.size** is the maximum capacity quota of the ZooKeeper directory. The unit is byte. Search for the **GC_OPTS** configuration item and check the value of **Xmx**.

Step 6 Compare the values of **max.data.size** and **Xmx*0.65**. The threshold is the smaller value multiplied by 80%. You can change the values of **max.data.size** and **Xmx*0.65** to increase the threshold.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.79 ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold

Description

The system checks the Znode usage of all service directories with quota configured every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. Confirm the Znode for which the alarm is generated in **Location** of this alarm.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** and click **Resource**. In **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written into the top Znode.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select Location from the drop-down list box next to **ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold**, and obtain the Znode path in ServiceDirectory.

Step 4 Log in to the ZooKeeper client as a cluster user and delete unwanted data in the Znode for which the alarm is generated.

Step 5 Log in to FusionInsight Manager, and choose **Cluster** > *Name of the desired cluster* > **Services** > *Component of the top Znode for which the alarm isgenerated.* Choose **Configurations** > **All Configurations**, search for **zk.quota.number**, increase its value, click **Save**.

NOTICE

If the Component of the top Znode for which the alarm isgenerated is ClickHouse, change the value of **clickhouse.zookeeper.quota.node.count**.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.80 ALM-14000 HDFS Service Unavailable

Description

The system checks the NameService service status every 60 seconds. This alarm is generated when all the NameService services are abnormal and the system considers that the HDFS service is unavailable.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The ZooKeeper service is abnormal.
- All NameService services are abnormal.

Procedure

Check the ZooKeeper service status.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarm page, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 See **ALM-13000 ZooKeeper Service Unavailable** to rectify the health status of ZooKeeper fault and check whether the **Running Status** of the ZooKeeper service restores to **Normal**.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the **O&M** > **Alarm** > **Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Handle the NameService service exception alarm.

Step 4 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the Alarms page, check whether **ALM-14010 NameService Service Unavailable** is reported.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 See **ALM-14010 NameService Service Unavailable** to handle the abnormal NameService services and check whether each NameService service exception alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 On the **O&M** > **Alarm** > **Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.81 ALM-14001 HDFS Disk Usage Exceeds the Threshold

Description

The system checks the HDFS disk usage every 30 seconds and compares the actual HDFS disk usage with the threshold. The HDFS disk usage indicator has a default threshold, this alarm is generated when the value of the disk usage of a Hadoop distributed file system (HDFS) indicator exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Writing Hadoop distributed file system (HDFS) data is affected.

Possible Causes

The disk space configured for the HDFS cluster is insufficient.

Procedure

Check the disk capacity and delete unnecessary files.

Step 1 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**.

Step 2 Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Disk**, and select **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold (80% by default).

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Step 3 In the **Basic Information** area, click the **NameNode(Active)** of the failure NameService and the HDFS WebUI page is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 4 On the HDFS web user interface (WebUI), click **Datanodes** tab. In the **Block pool used** column, view the disk usage of all DataNodes to check whether the disk usage of any DataNode exceeds the threshold.

- If yes, go to **Step 6**.
- If no, go to **Step 11**.

Step 5 Log in to the MRS client node as user **root**.

Step 6 Run **cd /opt/client** to switch to the client installation directory, and run **source bigdata_env**. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Please obtain the password from the administrator.

Step 7 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Expand the system.

Step 9 Expand the disk capacity.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.82 ALM-14002 DataNode Disk Usage Exceeds the Threshold

Description

The system checks the DataNode disk usage every 30 seconds and compares the actual disk usage with the threshold. A default threshold range is provided for the DataNode disk usage. This alarm is generated when the DataNode disk usage exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS**.

If **Trigger Count** is **1**, this alarm is cleared when the DataNode disk usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the DataNode disk usage is less than or equal to 80% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Insufficient disk space will impact data write to HDFS.

Possible Causes

- The disk space configured for the HDFS cluster is insufficient.
- Data skew occurs among DataNodes.

Procedure

Check whether the cluster disk capacity is full.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the **ALM-14001 HDFS Disk Usage Exceeds the Threshold** alarm exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Handle the alarm by following the instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Step 3 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the balance status of DataNodes.

Step 4 On FusionInsight Manager, choose **Hosts**. Check whether the number of DataNodes on each rack is almost the same. If the difference is large, adjust the racks to which DataNodes belong to ensure that the number of DataNodes on each rack is almost the same. Restart the HDFS service for the settings to take effect.

Step 5 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 6 In the **Basic Information** area, click **NameNode(Active)**. The HDFS web UI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 7 In the **Summary** area of the HDFS web UI, check whether the value of **Max** is 10% greater than that of **Median** in **DataNodes usages**.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Balance skewed data in the cluster. Log in to the MRS client as user **root**. If the cluster is in normal mode, run the **su - omm** command to switch to user **omm**. Run the **cd** command to go to the client installation directory and run the **source bigdata_env** command. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Obtain the password from the MRS cluster administrator.

Step 9 Run the following command to balance data distribution:

hdfs balancer -threshold 10

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.83 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold

Description

The system checks the lost blocks every 30 seconds and compares the actual lost blocks with the threshold. The lost blocks indicator has a default threshold. This alarm is generated when the number of lost HDFS blocks exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

If **Trigger Count** is **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the safe mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.

Procedure

Check the DataNode instance.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**.

Step 2 Check whether the **Running Status** of all DataNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Step 3 Restart the DataNode instance and check whether the DataNode instance restarts successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Delete the damaged file.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **NameNode(Active)**. On the WebUI page of the HDFS, view the information about lost blocks.

NOTE

- If a block is lost, a line in red is displayed on the WebUI.
- By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 The user checks whether the file containing the lost data block is useful.

NOTE

Files generated in directories **/mr-history**, **/tmp/hadoop-yarn**, and **/tmp/logs** during MapReduce task execution are unnecessary.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 The user checks whether the file containing the lost data block is backed up.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs
- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 9 On the node client, run **hdfs fsck / -delete** to delete the lost file. If the file where the lost block is located is a useful file, you need to write the file again to restore the data.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 10 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 12 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.84 ALM-14006 Number of HDFS Files Exceeds the Threshold

Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

If **Trigger Count** is **1**, this alarm is cleared when the number of HDFS files is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of HDFS files is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14006	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Disk storage space is insufficient, which may result in data import failure. The performance of the HDFS system is affected.

Possible Causes

The number of HDFS files exceeds the threshold.

Procedure

Check the number of files in the system.

Step 1 On FusionInsight Manager, check the number of HDFS files. Specifically, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **File and Block**, and select **HDFS File** and **Total Blocks**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**, and search for the **GC_OPTS** parameter under **NameNode**.

Step 3 Configure the threshold of the number of configuration file objects. Specifically, change the value of **Xmx** (GB) in the **GC_OPTS** parameter. The threshold (specified by y) is calculated as follows: y = 0.2007 x Xmx - 0.6312, where x indicates the memory capacity Xmx (GB) and y indicates the number of files (unit: kW). Adjust the memory size as required.

Step 4 Confirm that the value of **GC_PROFILE** is **custom** so that the **GC_OPTS** configuration takes effect. Click **Save** and choose **More** > **Restart Instance** to restart the service.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether needless files exist in the system.

Step 6 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env** to configure the environment variables.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the MRS cluster administrator.

Step 7 Run **hdfs dfs -ls** *file or directory* to check whether the files in the directory can be deleted.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Run the **hdfs dfs -rm -r** *file or directory path* command. After deleting unnecessary files, wait until the files are retained in the recycle bin for a period longer than the value of **fs.trash.interval** on the NameNode. Then check whether the alarm is cleared.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

Configuration rules of the NameNode JVM parameter

Default value of the NameNode JVM parameter **GC_OPTS**:

-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -Djdk.tls.ephemeralDHKeySize=3072 -Djdk.tls.rejectClientInitiatedRenegotiation=true -Djava.io.tmpdir=${Bigdata_tmp_dir}

The number of NameNode files is proportional to the used memory size of the NameNode. When file objects change, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

Table 9-90 NameNode JVM configuration

Number of File Objects	Reference Value
10,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
20,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
50,000,000	-Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
100,000,000	-Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
200,000,000	-Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
300,000,000	-Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

9.13.85 ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold

Description

The system checks the HDFS NameNode Heap Memory usage every 30 seconds and compares the actual Heap memory usage with the threshold. The HDFS NameNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS NameNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The HDFS NameNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS NameNode Heap Memory is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the NameNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in the HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of **HDFS->NameNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of files in **Step 6** and the NameNode Heap Memory parameters in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the heap memory parameters of the NameNode based on the mapping between the number of file objects and the memory. Click **Save** and choose **Dashboard** > **More** > **Restart Service**.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.86 ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold

Description

The system checks the HDFS DataNode Heap Memory usage every 30 seconds and compares the actual Heap Memory usage with the threshold. The HDFS DataNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS DataNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The HDFS DataNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS DataNode Heap Memory is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the DataNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **DataNodes** tab, and check the number of blocks of all DataNodes related to the alarm.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the GC_OPTS memory parameter of **HDFS->DataNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of block in **Step 6** and the DataNode Heap Memory parameters in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the heap memory parameters of the DataNode based on the mapping between the number of blocks and the memory. Click **Save** and choose **Dashboard** > **More** > **Restart Service**.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select **HDFS** in the required cluster from the **Service**.

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.87 ALM-14009 Number of Dead DataNodes Exceeds the Threshold

Description

The system periodically detects the number of dead DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The number of DataNodes in the Dead state has a default threshold. This alarm is generated when the number exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* > **HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

DataNodes that are in the Dead state cannot provide HDFS services.

Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.
- NameNodes are overloaded.
- The NameNodes are not restarted after the DataNode is deleted.

Procedure

Check whether DataNodes are faulty.

Step 1 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. The **HDFS Status** page is displayed.

Step 2 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 3 On the HDFS WebUI, click the **Datanodes** tab. In the **In operation** area, click **Filter** to check whether **down** is in the drop-down list.

- If yes, select **down**, record the information about the filtered DataNodes, and go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **HDFS** > **Instance** to check whether recorded DataNodes exist in the instance list.

- If all recorded DataNodes exist, go to **Step 5**.
- If none of the recorded DataNodes exists, go to **Step 6**.
- If some of the recorded DataNodes exist, go to **Step 7**.

Step 5 Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 6 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Step 7 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them. Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the status of the network between the NameNode and the DataNode.

Step 8 Log in to the faulty DataNode on the management page as user **root**, and run the **ping** *IP address of the NameNode* command to check whether the network between the DataNode and the NameNode is abnormal.

On the FusionInsight Manager page, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, view the service plane IP address of the faulty DataNode.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Rectify the network fault, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the DataNode is overloaded.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 See **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check whether the NameNode is overloaded.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 See **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to **Step 15**.
- If no, go to **Step 16**.

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 17 Select **HDFS** in the required cluster from the **Service**.

Step 18 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.88 ALM-14010 NameService Service Is Abnormal

Description

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

This alarm is cleared when the NameService service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The KrbServer service is abnormal.
- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.

- The NameNode enters safe mode.

Procedure

Check the KrbServer service status.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Check whether the KrbServer service exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Click **KrbServer**.

Step 4 Click **Instances**. On the KrbServer management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the instance successfully restarts.

- If yes, go to **Step 5**.
- If no, go to **Step 24**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the JournalNode instance status.

Step 6 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 7 Choose **HDFS** > **Instances**.

Step 8 Check whether the **Running Status** of the JournalNode is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Select the faulty JournalNode, and choose **More** > **Restart Instance**. Check whether the JournalNode successfully restarts.

- If yes, go to **Step 10**.
- If no, go to **Step 24**.

Step 10 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the DataNode instance status.

Step 11 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 12 Click **Instances** and check whether **Running Status** of all DataNodes is **Normal**.

- If yes, go to **Step 15**.
- If no, go to **Step 13**.

Step 13 Click **Instances**. On the DataNode management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the DataNode successfully restarts.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check disk status.

Step 15 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Host**.

Step 16 In the **Disk** column, check whether the disk space is insufficient.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 Expand the disk capacity.

Step 18 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check whether NameNode is in the safe mode.

Step 19 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click **NameNode(Active)** of the abnormal NameService. The NameNode web UI is displayed.

NOTE

By default, the admin user does not have the management rights of other components. If the page cannot be opened or the content is not completely displayed due to insufficient permission when you access the native page of a component, you can manually create a user with the management rights of the corresponding component to log in to the component.

Step 20 On the NameNode web UI, check whether "Safe mode is ON." is displayed.

Information behind **Safe mode is ON** is alarm information and is displayed based actual conditions.

- If yes, go to **Step 21**.
- If no, go to **Step 24**.

Step 21 Log in to the client as user **root**. Run the **cd** command to go to the client installation directory and run the **source bigdata_env** command. If the cluster uses the security mode, perform security authentication. Run the **kinit hdfs** command and enter the password as prompted. The password can be obtained from the MRS cluster administrator. If the cluster uses the non-security mode, log in as user **omm** and run the command. Ensure that user **omm** has the client execution permission.

Step 22 Run **hdfs dfsadmin -safemode leave**.

Step 23 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Collect the fault information.

Step 24 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 25 In the **Service** area, select the following nodes of the desired cluster.

- ZooKeeper
- HDFS

Step 26 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 27 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.89 ALM-14011 DataNode Data Directory Is Not Configured Properly

Description

The DataNode parameter **dfs.datanode.data.dir** specifies DataNode data directories. This alarm is generated when a configured data directory cannot be created, a data directory uses the same disk as other critical directories in the system, or multiple directories use the same disk immediately.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode for which the alarm is generated is restarted.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the DataNode data directory is mounted to the root directory or a critical directory, the disk space of the root directory or critical directory will be used up after long time running and the system will be faulty.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk with critical directories, such as **/** or **/boot**.
- Multiple directories in the DataNode data directory use the same disk.

Procedure

Check the alarm cause and information about the DataNode for which the alarm is generated.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 In **HostName** of **Location**, obtain the host name of the DataNode for which the alarm is generated.

Delete directories that do not comply with the disk plan from the DataNode data directory.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, click the DataNode instance on the node for which the alarm is generated.

Step 4 Click **Instance Configurations** and view the value of the DataNode parameter **dfs.datanode.data.dir**.

Step 5 Check whether all DataNode data directories are consistent with the disk plan.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.

Step 7 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** and restart the DataNode instance.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Log in to the DataNode for which the alarm is generated as user **root**.

- If the alarm cause is "The DataNode data directory fails to be created", go to **Step 10**.
- If the alarm cause is "The DataNode data directory uses the same disk with critical directories, such **/** or **/boot**", go to **Step 17**.
- If the alarm cause is "Multiple directories in the DataNode data directory uses the same disk", go to **Step 21**.

Check whether the DataNode data directory fails to be created.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **ls** command to check whether the directories exist in the DataNode data directory.

- If yes, go to **Step 26**.
- If no, go to **Step 12**.

Step 12 Run the **mkdir** *data directory* command to create the directory and check whether the directory can be successfully created.

- If yes, go to **Step 24**.
- If no, go to **Step 13**.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** to check whether alarm **ALM-12017 Insufficient Disk Capacity** exists.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Adjust the disk capacity and check whether alarm **ALM-12017 Insufficient Disk Capacity** is cleared. For details, see **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 12**.
- If no, go to **Step 15**.

Step 15 Check whether user **omm** has the **rwx** or **x** permission of all the upper-layer directories of the directory. (For example, for **/tmp/abc/**, user **omm** has the **x** permission for directory **tmp** and the **rwx** permission for directory **abc**.)

- If yes, go to **Step 24**.
- If no, go to **Step 16**.

Step 16 Run the **chmod u+rwx** *path* or **chmod u+x** *path* command as user **root** to assign the **rwx** or **x** permission of these directories to user **omm**. Then go to **Step 12**.

Check whether the DataNode data directory use the same disk as other critical directories in the system.

Step 17 Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory.

Step 18 Check whether the directories mounted to the disk are critical directories, such as **/** or **/boot**.

- If yes, go to **Step 19**.
- If no, go to **Step 24**.

Step 19 Change the value of the DataNode parameter **dfs.datanode.data.dir** and delete the directories that use the same disk as critical directories.

Step 20 Go to **Step 24**.

Check whether multiple directories in the DataNode data directory use the same disk.

Step 21 Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.

Step 22 Modify the DataNode node parameters **dfs.datanode.data.dir** to reserve only one directory among the directories that mounted to the same disk directory.

Step 23 Go to **Step 24**.

Restart the DataNode and check whether the alarm is cleared.

Step 24 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** and restart the DataNode instance

Step 25 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 26**.

Collect fault information.

Step 26 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 27 Select **HDFS** in the required cluster from the **Service**.

Step 28 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 29 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.90 ALM-14012 JournalNode Is Out of Synchronization

Description

On the active NameNode, the system checks the data consistency of all JournalNodes in the cluster every 5 minutes. This alarm is generated when the data on a JournalNode is inconsistent with the data on the other JournalNodes.

This alarm is cleared in 5 minutes after the data on JournalNodes is consistent.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Impact on the System

When a JournalNode is working incorrectly, the data on the node becomes inconsistent with that on the other JournalNodes. If data on more than half of JournalNodes is inconsistent, the NameNode cannot work correctly, making the HDFS service unavailable.

Possible Causes

- The JournalNode instance does not exist (deleted or migrated).
- The JournalNode instance has not been started or has been stopped.
- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

Procedure

Check whether the JournalNode instance has been started up.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, check whether the JournalNode instance exists on the node for which the alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Choose **O&M** > **Alarm** > **Alarms**. In the alarm list, click **Clear** in the **Operation** column of the alarm. In the dialog box that is displayed, click **OK**. No further action is needed.

Step 5 Click the JournalNode instance and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Select the JournalNode instance and choose **Start Instance** to start the instance.

Step 7 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the JournalNode instance is working correctly.

Step 8 Check whether **Running Status** of the JournalNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Select the JournalNode instance and choose **More** > **Restart Instance** to start the instance.

Step 10 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the network of the JournalNode is reachable.

Step 11 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** to check the service IP address of the active NameNode.

Step 12 Log in to the active NameNode as user **root**.

Step 13 Run the **ping** command to check whether a timeout occurs or the network is unreachable between the active NameNode and the JournalNode.

ping *service IP address of the JournalNode*

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Contact the network administrator to rectify the network fault and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **HDFS** in the required cluster from the **Service**.

Step 17 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.91 ALM-14013 Failed to Update the NameNode FsImage File

Description

HDFS metadata is stored in the FsImage file of the NameNode data directory, which is specified by the **dfs.namenode.name.dir** configuration item. The standby NameNode periodically combines existing FsImage files and Editlog files stored in the JournalNode to generate a new FsImage file, and then pushes the new FsImage file to the data directory of the active NameNode. This period is specified by the **dfs.namenode.checkpoint.period** configuration item of HDFS. The default value is 3600s, namely, one hour. If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification.

On the active NameNode, the system checks the FsImage file information every five minutes. This alarm is generated when no FsImage file is generated within three combination periods.

This alarm is cleared when a new FsImage file is generated and pushed to the active NameNode, which indicates that the HDFS metadata combination function can be properly used.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Impact on the System

If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification. If it is not rectified, the Editlog files increase continuously after HDFS runs for a period. In this case, HDFS restart is time-consuming because a large number of Editlog files need to be loaded. In addition, this alarm also indicates that the standby NameNode is abnormal and the NameNode high availability (HA) mechanism becomes invalid. When the active NameNode is faulty, the HDFS service becomes unavailable.

Possible Causes

- The standby NameNode is stopped.
- The standby NameNode instance is working incorrectly.
- The standby NameNode fails to generate a new FsImage file.
- Space of the data directory on the standby NameNode is insufficient.
- The standby NameNode fails to push the FsImage file to the active NameNode.
- Space of the data directory on the active NameNode is insufficient.

Procedure

Check whether the standby NameNode is stopped.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 View **Location** and obtain the host name of the active NameNode for which the alarm is generated and name of the NameService where the active NameNode resides.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**, find the standby NameNode instance of the NameService in the instance list, and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Select the standby NameNode instance, choose **Start Instance**, and wait until the startup is complete.

Step 5 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the NameNode instance is working correctly.

Step 6 Check whether **Running Status** of the standby NameNode instance is **Normal**.

- If yes, go to **Step 9**.
- If no, go to **Step 7**.

Step 7 Select the standby NameNode instance, choose **More** > **Restart Instance**, and wait until the startup is complete.

Step 8 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Check whether the standby NameNode fails to generate a new FsImage file.

Step 9 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**, and search and obtain the value of **dfs.namenode.checkpoint.period**. This value is the period of NameNode metadata combination.

Step 10 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** and obtain the service IP addresses of the active and standby NameNodes of the NameService for which the alarm is generated.

Step 11 Click the **NameNode(***xx***,Standy)** and **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the standby NameNode.

Step 12 Log in to the standby NameNode as user **root** or **omm**.

Step 13 Go to the FsImage storage directory and check the generation time of the newest FsImage file.

cd *Storage directory of the standby NameNode***/current**

```
stat -c %y $(ls -t | grep "fsimage_[0-9]*$" | head -1)
```

Step 14 Run the **date** command to obtain the current system time.

Step 15 Calculate the time difference between the generation time of the newest FsImage file and the current system time and check whether the time difference is greater than three times of the metadata combination period.

- If yes, go to **Step 16**.
- If no, go to **Step 20**.

Step 16 The metadata combination function of the standby NameNode is faulty. Run the following command to check whether the fault is caused by insufficient storage space.

Go to the FsImage storage directory and check the size of the newest FsImage file (in MB).

```
cd Storage directory of the standby NameNode/current
```

```
du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'
```

Step 17 Run the following command to check the available disk space of the standby NameNode (in MB).

```
df -m ./ | awk 'END{print $4}'
```

Step 18 Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.

- If yes, go to **Step 7**.
- If no, go to **Step 19**.

Step 19 Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check whether the standby NameNode fails to push the FsImage file to the active NameNode.

Step 20 Log in to the standby NameNode as user **root**.

Step 21 Run the **su - omm** command to switch to user **omm**.

Step 22 Run the following command to check whether the standby NameNode can push the file to the active NameNode.

```
tmpFile=/tmp/tmp_test_$(date +%s)
```

```
echo "test" > $tmpFile
```

```
scp $tmpFile Service IP address of the active NameNode:/tmp
```

- If yes, go to **Step 24**.
- If no, go to **Step 23**.

Step 23 When the standby NameNode fails to push data to the active NameNode as user **omm**, contact the system administrator to handle the fault. Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Check whether space on the data directory of the active NameNode is insufficient.

Step 24 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**, click the active NameNode of the NameService for which the alarm is generated, and then click **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the active NameNode.

Step 25 Log in to the active NameNode as user **root** or **omm**.

Step 26 Go to the FsImage storage directory and check the size of the newest FsImage file (in MB).

```
cd Storage directory of the active NameNode/current
```

```
du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'
```

Step 27 Run the following command to check the available disk space of the active NameNode (in MB).

```
df -m ./ | awk 'END{print $4}'
```

Step 28 Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.

- If yes, go to **Step 30**.
- If no, go to **Step 29**.

Step 29 Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Collect fault information.

Step 30 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 31 Select **NameNode** in the required cluster from the **Service**.

Step 32 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 33 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.92 ALM-14014 NameNode GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the NameNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14014	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the NameNode process may interrupt the services.

Possible Causes

The heap memory of the NameNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14014 NameNode GC Time Exceeds the Threshold.** Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection**, and select **NameNode Garbage Collection (GC)** to check the GC duration statistics of the NameNode process collected every minute.

Step 3 Check whether the GC duration of the NameNode process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **NameNode** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 5 Save the configuration and restart the NameNode instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **NameNode** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.93 ALM-14015 DataNode GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the DataNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the DataNode process may interrupt the services.

Possible Causes

The heap memory of the DataNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14015 DataNode GC Time Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **DataNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection**, and select **DataNode Garbage Collection (GC)** to check the GC duration statistics of the DataNode process collected every minute.

Step 3 Check whether the GC duration of the DataNode process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **DataNode** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 5 Save the configuration and restart the DataNode instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **DataNode** in the required cluster from the **Service**.

Step 9 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.94 ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of HDFS every 30 seconds. This alarm is generated when the direct memory usage of DataNode instances exceeds the threshold (90% of the maximum memory).

This alarm is automatically cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14016	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available direct memory of DataNode instances is insufficient, a memory overflow may occur and the service breaks down.

Possible Causes

The direct memory of DataNode instances is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the **Home** page of FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click the drop-down list in the row containing **ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold**, and view the role name and IP address of the instance for which the alarm is generated in the **Location** area.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**. On the page that is displayed, click the **Instance** tab. In the instance list, select **DataNode** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize** > **Resource**, and select **DataNode Memory** to check the direct memory usage.

Step 3 Check whether the used direct memory of a DataNode instance reaches 90% (default threshold) of the maximum direct memory allocated to it.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the **Home** page of FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**. On the page that is displayed, click the **Configuration** tab then the **All Configurations** sub-tab, and select **DataNode** > **System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Adjust the value of **-XX:MaxDirectMemorySize**.

1. In **GC_OPTS**, check the value of **-Xmx** and check whether the node memory is sufficient.

> **NOTE**
>
> You can determine whether the node memory is sufficient based on the actual environment. For example, you can use the following method:
>
> Use the IP address to log in to the instance for which the alarm is generated as user **root** and run the **free -g** command to check the value of **Mem** in the **free** column. The value indicates the available memory of the node. In the following example, the available memory of the node is 4 GB.
>
> ```
>              total        used        free      shared  buff/cache   available
> Mem:           112          48           4          10          58          46
> ......
> ```
>
> If the value of **Mem** is at least that of **-Xmx**, the node memory is sufficient. If the value of **Mem** is less than that of **-Xmx**, the node memory is insufficient.

– If yes, change the value of **-XX:MaxDirectMemorySize** to that of **-Xmx**.

– If no, increase **-XX:MaxDirectMemorySize** to a value no larger than that of **Mem**.

2. Save the configuration and restart the DataNode instances.

Step 6 Check whether **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, rectify the fault by referring to **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **DataNode** for the target cluster.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.95 ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the HDFS service every 30 seconds. This alarm is generated when the direct memory usage of a NameNode instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the HDFS service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the NameNode instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms.** On the displayed interface, click the drop-down button of **ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource**, and select **NameNode Memory** to check the direct memory usage.

Step 3 Check whether the used direct memory of NameNode reaches 90% of the maximum direct memory specified for NameNode by default.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **NameNode** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize". Save the configuration and restart the NameNode instance.

Step 6 Check whether the **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **NameNode** in the required cluster from the **Service**.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.96 ALM-14018 NameNode Non-heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the HDFS NameNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS NameNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS NameNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS NameNode is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14018	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

Possible Causes

Non-heap memory of the HDFS NameNode is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the NameNode JVM non-heap memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. The HDFS status page is displayed.

Step 5 In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** non-heap memory parameter of **HDFS->NameNode**.

Adjust system configurations.

Step 8 Check whether the non-heap memory is properly configured based on the number of file objects in **Step 6** and the non-heap parameters configured for NameNode in **Step 7**.

- If yes, go to **Step 9**.

- If no, go to **Step 12**.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the **GC_OPTS** parameter of the NameNode based on the mapping between the number of file objects and non-heap memory.

Step 10 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 13 Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

Step 14 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.97 ALM-14019 DataNode Non-heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the HDFS DataNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS DataNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS DataNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds>** *Name of the desired cluster* **> HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS DataNode is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14019	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the memory usage of the HDFS DataNode is too high, data read/write performance of HDFS will be affected.

Possible Causes

Non-heap memory of the HDFS DataNode is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the DataNode JVM non-heap memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Datanodes** tab to view the number of blocks of all DataNodes that report alarms.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** non-heap memory parameter of **HDFS->DataNode**.

Adjust system configurations.

Step 8 Check whether the memory is properly configured based on the number of blocks in **Step 6** and the memory parameters configured for DataNode in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the **GC_OPTS** parameter of the DataNode based on the mapping between the number of blocks and memory.

Step 10 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 13 Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

Step 14 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.98 ALM-14020 Number of Entries in the HDFS Directory Exceeds the Threshold

Description

The system obtains the number of subfiles and subdirectories in a specified directory every hour and checks whether it reaches the percentage of the threshold (the maximum number of subfiles and subdirectories in an HDFS directory, the threshold for triggering an alarm is **90%** by default). If it exceeds the percentage of the threshold, an alarm is triggered.

When the number of subfiles and subdirectories in the directory the alarm is lower than the percentage of the threshold, the alarm is automatically cleared. When the monitoring switch is disabled, alarms corresponding to all directories are cleared. If a directory is removed from the monitoring list, alarms corresponding to the directory are cleared.

NOTE

- The **dfs.namenode.fs-limits.max-directory-items** parameter specifies the maximum number of subfiles and subdirectories in the HDFS directory. Its default value is **1048576**. If the number of subfiles and subdirectories in a directory exceeds the parameter value, subfiles and subdirectories cannot be created in the directory.
- The **dfs.namenode.directory-items.monitor** parameter specifies the list of directories to be monitored. Its default value is **/tmp,/SparkJobHistory,/mr-history**.
- The **dfs.namenode.directory-items.monitor.enabled** parameter is used to enable or disable the monitoring switch. Its default value is **true**, which means the monitoring switch is enabled by default.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14020	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Directory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the number of entries in the monitored directory exceeds 90% of the threshold, an alarm is triggered, but entries can be added to the directory. Once the maximum threshold is exceeded, entries will fail to be added to the directory.

Possible Causes

The number of entries in the monitored directory exceeds 90% of the threshold.

Procedure

Check whether unnecessary files exist in the system.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command to set the environment variables.

If the cluster is in security mode, security authentication is required.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the following command to check whether files and directories in the directory with the alarm can be deleted:

hdfs dfs -ls *Directory with the alarm*

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the following command to delete unnecessary files.

hdfs dfs -rm -r -f *File or directory path*

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 4 Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the threshold is correctly configured.

Step 5 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for the **dfs.namenode.fs-limits.max-directory-items** parameter and check whether the parameter value is appropriate.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Increase the parameter value.

Step 7 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 8 Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.99 ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold

Description

The system checks the average RPC processing time of NameNode every 30 seconds, and compares the actual average RPC processing time with the threshold (default value: 100 ms). This alarm is generated when the system detects that the average RPC processing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14021	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.

Procedure

Obtain alarm information.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, click the alarm.

Step 2 Check the alarm. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

Check whether the threshold is too small.

Step 3 Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **RPC**, and select **Average Time of Active NameNode RPC Processing** and click **OK**.

Step 5 On the **Average Time of Active NameNode RPC Processing** monitoring page, obtain the value of the NameService node involved in this alarm.

Step 6 On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> HDFS**. Locate **Average Time of Active NameNode RPC Processing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the peak value within one day before and after the alarm is generated. Click **OK** to save the new threshold.

Step 7 Wait for 5 minutes and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the CPU performance of the NameNode node is sufficient.

Step 8 On the FusionInsight Manager portal, click **O&M > Alarm >Alarms** and check whether **ALM-12016 CPU Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 10 Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether the memory of the NameNode node is too small.

Step 11 On the FusionInsight Manager portal, click **O&M > Alarm >Alarms** and check whether **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Handle **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** by taking recommended actions.

Step 13 Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether NameNode parameters are configured properly.

Step 14 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

Step 15 Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

Step 16 Click **Save** and click **OK**.

Step 17 On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

Step 18 On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

Step 19 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Collect fault information.

Step 20 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 21 Select the following node in the required cluster from the **Service**.

- HDFS

Step 22 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.100 ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold

Description

The system checks the average RPC queuing time of NameNode every 30 seconds, and compares the actual average RPC queuing time with the threshold (default value: 200 ms). This alarm is generated when the system detects that the average RPC queuing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14022	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.
- The volume of services that access HDFS is too large and therefore NameNode is overloaded.

Procedure

Obtain alarm information.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, click the alarm.

Step 2 Check the alarm. Obtain the alarm generation time from **Generated**. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

Check whether the threshold is too small.

Step 3 Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **RPC**, and select **Average Time of Active NameNode RPC Queuing** and click **OK**.

Step 5 On the **Average Time of Active NameNode RPC Queuing** monitoring page, obtain the value of the NameService node involved in this alarm.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS**. Locate **Average Time of Active NameNode RPC Queuing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the monitored value. Click **OK** to save the new threshold.

Step 7 Wait for 1 minute and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the CPU performance of the NameNode node is sufficient.

Step 8 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and check whether **ALM-12016 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 10 Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether the memory of the NameNode node is too small.

Step 11 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Handle **ALM-14007 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 13 Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether NameNode parameters are configured properly.

Step 14 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

Step 15 Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

Step 16 Click **Save**, and click **OK**.

Step 17 On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

Step 18 On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

Step 19 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check whether the HDFS workload changes and reduce the workload properly.

Step 20 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, click **Customize**, select **Average Time of Active NameNode RPC Queuing** and click **OK**.

Step 21 Click ⤡. The **Details** page is displayed.

Step 22 Set the monitoring data display period, from 5 days before the alarm generation time to the alarm generation time. Click **OK**.

Step 23 On the **Average RPC Queuing Time** monitoring page, check whether the point in time when the queuing time increases abruptly exists.

- If yes, go to **Step 24**.
- If no, go to **Step 27**.

Step 24 Confirm and check the point in time. Check whether a new task frequently accesses HDFS and whether the access frequency can be reduced.

Step 25 If a Balancer task starts at the point in time, stop the task or specify a node for the task to reduce the HDFS workload.

Step 26 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 27**.

Collect fault information.

Step 27 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 28 Select **HDFS** in the required cluster from the **Service**.

Step 29 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 30 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.101 ALM-14023 Percentage of Total Reserved Disk Space for Replicas Exceeds the Threshold

Description

The system checks the percentage of total reserved disk space for replicas (Total reserved disk space for replicas/(Total reserved disk space for replicas + Total remaining disk space)) every 30 seconds and compares the actual percentage with the threshold (**90%** by default). This alarm is generated when the percentage of total reserved disk space for replicas exceeds the threshold for multiple consecutive times (**Trigger Count**).

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is **1** and the percentage of total reserved disk space for replicas is less than or equal to the threshold; the value of **Trigger Count** is greater than **1** and the percentage of total reserved disk space for replicas is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14023	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The performance of writing data to HDFS is affected. If all remaining DataNode space is reserved for replicas, writing HDFS data fails.

Possible Causes

- The alarm threshold is improperly configured.
- The disk space configured for the HDFS cluster is insufficient.
- The volume of services that access HDFS is too large and therefore DataNode is overloaded.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS** > **Disk** > **Percentage of Reserved Space for Replicas of Unused Space** to check whether the alarm threshold is appropriate. (The default threshold is **90%**. Users can change it as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** > **Disk** > **Percentage of Reserved Space for Replicas of Unused Space** and Click **Modify,** change the threshold based on the actual usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether an alarm indicating insufficient disk space is generated.

Step 4 On the FusionInsight Manager portal, check whether **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** exists on the **O&M > Alarm > Alarms** page.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Handle the alarm by referring to instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Expand the DataNode capacity.

Step 7 Expand the DataNode capacity.

Step 8 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.102 ALM-14024 Tenant Space Usage Exceeds the Threshold

Description

The system checks the space usage (used space of each directory/space allocated to each directory) of each directory associated with a tenant every hour and compares the space usage of each directory with the threshold set for the directory. This alarm is generated when the space usage exceeds the threshold.

This alarm is cleared when the space usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14024	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

This alarm is generated if the space usage of the tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the used space exceeds the maximum storage space allocated to the directory, the HDFS fails to write data to the directory.

Possible Causes

- The alarm threshold is improperly configured.
- The space allocated to the tenant is improper.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 On the **Resources** page, click **Modify** to modify or delete the storage space threshold.

Step 4 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the space allocated to the tenant is appropriate.

Step 5 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space quota of the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 On the **Resources** page, click **Modify** to modify the storage space quota.

Step 7 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.103 ALM-14025 Tenant File Object Usage Exceeds the Threshold

Description

The system checks the file object usage (used file objects of each directory/number of file objects allocated to each directory) of each directory associated with a tenant every hour and compares the file object usage of each directory with the threshold set for the directory. This alarm is generated when the file object usage exceeds the threshold.

This alarm is cleared when the file object usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14025	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

This alarm is generated if the usage of file objects in a tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the number of used file objects exceeds the maximum number of file objects allocated to the directory, the HDFS fails to write data to the directory.

Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of file objects allocated to the tenant directory is inappropriate.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the file object threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 On the **Resources** page, click **Modify** to modify or delete the file object threshold of the tenant directory for which the alarm is generated.

Step 4 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the maximum number of file objects allocated to the tenant is appropriate.

Step 5 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the maximum number of file objects configured for the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 On the **Resources** page, click **Modify** to modify or delete the maximum number of file objects configured for the tenant directory.

Step 7 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.104 ALM-14026 Blocks on DataNode Exceed the Threshold

Description

The system checks the number of blocks on each DataNode every 30 seconds. This alarm is generated when the number of blocks on the DataNode exceeds the threshold.

If **Trigger Count** is **1** and the number of blocks on the DataNode is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks on the DataNode is less than or equal to 90% of the threshold, this alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14026	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

If this alarm is reported, there are too many blocks on the DataNode. In this case, data writing into the HDFS may fail due to insufficient disk space.

Possible Causes

- The alarm threshold is improperly configured.
- Data skew occurs among DataNodes.
- The disk space configured for the HDFS cluster is insufficient.

Procedure

Change the threshold.

Step 1 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **HDFS**. Then choose **Configurations** > **All Configurations**. On the displayed page, find the **GC_OPTS** parameter under **HDFS->DataNode**.

Step 2 Set the threshold of the DataNode blocks. Specifically, change the value of **Xmx** of the **GC_OPTS** parameter. **Xmx** specifies the memory, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required. Confirm that **GC_PROFILE** is set to **custom** and save the configuration.

Step 3 Choose **Cluster**, click the name of the desired cluster, and choose **HDFS** > **Instance**. Select the DataNode instance whose status is **Expired**, click **More**, and select **Restart Instance** to make the **GC_OPTS** configuration take effect.

Step 4 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether associated alarms are reported.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the **ALM-14002 DataNode Disk Usage Exceeds the Threshold** alarm exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Handle the alarm by following the instructions in **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Expand the DataNode capacity.

Step 8 Expand the DataNode capacity.

Step 9 On FusionInsight Manager, wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 12 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Configuration rules of the DataNode JVM parameter.

Default value of the DataNode JVM parameter **GC_OPTS**:

-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -Djdk.tls.ephemeralDHKeySize=2048

The average number of blocks stored in each DataNode instance in the cluster is: Number of HDFS blocks x 3/Number of DataNodes. If the average number of blocks changes, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -**

XX:MaxNewSize=256M in the default value. The following table lists the reference values.

Table 9-91 DataNode JVM configuration

Average Number of Blocks in a DataNode Instance	Reference Value
2,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
5,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Xmx specifies memory which corresponds to the threshold of the number of DataNode blocks, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required.

9.13.105 ALM-14027 DataNode Disk Fault

Description

The system checks the disk status on DataNodes every 60 seconds. This alarm is generated when a disk is faulty.

After all faulty disks on the DataNode are recovered, you need to manually clear the alarm and restart the DataNode.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14027	Major	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Failed Volumes	Specifies the list of faulty disks.

Impact on the System

If this alarm is reported, there are abnormal disk partitions on the DataNode. This may cause the loss of written files.

Possible Causes

- The hard disk is faulty.
- The disk permissions are configured improperly.

Procedure

Check whether a disk alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Modify disk permissions.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.

Step 5 Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission of the faulty disk is **711** and whether the user is **omm**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:

```
chown omm:wheel data1
```

```
chmod 711 data1
```

Step 7 In the alarm list on Manager, click **Clear** in the **Operation** column of the alarm to manually clear the alarm. Choose **Cluster** > **Services** > **HDFS** > **Instance**, select the DataNode, choose **More** > **Restart Instance**, wait for 5 minutes, and check whether a new alarm is reported.

- If no, no further action is required.
- If yes, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **HDFS** and **OMS** for the target cluster.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

Related Information

None

9.13.106 ALM-14028 Number of Blocks to Be Supplemented Exceeds the Threshold

Description

The system checks the number of blocks to be supplemented every 30 seconds and compares the number with the threshold. The number of blocks to be supplemented has a default threshold. This alarm is generated when the number of blocks to be supplemented exceeds the threshold.

You can change the threshold specified by **Blocks Under Replicated (NameNode)** by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS** > **File and Block**.

If **Trigger Count** is set to **1** and the number of blocks to be supplemented is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks to be supplemented is less than or equal to 90% of the threshold, this alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14028	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.
- The number of replicas written into the file is greater than the number of DataNodes.

Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs

- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 4 Run the **hdfs fsck / >> fsck.log** command to obtain the status of the current cluster.

Step 5 Run the following command to count the number (*M*) of blocks to be replicated:

cat fsck.log | grep "Under-replicated"

Step 6 Run the following command to count the number (*N*) of blocks to be replicated in the **/tmp/hadoop-yarn/staging/** directory:

cat fsck.log | grep "Under replicated" | grep "/tmp/hadoop-yarn/staging/" | wc -l

NOTE

/tmp/hadoop-yarn/staging/ is the default directory. If the directory is modified, obtain it from the configuration item **yarn.app.mapreduce.am.staging-dir** in the **mapred-site.xml** file.

Step 7 Check whether the percentage of *N* is greater than 50% (N/M > 50%).

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Run the following command to reconfigure the number of file replicas in the directory (set the number of file replicas to the number of DataNodes or the default number of file replicas):

hdfs dfs -setrep -w *Number of file replicas*/tmp/hadoop-yarn/staging/

NOTE

To obtain the default number of file replicas:

Log in to FusionInsight Manager, choose **Cluster** > **Services** > **HDFS** > **Configurations** > **All Configurations**, and search for the **dfs.replication** parameter. The value of this parameter is the default number of file replicas.

Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.

- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 11 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.107 ALM-14029 Number of Blocks in a Replica Exceeds the Threshold

Description

The system checks the number of blocks in a single replica every four hours and compares the number with the threshold. There is a threshold for the number of blocks in a single replica. This alarm is generated when the actual number of blocks in a single replica exceeds the threshold.

This alarm is cleared when the number of blocks to be supplemented is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14029	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Replica data is prone to be lost when a node is faulty. Too many files of a single replica affect the security of the HDFS file system.

Possible Causes

- The DataNode is faulty.
- The disk is faulty.
- Files are written to a single replica.

Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Check whether files of a single replica have been written into the service.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs

- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 5 Run the following command on the client node to increase the number of replicas for a single replica file:

hdfs dfs -setrep -w *file replica number file name or file path*

Step 6 In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.108 ALM-14030 HDFS Allows Write of Single-Replica Data

Description

This alarm is generated when **dfs.single.replication.enable** is set to **true**, indicating that HDFS is configured to allow write of single-replica data.

This alarm is cleared when this function is disabled on HDFS.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14030	Warning	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Impact on the System

Data of a single replica may be lost. Therefore, the system does not allow write of single-replica data by default. If this configuration is enabled on HDFS and the number of HDFS replicas configured on the client is 1, single-replica data can be written to HDFS.

Possible Causes

The HDFS configuration item **dfs.single.replication.enable** is set to **true**.

Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **HDFS**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab.

Step 2 Search for **dfs.single.replication.enable** in the search box, change the value of the configuration item to **false**, and click **Save**.

Step 3 On the **Dashboard** page of the HDFS service, click **More** and select **Service Rolling Restart** in the upper right corner.

Step 4 After the HDFS service is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 7 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

9.13.109 ALM-16000 Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold

Description

The system detects the percentage of sessions connected to the HiveServer to the maximum number of allowed sessions every 30 seconds. This indicator can be viewed on the **Cluster** > *Name of the desired cluster* > **Services** > **Hive > Instance** > *HiveServer instance***.** This alarm is generated when the percentage exceeds the default value **90%**.

To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive > Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer**.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16000	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If a connection alarm is generated, too many sessions are connected to Hive and new connections are unavailable.

Possible Causes

Too many clients are connected to HiveServer.

Procedure

Increase the maximum number of connections to Hive.

Step 1 On the FusionInsight Manager portal, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations >All Configurations**.

Step 2 Search for **hive.server.session.control.maxconnections** and increase the value of this parameter. If the value of this parameter is **A**, the threshold is **B**, and the number of sessions connected to the HiveServer is **C**, adjust the value of this parameter according to **A x B > C**. To view the number of sessions connected to the HiveServer, check the value of **Statistics for Sessions of the HiveServer** on the Hive monitoring page.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.110 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold

Description

This alarm is generated when the Hive warehouse space usage exceeds the specified threshold (85% by default). The system checks the Hive data warehouse space usage every 30s. The indicator **Percentage of HDFS Space Used by Hive to the Available Space** can be viewed on the Hive service monitoring page.

To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive > Percentage of HDFS Space Used by Hive to the Available Space**.

When the **Trigger Count** is 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to 90% of the threshold.

NOTE

The administrator can reduce the warehouse space usage by expanding the warehouse capacity or releasing the used space.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16001	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The system fails to write data, which causes data loss.

Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The HDFS space is insufficient.
- Some data nodes break down.

Procedure

Expand the system configuration.

Step 1 Analyze the cluster HDFS capacity usage and increase the upper limit of the HDFS capacity available for Hive.

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**, find **hive.metastore.warehouse.size.percent**, and increase its value so that larger HDFS capacity will be available for Hive. Assume that the value of the configuration item is A, the total HDFS storage space is B, the threshold is C, and the HDFS space used by Hive is D. The adjustment policy is A x B x C > D. The total HDFS storage space can be viewed on the HDFS NameNode page. The HDFS space used by Hive can be viewed on the Hive monitoring page.

Step 2 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Expand the system.

Step 3 Expand the system.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the data node is normal.

Step 5 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 6 Check whether "ALM-12006 Node Fault", "ALM-12007 Process Fault", or "ALM-14002 DataNode Disk Usage Exceeds the Threshold" exist.

- If yes, go to **Step 7**.

- If no, go to **Step 9**.

Step 7 Clear the alarm by following the steps provided in "ALM-12006 Node Fault", "ALM-12007 Process Fault", and "ALM-14002 DataNode Disk Usage Exceeds the Threshold".

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **Hive** in the required cluster from the **Service**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.111 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold

Description

The system checks the percentage of the HQL statements that are executed successfully in every 30 seconds. The formula is: Percentage of HQL statements that are executed successfully = Number of HQL statements that are executed successfully by Hive in a specified period/Total number of HQL statements that are executed by Hive. This indicator can be viewed on the **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** > *HiveServer instance* **.** The default threshold of the percentage of HQL statements that are executed successfully is **90%**. An alarm is reported when the percentage is lower than the **90%**. Users can view the name of the host where an alarm is generated in the location information about the alarm. The IP address of the host is the IP address of the HiveServer node.

Users can modify the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** > **Percentage of HQL Statements That Are Executed Successfully by Hive**.

This alarm is cleared when the execution success rate is higher than 110% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The system configuration and performance cannot meet service processing requirements.

Possible Causes

- A syntax error occurs in HQL statements.
- The HBase service is abnormal when a Hive on HBase task is performed.
- The Spark service is abnormal when a Hive on Spark task is performed.
- The dependent basic services, such as HDFS, Yarn, and ZooKeeper, are abnormal.

Procedure

Check whether the HQL statements comply with syntax.

Step 1 On the FusionInsight Manager page, choose **O&M** > **Alarm** to view the alarm details and obtain the node where the alarm is generated.

Step 2 Use the Hive client to log in to the HiveServer node where an alarm is reported. Query the HQL syntax provided by Apache, and check whether the HQL commands are correct.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

NOTE

To view the user who runs an incorrect statement, you can download the hiveserver audit log file of the HiveServer node where this alarm is generated. **Start Data** and **End Data** are 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.

Step 3 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 4**.

Check whether the HBase service is abnormal.

Step 4 Check whether an Hive on HBase task is performed with the user who runs the HQL command.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 On the FusionInsight Manager page, click **Cluster** > *Name of the desired cluster* > **Services**, check whether the HBase service is normal in the service list.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Choose **O&M** > **Alarm**, check the related alarms displayed on the alarm page and clear them according to related alarm help.

Step 7 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

Check whether the HDFS, Yarn, and ZooKeeper are normal.

Step 8 On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services**.

Step 9 In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Check the related alarms displayed on the alarm page and clear them according to related alarm help.

Step 11 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 After 1 minute, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager home page, choose **O&M** > **Log > Download**.

Step 14 Select the following nodes in the required cluster from the **Service**:

- MapReduce
- Hive

Step 15 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.112 ALM-16003 Background Thread Usage Exceeds the Threshold

Description

The system checks the background thread usage in every 30 seconds. This alarm is generated when the usage of the background thread pool of Hive exceeds the threshold, 90% by default.

NOTE

MRS 3.X supports the multi-instance function. If the multi-instance function is enabled in the cluster and multiple Hive services are installed, determine the Hive service for which the alarm is generated based on the value of **ServiceName** in **Location** of the alarm. For example, if Hive1 service is unavailable, **ServiceName** is set to **Hive1** in **Location**, and the operation object in the handling procedure is changed from Hive to Hive1.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

There are too many background threads, so the newly submitted task cannot run in time.

Possible Causes

The usage of the background thread pool of Hive is excessively high when:

- There are many tasks executed in the background thread pool of HiveServer.
- The capacity of the background thread pool of HiveServer is too small.

Procedure

Check the number of tasks executed in the background thread pool of HiveServer.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of **Background Thread Count** and **Background Thread Usage**.

Step 2 Check whether the number of background threads in the latest half an hour is excessively high. (By default, the queue number is 100, and the thread number is considered as high if it is 90 or larger.)

- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Adjust the number of tasks submitted to the background thread pool. (For example, cancel some time-consuming tasks with low performance.)

Step 4 Check whether the values of Background Thread Count and Background Thread Usage decrease.

- If it is, go to **Step 7**.
- If it is not, go to **Step 5**.

Check the capacity of the HiveServer background thread pool.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of Background Thread Count and Background Thread Usage.

Step 6 Increase the value of **hive.server2.async.exec.threads** in the **${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_23_HiveServer/etc/hive-site.xml** file. For example, increase the value by 20%.

Step 7 Save the modification.

Step 8 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **Hive** in the required cluster from the **Service**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.113 ALM-16004 Hive Service Unavailable

Description

This alarm is generated when the HiveServer service is unavailable. The system checks the HiveServer service status every 60 seconds.

This alarm is cleared when the HiveServer service is normal.

NOTE

MRS 3.X supports the multi-instance function. If the multi-instance function is enabled in the cluster and multiple Hive service instances are installed, you need to determine the Hive service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the Hive1 service is unavailable, **ServiceName=Hive1** is displayed in **Location**, and the operation object in the procedure needs to be changed from Hive to Hive1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16004	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- Hive service unavailability may be related to the faults of the Hive process as well as basic services, such as ZooKeeper, Hadoop distributed file system (HDFS), Yarn, and DBService.
  - The ZooKeeper service is abnormal.
  - The HDFS service is abnormal.
  - The Yarn service is abnormal.
  - The DBService service is abnormal.
  - The Hive service process is abnormal. If the alarm is caused by Hive process fault, the alarm report has a delay of about 5 minutes.
- The network communication between the Hive and basic services is interrupted.

Procedure

Check the HiveServer/MetaStore process status.

Step 1 On the FusionInsight Manager portal, click **Cluster >** *Name of the desired cluster* **> Services** > **Hive** > **Instance**. In the Hive instance list, check whether the HiveServer or MetaStore instances are in the Unknown state.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 In the Hive instance list, choose **More** > **Restart Instance** to restart the HiveServer/MetaStore process.

Step 3 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the ZooKeeper service status.

Step 4 On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 In the **Process Fault**, check whether **ServiceName** is **ZooKeeper**.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the steps provided in "ALM-12007 Process Fault".

Step 7 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the HDFS service status.

Step 8 On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the steps provided in "ALM-14000 HDFS Service Unavailable".

Step 10 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the Yarn service status.

Step 11 In FusionInsight Manager alarm list, check whether **Yarn Service Unavailable** is generated.

- If yes, go to **Step 12**.

- If no, go to **Step 14**.

Step 12 Rectify the fault. For details, see "ALM-18000 Yarn Service Unavailable".

Step 13 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check the DBService service status.

Step 14 In FusionInsight Manager alarm list, check whether **DBService Service Unavailable** is generated.

- If yes, go to **Step 15**.
- If no, go to **Step 17**.

Step 15 Rectify the fault. For details, see "ALM-27001 DBService Service Unavailable".

Step 16 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Check the network connection between the Hive and ZooKeeper, HDFS, Yarn, and DBService.

Step 17 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**.

Step 18 Click **Instance**.

The HiveServer instance list is displayed.

Step 19 Click **Host Name** in the row of **HiveServer**.

The active HiveServer host status page is displayed.

Step 20 Record the IP address under **Basic Information**.

Step 21 Use the IP address obtained in **Step 20** to log in to the host where the active HiveServer runs as user **omm**.

Step 22 Run the **ping** command to check whether communication between the host that runs the active HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services is normal. (Obtain the IP addresses of the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services in the same way as that for obtaining the IP address of the active HiveServer.)

- If yes, go to **Step 25**.
- If no, go to **Step 23**.

Step 23 Contact the administrator to restore the network.

Step 24 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 25**.

Collect fault information.

Step 25 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 26 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS
- Yarn
- DBService
- Hive

Step 27 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 28 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.114 ALM-16005 The Heap Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the heap memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

When the heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The heap memory of the Hive instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16005**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum heap memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum heap memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/ METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the heap memory used by the HiveServer process reaches the threshold (default value: 95%) of the maximum heap memory set by the HiveServer process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically. On the FusionInsight Manager home page, choose **O&M**> **Alarm**> **Thresholds** > *Name of the desired cluster* **>** **Hive** > **CPU and Memory** > **HiveServer Heap Memory Usage Statistics (HiveServer)** to view **Threshold**.

Suggestions for GC parameter settings for the MetaServer:

- When the heap memory used by the MetaStore process reaches the threshold (default value: 95%) of the maximum heap memory set by the MetaStore process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. On the FusionInsight Manager home page, choose **O&M**> **Alarm**> **Thresholds** > *Name of the desired cluster* **>** **Hive** > **CPU and Memory** > **MetaStore Heap Memory Usage Statistics (MetaStore)** to view **Threshold**.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.115 ALM-16006 The Direct Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the direct memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** to change the threshold.

The alarm is cleared when the direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the direct memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The direct memory of the Hive instance on the node is overused or the direct memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16006**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used direct memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum direct memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used direct memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum direct memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-XX:MaxDirectMemorySize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.116 ALM-16007 Hive GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) time of the Hive service every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 12 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive**. This alarm is cleared when the Hive GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the GC time exceeds the threshold, Hive data read and write are affected.

Possible Causes

The memory of Hive instances is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16007**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC) Time of HiveServer** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC) Time of MetaStore** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to **Step 4**.

- If no, go to **Step 7**.

Check the current JVM configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services > Hive > Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/ METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the Hive GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Suggestions for GC parameter settings for the MetaServer:

- When the Meta GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal of active and standby clusters, choose **O&M** > **Log > Download**.

Step 8 In the **Service**, select **Hive** in the required cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.117 ALM-16008 Non-Heap Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the non-heap memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive** to change the threshold.

The alarm is cleared when the non-heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

When the non-heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The non-heap memory of the Hive instance on the node is overused or the non-heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16008**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster > ***Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-XX:MaxMetaspaceSize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:**

  MaxMetaspaceSize is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:**

  MaxMetaspaceSize is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.118 ALM-16009 Map Number Exceeds the Threshold

Description

The system checks the number of HQL maps in every 30 seconds. This alarm is generated if the number exceeds the threshold. By default, **Trigger Count** is set to **3**, and the threshold is 5000.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the number of HQL maps executed on Hive is excessively large, the HQL execution speed is slow, and a large number of resources are occupied.

Possible Causes

The HQL statements are not the optimal.

Procedure

Check the number of HQL maps.

Step 1 On FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Resource**. Check the HQL statements with the excessively large number (5000 or more) of maps in **HQL Map Count**.

Step 2 Locate the corresponding HQL statements, optimize them and execute them again.

Step 3 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.119 ALM-16045 Hive Data Warehouse Is Deleted

Description

The system checks the Hive data warehouse in every 60 seconds.This alarm is generated when the Hive data warehouse is deleted.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16045	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The default Hive data warehouse is deleted. As a result, creating databases or tables in the default data warehouse fails, and services are affected.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that the default data warehouse is deleted.

Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **warehouse** directory exists in **hdfs://hacluster/user/***<username>***/.Trash/Current/**.

hdfs dfs -ls hdfs://hacluster/user/*<username>***/.Trash/Current/**

For example, if **user/hive/warehouse** exists:

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx------   - test hadoop          0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 By default, there is an automatic recovery mechanism for the data warehouse. You can wait for 5 ~10s to check whether the default data warehouse is restored. If the data warehouse is not recovered, manually run the following command to restore the data warehouse.

hdfs dfs -mv hdfs://hacluster/user/*<username>***/.Trash/Current/user/hive/warehouse /user/hive/warehouse**

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.120 ALM-16046 Hive Data Warehouse Permission Is Modified

Description

The system checks the Hive data warehouse permission in every 60 seconds. This alarm is generated if the permission is modified.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16046	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the permission on the Hive default data warehouse is modified, the permission for users or user groups to create databases or tables in the default data warehouse is changed.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that default data warehouse permission is changed.

Procedure

Check the Hive default data warehouse permission.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to go to the HDFS client installation directory:

cd *Client installation directory*

source bigdata_env

kinit *User who has the supergroup permission* (Skip this step for a common cluster.)

Step 3 Run the following command to restore the default data warehouse permission:

- Security mode: **hdfs dfs -chmod 770 hdfs://hacluster/user/hive/warehouse**
- Non-security mode: **hdfs dfs -chmod 777 hdfs://hacluster/user/hive/warehouse**

Step 4 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **hdfs://hacluster/user/hive/warehouse** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.121 ALM-16047 HiveServer Has Been Deregistered from ZooKeeper

Description

The system checks the Hive service every 60 seconds. This alarm is generated when Hive registration information on ZooKeeper is lost or Hive cannot connect to ZooKeeper.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16047	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the Hive configuration cannot be read from ZooKeeper, HiveServer will be unavailable.

Possible Causes

- The network is disconnected.
- The ZooKeeper instance is abnormal.

Procedure

Restart related instances.

Step 1 Log in to FusionInsight Manager. Choose **O&M** > **Alarm** > **Alarms**, click the drop-down list in the row that contains the alarm, and view role and the IP address of the node for which the alarm is generated in **Location**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance**, select the instance at the IP address for which the alarm is generated, and choose **More** > **Restart Instance**.

Step 3 Wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Hive** for the target cluster.

Step 6 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.122 ALM-16048 Tez or Spark Library Path Does Not Exist

Description

The system checks the Tez and Spark library paths every 180 seconds. This alarm is generated when the Tez or Spark library path does not exist.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16048	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Hive on Tez and Hive on Spark functions are affected.

Possible Causes

The Tez or Spark library path is deleted from the HDFS.

Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **tezlib** or **sparklib** directory exists in the **hdfs://hacluster/user/{User name}/.Trash/Current/** director:

hdfs dfs -ls hdfs://hacluster/user/*<username>***/.Trash/Current/**

For example, the following information shows that **/user/hive/tezlib/8.1.0.1/** and **/user/hive/sparklib/8.1.0.1/** exist.

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx------   - test hadoop          0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the following command to restore **tezlib** and **sparklib**.

hdfs dfs -mv hdfs://hacluster/user/*<username>***/.Trash/Current/user/hive/tezlib/8.1.0.1/tez.tar.gz /user/hive/tezlib/8.1.0.1/tez.tar.gz**

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.123 ALM-17003 Oozie Service Unavailable

Description

The system checks the Oozie service status in every 5 seconds. This alarm is generated when Oozie or a component on which Oozie depends cannot provide services properly.

This alarm is automatically cleared when the Oozie service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17003	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Oozie cannot be used to submit jobs.

Possible Causes

- The DBService service is abnormal or the data of Oozie stored in DBService is damaged.
- The HDFS service is abnormal or the data of Oozie stored in HDFS is damaged.
- The Yarn service is abnormal.
- The Nodeagent process is abnormal.

Procedure

Query the Oozie service health status code.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* >**Services** > **Oozie**. Click **oozie** (any one is OK) on the **oozie WebUI**. to go to the Oozie WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 2 Add **/servicehealth** to the URL in the address box of the browser and access again. The value of **statusCode** is the current Oozie service health status code.

For example, visit **https://10.10.0.117:20026/Oozie/oozie/130/oozie/servicehealth**. The result is as follows:

```
{"beans":[{"name":"serviceStatus","statusCode":0}]}
```

If the health status code cannot be displayed or the browser does not respond, the service may be unavailable due to Oozie process fault. See **Step 13** to rectify the fault.

Step 3 Perform the operations based on the error code. For details, see **Table 9-92**.

Table 9-92 Oozie service health status code

Status Code	Description	Error Cause	Solution
0	The service is running properly.	None	None
18002	The DBService service is abnormal.	Oozie fails to connect to DBService or the data stored in DBService is damaged.	See **Step 4**.

Status Code	Description	Error Cause	Solution
18003	The HDFS service is abnormal.	Oozie fails to connect to HDFS or the data stored in HDFS is damaged.	See **Step 7**.
18005	The MapReduce service is abnormal.	The Yarn service is abnormal.	See **Step 11**.

Check the DBService service.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the DBService service is running properly.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Resolve the problem of DBService based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 6 Log in to the Oozie database to check whether the data is complete.

1. Log in to the active DBService node as user **root**.

   On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService > Instance** to view the IP address of the active DBservice node.

2. Run the following command to log in to the Oozie database:

   su - omm

   source ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/FusionInsight-dbservice-2.7.0/.dbservice_profile

   gsql -U *Username* **-W** *Oozie database password* **-p 20051 -d** *Database name*

3. After the login is successful, enter **\d** to check whether there are 15 data tables.

   The Oozie service has 15 data tables by default. If these data tables are deleted or the table structure is modified, the Oozie service may be unavailable. Contact the O&M personnel to back up the data and perform restoration.

Check the HDFS service.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the HDFS service is running properly.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Resolve the problem of HDFS based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 9 Log in to HDFS to check whether the Oozie file directory structure is complete.

1. Download and install an HDFS client..
2. Log in to the client node as user **root** and run the following commands to check whether **/user/oozie/share** exists.

   If the cluster uses the security mode, perform security authentication.

   kinit admin

   hdfs dfs -ls /user/oozie/share

- If yes, go to **Step 18**.
- If no, go to **Step 10**.

Step 10 In the Oozie client installation directory, manually upload the share directory to **/user/oozie** in HDFS, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check the Yarn and MapReduce service.

Step 11 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the Yarn and MapReduce services are running properly.

- If yes, go to **Step 18**.
- If no, go to **Step 12**.

Step 12 Resolve the problem of Yarn and MapReduce based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check the Oozie process.

Step 13 Log in to each node of Oozie as user **root**.

Step 14 Run the **ps -ef | grep oozie** command to check whether the Oozie process exists.

- If yes, go to **Step 15**.
- If no, go to **Step 18**.

Step 15 Collect fault information in **prestartDetail.log**, **oozie.log**, and **catalina.out** in the Oozie log directory **/var/log/Bigdata/oozie**. If the alarm is not caused by manual misoperation, go to **Step 16**.

Check the Nodeagent process.

Step 16 Log in to each node of Oozie as user **root**. Run the **ps -ef | grep nodeagent** command to check whether the Nodeagent process exists.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 Run the **kill -9** *The process ID of nodeagent* command, wait 10 minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.124 ALM-17004 Oozie Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the Oozie service every 60 seconds. The alarm is generated when the heap memory usage of a Metadata instance exceeds the threshold (95% of the maximum memory). The alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The heap memory overflow may cause a service breakdown.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **Oozie Heap Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Oozie Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the used heap memory of Oozie reaches the threshold (the default value is 95% of the maximum heap memory) specified for Oozie.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations > All Configurations**. Set Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save** > **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.125 ALM-17005 Oozie Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non heap memory usage of Oozie every 30 seconds. This alarm is reported if the non heap memory usage of Oozie exceeds the threshold (80%). This alarm is cleared if the non heap memory usage is lower than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
17005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the Oozie instance is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **Oozie Non Heap Memory Usage Exceeds the Threshold**. On the displayed page, check the location information of the alarm. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Oozie Non Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the non-heap memory used by Oozie reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Configurations** and then **All Configurations**. On the displayed page, search for the **GC_OPTS** parameter in the search box and check whether it contains **-XX: MaxMetaspaceSize**. If yes, increase the value of **-XX: MaxMetaspaceSize** based on the site requirements. If no, manually add **-XX: MaxMetaspaceSize** and set its value to 1/8 of the value of **-Xmx**. Click **Save**, and then click **OK**

NOTE

JDK1.8 does not support the **MaxPermSize** parameter.

Suggestions on GC parameter settings for Oozie:

Set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Oozie** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.126 ALM-17006 Oozie Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Oozie service every 30 seconds. The alarm is generated when the direct memory usage of an Oozie instance exceeds the threshold (80% of the maximum memory). The alarm is cleared when the direct memory usage of Oozie is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The direct memory overflow may cause a service breakdown.

Possible Causes

The direct memory of the Oozie instance is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Oozie Direct Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Oozie Direct Buffer Resource Percentage**. Click **OK**.

Step 3 Check whether the used direct memory of Oozie reaches the threshold (the default value is 80% of the maximum direct memory) specified for Oozie.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations**. Click **All Configurations**. Search **GC_OPTS** in the search box. Increase the value of **-XX:MaxDirectMemorySize** as required, and click **Save**. Click **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set the value of **-XX:MaxDirectMemorySize** to 1/4 of the value of **-Xmx**. For example, if **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 2 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service** drop-down list.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.127 ALM-17007 Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold

Description

The system checks GC time of the Oozie process every 60 seconds. The alarm is generated when GC time of the Oozie process exceeds the threshold (default value: **12 seconds**). The alarm is cleared when GC time is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Oozie responds slowly when it is used to submit tasks.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Procedure

Check GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of Oozie**. Click **OK**.

Step 3 Check whether GC time of the Oozie process every second exceeds the threshold (default value: **12 seconds**).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations**. Click **All Configurations**. Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save**. Click **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service** drop-down list.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.128 ALM-18000 Yarn Service Unavailable

Description

This alarm is generated when the Yarn service is unavailable. The alarm module checks the Yarn service status every 60 seconds.

The alarm is cleared when the Yarn service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceNam	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide Yarn services. Users cannot run new applications. Submitted applications cannot be run.

Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- There is no active ResourceManager instance in the Yarn cluster.
- All the NodeManagers in the Yarn cluster are abnormal.

Procedure

Check ZooKeeper service status.

Step 1 On the FusionInsight Manager, check whether the alarm list contains **ALM-13000 ZooKeeper Service Unavailable**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check the HDFS service status.

Step 3 On the FusionInsight Manager, check whether the alarm list contains the HDFS alarms.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M > Alarm > Alarms**, handle HDFS alarms based on the alarm help, and check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ResourceManager status in the Yarn cluster.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**.

Step 6 In **Dashboard**, check whether there is an active ResourceManager instance in the Yarn cluster.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Check the NodeManager node status in the Yarn cluster.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Instance**.

Step 8 Query NodeManager **Running Status**, and check whether there are unhealthy nodes.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Rectify the fault by following the steps provided in **ALM-18002 NodeManager Heartbeat Lost** or **ALM-18003 NodeManager Unhealthy**. After the fault is rectified, check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager portal of the active cluster, choose **O&M** > **Log > Download**.

Step 11 Select **Yarn** in the required cluster from the **Service**.

Step 12 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.129 ALM-18002 NodeManager Heartbeat Lost

Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number with the threshold. The Number of Lost Nodes indicator has a default threshold. The alarm is generated when the value of Number of Lost Nodes exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.lost.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of lost nodes exceeds the threshold, and is cleared when the number of lost nodes is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Lost Host	Specifies the list of hosts with lost nodes.

Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- NodeManager is forcibly deleted without decommission.
- All the NodeManager instances are stopped or the NodeManager process is faulty.
- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

Procedure

Check the NodeManager status.

Step 1 On the FusionInsight Manager, and choose **O&M** > **Alarm > Alarms**. Click ⌄ before the alarm and obtain lost nodes in **Additional Information**.

Step 2 Check whether the lost nodes are hosts that have been manually deleted without decommission.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 After the setting, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**. Search for **yarn.nodemanager.lost.alarm.threshold** and change its value to the number of hosts that are not out of service and proactively deleted. After the setting, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 Manually clear the alarm. Note that decommission must be performed before deleting hosts.

Step 5 On the FusionInsight Manager portal, choose **Cluster > Hosts**, and check whether the nodes obtained in **Step 1** are healthy.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Rectify the node fault based on **ALM-12006 Node Fault** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the process status.

Step 7 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Instance**, and check whether there are NodeManager instances whose status is not **Good**.

- If yes, go to **Step 10**.
- If no, go to **Step 8**.

Step 8 Check whether the NodeManager instance is deleted.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Restart the active and standby ResourceManager instances, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check the instance status.

Step 10 Select NodeManager instances which running state is not **Normal** and restart them. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the network status.

Step 11 Log in to the management node, **ping** the IP address of the lost NodeManager node to check whether the network is disconnected or busy.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Rectify the network, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log > Download**.

Step 14 Select **Yarn** in the required cluster from the **Service**.

Step 15 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.130 ALM-18003 NodeManager Unhealthy

Description

The system checks the number of unhealthy NodeManager nodes every 30 seconds, and compares the number with the threshold. The Unhealthy Nodes indicator has a default threshold. This alarm is generated when the value of the Unhealthy Nodes indicator exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.unhealthy.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of unhealthy nodes exceeds the threshold, and is cleared when the number of unhealthy nodes is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Unhealthy Host	Specifies the list of hosts with unhealthy nodes.

Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- The hard disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Procedure

Check the hard disk space of the host.

Step 1 On the FusionInsight Manager, and choose **O&M** > **Alarm > Alarms**. Click ⌄ before the alarm and obtain unhealthy nodes in **Additional Information**.

Step 2 Choose **Cluster** > *Name of the desired cluster* **> Services > Yarn** > **Instance**, select the NodeManager instance corresponding to the host, choose **Instance Configurations > All Configurations** and view disks corresponding to **yarn.nodemanager.local-dirs** and **yarn.nodemanager.log-dirs**.

Step 3 Choose **O&M > Alarm > Alarms**. In the alarm list, check whether the related disk has the alarm **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the disk fault based on **ALM-12017 Insufficient Disk Capacit** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 5 Choose **Hosts** > *Name of the desired host* . On the **Dashboard** page, check the disk usage of the corresponding partition. Check whether the percentage of the used space of the mounted disk exceeds the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**

- If yes, go to **Step 6**.

- If no, go to **Step 7**.

Step 6 Reduce the disk usage to less than the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**, wait for 10 to 20 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the access permission of the local directory on each NodeManager node.

Step 7 Obtain the NodeManager directory viewed in **Step 2**, log in to each NodeManager node as user **root**, and go to the obtained directory.

Step 8 Run the **ll** command to check whether the permission of the **localdir** and **containerlogs** folders is **755** and whether **User:Group** is **omm:ficommon**.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Run the following command to set the permission to **755** and **User:Group** to **omm:ficommon**:

chmod 755 *<folder_name>*

chown omm:ficommon *<folder_name>*

Step 10 Wait for 10 to 20 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log > Download**.

Step 12 Select **Yarn** in the required cluster from the **Service**.

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.131 ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold

Description

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to 95% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager** (Indicates the host name of the instance for which the alarm is generated)**.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **ResourceManager > Percentage of Used Memory of the ResourceManager**. Check the heap memory usage.

Step 3 Check whether the used heap memory of ResourceManager reaches 95% of the maximum heap memory specified for ResourceManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.132 ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Description

The system checks the heap memory usage of Mapreduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Mapreduce JobHistoryServer exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Mapreduce** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to 95% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Mapreduce JobHistoryServer is overhigh, the performance of Mapreduce log archiving is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Mapreduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Mapreduce** > **Instance** > **JobHistoryServer.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **JobHistoryServer heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the heap memory usage.

Step 3 Check whether the used heap memory of JobHistoryServer reaches 95% of the maximum heap memory specified for JobHistoryServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Mapreduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Click **OK** and restart the role instance.

NOTE

The mapping between the number of historical tasks (10000) and the memory of JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Mapreduce

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.133 ALM-18010 ResourceManager GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the ResourceManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the ResourceManager process may interrupt the services.

Possible Causes

The heap memory of the ResourceManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18010 ResourceManager GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **>** **Services** > **Yarn** > **Instance** > **ResourceManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of ResourceManager** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the ResourceManager process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Save the configuration and restart the ResourceManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ResourceManager** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.134 ALM-18011 NodeManager GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the NodeManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the NodeManager process may interrupt the services.

Possible Causes

The heap memory of the NodeManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18011 NodeManager GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of NodeManager** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the NodeManager process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the NodeManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **NodeManager** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

9.13.135 ALM-18012 JobHistoryServer GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the JobHistoryServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the JobHistoryServer process may interrupt the services.

Possible Causes

The heap memory of the JobHistoryServer instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18012 JobHistoryServer GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of the JobHistoryServer** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the JobHistoryServer process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the JobHistoryServer instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

9.13.136 ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a ResourceManager instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the ResourceManager instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Memory Usage Status of ResourceManager** to check the direct memory usage.

Step 3 Check whether the used direct memory of ResourceManager reaches 90% of the maximum direct memory specified for ResourceManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System** to increase the value of check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete **-XX:MaxDirectMemorySize**.

Step 6 Save the configuration and restart the ResourceManager instance.

Step 7 Check whether the **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **ResourceManager** in the required cluster from the **Service**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.137 ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a NodeManager instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18014	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the NodeManager instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm > Alarms** > **ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager** to check the direct memory usage.

Step 3 Check whether the used direct memory of NodeManager reaches 90% of the maximum direct memory specified for NodeManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations**> **NodeManager** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the NodeManager instance.

Step 7 Check whether the **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **NodeManager** in the required cluster from the **Service**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.138 ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the MapReduce service every 30 seconds. This alarm is generated when the direct memory usage of a JobHistoryServer instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the MapReduce service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistoryServer instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer (IP address for which the alarm is generated).** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Memory Usage Status of JobHistoryServer** to check the direct memory usage.

Step 3 Check whether the used direct memory of JobHistoryServer reaches 90% of the maximum direct memory specified for JobHistoryServer by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the JobHistoryServer instance.

Step 7 Check whether the **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 11 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

9.13.139 ALM-18016 Non Heap Memory Usage of ResourceManager Exceeds the Threshold

Description

The system checks the Non Heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn ResourceManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18016	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn ResourceManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18016 Non Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Percentage of Used Memory of the ResourceManager**. ResourceManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of ResourceManager reaches 90% of the maximum Non Heap memory specified for ResourceManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Adjust the **GC_OPTS** memory parameter of ResourceManager. Save the configuration and restart the ResourceManager instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.140 ALM-18017 Non Heap Memory Usage of NodeManager Exceeds the Threshold

Description

The system checks the Non Heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn NodeManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn NodeManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18017 Non Heap Memory Usage of Yarn NodeManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager**. NodeManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of NodeManager reaches 90% of the maximum Non Heap memory specified for NodeManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Adjust the **GC_OPTS** memory parameter of NodeManager, click **Save**, and click **OK,** and restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.141 ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn NodeManager exceeds the threshold (95% of the maximum memory by default).

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18018	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn NodeManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager** to check the heap memory usage.

Step 3 Check whether the used heap memory of NodeManager reaches 95% of the maximum heap memory specified for NodeManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**, and click **OK**, and restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.142 ALM-18019 Non Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Description

The system checks the Non Heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of MapReduce JobHistoryServer exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **MapReduce** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18019	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce task submission and operation is affected. In addition, a memory overflow may occur so that the MapReduce service is unavailable.

Possible Causes

The Non Heap memory of the MapReduce JobHistoryServer instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18019 Non Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **JobHistoryServer Non Heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of JobHistoryServer reaches 90% of the maximum Non Heap memory specified for JobHistoryServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Adjust the **GC_OPTS** memory parameter of the NodeManager, click **Save**, and click **OK,** and restart the role instance.

NOTE

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- MapReduce

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.143 ALM-18020 Yarn Task Execution Timeout

Description

The system checks MapReduce and Spark tasks (except for permanent JDBC tasks) submitted to Yarn every 15 minutes. This alarm is generated when the task execution time exceeds the timeout duration specified by the user. However, the task can be properly executed. The client timeout parameter of MapReduce is mapreduce.application.timeout.alarm and that of Spark is spark.application.timeout.alarm. The unit is ms.

This alarm is cleared when the task is finished or terminated.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18020	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
ApplicationName	Specifies the object (application ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The alarm persists after task execution times out. However, the task can still be properly executed, so this alarm does not exert any impact on the system.

Possible Causes

- The specified timeout duration is shorter than the required execution time.
- The queue resources for task running are insufficient.
- Task data skew occurs. As a result, some tasks process a large amount of data and take a long time to execute.

Procedure

Check whether the timeout interval is correctly set.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. The **Alarms** page is displayed.

Step 2 Select the alarm whose ID is **18020**. In the alarm details, view **Location** to obtain the timeout task name and timeout duration.

Step 3 Based on the task name and timeout interval, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to log in to the native Yarn page. Then find the task on the native page, check its **StartTime** and calculate the task execution time based on the current system time. Check whether the task execution time exceeds the timeout duration.

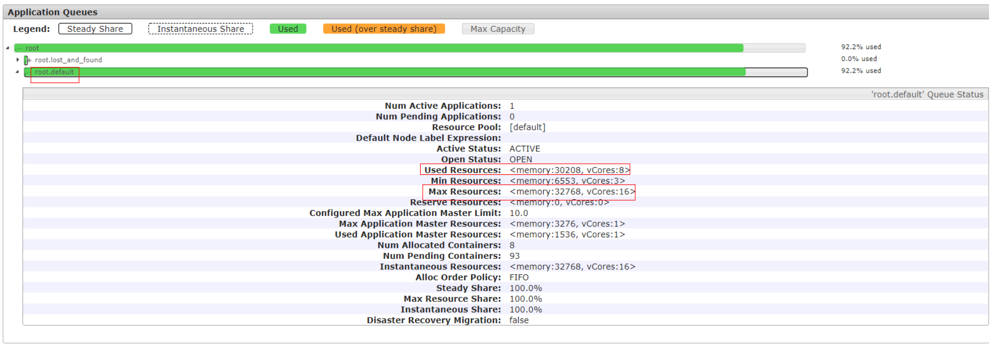
- If yes, go to **Step 5**.
- If no, go to **Step 10**.

Step 4 Evaluate the expected task execution time based on the service and compare it with the task timeout interval. If the timeout interval is too short, set the timeout interval (**mapreduce.application.timeout.alarm** or **spark.application.timeout.alarm**) of the client to the task expected execution time. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the queue resources are sufficient.

Step 5 Find the task on the native page and view the queue name of the task. Click **Scheduler** on the left of the native page. On the **Applications Queues** page, find the corresponding queue name and expand the queue details, as shown in the following figure.



'root.default' Queue Status

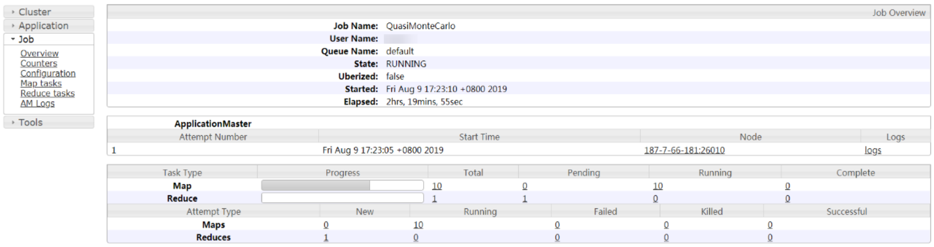
Num Active Applications: 1
Num Pending Applications: 0
Resource Pool: [default]
Default Node Label Expression:
Active Status: ACTIVE
Open Status: OPEN
Used Resources: <memory:30208, vCores:8>
Min Resources: <memory:6553, vCores:3>
Max Resources: <memory:32768, vCores:16>
Reserve Resources: <memory:0, vCores:0>
Configured Max Application Master Limit: 10.0
Max Application Master Resources: <memory:3276, vCores:1>
Used Application Master Resources: <memory:1536, vCores:1>
Num Allocated Containers: 8
Num Pending Containers: 93
Instantaneous Resources: <memory:32768, vCores:16>
Alloc Order Policy: FIFO
Steady Share: 100.0%
Max Resource Share: 100.0%
Instantaneous Share: 100.0%
Disaster Recovery Migration: false

Step 6 Check whether the value of **Used Resources** in the queue details is approximately equal to the value of **Max Resources**, which indicates that the resources in the queue submitted by the task have been used up. If the queue resources are insufficient, choose **Tenant Resources** > **Dynamic Resource Plan** > **Resource Distribution Policy** on FusionInsight Manager and increase the value of **Max Resources** for the queue. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether data skew occurs.

Step 7 On the native Yarn page, click *task ID* (for example, **application_1565337919723_0002**) > **Tracking URL:ApplicationMaster** > **job_1565337919723_0002**. The following page is displayed.



Job Name:	QuasiMonteCarlo
User Name:	[redacted]
Queue Name:	default
State:	RUNNING
Uberized:	false
Started:	Fri Aug 9 17:23:10 +0800 2019
Elapsed:	2hrs, 19mins, 55sec

ApplicationMaster

Attempt Number	Start Time	Node	Logs
1	Fri Aug 9 17:23:05 +0800 2019	187-7-66-181:26010	logs

Task Type	Progress	Total	Pending	Running	Complete
Map		10	0	10	0
Reduce		1	1	0	0

Attempt Type	New	Running	Failed	Killed	Successful
Maps	0	10	0	0	0
Reduces	1	0	0	0	0

Step 8 Choose **Job** > **Map tasks** or **Job** > **Reduce tasks** on the left and check whether the execution time of each Map or Reduce task differs greatly. If yes, task data skew occurs. In this case, you need to balance the task data.

Step 9 Rectify the fault based on the preceding causes and perform the tasks again. Then, check whether the alarm persists.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 12 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.144 ALM-18021 Mapreduce Service Unavailable

Description

The alarm module checks the MapReduce service status every 60 seconds. This alarm is generated when the system detects that the MapReduce service is unavailable.

The alarm is cleared when the MapReduce service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18021	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the MapReduce service. For example, MapReduce cannot be used to view task logs or the log archive function is unavailable.

Possible Causes

- The JobHistoryServer instance is abnormal.
- The KrbServer service is abnormal.
- The ZooKeeper service abnormal.
- The HDFS service abnormal.
- The Yarn service is abnormal.

Procedure

Check MapReduce service JobHistoryServer instance status.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** > **Instance**.

Step 2 Check whether the running status of JobHistoryServer is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Check the KrbServer service status.

Step 3 In the alarm list on FusionInsight Manager, check whether **ALM-25500 KrbServer Service Unavailable** exists.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ZooKeeper service.

Step 5 In the alarm list on FusionInsight Manager, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the HDFS service status.

Step 7 In the alarm list on FusionInsight Manager, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the Yarn service status.

Step 9 In the alarm list on FusionInsight Manager, check whether **ALM-18000 Yarn Service Unavailable** exists.

- If yes, go to **Step 10**
- If no, go to **Step 11**.

Step 10 Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download.**

Step 12 Select **MapReduce** in the required cluster from the **Service.**

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.145 ALM-18022 Insufficient Yarn Queue Resources

Description

The alarm module checks Yarn queue resources every 60 seconds. This alarm is generated when available resources or ApplicationMaster (AM) resources of a queue are insufficient.

This alarm is cleared when available resources are sufficient.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18022	Minor	Yes

Parameters

Parameter Name	Description
Source	Specifies the cluster for which the alarm is generated.
QueueName	Specifies the queue for which the alarm is generated.
QueueMetric	Specifies the metric of the queue for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- An application being executed takes longer time.
- An application fails to be executed for a long time after being submitted.

Possible Causes

- NodeManager node resources are insufficient.
- The configured maximum resource capacity of the queue is excessively small.
- The configured maximum AM resource percentage is excessively small.

Procedure

View alarm details.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm > Alarms**.

Step 2 View location information of this alarm and check whether **QueueName** is **root** and **QueueMetric** is **Memory** or **QueueName** is **root** and **QueueMetric** is **vCores**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 The memory or CPU of the Yarn cluster is insufficient. In this case, log in to the node where NodeManager resides and run the **free -g** and **cat /proc/cpuinfo** commands to query the available memory and available CPU of the node, respectively. On FusionInsight Manager, increase the values of **yarn.nodemanager.resource.memory-mb** and **yarn.nodemanager.resource.cpu-vcores** for the Yarn NodeManager based on the query results. Then, restart the NodeManager instance. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 View location information of this alarm and check whether **QueueName** is **<*Tenant Queue*>** and **QueueMetric** is **Memory**, or **QueueName** is **<*Tenant Queue*>** and **QueueMetric** is **vCores** in **Location**, check whether **available Memory =** or **available vCores =** are included in **Additional Information**.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 The memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources** > **Dynamic Resource Plan > Resource Distribution Policy** and increase the value of **Maximum Capacity**. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available Memory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available Memory =** in **Additional Information**.

If **Additional Information** contains **available vCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available vCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 7 If **available AmMemory =** or **available AmvCores =** is included in **Additional Information**, ApplicationMaster memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources** > **Dynamic Resource Plan** > **Queue Configuration** and increase the value of **Maximum Am Resource Percent**. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available AmMemory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available AmMemory =** in **Additional Information**.

If **Additional Information** contains **available AmvCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available AmvCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 Log in to FusionInsight Manager of the active cluster, and choose **O&M** > **Log** > **Download**.

Step 10 Select **Yarn** in the required cluster from the **Service**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

9.13.146 ALM-18023 Number of Pending Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of pending applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 60.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18023	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
QueueName	Identifies the queue for which the alarm is generated.
QueueMetric	Identifies the queue indicator for which the alarm is generated.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Applications** > **Pending Applications**, and increase the thresholds as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.147 ALM-18024 Pending Yarn Memory Usage Exceeds the Threshold

Description

The alarm module checks the pending memory of Yarn every 60 seconds. The alarm is generated when the pending memory exceeds the threshold. Pending memory indicates the total memory that is not allocated to submitted Yarn applications.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18024	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
QueueName	Identifies the queue for which the alarm is generated.
QueueMetric	Identifies the queue indicator for which the alarm is generated.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **CPU and Memory** > **Pending Memory**, and increase the threshold as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.148 ALM-18025 Number of Terminated Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of terminated applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18025	Major	Yes

Parameters

Name	Meaning
Cluster Name	Specifies the cluster for which the alarm is generated.
Service Name	Specifies the service for which the alarm is generated.
Role Name	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A large number of application tasks are forcibly terminated.

Possible Causes

- The user forcibly terminates a large number of tasks.
- The system terminates tasks due to some error.

Procedure

Check the alarm details.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.

Step 2 View **Additional Information** in the alarm details to check whether the alarm threshold is too small.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Other** > **Terminated Applications of root queue** to modify the threshold. Go to **Step 6**.

Step 4 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager(Active)** to access the ResourceManager web UI.

Step 5 Click **KILLED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task termination details (for example, the task is terminated by a user).

Step 6 Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 8 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.149 ALM-18026 Number of Failed Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of failed applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18026	Major	Yes

Parameters

Name	Meaning
Cluster Name	Specifies the cluster for which the alarm is generated.
Service Name	Specifies the service for which the alarm is generated.
Role Name	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- A large number of application tasks fail to be executed.
- Failed tasks need to be submitted again.

Possible Causes

The task fails to be executed due to some error.

Procedure

Check the alarm details.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.

Step 2 View **Additional Information** in the alarm details to check whether the alarm threshold is too small.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Other** > **Failed Applications of root queue** to modify the threshold. Go to **Step 6**.

Step 4 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager(Active)** to access the ResourceManager web UI.

Step 5 Click **FAILED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task failure causes.

Step 6 Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager, choose O&M > Log > Download.

Step 8 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.150 ALM-19000 HBase Service Unavailable

Description

This alarm is generated when the HBase service is unavailable. The alarm module checks the HBase service status every 120 seconds.

This alarm is cleared when the HBase service recovers.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, ServiceName=HBase1 is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Operations, such as reading or writing data and creating tables, cannot be performed.

Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The HBase service is abnormal.
- The network is abnormal.

Procedure

Check the ZooKeeper service status.

Step 1 On the FusionInsight Manager, check whether the running status of ZooKeeper is **Normal** on service list.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait several minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the HDFS service status.

Step 5 In the alarm list, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**.

Step 7 Wait several minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Check whether **Safe Mode** is **ON**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

Step 9 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication. Obtain the password of user hdfs from the administrator, run the **kinit hdfs** command and enter the password as prompted.

Step 10 Run the following command to manually exit the safe mode:

```
hdfs dfsadmin -safemode leave
```

Step 11 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service status.

Step 12 On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services** > **HBase**.

Step 13 Check whether there is one active HMaster and one standby HMaster.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

Step 14 Click **Instances**, select the HMaster whose status is not **Active**, click **More**, and select **Restart Instance** to restart the HMaster. Check whether there is one active HMaster and one standby HMaster again.

- If yes, go to **Step 15**.
- If no, go to **Step 21**.

Step 15 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **HMaster(Active)** to go to the HMaster WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 16 Check whether at least one RegionServer exists under **Region Servers**.

- If yes, go to **Step 17**.
- If no, go to **Step 21**.

Step 17 Check **Tables** > **System Tables**, as shown in **Figure 9-26**. Check whether **hbase:meta**, **hbase:namespace**, and **hbase:acl** exist in the **Table Name** column.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Figure 9-26 HBase system table

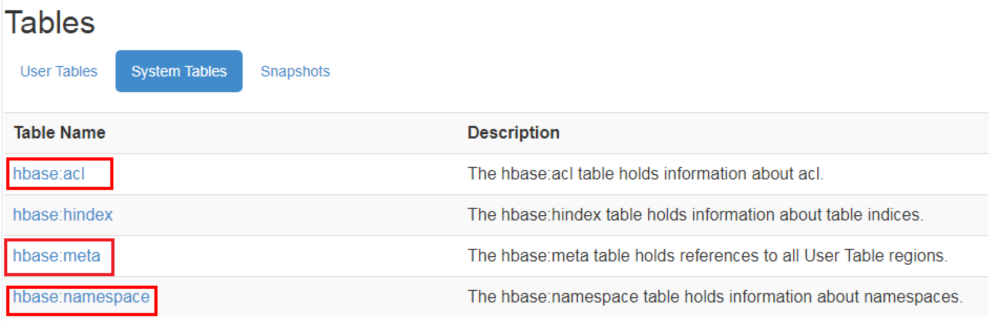

Table Name	Description
hbase:acl	The hbase:acl table holds information about acl.
hbase:hindex	The hbase:hindex table holds information about table indices.
hbase:meta	The hbase:meta table holds references to all User Table regions.
hbase:namespace	The hbase:namespace table holds information about namespaces.

Step 18 As shown in **Figure 9-26**, click the **hbase:meta**, **hbase:namespace**, and **hbase:acl** hyperlinks and check whether the pages are properly displayed. If the pages are properly displayed, the tables are normal.

If they are, go to **Step 19**.

If they are not, go to **Step 23**.

NOTE

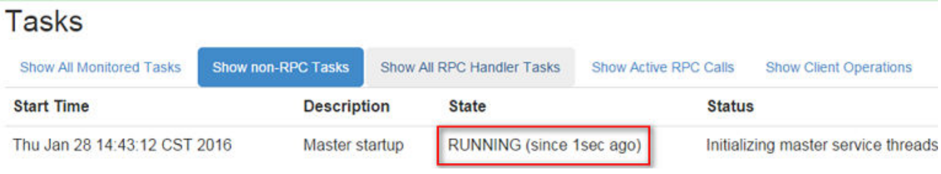
In normal mode, **ACL** is enabled for HBase by default. The **hbase:acl** table is generated only when **ACL** is manually enabled. In this case, check this table. In other scenarios, this table does not need to be checked.

Step 19 View the HMaster startup status.

In **Figure 9-27**, if the **RUNNING** state exists in **Tasks**, HMaster is being started. In the **State** column, you can view the time when HMaster is in the **RUNNING** state. In **Figure 9-28**, if the state is **COMPLETE**, HMaster is started.

Check whether HMaster is in the **RUNNING** state for a long time.

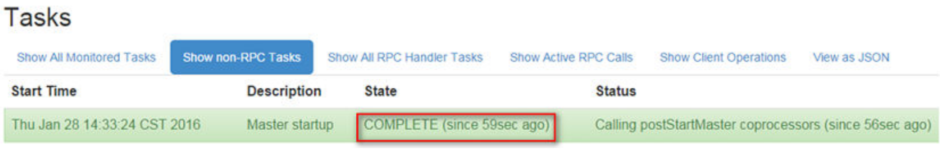
Figure 9-27 HMaster is being started



Tasks

Start Time	Description	State	Status
Thu Jan 28 14:43:12 CST 2016	Master startup	RUNNING (since 1sec ago)	Initializing master service threads

Figure 9-28 HMaster is started



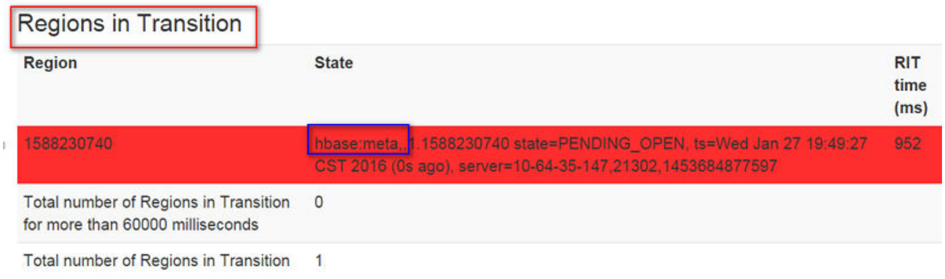
Tasks

Start Time	Description	State	Status
Thu Jan 28 14:33:24 CST 2016	Master startup	COMPLETE (since 59sec ago)	Calling postStartMaster coprocessors (since 56sec ago)

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 On the HMaster WebUI, check whether any hbase:meta is in the **Region in Transition** state for a long time.

Figure 9-29 Region in Transition



Regions in Transition

Region	State	RIT time (ms)
1588230740	hbase:meta,,1.1588230740 state=PENDING_OPEN, ts=Wed Jan 27 19:49:27 CST 2016 (0s ago), server=10-64-35-147,21302,1453684877597	952
Total number of Regions in Transition for more than 60000 milliseconds	0	
Total number of Regions in Transition	1	

- If yes, go to **Step 21**.
- If no, go to **Step 22**.

Step 21 In the precondition that services are not affected, log in to the FusionInsight Manager portal and choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **More** > **Restart Service**. Enter the administrator password and click **OK**.

- If yes, go to **Step 22**.
- If no, go to **Step 23**.

Step 22 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Check the network connection between HMaster and dependent components.

Step 23 On the FusionInsight Manager, choose **Cluster** >*Name of the desired cluster* > **Services** > **HBase**.

Step 24 Click **Instance** and the HMaster instance list is displayed. Record the **management IP Address** in the row of **HMaster(Active)**.

Step 25 Use the IP address obtained in **Step 24** to log in to the host where the active HMaster runs as user **omm** .

Step 26 Run the **ping** command to check whether communication between the host that runs the active HMaster and the hosts that run the dependent components. (The dependent components include ZooKeeper, HDFS and Yarn. Obtain the IP addresses of the hosts that run these services in the same way as that for obtaining the IP address of the active HMaster.)

- If yes, go to **Step 29**.
- If no, go to **Step 27**.

Step 27 Contact the administrator to restore the network.

Step 28 In the alarm list, check whether **HBase Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 29**.

Collect fault information.

Step 29 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 30 Select the following nodes in the required cluster from the **Service** drop-down list:

- ZooKeeper
- HDFS
- HBase

Step 31 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 32 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.151 ALM-19006 HBase Replication Sync Failed

Description

The alarm module checks the HBase DR data synchronization status every 30 seconds. When disaster recovery (DR) data fails to be synchronized to a standby cluster, the alarm is triggered.

When DR data synchronization succeeds, the alarm is cleared.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19006	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

HBase data in a cluster fails to be synchronized to the standby cluster, causing data inconsistency between active and standby clusters.

Possible Causes

- The HBase service on the standby cluster is abnormal.
- A network exception occurs.

Procedure

Observe whether the system automatically clears the alarm.

Step 1 On the FusionInsight Manager portal of the active cluster, click **O&M** > **Alarm** > **Alarms.**

Step 2 In the alarm list, click the alarm to obtain alarm generation time from **Generated** of the alarm. Check whether the alarm has existed for five minutes.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Wait five minutes and check whether the system automatically clears the alarm.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the HBase service status of the standby cluster.

Step 4 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M** > **Alarm** > **Alarms.**

Step 5 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 6 Access the node where the HBase client of the active cluster resides as user **omm**.

If the cluster uses a security mode, perform security authentication first and then access the **hbase shell** interface as user **hbase**.

cd /opt/client

source ./bigdata_env

kinit *hbaseuser*

Step 7 Run the **status 'replication', 'source'** command to check the DR synchronization status of the faulty node.

The DR synchronization status of a node is as follows.

```
10-10-10-153:
SOURCE: PeerID=abc, SizeOfLogQueue=0, ShippedBatches=2, ShippedOps=2, ShippedBytes=320,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=0,
TimeStampsOfLastShippedOp=Mon Jul 18 09:53:28 CST 2016, Replication Lag=0,
FailedReplicationAttempts=0
SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788,
TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788,
FailedReplicationAttempts=5
```

Step 8 Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

In the preceding step, data on the faulty node 10-10-10-153 fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

Step 9 Run the **list_peers** command to find the cluster and the HBase instance corresponding to the **PeerID** value.

```
PEER_ID CLUSTER_KEY STATE TABLE_CFS
abc1 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase2 ENABLED
abc 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase ENABLED
```

In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

Step 10 In the service list of FusionInsight Manager of the standby cluster, check whether the running status of the HBase instance obtained by using **Step 9** is **Normal**.

- If yes, go to **Step 14**.
- If no, go to **Step 11**.

Step 11 In the alarm list, check whether the **ALM-19000 HBase Service Unavailable** alarm is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Follow troubleshooting procedures in **ALM-19000 HBase Service Unavailable** to rectify the fault.

Step 13 Wait for a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check network connections between RegionServers on active and standby clusters.

Step 14 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M** > **Alarm** > **Alarms.**

Step 15 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 16 Use the IP address obtained in **Step 15** to log in to a faulty RegionServer node as user **omm**.

Step 17 Run the **ping** command to check whether network connections between the faulty RegionServer node and the host where RegionServer of the standby cluster resides are in the normal state.

- If yes, go to **Step 20**.
- If no, go to **Step 18**.

Step 18 Contact the network administrator to restore the network.

Step 19 After the network is running properly, check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 20**.

Collect fault information.

Step 20 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 21 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 22 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

9.13.152 ALM-19007 HBase GC Time Exceeds the Threshold

Description

The system checks the old generation garbage collection (GC) time of the HBase service every 60 seconds. This alarm is generated when the detected old generation GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks by default). To change the threshold, on the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase > GC > GC time for old generation**. This alarm is cleared when the old generation GC time of the HBase service is shorter than or equal to the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

If the old generation GC time exceeds the threshold, HBase data read and write are affected.

Possible Causes

The memory of HBase instances is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in HBase. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19007**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of HMaster** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of RegionServer** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Check the current JVM configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. In Search, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of role HMaster(HBase->HMaster), RegionServer(HBase->RegionServer). Adjust the values of **-Xmx** and **-XX:CMSInitiatingOccupancyFraction** of the GC_OPTS parameter by referring to the Note.

NOTE

1. Suggestions on GC parameter configurations for HMaster
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
   - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set -Xmx to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to one eighth of **-Xmx**.
   - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
   - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.
   - **XX:CMSInitiatingOccupancyFraction** to be less than and equal to **85**, and it is calculated as follows: 100 x (hfile.block.cache.size + hbase.regionserver.global.memstore.size)

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 7 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.153 ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold

Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the heap memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

If the available HBase heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the HBase service is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19008**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** by referring to the Note.

NOTE

1. Suggestions on GC parameter configurations for HMaster
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
   - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set -Xmx to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to one eighth of **-Xmx**.
   - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
   - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **HBase** in the required cluster from the **Service** drop-down list.

Step 8 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.154 ALM-19009 Direct Memory Usage of the HBase Process Exceeds the Threshold

Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the direct memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

If the available HBase direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the HBase service is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and check whether **XX:MaxDirectMemorySize** exists in **GC_OPTS**.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Nameof the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and delete **XX:MaxDirectMemorySize** from **GC_OPTS**.

Step 6 Check whether the **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold** alarm is generated.

If yes, handle the alarm by referring to **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold**.

If no, go to **Step 8**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** in the required cluster drop-down list box, select **HBase**.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.155 ALM-19011 RegionServer Region Number Exceeds the Threshold

Description

The system checks the number of regions on each RegionServer in each HBase service instance every 30 seconds. The region number is displayed on the HBase service monitoring page and RegionServer role monitoring page. This alarm is generated when the number of regions on a RegionServer exceeds the threshold (default value: 2000) for 20 consecutive times. The threshold can be changed by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase**. This alarm is cleared when the number of regions is less than or equal to the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The data read/write performance of HBase is affected when the number of regions on a RegionServer exceeds the threshold.

Possible Causes

- The RegionServer region distribution is unbalanced.
- The HBase cluster scale is too small.

Procedure

View alarm location information.

Step 1 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms**, select this alarm, and view the service instance and host name in **Location**.

Step 2 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, check whether the region distribution on the RegionServer is balanced.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- If yes, go to **Step 9**.
- If no, go to **Step 3**.

Total:3				0	16

Enable load balancing.

Step 3 Log in to the node where the HBase client is located as user **root**. Go to the client installation directory, and set environment variables.

cd *client installation directory*

source bigdata_env

If the cluster adopts the security mode, perform security authentication. Specifically, run the **kinit hbase** command and enter the password as prompted (obtain the password from the administrator).

Step 4 Run the following commands to go to the HBase shell command window and check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 On the HBase shell command window, run the following commands to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 6 On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 7 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 8**.
- If no, go to **Step 21**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Delete unwanted HBase tables.

NOTE

Exercise caution when deleting data to ensure data is deleted correctly.

Step 9 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, view tables stored in the HBase service instance and record unwanted tables that can be deleted.

Step 10 On the HBase shell command window, run the **disable** command and **drop** command to delete the table to decrease the number of regions.

disable '*name of the table to be deleted***'**

drop '*name of the table to be deleted***'**

Step 11 On the HBase shell command window, run the following command to check whether the load balancing function is enabled.

balancer_enabled

- If yes, go to **Step 13**.
- If no, go to **Step 12**.

Step 12 On the HBase shell command window, run the following commands to enable the load balancing function and confirm that the function is enabled.

balance_switch true

balancer_enabled

Step 13 On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

Step 14 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 15**.
- If no, go to **Step 21**.

Step 15 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Adjust the threshold.

Step 16 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase** > **Regions(RegionServer)**, select the applied rule, and click **Modify** to check whether the threshold is proper.

- If it is excessively small, increase the threshold as required and go to **Step 17**.
- If it is proper, go to **Step 18**.

Step 17 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Perform system capacity expansion.

Step 18 Add nodes to the HBase cluster and add RegionServer instances to the nodes. Then enable and manually trigger the load balancing function.

Step 19 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 21**.

Collect fault information.

Step 21 On the FusionInsight Manager home page of the active and standby clusters, choose **O&M**> **Log** > **Download**.

Step 22 Select **HBase** in the required cluster from the **Service**.

Step 23 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 24 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.156 ALM-19012 HBase System Table Directory or File Lost

Description

The system checks whether HBase directories and files exist on the HDFS every 120 seconds. This alarm is generated when the system detects that the files or directories do not exist. This alarm is cleared when the files or directories are restored.

The HBase directories and files are as follows:

- Directory of the namespace **hbase** on the HDFS
- **hbase.version** file
- Directory of the table **hbase:meta** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:namespace** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:hindex** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the **hbase:acl** table on the HDFS, .tableinfo, and .regioninfo file (This table does not exist in the common mode cluster by default.)

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19012	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The HBase service fails to restart or start.

Possible Causes

Files or directories on the HDFS are missing.

Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Click this alarm and check whether **Alarm Cause** indicates unknown errors.

- If yes, go to **Step 4**.
- If no, go to **Step 2**

Step 2 On the FusionInsight Manager home page, choose **O&M** > **Backup and Restoration** > **Backup Management**. Check whether there are success records of the backup task named **default** or other HBase metadata backup tasks that have been successfully executed.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Use the latest backup metadata to restore the metadata of the HBase service.

Collect fault information.

Step 4 On the FusionInsight Manager page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 5 In the **Service** area, select faulty HBase services in the required cluster.

Step 6 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.157 ALM-19013 Duration of Regions in transaction State Exceeds the Threshold

Description

The system checks the number of regions in transaction state on HBase every 300 seconds. This alarm is generated when the system detects that the duration of regions in transaction state exceeds the threshold for two consecutive times. This alarm is cleared when all timeout regions are restored.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Some data in the table gets lost or becomes unavailable.

Possible Causes

- Compaction is permanently blocked.
- The HDFS files are abnormal.

Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select this alarm, and view the **HostName** and **RoleName** in **Location**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services > HBase**, Click the drop-down menu in the chartarea and choose **Customize > Service** >

Region in transaction count to view **Region in transaction count over threshold**. Check whether the monitoring item detects a value in three consecutive detection periods. (The default threshold is 60 seconds.)

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **HMaster (Active)** > **Tables** to check whether the regions of only one table transaction status time out.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Log in to the client as user **root**. Run the following command:

cd *client installation directory*

source bigdata_env

If the cluster is in security mode, run the **kinit hbase** command

Log in to the HMaster WebUI, choose **Procedure & Locks** in the navigation tree, and check whether any process ID is in the **Waiting** state in **Procedures**. If yes, run the following command to release the procedure lock:

hbase hbck -j *client installation directory***/HBase/hbase/tools/hbase-hbck2-*.jar bypass -o** *pid*

Check whether the state is in the **Bypass** state. If the procedure on the UI is always in **RUNNABLE(Bypass)** state, perform an active/standby switchover. Run the **assigns** command to bring the region online again.

hbase hbck -j *client installation directory***/HBase/hbase/tools/hbase-hbck2-*.jar assigns -o** *regionName*

Step 6 Repeat **Step 4**. Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On the FusionInsight Manager page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service** area, select faulty HBase services in the required cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.158 ALM-19014 Capacity Quota Usage on ZooKeeper Exceeds the Threshold Severely

Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the ZNode capacity usage of the HBase service exceeds the critical alarm threshold (90% by default).

This alarm is cleared when the ZNode capacity usage is less than the critical alarm threshold.

NOTE

If the multi-instance function has been enabled in the cluster and multiple HBase services have been installed, determine the HBase service for which the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the value of **ServiceName** is **HBase-1**, change the operation object in the procedure from **HBase** to **HBase-1**.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19014	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Threshold	Specifies the threshold for which the alarm is generated.

Impact on the System

This alarm indicates that the capacity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Procedure

Check the capacity configuration and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19014**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:

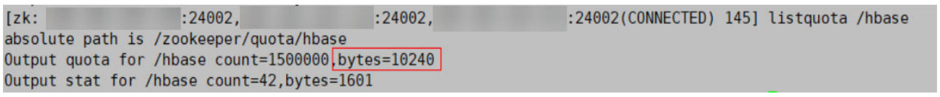
source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode capacity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the capacity configuration of the root ZNode of the HBase service.



```
[zk: [redacted]:24002,[redacted]:24002,[redacted]:24002(CONNECTED) 145] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=42,bytes=1601
```

Step 4 Run the **getusage /hbase/splitWAL** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared five minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HBase** for the target cluster.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.159 ALM-19015 Quantity Quota Usage on ZooKeeper Exceeds the Threshold

Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the ZNode quantity usage of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the ZNode quantity usage is less than the alarm threshold.

NOTE

If the multi-instance function has been enabled in the cluster and multiple HBase services have been installed, determine the HBase service for which the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the value of **ServiceName** is **HBase-1**, change the operation object in the procedure from **HBase** to **HBase-1**.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Threshold	Specifies the threshold for which the alarm is generated.

Impact on the System

This alarm indicates that the ZNode quantity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to **Critical**, affecting data writing.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Procedure

Check the quantity quota and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19015**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:

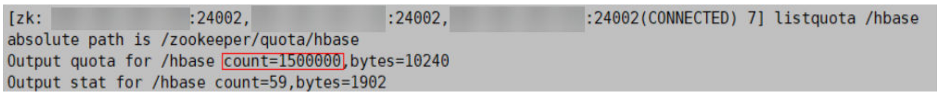
source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity quota configuration of the root ZNode of the HBase service.



```
[zk: [redacted]:24002,[redacted]:24002,[redacted]:24002(CONNECTED) 7] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=59,bytes=1902
```

Step 4 Run the **getusage /hbase/splitWAL** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

9.13.162 ALM-19018 HBase Compaction Queue Size Exceeds the Threshold

Description

The system checks the HBase compaction queue size every 300 seconds. This alarm is generated when the compaction queue size exceeds the alarm threshold (**100** by default). This alarm is cleared when the compaction queue size is less than the threshold.

NOTE

If the multi-instance function has been enabled in the cluster and multiple HBase services have been installed, determine the HBase service for which the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the value of **ServiceName** is **HBase-1**, change the operation object in the procedure from **HBase** to **HBase-1**.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19018	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster performance may deteriorate, affecting data read and write.

Possible Causes

- The number of HBase RegionServers is too small.
- There are excessive regions on a single RegionServer of HBase.
- The HBase RegionServer heap size is small.
- Resources are insufficient.
- Related parameters are not configured properly.

Procedure

Check whether related parameters are properly configured.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, check whether the alarm whose **Alarm ID** is **19008** or **19011** exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. On the page that is disaplyed, click the **Configuration** tab then the **All Configurations** sub-tab, search for **hbase.hstore.compaction.min**, **hbase.hstore.compaction.max**, **hbase.regionserver.thread.compaction.small**, and **hbase.regionserver.thread.compaction.throttle**, and set them to larger values.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 6 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.163 ALM-19019 Number of HBase HFiles to Be Synchronized Exceeds the Threshold

Description

The system checks the number of HFiles to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of HFiles to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **HBase** . This alarm is cleared when the number of HFiles to be synchronized is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19019	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the number of HFiles to be synchronized by a RegionServer exceeds the threshold, the number of ZNodes used by HBase exceeds the threshold, affecting the HBase service status.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19019**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to restore the network.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform **Step 6** to **Step 10** to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to **Step 14**.

- If no, go to **Step 15**.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect the fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.164 ALM-19020 Number of HBase WAL Files to Be Synchronized Exceeds the Threshold

Description

The system checks the number of WAL files to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of WAL files to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **HBase** . This alarm is cleared when the number of WAL files to be synchronized is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19020	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the number of WAL files to be synchronized by a RegionServer exceeds the threshold, the number of ZNodes used by HBase exceeds the threshold, affecting the HBase service status.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19020**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to restore the network.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform **Step 6** to **Step 10** to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to **Step 14**.

- If no, go to **Step 15**.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect the fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.165 ALM-20002 Hue Service Unavailable

Description

This alarm is generated when the Hue service is unavailable. The system checks the Hue service status every 60 seconds.

This alarm is cleared when the Hue service is normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
20002	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- The internal KrbServer service on which the Hue service depends is abnormal.
- The internal DBService service on which the Hue service depends is abnormal.
- The network connection to the DBService is abnormal.

Procedure

Check whether the KrbServer is abnormal.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, check whether the **KrbServer** running status is **Normal**.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Restart the KrbServer service.

Step 3 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the DBService is abnormal.

Step 4 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 5 In the service list, check whether the **DBService** running status is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Restart the DBService.

NOTE

To restart the service, enter the FusionInsight Manager administrator password.

Step 7 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the network connection to the DBService is normal.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hue** > **Instance**, record the IP address of the active Hue.

Step 9 Log in to the active Hue.

Step 10 Run the **ping** command to check whether communication between the host that runs the active Hue and the hosts that run the DBService is normal. (Obtain the IP addresses of the hosts that run the DBService in the same way as that for obtaining the IP address of the active Hue.)

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Contact the administrator to restore the network.

Step 12 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service** drop-down list:

- Hue
- Controller

Step 15 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hue**.

Step 17 Choose **More** > **Restart Service**, and click **OK**.

Step 18 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.166 ALM-24000 Flume Service Unavailable

Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is automatically cleared after the Flume service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Flume cannot work and data transmission is interrupted.

Possible Causes

All Flume instances are faulty.

Procedure

Step 1 Log in to a Flume node as user **omm** and run the **ps -ef|grep "flume.role=server"** command to check whether the Flume process exists on the node.

- If yes, go to **Step 3**.

- If no, restart the faulty Flume node or Flume service and go to **Step 2**.

Step 2 In the alarm list, check whether alarm "Flume Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Collect the fault information.

Step 3 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 4 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 5 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

9.13.167 ALM-24001 Flume Agent Exception

Description

The Flume agent instance for which the alarm is generated cannot be started. This alarm is generated when the Flume agent process is faulty (The system checks in every 5 seconds.) or Flume agent fails to start (The system reporting alarms immediately).

This alarm is cleared when the Flume agent process recovers, Flume agent starts successfully and the alarm handling is completed.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
AgentId	Specifies the ID of the agent for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume agent instance for which the alarm is generated cannot provide services properly, and the data transmission tasks of the instance are temporarily interrupted. Real-time data is lost during real-time data transmission.

Possible Causes

- The JAVA_HOME directory does not exist or the Java permission is incorrect.
- The Flume agent directory permission is incorrect.
- Flume agent fails to start.

Procedure

Check whether the JAVA_HOME directory exists or whether the JAVA permission is correct.

Step 1 Log in to the host for which the alarm is generated as user **root**.

Step 2 Run the following command to obtain the installation directory of the Flume client for which the alarm is generated: (The value of **AgentId** can be obtained from **Location** of the alarm.)

ps -ef|grep *AgentId* **| grep -v grep | awk -F 'conf-file ' '{print $2}' | awk -F 'fusioninsight' '{print $1}'**

Step 3 Run the **su -** *Flume installation user* command to switch to the Flume installation user and run the **cd** *Flume client installation directory***/fusioninsight-flume-1.9.0/conf/** command to go to the Flume configuration directory.

Step 4 Run the **cat ENV_VARS | grep JAVA_HOME** command.

Step 5 Check whether the **JAVA_HOME** directory exists. If the command output in **Step 4** is not empty and **ll $JAVA_HOME/** is not empty, the **JAVA_HOME** directory exists.

- If yes, go to **Step 7**.

- If no, go to **Step 6**.

Step 6 Specify a correct **JAVA_HOME** directory.

Step 7 Run the **$JAVA_HOME/bin/java -version** command to check whether the Flume agent running user has the Java execution permission. If the Java version is displayed in the command output, the Java permission meets the requirement. Otherwise, the Java permission does not meet the requirement.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

NOTE

JAVA_HOME is the environment variable exported during Flume client installation. You can also go to *Flume client installation directory***/fusioninsight-flume-1.9.0/conf** and run the **cat ENV_VARS | grep JAVA_HOME** command to view the variable value.

Step 8 Run the **chmod 750 $JAVA_HOME/bin/java** command to grant the Java execution permission to the Flume agent running user.

Check the directory permission of the Flume agent.

Step 9 Log in to the host for which the alarm is generated as user **root**.

Step 10 Run the following command to switch to the Flume agent installation directory:

cd *Flume client installation directory***/fusioninsight-flume-1.9.0/conf/**

Step 11 Run the **ls -al * -R** command to check whether any file owner is the user who running the Flume agent.

- If yes, go to **Step 12**.
- If no, run the **chown** command to change the file owner to the user who runs the Flume agent.

Check the Flume agent configuration.

Step 12 Run the **cat properties.properties | grep spooldir** and **cat properties.properties | grep TAILDIR** commands to check whether the Flume source type is spoolDir or tailDir. If any command output is displayed, the Flume source type is spoolDir or tailDir.

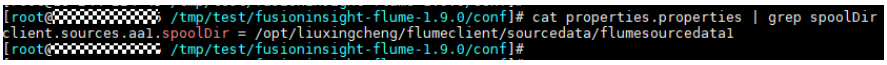
- If yes, go to **Step 13**.
- If no, go to **Step 17**.

Step 13 Check whether the data monitoring directory exists.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

NOTE

Run the **cat properties.properties | grep spoolDir** command to view the spoolDir monitoring directory.



```
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep spoolDir
client.sources.aal.spoolDir = /opt/liuxingcheng/flumeclient/sourcedata/flumesourcedatal
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]#
```

Run the **cat properties.properties | grep parentDir** command to view the tailDir monitoring directory.

```
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep parentDir
server.sources.AAAA.filegroups.F1.parentDir = /tmp/flumetest/taildir_data
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]#
```

Step 14 Specify a correct data monitoring directory.

Step 15 Check whether the Flume agent user has the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

- If yes, go to **Step 17**.
- If no, go to **Step 16**.

NOTE

Go to the monitoring directory as the Flume running user. If files can be created, the Flume running user has the read, write, and execute permissions on the monitoring directory.

Step 16 Run the **chmod 777** *Flume monitoring directory* command to grant the Flume agent running user the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

Step 17 Check whether the components connected to the Flume sink are in safe mode.

- If yes, go to **Step 18**.
- If no, go to **Step 23**.

NOTE

If the sinks in the **properties.properties** configuration file are the HDFS sink and HBase sink, and the configuration file contains a keytab file, the components connected to the Flume sink are in safe mode.

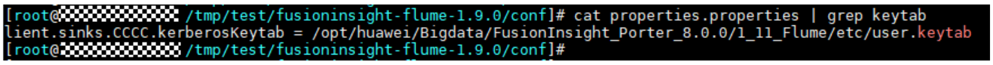
If the sink in the **properties.properties** configuration file is the kafka sink and ***.security.protocol** is set to **SASL_PLAINTEXT** or **SASL_SSL**, Kafka connected to the Flume sink is in safe mode.

Step 18 Run the **ll** *ketab path* command to check whether the keytab authentication path specified by the ***.kerberosKeytab** parameter in the configuration file exists.

- If yes, go to **Step 20**.
- If no, go to **Step 19**.

NOTE

To view the ketab path, run the **cat properties.properties | grep keytab** command.



```
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep keytab
lient.sinks.CCCC.kerberosKeytab = /opt/huawei/Bigdata/FusionInsight_Porter_8.0.0/1_11_Flume/etc/user.keytab
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]#
```

Step 19 Change the value of **kerberosKeytab** in **Step 18** to the custom keytab path and go to **Step 21**.

Step 20 Perform **Step 18** to check whether the Flume agent running user has the permission to access the keytab authentication file. If the keytab path is returned, the user has the permission. Otherwise, the user does not have the permission.

- If yes, go to **Step 22**.
- If no, go to **Step 21**.

Step 21 Run the **chmod 755** *ketab file* command to grant the read permission on the keytab file specified in **Step 19**, and restart the Flume process.

Step 22 Check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 23**.

Collect the fault information.

Step 23 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 24 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 25 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

None

9.13.168 ALM-24003 Flume Client Connection Interrupted

Description

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in three consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
Client IP Address	Specifies the IP address of the Flume client.

Name	Meaning
Client Name	Specifies the agent name of the Flume client.
Sink Name	Specifies the sink name of Flume Agent.

Impact on the System

The communication between the Flume client and the server fails. The Flume client cannot send data to the Flume server.

Possible Causes

- The network connection between the Flume client and the server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

Procedure

Check the network connection between the Flume client and the server.

Step 1 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 2 Run the **ping** *Flume server IP address* command to check whether the network connection between the Flume client and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Check whether the Flume client's process is normal.

Step 3 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 4 Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.

- If yes, go to **Step 5**.
- If no, go to **Step 11**.

Check the Flume client configuration.

Step 5 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 6 Run the **cd** *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf/** command to go to Flume's configuration directory.

Step 7 Run the **cat properties.properties** command to query the current configuration file of the Flume client.

Step 8 Check whether the **properties.properties** file is correctly configured according to the configuration description of the Flume agent.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Modify the **properties.properties** configuration file.

Check whether the alarm is cleared.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Collect logs in the **/var/log/Bigdata/flume-client** directory on the Flume client using a transmission tool.

Step 15 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

9.13.169 ALM-24004 Exception Occurs When Flume Reads Data

Description

The alarm module monitors the status of Flume Source. This alarm is generated immediately when the duration in which Source fails to read the data exceeds the threshold.

The default threshold is **0**, indicating that the threshold is disabled. You can change the threshold by modifying the **properties.properties** file in the **conf** directory. Specifically, modify the **NoDatatime** parameter of required the source.

The alarm is cleared when Source reads the data and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
AgentId	Specifies the ID of the agent for which the alarm is generated.
ComponentType	Specifies the component type for which the alarm is generated.
ComponentName	Specifies the component name for which the alarm is generated.

Impact on the System

If data is found in the data source and Flume Source continuously fails to read data, the data collection is stopped.

Possible Causes

- Flume Source is faulty, so data cannot be sent.
- The network is faulty, so the data cannot be sent.

Procedure

Check whether Flume Source is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for **keyword type = spooldir** in the file, and check whether the Flume source type is spoolDir.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 View the spoolDir directory to check whether all files are already transferred.

- If yes, no further action is required.

- If no, go to **Step 5**.

NOTE

The monitoring directory of spooDir is specified by the **.spoolDir** parameter in the **properties.properties** configuration file. If all files in the monitoring directory have been transferred, the file name extension of all files in the monitoring directory is **.COMPLETED**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.source.kafka.KafkaSource** in the file, and check whether the Flume source type is Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Check whether the topic data configured by Kafka Source has been used up.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance**.

Step 6 Go to the Flume instance page of the faulty node to check whether the indicator **Source Speed Metrics** in the alarm is 0.

- If yes, go to **Step 11**.
- If no, go to **Step 7**.

Check the network connection between the faulty node and the node that corresponds to the Flume Source IP address.

Step 7 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume source type is Avro.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume source* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Contact the network administrator to restore the network.

Step 10 In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.170 ALM-24005 Exception Occurs When Flume Transmits Data

Description

The alarm module monitors the capacity status of Flume Channel. The alarm is generated immediately when the duration that Channel is fully occupied exceeds the threshold or the number of times that Source fails to send data to Channel exceeds the threshold.

The default threshold is **10**. You can change the threshold by modifying the **channelfullcount** parameter of the related channel in the **properties.properties** configuration file in the **conf** directory.

The alarm is cleared when the space of Flume Channel is released and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
AgentId	Specifies the ID of the agent for which the alarm is generated.
ComponentType	Specifies the type of the component for which the alarm is generated.
ComponentName	Specifies the component for which the alarm is generated.

Impact on the System

If the disk usage of Flume Channel increases continuously, the time required for importing data to a specified destination prolongs. When the disk usage of Flume Channel reaches 100%, the Flume agent process pauses.

Possible Causes

- Flume Sink is faulty, so the data cannot be sent.
- The network is faulty, so the data cannot be sent.

Procedure

Check whether Flume Sink is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for **type = hdfs** in the file, and check whether the Flume sink type is HDFS.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 On FusionInsight Manager, check whether **HDFS Service Unavailable** alarm is generated in the alarm list and whether the HDFS service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-14000 HDFS Service Unavailable; if the HDFS service is stopped, start it. Then, go to **Step 7**.
- If no, go to **Step 7**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **type = hbase** in the file, and check whether the Flume sink type is HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 On FusionInsight Manager, check whether **HBase Service Unavailable** alarm is generated in the alarm list and whether the HBase service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-19000 HBase Service Unavailable; if the HBase service is stopped, start it. Then, go to **Step 7**.

- If no, go to **Step 7**.

Step 5 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.sink.kafka.KafkaSink** in the file, and check whether the Flume sink type is Kafka.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 On FusionInsight Manager, check whether **Kafka Service Unavailable** alarm is generated in the alarm list and whether the Kafka service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-38000 Kafka Service Unavailable; if the Kafka service is stopped, start it. Then, go to **Step 7**.
- If no, go to **Step 7**.

Step 7 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance**.

Step 8 Go to the Flume instance page of the faulty node to check whether the indicator **Sink Speed Metrics** is 0.

- If yes, go to **Step 13**.
- If no, go to **Step 9**.

Check the network connection between the faulty node and the node that corresponds to the Flume Sink IP address.

Step 9 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume sink type is Avro.

- If yes, go to **Step 10**.
- If no, go to **Step 13**.

Step 10 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume sink* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Contact the network administrator to restore the network.

Step 12 In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect the fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 15 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.171 ALM-24006 Heap Memory Usage of Flume Server Exceeds the Threshold

Description

The system checks the heap memory usage of the Flume service every 60 seconds. This alarm is generated when the heap memory usage of the Flume instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory of the Flume instance is overused or the heap memory is inappropriately allocated.

Procedure

Check the heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Heap Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the heap memory used by Flume reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.172 ALM-24007 Flume Server Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Flume service every 60 seconds. This alarm is generated when the direct memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the Flume direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the Flume process is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Direct Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Direct Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the direct memory used by Flume reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.173 ALM-24008 Flume Server Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the Flume service every 60 seconds. This alarm is generated when the non-heap memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the Flume instance is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Non Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Non Heap Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the non-heap memory used by Flume reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxPermSize** to twice the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.13.174 ALM-24009 Flume Server Garbage Collection (GC) Time Exceeds the Threshold

Description

The system checks the GC duration of the Flume process every 60 seconds. This alarm is generated when the GC duration of the Flume process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Flume data transmission efficiency decreases.

Possible Causes

The heap memory of the Flume process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **GC Duration Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Garbage Collection (GC) Duration of Flume**. Then, click **OK**.

Step 3 Check whether the GC duration of the Flume process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

9.13.175 ALM-25000 LdapServer Service Unavailable

Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the system detects that both the active and standby LdapServer services are abnormal.

This alarm is cleared when the system detects that one or two LdapServer services are normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer users and LdapServer users in the cluster. For example, users, user groups, or roles cannot be added, deleted, or modified, and user passwords cannot be changed on the FusionInsight Manager portal. The authentication for existing users in the cluster is not affected.

Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

Procedure

Check whether the nodes where the two SlapdServer instances of the LdapServer service are located are faulty.

Step 1 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services** > **LdapServer** > **Instance** to go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances locates.

Step 2 Choose **O&M > Alarm > Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 Node Fault".

Step 5 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer process is normal.

Step 6 Choose **O&M > Alarm > Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Process Fault** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Check whether the service and host name in the alarm are consistent with the LdapServer service and host name.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 11 Select **LdapServer** in the required cluster from the **Service**.

Step 12 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.176 ALM-25004 Abnormal LdapServer Data Synchronization

Description

The system checks the LdapServer data every 30 seconds. This alarm is generated when the data on the active and standby LdapServers of Manager is inconsistent for 12 consecutive times. This alarm is cleared when the data on the active and standby LdapServers is consistent.

The system checks the LdapServer data every 30 seconds. This alarm is generated when the LdapServer data in the cluster is inconsistent with that on Manager for 12 consecutive times. This alarm is cleared when the data is consistent.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25004	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

LdapServer data inconsistency occurs because the LdapServer data in Manager is damaged or the LdapServer data in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

Possible Causes

- The network of the node where the LdapServer process locates is faulty.
- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.

Procedure

Check whether the network where the LdapServer nodes reside is faulty.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Record the IP address of HostName in the alarm locating information as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact O&M personnel and log in to the nodes corresponding to IP 1. Run the ping command to check whether the IP address of the management plane of the active OMS node can be pinged.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to recover the network and check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the LdapServer processes are normal.

Step 4 On the **Alarm** page of FusionInsight Manager, check whether the **OLdap Resource Abnormal** exists.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Clear the alarm by following the steps provided in "ALM-12004 OLdap Resource Abnormal".

Step 6 Check whether **Abnormal LdapServer Data Synchronization** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 On the **Alarm** page of FusionInsight Manager, check whether **Process Faul**t is generated for the LdapServer service.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer processes are normal.

Step 10 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Record the IP address of HostName in the alarm locating information as "IP1" (if multiple alarms exist, record the IP addresses as "IP1", "IP2", and "IP3" respectively). Choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Configurations**. Record the port number of LdapServer as "PORT". (If the IP address in the alarm locating information is the IP address of the standby management node, choose **System** > **OMS** > **oldap** > **Modify Configuration** and record the listening port number of LdapServer.)

Step 11 Log in to the nodes corresponding to IP1 as user **omm**.

Step 12 Run the following command to check whether errors are displayed in the queried information.

ldapsearch -H ldaps://*IP1*:*PORT* **-LLL -x -D cn=root,dc=hadoop,dc=com -W -b ou=Peoples,dc=hadoop,dc=com**

After running the command, enter the **LDAP** administrator password. Contact the system administrator to obtain the password.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Recover the LdapServer and OMS nodes using data backed up before the alarm is generated.

> NOTE
>
> Use the OMS data and LdapServer data backed up at the same point in time to recover the data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.

Step 14 Check whether alarm **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **LdapServer** in the required cluster and **OmsLdapServer** from the **Service**.

Step 17 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.177 ALM-25005 nscd Service Exception

Description

The system checks the status of the nscd service every 60 seconds. This alarm is generated when the nscd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The **id** command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The nscd service is not started.
- The network is faulty, and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Procedure

Check whether the nscd service is started.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively).

Step 2 Contact the O&M personnel to access the node using IP1 as user **root**. Run the **ps -ef | grep nscd** command on the node and check whether the **/usr/sbin/nscd** process is started.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Run the **service nscd restart** command as user **root** to restart the nscd service. Then run the **ps -ef | grep nscd** command to check whether the nscd service is started.

- If yes, go to **Step 4**.
- If no, go to **Step 15**.

Step 4 Wait for 5 minutes and run the ps -ef | grep nscd command again as user root. Check whether the service exists.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Check whether the network is faulty, and whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root** and run the **ping** command to check whether the network connectivity between this node and the LdapServer node. is normal.

- If yes, go to **Step 6**.
- If no, contact network administrators to troubleshoot the fault.

Check whether the NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command to check whether the **passwd**, **group**, **services**, **netgroup**, and **aliases** of NameService are correctly configured.

The correct parameter configurations are as follows:

passwd: **compat ldap**; **group**: **compat ldap**; **services**: **files ldap**; **netgroup**: **files ldap**; **aliases**: **files ldap**

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Log in to the alarmed node as user **root**. Run the **cat /etc/nscd.conf** command to check whether the **enable-cache passwd**, **positive-time-to-live passwd**, **enable-cache group**, and **positive-time-to-live group** in the configuration file are correctly configured.

The correct parameter configurations are as follows:

enable-cache passwd: **yes**; **positive-time-to-live passwd**: **600**; **enable-cache group**: **yes**; **positive-time-to-live group**: **3600**

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Run the **/usr/sbin/nscd -i group** and **/usr/sbin/nscd -i passwd** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 9 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in **Step 6** and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 10 Run the **vi /etc/nscd.conf** command as user **root**. Correct the configurations in **Step 7** and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 11 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **nscd Service Exception** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether frame freezing occurs when running a command in the operating system.

Step 12 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Run the **cat /var/log/messages** command to check whether the nscd frequently restarts or the error information "Can't contact LDAP server" exists.

nscd exception example:

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: 
Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: 
Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780: 
Can't contact LDAP server
```

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Run the **vi$BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/ldap.conf** command to enter the editing mode, press **Insert** to start editing, and then change the first two IP addresses of the URI configuration item.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq!** to save the settings and exit.

Run the **service nscd restart** command to restart the nscd service. Wait 5 minutes and run the **id admin** command again. Check whether the command execution is slow.

- If yes, go to **Step 15**.
- If no, log in to other faulty nodes and repeat **Step 12** to **Step 14** to check whether the first LdapServer node in the URI before modifying **/etc/ldap.conf** is faulty. For example, check whether the service IP address is unreachable, the network delay is too long, or other abnormal software is deployed.

Collect the fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **LdapClient** for the target cluster.

Step 17 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.178 ALM-25006 Sssd Service Exception

Description

The system checks the status of the sssd service every 60 seconds. This alarm is generated when the sssd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The id command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The sssd service is not started or is incorrectly started.
- The network is faulty and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Procedure

Check whether the sssd service is correctly started.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. Find the IP address of **HostName** in **Location** of the alarm and record it as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact the O&M personnel to access the node using IP1 as user root. Run the **ps -ef | grep sssd** command and check whether the **/usr/sbin/sssd** process is started.

- If the process is started, go to **Step 3**.
- If the process is not started, go to **Step 4**.

Step 3 Check whether the sssd process queried in **Step 2** has three subprocesses.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Run the **service sssd restart** command as user **roo**t to restart the sssd service. Then run the **ps -ef | grep sssd** command to check whether the sssd process is normal.

In the normal state, the **/usr/sbin/sssd** process has three subprocesses: **/usr/libexec/sssd/sssd_be**, **/usr/libexec/sssd/sssd_nss**, and **/usr/libexec/sssd/sssd_pam**.

- If it exists, go to **Step 9**.
- If it does not exist, go to **Step 13**.

Check whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root**. Run the **ping** command to check the network connectivity between this node and the LdapServer node.

- If the network is normal, go to **Step 6**.
- If the network is faulty, contact network administrators to troubleshoot the fault.

Check whether NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command and check the **passwd** and **group** configurations of NameService.

The correct parameter configurations are as follows: **passwd: compat ldap** and **group: compat ldap**.

- If the configurations are correct, go to **Step 7**.
- If the configurations are incorrect, go to **Step 8**.

Step 7 Run the **/usr/sbin/sss_cache -G** and **/usr/sbin/sss_cache -U** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 9**.
- If no result is queried, go to **Step 13**.

Step 8 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in **Step 6** and save the file. Run the **service sssd restart** command to restart the sssd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 9**.
- If no result is queried, go to **Step 13**.

Step 9 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **sssd Service Exception** alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm persists, go to **Step 10**.

Check whether frame freezing occurs when running a command in the operating system.

Step 10 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Run the **cat /var/log/messages** command to check whether the sssd frequently restarts or the error information **Can't contact LDAP server** exists.

sssd restart example:

```
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Run the **vi $BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/sssd/sssd.conf** command to reverse the first two IP addresses of the **ldap_uri** configuration item, save the settings, and exit.

Run the **ps -ef | grep sssd** command to query the ID of the sssd process, kill it, and run the **/usr/sbin/sssd -D -f** command to restart the sssd service. Wait 5 minutes and run the **id admin** command again.

Check whether the command execution is slow.

- If yes, go to **Step 13**.
- If no, log in to other faulty nodes and run **Step 10** to **Step 12**. Collect logs and check whether the first ldapserver node in the ldap_uri before modifying **/etc/sssd/sssd.conf** is faulty. For example, check whether the service IP address is unreachable, the network latency is too long, or other abnormal software is deployed.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 14 Select **LdapClient** in the required cluster from the **Service**.

Step 15 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.179 ALM-25500 KrbServer Service Unavailable

Description

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the system detects that the KrbServer service is abnormal.

This alarm is cleared when the system detects that the KrbServer service is normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25500	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer component in the cluster. The authentication of KrbServer in other components will be affected. The running status of components that depend on KrbServer in the cluster is Bad.

Possible Causes

- The node where the KrbServer service locates is faulty.
- The OLdap service is abnormal.

Procedure

Check whether the node where the KrbServer service locates is faulty.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer** > **Instance** to go to the KrbServer instance page to obtain the host name of the node where the KrbServer service locates.

Step 2 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 Node Fault".

Step 5 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the OLdap service is normal.

Step 6 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **OLdap Resource Abnormal** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm according to "ALM-12004 OLdap Resource Abnormal".

Step 8 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 10 Select **KrbServer** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.180 ALM-26051 Storm Service Unavailable

Description

The system checks the Storm service status every 30 seconds. This alarm is generated when all Nimbus nodes in the cluster are abnormal and the Storm service is unavailable.

This alarm is cleared when the Storm service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26051	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Storm service, and users cannot perform new Storm tasks.

Possible Causes

- The Kerberos cluster is faulty.
- The ZooKeeper cluster is faulty or suspended.
- The active and standby Nimbus nodes in the Storm cluster are abnormal

Procedure

Check the status of the Kerberos cluster. (Skip this step if the normal mode is used.)

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Check whether the running status of the Kerberos service is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 See the related maintenance information of **ALM-25500 KrbServer Service Unavailable**.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the status of the ZooKeeper cluster.

Step 5 Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 If ZooKeeper service is stopped, start it, else see the related maintenance information of **ALM-13000 ZooKeeper Service Unavailable**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the status of the active and standby Nimbus nodes.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to go to the Nimbus Instances page.

Step 9 Check whether only one Nimbus node that is in the **Active** state in **Roles**.

- If yes, go to **Step 13**.
- If no, go to **Step 10**.

Step 10 Select two Nimbus role instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Log in to the FusionInsight Manager portal again, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to check whether the running status is **Normal**.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collecting Fault Information

Step 13 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service** drop-down list:

- KrbServer

  NOTE

  KrbServer logs do not need to be downloaded in normal mode.
- ZooKeeper
- Storm

Step 15 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.181 ALM-26052 Number of Available Supervisors of the Storm Service Is Less Than the Threshold

Description

The system periodically checks the number of available Supervisors every 60 seconds and compares the number of available Supervisors with the threshold. This alarm is generated when the number of available Supervisors is less than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster*.

This alarm is cleared when the number of available Supervisors is greater than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26052	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Existing tasks in the cluster cannot be performed. The cluster can receive new Storm tasks, but cannot perform these tasks.

Possible Causes

The status of some Supervisors in the cluster is abnormal.

Procedure

Check the Supervisor status.

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Supervisor** to go to the Storm service management page.

Step 2 In **Roles**, check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for 30 seconds, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

NOTE

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

Collect fault information.

Step 5 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 6 Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

Step 7 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.182 ALM-26053 Storm Slot Usage Exceeds the Threshold

Description

The system checks the slot usage every 60 seconds and compares the actual slot usage with the threshold. This alarm is generated when the slot usage is greater than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds**.

This alarm is cleared when the slot usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26053	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

New Storm tasks cannot be performed.

Possible Causes

- The status of some Supervisors in the cluster is abnormal.
- The status of all Supervisors is normal, but the processing capability is insufficient.

Procedure

Check the Supervisor status.

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Instance** to go to the Storm instance management page.

Step 2 Check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 10**.

Step 4 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Increase the number of slots in each Supervisor.

Step 5 Log in to the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Configurations** > **All Configurations**.

Step 6 Increase the number of ports in the **supervisor.slots.ports** parameter of each Supervisor role and restart the instance.

Step 7 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Perform capacity expansion for Supervisor.

Step 9 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

NOTE

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

Collect fault information.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 11 Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

Step 12 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.183 ALM-26054 Nimbus Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of Storm Nimbus every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Storm Nimbus exceeds the threshold (80% of the maximum memory by default) for 5 consecutive times.

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Storm** > **Nimbus** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26054	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Storm Nimbus is overhigh, frequent GCs occur. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Storm Nimbus instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Heap Memory Usage of Storm Nimbus Exceeds the Threshold** > **Location**. Check the host name of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Nimbus** > **Heap Memory Usage of Nimbus**. Click **OK**.

Step 3 Check whether the used heap memory of Nimbus reaches the threshold (The default value is 80% of the maximum heap memory) specified for Nimbus.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Configurations** > **All Configurations** > **Nimbus** > **System**. Change the value of **-Xmx** in **NIMBUS_GC_OPTS** based on site requirements, and click **Save**. Click **OK**.

NOTE

- You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.
- The number of Workers grows as the Storm cluster scale increases. You can increase the value of **GC_OPTS** for Nimbus. The recommended value is as follows: If the number of Workers is 20, set **-Xmx** to a value greater than or equal to 1 GB. If the number of Workers exceeds 100, set **-Xmx** to a value greater than or equal to 5 GB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service** drop-down list.

- NodeAgent
- Storm

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.184 ALM-27001 DBService Service Unavailable

Description

The alarm module checks the DBService service status every 30 seconds. This alarm is generated when the system detects that DBService service is unavailable.

This alarm is cleared when DBService service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27001	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in some services exceptions.

Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

Procedure

Check whether the floating IP address exists in the cluster environment.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Instance**.

Step 2 Check whether the active instance exists.

- If yes, go to **Step 3**.
- If no, go to **Step 9**.

Step 3 Select the active DBServer instance and record the IP address.

Step 4 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **ifconfig** command to check whether the DBService floating IP address exists on the node.

- If yes, go to **Step 5**.

- If no, go to **Step 9**.

Step 5 Run the **ping** *floatip* command to check whether the DBService floating IP address can be pinged successfully.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Log in to the host that corresponds to the DBService floating IP address as user **root**, and run the command to delete the floating IP address.

ifconfig *interface* **down**

Step 7 On the FusionInsight Manager home page, choose **Cluster >** *Name of the desired cluster* > **Services** > **DBService** > **More** > **Restart Service** to restart DBService, and check whether DBService is restarted successfully.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check the status of the active DBServer instance.

Step 9 Select the DBServer instance whose role status is abnormal and record the IP address.

Step 10 On the **Alarm** page, check whether **Process Fault** occurs in the DBServer instance on the host that corresponds to the IP address.

- If yes, go to **Step 11**.
- If no, go to **Step 14**.

Step 11 Handle the alarm according to "ALM-12007 Process Fault".

Step 12 Wait for about 5 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check the status of the active and standby DBServers.

Step 13 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **su - omm** command to switch to user **omm**.

Step 14 Run the **cd ${DBSERVER_HOME}** command to go to the installation directory of the DBService.

Step 15 Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.

```

10_5_89_12          floatip          Normal              Normal              Single_active
10_5_89_12          gaussDB            Active_normal          Normal              Active_standby
10_5_89_66          floatip          Stopped             Normal              Single_active
10_5_89_66          gaussDB            Standby_normal          Normal              Active_standby
```

- If yes, go to **Step 16**.
- If no, go to **Step 19**.

Step 16 Check whether the active and standby HA processes are in the abnormal state.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* > **Services** > **DBService** > **More** > **Restart Service** to restart DBService, and check whether the system displays a message indicating that the restart is successful.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Step 18 Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 19**.

Collect fault information.

Step 19 On FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 20 Select **DBService** in the required cluster and **NodeAgent** from the **Service**.

Step 21 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 22 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.185 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes

Description

This alarm is generated when the active or standby DBService node does not receive heartbeat messages from the peer node for 7 seconds.

This alarm is cleared when the heartbeat recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies a local DBService HA.
Peer DBService HA Name	Specifies a peer DBService HA.

Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

Possible Causes

The link between the active and standby DBService nodes is abnormal.

Procedure

Check whether the network between the active DBService server and the standby DBService server is normal.

Step 1 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and view the standby DBService server address.

Step 2 Log in to the active DBService server as user **root**.

Step 3 Run the **ping** *standby DBService heartbeat IP address* command to check whether the standby DBService server is reachable.

- If yes, go to **Step 6**.

- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following nodes in the required cluster from the **Service**:

- DBService
- Controller
- NodeAgent

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.186 ALM-27004 Data Inconsistency Between Active and Standby DBServices

Description

The system checks the data synchronization status between the active and standby DBService every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27004	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies the HA name of the local DBService.
Peer DBService HA Name	Specifies the HA name of the peer DBService.
SYNC_PERCENT	Specifies the synchronization percentage.

Impact on the System

When data is not synchronized between the active and standby DBServices, data may be lost or abnormal if the active instance becomes abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.
- The standby node disk space is full.
- The CPU usage of the GaussDB process on the active DBService node is high. You need to locate the failure cause based on logs.

Procedure

Check whether the network between the active and standby nodes is normal.

Step 1 On FusionInsight Manager, choose **Cluster > Services > DBService > Instance**, check the service IP address of the standby DBServer instance.

Step 2 Log in to the active DBService node as user **root**.

Step 3 Run the **ping** *Standby DBService heartbeat IP address* command to check whether the standby DBService node is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the standby DBService is normal.

Step 6 Log in to the standby DBService node as user **root**.

Step 7 Run the **su - omm** command to switch to user **omm**.

Step 8 Go to the **${DBSERVER_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Check whether the standby node disk space is full.

Step 9 Log in to the standby DBService node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Go to the **${DBSERVER_HOME}** directory, and run the following commands to obtain the DBService data directory:

cd ${DBSERVER_HOME}

source .dbservice_profile

echo ${DBSERVICE_DATA_DIR}

Step 12 Run the **df -h** command to view the system disk partition usage information.

Step 13 Check whether the DBService data directory space is full.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 Expand the disk capacity.

Step 15 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 17 In the **Service** area, select **DBService** of the target cluster and **OS**, **OS Statistics**, and **OS Performance** under **OMS**, and click **OK**.

Step 18 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.187 ALM-27005 Database Connections Usage Exceeds the Threshold

Description

The system checks the usage of the number of database connections of the nodes where DBServer instances are located every 30 seconds and compares the usage with the threshold. If the usage exceeds the threshold for five consecutive times (this number is configurable, and 5 is the default value), the system generates this alarm. The default usage threshold is 90%, and you can configure it based on site requirements.

The trigger count is configurable. This alarm is cleared in the following scenarios:

- The trigger count is 1, and the usage of the number of database connections is less than or equal to the threshold.
- The trigger count is greater than 1, and the usage of the number of database connections is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Upper-layer services may fail to connect to the DBService database, affecting services.

Possible Causes

- Too many database connections are used.
- The maximum number of database connections is improperly configured.
- The alarm threshold or alarm trigger count is improperly configured.

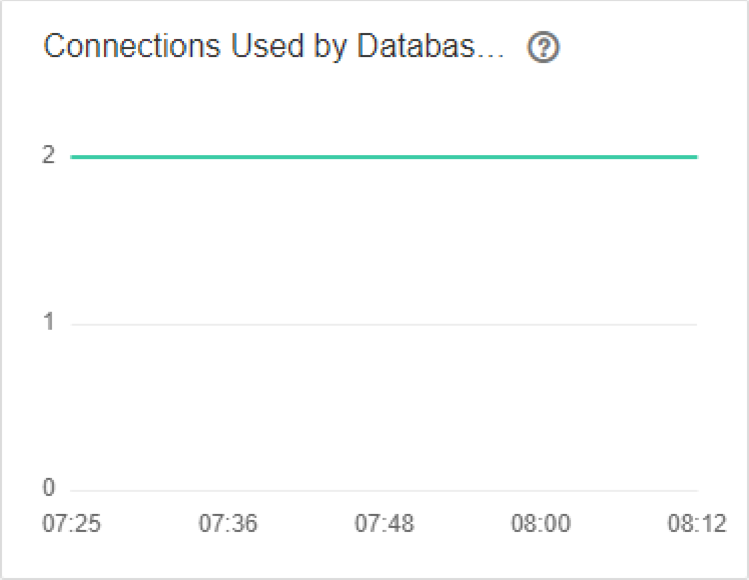
Procedure

Checking whether too many data connections are used

Step 1 On FusionInsight Manager, click DBService in the service list on the left navigation pane. The DBService monitoring page is displayed.

Step 2 Observe the number of connections used by the database user, as shown in **Figure 9-31**. Based on the service scenario, reduce the number of database user connections.

Figure 9-31 Number of connections used by database users



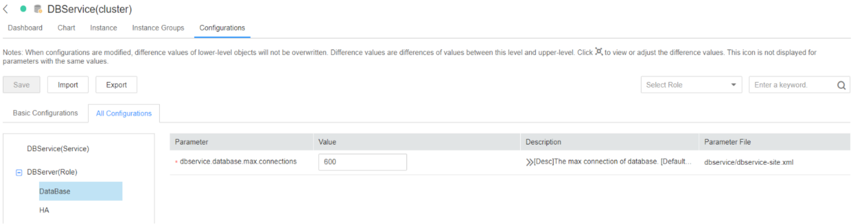
Step 3 Wait for 2 minutes and check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Checking whether the maximum number of database connections is properly configured

Step 4 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Configurations**. On the displayed page, select the **All Configurations** tab, and increase the maximum number of database connections based on service requirements, as shown in **Figure 9-32**. Click **Save**. In the displayed **Save configuration** dialog box, click **OK**.

Figure 9-32 Setting the maximum number of database connections



Notes: When configurations are modified, difference values of lower-level objects will not be overwritten. Difference values are differences of values between this level and upper-level. Click to view or adjust the difference values. This icon is not displayed for parameters with the same values.

Parameter	Value	Description	Parameter File
* dbservice.database.max.connections	600	[Desc]The max connection of database. [Default...	dbservice/dbservice-site.xml

Step 5 After the maximum number of database connections is changed, restart DBService (do not restart the upper-layer services).

Procedure: Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the displayed page, choose **More** > **Restart Service**. Enter the password of the current login user and click **OK**. Do not select **Restart upper-layer services.**, click **OK**.

Step 6 After the service is restarted, wait for 2 minutes and check whether the alarm is cleared.

- If it is, no further action is required.

- If it is not, go to **Step 7**.

Checking whether the alarm threshold or trigger count is properly configured

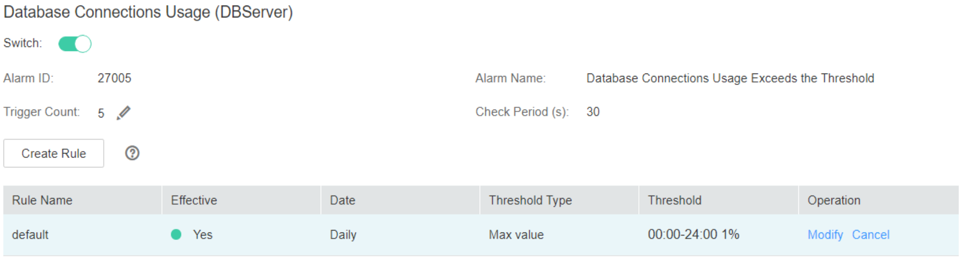
Step 7 Log in to FusionInsight Manager and change the alarm threshold and alarm trigger count based on the actual database connection usage.

Choose **O&M**> **Alarm** > **Thresholds** > *Name of the desired cluster* > **DBService > Database > Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click the pencil icon next to **Trigger Count**. In the displayed dialog box, change the trigger count, as shown in **Figure 9-33**.

NOTE

Trigger Count: If the usage of the number of database connections exceeds the threshold consecutively for more than the value of this parameter, an alarm is generated.

Figure 9-33 Setting alarm trigger count



Database Connections Usage (DBServer)

Step 8 Wait for 2 minutes and check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

Collect fault information

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Select **DBService** in the required cluster from the **Service**.

Step 11 Specify the host for collecting logs by setting the **Host** parameter that is optional. By default, all hosts are selected.

Step 12 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.188 ALM-27006 Disk Space Usage of the Data Directory Exceeds the Threshold

Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds and compares the disk usage with the threshold. The alarm is generated when the disk space usage exceeds the threshold for five consecutive times (the default value). The number of consecutive times is configurable. The disk space usage threshold of the data directory is set to 80% by default, which is configurable as well.

The value of **hit number** is configurable. When the value is set to **1** and the disk space usage is lower than or equal to the threshold, the alarm is cleared. When the value is greater than 1 and the disk space usage is lower than 90% of the threshold, the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27006	Major	Yes

Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- Service processes become unavailable.

- When the disk space usage of the data directory exceeds 90%, the database reports the "Database Enters the Read-Only Mode" alarm and enters the read-only mode, which may cause service data loss.

Possible Causes

- The alarm threshold is improperly configured.
- The data volume of the database is too large or the disk configuration cannot meet service requirements, causing excessive disk usage.

Procedure

Check whether the threshold is set properly.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **DBService** > **Database** > **Disk Space Usage of the Data Directory** to check whether the alarm threshold is proper (the default value 80% is a proper value).

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Change the alarm threshold based on the actual service situation.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory is lower than the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether large files are incorrectly written into the disk.

Step 5 Log in to the active DBService node as user **omm**.

Step 6 Run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

```
source $DBSERVER_HOME/.dbservice_profile
```

```
find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M
```

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Handle the large files based on the actual scenario and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 10 Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.189 ALM-27007 Database Enters the Read-Only Mode

Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds. The alarm is generated when the disk space usage exceeds 90%.

The alarm is cleared when the disk space usage is lower than 80%.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27007	Critical	Yes

Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The database enters the read-only mode, causing service data loss.

Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

Procedure

Check whether the disk space usage reaches the upper limit.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**.

Step 2 On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory exceeds 90%.

- If yes, go to **Step 3**.
- If no, go to **Step 13**.

Step 3 Log in to the active management node of the DBServer as user **omm** and run the following commands to check whether the database enters the read-only mode:

source $DBSERVER_HOME/.dbservice_profile

gsql -U omm -W *password* **-d postgres -p 20051**

show default_transaction_read_only;

NOTE

In the preceding commands, *password* indicates the password of user **omm** of the DBService database. You can run the **\q** command to exit the database.

Check whether the value of **default_transaction_read_only** is **on**.

```
POSTGRES=# show default_transaction_read_only;
 default_transaction_read_only
-------------------------------
 on
(1 row)
```

- If yes, go to **Step 4**.
- If no, go to **Step 13**.

Step 4 Run the following commands to open the **dbservice.properties** file:

source $DBSERVER_HOME/.dbservice_profile

```
vi ${DBSERVICE_SOFTWARE_DIR}/tools/dbservice.properties
```

Step 5 Change the value of **gaussdb_readonly_auto** to **OFF**.

Step 6 Run the following command to open the **postgresql.conf** file:

```
vi ${DBSERVICE_DATA_DIR}/postgresql.conf
```

Step 7 Delete **default_transaction_read_only = on**.

Step 8 Run the following command for the configuration to take effect:

```
gs_ctl reload -D ${DBSERVICE_DATA_DIR}
```

Step 9 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the right of the alarm "Database Enters the Read-Only Mode", click **Clear** in the **Operation** column. In the dialog box that is displayed, click **OK** to manually clear the alarm.

Step 10 Log in to the active management node of the DBServer as user **omm** and run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

```
source $DBSERVER_HOME/.dbservice_profile
```

```
find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M
```

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Handle the files that are incorrectly written into the directory based on the actual scenario.

Step 12 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage is lower than 80%.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 15 Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.

Step 16 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.190 ALM-38000 Kafka Service Unavailable

Description

The system checks the Kafka service status every 30 seconds. This alarm is generated when the Kafka service is unavailable.

This alarm is cleared when the Kafka service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Kafka service, and users cannot perform new Kafka tasks.

Possible Causes

- The KrbServer service is abnormal.(Skip this step if the normal mode is used.)
- The ZooKeeper service is abnormal or does not respond.
- The Broker instance in the Kafka cluster are abnormal.

Procedure

Check the status of the KrbServer service. (Skip this step if the normal mode is used.)

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > KrbServer**.

Step 2 Check whether the running status of the KrbServer service is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**.

Step 4 Perform **Step 2** again.

Check the status of the ZooKeeper cluster.

Step 5 Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 If ZooKeeper service is stopped, start it, else rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.

Step 7 Perform **Step 5** again.

Check the Broker status.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to go to the Kafka instances page.

Step 9 Check whether all instances in **Roles** are running properly.

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Select all Broker instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** to check whether the running status is **Normal**.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collecting Fault Information

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 14 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 15 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.191 ALM-38001 Insufficient Kafka Disk Capacity

Description

The system checks the Kafka disk usage every 60 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated when the disk usage is greater than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds**. Under the service list, choose **Kafka > Disk > Broker Disk Usage (Broker)** and change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the Kafka disk usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Kafka disk usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Kafka data write operations are affected.

Possible Causes

- The configuration (such as number and size) of the disks for storing Kafka data cannot meet the requirement of the current service traffic, due to which the disk usage reaches the upper limit.
- Data retention time is too long, due to which the data disk usage reaches the upper limit.
- The service plan does not distribute data evenly, due to which the usage of some disks reaches the upper limit.

Procedure

Check the disk configuration of Kafka data.

Step 1 On the FusionInsight Manager portal and click **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, locate the alarm and obtain **HostName** from **Location**.

Step 3 Click **Cluster** > *Name of the desired cluster* > **Hosts**.

Step 4 In the host list, click the host name obtained in **Step 2**.

Step 5 Check whether the **Disk** area contains the partition name in the alarm.

- If yes, go to **Step 6**.
- If no, manually clear the alarm and no further operation is required.

Step 6 Check whether the disk partition usage contained in the alarm reaches 100% in the **Disk** area.

- If yes, handle the alarm by following the instructions in **Related Information**.
- If no, go to **Step 7**.

Check the Kafka data storage duration.

Step 7 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations**.

Step 8 Check whether the value of parameter **disk.adapter.enable** is set to **true**.

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Set the value of **disk.adapter.enable** to **true**. Check whether the value of **adapter.topic.min.retention.hours** is properly set.

- If yes, go to **Step 10**.
- If no, adjust the data retention period based on service requirements.

NOTICE

If the disk auto-adaptation function is enabled, some historical data of specified topics is deleted. If the retention period of some topics cannot be adjusted, click **All Configurations** and add the topics to the value of the **disk.adapter.topic.blacklist** parameter.

Step 10 Wait 10 minutes and check whether the usage of faulty disks reduces.

- If yes, wait until the alarm is cleared.
- If no, go to **Step 11**.

Check the Kafka data plan.

Step 11 In the **Instance** area, click **Broker**. In the **Real Time** area of Broker, Click the drop-down menu in the Chart area and choose **Customize** to customize monitoring items.

Step 12 In the dialog box, select **Disk** > **Broker Disk Usage** and click **OK**.

The Kafka disk usage information is displayed.

Step 13 View the information in **Step 12** to check whether there is only the disk parathion for which the alarm is generated in **Step 2**.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Perform disk planning and mount a new disk again. Go to the **Instance Configurations** page of the node for which the alarm is generated, modify **log.dirs**, add other disk directories, and restart the Kafka instance.

Step 15 Determine whether to shorten the data retention time configured on Kafka based on service requirements and service traffic.

- If yes, go to **Step 16**.
- If no, go to **Step 17**.

Step 16 Log in to FusionInsight Manager, select **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations**, and click **All Configurations**. In the search box on the right, enter **log.retention.hours**. The value of the parameter indicates the default data retention time of the topic. You can change the value to a smaller one.

NOTE

- For a topic whose data retention time is configured alone, the modification of the data retention time on the Kafka Service Configuration page does not take effect.
- To modify the data retention time for a topic, use the Kafka client command-line interface (CLI) to configure the topic.

  Example: **kafka-topics.sh --zookeeper "***ZooKeeper IP address***:2181/kafka" --alter --topic "***Topic bane***" --config retention.ms= "***retention time***"**

Step 17 Check whether the usage of some disks reaches the upper limit due to unreasonable configuration of the partitions of some topics. For example, the number of partitions configured for a topic with large data volume is smaller than the number of disks. In this case, the data is not evenly allocated to disks.

NOTE

If you do not know which topic has large data volume, you can log in to an instance node based on the host node information obtained in **Step 2**, and go to the data directory (directory specified by **log.dirs** before the modification in **Step 14**) to check whether there is topic with partition that use large disk space.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Step 18 In the Kafka client CLI, run the following command to perform partition capacity expansion for the topic:

kafka-topics.sh --zookeeper "*ZooKeeper IP address***:2181/kafka" --alter --topic "***Topic name***" --partitions="***New number of partitions***"**

NOTE

- You are advised to set the new number of partitions to a multiple of the number of Kafka data disks.
- The step may not quickly clear the alarm, and you need to modify the data retention time in **Step 11** to gradually balance data allocation.

Step 19 Determine whether to perform capacity expansion.

NOTE

You are advised to perform capacity expansion for Kafka when the current disk usage exceeds 80%.

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 Expand the disk capacity and check whether the alarm is cleared after capacity expansion.

- If yes, no further action is required.
- If no, go to **Step 22**.

Step 21 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 22**.

Collect fault information.

Step 22 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 23 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 24 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 25 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

Step 1 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**, stop the Broker instance whose status is **Restoring**, record the management IP address of the node where the Broker instance is located, and record **broker.id**. The value can be obtained by using the following method: Click the role name. On the **Configurations** page, select **All Configurations**, and search for the **broker.id** parameter.

Step 2 Log in to the recorded management IP address as user **root**, and run the **df -lh** command to view the mounted directory whose disk usage is 100%, for example, **${BIGDATA_DATA_HOME}/kafka/data1**.

Step 3 Go to the directory, run the **du -sh *** command to view the size of each file in the directory,check whether files other than **kafka-logs** exist, and determine whether these files can be deleted or migrated.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 Go to the **kafka-logs** directory, run the **du -sh *** command, select a partition folder to be moved. The naming rule is **Topic name-Partition ID**. Record the topic and partition.

Step 5 Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the **kafka-logs** directory in the same way.

1. Decrease the number in the second line in the file. (To remove multiple directories, the number deducted is equal to the number of files to be removed.)
2. Delete the line of the to-be-removed partition. (The line structure is "Topic name Partition ID Offset". Save the data before deletion. Subsequently, the content must be added to the file of the same name in the destination directory.)

Step 6 Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the destination data directory. For example, **${BIGDATA_DATA_HOME}/kafka/data2/kafka-logs** in the same way.

- Increase the number in the second line in the file. (To move multiple directories, the number added is equal to the number of files to be moved.)

- Add the to-be moved partition to the end of the file. (The line structure is "Topic name Partition ID Offset". You can copy the line data saved in **Step 5**.)

Step 7 Move the partition to the destination directory. After the partition is moved, run the **chown omm:wheel -R** *Partition directory* command to modify the directory owner group for the partition.

Step 8 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to start the Broker instance.

Step 9 Wait for 5 to 10 minutes and check whether the health status of the Broker instance is **Normal**.

- If yes, resolve the disk capacity insufficiency problem according to the handling method of "ALM-38001 Insufficient Kafka Disk Space" after the alarm is cleared.
- If no, contact the O&M personnel.

----End

9.13.192 ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold

Description

The system checks the Kafka service status every 30 seconds. The alarm is generated when the heap memory usage of a Kafka instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available Kafka heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the Kafka instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Kafka Heap Memory Usage Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Process** > **Heap Memory Usage of Kafka**, and click **OK**.

Step 3 Check whether the used heap memory of Kafka reaches 95% of the maximum heap memory specified for Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Check the heap memory size configured for Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations**> **Broker(Role)** > **Environment**. Increase the value of **KAFKA_HEAP_OPTS** by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Heap Memory Usage of Kafka** by referring to **Step 2**, and set the value of **KAFKA_HEAP_OPTS** to twice the value of **Heap Memory Used by Kafka.**

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.193 ALM-38004 Kafka Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Kafka service every 30 seconds. This alarm is generated when the direct memory usage of a Kafka instance exceeds the threshold (80% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the direct memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the direct memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the Kafka instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Kafka Direct Memory Usage Exceeds the Threshold** > **Location** to check the host name of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the Chart area and choose **Customize** > **Process** > **Kafka Direct Memory Usage**, and click **OK**.

Step 3 Check whether the used direct memory of Kafka reaches 80% of the maximum direct memory specified for Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the direct memory size configured for the Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Environment** to increase the value of **-Xmx** configured in the **KAFKA_HEAP_OPTS** parameter by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Kafka Direct Memory Usage** by referring to **Step 2**, and set the value of **KAFKA_HEAP_OPTS** to twice the value of **Direct Memory Used by Kafka.**

Step 5 Save the configuration and restart the Kafka service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.194 ALM-38005 GC Duration of the Broker Process Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the Broker process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the GC duration is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the GC duration is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the Broker process may interrupt the services.

Possible Causes

The Kafka GC duration of the node is too long or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **GC Duration of the Broker Process Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Process** > **Broker GC Duration per Minute**, and click **OK**.

Step 3 Check whether the GC duration of the Broker process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the direct memory size configured for the Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)**

> **Environment** to increase the value of **-Xmx** configured in the **KAFKA_HEAP_OPTS** parameter by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to set the value of **KAFKA_HEAP_OPTS** to twice the value of **Direct Memory Used by Kafka.**

  On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Process** > **Kafka Direct Memory Resource Status** to check the value of **Direct Memory Used by Kafka**.

Step 5 Save the configuration and restart the Kafka service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.195 ALM-38006 Percentage of Kafka Partitions That Are Not Completely Synchronized Exceeds the Threshold

Description

The system checks the percentage of Kafka partitions that are not completely synchronized to the total number of partitions every 60 seconds. This alarm is generated when the percentage exceeds the threshold (50% by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Too many Kafka partitions that are not completely synchronized affect service reliability. In addition, data may be lost when leaders are switched.

Possible Causes

Some nodes where the Broker instance resides are abnormal or stop running. As a result, replicas of some partitions in Kafka are out of the in-sync replicas (ISR) set.

Procedure

Check Broker instances.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.

Step 2 Check whether faulty nodes exist among all Broker nodes.

- If yes, record the host name of the node and go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** to check whether the fault described in **Step 2** exists in the alarm information and handle the alarm based on corresponding methods.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.

Step 5 Check whether stopped nodes exist among all Broker instance.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Select all stopped Broker instances and click **Start Instance**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 10 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.13.196 ALM-38007 Status of Kafka Default User Is Abnormal

Description

The system checks the default user of Kafka every 60 seconds. This alarm is generated when the system detects that the user status is abnormal.

Trigger Count is set to **1**. This alarm is cleared when the user status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38007	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the condition that the Kafka default user status is abnormal.

Impact on the System

If the Kafka default user status is abnormal, metadata synchronization between Brokers and interaction between Kafka and ZooKeeper will be affected, affecting service production, consumption, and topic creation and deletion.

Possible Causes

- The Sssd service is abnormal.
- Some Broker instances stop running.

Procedure

Check whether the Sssd service is abnormal.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Status of Kafka Default User Is Abnormal** > **Location** to check the host name of the instance for which the alarm is generated.

Step 2 Find the host information in the alarm information and log in to the host.

Step 3 Run the **id -Gn kafka** command and check whether "No such user" is displayed in the command output.

- If yes, record the host name of the node and go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms**. Check whether there is **Sssd Service Exception** in the alarm information. If there is, handle the alarm based on alarm information.

Check the running status of the Broker instance.

Step 5 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instance page is displayed.

Step 6 Check whether there are stopped nodes on all Broker instances.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Select all stopped Broker instances and click **Start Instance**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 In the **Service** area, select **Kafka** in the required cluster.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.197 ALM-38008 Abnormal Kafka Data Directory Status

Description

The system checks the Kafka data directory status every 60 seconds. This alarm is generated when the system detects that the status of a data directory is abnormal.

Trigger Count is set to **1**. This alarm is cleared when the data directory status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
DirName	Specifies the directory name for which the alarm is generated.
Trigger Condition	Specifies the condition that the Kafka data directory status is abnormal.

Impact on the System

If the Kafka data directory status is abnormal, the current replicas of all partitions in the data directory are brought offline, and the data directory status of multiple nodes is abnormal at the same time. As a result, some partitions may become unavailable.

Possible Causes

- The data directory permission is tampered with.
- The disk where the data directory is located is faulty.

Procedure

Check the permission on the faulty data directory.

Step 1 Find the host information in the alarm information and log in to the host.

Step 2 In the alarm information, check whether the data directory and its subdirectories belong to the omm:wheel group.

- If yes, record the host name of the node and go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Restore the owner group of the data directory and its subdirectories to omm:wheel.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Check whether the disk where the data directory is located is faulty.

Step 4 In the upper-level directory of the data directory, create and delete files as user **omm**. Check whether data read/write on the disk is normal.

Step 5 Replace or repair the disk where the data directory is located to ensure that data read/write on the disk is normal.

Step 6 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. On the Kafka instance page that is displayed, restart the Broker instance on the host recorded in **Step 2**.

Step 7 After Broker is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** area, select **Kafka** in the required cluster.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.198 ALM-38009 Busy Broker Disk I/Os (Applicable to Versions Later Than MRS 3.1.0)

NOTE

This section applies to versions later than MRS 3.1.0.

Description

The system checks the I/O status of each Kafka disk every 60 seconds. This alarm is generated when the disk I/O of a Kafka data directory on a broker exceeds the threshold (80% by default).

Its **Trigger Count** is **3**. This alarm is cleared when the disk I/O is lower than the threshold (80% by default).

Attribute

Alarm ID	Alarm Severity	Auto Clear
38009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DataDirectoryName	Specifies the name of the Kafka data directory with frequent disk I/Os.

Impact on the System

The disk partition has frequent I/Os. Data may fail to be written to the Kafka topic for which the alarm is generated.

Possible Causes

- There are many replicas configured for the topic.
- The parameter for batch writing producer's messages is inappropriately configured. The service traffic of this topic is too heavy, and the current partition configuration is inappropriate.

Procedure

Check the number of topic replicas.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Locate the row that contains this alarm, click ⌄, and view the host name in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services** > **Kafka** > **KafkaTopic Monitor**, search for the topic for which the alarm is generated, and check the number of replicas.

Step 3 Reduce the replication factors of the topic (for example, reduce to **3**) if the number of replicas is greater than 3.

Run the following command on the FusionInsight client to replan the replicas of Kafka topics:

```
kafka-reassign-partitions.sh --zookeeper {zk_host}:{port}/kafka --reassignment-json-file {manual assignment json file path} --execute
```

For example:

```
/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 10.149.0.90:2181,10.149.0.91:2181,10.149.0.92:2181/kafka --reassignment-json-file expand-cluster-reassignment.json --execute
```

NOTE

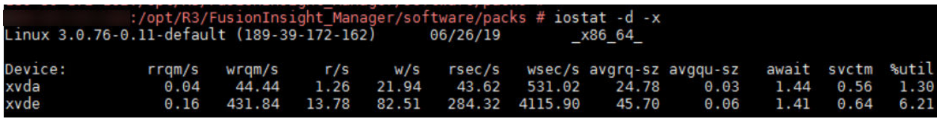
In the **expand-cluster-reassignment.json** file, describe the brokers to which the partitions of the topic are migrated in the following format: {"partitions":[{"topic": "*topicName*","partition": 1,"replicas": [1,2,3] }],"version":1}

Step 4 Observe for a period of time and check whether the alarm is cleared. If the alarm persists, go to **Step 5**.

Check the partition planning of the topic.

Step 5 On the **KafkaTopic Monitor** page, view **Topic Input Traffic** in the **Topic Traffic** area of each topic, obtain the topic with the largest value, and check the partitions of this topic as well as information about the host of these partitions.

Step 6 Log in to the host queried in **Step 5** and run the **iostat -d -x** command to check the **%util** value of each disk.



```
[redacted]:/opt/R3/FusionInsight_Manager/software/packs # iostat -d -x
Linux 3.0.76-0.11-default (189-39-172-162)      06/26/19        _x86_64_

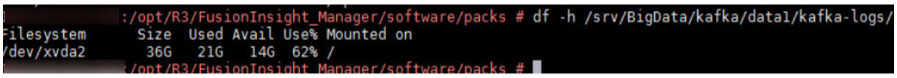
Device:         rrqm/s   wrqm/s     r/s     w/s   rsec/s   wsec/s avgrq-sz avgqu-sz   await  svctm  %util
xvda              0.04    44.44    1.26   21.94    43.62   531.02    24.78     0.03    1.44   0.56   1.30
xvde              0.16   431.84   13.78   82.51   284.32  4115.90    45.70     0.06    1.41   0.64   6.21
```

- If the **%util** value of each disk exceeds the threshold (**80%** by default), expand the Kafka disk capacity. After the capacity expansion, replan the topic partitions by referring to **Step 3**.
- If the **%util** values of the disks vary greatly, check the disk partition configuration of Kafka. For example, check the value of **log.dirs** in the **${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_14_Broker/etc/server.properties** file.

  Run the following command to view the **Filesystem** information:

  df -h *log.dirs value*

  The command output is as follows.

```
[redacted]:/opt/R3/FusionInsight_Manager/software/packs # df -h /srv/BigData/kafka/data1/kafka-logs/
Filesystem      Size  Used Avail Use% Mounted on
/dev/xvda2       36G   21G   14G  62% /
[redacted]:/opt/R3/FusionInsight_Manager/software/packs #
```

- If the partition where Filesystem is located matches the partition with a high **%util** value, plan Kafka partitions on idle disks, configure **log.dirs** as an idle disk directory, and replan topic partitions by referring to **Step 3**. Ensure that the partitions of the topic are evenly distributed to each disk.

Step 7 Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, repeat **Step 5** to **Step 6** three times. Then, go to **Step 8**.

Step 8 Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

None

9.13.199 ALM-38010 Topics with Single Replica

Description

The system checks the number of replicas of each topic every 60 seconds on the node where the Kafka Controller resides. This alarm is generated when there is one replica for a topic.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38010	Warning	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
TopicName	Specifies the list of topics for which the alarm is generated.

Impact on the System

There is the single point of failure (SPOF) risk for topics with only one replica. When the node where the replica resides becomes abnormal, the partition does not have a leader, and services on the topic are affected.

Possible Causes

- The number of replicas for the topic is incorrectly configured.

Procedure

Check the number of replicas for the topic.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ of this alarm, and view the **TopicName** list in **Location**.

Step 2 Check whether replicas need to be added for the topic for which the alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight client, re-plan topic replicas and describe the partition distribution of the topic in the **add-replicas-reassignment.json** file in the following format: {"partitions":[{"topic": "*topic name*","partition": 1,"replicas": [1,2] }],"version":1}. Then, run the following command to add replicas:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}***/kafka --reassignment-json-file** *{manual assignment json file path}* **--execute**

For example:

/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --execute

Step 4 Run the following command to check the task execution progress:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}***/kafka --reassignment-json-file** *{manual assignment json file path}* **--verify**

For example:

/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --verify

Step 5 After completing the handling operations or confirming that the alarm has no impact, manually clear the alarm on FusionInsight Manager.

Step 6 After a period of time, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service** area, select **Kafka** in the required cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

If the alarm has no impact, manually clear the alarm.

Related Information

None

9.13.200 ALM-38011 User Connection Usage on Broker Exceeds the Threshold

Description

The system checks the number of connections of each user on Broker every 30 seconds. This alarm is generated when the connection usage of a user on the Broker exceeds the threshold (80% by default) for 5 consecutive times.

The number of times that smoothing is performed is **5**. This alarm is cleared when the connection usage of a user on the Broker is less than the threshold.

The alarm can be automatically cleared. However, if the number of connections of a user suddenly becomes **0** and no connection is created, the alarm cannot be automatically cleared. You need to manually clear it.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
UserName	Specifies the username for which the alarm is generated.

Impact on the System

If the number of connections of a user is excessive, the user cannot create new connections to the Broker.

Possible Causes

- The number of connections (created by a user) used by the client exceeds the preset threshold.
- The threshold for the connection usage does not meet service requirements.

Procedure

Check the number of connections established by the same user on the client.

Step 1 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms** > **User Connection Usage on Broker Exceeds the Threshold**. Check the host name and username of the Broker instance for which the alarm is generated in **Location**.

Step 2 On FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Other**, and select **User Connection Usage on Broker**, **Maximum Number of User Connections on Broker**, and **Number of User Connections on Broker** to view the number of the current user connections on the Broker.

Step 3 Observe the number of real-time connections of the current alarm user and check whether the real-time monitoring data of the current user exists.

- If yes, go to **Step 4**.
- If no, the current user has disconnected all connections. You need to clear the alarm manually, and no further action is required.

NOTE

After the alarm user disconnects all connections, the monitoring data of the user disappears. In this case, the alarm will not be automatically cleared. You need to manually clear it.

Step 4 Check whether the user is authorized by the service side.

If yes, go to **Step 7**.

If no, go to **Step 5**.

Step 5 Run the following command on the client to limit the number of connections of the user. There are two configuration rules based on the following commands:

1. For the specific Broker and user, run the following command:

   kafka-configs.sh --bootstrap-server *<broker ip:port>* **--alter --add-config 'max.connections.per.user.overrides=[***<username>***:***<connection.number>***]' --entity-type brokers --entity-name** *<broker.id>* **--command-config Kafka/kafka/config/producer.properties**

NOTE

For unauthorized users, confirm with the service side to reduce the maximum number of connections of an unauthorized user or set the maximum number of connections to **0**.

In the command, you need to specify the IP address and port number of Broker, set values of configuration items, and specify the **brokerId** and **username**. Here, the user refers to the authorized Kerberos user.

The configuration updated using the command line tool can take effect dynamically. The configuration becomes invalid after the service is restarted. To make the configuration take effect after the restart, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations**> **Broker** > **Server** on the FusionInsight Manager home page and update the configuration to **max.connections.per.user.overrides**.

2. For the specific use and default Broker (that is, all Broker instances in the cluster), run the following command:

   kafka-configs.sh --bootstrap-server *<broker ip:port>* **--alter --add-config 'max.connections.per.user.overrides=[***<username>***:***<connection.number>***]' --entity-type brokers ---entity-default --command-config Kafka/kafka/config/client.properties**

   Example:

   kafka-configs.sh --bootstrap-server 10.153.3.26:21007 --alter --add-config 'max.connections.per.user.overrides=[showcase:4]' --entity-type brokers --entity-name 1 --command-config Kafka/kafka/config/client.properties

Step 6 Check whether the maximum number of connections is **0** and whether the number of connections of the current user decreases or remains unchanged according to **Step 2**.

- If yes, manually clear the alarm and no further action is required.
- If no, go to **Step 7**.

Step 7 Check whether the number of real-time connections and connection usage of the current user are sharply increased when they are compared with historical data, and whether have exceeded the specified maximum number of connections.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

NOTE

If there is an obvious increase after the comparison and the maximum number of connections has reached the preset value, the connections of the user may be abnormal. You need to confirm with the service party.

Check whether the number of user connections meets service requirements.

Step 8 Check whether the number of connections of the user meets service requirements.

- If yes, go to **Step 9**.
- If no, contact the service party to rectify the fault.

NOTE

If the number of user connections is abnormal, contact the service party to rectify the fault from the following aspects:

- Check whether new services are added so that the number of user connections increases sharply.
- Check whether handle leakage occurs on the code at the service side.

Step 9 Consider whether to increase the maximum number of connections of the user.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Increase the maximum number of connections based on the service requirements. Set the number of connections of the user on the Kafka client. For details, see **Step 5**.

Step 11 Wait for several minutes and then check whether the alarm is automatically cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 2**.

Step 12 Determine whether to add the user to the whitelist based on service requirements on the service side.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

NOTE

To add a user to the whitelist, you need to restart the Kafka service. However, this operation will cause service interruption and affect service running. Therefore, you must confirm with the service side before performing this operation.

Step 13 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Server** to add the user to the **max.connections.per.user.whitelist** configuration item.

Step 14 Restart the service for the modification to take effect. In addition, you need to manually clear the alarm, and no further action is required.

Collect the fault information.

Step 15 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 17 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.201 ALM-43001 Spark2x Service Unavailable

Description

The system checks the Spark2x service status every 300 seconds. This alarm is generated when the Spark2x service is unavailable.

This alarm is cleared when the Spark2x service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43001	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Spark tasks submitted by users fail to be executed.

Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- ZooKeeper is abnormal.
- HDFS is abnormal.
- Yarn is abnormal.
- The corresponding Hive service is abnormal.
- The Spark2x assembly package is abnormal.

Procedure

If the alarm is abnormal Spark2x assembly packet, the Spark packet is abnormal. Wait for about 10 minutes. The alarm is automatically cleared.

Check whether service unavailability alarms exist in services that Spark2x depends on.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**.

Step 2 Check whether the following alarms exist in the alarm list:

- ALM-25500 KrbServer Service Unavailable
- ALM-25000 LdapServer Service Unavailable
- ALM-13000 ZooKeeper Service Unavailable
- ALM-14000 HDFS Service Unavailable
- ALM-18000 Yarn Service Unavailable
- ALM-16004 Hive Service Unavailable

NOTE

If the multi-instance function is enabled for the cluster and multiple Spark2x services are installed, check the Spark2x service for which the alarm is generated based on the value of **ServiceName** in location information and check whether the Hive service is faulty. Spark2x corresponds to Hive, spark2x1 corresponds to Hive1, and other services follow the same rule.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Handle the alarms based on the troubleshooting methods provided in the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm GuardianService Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 In the **Service** area, select the following nodes of the desired cluster. (Hive is the specific Hive service determined based on **ServiceName** in the alarm location information).

- KrbServer
- LdapServer
- ZooKeeper
- HDFS
- Yarn
- Hive

Step 6 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.202 ALM-43006 Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JobHistory2x Process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the JobHistory2x Process is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43006**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JobHistory2x Process reaches the threshold(default value is 95%) of the maximum heap memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **SPARK_DAEMON_MEMORY** is 4GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **>** **Spark2x** > **Memory** >**JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.203 ALM-43007 Non-Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JobHistory2x Process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the JobHistory2x Process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43007**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**, Check whether the used non-heap memory of the JobHistory2x Process reaches the threshold(default value is 95%) of the maximum non-heap memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the non-heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. You can change the value of **-**

XX:MaxMetaspaceSize in **SPARK_DAEMON_JAVA_OPTS** according to the following rules: Ratio of the JobHistory2x non-heap memory usage to the **Threshold** of **JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** in the alarm period.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.13.204 ALM-43008 The Direct Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the direct memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JobHistory2x Process direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistory2x Process is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43008**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct memory of the JobHistory2x Process reaches the threshold(default value is 95%) of the maximum direct memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Direct Memory of JobHistory2x**, and click **OK**. Based on the alarm generation time, check the values of the used direc memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **-XX:MaxDirectMemorySize** in **SPARK_DAEMON_JAVA_OPTS** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. It is recommended that the value be less than or equal to the value of **SPARK_DAEMON_MEMORY**.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.205 ALM-43009 JobHistory2x Process GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) time of the JobHistory2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks.) To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Time** > **Total GC time in milliseconds (JobHistory2x)**. This alarm is cleared when the JobHistory2x GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the GC time exceeds the threshold, JobHistory2x maybe run in low performance.

Possible Causes

The memory of JobHistory2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of JobHistory2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold(default value: 12 seconds).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **SPARK_DAEMON_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.

Step 4 Restart all JobHistory2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log > Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service**.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.206 ALM-43010 Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JDBCServer2x Process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the JDBCServer2x Process is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43010**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JDBCServer2x Process reaches the threshold(default value is 95%) of the maximum heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. The default value of **SPARK_DRIVER_MEMORY** is 4 GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JobHistory2x to the **Threshold** of the **JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

9.13.207 ALM-43011 Non-Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of an JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JDBCServer2x Process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the JDBCServer2x Process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43011**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**, Check whether the used non-heap memory of the JDBCServer2x Process reaches the threshold(default value is 95%) of the maximum non-heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the non-heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. You can change the value of **-XX: MaxMetaspaceSize** in **spark.driver.extraJavaOptions** according to the following rules: Ratio of the JDBCServer2x non-heap memory usage to the **Threshold** of **JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** in the alarm period.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** > **JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log >Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

9.13.208 ALM-43012 Direct Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the direct heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JDBCServer2x Process direct heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct heap memory of the JDBCServer2x Process is overused or the direct heap memory is inappropriately allocated.

Procedure

Check direct heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43012**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > Memory > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct heap memory of the JDBCServer2x Process reaches the threshold(default value is 95%) of the maximum direct heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Direct Memory of JDBCServer2x**, and click **OK**. Based on the alarm generation time, check the values of the used direct memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. The default value of **-XX:MaxDirectMemorySize** in **spark.driver.extraJavaOptions** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the

JDBCServer2x to the **Threshold** of the **JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high service concurrency, you are advised to add instances.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

9.13.209 ALM-43013 JDBCServer2x Process GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) time of the JDBCServer2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks.) To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Time** > **Total GC time in milliseconds (JDBCServer2x)**. This alarm is cleared when the JDBCServer2x GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

If the GC time exceeds the threshold, JDBCServer2x maybe run in low performance.

Possible Causes

The memory of JDBCServer2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43013**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of JDBCServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold(default value: 12 seconds).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Default**. The default value of **SPARK_DRIVER_MEMORY** is 4 GB. 9.13.210 ALM-43017 JDBCServer2x Process Full GC Number Exceeds the Threshold

Description

The system checks the number of Full garbage collection (GC) times of the JDBCServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive checks.) You can change the threshold by choosing **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC number** > **Full GC Number of JDBCServer2x**. This alarm is cleared when the Full GC number of the JDBCServer2x process is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43017	Major	Yes

Parameters

Name	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The performance of the JDBCServer2x process is affected, or even the JDBCServer2x process is unavailable.

Possible Causes

The heap memory usage of the JDBCServer2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

Procedure

Check the number of Full GCs.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. On the displayed page, click the JDBCServer2x for which the alarm is reported. On the **Dashboard** page that is displayed, click the drop-down menu in the Chart area and choose **Customize** > **GC Number** > **Full GC Number of JDBCServer2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JDBCServer2x process is greater than the threshold(default value: 12).

- If it is, go to **Step 3**.

- If it is not, go to **Step 6**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations**. On the displayed page, choose **JDBCServer2x** > **Tuning**. The default value of **SPARK_DRIVER_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

Step 4 Restart all JDBCServer2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 Log in to FusionInsight Manager, and choose **O&M** > **Log** > **Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service** drop-down list.

Step 8 Click ✎ in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.13.212 ALM-43019 Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Severity	Auto Clear
43019	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available IndexServer2x process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated.

Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43019**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **IndexServer2x Memory Usage Statistics** > **OK**. Check whether the heap memory used by the IndexServer2x process reaches the maximum heap memory threshold (95% by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Statistics for the heap memory of the IndexServer2x Process** > **OK**. Based on the alarm generation time, check the values of the used heap memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configuration** > **IndexServer2x**> **Tuning**. The default value of the **SPARK_DRIVER_MEMORY** parameter is 4 GB. You can change the value based on the ratio of the maximum heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, double the rate.

> **NOTE**
>
> On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

9.13.213 ALM-43020 Non-Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the non-heap memory usage of the IndexServer2x process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Severity	Auto Clear
43020	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available IndexServer2x process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the IndexServer2x process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43020**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory > IndexServer2x Memory Usage Statistics** > **OK**. Check whether the non-heap memory used by the IndexServer2x process reaches the maximum non-heap memory threshold (95% by default).

- If the threshold is reached, go to **Step 3**.

- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Statistics for the non-heap memory of the IndexServer2x Process** > **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x**> **Tuning**. You can change the value of **XX:MaxMetaspaceSize** in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum non-heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** in the alarm period.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.214 ALM-43021 Direct Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the direct heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Severity	Auto Clear
43021	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available IndexServer2x process direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct heap memory of the IndexServer2x process is overused or the direct heap memory is inappropriately allocated.

Procedure

Check direct heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43021**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **IndexServer2x Memory Usage Statistics** > **OK**. Check whether the direct memory used by the IndexServer2x process reaches the maximum direct memory threshold.

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Direct Memory of IndexServer2x** > **OK**. Based on the alarm generation time, check the values of the used direct memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x**> **Tuning**. You can change the value of **XX:MaxDirectMemorySize** (the default value is 512 MB) in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum direct memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, double the rate.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

9.13.215 ALM-43022 IndexServer2x Process GC Time Exceeds the Threshold

Description

The system checks the GC time of the IndexServer2x process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Time** > **Total GC time in milliseconds (IndexServer2x)**. This alarm is cleared when the IndexServer2x GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Severity	Auto Clear
43022	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the GC time exceeds the threshold, IndexServer2x may run in low performance or even unavailable.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, GC occurs frequently.

Procedure

Check the GC time.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm with ID **43022**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance** and click the IndexServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold (default value: 12 seconds).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Default**. The default value of the **SPARK_DRIVER_MEMORY** is 4 GB. You can change the value according to the following rules: Increase the value of the **SPARK_DRIVER_MEMORY** parameter 1.5 times to its default value. If this alarm is still generated occasionally after the adjustment, increase the value by 0.5 times. Double the value if the alarm is reported frequently.

Step 4 Restart all IndexServer2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

None

9.13.216 ALM-43023 IndexServer2x Process Full GC Number Exceeds the Threshold

Description

The system checks the Full GC number of the IndexServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (12) for three consecutive times. You can change the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Number** > **Full GC Number of IndexServer2x**. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold.

Attribute

Alarm ID	Severity	Auto Clear
43023	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the GC number exceeds the threshold, IndexServer2x maybe run in low performance or even unavailable.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

Procedure

Check the number of Full GCs.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm with the ID **43023**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance** and click the IndexServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the chart area and choose **Customize** > **GC Number > Full GC Number of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC number is larger than the threshold (default value: 12).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Tuning**. The default value of the **SPARK_DRIVER_MEMORY** is 4 GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. Double the value if the alarm is reported frequently. In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Restart all IndexServer2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

9.13.217 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold

Description

This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold. The system queries the number of queuing tasks in a resource group through the JMX interface. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to configure a resource group. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to configure the threshold of each resource group.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44004	Major	Yes

Parameters

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the number of queuing tasks in a resource group exceeds the threshold, a large number of tasks may be in the queuing state. The Presto task time exceeds the expected value. When the number of queuing tasks in a resource group exceeds the maximum number (**maxQueued**) of queuing tasks in the resource group, new tasks cannot be executed.

Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

Procedure

Step 1 Choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to adjust the resource group configuration.

Step 2 You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to modify the threshold of each resource group.

Step 3 Collect the fault information.

1. Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks based on **Resource Group** in the additional information on the Presto client.
2. Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and search for resource group information to view the monitoring collection information of the resource group.
3. Contact O&M personnel and send the collected logs.

----End

9.13.218 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold

Description

The system collects GC time of the Presto Coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Presto** > **Coordinator** > **Presto Process Garbage Collection Time** > **Garbage Collection Time of the Coordinator Process** on MRS Manager. This alarm is cleared when the Coordinator process GC time is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44005	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.

Parameter	Description
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the GC time of the Coordinator process is too long, the Coordinator process running performance will be affected and the Coordinator process will even be unavailable.

Possible Causes

The heap memory of the Coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.

   NOTE

   For MRS 1.8.10 or earlier, log in to MRS Manager and choose **Alarms**.

2. Select the alarm whose **Alarm ID** is **44005** and then check the role name in **Location** and confirm the IP adress of the instance.
3. Choose **Components** > **Presto** > **Instances** > **Coordinator** (business IP address of the instance for which the alarm is generated) > **Customize** > **Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Coordinator process is longer than 5 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Presto** > **Service Configuration**, and switch **Basic** to **All**. Choose **Presto** > **Coordinator**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

9.13.219 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold

Description

The system collects GC time of the Presto Worker process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Presto** > **Worker** > **Presto Garbage Collection Time** > **Garbage Collection Time of the Worker Process** on MRS Manager. This alarm is cleared when the Worker process GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44006	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the GC time of the Worker process is too long, the Worker process running performance will be affected and the Worker process will even be unavailable.

Possible Causes

The heap memory of the Worker process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.

NOTE

For MRS 1.8.10 or earlier, log in to MRS Manager and choose **Alarms**.

2. Select the alarm whose **Alarm ID** is **44006**. Then check the role name in **Location** and confirm the IP adress of the instance.
3. Choose **Components** > **Presto** > **Instances** > **Worker** (business IP address of the instance for which the alarm is generated) > **Customize** > **Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Worker process is longer than 5 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Presto** > **Service Configuration**, and switch **Basic** to **All**, and choose **Presto** > **Worker** Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

9.13.220 ALM-45000 HetuEngine Service Unavailable

Description

The system checks the HetuEngine service status every 300 seconds. This alarm is generated when the HetuEngine service is unavailable.

This alarm is cleared when the HetuEngine service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

HetuEngine tasks fail to execute.

Possible Causes

- The KrbServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The DBService service is abnormal.
- The Hive service is abnormal.
- Thre are no HSBroker instances in HetuEngine.

Procedure

Check the KrbServer service status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarm**.

Step 2 In the alarm list, check whether the "ALM-25500 KrbServer Service Unavailable" alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Clear "ALM-25500 KrbServer Service Unavailable" according to the alarm help.

Step 4 In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ZooKeeper service status.

Step 5 In the alarm list, check whether the alarm "ALM-12007 Process Fault" is generated.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 In the alarm list, click ⌄ in the row that contains the "Process Fault" alarm. Check whether the name of the service for which the alarm is generated is ZooKeeper in **Location Information**.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Clear "ALM-12007 Process Fault" according to the alarm help.

Step 8 In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the HDFS service status.

Step 9 In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Clear "ALM-14000 HDFS Service Unavailable" according to the alarm help.

Step 11 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the YARN service status.

Step 12 In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Clear "ALM-18000 YARN Service Unavailable" according to the alarm help.

Step 14 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check the DBService service status.

Step 15 In the alarm list, check whether the "ALM-27001 DBService Service Unavailable" alarm is generated.

- If yes, go to **Step 16**.
- If no, go to **20**.

Step 16 Clear "ALM-27001 DBService Service Unavailable" according to the alarm help.

Step 17 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to 20.

Check the Hive service status.

Step 18 In the alarm list, check whether the "ALM-16004 Hive Service Unavailable" alarm is generated.

- If yes, go to **Step 19**.
- If no, go to 20.

Step 19 Clear "ALM-16004 Hive Service Unavailable" according to the alarm help.

Step 20 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to 20.

Check whether there are no HSBroker instances in HetuEngine.

Step 21 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.

Step 22 Check whether there are no HSBroker instances.

- If yes, click **Add Instance** to add one.
- If no, go to 23.

Step 23 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to 23.

Check the network connection between HetuEngine and ZooKeeper, HDFS, YARN, DBService, and Hive.

Step 24 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.

Step 25 Click the host name in the **HSBroker** row and record the management IP address in the **Basic Information** area.

Step 26 Log in to the host where HSBroker resides as user **omm** using the IP address obtained in **Step 25**.

Step 27 Run the **ping** command to check whether the network connection between the host where HSBroker resides and the hosts where ZooKeeper, HDFS, Yarn, DBService, and Hive reside is in the normal state.

- If yes, go to **Step 30**.
- If no, go to **Step 28**.

Step 28 Contact the network administrator to restore the network.

Step 29 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Collect fault information.

Step 30 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 31 Expand the **Service** drop-down list. In the **Services** dialog box that is displayed, select **HetuEngine** under the target cluster name, and click **OK**.

Step 32 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 33 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 34 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.13.221 ALM-45175 Average Time for Calling OBS Metadata APIs Is Greater than the Threshold

Description

The system checks whether the average duration for calling OBS metadata APIs is greater than the threshold every 30 seconds. This alarm is generated when the number of consecutive times that the average time exceeds the specified threshold is greater than the number of smoothing times.

This alarm is automatically cleared when the average duration for calling the OBS metadata APIs is lower than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45175	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the average time for calling the OBS metadata APIs exceeds the threshold, the upper-layer big data computing services may be affected. To be more specific, the execution time of some computing tasks will exceed the threshold.

Possible Causes

Frame freezing occurs on the OBS server, or the network between the OBS client and the OBS server is unstable.

Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Average Time for Calling the OBS Metadata API Exceeds the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Average time of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Average Time for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.222 ALM-45176 Success Rate of Calling OBS Metadata APIs Is Lower than the Threshold

Description

The system checks whether the success rate of calling OBS metadata APIs is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for writing OBS data is greater than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45176	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the success rate of calling the OBS metadata APIs is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

Possible Causes

An execution exception or severe timeout occurs on the OBS server.

Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Success Rate for Calling the OBS Metadata API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Success Rate for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

9.13.223 ALM-45177 Success Rate of Calling OBS Data Read APIs Is Lower than the Threshold

Description

The system checks whether the success rate of calling APIs for reading OBS data is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for reading OBS data is greater than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45177	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the success rate of calling the OBS APIs for reading data is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

Possible Causes

An execution exception or severe timeout occurs on the OBS server.

Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Success Rate for Calling the OBS Data Read API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS data read operation interface calls** from **OBS data read operation**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Success Rate for Calling the OBS Data Read API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

9.13.224 ALM-45178 Success Rate of Calling OBS Data Write APIs Is Lower Than the Threshold

Description

The system checks whether the success rate of calling APIs for writing OBS data is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for writing OBS data is greater than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45178	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the success rate of calling the OBS APIs for writing data is lower than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

Possible Causes

An execution exception or severe timeout occurs on the OBS server.

Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Success Rate for Calling the OBS Data Write API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS data write operation interface calls** from **OBS data write operation**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Success Rate for Calling the OBS Data Write API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

9.13.225 ALM-45275 Ranger Service Unavailable

Description

The alarm module checks the Ranger service status every 180 seconds. This alarm is generated if the Ranger service is abnormal.

This alarm is cleared after the Ranger service recovers.

Attributes

Alarm ID	Alarm Severity	Automatically Cleared
45275	Critical	Yes

Parameters

Name	Meaning
Source	Cluster for which the alarm is generated.
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

When the Ranger service is unavailable, Ranger cannot work properly and the native Ranger UI cannot be accessed.

Possible Causes

- The DBService service on which Ranger depends is abnormal.
- The RangerAdmin role instance is abnormal.

Procedure

Check the DBService process status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, check whether the ALM-27001 DBService Service Unavailable alarm is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the DBService service fault by following the handling procedure of ALM-27001 DBService Service Unavailable. After the DBService alarm is cleared, check whether Ranger Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check all RangerAdmin instances.

Step 3 Log in to the node where the RangerAdmin instance is located as user **omm** and run the **ps -ef|grep "proc_rangeradmin"** command to check whether the RangerAdmin process exists on the current node.

- If yes, go to **Step 5**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 4**.

Step 4 In the alarm list, check whether the alarm "Ranger Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 7 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

9.13.226 ALM-45276 Abnormal RangerAdmin Status

Description

The alarm module checks the RangerAdmin service status every 60 seconds. This alarm is generated if RangerAdmin is unavailable.

This alarm is automatically cleared after the RangerAdmin service recovers.

Attributes

Alarm ID	Alarm Severity	Automatically Cleared
45276	Major	Yes

Parameters

Name	Meaning
Source	Cluster for which the alarm is generated.
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the status of a RangerAdmin is abnormal, access to the Ranger native UI is not affected. If there are two abnormal RangerAdmin instances, the Ranger native UI cannot be accessed and operations such as creating, modifying, and deleting policies are unavailable.

Possible Causes

The RangerAdmin port is not started.

Procedure

Check the port process.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the node where the RangerAdmin instance is located as user **omm**. Run the **ps -ef|grep "proc_rangeradmin" | grep -v grep | awk -F ' ' '{print $2}'** command to obtain ***pid*** of the RangerAdmin process, and run the **netstat -anp| grep *pid* | grep LISTEN** command to check whether the RangerAdmin process listens to port 21401 in the security mode and port 21400 in standard mode.

- If yes, go to **Step 4**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 3**.

Step 3 In the alarm list, check whether the "Abnormal RangerAdmin Status" alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 4**.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 6 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

9.13.227 ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the RangerAdmin instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45277	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory usage of the RangerAdmin instance is high or the heap memory is improperly allocated.

Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by RangerAdmin reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.228 ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the direct memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the direct memory usage of RangerAdmin is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45278	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the RangerAdmin instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by RangerAdmin reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for RangerAdmin cannot meet the direct memory required by the RangerAdmin process. You are advised to check the direct memory usage of RangerAdmin and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by RangerAdmin. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

9.13.229 ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the non-heap memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45279	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory usage of the RangerAdmin instance is high or the non-heap memory is improperly allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by RangerAdmin reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the RangerAdmin instance cannot meet the non-heap memory required by the RangerAdmin process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to the twice of the current non-heap memory usage or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.13.230 ALM-45280 RangerAdmin GC Duration Exceeds the Threshold

Description

The system checks the GC duration of the RangerAdmin process every 60 seconds. This alarm is generated when the GC duration of the RangerAdmin process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45280	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The RangerAdmin responds slowly.

Possible Causes

The heap memory of the RangerAdmin instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45280 RangerAdmin GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **RangerAdmin GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the RangerAdmin process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

> If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.13.231 ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the UserSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45281	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory usage of the UserSync instance is high or the heap memory is improperly allocated.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by UserSync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.232 ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the UserSync service every 60 seconds. This alarm is generated when the direct memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the UserSync direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45282	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the UserSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the UserSync reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for UserSync cannot meet the direct memory required by the UserSync process. You are advised to check the direct memory usage of UserSync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by UserSync. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.233 ALM-45283 UserSync Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45283	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the UserSync process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45283 UserSync Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by UserSync reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and click **Save** to save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the UserSync instance cannot meet the non-heap memory required by the UserSync process. You are advised to change the **-XX:MaxPermSize** value of **GC_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.13.234 ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold

Description

The system checks the GC duration of the UserSync process every 60 seconds. This alarm is generated when the GC duration of the UserSync process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Attributes

Alarm ID	Alarm Severity	Automatically Cleared
45284	Major	Yes

Parameters

Name	Meaning
Source	Cluster for which the alarm is generated.
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.
Trigger Condition	Threshold for triggering the alarm.

Impact on the System

UserSync responds slowly.

Possible Causes

The heap memory of the UserSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **UserSync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the UserSync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

> If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the value of **GC_OPTS** to the twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.13.235 ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the heap memory usage of the TagSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45285	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory usage of the TagSync instance is high or the heap memory is improperly allocated.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by TagSync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

> **NOTE**
>
> If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.13.236 ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the TagSync service every 60 seconds. This alarm is generated when the direct memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the TagSync direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45286	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the TagSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the TagSync reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for TagSync cannot meet the direct memory required by the TagSync process. You are advised to check the direct memory usage of TagSync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by TagSync. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.13.237 ALM-45287 TagSync Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45287	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the TagSync process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45287 TagSync Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by TagSync reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the TagSync instance cannot meet the non-heap memory required by the TagSync process. You are advised to change the **-XX:MaxPermSize** value of **GC_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

9.13.238 ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold

Description

The system checks the GC duration of the TagSync process every 60 seconds. This alarm is generated when the GC duration of the TagSync process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Attributes

Alarm ID	Alarm Severity	Auto Clear
45288	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

TagSync responds slowly.

Possible Causes

The heap memory of the TagSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **TagSync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the TagSync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

> If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.239 ALM-45425 ClickHouse Service Unavailable

Description

The alarm module checks the ClickHouse instance status every 60 seconds. This alarm is generated when the alarm module detects that all ClickHouse instances are abnormal.

This alarm is cleared when the system detects that any ClickHouse instance is restored and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45425	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The ClickHouse service is abnormal. You cannot use FusionInsight Manager to perform cluster operations on the ClickHouse service. The ClickHouse service function is unavailable.

Possible Causes

The configuration information in the **metrika.xml** file in the component configuration directory of the faulty ClickHouse instance node is inconsistent with that of the corresponding ClickHouse instance in the ZooKeeper.

Procedure

Check whether the configuration in metrika.xml of the ClickHouse instance is correct.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**, and locate the abnormal ClickHouse instance based on the alarm information.

- If yes, go to **Step 2**.
- If no, go to **Step 9**.

Step 2 Log in to the host where the ClickHouse service is abnormal and ping the IP address of another normal ClickHouse instance node to check whether the network connection is normal.

- If yes, go to **Step 3**.
- If no, contact the network administrator to repair the network.

Step 3 Choose **Cluster** > **Services** > **ClickHouse** > **Instance**, click the abnormal instance name in the **Role** column, click **Configurations**, search for **macros.id** in the search box, and find the value of **macros.id** of the current instance.

Step 4 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 5 Run the following command to check whether the ClickHouse cluster topology information can be obtained.

get /clickhouse/config/*value of* ***macros.id*** *in* **Step 3/metrika.xml**

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Log in to the host where the ClickHouse instance is abnormal and go to the configuration directory of the ClickHouse instance.

cd ${BIGDATA_HOME}**/FusionInsight_ClickHouse_***Version***/**
x_x_**ClickHouseServer/etc**

cat metrika.xml

Step 7 Check whether the cluster topology information on ZooKeeper obtained in **Step 5** is the same as that in the **metrika.xml** file in the component configuration directory in **Step 6**.

- If yes, check whether the alarm is cleared. If the alarm persists, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. Then, check whether the service status is normal and whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 11 Choose the corresponding host form the host list.

Step 12 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.13.240 ALM-45426 ClickHouse Service Quantity Quota Usage in ZooKeeper Exceeds the Threshold

Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45426	Major (default)	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

Possible Causes

- When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the number of znodes may exceed the configured threshold.
- No quota limit is set for the metadata directory **/clickhouse** of ClickHouse in ZooKeeper.

Procedure

Check the number of znodes created by ClickHouse on ZooKeeper.

Step 1 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 2 Run the following command to check the quota used by the ClickHouse in the ZooKeeper and check whether the quota information is correctly set:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Quota for path /clickhouse does not exist.
```

If the preceding information indicates that the quota configuration is incorrect, go to **Step 3**.

If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**. On this sub-tab page, search for **quotas.auto.check.enable** to check whether its value is **true**.

If the value is not **true**, change the value to **true** and click **Save**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. After the synchronization is successful, go to **Step 1**.

Step 5 Run the following command and check whether the ratio of the **count** value of **Output stat** to the **count** value of **Output quota** in the command output is greater than **0.9**:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **count** value of **Output stat** is **2667**, and the **count** value of **Output quota** is **200000**.

- If yes, go to **Step 6**.
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Step 6 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Configurations** > **All Configurations**, search for the **clickhouse.zookeeper.quota.node.count** parameter, and change the value of this parameter to twice the **count** value of **Output stat** in **Step 5**.

Step 7 Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform **Step 6** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 10 Choose the corresponding host form the host list.

Step 11 Click ✏ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.241 ALM-45427 ClickHouse Service Capacity Quota Usage in ZooKeeper Exceeds the Threshold

Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45427	Major (default)	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

Possible Causes

- When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the capacity of znodes may exceed the configured threshold.
- No quota limit is set for the metadata directory **/clickhouse** of ClickHouse in ZooKeeper.

Procedure

Check the znode capacity of the ClickHouse in the ZooKeeper.

Step 1 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 2 Run the following command to check the quota used by the ClickHouse in the ZooKeeper and check whether the quota information is correctly set:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Quota for path /clickhouse does not exist.
```

- If the preceding information indicates that the quota configuration is incorrect, go to **Step 3**.
- If not, go to **Step 5**.

Step 3 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**. On this sub-tab page, search for **quotas.auto.check.enable** to check whether its value is **true**.

If the value is not **true**, change the value to **true** and click **Save**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. After the synchronization is successful, go to **Step 1**.

Step 5 Run the following command and check whether the ratio of the **bytes** value of **Output stat** to the **bytes** value of **Output quota** in the command output is greater than **0.9**:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **bytes** value of **Output stat** is **60063**, and the **bytes** value of **Output quota** is **1000000000**.

- If yes, go to **Step 6**.
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Step 6 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Configurations** > **All Configurations**, search for the **clickhouse.zookeeper.quota.size** parameter, and change the value of this parameter to twice the **bytes** value of **Output stat** in **Step 5**.

Step 7 Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform **Step 6** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 10 Choose the corresponding host form the host list.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.13.242 ALM-45428 ClickHouse Disk I/O Exception

Description

This alarm is generated when the alarm module detects EIO or EROFS errors during ClickHouse read and write every 60 seconds.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45428	Major (default)	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- ClickHouse fails to read and write data. The INSERT, SELECT, and CREATE operations on the local tables may be abnormal. Distributed tables are not affected.
- Services are affected, and I/Os fail.

Possible Causes

The disk is aged or has bad sectors.

Procedure

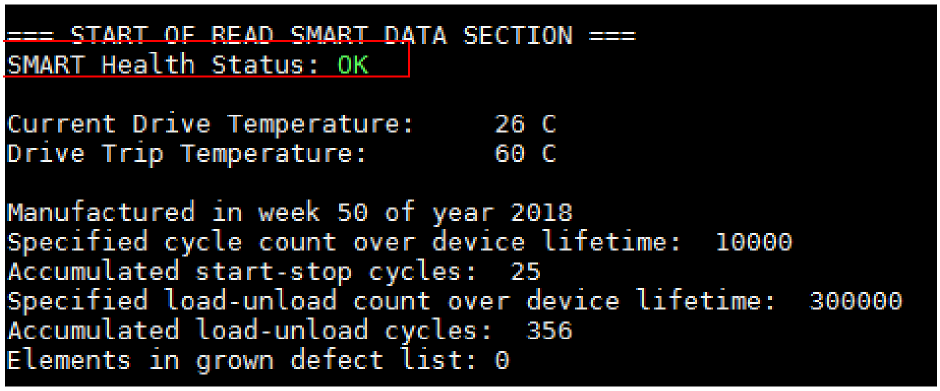
Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45428 ClickHouse Disk I/O Exception**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 Use PuTTY to log in to the node for which the fault is generated as user **root**.

Step 3 Run the **df -h** command to check the mount directory and find the disk mounted to the faulty directory.

Step 4 Run the **smartctl -a /dev/sd*** command to check disks.

- If **SMART Health Status: OK** is displayed, as shown in the following figure, the disk is healthy. In this case, go to **Step 7**.

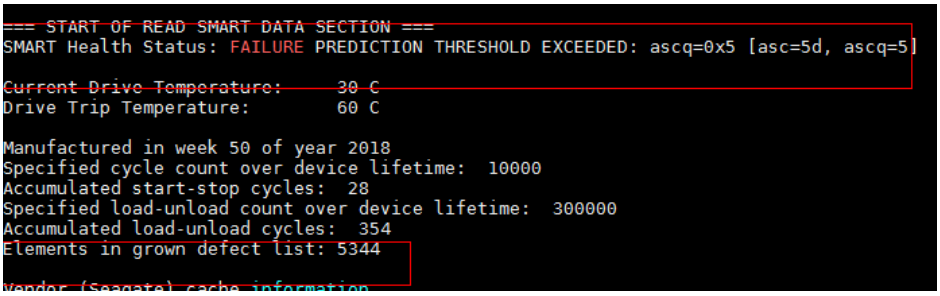


```
=== START OF READ SMART DATA SECTION ===
SMART Health Status: OK

Current Drive Temperature:     26 C
Drive Trip Temperature:        60 C

Manufactured in week 50 of year 2018
Specified cycle count over device lifetime:  10000
Accumulated start-stop cycles:  25
Specified load-unload count over device lifetime:  300000
Accumulated load-unload cycles:  356
Elements in grown defect list: 0
```

- If the number following **Elements in grown defect list** is not 0, as shown in the following figure, the disk may have bad sectors. If **SMART Health Status: FAILURE** is displayed, the disk is in the sub-health state. In this case, go to **Step 5**.



```
=== START OF READ SMART DATA SECTION ===
SMART Health Status: FAILURE PREDICTION THRESHOLD EXCEEDED: ascq=0x5 [asc=5d, ascq=5]

Current Drive Temperature:     30 C
Drive Trip Temperature:        60 C

Manufactured in week 50 of year 2018
Specified cycle count over device lifetime:  10000
Accumulated start-stop cycles:  28
Specified load-unload count over device lifetime:  300000
Accumulated load-unload cycles:  354
Elements in grown defect list: 5344

Vendor (Seagate) cache information
```

Step 5 Rectify the fault by following the instructions provided in "Hard Disk Mounted to the ClickHouse Partition Directory Is Faulty" in .

Step 6 After the fault is rectified, manually clear the alarm on FusionInsight Manager and check whether the alarm is generated again during the periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 9 Choose the corresponding host form the host list.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

If the alarm has no impact, manually clear the alarm.

Related Information

9.13.243 ALM-45429 Table Metadata Synchronization Failed on the Added ClickHouse Node

NOTE

This section applies only to MRS 3.1.2 or later.

Description

This alarm is generated when the local table corresponding to the distributed table fails to be created during ClickHouse capacity expansion.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45429	Major	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The distributed table fails to be queried.

Possible Causes

A node is stopped or faulty during capacity expansion.

Procedure

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**.

Step 2 Check whether an instance is stopped, decommissioned, or faulty.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Start the instance or rectify the instance fault until all instances are running properly.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, locate this alarm and the faulty host based on the location information.

Step 5 Log in to the faulty host as user **omm**.

Step 6 Run the following commands to initialize environment variables:

source *Cluster installation directory*/**FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/ENV_VARS**

source *Cluster installation directory*/**FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/clickhouse-env.sh**

export CLICKHOUSE_CONF_DIR=${CLICKHOUSE_CONF_DIR}

Step 7 Run the following command to run the metadata synchronization tool to synchronize metadata from the existing node to the faulty node:

sh *Cluster installation directory*/**FusionInsight_ClickHouse_*/install/FusionInsight-ClickHouse-*/clickhouse/sbin/clickhouse-create-meta.sh true**

Step 8 Run the following command to view the log information and check whether the metadata has been synchronized:

vim /var/log/Bigdata/clickhouse/clickhouseServer/start.log

- If the synchronization is complete, go to **Step 9**.
- If the synchronization fails, go to **Step 10**.

Step 9 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the **Alarm ID** column, locate the corresponding alarm and click **Clear** in the **Operation** column. In the displayed dialog box, click **OK** to manually clear the alarm.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **ClickHouse** for the target cluster, and click **OK**.

Step 12 Choose the corresponding host form the host list.

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm needs to be manually cleared after the fault is rectified.

Related Information

9.13.244 ALM-45430 Permission Metadata Synchronization Failed on the Added ClickHouse Node

NOTE

This section applies only to MRS 3.1.2 or later.

Description

This alarm is generated when user and permission information fails to be synchronized during ClickHouse capacity expansion.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45430	Major	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The created user does not have operation permissions on the node.

Possible Causes

A node is stopped or faulty during capacity expansion.

Procedure

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**.

Step 2 Check whether an instance is stopped, decommissioned, or faulty.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Start the instance or rectify the instance fault until all instances are running properly.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, locate this alarm and the faulty host based on the location information.

Step 5 Log in to the faulty host as user **omm**.

Step 6 Run the following commands to initialize environment variables:

source *Cluster installation directory*/**FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/ENV_VARS**

source *Cluster installation directory*/**FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/clickhouse-env.sh**

export CLICKHOUSE_CONF_DIR=${CLICKHOUSE_CONF_DIR}

Step 7 Run the following command to run the metadata synchronization tool to synchronize metadata from the existing node to the faulty node:

sh *Cluster installation directory*/**FusionInsight_ClickHouse_*/install/FusionInsight-ClickHouse-*/clickhouse/sbin/clickhouse-create-meta.sh true**

Step 8 Run the following command to view the log information and check whether the metadata has been synchronized:

vim /var/log/Bigdata/clickhouse/clickhouseServer/start.log

If the synchronization is complete, go to **Step 9**.

If the synchronization fails, go to **Step 10**.

Step 9 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the **Alarm ID** column, locate the corresponding alarm and click **Clear** in the **Operation** column. In the displayed dialog box, click **OK** to manually clear the alarm.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **ClickHouse** for the target cluster, and click **OK**.

Step 12 Choose the corresponding host form the host list.

Step 13 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm needs to be manually cleared after the fault is rectified.

9.13.245 ALM-45635 FlinkServer Job Execution Failure

This section applies to MRS 3.1.2 or later.

Description

The system checks whether FlinkServer jobs fail to be executed every 10 seconds. This alarm is generated when a FlinkServer job fails. This alarm is cleared when the job is successfully restarted.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45635	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no impact on the system.

Possible Causes

You can view failure causes in specific logs.

Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.

Step 3 Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

9.13.246 ALM-45636 FlinkServer Job Checkpoints Keep Failing

This section applies to MRS 3.1.2 or later.

Description

The system checks the number of consecutive checkpoint failures based on the configured alarm checking interval. This alarm is generated when the number of consecutive checkpoint failures of a FlinkServer job reaches the configured threshold. This alarm is cleared when checkpoints are recovered or the job is successfully restarted.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45636	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no impact on the system.

Possible Causes

You can view failure causes in specific logs.

Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.

Step 3 Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

9.13.248 ALM-45638 Number of Restarts After FlinkServer Job Failures Exceeds the Threshold

This section applies to MRS 3.1.2 or later.

Description

The system checks the number of FlinkServer job restarts based on the alarm checking interval. This alarm is generated when the number exceeds the configured threshold. This alarm is cleared when the job is restarted.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45638	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

This alarm has no impact on the system.

Possible Causes

You can view the causes in the specific logs.

Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.

Step 3 Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission, choose **Cluster** > **Services** > **Flink**, click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management** and choose **More** > **Job Monitoring** in the **Operation** column to view the TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M personnel personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, select **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***User name***/logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M personnel personnel and send the collected fault logs.

----End

Alarm Clearing

This alarm is cleared when the FlinkServer job is successfully restarted.

10 MRS Manager Operation Guide (Applicable to 2.x and Earlier Versions)

10.1 Introduction to MRS Manager

Overview

MRS manages and analyzes massive data and helps you rapidly obtain desired data from structured and unstructured data. The structure of open-source components is complex. The installation, configuration, and management processes are time- and labor-consuming. MRS Manager is a unified enterprise-level cluster management platform and provides the following functions:

- Cluster monitoring enables you to quickly view the health status of hosts and services.
- Graphical metric monitoring and customization enable you to quickly obtain key information about the system.
- Service property configurations can meet service performance requirements.
- With cluster, service, and role instance functions, you can start or stop services and clusters in one click.

Introduction to the MRS Manager GUI

MRS Manager provides a unified cluster management platform, facilitating rapid and easy O&M for clusters. For details about how to access MRS Manager, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Table 10-1 describes the functions of each operation entry.

Table 10-1 Functions of each entry on the operation bar

Parameter	Function
Dashboard	Displays the status of all services, main monitoring indicators of each service, and host status in charts, such as bar charts, line charts, and tables. You can customize a dashboard for the key monitoring indicators and drag it to any position on the interface. The system dashboard page supports automatic data update.
Services	Provides the service monitoring, operation, and configuration guidance, which helps you manage services in a unified manner.
Hosts	Provides guidance on how to monitor, operate, and configure hosts, helping you manage hosts in a unified manner.
Alarms	Supports alarm query and provides guidance on alarm handling, helping you identify and rectify product faults and potential risks in a timely manner to ensure normal system operation.
Audit	Allows authorized users to query and export audit logs, helping you to view all user activities and operations.
Tenant	Provides a unified tenant management platform.
System	Provides monitoring, alarm configuration management, and backup management.

Go to the **System** tab page, and switch to another function pages through shortcuts. See **Table 10-2**.

The following is an example of quick redirection through shortcuts:

Step 1 On MRS Manager, click **System**.

Step 2 On the **System** tab page, click a function link. The function page is displayed.

For example, in the **Backup and Restoration** area, click **Back Up Data**. The page for backing up data is displayed.

Step 3 Move the cursor to the left border of the browser window. The **System** black shortcut menu is displayed. After you move the cursor out of the menu, the menu is collapsed.

Step 4 In the shortcut menu that is displayed, you can click a function link to go to the corresponding function page.

For example, choose **Maintenance > Export Log**. The page for exporting logs is displayed.

----End

Table 10-2 Shortcut menus on the **System** tab page

Menu	Function Link
Backup and Restoration	Back Up Data
	Restore Data
Maintenance	Export Log
	Export Audit Log
	Check Health Status
Monitoring and Alarm	Configure Syslog
	Configure Alarm Threshold
	Configure SNMP
	Configure Monitoring Metric Dump
	Configure Resource Contribution Ranking
Permission	Manage User
	Manage User Group
	Manage Role
	Configure Password Policy
	Change OMS Database Password
Patch	Manage Patch

Reference

MapReduce Service (MRS) is a data analysis service. It is used to manage and analyze massive sets of data.

MRS uses MRS Manager to manage big data components, such as components in the Hadoop ecosystem. Therefore, some concepts on the MRS Console must be different from those on MRS Manager. For details, see **Table 10-3**.

Table 10-3 Difference Comparison

Concept	MRS	MRS Manager
MapReduce Service	Indicates the data analysis cloud service, called MRS. This service includes components such as Hive, Spark, Yarn, HDFS, and ZooKeeper.	Provides a unified management platform for big data components in tenant clusters.

10.2 Checking Running Tasks

Scenario

When you perform operations on MRS Manager to trigger a task, the task execution process and progress are displayed. After the task window is closed, you need to open the task window by using the task management function.

MRS Manager reserves 10 latest tasks by default, for example, restarting services, synchronizing service configurations, and performing health check.

Procedure

Step 1 On MRS Manager, click 📋 to open the task list.

You can view the following information in the task list: **Name**, **Status**, **Progress**, **Start Time** and **End Time**.

Step 2 Click the target task name to view the detailed information about the running task.

----End

10.3 Monitoring Management

10.3.1 Dashboard

On MRS Manager, nodes in a cluster can be classified into management nodes, control nodes, and data nodes. The change trends of key host monitoring metrics on each type of node can be calculated and displayed as curve charts in reports based on the customized periods. If a host belongs to multiple node types, the metric statistics will be repeatedly collected.

This section provides overview of MRS clusters and describes how to view, customize, and export node monitoring metrics on MRS Manager.

Procedure

Step 1 Log in to MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 Choose **Dashboard** on MRS Manager.

Step 3 In **Period**, you can specify a period to view monitoring data. The options are as follows:

- Real time
- Last 3 hours
- Last 6 hours
- Last 24 hours

- Last week
- Last month
- Last 3 months
- Last 6 months
- Customize. If you select this option, you can customize the period for viewing monitoring data.

Step 4 Click **View** to view monitoring data in a period.

- You can view **Health Status** and **Roles** of each service on the **Service Summary** page of MRS Manager.
- Click ? above the curve chart to view details about a metric.

Step 5 Customize a monitoring report.

1. Click **Customize** and select monitoring metrics to be displayed on MRS Manager.

   MRS Manager supports a maximum of 14 monitoring metrics, but at most 12 customized monitoring metrics can be displayed on the page.
   - Cluster Host Health Status
   - Cluster Network Read Speed Statistics
   - Host Network Read Speed Distribution
   - Host Network Write Speed Distribution
   - Cluster Disk Write Speed Statistics
   - Cluster Disk Usage Statistics
   - Cluster Disk Information
   - Host Disk Usage Statistics
   - Cluster Disk Read Speed Statistics
   - Cluster Memory Usage Statistics
   - Host Memory Usage Distribution
   - Cluster Network Write Speed Statistics
   - Host CPU Usage Distribution
   - Cluster CPU Usage Statistics
2. Click **OK** to save the selected monitoring metrics for display.

   NOTE

   Click **Clear** to cancel all the selected monitoring metrics in a batch.

Step 6 Set an automatic refresh interval or click ↻ for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

  NOTE

  If you select **Full Screen**, the **Dashboard** window will be maximized.

Step 7 Export a monitoring report.

1. Select a period. The options are as follows:
   - Real time
   - Last 3 hours
   - Last 6 hours
   - Last 24 hours
   - Last week
   - Last month
   - Last 3 months
   - Last 6 months
   - Customize. If you select this option, you can customize a time of period to export a report.
2. Click **Export**. MRS Manager will generate a report about the selected monitoring metrics in a specified time of period. Save the report.

   NOTE

   To view the curve charts of monitoring metrics in a specified period, click **View**.

----End

10.3.2 Managing Services and Monitoring Hosts

You can manage the following status and indicators of all services (including role instances) and hosts on the MRS Manager:

- Status information: includes operation, health, configuration, and role instance status.
- Metric information: includes key monitoring metrics for services.
- Metric export: allows you to export monitoring reports.

NOTE

Set an automatic refresh interval or click ↻ for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

Managing Service Monitoring

Step 1 On MRS Manager, click **Services**.

The service list includes **Service**, **Operating Status**, **Health Status**, **Configuration Status**, **Roles**, and **Operation** are displayed in the component list.

- **Table 10-4** describes the service operating status.

Table 10-4 Service operating status

Status	Description
Started	The service is started.
Stopped	The service is stopped.
Failed to start	Failed to start the role instance.
Failed to stop	Failed to stop the role instance.
Unknown	Indicates initial service status after the background system restarts.

- **Table 10-5** describes the service health status.

Table 10-5 Service health status

Status	Description
Good	Indicates that all role instances in the service are running properly.
Bad	Indicates that the running status of at least one role instance is **Faulty** or the status of the service on which the current service depends is abnormal.
Unknown	Indicates that all role instances in the service are in the **Unknown** state.
Concerning	Indicates that the background system is restarting the service.
Partially Healthy	Indicates that the status of the service on which the service depends is abnormal, and APIs related to the abnormal service cannot be invoked by external systems.

- **Table 10-6** describes the service health status.

Table 10-6 Service configuration status

Status	Description
Synchronized	The latest configuration takes effect.
Expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use **Synchronize Configuration** to rectify the fault.

Status	Description
Configuring	Parameters are being configured.
Unknown	Current configuration status cannot be obtained.

By default, the **Service** column is sorted in ascending order. You can click the icon next to **Service**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

Step 2 Click a specified service in the list to view its status and metric information.

Step 3 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

Managing Role Instances

Step 1 On MRS Manager, click **Services** and click the target service name in the service list.

Step 2 Click **Instance** to view the role status.

The role instance list contains the **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Operation Status**, **Health Status,** and **Configuration Status** of an instance.

- **Table 10-7** shows the configuration status of a role instance.

Table 10-7 Role instance status

Status	Description
Started	The role instance has been started.
Stopped	The role instance has been stopped.
Failed to start	Failed to start the role instance.
Failed to stop	Failed to stop the role instance.
Decommissioning	The role instance is being decommissioned.
Decommissioned	The role instance has been decommissioned.
Recommissioning	The role instance is being recommissioned.
Unknown	Indicates initial role instance status after the background system restarts.

- Table 10-8 shows the health status of a role instance.

Table 10-8 Role instance health status

Status	Description
Good	The role instance is running properly.
Bad	The role instance is abnormal. For example, the port cannot be accessed if PID does not exist.
Unknown	The host where a role instance resides does not connect to the background system.
Concerning	The background system is restarting a role instance.

- Table 10-9 shows the configuration status of a role instance.

Table 10-9 Role instance configuration status

Status	Description
Synchronized	The latest configuration takes effect.
Expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use **Synchronize Configuration** to rectify the fault.
Configuring	Parameters are being configured.
Unknown	Current configuration status cannot be obtained.

By default, the **Role** column is sorted in ascending order. You can click the sorting icon next to **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

You can filter out all instances of the same role in the **Role** column.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. Click **Reset** to clear the search criteria. Fuzzy search is supported.

Step 3 Click the target role instance to view its status and metric information.

Step 4 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

Managing Hosts

Step 1 On MRS Manager, click **Hosts** to view the status of all hosts.

The host list contains the host name, management IP address, service IP address, rack, network speed, operating status, health status, disk usage, memory usage, and CPU usage.

- **Table 10-10** shows the host operating status.

Table 10-10 Host operating status

Status	Description
Normal	The host and service roles on the host are running properly.
Isolated	The host is isolated, and the service roles on the host stop running.

- **Table 10-11** describes the host health status.

Table 10-11 Host health status

Status	Description
Good	The host can properly send heartbeats.
Bad	The host fails to send heartbeats due to timeout.
Unknown	The host initial status is unknown during the operation of adding or deleting a host.

By default, the **Host Name** column is sorted by host name in ascending order. You can click the sorting icon next to **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Network Speed**, **Operating Status**, **Health Status**, **Disk Usage**, **Memory Usage**, or **CPU Usage** to change the sorting mode.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. Click **Reset** to clear the search criteria. Fuzzy search is supported.

Step 2 Click the target host in the host list to view its status and metric information.

Step 3 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

10.3.3 Managing Resource Distribution

On MRS Manager, you can query the top value curves, bottom value curves, or average data curves of key service and host monitoring metrics, that is, the resource distribution information. MRS Manager allows you to view the monitoring data of the last hour.

You can also modify the resource distribution on MRS Manager to display both the top and bottom value curves in service and host resource distribution figures.

Resource distribution of some monitoring metrics is not recorded.

Procedure

- View the resource distribution of service monitoring metrics.
  1. On MRS Manager, click **Services**.
  2. Select the target service from the service list.
  3. Click **Resource Distribution**.

     Select key metrics of the service from **Metric**. MRS Manager displays the resource distribution of the metrics in the last hour.
- View the resource distribution of host monitoring metrics.
  1. Click **Hosts**.
  2. Click the name of the specified host in the host list.
  3. Click **Resource Distribution**.

     Select key metrics of the host from **Metrics**. MRS Manager displays the resource distribution of the metrics in the last hour.
- Configure resource distribution.
  1. On MRS Manager, click **System**.
  2. In **Configuration**, click **Configure Resource Contribution Ranking** under **Monitoring and Alarm**.
  3. Change the number of resources to be displayed.
     - Set **Number of Top Resources** to the number of top values.
     - Set **Number of Bottom Resources** to the number of bottom values.

     NOTE

     The sum of the maximum value and minimum value of resource distribution cannot be greater than 5.
  4. Click **OK** to save the configurations.

     The message "Number of top and bottom resources saved successfully" is displayed in the upper right corner of the page.

10.3.4 Configuring Monitoring Metric Dumping

You can configure interconnection parameters on MRS Manager to save monitoring metric data to a specified FTP server using the FTP or SFTP protocol. In this way, MRS clusters can interconnect with third-party systems. The FTP protocol does not encrypt data, which brings potential security risks. Therefore, the SFTP protocol is recommended.

MRS Manager supports the collection of all the monitoring metric data in the managed clusters. The collection period is 30 seconds, 60 seconds, or 300 seconds. The monitoring metric data is stored to different monitoring files on the FTP server by collection period. The monitoring file naming rule is in the "*Cluster name*_**metric**_*Monitoring metric data collection period*_*File saving time*.**log**" format.

Prerequisites

The ECS corresponding to the dump server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the dump server. The FTP service on the dump server is running properly.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure Monitoring Metric Dump** under **Monitoring and Alarm**.

Step 3 Table 10-12 describes dump parameters.

Table 10-12 Dump parameters

Parameter	Description
FTP IP Address	Mandatory. This parameter specifies the FTP server for storing monitoring files after the monitoring indicator data is interconnected.
FTP Port	Mandatory. This parameter specifies the port connected to the FTP server.
FTP Username	Mandatory. This parameter specifies the username for logging in to the FTP server.
FTP Password	Mandatory. This parameter specifies the password for logging in to the FTP server.
Save Path	Mandatory. This parameter specifies the path for storing monitoring files on the FTP server.
Dump Interval (s)	Mandatory. This parameter specifies the interval at which monitoring files are periodically stored on the FTP server, in seconds.
Dump Mode	Mandatory. This parameter specifies the protocol used for sending monitoring files. This parameter is mandatory. The options are **FTP** and **SFTP**.
SFTP Public Key	Optional. This parameter specifies the public key of the FTP server and is valid only when **Dump Mode** is set to **SFTP**. You are advised to configure a public key. Otherwise, security risks may arise.

Step 4 Click **OK** to complete the settings.

----End

10.4 Alarm Management

10.4.1 Viewing and Manually Clearing an Alarm

Scenario

You can view and clear alarms on MRS Manager.

Generally, the system automatically clears an alarm when the fault is rectified. If the fault has been rectified and the alarm cannot be automatically cleared, you can manually clear the alarm.

You can view the latest 100,000 alarms (including uncleared, manually cleared, and automatically cleared alarms) on MRS Manager. If the number of cleared alarms exceeds 100,000 and is about to reach 110,000, the system automatically dumps the earliest 10,000 cleared alarms to **${BIGDATA_HOME}/OMSV100R001C00x8664/workspace/data** on the active management node. A directory is automatically generated when alarms are dumped for the first time.

NOTE

Set an automatic refresh interval or click ↻ for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

Procedure

Step 1 On MRS Manager, click **Alarms** to view the alarm information in the alarm list.

- By default, the alarm list page displays the latest 10 alarms.
- By default, alarms are displayed in descending order by **Generated**. You can click **Alarm ID**, **Alarm Name**, **Severity**, **Generated**, **Location**, **Operation** to change the display mode.
- You can filter all alarms of the same severity in **Severity**, including cleared and uncleared alarms.
- You can click 🔴, 🟠, 🟡, or 🔵 to filter out **Critical**, **Major**, **Minor**, or **Warning** alarms.

Step 2 Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view the information about specified alarms. Click **Reset** to clear the search criteria.

NOTE

You can set the **Start Time** and **End Time** to specify the time range. You can search for alarms generated within the time range.

Handle the alarm by referring to **Alarm Reference**. If the alarms in some scenarios are generated due to other cloud services that MRS depends on, you need to contact maintenance personnel of the corresponding cloud services.

Step 3 If the alarm needs to be manually cleared after errors are rectified, click **Clear Alarm**.

NOTE

If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.

----End

10.4.2 Configuring an Alarm Threshold

Scenario

You can configure an alarm threshold to learn the metric health status. After **Send Alarm** is selected, the system sends an alarm message when the monitored data reaches the alarm threshold. You can view the alarm information in **Alarms**.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure Alarm Threshold** under **Monitoring and Alarm**, select monitoring metrics as planned, and set their baselines.

Step 3 Click a metric, for example, **CPU Usage**, and click **Create Rule**.

Step 4 Set the monitoring metric rule parameters on the displayed configuration page.

Table 10-13 Monitoring metric rule parameters

Parameter	Value	Description
Rule Name	CPU_MAX (example value)	Specifies the rule name.
Reference Date	2014/11/06 (example)	Specifies the date on which the reference indicator history is generated.

Parameter	Value	Description
Threshold Type	● Max. value ● Min. value	Specifies the maximum or minimum value of a metric. If this parameter is set to **Max. Value**, the system generates an alarm when the actual value of the metric is greater than the threshold. If this parameter is set to **Min. Value**, the system generates an alarm when the actual value of the metric is smaller than the threshold.
Alarm Severity	● Critical ● Major ● Minor ● Suggestion	Alarm Severity
Time Range	From 00:00 to 23:59 (example)	Specifies the period in which the rule takes effect.
Threshold	80 (example)	Specifies the threshold of the rule monitoring metrics.
Date	● Workday ● Weekend ● Other	Specifies the type of date when the rule takes effect.
Add Date	11/06 (example)	This parameter is valid only when **Date** is set to **Other**. You can select multiple dates.

Step 5 Click **OK**. A message is displayed in the upper right corner of the page, indicating that the template is saved successfully.

Send alarm is selected by default. MRS Manager checks whether the value of each monitored metric reaches the threshold. If the number of consecutive check times is equal to the value of **Trigger Count**, and the threshold is not reached in these checks, the system sends an alarm. The value can be customized. **Check Period (s)** indicates the interval at which MRS Manager checks monitoring metrics.

Step 6 Locate the row that contains the newly added rule, and click **Apply** in the **Operation** column. A message is displayed in the upper right corner, indicating that the rule *xx* is successfully added. Click **Cancel** in the **Operation** column. A message is displayed in the upper right corner, indicating that the rule *xx* is successfully canceled.

----End

10.4.3 Configuring Syslog Northbound Interface Parameters

Scenario

You can configure the northbound interface so that alarms generated on MRS Manager can be reported to your monitoring O&M system using Syslog.

NOTICE

If the Syslog protocol is not encrypted, data may be stolen.

Prerequisites

The ECS corresponding to the server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the server.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure Syslog** under **Monitoring and Alarm**.

The **Syslog Service** is disabled by default. Click the switch to enable the Syslog service.

Step 3 Set the interconnection parameters listed in **Table 10-14**.

Table 10-14 Syslog parameters

Area	Parameter	Description
Syslog Protocol	Service IP Address	Specifies the IP address of the interconnection server.
	Server Port	Specifies the port number for interconnection.
	Protocol	Specifies the protocol type. The options are as follows: ● **TCP** ● **UDP**

Area	Parameter	Description
	Severity	Specifies the severity of the reported message. The options are as follows: ● **Informational** ● **Emergency** ● **Alert** ● **Critical** ● **Error** ● **Warning** ● **Notice** ● **Debug**
	Facility	Specifies the module where the log is generated.
	Identifier	Specifies the product ID. The default value is **MRS Manager**.
Report Message	Report Format	Specifies the message format of the alarm report. For details, see help information on the web page.
	Alarm Status	Specifies the type of the alarm to be reported. ● **Fault**: indicates that the Syslog alarm message is reported when MRS Manager generates an alarm. ● **Clear**: indicates that a Syslog alarm message is reported when an alarm on MRS Manager is cleared. ● **Event**: indicates that the Syslog alarm message is reported when MRS Manager generates an event.

Area	Parameter	Description
	Report Alarm Severity	Specifies the level of the alarm to be reported. The value can be **Suggestion**, **Minor**, **Major**, and **Critical**.
Uncleared Alarm Reporting	Periodic Uncleared Alarm Report	Specifies whether uncleared alarms are reported periodically. By default, the switch of **Periodic Uncleared Alarm Reporting** is disabled. You can click the switch to enable it.
	Report Interval (min)	Specifies the interval for periodically reporting uncleared alarms to the remote Syslog service. This parameter is valid only when **Periodic Uncleared Alarm Reporting** switch is enabled. The unit is minute. The default value is **15**. The value ranges from 5 minutes to one day (1,440 minutes).
Heartbeat Settings	Heartbeat Report	Specifies whether to periodically report Syslog heartbeat messages. By default, the switch of **Periodic Uncleared Alarm Reporting** is disabled. You can click the switch to enable it.
	Heartbeat Period (min)	Specifies the interval for periodically reporting heartbeat messages. This parameter is valid only when **Heartbeat Report** switch is enabled. The unit is minute. The default value is **15**. The value ranges from 1 to 60.

Area	Parameter	Description
	Heartbeat Packet	Specifies the content of the reported heartbeat message. This parameter is enabled when **Heartbeat Report** is enabled. The value can contain a maximum of 256 characters, including digits, letters, underscores (_), vertical bars (|), colons (:), spaces, commas (,), and periods (.).

NOTE

After the periodic heartbeat packet function is enabled, packets may be interrupted during automatic recovery of some cluster error tolerance (for example, active/standby management node switchover). In this case, wait for automatic recovery.

Step 4 Click **OK** to complete the settings.

----End

10.4.4 Configuring SNMP Northbound Interface Parameters

Scenario

You can configure the northbound interface so that alarms and monitoring metrics on MRS Manager can be integrated to the network management platform using SNMP.

Prerequisites

The ECS corresponding to the server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the server.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure SNMP** under **Monitoring and Alarm**.

The **SNMP Service** is disabled by default. Click the switch to enable the SNMP service.

Step 3 Set the interconnection parameters listed in **Table 10-15**.

Table 10-15 Syslog parameters

Parameter	Description
Version	Specifies the version of the SNMP, which can be: ● v2c: an earlier version with low security ● v3: the latest version of SNMP with higher security than SNMPv2c The SNMP v3 version is recommended.
Local Port	Specifies the local port. The default value is **20000**. The value ranges from **1025** to **65535**.
Read Community Name	Specifies the read-only community name. This parameter is valid only when **Version** is set to **v2c**.
Write Community Name	Specifies the write community name. This parameter is valid only when **Version** is set to **v2c**.
Security Username	Specifies the SNMP security username. This parameter is valid only when **Version** is set to **v3**.
Authentication Protocol	Specifies the authentication protocol. You are advised to set this parameter to set this parameter to **SHA**. This parameter is valid only when **Version** is set to **v3**.
Authentication Password	Specifies the authentication key. This parameter is valid only when **Version** is set to **v3**.
Confirm Password	Used to confirm the authentication key. This parameter is valid only when **Version** is set to **v3**.
Encryption Protocol	Specifies the encryption protocol. You are advised to set this parameter to **AES256**. This parameter is valid only when **Version** is set to **v3**.
Encryption Password	Specifies the encryption key. This parameter is valid only when **Version** is set to **v3**.
Confirm Password	Used to confirm the encryption key. This parameter is valid only when **Version** is set to **v3**.

NOTE

- The **Authentication Password** and **Encryption Password** must contain 8 to 16 characters, including at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. The two passwords must be different. The two passwords cannot be the same as the security username or the reverse of the security username.
- For security purposes, periodically change the authentication password and encryption password when the SNMP protocol is used.
- If SNMPv3 is used, a security user will be locked after five consecutive authentication failures within 5 minutes. The user will be automatically unlocked 5 minutes later.

Step 4 Click **Create Trap Target** in the **Trap Target** area. In the displayed dialog box, set the following parameters:

- **Target Symbol** specifies the trap target ID, which is the ID of the NMS or host that receives traps. The value consists of 1 to 255 characters, including letters or digits.
- **Target IP Address** specifies the IP address of the target trap. IP addresses of class A, B, and C can be used to communicate with the IP address of the management plane of the management node.
- **Target Port** specifies the port receiving traps. The port number must be consistent with the peer end and ranges from 0 to 65535.
- **Trap Community Name** is valid only when **Version** is set to **v2c**.

Click **OK**. The **Create Trap Target** dialog box is closed.

Step 5 Click **OK** to complete the settings.

----End

10.5 Object Management

10.5.1 Managing Objects

MRS contains different types of basic objects as described in **Table 10-16**.

Table 10-16 MRS basic object overview

Object	Description	Example
Service	Function set that can complete specific business.	KrbServer service and LdapServer service
Service instance	Specific instance of a service, usually called service.	KrbServer service
Service role	Function entity that forms a complete service, usually called role.	KrbServer is composed of the KerberosAdmin role and KerberosServer role.
Role instance	Specific instance of a service role running on a host.	KerberosAdmin that is running on Host2 and KerberosServer that is running on Host3
Host	An ECS running Linux OS.	Host1 to Host5
Rack	Physical entity that contains multiple hosts connecting to the same switch.	Rack1 contains Host1 to Host5.
Cluster	Logical entity that consists of multiple hosts and provides various services.	Cluster names **Cluster1** consists of five hosts (Host1 to Host5) and provides services such as KrbServer and LdapServer.

10.5.2 Viewing Configurations

On MRS Manager, users can view the configurations of services (including roles) and role instances.

Procedure

- Query service configurations.
  a. On MRS Manager page, click **Services**.
  b. Select the target service from the service list.
  c. Click **Service Configuration**.
  d. Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.
  e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

     The parameters under the service nodes and role nodes are service configuration parameters and role configuration parameters respectively.
  f. In the **Non-default** parameter, select **Non-default**. The parameters whose values are not default values will be displayed.
- Query role instance configurations.
  a. On MRS Manager page, click **Services**.
  b. Select the target service from the service list.
  c. Click the **Instances** tab.
  d. Click the target role instance from the role instance list.
  e. Click **Instance Configuration**.
  f. Set **Type** to **All**. The navigation tree of all configuration parameters of the role instance is displayed.
  g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.
  h. In the **Non-default** parameter, select **Non-default**. The parameters whose values are not default values will be displayed.

10.5.3 Managing Services

You can perform the following operations on MRS Manager:

- Start the service in the **Stopped**, **Stop Failed**, or **Start Failed** state to use the service.
- Stop the services or stop abnormal services.
- Restart abnormal services or configure expired services to restore or enable the services.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Locate the row that contains the target service, **Start**, **Stop**, or **Restart** to start, stop, or restart the service.

Services are interrelated. If a service is started, stopped, and restarted, services dependent on it will be affected.

The services will be affected in the following ways:

- If a service is to be started, the lower-layer services dependent on it must be started first.
- If a service is stopped, the upper-layer services dependent on it are unavailable.
- If a service is restarted, the running upper-layer services dependent on it must be restarted.

----End

10.5.4 Configuring Service Parameters

On MRS Manager, you can view and modify the default service configurations based on site requirements and export or import the configurations.

Impact on the System

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.
- The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

Procedure

- Modify a service.
  a. Click **Services**.
  b. Select the target service from the service list.
  c. Click **Service Configuration**.
  d. Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.
  e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

     If you want to cancel the modification of a parameter value, click ↻ to restore it.

NOTE

You can also use host groups to change role instance configurations in batches. Select a role name from the **Role** drop-down list and choose **< Select Host >** in the **Host** drop-down list. Enter a name in the **Host Group Name** text box, select the hosts to be modified from the **Host** list, add them to the **Selected hosts** area, and click **OK**. The added host group can be selected from **Host** and is only valid on the current page. The page cannot be saved after being refreshed.

f. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

   After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

NOTE

To update the queue configuration of the Yarn service without restarting service, choose **More** > **Refresh Queue** to update the queue for the configuration to take effect.

- Export service configuration parameters.
  a. Click **Services**.
  b. Select a service.
  c. Click **Service Configuration**.
  d. Click **Export Service Configuration**. Select a path for saving the configuration files.
- Import service configuration parameters.
  a. Click **Services**.
  b. Select a service.
  c. Click **Service Configuration**.
  d. Click **Import Service Configuration**.
  e. Select the target configuration file.
  f. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

     After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

10.5.5 Configuring Customized Service Parameters

Each component of MRS supports all open-source parameters. You can modify some parameters for key application scenarios on MRS Manager. Some component clients may not include all parameters with open-source features. For component parameters that cannot be directly modified on Manager, users can add new parameters for components by using the configuration customization function on Manager. Newly added parameters are saved in component configuration files and take effect after restart.

Impact on the System

- After the service attributes are configured, the service needs to be restarted and cannot be accessed.

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

Prerequisites

You have understood the meanings of parameters to be added, configuration files that have taken effect, and the impact on components.

Procedure

Step 1 On MRS Manager, click **Services**.

Step 2 Select the target service from the service list.

Step 3 Click **Service Configuration**.

Step 4 Set **Type** to **All**.

Step 5 In the navigation tree, select **Customization**. The customized parameters of the current component are displayed on Manager.

The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Different configuration files may have same open source parameters. After the parameters in different files are set to different values, whether the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

Step 6 Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.

- You can click ⊕ or ⊗ to add or delete a user-defined parameter. You can delete a customized parameter only after you click ⊕ for the first time.
- If you want to cancel the modification of a parameter value, click ↻ to restore it.

Step 7 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

Task Example

Configuring Customized Hive Parameters

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters to take effect are controlled by HDFS in a unified manner. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout period for all clients to connect to the HDFS server. If you need to modify the timeout period for Hive to connect to HDFS, you can use the configuration customization function. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

Step 1 On MRS Manager, choose **Services** > **Hive** > **Service Configuration**.

Step 2 Set **Type** to **All**.

Step 3 In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

Step 4 In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Name** column, and enter a new value in the **Value** column, for example, **150000**. The unit is millisecond.

Step 5 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the service.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

10.5.6 Synchronizing Service Configurations

Scenario

If **Configuration Status** of a service is **Expired** or **Failed**, synchronize configurations for the cluster or service to restore its configuration status. If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.

Impact on the System

After synchronizing service configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Select the target service from the service list.

Step 3 In the upper part of the service status and metric information, choose **More** > **Synchronize Configuration**.

Step 4 In the displayed dialog box, select **Restart services and instances whose configuration have expired.** and click **OK** to restart the service whose configuration has expired.

When **Operation successful** is displayed, click **Finish**. The service is started successfully.

----End

10.5.7 Managing Role Instances

Scenario

You can start a role instance that is in the **Stopped**, **Failed to stop** or **Failed to start** status, stop an unused or abnormal role instance or restart an abnormal role instance to recover its functions.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Select the target service from the service list.

Step 3 Click the **Instances** tab.

Step 4 Select the check box on the left of the target role instance.

Step 5 Choose **More** > **Start Instance**, **Stop Instance**, or **Restart Instance** accordingly.

----End

10.5.8 Configuring Role Instance Parameters

Scenario

You can view and modify default role instance configurations on MRS Manager based on site requirements. The configurations can be imported and exported.

Impact on the System

You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

Procedure

- Modifying role instance configurations
  a. Click **Services**.
  b. Select the target service from the service list.
  c. Click the **Instances** tab.
  d. Click the target role instance from the role instance list.
  e. Click **Instance Configuration**.
  f. Set **Type** to **All**. The navigation tree of all configuration parameters of the role instance is displayed.
  g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

     If you want to cancel the modification of a parameter value, click ↻ to restore it.
  h. Click **Save Configuration**, select **Restart the role instance**, and click **OK** to restart the role instance.

After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.

- Exporting Configuration Parameters of a Role Instance
  a. Click **Services**.
  b. Select a service.
  c. Select a role instance or click the **Instances** tab.
  d. Select a role instance on a specified host.
  e. Click **Instance Configuration**.
  f. Click **Export Instance Configuration** to export the configuration data of a specified role instance, and choose a path for saving the configuration file.
- Import configuration data of a role instance.
  a. Click **Services**.
  b. Select a service.
  c. Select a role instance or click the **Instances** tab.
  d. Select a role instance on a specified host.
  e. Click **Instance Configuration**.
  f. Click **Import Instance Configuration** to import the configuration data of the specified role instance.
  g. Click **Save Configuration** and select **Restart the role instance**. Click **OK**.

     After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.

10.5.9 Synchronizing Role Instance Configuration

Scenario

When **Configuration Status** of a role instance is **Expired** or **Failed**, you can synchronize the configuration data of the role instance with the background configuration.

Impact on the System

After synchronizing a role instance configuration, you need to restart the role instance whose configuration has expired. The role instance is unavailable during restart.

Procedure

Step 1 On MRS Manager, click **Services** and select a service name.

Step 2 Click the **Instances** tab.

Step 3 Click the target role instance from the role instance list.

Step 4 Choose **More** > **Synchronize Configuration** above the role instance status and indicator information.

Step 5 In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the role instance.

After **Operation successful** is displayed, click **Finish**. The role instance is started successfully.

----End

10.5.10 Decommissioning and Recommissioning a Role Instance

Scenario

If a Core or Task node is faulty, the cluster status may be displayed as **Abnormal**. In an MRS cluster, data can be stored on different Core nodes. Users can decommission the specified role instance on MRS Manager to stop the role instance from providing services. After fault rectification, you can recommission the role instance.

The following role instances can be decommissioned and recommissioned.

- DataNode role instance on HDFS
- NodeManager role instance on Yarn
- RegionServer role instance on HBase
- Broker role instance on Kafka

Restrictions:

- If the number of the DataNodes is less than or equal to that of HDFS copies, decommissioning cannot be performed. If the number of HDFS copies is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and the decommissioning will be stopped 30 minutes after the decommissioning attempt is performed on Manager.
- If the number of Kafka Broker instances is less than or equal to that of copies, decommissioning cannot be performed. For example, if the number of Kafka copies is two and the number of nodes is less than three in the system, decommissioning cannot be performed. Instance decommissioning will fail on Manager and exit.
- If a role instance is out of service, you must recommission the instance to start it before using it again.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Click a service in the service list.

Step 3 Click the **Instances** tab.

Step 4 Select an instance.

Step 5 Choose **More** > **Decommission** or **Recommission** to perform the corresponding operation.

NOTE

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS Manager displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

10.5.11 Managing a Host

Scenario

When a host is abnormal or faulty, you need to stop all roles of the host on MRS Manager to check the host. After the host fault is rectified, start all roles running on the host to recover host services.

Procedure

Step 1 Click **Hosts**.

Step 2 Select the check box of the target host.

Step 3 Choose **More** > **Start All Roles** or **Stop All Roles** accordingly.

----End

10.5.12 Isolating a Host

Scenario

If a host is found to be abnormal or faulty, affecting cluster performance or preventing services from being provided, you can temporarily exclude that host from the available nodes in the cluster. In this way, the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation.

Users can isolate a host manually on MRS Manager based on the actual service requirements or O&M plan. Only non-management nodes can be isolated.

Impact on the System

- After a host is isolated, all role instances on the host will be stopped. You cannot start, stop, or configure the host and any instances on the host.
- After a host is isolated, statistics about the monitoring status and indicator data of the host hardware and instances on the host cannot be collected or displayed.

Procedure

Step 1 On MRS Manager, click **Hosts**.

Step 2 Select the check box of the host to be isolated.

Step 3 Choose **More** > **Isolate Host**,

Step 4 and click **OK** in the displayed dialog box.

After **Operation successful.** is displayed, click **Finish**. The host is isolated successfully, and the value of **Operating Status** becomes **Isolated**.

NOTE

For isolated hosts, you can cancel the isolation and add them to the cluster again. For details, see **Canceling Host Isolation**.

----End

10.5.13 Canceling Host Isolation

Scenario

After the exception or fault of a host is handled, you must cancel the isolation of the host for proper usage.

Users can cancel the isolation of a host on MRS Manager.

Prerequisites

- The host is in the **Isolated** state.
- The exception or fault of the host has been rectified.

Procedure

Step 1 On MRS Manager, click **Hosts**.

Step 2 Select the check box of the host to be de-isolated.

Step 3 Choose **More** > **Cancel Host Isolation**,

Step 4 and click **OK** in the displayed dialog box.

After **Operation successful.** is displayed, click **Finish**. The host is de-isolated successfully, and the value of **Operating Status** becomes **Normal**.

Step 5 Click the name of the de-isolated host to show its status, and click **Start All Roles**.

----End

10.5.14 Starting or Stopping a Cluster

Scenario

A cluster is a collection of service components. You can start or stop all services in a cluster.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 In the upper part of the service list, choose **More** > **Start Cluster** or **Stop Cluster** accordingly.

----End

10.5.15 Synchronizing Cluster Configurations

Scenario

If **Configuration Status** of all services or some services is **Expired** or **Failed**, synchronize configuration for the cluster or service to restore its configuration status.

- If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.
- If all services in the cluster are in the **Failed** state, synchronize the service configuration with the background configuration.

Impact on the System

After synchronizing cluster configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 In the upper part of the service list, choose **More** > **Synchronize Configuration**.

Step 3 In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

10.5.16 Exporting Configuration Data of a Cluster

Scenario

You can export all configuration data of a cluster on MRS Manager to meet site requirements. The exported configuration data is used to rapidly update service configuration.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Choose **More** > **Export Cluster Configuration**.

The exported file is used to update service configurations. For details, see **Import service configuration parameters** in Configuring Service Parameters.

----End

10.6 Log Management

10.6.1 About Logs

Log Description

MRS cluster logs are stored in the **/var/log/Bigdata** directory. The following table lists the log types.

Table 10-17 Log types

Type	Description
Installation log	Installation logs record information about FusionInsight Manager, cluster, and service installation to help users locate installation errors.
Run logs	Run logs record the running track information, debugging information, status changes, potential problems, and error information generated during the running of services.
Audit logs	Audit logs record information about users' activities and operation instructions, which can be used to locate fault causes in security events and determine who are responsible for these faults.

The following table lists the MRS log directories.

Table 10-18 Log directories

File Directory	Log Content
/var/log/Bigdata/audit	Component audit log.
/var/log/Bigdata/controller	Log collecting script log. Controller process log. Controller monitoring log.
/var/log/Bigdata/dbservice	DBService log.
/var/log/Bigdata/flume	Flume log.
/var/log/Bigdata/hbase	HBase log.
/var/log/Bigdata/hdfs	HDFS log.
/var/log/Bigdata/hive	Hive log.

File Directory	Log Content
/var/log/Bigdata/httpd	HTTPD log.
/var/log/Bigdata/hue	Hue log.
/var/log/Bigdata/kerberos	Kerberos log.
/var/log/Bigdata/ldapclient	LDAP client log.
/var/log/Bigdata/ldapserver	LDAP server log.
/var/log/Bigdata/loader	Loader log.
/var/log/Bigdata/logman	logman script log management log.
/var/log/Bigdata/mapreduce	MapReduce log.
/var/log/Bigdata/nodeagent	NodeAgent log.
/var/log/Bigdata/okerberos	OMS Kerberos log.
/var/log/Bigdata/oldapserver	OMS LDAP log.
/var/log/Bigdata/omm	**oms**: complex event processing log, alarm service log, HA log, authentication and authorization management log, and monitoring service run log of the omm server. **oma**: installation log and run log of the omm agent. **core**: dump log generated when the omm agent and the HA process are suspended.
/var/log/Bigdata/spark	Spark log.
/var/log/Bigdata/sudo	Log generated when the **sudo** command is executed by user **omm**.
/var/log/Bigdata/timestamp	Time synchronization management log.
/var/log/Bigdata/tomcat	Tomcat log.
/var/log/Bigdata/yarn	Yarn log.
/var/log/Bigdata/zookeeper	ZooKeeper log.
/var/log/Bigdata/kafka	Kafka log.
/var/log/Bigdata/storm	Storm log.
/var/log/Bigdata/patch	Patch log.

Run logs

Table 10-19 describes the running information recorded in run logs.

Table 10-19 Running information

Run Log	Description
Installation preparation log	Records information about preparations for the installation, such as the detection, configuration, and feedback operation information.
Process startup log	Records information about the commands executed during the process startup.
Process startup exception log	Records information about exceptions during process startup, such as dependent service errors and insufficient resources.
Process run log	Records information about the process running track information and debugging information, such as function entries and exits as well as cross-module interface messages.
Process running exception log	Records errors that cause process running errors, for example, the empty input objects or encoding or decoding failure.
Process running environment log	Records information about the process running environment, such as resource status and environment variables.
Script logs	Records information about the script execution process.
Resource reclamation log	Records information about the resource reclaiming process.
Uninstallation clearing logs	Records information about operations performed during service uninstallation, such as directory deletion and execution time

Audit logs

Audit information recorded in audit logs includes FusionInsight Manager audit information and component audit information.

Table 10-20 Audit information of FusionInsight Manager

Audit Log	Operation Type	Operation
Manager audit log	User management	Creating a user Modifying a user Deleting a user Creating a user group Modifying a user group Deleting a user group Adding a role Modifying a role Deleting a role Changing a password policy Changing a password Resetting a password User login User logout Unlocking the screen Downloading the authentication credential Unauthorized operation Unlocking a user account Locking a user account Locking the screen Exporting user information Exporting a user group Exporting a role

Audit Log	Operation Type	Operation
	Tenant management	Saving the static configuration Adding a tenant Deleting a tenant Associating a service with a tenant Deleting a service from a tenant Configuring resources Creating resources Deleting resources Adding a resource pool Modifying a resource pool Deleting a resource pool Restoring tenant data

Audit Log	Operation Type	Operation
	Cluster management	Starting a cluster Stopping a cluster Saving configurations Synchronizing cluster configurations Customizing cluster monitoring indicators Saving monitoring thresholds Downloading a client configuration file Configuring the northbound API Configuring the northbound SNMP API Creating a threshold template Deleting a threshold template Applying a threshold template Saving cluster monitoring configuration data Exporting configuration data Importing cluster configuration data Exporting an installation template Modifying a threshold template Canceling the application of a threshold template Masking alarms Sending an alarm Changing the OMS database password Changing the component database password Starting the health check of a cluster

Audit Log	Operation Type	Operation
		Updating the health check configuration Exporting cluster health check results Importing a certificate file Deleting historical health check reports Exporting historical health check reports Customizing report monitoring indicators Exporting report monitoring data Customizing monitoring indicators for static resource pools Exporting monitoring data of a static resource pool
	Service management	Starting a service Stopping a service Synchronizing service configurations Refreshing a service queue Customizing service monitoring indicators Restarting a service Exporting service monitoring data Importing service configuration data Starting the health check of a service Exporting service health check results Configuring the service Uploading a configuration file Downloading a configuration file

Audit Log	Operation Type	Operation
	Instance management	Synchronizing instance configurations Commissioning an instance Decommissioning an instance Starting an instance Stopping an instance Customizing instance monitoring indicators Restarting an instance Exporting instance monitoring data Importing instance configuration data
	Host management	Setting a node rack Starting all roles Stopping all roles Isolating a host Canceling host isolation Customizing host monitoring indicators Exporting host monitoring data Starting the health check of a host Exporting the health check result of a host

Audit Log	Operation Type	Operation
	Maintenance management	Exporting alarms Clearing alarms Exporting events Clearing alarms in batches Clearing alarm through SNMP Adding a trap target through SNMP Deleting a trap target through SNMP Checking alarms through SNMP Synchronizing alarms through SNMP Modifying audit dump configurations Exporting audit logs Collecting log files Downloading log files Uploading a file Deleting an uploaded file Creating a backup task Executing a backup task Stopping a backup task Deleting a backup task Modifying a backup task Locking a backup task Unlocking a backup task Creating a restoration task Executing a backup restoration task Stopping a restoration task Retrying a restoration task Deleting a restoration task

Table 10-21 Component audit information

Audit Log	Operation Type	Operation
DBService audit log	Maintenance management	Performing backup restoration operations
HBase audit log	Data definition language (DDL) statement	Creating a table Deleting a table Modifying a table Adding a column family Modifying a column family Deleting a column family Enabling a table Disabling a table Modify the user information Changing a password User login
	Data manipulation language (DML) statement	Putting data (to the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables) Deleting data (from the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables) Checking and putting data (to the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables) Checking and deleting data (from the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables)
	Permission control	Assigning permissions to a user Canceling permission assigning

Audit Log	Operation Type	Operation
Hive audit logs	Metadata operation	Defining metadata, such as creating databases and tables Deleting metadata, such as deleting databases and tables Modifying metadata, such as adding columns and renaming tables Importing and exporting metadata
	Data maintenance	Loading data to a table Inserting data into a table
	Permissions management	Creating or deleting roles Granting/Reclaiming roles Granting/Reclaiming permissions
HDFS audit log	Permissions management	Managing permissions on files or folders Managing permissions on owner information files or folders
	File operation	Creating a folder Creating a file Opening a file Appending file content Changing a file name Deleting a file or folder Setting time property of a file Setting the number of file copies Merging files Checking the file system File links

Audit Log	Operation Type	Operation
MapReduce audit log	Application running	Starting a Container request Stopping a Container request After Container request is completed, the status of the request is displayed as succeeded. After Container request is completed, the status of the request is displayed as failed. After Container request is completed, the status of the request is displayed as suspended. Submitting a task Ending a task
LdapServer audit log	Maintenance management	Adding an operating system user Adding a user group Adding a user to user group Deleting a user Deleting a group
KrbServer audit log	Maintenance management	Changing the password of a Kerberos account Adding a Kerberos account Deleting a Kerberos account Authenticating a user
Loader audit log	Security management	User login
	Metadata management	Querying connector information Querying a framework Querying step information

Audit Log	Operation Type	Operation
	Managing data source connections	Querying a data source connection Adding a data source connection Updating a data source connection Deleting a data source connection Activating a data source connection Disabling a data source connection
	Job management	Querying a job Creating a Job Updating a Job Deleting a job Activating a job Disabling a job Querying all execution records of a job Querying the latest execution record of a job Submitting a job Stopping a job
Hue audit log	Service startup	Starting Hue
	User operation	User login User logout
	Task operation	Creating a job Modifying a job Deleting a job Submitting a task Saving a task Updating the status of a task
ZooKeeper audit log	Permissions management	Setting the access permission to Znode
	Znode operation	Creating a Znode Deleting a Znode Configuring Znode data

Audit Log	Operation Type	Operation
Storm audit log	Nimbus	Submitting a topology Stopping a topology Reallocating a topology Deactivating a topology Activating a topology
	UI	Stopping a topology Reallocating a topology Deactivating a topology Activating a topology

MRS audit logs are stored in the database. You can view and export audit logs on the **Audit** page.

The following table lists the directories to store component audit logs. Audit log files of some components are stored in **/var/log/Bigdata/audit**, such as HDFS, HBase, MapReduce, Hive, Hue, Yarn, Storm, and ZooKeeper. The component audit logs are automatically compressed and backed up to **/var/log/Bigdata/audit/bk** at 03: 00 every day. A maximum of latest 90 compressed backup files are retained, and the backup time cannot be changed.

Audit log files of other components are stored in the component log directory.

Table 10-22 Directory for storing component audit logs

Component	Audit Log Directory
DBService	/var/log/Bigdata/audit/dbservice/dbservice_audit.log

10.6.2 Manager Log List

Log Description

Log path: The default storage path of Manager log files is **/var/log/Bigdata/***Manager component*.

- ControllerService: **/var/log/Bigdata/controller/** (operation & maintenance system (OMS) installation and run logs)
- Httpd: **/var/log/Bigdata/httpd** (httpd installation and run logs)
- logman: **/var/log/Bigdata/logman** (log packaging tool logs)
- NodeAgent: **/var/log/Bigdata/nodeagent** (NodeAgent installation and run logs)
- okerberos: **/var/log/Bigdata/okerberos** (okerberos installation and run logs)
- oldapserver: **/var/log/Bigdata/oldapserver** (oldapserver installation and run logs)
- MetricAgent: **/var/log/Bigdata/metric_agent** (MetricAgent run log)
- omm: **/var/log/Bigdata/omm** (omm installation and run logs)
- timestamp: **/var/log/Bigdata/timestamp** (NodeAgent startup time logs)
- tomcat: **/var/log/Bigdata/tomcat** (Web process logs)

- Patch: **/var/log/Bigdata/patch** (patch installation log)
- Sudo: **/var/log/Bigdata/sudo** (sudo script execution log)
- OS: **/var/log/***message file* (OS system log)
- OS Performance: **/var/log/osperf** (OS performance statistics log)
- OS Statistics: **/var/log/osinfo/statistics** (OS parameter configuration log)

Log archiving rule:

The automatic compression and archiving function is enabled for Manager logs. By default, when the size of a log file exceeds 10 MB, the log file is automatically compressed. The naming rule of a compressed log file is as follows: <*Original log name*>-<*yyyy-mm-dd_hh-mm-ss*>.[*ID*].**log.zip** A maximum of 20 latest compressed files are reserved.

Table 10-23 Manager logs

Type	Log File Name	Description
Controller run log	controller.log	Log that records component installation, upgrade, patch installation, configuration, monitoring, alarms, and routine O&M operations
	controller_client.log	Run log of the Representational State Transfer (REST) API
	acs.log	ACS run log file
	acs_spnego.log	spnego user log in ACS
	aos.log	AOS run log
	plugin.log	AOS plug-in log
	backupplugin.log	Log that records the backup and restoration operations
	controller_config.log	Configuration run log
	controller_nodesetup.log	Controller loading task log
	controller_root.log	System log of the Controller process
	controller_trace.log	Log that records the remote procedure call (RPC) communication between Controller and NodeAgent

Type	Log File Name	Description
	controller_monitor.log	Monitoring log
	controller_fsm.log	State machine log
	controller_alarm.log	Controller alarm log
	controller_backup.log	Controller backup and recovery log
	install.log, distributeAdapterFiles.log, install_os_optimization.log	OMS installation log
	oms_ctl.log	OMS startup and stop log
	installntp.log	NTP installation log
	modify_manager_param.log	Manager parameter modification log
	backup.log	OMS backup script run log
	supressionAlarm.log	Alarm script run log
	om.log	OM certificate generation log
	backupplugin_ctl.log	Startup log of the backup and restoration plug-in process
	getLogs.log	Run log of the collection log script
	backupAuditLogs.log	Run log of the audit log backup script
	certStatus.log	Log that records regular certificate checks
	distribute.log	Certificate distribution log
	ficertgenetrate.log	Certificate replacement logs, including logs of level-2 certificates, CAS certificates, and httpd certificates
	genPwFile.log	Log that records the generation of certificate password files

Type	Log File Name	Description
	modifyproxyconf.log	Log that records the modification of the HTTPD proxy configuration
	importTar.log	Log that records the process of importing certificates into the trust library
Httpd	install.log	Httpd installation log
	access_log, error_log	Httpd run log
logman	logman.log	Log packaging tool log
NodeAgent	install.log, install_os_optimization.log	NodeAgent installation log
	installntp.log	NTP installation log
	start_ntp.log	NTP startup log
	ntpChecker.log	NTP check log
	ntpMonitor.log	NTP monitoring log
	heartbeat_trace.log	Log that records heartbeats between NodeAgent and Controller
	alarm.log	Alarm log
	monitor.log	Monitoring log
	nodeagent_ctl.log, start-agent.log	NodeAgent startup log
	agent.log	NodeAgent run log
	cert.log	Certificate log
	agentplugin.log	Agent plug-in running status monitoring log
	omaplugin.log	OMA plug-in run log
	diskhealth.log	Disk health check log
	supressionAlarm.log	Alarm script run log
	updateHostFile.log	Host list update log
	collectLog.log	Run log of the node log collection script

Type	Log File Name	Description
	host_metric_collect.log	Host index collection run log
	checkfileconfig.log	Run log file of file permission check
	entropycheck.log	Entropy check run log
	timer.log	Log of periodic node scheduling
	pluginmonitor.log	Component monitoring plug-in log
	agent_alarm_py.log	Log that records alarms upon insufficient NodeAgent file permission
okerberos	addRealm.log, modifyKerberosRealm.log	Domain handover log
	checkservice_detail.log	Okerberos health check log
	genKeytab.log	keytab generation log
	KerberosAdmin_genConfigDetail.log	Run log that records the generation of kadmin.conf when starting the kadmin process
	KerberosServer_genConfigDetail.log	Run log that records the generation of krb5kdc.conf when starting the krb5kdc process
	oms-kadmind.log	Run log of the kadmin process
	oms_kerberos_install.log, postinstall_detail.log	Okerberos installation log
	oms-krb5kdc.log	Run log of the krbkdc process
	start_detail.log	Okerberos startup log
	realmDataConfigProcess.log	Log rollback for domain handover failure
	stop_detail.log	Okerberos stop log
oldapserver	ldapserver_backup.log	Oldapserver backup log

Type	Log File Name	Description
	ldapserver_chk_service.log	Oldapserver health check log
	ldapserver_install.log	Oldapserver installation log
	ldapserver_start.log	Oldapserver startup log
	ldapserver_status.log	Log that records the status of the Oldapserver process
	ldapserver_stop.log	Oldapserver stop log
	ldapserver_wrap.log	Oldapserver service management log
	ldapserver_uninstall.log	Oldapserver uninstallation log
	restart_service.log	Oldapserver restart log
	ldapserver_unlockUser.log	Log that records information about unlocking LDAP users and managing accounts
omm	omsconfig.log	OMS configuration log
	check_oms_heartbeat.log	OMS heartbeat log
	monitor.log	OMS monitoring log
	ha_monitor.log	HA_Monitor operation log
	ha.log	HA operation log
	fms.log	Alarm log
	fms_ha.log	HA alarm monitoring log
	fms_script.log	Alarm control log
	config.log	Alarm configuration log
	iam.log	IAM log
	iam_script.log	IAM control log
	iam_ha.log	IAM HA monitoring log
	config.log	IAM configuration log
	operatelog.log	IAM operation log

Type	Log File Name	Description
	heartbeatcheck_ha.log	OMS heartbeat HA monitoring log
	install_oms.log	OMS installation log
	pms_ha.log	HA monitoring log
	pms_script.log	Monitoring control log
	config.log	Monitoring configuration log
	plugin.log	Monitoring plug-in run log
	pms.log	Monitoring log
	ha.log	HA run log
	cep_ha.log	CEP HA monitoring log
	cep_script.log	CEP control log
	cep.log	CEP log
	config.log	CEP configuration log
	omm_gaussdba.log	GaussDB HA monitoring log
	gaussdb-<SERIAL>.log	GaussDB run log
	gs_ctl-<DATE>.log	GaussDB control log archive log
	gs_ctl-current.log	GaussDB control log
	gs_guc-current.log	GaussDB operation log
	encrypt.log	Omm encryption log
	omm_agent_ctl.log	OMA control log
	oma_monitor.log	OMA monitoring log
	install_oma.log	OMA installation log
	config_oma.log	OMA configuration log
	omm_agent.log	OMA run log
	acs.log	ACS resource log
	aos.log	AOS resource log
	controller.log	Controller resource log

Type	Log File Name	Description
	feed_watchdog.log	feed_watchdog resource log
	floatip.log	Floating IP address resource log
	ha_ntp.log	NTP resource log
	httpd.log	Httpd resource log
	okerberos.log	Okerberos resource log
	oldap.log	OLdap resource log
	tomcat.log	Tomcat resource log
	send_alarm.log	Run log of the HA alarm sending script of the management node
timestamp	restart_stamp	NodeAgent start time log
tomcat	cas.log, localhost_access_cas_log.log	CAS run log
	catalina.log, catalina.out, host-manager.log, localhost.log, manager.log	Tomcat run log
	localhost_access_web_log.log	Log that records the access to REST APIs of FusionInsight Manager
	web.log	Run log of the web process
	northbound_ftp_sftp.log, snmp.log	Northbound log
watchdog	watchdog.log, feed_watchdog.log	watchdog run log
patch	oms_installPatch.log	OMS patch installation log
	agent_installPatch.log	Agent patch installation log
	agent_uninstallPatch.log	Agent patch uninstallation log
	NODE_AGENT_restoreFile.log	Agent patch restoration log

Type	Log File Name	Description
	NODE_AGENT_updateFile.log	Agent patch update log
	OMA_restoreFile.log	OMA patch restoration file log
	OMA_updateFile.log	OMA patch update file log
	CONTROLLER_restoreFile.log	CONTROLLER patch restoration file log
	CONTROLLER_updateFile.log	CONTROLLER patch update file log
	OMS_restoreFile.log	OMS patch restoration file log
	oms_uninstallPatch.log	OMS patch uninstallation log
	OMS_updateFile.log	OMS patch update file log
	createStackConf.log, decompress.log, decompress_OMS.log, distrExtractPatchOnOMS.log, slimReduction.log, switch_adapter.log	Patch installation log
sudo	sudo.log	Sudo script execution log

Log Levels

Table 10-24 describes the log levels provided by Manager. The priorities of log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the specified level are printed. The number of printed logs decreases as the specified log level increases.

Table 10-24 Log levels

Level	Description
FATAL	Logs of this level record fatal error information about the current event processing that may result in a system crash.
ERROR	Logs of this level record error information about the current event processing, which indicates that system running is abnormal.

Level	Description
WARN	Abnormal information about the current event processing. These abnormalities will not result in system faults.
INFO	Normal running status information about the system and events.
DEBUG	Logs of this level record the system information and system debugging information.

Log Formats

The following table lists the Manager log formats.

Table 10-25 Log formats

Type	Component	Format	Example
Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	<*yyyy-MM-dd HH:mm:ss,SSS*>|<*Log level*>|<*Name of the thread that generates the log*>|<*Message in the log*>|<*Location where the log event occurs*>	2015-06-30 00:37:09,067 INFO [pool-1-thread-1] Completed Discovering Node. com.xxx.hadoop.om.controller.tasks.nodesetup.DiscoverNodeTask.execute(DiscoverNodeTask.java:299)

10.6.3 Viewing and Exporting Audit Logs

Scenario

This section describes how to view and export audit logs on MRS Manager. The audit logs can be used to trace security events, locate fault causes, and determine responsibilities.

The system record the following log information:

- User activity information, such as user login and logout, system user information modification, and system user group information modification
- User operation instruction information, such as cluster startup, stop, and software upgrade.

Procedure

- Viewing audit logs

a. On MRS Manager, click **Audit** to view the default audit logs.

   If the audit content of an audit log contains more than 256 characters, click the expand button of the audit log to expand the audit details. Click **Log File** to download the complete file and view the information.

   - By default, records are sorted in descending order by the **Occurred** column. You can click **Operation Type**, **Severity**, **Occurred**, **User**, **Host**, **Service**, **Instance**, or **Operation Result** to change the sorting mode.
   - All alarms of the same severity can be filtered by **Severity**. The results include cleared and uncleared alarms.

   Exported audit logs contain the following information:

   - **Sno**: indicates the number of audit logs generated by MRS Manager. The number is incremented by 1 when a new audit log is generated.
   - **Operation Type**: indicates the operation type of a user operation. There are nine scenarios: **Alarm**, **Auditlog**, **Backup And Restoration**, **Cluster**, **Collect Log**, **Host**, **Service**, **Tenant** and **User_Manager**. **User_Manager** is supported only in clusters with Kerberos authentication enabled. Each scenario contains different operation types. For example, **Alarm** includes **Export alarms**; **Cluster** includes **Start cluster**, and **Tenant** include **Add tenant**.
   - **Severity**: indicates the security level of each audit log, including **Critical**, **Major**, **Minor** and **Informational**.
   - **Start Time**: indicates the time when the operation starts. The time is .
   - **End Time**: indicates the time when the operation ends. The time is .
   - **User IP Address**: indicates the IP address used by a user to perform operations.
   - **User**: indicates the name of the user who performs the operation.
   - **Host**: indicates the node where the user operation is performed. The information is not saved if the operation does not involve a node.
   - **Service**: indicates the service in the cluster where the user operation is performed. The information is not saved if the operation does not involve a service.
   - **Instance**: indicates the role instance in the cluster where the user operation is performed. The information is not saved if the operation does not involve a role instance.
   - **Operation Result**: indicates the operation result, including **Successful**, **Failed** and **Unknown**.
   - **Content**: indicates execution information of the user operation.

b. Click **Advanced Search**. In the search area, set search criteria and click **Search** to view audit logs of the specified type. Click **Reset** to clear the search criteria.

NOTE

Start Time and **End Time** specify the start time and end time of the time range. You can search for alarms generated within the time range.

- Exporting audit logs
  a. In the audit log list, click **Export All** to export all logs.
  b. In the audit log list, select the check box of a log and click **Export** to export the log.

10.6.4 Exporting Service Logs

Scenario

This section describes how to export logs generated by each service role from MRS Manager.

Prerequisites

- You have obtained the access key ID (AK) and secret access key (SK) of the account.
- A parallel file system has been created in OBS.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Click **Export Log** under **Maintenance**.

Step 3 Set a service for **Service**. Set **Host** to the IP address of the host where the service is deployed. Select the corresponding time for **Start Time** and **End Time**.

Step 4 In **Export To**, select a path for saving logs. This parameter is available only for clusters with Kerberos authentication enabled.

- **Local PC**: indicates that logs are saved to the local environment. Then go to **Step 8**.
- **OBS**: indicates that logs are saved to OBS. This is the default option. Then go to **Step 5**.

Step 5 Set **OBS Path** to the path for storing service logs on OBS.

The value must be a complete path and cannot start with a slash (/). The path can be nonexistent and will be automatically created by the system. The full path of OBS can contain a maximum of 900 bytes.

Step 6 In **Bucket**, enter the name of the created OBS file system.

Step 7 Set **AK** and **SK** to the access key ID and secret access key of the user.

Step 8 Click **OK**.

----End

10.6.5 Configuring Audit Log Dumping Parameters

Scenario

If audit logs are stored in the database for a long time, the disk space for the data directory may be insufficient. Therefore, you can set dump parameters to automatically dump audit logs to a specified directory on a server.

If you do not configure the audit log dumping, the system automatically saves the audit logs to a file when the number of audit logs reaches 100,000 pieces. The save path is **${BIGDATA_HOME}/OMSV100R001C00x8664/workspace/conf/data/operatelog** on the active management node. The file name format is **OperateLog_store_***YY_MM_DD_HH_MM_SS***.csv**. A maximum of 50 historical audit log files can be saved. The directory is automatically generated when audit logs are dumped for the first time.

Prerequisites

The ECS corresponding to the dump server must be in the same VPC as the master node of the MRS cluster, and the master node can access the IP address and specified port of the dump server. The SFTP service on the dump server is running properly.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Choose **Dump Audit Log** under **Maintenance**.

Table 10-26 Audit log dump parameters

Parameter	Value	Description
Dump Audit Log	● On ● Off	(Mandatory) Specifies whether to enable audit log dumping. ● **On**: enables audit log dumping. ● **Off**: disables audit log dumping.
Dumping Mode	● By quantity ● By time	(Mandatory) Specifies the dump mode. ● **By quantity**: If the number of logs reaches the value of this parameter (**100,000** by default), the logs are dumped. ● **By time**: Logs are dumped at a specified date.

Parameter	Value	Description
SFTP IP	**192.168.10.51** (example value)	(Mandatory) Specifies the SFTP server for storing dumped audit logs.
SFTP Port	**22** (example value)	(Mandatory) Specifies the port of the SFTP server for storing dumped audit logs.
Save Path	**/opt/omm/oms/auditLog** (example value)	(Mandatory) Specifies the path for storing audit logs on the SFTP server.
SFTP Username	**root** (example value)	(Mandatory) Specifies the username for logging in to the SFTP server.
SFTP Password	**Root_123** (example value)	(Mandatory) Specifies the password for logging in to the SFTP server.
SFTP Public Key	-	(Optional) Specifies the public key of the SFTP server. You are advised to set the public key of the SFTP server. Otherwise, security risks may exist.
Dumping Date	November 06 (example value)	(Mandatory) Specifies the data when the system starts dumping audit logs. This parameter is valid when **Dump Mode** is set to **By time**. The logs to be dumped include all the audit logs generated before 00:00 on January 1 of the current year.

NOTE

Key fields in the audit log dump file are as follows:

- **USERTYPE** indicates the user type. Value **0** indicates the **Human-machine** user, and value **1** indicates the **Machine-machine** user.
- **LOGLEVEL** indicates the security level. Value **0** indicates critical, value **1** indicates major, value **2** indicates minor, and value **3** indicates informational.
- **OPERATERESULT** indicates the operation result. Value **0** indicates that the operation is successful, and value **1** indicates that the operation is failed.

----End

10.7 Health Check Management

10.7.1 Performing a Health Check

Scenario

To ensure that cluster parameters, configurations, and monitoring are correct and that the cluster can run stably for a long time, you can perform a health check during routine maintenance.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Procedure

- Manually perform the health check for all services.
  a. Click **Services** and select the target service.
  b. Choose **More** > **Start Service Health Check** to start the health check for the service.

  NOTE

  - The cluster health check includes Manager, service, and host status checks.
  - To perform cluster health checks, you can also choose **System** > **Check Health Check** > **Start Cluster Health Check** on MRS Manager.
  - To export the health check result, click **Export Report** in the upper left corner.
- Manually perform the health check for a service.
  a. Click **Services**. In the services list, click the desired service name.
  b. Choose **More** > **Start Service Health Check** to start the health check for the service.
- Manually perform the health check for a host.
  a. Click **Hosts**.
  b. Select the check box of the host for which you want to check the health status.
  c. Choose **More** > **Start Host Health Check** to start the health check for the host.
- Automatically performing a health check
  a. Click **System**.
  b. Click **Check Health Status** under **Maintenance**.
  c. Click **Configure Health Check** to configure automatic health check items.

     Periodic Health Check: specifies whether to enable automatic health check. The **Periodic Health Check** function is disabled by default. You can click to enable the function and select **Daily**, **Weekly**, or **Monthly** based on management requirements.

d. Click **OK** to save the settings. The **Health check configuration saved successfully** is displayed in the upper right corner.

10.7.2 Viewing and Exporting a Health Check Report

Scenario

You can view the health check result in MRS Manager and export the health check results for further analysis.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Prerequisites

You have performed a health check.

Procedure

Step 1 Click **Services**.

Step 2 Choose **More** > **View Cluster Health Check Report** to view the health check report of a cluster.

Step 3 Click **Export Report** on the health check report pane to export the report and view detailed information about check items.

NOTE

For details about how to rectify the faults of the check items, see **DBService Health Check Indicators** to **ZooKeeper Health Check Indicators**.

----End

10.7.3 Configuring the Number of Health Check Reports to Be Reserved

Scenario

Health check reports of MRS clusters, services, and hosts may vary with the time and scenario. You can modify the number of health check reports to be reserved on MRS Manager for later comparison.

This setting is valid for health check reports of clusters, services, and hosts. Report files are saved in **$BIGDATA_DATA_HOME/Manager/healthcheck** on the active management node by default and are automatically synchronized to the standby management node.

Prerequisites

Users have specified service requirements and planned the save time and health check frequency, and the disk space of the active and standby management nodes is sufficient.

Procedure

Step 1 Choose **System** > **Check Health Status** > **Configure Health Check**.

Step 2 Set **Max. Number of Health Check Reports** to the number of health check reports to be reserved. The value ranges from 1 to 100. The default value is 50.

Step 3 Click **OK** to save the settings. The **Health check configuration saved successfully** is displayed in the upper right corner.

----End

10.7.4 Managing Health Check Reports

Scenario

On MRS Manager, users can manage historical health check reports, for example, viewing, downloading, and deleting historical health check reports.

Procedure

- Download a specified health check report.
  a. Choose **System** > **Check Health Status**.
  b. Locate the row that contains the target health check report and click **Download** to download the report file.
- Download specified health check reports in batches.
  a. Choose **System** > **Check Health Status**.
  b. Select multiple health check reports and click **Download File** to download them.
- Delete a specified health check report.
  a. Choose **System** > **Check Health Status**.
  b. Locate the row that contains the target health check report and click **Delete** to delete the report file.
- Delete specified health check reports in batches.
  a. Choose **System** > **Check Health Status**.
  b. Select multiple health check reports and click **Delete File** to delete them.

10.7.5 DBService Health Check Indicators

Service Health Check

Indicator: Service Status

Description: This indicator is used to check whether the DBService service status is normal. If the status is abnormal, the service is unhealthy.

Handling method: If the indicator is abnormal, rectify the fault by referring to ALM-27001.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.6 Flume Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Flume service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-24000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.7 HBase Health Check Indicators

Normal RegionServer Count

Indicator: Normal RegionServer Count

Description: This indicator is used to check the number of RegionServers that are running properly in an HBase cluster.

Recovery Guide: If the indicator is abnormal, check whether the status of RegionServer is normal. If the status is abnormal, resolve the problem and check that the network is normal.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the HBase service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the status of HMaster and RegionServer is normal. If the status is abnormal, resolve the problem. Then, check whether the status of the ZooKeeper service is faulty. On the HBase client, check whether the data in the HBase table can be correctly read and locate the data reading failure cause. Handle the alarm following instructions in the alarm processing document.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.8 Host Health Check Indicators

Swap Usage

Indicator: Swap Usage

Description: Swap usage of the system. The value is calculated using the following formula: Swap usage = Used swap size/Total swap size. Assume that the current threshold is set to 75.0%. If the usage of the file handles in the system exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the swap usage of the node.

   Log in to the unhealthy node and run the **free -m** command to check the total swap space and used swap space. If the swap space usage exceeds the threshold, go to **2**.
2. If the swap usage exceeds the threshold, you are advised to expand the system capacity, for example, add nodes.

Host File Handle Usage

Indicator: Host File Handle Usage

Description: This indicator indicates the file handle usage in the system. Host file handle usage = Number of used handles/Total number of handles. If the usage exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the file handle usage of the host.

Log in to the unhealthy node and run the **cat /proc/sys/fs/file-nr** command. In the command output, the first and third columns indicate the number of used handles and the total number of handles, respectively. If the usage exceeds the threshold, go to **2**.

2. If the file handle usage of the host exceeds the threshold, you are advised to check the system and analyze the file handle usage.

NTP Offset

Indicator: NTP Offset

Description: This indicator indicates the NTP time offset. If the time deviation exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the NTP time offset.

   Log in to the unhealthy node and run the **/usr/sbin/ntpq -np** command to view the information. In the command output, the **Offset** column indicates the time offset. If the time offset is greater than the threshold, go to **2**.

2. If the indicator is abnormal, check whether the clock source configuration is correct. Contact O&M personnel.

Average Load

Indicator: Average Load

Description: Average system load, indicating the average number of processes in the running queue in a specified period. The system average load is calculated using the load value obtained by the uptime command. Calculation method: (Load of 1 minute + Load of 5 minutes + Load of 15 minutes)/(3 x Number of CPUs). Assume that the current threshold is set to 2. If the average load exceeds 2, the system is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the **uptime** command. The last three columns in the command output indicate the load in 1 minute, 5 minutes, and 15 minutes, respectively. If the average system load exceeds the threshold, go to **2**.
2. If the system average load exceeds the threshold, you are advised to perform system capacity expansion, such as adding nodes.

D State Process

Indicator: D State Process

Description: This indicator indicates the unstoppable sleep process, that is, the process in the D state. A process that is in the D state is waiting for I/O, such as disk I/O and network I/O, and experiences an I/O exception. If any process in the D state exists in the system, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12028.

Hardware Status

Indicator: Hardware Status

Description: This indicator is used to check the system hardware status, including the CPU, memory, disk, power supply, and fan. This indicator obtains related hardware information using **ipmitool sdr elist**. If the hardware status is abnormal, the hardware is unhealthy.

Recovery Guide:

1. Log in to the node where the check result is unhealthy. Run the **ipmitool sdr elist** command to check system hardware status. The last column in the command output indicates the hardware status. If the status is included in the following fault description table, the check result is unhealthy.

Module	Symptom
Processor	IERR Thermal Trip FRB1/BIST failure FRB2/Hang in POST failure FRB3/Processor startup/init failure Configuration Error SM BIOS Uncorrectable CPU-complex Error Disabled Throttled Uncorrectable machine check exception
Power Supply	Failure detected Predictive failure Power Supply AC lost AC lost or out-of-range AC out-of-range, but present Config Error: Vendor Mismatch Config Error: Revision Mismatch Config Error: Processor Missing Config Error: Power Supply Rating Mismatch Config Error: Voltage Rating Mismatch Config Error

Module	Symptom
Power Unit	240VA power down Interlock power down AC lost Soft-power control failure Failure detected Predictive failure
Memory	Uncorrectable ECC Parity Memory Scrub Failed Memory Device Disabled Correctable ECC logging limit reached Configuration Error Throttled Critical Overtemperature
Drive Slot	Drive Fault Predictive Failure Parity Check In Progress In Critical Array In Failed Array Rebuild In Progress Rebuild Aborted
Battery	Low Failed

2. If the indicator is abnormal, contact O&M personnel.

Host Name

Indicator: Host Name

Description: This indicator is used to check whether the host name is set. If the host name is not set, the system is unhealthy. If the indicator is abnormal, you are advised to set the host name properly.

Recovery Guide:

1. Log in to the node where the check result is unhealthy.
2. Run the hostname host name command to change the host name to ensure that the host name is consistent with the planned host name.

   hostname*host name* For example, to change the host name to **Bigdata-OM-01**, run the **hostname Bigdata-OM-01** command.
3. Modify the host name configuration file.

Run the **vi /etc/HOSTNAME** command to edit the file. Change the file content to **Bigdata-OM-01**. Save the file, and exit.

Umask

Indicator: Umask

Description: This indicator is used to check whether the umask setting of user **omm** is correct. If Umask is not 0077, the system is unhealthy.

Recovery Guide:

1. If the indicator is abnormal, you are advised to set umask of user **omm** to 0077. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the **vi ${BIGDATA_HOME}/.om_profile** command and change the value of **umask** to **0077**. Save and exit.

OMS HA Status

Indicator: OMS HA Status

Description: This indicator is used to check whether the OMS two-node cluster resources are normal. You can run the **${CONTROLLER_HOME}/sbin/status-oms.sh** command to view the detailed information about the status of the OMS two-node cluster resources. If any module is abnormal, the OMS is unhealthy.

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **${CONTROLLER_HOME}/sbin/status-oms.sh** command to check the OMS status.
2. If floatip, okerberos, and oldap are abnormal, handle the problems by referring to ALM-12002, ALM-12004, and ALM-12005 respectively.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

   If controller resources are abnormal, view **/var/log/Bigdata/controller/controller.log** of the faulty node.

   If CEP resources are abnormal, view **/var/log/Bigdata/omm/oms/cep/cep.log** of the faulty node.

   If AOS resources are abnormal, view **/var/log/Bigdata/controller/aos/aos.log** of the faulty node.

   If feed_watchdog resources are abnormal, view **/var/log/Bigdata/watchdog/watchdog.log** of the abnormal node.

   If HTTPD resources are abnormal, view **/var/log/Bigdata/httpd/error_log** of the abnormal node.

   If FMS resources are abnormal, view **/var/log/Bigdata/omm/oms/fms/fms.log** of the abnormal node.

   If PMS resources are abnormal, view **/var/log/Bigdata/omm/oms/pms/pms.log** of the abnormal node.

   If IAM resources are abnormal, view **/var/log/Bigdata/omm/oms/iam/iam.log** of the abnormal node.

If the GaussDB resource is abnormal, check the **/var/log/Bigdata/omm/oms/db/omm_gaussdba.log** of the abnormal node.

If NTP resources are abnormal, view **/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log** of the abnormal node.

If Tomcat resources are abnormal, view **/var/log/Bigdata/tomcat/catalina.log** of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

Checking the Installation Directory and Data Directory

Indicator: Installation Directory and Data Directory Check

Description: This indicator checks the **lost+found** directory in the root directory of the disk partition where the installation directory (**/opt/Bigdata** by default) is located. If the directory contains the files of user **omm**, there are exceptions. When a node is abnormal, related files are stored in the **lost+found** directory. This indicator is used to check whether files are lost in such scenarios. Check the installation directory (for example, **/opt/Bigdata**) and data directory (for example, **/srv/BigData**). If any files of non-omm users exist in the two directories, the system is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**. Check whether files or folders of user omm exist in the **lost+found** directory.

   If the **omm** user file exists, you are advised to restore it and check again. If the **omm** user file does not exist, go to 2.

2. Check the installation directory and data directory. Check whether the files or folders of other users exist in the installation directory and data directory. If the files and folders are manually generated temporary files, you are advised to delete them and check again.

CPU Usage

Indicator: CPU Usage

Description: This indicator is used to check whether the CPU usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12016.

Memory Usage

Indicator: Memory Usage

Description: This indicator is used to check whether the memory usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12018.

Host Disk Usage

Indicator: Host Disk Usage

Description: This indicator is used to check whether the host disk usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12017.

Host Disk Write Rate

Indicator: Host Disk Write Rate

Description: This indicator is used to check the disk write rate of a host. The write rate of the host disk may vary according to the service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

Recovery Guide: Determine whether the current disk write rate is normal based on the service scenario.

Host Disk Read Rate

Indicator: Host Disk Read Rate

Description: This indicator is used to check the disk read rate of a host. The read rate of the host disk may vary by service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

Recovery Guide: Determine whether the current disk read rate is normal based on the service scenario.

Host Service Plane Network Status

Indicator: Host Service Plane Network Status

Description: This indicator is used to check the connectivity of the service plane network of the cluster host. If the hosts are disconnected, the cluster is unhealthy.

Recovery Guide: If the single-plane networking is used, check the IP address of the single plane. For a dual-plane network, the operation procedure is as follows:

1. Check the network connectivity between the service plane IP addresses of the active and standby management nodes.

   If the network is abnormal, go to **3**.

   If the network is normal, go to **2**.

2. Check the network connectivity between the IP address of the active management node and the IP address of the abnormal node in the cluster.
3. If the network is disconnected, contact O&M personnel to rectify the network fault to ensure that the network meets service requirements.

Host Status

Indicator: Host Status

Description: This indicator is used to check whether the host status is normal. If a node is faulty, the host is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-12006.

Alarm Check

Indicator: Alarm Check

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.9 HDFS Health Check Indicators

Average Packet Sending Time

Indicator: Average Packet Sending Time

Description: This indicator is used to collect statistics on the average time for the DataNode in the HDFS to execute SendPacket each time. If the average time is greater than 2,000,000 ns, the DataNode is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high. Check whether the HDFS load in the cluster is high.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the HDFS service status is normal. If a node is faulty, the host is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the health status of the KrbServer, LdapServer and ZooKeeper services are faulty. If yes, rectify the fault. Then, check whether the file writing failure is caused by HDFS SafeMode ON. Use the client to check whether data cannot be written into HDFS and locate the cause of the HDFS data writing failure. Handle the alarm following instructions in the alarm processing document.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.10 Hive Health Check Indicators

Maximum Number of Sessions Allowed by HiveServer

Indicator: Maximum Number of Sessions Allowed by HiveServer

Description: This indicator is used to check the maximum number of sessions that can be connected to Hive.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Number of Sessions Connected to HiveServer

Indicator: Number of Sessions Connected to HiveServer

Description: This indicator is used to check the number of Hive connections.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Hive service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.11 Kafka Health Check Indicators

Number of Available Broker Nodes

Indicator: Number of Brokers

Description: This indicator is used to check the number of available Broker nodes in a cluster. If the number of available Broker nodes in a cluster is less than 2, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Kafka service instance page and click the host name of the unavailable Broker instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to the alarm handling suggestions in **Process Fault**. If the status is not **Good**, rectify the fault by referring to the handling procedure of the **Node Fault** alarm.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Kafka service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to the alarm "Kafka Service Unavailable".

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.12 KrbServer Health Check Indicators

KerberosAdmin Service Availability

Indicator: KerberosAdmin Service Availability

Description: The system checks the KerberosAdmin service status. If the check result is abnormal, the KerberosAdmin service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KerberosAdmin service is located is faulty or the SlapdServer service is unavailable. During the KerberosAdmin service recovery, try the following operations:

1. Check whether the node where the KerberosAdmin service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

KerberosServer Service Availability

Indicator: KerberosServer Service Availability

Description: The system checks the KerberosServer service status. If the check result is abnormal, the KerberosServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KerberosServer service is located is faulty or the SlapdServer service is unavailable. During the KerberosServer service recovery, try the following operations:

1. Check whether the node where the KerberosServer service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

Service Health Status

Indicator: Service Status

Description: The system checks the KrbServer service status. If the check result is abnormal, the KrbServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KrbServer service resides is faulty or the LdapServer service is unavailable. For details, see the handling procedure of ALM-25500.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check the alarm information about the KrbServer service. If any alarms exist, the KrbServer service may be abnormal.

Recovery Guide: If this indicator check result is abnormal, see the related alarm document to handle the alarms.

10.7.13 LdapServer Health Check Indicators

SlapdServer Service Availability

Indicator: SlapdServer Service Availability

Description: The system checks the SlapdServer service status. If the status is abnormal, the SlapdServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the SlapdServer service is located is faulty or the SlapdServer process is faulty. During the SlapdServer service recovery, try the following operations:

1. Check whether the node where the SlapdServer service locates is faulty. For details, see ALM-12006.
2. Check whether the SlapdServer process is normal. For details, see ALM-12007.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check the alarm information about the LdapServer service. If the status is abnormal, the LdapServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the active LdapServer service resides is faulty or the active LdapServer process is faulty. For details, see ALM-25000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check the alarm information about the LdapServer service. If any alarms exist, the LdapServer service may be abnormal.

Recovery Guide: If this indicator check result is abnormal, see the related alarm document to handle the alarms.

10.7.14 Loader Health Check Indicators

ZooKeeper Health Status

Indicator: ZooKeeper health status

Description: This indicator is used to check whether the ZooKeeper health status is normal. If the status is abnormal, the ZooKeeper service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

HDFS Health Status

Indicator: HDFS health status

Description: This indicator is used to check whether the HDFS health status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

DBService Health Status

Indicator: DBService Health Status

Description: This indicator is used to check whether the DBService health status is normal. If the status is abnormal, the DBService service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Yarn Health Status

Indicator: Yarn health status

Description: This indicator is used to check whether the Yarn health status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

MapReduce Health Status

Indicator: MapReduce Health Status

Description: This indicator is used to check whether the MapReduce health status is normal. If the status is abnormal, the MapReduce service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Loader Process Status

Indicator: Loader Process Status

Description: This indicator is used to check whether the Loader process is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Loader service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist for loader. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.15 MapReduce Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the MapReduce service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.16 OMS Health Check Indicators

OMS Status Check

Indicator: OMS Status Check

Description: The OMS status check includes the HA status check and resource status check. The HA status includes **active**, **standby**, and **NULL**, indicating the active node, standby node, and unknown, respectively. The resource status includes normal, abnormal, and NULL. If the HA status is NULL, the HA status is unhealthy. If the resource status is NULL or abnormal, the resource status is unhealthy.

Table 10-27 OMS status description

Name	Description
HA state	**active**: indicates the active node. **standby**: indicates the standby node. **NULL**: unknown
Resource status	**normal**: All resources are normal. **abnormal**: indicates that abnormal resources exist. **NULL**: unknown

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **${CONTROLLER_HOME}/sbin/status-oms.sh** command to check the status of OMS.
2. If the HA status is NULL, the system may be restarting. NULL is an intermediate state, and the HA status will automatically change to a normal state.
3. If the resource status is abnormal, certain component resources of FusionInsight Manager are abnormal. Check whether the status of components such as acs, aos cep, controller, feed_watchdog, fms, guassDB, httpd, iam, ntp, okerberos, oldap, pms, and tomcat component is normal.
4. If any Manager component resource is abnormal, see Manager component status check to rectify the fault.

Manager Component Status Check

Indicator: Manager Component Status Check

Description: This indicator is used to check the running status and HA status of Manager components. The resource running status includes **Normal** and **Abnormal**, and the resource HA status includes **Normal** and **Exception**. Manager components include Acs, Aos, Cep, Controller, feed_watchdog, Floatip, Fms, GaussDB, HeartBeatCheck, httpd, IAM, NTP, Okerberos, OLDAP, PMS, and Tomcat. If the running status and HA status is not Normal, the check result is unhealthy.

Table 10-28 Manager status description

Name	Description
Resource running status:	**Normal**: The system is running properly. **Abnormal**: The running is abnormal. **Stopped**: The task is stopped. **Unknown**: The status is unknown. **Starting**: The process is being started. **Stopping**: The task is being stopped. **Active_normal**: The active node is running properly. **Standby_normal**: The standby node is running properly. **Raising_active**: The node is being promoted to be the active node. **Lowing_standby**: The node is being set to be the standby node. **No_action**: the action does not exist. **Repairing**: The disk is being repaired. **NULL**: unknown
Resource HA status	**Normal**: the status is normal. **Exception**: indicates a fault. **Non_steady**: indicates the non-steady state. **Unknown**: unknown **NULL**: unknown

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **${CONTROLLER_HOME}/sbin/status-oms.sh** command to check the status of OMS.
2. If floatip, okerberos, and oldap are abnormal, handle the problems by referring to ALM-12002, ALM-12004, and ALM-12005 respectively.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

   If controller resources are abnormal, view **/var/log/Bigdata/controller/controller.log** of the faulty node.

   If CEP resources are abnormal, view **/var/log/Bigdata/omm/oms/cep/cep.log** of the faulty node.

   If AOS resources are abnormal, view **/var/log/Bigdata/controller/aos/aos.log** of the faulty node.

   If feed_watchdog resources are abnormal, view **/var/log/Bigdata/watchdog/watchdog.log** of the abnormal node.

If HTTPD resources are abnormal, view **/var/log/Bigdata/httpd/error_log** of the abnormal node.

If FMS resources are abnormal, view **/var/log/Bigdata/omm/oms/fms/fms.log** of the abnormal node.

If PMS resources are abnormal, view **/var/log/Bigdata/omm/oms/pms/pms.log** of the abnormal node.

If IAM resources are abnormal, view **/var/log/Bigdata/omm/oms/iam/iam.log** of the abnormal node.

If the GaussDB resource is abnormal, check the **/var/log/Bigdata/omm/oms/db/omm_gaussdba.log** of the abnormal node.

If NTP resources are abnormal, view **/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log** of the abnormal node.

If Tomcat resources are abnormal, view **/var/log/Bigdata/tomcat/catalina.log** of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

OMA Running Status

Indicator: OMA Running Status

Description: This indicator is used to check the running status of the OMA. The status can be **Running** or **Stopped**. If the OMA is **Stopped**, the OMA is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run **${OMA_PATH}/restart_oma_app** to manually start the OMA and check again. If the check result is still unhealthy, go to **3**.
3. If manually starting the OMA cannot resolve the problem, you are advised to check the OMA logs in **/var/log/Bigdata/omm/oma/omm_agent.log**.
4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

SSH Trust Between Each Node and the Active Management Node

Indicator: SSH Trust Between Each Node and the Active Management Node

Description: This indicator is used to check whether the SSH mutual trust is normal. If you can switch to another node through SSH from the active OMS node as user omm without the need of entering the password, SSH communication is normal. Otherwise, SSH communication is abnormal. In addition, if you can switch to another node through SSH from the active OMS node but fail to switch to the active OMS node from the other nodes, SSH communication is abnormal.

Recovery Guide:

1. If the indicator check result is abnormal, the SSH trust relationships between the nodes and the active management node are abnormal. In this case, check whether the permission of the **/home/omm** directory is **omm**. If non-omm users have the directory permission, the SSH trust relationship may be

abnormal. You are advised to run **chown omm:wheel** to modify the permission and check again. If the permission on the **/home/omm** directory is normal, go to **2**.

2. The SSH trust relationship exception may cause heartbeat exceptions between Controller and NodeAgent, resulting in node fault alarms. In this case, rectify the fault by referring to the handling procedure of ALM-12006.

Process Running Time

Indicator: Running Time of NodeAgent, Controller, and Tomcat

Description: This indicator is used to check the running time of the NodeAgent, Controller, and Tomcat processes. If the time is less than half an hour (1,800s), the process may have been restarted. You are advised to check the process after half an hour. If multiple check results indicate that the process runs for less than half an hour, the process is abnormal.

Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the following command to check the PID based on the process name:

   ps -ef | grep NodeAgent
3. Run the following command to check the process startup time based on the PID:

   ps -p pid -o lstart
4. Check whether the process start time is normal. If the process restarts repeatedly, go to **5**.
5. View the related logs and analyze restart causes.

   If the runtime of NodeAgent is abnormal, check **/var/log/Bigdata/nodeagent/agentlog/agent.log**.

   If the Controller running time is abnormal, check the **/var/log/Bigdata/controller/controller.log** file.

   If the Tomcat running time is abnormal, check the **/var/log/Bigdata/tomcat/web.log** file.
6. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

Account and Password Expiration Check

Indicator: Account and Password Expiration Check

Description: This indicator checks the two operating system users **omm** and **ommdba** of MRS. For OS users, both the account and password expiration time must be checked. If the validity period of the account or password is not greater than 15 days, the account is abnormal.

Recovery Guide: If the validity period of the account or password is less than or equal to 15 days, contact O&M personnel.

10.7.17 Spark Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Spark service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-28001.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.18 Storm Health Check Indicators

Number of Working Nodes

Indicator: Number of Supervisors

Description: This indicator is used to check the number of available Supervisors in a cluster. If the number of available Supervisors in a cluster is less than 1, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Streaming service instance page and click the host name of the unavailable Supervisor instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to ALM-12007 Process Faults. If the status is not **Good**, rectify the fault by referring to the handling procedure of the ALM-12006 Node Faults.

Number of Idle Slots

Indicator: Number of Idle Slots

Description: This indicator is used to check the number of idle slots in a cluster. If the number of idle slots in a cluster is less than 1, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Storm service instance page and check the health status of the Supervisor instance. If the health status of all Supervisor instances is **Good**, you need to expand the capacity of the Core node in the cluster. If not, rectify the fault by referring to ALM-12007 Process Faults.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Storm service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to the alarm "ALM-26051 Storm Service Unavailable".

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.19 Yarn Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Yarn service status is normal. If the number of NodeManager nodes cannot be obtained, the system is unhealthy.

Recovery Guide: If this indicator is abnormal, you can handle the alarm by referring to the alarm handling guide and make sure that the network is normal.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.7.20 ZooKeeper Health Check Indicators

Average ZooKeeper Request Processing Latency

Indicator: Average ZooKeeper Service Request Processing Latency

Description: This indicator is used to check the average delay for the ZooKeeper service to process requests. If the average delay is greater than 300 ms, the ZooKeeper service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high.

ZooKeeper Connections Usage

Indicator: ZooKeeper Connections Usage

Description: This indicator is used to check whether the ZooKeeper memory usage exceeds 80%. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, you are advised to increase the memory available for the ZooKeeper service. The method of increasing the memory is as follows: Increase the value of **-Xmx** in the **GC_OPTS** configuration item in the ZooKeeper service. After the modification, restart the ZooKeeper service for the configuration to take effect.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether ZooKeeper service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the health status of the KrbServer and LdapServer services is faulty. If yes, rectify the fault. Log in to the ZooKeeper client, check whether the ZooKeeper data writing fails. If yes, find the failure cause based on the error message and handle the fault according to error message. Rectify the fault by following the procedure for handling ALM-13000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

10.8 Static Service Pool Management

10.8.1 Viewing the Status of a Static Service Pool

Scenario

MRS Manager manages and isolates service resources that are not running on YARN through the static service resource pool. It dynamically manages the total CPU, I/O, and memory resources that can be used by HDFS and YARN on the deployment node. The system supports time-based automatic adjustment of static service resource pools. This enables the cluster to automatically adjust the parameter values at different periods to ensure more efficient resource utilization.

On MRS Manager, you can view the monitoring metrics of the resources used by each service in the static service pool. The monitoring metrics are as follows:

- Service Total CPU Usage
- Service Total Disk I/O Read Speed
- Service Total Disk I/O Write Speed

- Service Total Memory Usage

Procedure

Step 1 On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.

Step 2 Click **Status**.

Step 3 Check the system resource adjustment base values.

- **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
- **CPU(%)** indicates the maximum number of CPUs that can be used by services on a node.
- **Memory(%)** indicates the maximum memory that can be used by services on a node.

Step 4 Check the cluster service resource usage.

In the chart area, select **All services** from the service drop-down list box. The resource usage status of all services in the service pool is displayed.

NOTE

Effective Configuration Group indicates the resource control configuration group used by the cluster service. By default, the **default** configuration group is used at all time every day, indicating that the cluster service can use all CPUs and 70% memory of the node.

Step 5 View the resource usage of a single service.

In the chart area, select a service from the service drop-down list box. The resource usage status of the service is displayed.

Step 6 You can set the interval for automatically refreshing the page.

The following refresh interval options are supported:

- **Refresh every 30 seconds**
- **Refresh every 60 seconds**
- **Stop refreshing**

Step 7 In the **Period** area, select a time range for viewing service resources. The options are as follows:

- Real time
- Last 3 hours
- Last 6 hours
- Last 24 hours
- Last week
- Last month
- Last 3 months

- Last 6 months
- Customize: If you select this option, you can customize the period for viewing monitoring data.

Step 8 Click **View** to view the service resource data in the corresponding time range.

Step 9 Customize a service resource report.

1. Click **Customize** and select the service source indicators to be displayed.
   - Service Total Disk I/O Read Speed
   - Service Total Memory Usage
   - Service Total Disk I/O Write Speed
   - Service Total CPU Usage
2. Click **OK** to save the selected monitoring metrics for display.

   NOTE

   Click **Clear** to cancel all the selected monitoring metrics in a batch.

Step 10 Export a monitoring report.

Click **Export**. MRS Manager will generate a report about the selected service resources in a specified time of period. Save the report.

NOTE

To view the curve charts of monitoring metrics in a specified period, click **View**.

----End

10.8.2 Configuring a Static Service Pool

Scenario

If you need to control the node resources that can be used by the cluster service or the CPU usage of the node used by the cluster in different time periods, you can adjust the resource base on MRS Manager and customize the resource configuration groups.

Prerequisites

- After the static service pool is configured, the HDFS and YARN services need to be restarted. During the restart, the services are unavailable.
- After a static service pool is configured, the maximum number of resources used by each service and role instance cannot exceed the upper limit.

Procedure

Step 1 Modify the system resource adjustment base.

1. On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.
2. Click **Configuration**. The service pool configuration group management page is displayed.

3. In the **System Resource Adjustment Base** area, change the values of **CPU(%)** and **Memory(%)** .

   Modifying **System Resource Adjustment Base** limits the maximum physical CPU and memory resource percentage of nodes that can be used by the Flume, HBase, HDFS, Impala and YARN services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

4. Click **Next**.

   If you need to modify the parameters again, click **Previous** in the lower part of the page.

Step 2 Modify the **default** configuration group of the service pool.

1. Click **default**. In the **Service Pool Configuration** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for the Flume, HBase, HDFS, Impala and YARN services.

NOTE

- The sum of **CPU LIMIT(%)** used by all services can exceed 100%.
- The sum of **CPU SHARE(%)** and **I/O(%)** used by all services must be 100%. For example, if CPU resources are allocated to the HDFS and Yarn services, the total CPU resources allocated to the two services are 100%.
- The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
- **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.

2. Click in the blank area of the page to complete the editing. MRS Manager generates the correct values of service pool parameters in the **Detailed Configuration** area based on the cluster hardware resources and allocation information.

3. You can click ✎ on the right of **Detailed Configuration** to modify the parameter values of the service pool based on service requirements.

   In the **Service Pool Configuration** area, click the specified service name. The **Detailed Configuration** area displays only the parameters of the service. Manual changing of parameter values does not refresh the service resource usage. In added configuration groups, the configuration group numbers of the parameters that take effect dynamically will be displayed. For example, **HBase: RegionServer: dynamic-config1.RES_CPUSET_PERCENTAGE**. The parameter functions do not change.

Table 10-29 Parameters of the static service pool

Parameter	Description
– RES_CPUSET_PERCENTAGE – dynamic-configX.RES_CPUSET_PERCENTAGE	Configures the service CPU percentage.

Parameter	Description
– RES_CPU_SHARE – dynamic-configX.RES_CPU_SHARE	Configures the service CPU share.
– RES_BLKIO_WEIGHT – dynamic-configX.RES_BLKIO_WEIGHT	Configures service I/O usage.
HBASE_HEAPSIZE	Configures the maximum JVM memory for RegionServer.
HADOOP_HEAPSIZE	Configures the maximum JVM memory of a DataNode.
yarn.nodemanager.resource.memory-mb	Configures the memory that can be used by NodeManager on the current node.
dfs.datanode.max.locked.memory	Configures the maximum memory that can be used by a DataNode as the HDFS cache.
FLUME_HEAPSIZE	Configures the maximum JVM memory that can be used by each Flume instance.
IMPALAD_MEM_LIMIT	Configures the maximum memory that can be used by an Impalad instance.

Step 3 Add a customized resource configuration group.

1. Determine whether to automatically adjust resource configurations based on the time.

   If yes, go to **Step 3.2**.

   If no, go to **Step 4**.

2. Click ⊕ to add a resource configuration group. In the **Scheduling Time** area, click ✎. The time policy configuration page is displayed.

   Modify the following parameters based on service requirements and click **OK**.

   - **Repeat**: If selected, the resource configuration group runs repeatedly based on the scheduling period. If not selected, set the date and time when the configuration of the group of resources can be applied.
   - **Repeat Policy**: can be set to **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.
   - **Between**: indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved. This parameter is valid only when **Repeat** is selected.

> NOTE
>
> - The **default** group of resource configuration takes effect in all undefined time segments.
> - The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
> - The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
> - Select a repetition policy. If the end time is earlier than the start time, the next day is labeled by default. For example, if a validity period ranges from 22:00 to 06:00, the customized resource configuration takes effect from 22:00 on the current day to 06:00 on the next day.
> - If the repeat policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: [04:00 to 07:00] and [06:00 to 08:00]. In this case, the configuration of the group that uses the monthly policy prevails.
> - If the repeat policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04:00 to 07:00, on Monday and Wednesday, respectively.

3. On the **Service Pool Configuration** page, modify the resource configuration of each service. Click the blank area on the page to complete the editing, and go to **Step 4**.

   You can click ✎ on the right of **Service Pool Configuration** to modify the parameters. Click ✎ in the **Detailed Configuration** area to manually update the parameter values generated by the system based on service requirements.

Step 4 Saves the settings.

Click **Save**. In the **Save Configuration** dialog box, select **Restart the affected services or instances**. Click **OK** to save the settings and restart related services.

Operation succeeded is displayed. click **Finish**. The service is started successfully.

----End

10.9 Tenant Management

10.9.1 Overview

Definition

An MRS cluster provides various resources and services for multiple organizations, departments, or applications to share. The cluster provides tenants as a logical entity to use these resources and services. A mode involving different tenants is called multi-tenant mode. Currently, only the analysis cluster supports tenant management.

Principles

The MRS cluster provides the multi-tenant function. It supports a layered tenant model and allows dynamic adding or deleting of tenants to isolate resources. It dynamically manages and configures tenants' computing and storage resources.

The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.

The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

As the unified tenant management platform of MRS clusters, MRS Manager provides enterprises with time-tested multi-tenant management models, enabling centralized tenant and service management. Tenants can create and manage tenants in a cluster based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- Permissions to view the current tenant's resources, add a subtenant, and manage the subtenant's resources are granted to the tenant's roles by default.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

MRS Manager supports a maximum of 512 tenants. The tenants that are created by default in the system contain **default**. Tenants that are in the topmost layer with the default tenant are called level-1 tenants.

Resource Pools

Yarn task queues support only the label-based scheduling policy. This policy enables Yarn task queues to associate NodeManagers that have specific node labels. In this way, Yarn tasks run on specified nodes so that tasks are scheduled and certain hardware resources are utilized. For example, Yarn tasks requiring a large memory capacity can run on nodes with a large memory capacity by means of label association, preventing poor service performance.

In an MRS cluster, the tenant logically divides Yarn cluster nodes to combine multiple NodeManagers into a resource pool. Yarn task queues can be associated with specified resource pools by configuring queue capacity policies, ensuring efficient and independent resource utilization in the resource pools.

MRS Manager supports a maximum of 50 resource pools. The system has a **Default** resource pool.

10.9.2 Creating a Tenant

Scenario

You can create a tenant on MRS Manager to specify the resource usage.

Prerequisites

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the HDFS directory.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click **Create Tenant**. On the page that is displayed, configure tenant properties.

Table 10-30 Tenant parameters

Parameter	Description
Name	Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).
Tenant Type	The options include **Leaf** and **Non-leaf**. If **Leaf** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If **Non-leaf** is selected, sub-tenants can be added to the current tenant.
Dynamic Resources	Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the tenant name in Yarn. When dynamic resources are not **Yarn**, the system does not automatically create a task queue.
Default Resource Pool Capacity (%)	Specifies the percentage of the computing resources used by the current tenant in the **default** resource pool.
Default Resource Pool Max. Capacity (%)	Specifies the maximum percentage of the computing resources used by the current tenant in the **default** resource pool.
Storage Resource	Specifies storage resources for the current tenant. The system automatically creates a file folder named after the tenant name in the **/tenant** directory. When a tenant is created for the first time, the system automatically creates the **/tenant** directory in the HDFS root directory. If storage resources are not **HDFS**, the system does not create a storage directory under the root directory of HDFS.

Parameter	Description
Space Quota (MB)	Specifies the quota for HDFS storage space used by the current tenant. The value ranges from **1** to **8796093022208**. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the oHDFS physical disk. **NOTE** To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).
Storage Path	Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the tenant name in the **/tenant** directory by default. For example, the default HDFS storage directory for tenant **ta1** is **tenant/ta1**. When a tenant is created for the first time, the system automatically creates the **/tenant** directory in the HDFS root directory. The storage path is customizable.
Service	Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click **Associate Services**. In the dialog box that is displayed, set **Service** to **HBase**. If **Association Mode** is set to **Exclusive**, service resources are occupied exclusively. If **share** is selected, service resources are shared.
Description	Specifies the description of the current tenant.

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully.

NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the Manager_tenant role and the role corresponding to the tenant to the user. For details, see **Creating a User**.

----End

Related Tasks

Viewing an added tenant

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, click the name of the added tenant.

The **Summary** tab is displayed on the right by default.

Step 3 View **Basic Information**, **Resource Quota**, and **Statistics** of the tenant.

If HDFS is in the **Stopped** state, **Available** and **Used** of **Space** in **Resource Quota** are **unknown.**

----End

10.9.3 Creating a Sub-tenant

Scenario

You can create a sub-tenant on MRS Manager if the resources of the current tenant need to be further allocated.

Prerequisites

- A parent tenant has been added.
- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a sub-tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the storage directory of the parent tenant.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table:

Table 10-31 Sub-tenant parameters

Parameter	Description
Parent tenant	Specifies the name of the parent tenant.
Name	Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).

Parameter	Description
Tenant Type	The options include **Leaf** and **Non-leaf**. If **Leaf** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If **Non-leaf** is selected, sub-tenants can be added to the current tenant.
Dynamic Resources	Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the sub-tenant name in the Yarn parent queue. When dynamic resources are not **Yarn**, the system does not automatically create a task queue. If the parent tenant does not have dynamic resources, the sub-tenant cannot use dynamic resources.
Default Resource Pool Capacity (%)	Specifies the percentage of the resources used by the current tenant. The base value is the total resources of the parent tenant.
Default Resource Pool Max. Capacity (%)	Specifies the maximum percentage of the computing resources used by the current tenant. The base value is the total resources of the parent tenant.
Storage Resource	Specifies storage resources for the current tenant. The system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. If storage resources are not **HDFS**, the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources.
Space Quota (MB)	Specifies the quota for HDFS storage space used by the current tenant. The minimum value is 1, and the maximum value is the total storage quota of the parent tenant. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the oHDFS physical disk. If the quota is greater than the quota of the parent tenant, the actual storage capacity is subject to the quota of the parent tenant. **NOTE** To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).

Parameter	Description
Storage Path	Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is **ta1s** and the parent directory is **tenant/ta1**, the system sets this parameter for the sub-tenant to **tenant/ta1/ta1s**. The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.
Service	Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click **Associate Services**. In the dialog box that is displayed, set **Service** to **HBase**. If **Association Mode** is set to **Exclusive**, service resources are occupied exclusively. If **share** is selected, service resources are shared.
Description	Specifies the description of the current tenant.

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- When using this tenant, create a system user and assign the user a related tenant role. For details, see **Creating a User**.

----End

10.9.4 Deleting a tenant

Scenario

You can delete a tenant that is not required on MRS Manager.

Prerequisites

- A tenant has been added.
- You have checked whether the tenant to be deleted has sub-tenants. If the tenant has sub-tenants, delete them; otherwise, you cannot delete the tenant.

- The role of the tenant to be deleted cannot be associated with any user or user group. For details about how to cancel the binding between a role and a user, see **Modifying User Information**.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

Step 3 Click OK to save the settings.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

NOTE

- After the tenant is deleted, the task queue of the tenant still exists in Yarn.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

10.9.5 Managing a Tenant Directory

Scenario

You can manage the HDFS storage directory used by a specific tenant on MRS Manager. The management operations include adding a tenant directory, modifying the directory file quota, modifying the storage space, and deleting a directory.

Prerequisites

A tenant associated with HDFS storage resources has been added.

Procedure

- Viewing a tenant directory
  a. On MRS Manager, click **Tenant**.
  b. In the tenant list on the left, click the target tenant.
  c. Click the **Resource** tab.
  d. View the **HDFS Storage** table.
     - The Quota column indicates the quantity quotas of files and directories.
     - The **Storage Space Quota** column indicates the storage space size of the tenant directory.

- Adding a tenant directory
  1. On MRS Manager, click **Tenant**.
  2. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be added.
  3. Click the **Resource** tab.
  4. In the **HDFS Storage** table, click **Create Directory**.
     - In **Parent Directory**, select a storage directory of a parent tenant.

       This parameter applies only to sub-tenants. If the parent tenant has multiple directories, select any of them.
     - Set **Path** to a tenant directory path.

       NOTE

       - If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.
       - If the current tenant is a sub-tenant, the new path is created in the specified directory.

       A complete HDFS storage directory can contain a maximum of 1,023 characters. An HDFS directory name contains digits, letters, spaces, and underscores (_). The name cannot start or end with a space.
     - Set **Quota** to the quotas of file and directory quantity.

       Maximum Number of Files/Directories is optional. Its value ranges from **1** to **9223372036854775806**.
     - Set **Storage Space Quota** to the storage space size of the tenant directory.

       The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

       NOTE

       To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).
  5. Click **OK**. The system creates tenant directories in the HDFS root directory.
- Modify a tenant directory.
  1. On MRS Manager, click **Tenant**.
  2. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be modified.
  3. Click the **Resource** tab.
  4. In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.
     - Set **Quota** to the quotas of file and directory quantity.

       Maximum Number of Files/Directories is optional. Its value ranges from **1** to **9223372036854775806**.

- Set **Storage Space Quota** to the storage space size of the tenant directory.

  The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

  NOTE

  To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).

e. Click **OK**.

- Delete a tenant directory.

a. On MRS Manager, click **Tenant**.

b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be deleted.

c. Click the **Resource** tab.

d. In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

   The default HDFS storage directory set during tenant creation cannot be deleted. Only the newly added HDFS storage directory can be deleted.

e. Click **OK**.

10.9.6 Restoring Tenant Data

Scenario

Tenant data is stored on Manager and in cluster components by default. When components are restored from faults or reinstalled, some tenant configuration data may be abnormal. In this case, you can manually restore the tenant data.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, click a tenant node.

Step 3 Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the left of **Basic Information**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resources** and check the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Good** indicates that the component can provide services for the associated tenant. **Bad** indicates that the component cannot provide services for the tenant.

4. If any check result is abnormal, go to **Step 4** to restore tenant data.

Step 4 Click **Restore Tenant Data**.

Step 5 In the **Restore Tenant Data** window, select one or more components whose data needs to be restored. Click **OK**. The system automatically restores the tenant data.

----End

10.9.7 Creating a Resource Pool

Scenario

In an MRS cluster, users can logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The system contains a **Default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

You can create a customized resource pool on MRS Manager and add hosts that have not been added to other customized resource pools to it.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Click **Add Resource Pool**.

Step 4 In **Create Resource Pool**, set the properties of the resource pool.

- **Name**: Enter a name for the resource pool. The name of the newly created resource pool cannot be **Default**.

  The name consists of 1 to 20 characters and can contain digits, letters, and underscores (_) but cannot start with an underscore (_).

- **Hosts**: In the host list on the left, select the name of a specified host and click >> to add the selected host to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

Step 5 Click **OK**.

Step 6 After a resource pool is created, users can view the **Name**, **Members**, **Type**, **vCore** and **Memory** in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **Default** resource pool.

----End

10.9.8 Modifying a Resource Pool

Scenario

You can modify members of an existing resource pool on MRS Manager.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Locate the row that contains the specified resource pool, and click **Modify** in the **Operation** column.

Step 4 In **Modify Resource Pool**, modify **Added Hosts**.

- Adding a host: Select the name of a specified host in host list on the left and click >> to add the selected host to the resource pool.
- Deleting a host: In the host list on the right, select the name of a specified host and click << to add the selected host to the resource pool. The host list of a resource pool can be left blank.

Step 5 Click **OK**.

----End

10.9.9 Deleting a Resource Pool

Scenario

You can delete an existing resource pool on MRS Manager.

Prerequisites

- Any queue in a cluster cannot use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see **Configuring a Queue**.
- Resource distribution policies of all queues have been cleared from the resource pool being deleted. For details, see **Clearing Configuration of a Queue**.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

In the displayed dialog box, click **OK**.

----End

10.9.10 Configuring a Queue

Scenario

This section describes how to modify the queue configuration for a specified tenant on MRS Manager.

Prerequisites

A tenant associated with Yarn and allocated dynamic resources has been added.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 Click the **Queue Configuration** tab.

Step 4 In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

NOTE

In the tenant list on the left of the **Tenant Management** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click ✎ to open the queue modification page.

Table 10-32 Queue configuration parameters

Parameter	Description
Maximum Application	Specifies the maximum number of applications. The value ranges from 1 to 2147483647.
Maximum AM Resource Percent	Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster. The value ranges from 0 to 1.
Minimum User Limit Percent (%)	Specifies the minimum percentage of resources consumed by a user. The value ranges from 0 to 100.
User Limit Factor	Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster. The minimum value is **0**.
Status	Specifies the current status of a resource plan. The values are **Running** and **Stopped**.

Parameter	Description
Default Resource Pool	Specifies the resource pool used by a queue. The default value is **Default**. If you want to change the resource pool, configure the queue capacity first. For details, see **Configuring the Queue Capacity Policy of a Resource Pool**.

----End

10.9.11 Configuring the Queue Capacity Policy of a Resource Pool

Scenario

After a resource pool is added, the capacity policies of available resources need to be configured for Yarn task queues. This ensures that tasks in the resource pool are running properly. Each queue can be configured with the queue capacity policy of only one resource pool. Users can view the queues in any resource pool and configure queue capacity policies. After the queue policies are configured, Yarn task queues and resource pools are associated.

You can configure queue policies on MRS Manager.

Prerequisites

- A resource pool has been added.
- The task queues are not associated with other resource pools. By default, all queues are associated with the **Default** resource pool.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 In **Resource Pools**, select a specified resource pool.

Available Resource Quota: indicates that all resources in each resource pool are available for queues by default.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

Step 5 In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

Step 6 Click **OK** to save the settings.

----End

10.9.12 Clearing Configuration of a Queue

Scenario

Users can clear the configuration of a queue on MRS Manager when the queue does not need resources from a resource pool or if a resource pool needs to be disassociated from the queue. Clearing queue configurations means that the resource capacity policy of the queue is canceled.

Prerequisites

If a queue is to be unbound from a resource pool, this resource pool cannot serve as the default resource pool of the queue. Therefore, you must first change the default resource pool of the queue to another one. For details, see **Configuring a Queue**.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 In **Resource Pools**, select a specified resource pool.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Clear** in the **Operation** column.

In the **Clear Queue Configuration** dialog box, click **OK** to clear the queue configuration in the current resource pool.

NOTE

If no resource capacity policy is configured for a queue, the clearing function is unavailable for the queue by default.

----End

10.10 Backup and Restoration

10.10.1 Introduction

Purpose

MRS Manager provides backup and restoration for user data and system data. The backup function is provided based on components to back up Manager data (including OMS data and LdapServer data), Hive user data, component metadata saved in DBService, and HDFS metadata.

Backup and restoration tasks are performed in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- If the system is faulty, the data backup can be used to recover the system.
- If the active cluster is completely faulty, a mirror cluster identical to the active cluster needs to be created. You can use the backup data to restore the active cluster.

Table 10-33 Backing up metadata

Backup Type	Backup Content
OMS	Database data (excluding alarm data) and configuration data in the cluster management system to be backed up by default
LdapServer	User information, including the username, password, key, password policy, and group information
DBService	Metadata of the components (Hive) managed by DBService
NameNode	HDFS metadata.

Principles

Task

Before backup or restoration, you need to create a backup or restoration task and set task parameters, such as the task name, backup data source, and type of backup file save path. Data backup and restoration can be performed by executing backup and restoration tasks. When the Manager is used to recover the data of HDFS, HBase, Hive, and NameNode, no cluster can be accessed.

Each backup task can back up data of different data sources and generates an independent backup file for each data source. All the backup files generated in each backup task form a backup file set, which can be used in restoration tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS. The backup task provides the full backup or incremental backup policies. HDFS and Hive backup tasks support the incremental backup policy, while OMS, LdapServer, DBService, and NameNode backup tasks support only the full backup policy.

NOTE

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started at the same time.
- The interval at which a periodical task is automatically executed must be greater than 120s; otherwise, the task is postponed and will be executed in the next period. Manual tasks can be executed at any interval.
- When a periodic task is to be automatically executed, the current time cannot be 120s later than the task start time; otherwise, the task is postponed and executed in the next period.
- When a periodic task is locked, it cannot be automatically executed and needs to be manually unlocked.
- Before an OMS, LdapServer, DBService, or NameNode backup task starts, ensure that the LocalBackup partition on the active management node has more than 20 GB available space. Otherwise, the backup task cannot be started.
- When you are planning backup and restoration tasks, select the data to be backed up or restored strictly based on the service logic, data store structure, and database or table association. The system creates a default periodic backup task **default** whose execution interval is 24 hours to perform full backup of OMS, LdapServer, DBService, and NameNode data to the Linux local disk.

Specifications

Table 10-34 Backup and restoration feature specifications

Item	Specifications
Maximum number of backup or restoration tasks	100
Number of concurrent running tasks	1
Maximum number of waiting tasks	199
Maximum size of backup files on a Linux local disk (GB)	600

Table 10-35 Specifications of the **default** task

Item	OMS	LdapServer	DBService	NameNode
Backup period	1 hour			
Maximum number of copies	2			
Maximum size of a backup file	10 MB	20 MB	100 MB	1.5 GB

Item	OMS	LdapServer	DBService	NameNode
Maximum size of disk space used	20 MB	40 MB	200 MB	3 GB
Save path of backup data	*Data save path*/**LocalBackup/** of the active and standby management nodes			

NOTE

The backup data of the **default** task must be periodically transferred and saved outside the cluster based on the enterprise O&M requirements.

10.10.2 Backing Up Metadata

Scenario

To ensure the security of metadata either on a routine basis or before and after performing critical metadata operations (such as scale-out, scale-in, patch installation, upgrades, and migration), metadata must be backed up. The backup data can be used to recover the system if an exception occurs or if the operation has not achieved the expected result. This minimizes the adverse impact on services. Metadata includes data of OMS, LdapServer, DBService, and NameNode. MRS Manager data to be backed up includes OMS data and LdapServer data.

By default, metadata backup is supported by the **default** task. This section describes how to create a backup task and back up metadata on MRS Manager. Both automatic backup tasks and manual backup tasks are supported.

Prerequisites

- A standby cluster for backing up data has been created, and the network is connected. The inbound rules of the two security groups on the peer cluster have been added to the two security groups in each cluster to allow all access requests of all protocols and ports of all ECSs in the security groups.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path*/**LocalBackup/** has sufficient space on the active and standby management nodes.

Procedure

Step 1 Create a backup task.

1. On MRS Manager, choose **System** > **Back Up Data**.
2. Click **Create Backup Task**.

Step 2 Configure a backup policy.

1. Set **Task Name** to the name of the backup task.

2. Set **Backup Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

   To create a periodic backup task, set the following parameters:

   – **Started**: indicates the time when the task is started for the first time.

   – **Period**: indicates the task execution interval. The options include **By hour** and **By day**.

   – **Backup Policy**: indicates the volume of data to be backed up in each task execution. The options include **Full backup at the first time and incremental backup later**, **Full backup every time**, and **Full backup once every n times**. If you select **Full backup once every n times**, you need to specify the value of **n**.

Step 3 Select backup sources.

In the **Configuration** area, select **OMS** and **LdapServer** under **Metadata**.

Step 4 Set backup parameters.

1. Set **Path Type** of **OMS** and **LdapServer** to a backup directory type.

   The following backup directory types are supported:

   – **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path*/**LocalBackup/**. If you select **LocalDir**, you need to set the maximum number of copies to specify the number of backup files that can be retained in the backup directory.

   – **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:

     ▪ **Target Path**: indicates the HDFS directory for storing the backup files. The save path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory.

     ▪ **Max Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

     ▪ **Target Instance Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

2. Click **OK**.

Step 5 Execute the backup task.

In the **Operation** column of the created task in the backup task list, click **Back Up Now** if **Backup Mode** is set to **Periodic** or click **Start** If **Backup Mode** is set to **Manual** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version_Data source_Task execution time***.tar.gz**.

----End

10.10.3 Restoring Metadata

Scenario

You need to restore metadata in the following scenarios: A user modifies or deletes data unexpectedly, data needs to be retrieved, system data becomes abnormal or does not achieve the expected result, all modules are faulty, and data is migrated to a new cluster.

This section describes how to restore metadata on MRS Manager. Only manual restoration tasks are supported.

NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the data that is generated after the data backup and before the data restoration will be lost.
- Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail.
- By default, MRS clusters use DBService to store Hive metadata.

Impact on the System

- After the data is restored, the data generated between the backup time and restoration time is lost.
- After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.

Prerequisites

- The data in the OMS and LdapServer backup files has been backed up at the same time.
- The status of the OMS resources and the LdapServer instances is normal. If the status is abnormal, data restoration cannot be performed.
- The status of the cluster hosts and services is normal. If the status is abnormal, data restoration cannot be performed.
- The cluster host topologies during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
- The services added to the cluster during data restoration and data backup are the same. If the services are different, data restoration cannot be performed and you need to back up data again.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.
- The upper-layer applications depending on the MRS cluster have been stopped.

- On MRS Manager, you have stopped all the NameNode role instances whose data is to be recovered. Other HDFS role instances are running properly. After data is recovered, the NameNode role instances need to be restarted and cannot be accessed before the restart.
- You have checked whether NameNode backup files have been stored in the *Data save path***/LocalBackup/** directory on the active management node.

Procedure

Step 1 Check the location of backup data.

1. On MRS Manager, choose **System** > **Back Up Data**.
2. In the row where the specified backup task resides, choose **More** > **View History** in the **Operation** column to display the historical execution records of the backup task. In the window that is displayed, select a success record and click **View Backup Path** in the corresponding column to view its backup path information. Find the following information:
   - **Backup Object**: indicates the backup data source.
   - **Backup Path**: indicates the full path where backup files are stored.
3. Select the correct path, and manually copy the full path of backup files in **Backup Path**.

Step 2 Create a restoration task.

1. On MRS Manager, choose System > Recovery Management.
2. On the page that is displayed, click **Create Restoration Task**.
3. Set **Task Name** to the name of the restoration task.

Step 3 Select restoration sources.

In **Configuration**, select the metadata component whose data is to be restored.

Step 4 Set the restoration parameters.

1. Set **Path Type** to a backup directory type.
2. The settings vary according to backup directory types:
   - **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select **LocalDir**, you need to set **Source Path** to specify the full path of the backup file. For example, *Data storage path***/LocalBackup/***Backup task name_Task creation time***/***Data source_Task execution time***/***Version number_Data source_Task execution time***.tar.gz**.
   - **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:
     - **Source Path**: indicates the full HDFS path of a backup file. for example, *Backup path/Backup task name_Task creation time/Version_Data source_Task execution time***.tar.gz**.
     - **Source Instance Name**: indicates the name of NameService corresponding to the backup directory when a restoration task is being executed. The default value is **hacluster**.

3. Click **OK**.

Step 5 Execute the restoration task.

In the restoration task list, locate the row where the created task resides, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and try to execute the task again by clicking **Start**.

Step 6 Determine what metadata has been restored.

- If the OMS and LdapServer metadata is restored, go to **Step 7**.
- If DBService data is restored, no further action is required.
- Restore NameNode data. On MRS Manager, choose **Services > HDFS > More > Restart Service**. The task is complete.

Step 7 Restarting Manager for the recovered data to take effect

1. In MRS Manager, Choose **LdapServer** > **More** > **Restart Service** and click **OK**. Wait until the LdapServer service is restarted successfully.
2. Log in to the active management node. For details, see **Determining Active and Standby Management Nodes of Manager**.
3. Run the following command to restart OMS:

   sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh

   The command has been executed successfully if the following information is displayed:

   ```
   start HA successfully.
   ```
4. On MRS Manager, choose **KrbServer > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the KrbServer service configuration is synchronized and restarted successfully.
5. Choose **Services > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the cluster is configured and synchronized successfully.
6. Choose **Services > More > Stop Cluster**. After the cluster is stopped, choose **Services > More> Start Cluster**.

----End

10.10.4 Modifying a Backup Task

Scenario

This section describes how to modify the parameters of a created backup task on MRS Manager to meet changing service requirements. The parameters of restoration tasks can be viewed but not modified.

Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.

Procedure

Step 1 On MRS Manager, choose **System** > **Back Up Data**.

Step 2 In the task list, locate a specified task, click **Modify** in the **Operation** column to go to the configuration modification page.

Step 3 Modify the following parameters on the displayed page:

- Manual backup:
  - Target Path
  - Max Number of Backup Copies
- Periodic backup:
  - Started
  - Period
  - Target Path
  - Max Number of Backup Copies

NOTE

- When **Path Type** is set to **LocalHDFS**, **Target Path** is valid for modifying a backup task.
- After you change the value of **Target Path** for a backup task, full backup is performed by default when the task is executed for the first time.

Step 4 Click **OK**.

----End

10.10.5 Viewing Backup and Restoration Tasks

Scenario

This section describes how to view created backup and restoration tasks and check their running status on MRS Manager.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Click **Back Up Data** or **Restore Data**.

Step 3 In the task list, obtain the previous execution result in the **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

Step 4 In the **Operation** column of a specified task in the task list, choose **More** > **View History** to view the historical record of backup and restoration execution.

In the displayed window, click **View** in the **Details** column. The task execution logs and paths are displayed.

----End

Related Tasks

- Modifying a backup task

  For details, see **Modifying a Backup Task**.
- Viewing a restoration task

  In the **Operation** column of the specified task in the task list, click **View Details** to view the restoration task. You can only view but cannot modify the parameters of a restoration task.
- Executing a backup or restoration task

  In the task list, locate a specified task and click **Start** in the **Operation** column to start a backup or restoration task that is ready or fails to be executed. Executed restoration tasks cannot be repeatedly executed.
- Stopping backup tasks

  In the task list, locate a specified task and click **More** > **Stop** in the **Operation** column to stop a backup task that is running.
- Deleting a backup or restoration task

  In the **Operation** column of the specified task in the task list, choose **More** > **Delete** to delete the backup or restoration task. After a task is deleted, the backup data is retained by default.
- Suspending a backup task

  In the **Operation** column of the specified task in the task list, choose **More** > **Suspend** to suspend the backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To cancel the suspension status of a task, click **More** > **Resume**.

10.11 Security Management

10.11.1 Default Users of Clusters with Kerberos Authentication Disabled

User Classification

The MRS cluster provides the following two types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System users	User who runs OMS processes
Database users	● User who manages OMS database and accesses data ● User who runs the database of service components (Hive, Loader, and DBService)

System users

NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

Operation	Username	Initial Password	Description
MRS cluster node OS user	root	Set by the user	User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.

User Group Information

Default User Group	Description
supergroup	Primary group of user **admin**, which has no additional permissions in the cluster with Kerberos authentication disabled.
check_sec_ldap	Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. which is an internal system user group used only between components.
Manager_tenant	Tenant system user group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
System_administrator	MRS cluster system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.

Default User Group	Description
Manager_viewer	MRS Manager system viewer group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_operator	MRS Manager system operator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_auditor	MRS Manager system auditor group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_administrator	MRS Manager system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
compcommon	MRS cluster internal group, used to access public resources in the cluster. All system users and system running users are added to this user group by default.
default_1000	User group created for tenants, which is an internal system user group used only between components.
launcher-job	MRS internal group, which is used to submit jobs using V2 APIs.

OS User Group	Description
wheel	Primary group of MRS internal running user **omm**.
ficommon	MRS cluster common group that corresponds to **compcommon** for accessing public resource files stored in the OS of the cluster.

Database users

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

Operation	Default User	Initial Password	Description
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping.
	omm	ChangeMe@123456	User for accessing OMS database data
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component
	hive	HiveUser@	User for Hive to connect to the DBService database
	hue	HueUser@123	User for Hue to connect to the DBService database

10.11.2 Default Users of Clusters with Kerberos Authentication Enabled

User Classification

The MRS cluster provides the following three types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System user	● User created on Manager for MRS cluster O&M and service scenarios. There are two types of users: – **Human-machine** user: used for Manager O&M scenarios and component client operation scenarios. – **Machine-machine** user: used for MRS cluster application development scenarios. ● User who runs OMS processes.
Internal system user	Internal user who performs process communications, saves user group information, and associates user permissions.
Database user	● User who manages OMS database and accesses data. ● User who runs the database of service components (Hive, Hue, Loader, and DBService)

System User

NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

Type	Username	Initial Password	Description
System administrator of the MRS cluster	admin	Specified by the user during the cluster creation.	Manager administrator with the following permissions: ● Common HDFS and ZooKeeper user permissions. ● Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI. ● Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service. ● Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service.
MRS cluster node OS user	omm	Randomly generated by the system.	Internal running user of the MRS cluster system. This user is an OS user generated on all nodes and does not require a unified password.
MRS cluster node OS user	root	Set by the user.	User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.

Internal System Users

NOTE

Do not delete the following internal system users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
Component running user	hdfs	Hdfs@123	This user is the HDFS system administrator and has the following permissions: 1. File system operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. ● Views and sets disk quotas for users. 2. HDFS management operation permissions: ● Views the web UI status. ● Views and sets the active and standby HDFS status. ● Enters and exits the HDFS in security mode. ● Checks the HDFS file system.

Type	Default User	Initial Password	Description
	hbase	Hbase@123	This user is the HBase system administrator and has the following permissions: ● Cluster management permission: **Enable** and **Disable** operations on tables to trigger MajorCompact and ACL operations. ● Grants and revokes permissions, and shuts down the cluster. ● Table management permission: Creates, modifies, and deletes tables. ● Data management permission: Reads and writes data in tables, column families, and columns. ● Accesses the HBase web UI.
	mapred	Mapred@123	This user is the MapReduce system administrator and has the following permissions: ● Submits, stops, and views the MapReduce tasks. ● Modifies the Yarn configuration parameters. ● Accesses the Yarn and MapReduce web UI.
	spark	Spark@123	This user is the Spark system administrator and has the following permissions: ● Accesses the Spark web UI. ● Submits Spark tasks.

User Group Information

Default User Group	Description
hadoop	Users added to this user group have the permission to submit tasks to all Yarn queues.
hbase	Common user group. Users added to this user group will not have any additional permission.
hive	Users added to this user group can use Hive.
spark	Common user group. Users added to this user group will not have any additional permission.
supergroup	Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.
check_sec_ldap	Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components.
Manager_tenant	Tenant system user group, which is an internal system user group used only between components.
System_administrator	MRS cluster system administrator group, which is an internal system user group used only between components.
Manager_viewer	MRS Manager system viewer group, which is an internal system user group used only between components.
Manager_operator	MRS Manager system operator group, which is an internal system user group used only between components.
Manager_auditor	MRS Manager system auditor group, which is an internal system user group used only between components.
Manager_administrator	MRS Manager system administrator group, which is an internal system user group used only between components.
compcommon	Internal system group for accessing public resources in a cluster. All system users and system running users are added to this user group by default.
default_1000	User group created for tenants, which is an internal system user group used only between components.

Default User Group	Description
kafka	Kafka common user group. Users added to this group need to be granted with read and write permission by users in the **kafkaadmin** group before accessing the desired topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
storm	Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
stormadmin	Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
opentsdb	Common user group. Users added to this user group will not have any additional permission.
presto	Common user group. Users added to this user group will not have any additional permission.
flume	Common user group. Users added to this user group will not have any additional permission.
launcher-job	MRS internal group, which is used to submit jobs using V2 APIs.

OS User Group	Description
wheel	Primary group of MRS internal running user **omm**.
ficommon	MRS cluster common group that corresponds to **compcommon** for accessing public resource files stored in the OS of the cluster.

Database User

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping applications.
	omm	ChangeMe@123456	User for accessing OMS database data.
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component.
	hive	HiveUser@	User for Hive to connect to the DBService database.
	hue	HueUser@123	User for Hue to connect to the DBService database.
	sqoop	SqoopUser@	User for Loader to connect to the DBService database.
	ranger	RangerUser@	User for Ranger to connect to the DBService database.

10.11.3 Changing the Password of an OS User

Scenario

This section describes how to periodically change the login passwords of the OS users **omm**, **ommdba**, and **root** on MRS cluster nodes to improve the system O&M security.

Passwords of users **omm**, **ommdba**, and **root** on each node can be different.

Procedure

Step 1 Log in to the **Master1** node and then log in to other nodes whose OS user passwords need to be changed.

Step 2 Run the following command to switch to user **root**:

sudo su - root

Step 3 Run the following command to change the passwords of users **omm**, **ommdba**, or **root**:

passwd omm

passwd ommdba

passwd root

For example, if you run the **omm:passwd** command, the system displays the following information:

```
Changing password for user omm.
New password:
```

Enter a new password. The password change policies for an OS vary according to the OS that is used.

```
Retype new password:
passwd: all authentication tokens updated successfully.
```

NOTE

The default password complexity requirements of the MRS cluster are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The new password cannot be the same as last five historical passwords.

----End

10.11.4 Changing the password of user admin

This section describes how to periodically change the password of cluster user **admin** to improve the system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Changing the Password of User admin on the Cluster Node

Step 1 Update the client of the active management node. For details, see **Updating a Client (Versions Earlier Than 3.x)**.

Step 2 Log in to the active management node.

Step 3 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 4 Run the following command to switch to the client directory, for example, **/opt/client**.

cd /opt/client

Step 5 Run the following command to configure environment variables:

source bigdata_env

Step 6 Run the following command to change the password of user **admin**: This operation takes effect in the whole cluster.

kpasswd admin

Enter the old password and then enter a new password twice.

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

Changing the Password of User admin on MRS Manager

You can change the password of user **admin** on MRS Manager only for clusters with Kerberos authentication enabled and clusters with Kerberos authentication disabled but the EIP function enabled.

Step 1 Log in to MRS Manager as user **admin**.

Step 2 Click the username in the upper right corner of the page and choose **Change Password**.

Step 3 On the **Change Password** page, set **Old Password**, **New Password**, and **Confirm Password**.

NOTE

The default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

Step 4 Click **OK**. Log in to MRS Manager with the new password.

----End

Resetting the Password for User admin

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

cpw *Component running user name*

For example, to reset the password of user admin, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

10.11.5 Changing the Password of the Kerberos Administrator

Scenario

This section describes how to periodically change the password of the Kerberos administrator **kadmin** of the MRS cluster to improve the system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Prerequisites

A client has been prepared on the **Master1** node.

Procedure

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**.

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to change the password of **kadmin/admin**. This operation takes effect for all servers.

kpasswd kadmin/admin

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

10.11.6 Changing the Passwords of the LDAP Administrator and the LDAP User

Scenario

This section describes how to periodically change the passwords of the LDAP administrator **rootdn:cn=root,dc=hadoop,dc=com** and the LDAP user **pg_search_dn:cn=pg_search_dn,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

Impact on the System

All services need to be restarted for the new password to take effect. The services are unavailable during the restart.

Procedure

Step 1 On MRS Manager, choose **Services > LdapServer > More**.

Step 2 Click **Change Password**.

Step 3 In the **Change Password** dialog box, select the user whose password needs to be modified in the **User Information** drop-down box.

Step 4 Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The default password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters (`~!@#$%^&*()-_=+\|[{}];:",<.>/?).
- The password cannot be the username or the reverse username.
- The new password cannot be the same as the current password.

NOTE

The default password of the LDAP administrator **rootdn:cn=root,dc=hadoop,dc=com** is **LdapChangeMe@123**, and that of the LDAP user **pg_search_dn:cn=pg_search_dn,ou=Users,dc=hadoop,dc=com** is **pg_search_dn@123**. Periodically change the passwords and keep them secure.

Step 5 Select **I have read the information and understand the impact**, and click **OK** to confirm the modification and restart the service.

----End

10.11.7 Changing the Password of a Component Running User

Scenario

This section describes how to periodically change the password of the component running user of the MRS cluster to improve the system O&M security.

If the initial password is randomly generated by the system, reset the password.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Prerequisites

A client has been prepared on the **Master1** node.

Procedure

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

cpw *Component running user name*

For example, to reset the password of user admin, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.

- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

10.11.8 Changing the Password of the OMS Database Administrator

Scenario

This section describes how to periodically change the password of the OMS database administrator to improve the system O&M security.

Procedure

Step 1 Log in to the active management node.

NOTE

The password of user **ommdba** cannot be changed on the standby management node. Otherwise, the cluster may not work properly. Change the password on the active management node only.

Step 2 Run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch the directory:

cd $OMS_RUN_PATH/tools

Step 4 Run the following command to change the password of user **ommdba**:

mod_db_passwd ommdba

Step 5 Enter the old password of user **ommdba** and enter a new password twice.

The password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully.

```
Congratulations, update [ommdba] password successfully.
```

----End

10.11.9 Changing the Password of the Data Access User of the OMS Database

Scenario

This section describes how to periodically change the password of the data access user of the OMS database to improve the system O&M security.

Impact on the System

The OMS service needs to be restarted for the new password to take effect. The service is unavailable during the restart.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Change OMS Database Password**.

Step 3 Locate the row that contains user **omm**, and click **Change password** in the **Operation** column.

The password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

Step 4 Click **OK**. When **Operation successful** is displayed, click **Finish**.

Step 5 Locate the row that contains user **omm**, and click **Restart the OMS service** in the **Operation** column to restart the OMS database.

NOTE

If the password is changed but the OMS database is not restarted, the status of user **omm** changes to **Waiting to restart** and the password cannot be changed until the OMS database is restarted.

Step 6 In the displayed dialog box, select **I have read the information and understand the impact**. Click **OK**, and restart the OMS service.

----End

10.11.10 Changing the Password of a Component Database User

Scenario

This section describes how to periodically change the password of the component database user to improve the system O&M security.

Impact on the System

The services need to be restarted for the new password to take effect. The services are unavailable during the restart.

Procedure

Step 1 On MRS Manager, click **Services** and click the name of the database user service to be modified.

Step 2 Determine the component database user whose password is to be changed.

- To change the password of the DBService database user, go to **Step 3**.
- To change the password of the Loader, Hive, or Hue database user, stop the service first and then execute **Step 3**.

Click **Stop Service**.

Step 3 Choose **More** > **Change Password**.

Step 4 Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The password of the DBService database user contains 16 to 32 characters. The password of the Loader, Hive, or Hue database user contains 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

Step 5 Click **OK**. The system automatically restarts the corresponding service. When **Operation successful** is displayed, click **Finish**.

----End

10.11.11 Replacing the HA Certificate

Scenario

HA certificates are used to encrypt the communication between active/standby processes and HA processes to ensure the communication security. This section describes how to replace the HA certificates on the active and standby management nodes on MRS Manager to ensure the product security.

The certificate file and key file can be generated by the user.

Impact on the System

MRS Manager needs to be restarted during the replacement and cannot be accessed or provide services at that time.

Prerequisites

- You have obtained the **root-ca.crt** HA root certificate file and the **root-ca.pem** key file to be replaced.
- You have prepared a password, such as **Userpwd@123**, for accessing the key file.

  To avoid potential security risks, the password must meet the following complexity requirements:

  – The password must contain at least eight characters.

  – The password must contain at least four types of the following characters: uppercase letters, lowercase letters, digits, and special characters (~`!?,.:;-_'(){}[]/<>@#$%^&*+|\=).

Procedure

Step 1 Log in to the active management node.

Step 2 Run the following commands to switch the user:

sudo su - root

su - omm

Step 3 Run the following commands to generate **root-ca.crt** and **root-ca.pem** in the **${OMS_RUN_PATH}/workspace0/ha/local/cert** directory on the active management node:

sh ${OMS_RUN_PATH}/workspace/ha/module/hacom/script/gen-cert.sh --root-ca --country=*country* **--state=***state* **--city=***city* **--company=***company* **--organize=***organize* **--common-name=***commonname* **--email=***Administrator email address* **--password=***password*

For example, run the **sh ${OMS_RUN_PATH}/workspace/ha/module/hacom/script/gen-cert.sh --root-ca --country=XX--state=XX --city=XX --company=XX --organize=IT --common-name=HADOOP.COM --email=abc@XXX.com --password=Userpwd@123** command.

The command has been executed successfully if the following information is displayed:

```
Generate root-ca pair success.
```

Step 4 On the active management node, run the following command as user **omm** to copy **root-ca.crt** and **root-ca.pem** to the **${BIGDATA_HOME}/om-0.0.1/security/certHA** directory:

cp -arp ${OMS_RUN_PATH}/workspace0/ha/local/cert/root-ca.* ${BIGDATA_HOME}/om-0.0.1/security/certHA

Step 5 Copy **root-ca.crt** and **root-ca.pem** generated on the active management node to the **${BIGDATA_HOME}/om-0.0.1/security/certHA** directory on the standby management node as user **omm**.

Step 6 Run the following command to generate an HA certificate and perform the automatic replacement:

sh ${BIGDATA_HOME}/om-0.0.1/sbin/replacehaSSLCert.sh

Enter the password as prompted, and press **Enter**.

```
Please input ha ssl cert password:
```

The HA certificate is replaced successfully if the following information is displayed:

```
[INFO] Succeed to replace ha ssl cert.
```

Step 7 Run the following command to restart OMS:

sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh

The following information is displayed:

```
start HA successfully.
```

Step 8 Log in to the standby management node and switch to user **omm**. Repeat step **Step 6** to step **Step 7**.

Run the **sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh** command to check whether **HAAllResOK** of the management node is **Normal**. Access MRS Manager again. If MRS Manager can be accessed, the operation is successful.

----End

10.11.12 Updating Cluster Keys

Scenario

When a cluster is installed, an encryption key is generated automatically to store the security information in the cluster (such as all database user passwords and key file access passwords) in encryption mode. After the cluster is successfully installed, you are advised to periodically update the encryption key based on the following procedure.

Impact on the System

- After a cluster key is updated, a new key is generated randomly in the cluster. This key is used to encrypt and decrypt the newly stored data. The old key is not deleted, and it is used to decrypt data encrypted using the old key. After security information is modified, for example, a database user password is changed, the new password is encrypted using the new key.
- When the key is updated, the cluster is stopped and cannot be accessed.

Prerequisites

The upper-layer applications depending on the cluster are stopped.

Procedure

Step 1 Log in to MRS Manager and choose **Services** > **More** > **Stop Cluster**.

In the displayed dialog box, select **I have read the information and understand the impact.** Click **OK**. Wait until the system displays a message indicating that the operation is successful. Click **Finish**. The cluster is stopped successfully.

Step 2 Log in to the active management node.

Step 3 Run the following commands to switch the user:

sudo su - omm

Step 4 Run the following command to disable logout upon timeout:

TMOUT=0

Step 5 Run the following command to switch the directory:

cd ${BIGDATA_HOME}/om-0.0.1/tools

Step 6 Run the following command to update the cluster key:

sh updateRootKey.sh

Enter **y** as prompted.

```
The root key update is a critical operation.
Do you want to continue?(y/n):
```

The key is updated successfully if the following information is displayed:

```
...
Step 4-1: The key save path is obtained successfully.
...
Step 4-4: The root key is sent successfully.
```

Step 7 On MRS Manager, choose **Services > More > Start Cluster**.

In the displayed dialog box, click **OK**. After **Operation successful** is displayed, click **Finish**. The cluster is started.

----End

10.12 Permissions Management

10.12.1 Creating a Role

Scenario

This section describes how to create a role on MRS Manager and authorize and manage Manager and components.

Up to 1,000 roles can be created on MRS Manager.

Prerequisites

You have learned service requirements.

Procedure

Step 1 On MRS Manager, choose **System** > **Manage Role**.

Step 2 Click **Create Role** and fill in **Role Name** and **Description**.

Role Name is mandatory and contains 3 to 30 digits, letters, and underscores (_). **Description** is optional.

Step 3 In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

NOTE

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click 🔍. The search result is displayed.
- The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive. Results of the next page can be searched.

Table 10-36 Manager permission description

Resource Supporting Permission Management	Permission Setting
Alarm	Authorizes the Manager alarm function. You can select **View** to view alarms and **Management** to manage alarms.
Audit	Authorizes the Manager audit log function. You can select **View** to view audit logs and **Management** to manage audit logs.
Dashboard	Authorizes the Manager overview function. You can select **View** to view the cluster overview.
Hosts	Authorizes the node management function. You can select **View** to view node information and **Management** to manage nodes.
Services	Authorizes the service management function. You can select **View** to view service information and **Management** to manage services.
System_cluster_management	Authorizes the MRS cluster management function. You can select **Management** to use the MRS patch management function.
System_configuration	Authorizes the MRS cluster configuration function. You can select **Management** to configure MRS clusters on Manager.
System_task	Authorizes the MRS cluster task function. You can select **Management** to manage periodic tasks of MRS clusters on Manager.
Tenant	Authorizes the Manager multi-tenant management function. You can select **Management** to manage multi-tenants.

Table 10-37 HBase permission description

Resource Supporting Permission Management	Permission Setting
SUPER_USER_GROUP	Grants you HBase administrator rights.
Global	HBase resource type, indicating the whole HBase.
Namespace	HBase resource type, indicating namespace, which is used to store HBase tables. It has the following permissions: ● **Admin** permission to manage the namespace ● **Create**: permission to create HBase tables in the namespace ● **Read**: permission to access the namespace ● **Write**: permission to write data to the namespace ● **Execute**: permission to execute the coprocessor (Endpoint)
Table	HBase resource type, indicating a data table, which is used to store data. It has the following permissions: ● **Admin**: permission to manage a data table ● **Create**: permission to create column families and columns in a data table ● **Read**: permission to read a data table ● **Write**: permission to write data to a data table ● **Execute**: permission to execute the coprocessor (Endpoint)
ColumnFamily	HBase resource type, indicating a column family, which is used to store data. It has the following permissions: ● **Create**: permission to create columns in a column family ● **Read**: permission to read a column family ● **Write**: permission to write data to a column family
Qualifier	HBase resource type, indicating a column, which is used to store data. It has the following permissions: ● **Read**: permission to read a column ● **Write**: permission to write data to a column

By default, permissions of an HBase resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Read** and **Write** permissions are added to the **default** namespace, they are automatically added to the tables, column families, and columns in the namespace. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 10-38 HDFS permission description

Resource Supporting Permission Management	Permission Setting
Folder	HDFS resource type, indicating an HDFS directory, which is used to store files or subdirectories. It has the following permissions: ● **Read**: permission to access the HDFS directory ● **Write**: permission to write data to the HDFS directory ● **Execute**: permission to perform an operation. It must be selected when you add access or write permission.
Files	HDFS resource type, indicating a file in HDFS. It has the following permissions: ● **Read**: permission to access the file ● **Write**: permission to write data to the file ● **Execute**: permission to perform an operation. It must be selected when you add access or write permission.

Permissions of an HDFS directory of each level are not shared by directory types of sub-levels by default. For example, if **Read** and **Execute** permissions are added to the **tmp** directory, you must select **Recursive** at the same time to add permissions to subdirectories.

Table 10-39 Hive permission description

Resource Supporting Permission Management	Permission Setting
Hive Admin Privilege	Grants you Hive administrator rights.

Resource Supporting Permission Management	Permission Setting
Database	Hive resource type, indicating a Hive database, which is used to store Hive tables. It has the following permissions: ● **Select**: permission to query the Hive database ● **Delete**: permission to perform the deletion operation in the Hive database ● **Insert**: permission to perform the insertion operation in the Hive database ● **Create**: permission to perform the creation operation in the Hive database
Table	Hive resource type, indicating a Hive table, which is used to store data. It has the following permissions: ● **Select**: permission to query the Hive table ● **Delete**: permission to perform the deletion operation in the Hive table ● **Update**: grants users the **Update** permission of the Hive table ● **Insert**: permission to perform the insertion operation in the Hive table ● **Grant of Select**: permission to grant the **Select** permission to other users using Hive statements ● **Grant of Delete**: permission to grant the **Delete** permission to other users using Hive statements ● **Grant of Update**: permission to grant the **Update** permission to other users using Hive statements ● **Grant of Insert**: permission to grant the **Insert** permission to other users using Hive statements

By default, permissions of a Hive resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Select** and **Insert** permissions are added to the **default** database, they are automatically added to the tables and columns in the database. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 10-40 Yarn permission description

Resource Supporting Permission Management	Permission Setting
Cluster Admin Operations	Grants you Yarn administrator rights.
root	Root queue of Yarn. It has the following permissions: ● **Submit**: permission to submit jobs in the queue ● **Admin**: permission to manage permissions of the current queue
Parent Queue	Yarn resource type, indicating a parent queue containing sub-queues. A root queue is a type of a parent queue. It has the following permissions: ● **Submit**: permission to submit jobs in the queue ● **Admin**: permission to manage permissions of the current queue
Leaf Queue	Yarn resource type, indicating a leaf queue. It has the following permissions: ● **Submit**: permission to submit jobs in the queue ● **Admin**: permission to manage permissions of the current queue

By default, permissions of a Yarn resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if the **Submit** permission is added to the **root** queue, it is automatically added to the sub-queue. Permissions inherited by sub-queues will not be displayed as selected in the **Permission** table. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 10-41 Hue permission description

Resource Supporting Permission Management	Permission Setting
Storage Policy Admin	Grants you storage policy administrator rights.

Step 4 Click **OK**. Return to **Manage Role**.

----End

Related Tasks

Modifying a role

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage Role**.

Step 3 In the row of the role to be modified, click **Modify** to modify role information.

NOTE

If you change permissions assigned by the role, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a role

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage Role**.

Step 3 In the row of the role to be deleted, click **Delete**.

Step 4 Click **OK**. The role is deleted.

----End

10.12.2 Creating a User Group

Scenario

This section describes how to create user groups and specify their operation permissions on MRS Manager. Management of single or multiple users can be unified in the user groups. After being added to a user group, users can obtain operation permissions owned by the user group.

Up to 100 user groups can be created on MRS Manager.

Prerequisites

You have learned service requirements and created roles required by service scenarios.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 Above the user group list, click **Create User Group**.

Step 4 Input **Group Name** and **Description**.

Group Name is mandatory and contains 3 to 20 digits, letters, and underscores (_). **Description** is optional.

Step 5 In **Role**, click **Select and Add Role** to select and add specified roles.

If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

Step 6 Click **OK**. The user group is created.

----End

Related Tasks

Modifying a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be modified, click **Modify**.

NOTE

If you change role permissions assigned to the user group, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be deleted, click **Delete**.

Step 4 Click **OK**. The user group is deleted.

----End

10.12.3 Creating a User

Scenario

This section describes how to create users on MRS Manager based on site requirements and specify their operation permissions to meet service requirements.

Up to 1,000 users can be created on MRS Manager.

If a new password policy needs to be used for a new user's password, follow instructions in **Modifying a Password Policy** to modify the password policy and then perform the following operations to create a user.

Prerequisites

You have learned service requirements and created roles and role groups required by service scenarios.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 Above the user list, click **Create User**.

Step 4 Configure parameters as prompted and enter a username in **User Name**.

NOTE

- If a username exists, you cannot create another username that only differs from the existing username in case. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the correct username, which is case-sensitive.
- **User Name** is mandatory and contains 3 to 20 digits, letters, and underscores (_).
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

Step 5 Set **User Type** to either **Human-Machine** or **Machine-Machine**.

- **Human-Machine** users: used for O&M on MRS Manager and operations on component clients. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-Machine** users: used for MRS application development. If you select this user type, you do not need to enter a password, because the password is randomly generated.

Step 6 In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

NOTE

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager_tenant** role and the role corresponding to the tenant.

Step 7 In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

Step 8 In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on service requirements.

NOTE

- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user rights.
- A new user can access WebUIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

Step 9 In **Description**, provide description based on onsite service requirements.

Description is optional.

Step 10 Click **OK**. The user is created.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed. For details, see section **Changing the Password of an Operation User**.

----End

10.12.4 Modifying User Information

Scenario

This section describes how to modify user information on MRS Manager, including information about the user group, primary group, role, and description.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user to be modified, click **Modify**.

NOTE

If you change user groups for or assign role permissions to the user, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

10.12.5 Locking a User

This section describes how to lock users in MRS clusters. A locked user cannot log in to MRS Manager or perform security authentication in the cluster.

A locked user can be unlocked by manually or until the lock duration expires. You can lock a user by using either of the following methods:

- Automatic lock: Set **Number of Password Retries** in **Configure Password Policy**. If user login attempts exceed the parameter value, the user is automatically locked. For details, see **Modifying a Password Policy** .
- Manual lock: manually locks a user.

The following describes how to manually lock a user. **Machine-Machine** users cannot be locked.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user to be locked, click **Lock User**.

Step 4 In the window that is displayed, click **Yes** to lock the user.

----End

10.12.6 Unlocking a User

If a user is locked because the number of login attempts exceeds the value of **Number of Password Retries**, or the user is manually locked, the administrator can unlock the user on MRS Manager.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user to be unlocked, click **Unlock User**.

Step 4 In the window that is displayed, click **Yes** to unlock the user.

----End

10.12.7 Deleting a User

Scenario

If an MRS cluster user is not required, you can delete the user on MRS Manager.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user to be deleted, choose **More** > **Delete**.

Step 4 Click **OK**.

----End

10.12.8 Changing the Password of an Operation User

Scenario

Passwords of **Human-Machine** system users must be regularly changed to ensure MRS cluster security. This section describes how to change your passwords on MRS Manager.

If a new password policy needs to be used for the password modified by the user, follow instructions in **Modifying a Password Policy** to modify the password policy and then perform the following operations to modify the password.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after changing the password of the MRS cluster user.

Prerequisites

- You have obtained the current password policies.
- You have obtained the MRS Manager access address.

Procedure

Step 1 On MRS Manager, move the mouse cursor to in the upper right corner.

On the menu that is displayed, select **Change Password**.

Step 2 Fill in the **Old Password**, **New Password**, and **Confirm Password**. Click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

10.12.9 Initializing the Password of a System User

Scenario

This section describes how to initialize a password on MRS Manager if a user forgets the password or the password of a public account needs to be changed regularly. After password initialization, the user must change the password upon the first login.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

Initializing the Password of a Human-Machine User

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 Locate the row that contains the user whose password is to be initialized, choose **More** > **Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).

- The password cannot be the username or the reverse username.

----End

Initializing the Password of a Machine-Machine User

Step 1 Prepare a client based on service conditions and log in to the node where the client is installed.

Step 2 Run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

cpw *Component running user name*

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

10.12.10 Downloading a User Authentication File

Scenario

When a user develops big data applications and runs them in an MRS cluster that supports Kerberos authentication, the user needs to prepare a user authentication file for accessing the MRS cluster. The keytab file in the authentication file can be used for user authentication.

This section describes how to download a user authentication file and export the keytab file on MRS Manager.

NOTE

- Before downloading a **Human-machine** user authentication file, change the password for the user on MRS Manager to make the initial password set by the administrator invalid. Otherwise, the exported keytab file cannot be used. For details, see **Changing the Password of an Operation User**.
- After a user password is changed, the exported keytab file becomes invalid, and you need to export a keytab file again.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user for whom you want to export the keytab file, choose **More** > **Download authentication credential** to download the authentication file. After the file is automatically generated, save it to a specified path and keep it properly.

Step 4 Open the authentication file with a decompression program.

- **user.keytab** indicates a user keytab file used for user authentication.
- **krb5.conf** indicates the configuration file of the authentication server. The application connects to the authentication server according to the configuration file information when authenticating users.

----End

10.12.11 Modifying a Password Policy

Scenario

This section describes how to set password and user login security rules as well as user lock rules. Password policies set on MRS Manager take effect for **Human-machine** users only, because the passwords of **Machine-machine** users are randomly generated.

If a new password policy needs to be used for a new user's password or the password modified by the user, perform the following operations to modify the password policy first, and then create a user or change the password by following instructions in **Creating a User** or **Changing the Password of an Operation User**.

NOTICE

Modify password policies based on service security requirements, because they involve user management security. Otherwise, security risks may be caused.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Click **Configure Password Policy**.

Step 3 Modify password policies as prompted. For parameter details, see the following table:

Table 10-42 Password policy parameter description

Parameter	Description
Minimum Password Length	Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is **8**.
Number of Character Types	Indicates the minimum number of character types a password contains. The character types are uppercase letters, lowercase letters, digits, spaces, and special characters (~`!?,.:;-_'(){}[]/<>@#$%^&*+|\=). The value can be **3** or **4**. The default value **3** indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces.
Password Validity Period (days)	Indicates the validity period (days) of a password. The value ranges from 0 to 90. 0 means that the password is permanently valid. The default value is **90**.
Password Expiration Notification Days	Indicates the number of days in advance users are notified that their passwords are about to expire. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to MRS Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from **0** to *X* (*X* must be set to the half of the password validity period and rounded down). Value **0** indicates that no notification is sent. The default value is **5**.
Interval of Resetting Authentication Failure Count (min)	Indicates the interval of retaining incorrect password attempts, in minutes. The value ranges from 0 to 1440. 0 indicates that incorrect password attempts are permanently retained and 1440 indicates that incorrect password attempts are retained for one day. The default value is **5**.
Number of Password Retries	Indicates the number of consecutive wrong passwords allowed before the system locks the user. The value ranges from 3 to 30. The default value is **5**.

Parameter	Description
Account Lock Duration (min)	Indicates the time period for which a user is locked when the user lockout conditions are met. The value ranges from 5 to 120. The default value is **5**.

----End

10.13 MRS Multi-User Permission Management

10.13.1 Users and Permissions of MRS Clusters

Overview

- **MRS Cluster Users**

  Indicate the security accounts of Manager, including usernames and passwords. These accounts are used to access resources in MRS clusters. Each MRS cluster in which Kerberos authentication is enabled can have multiple users.

- **MRS Cluster Roles**

  Before using resources in an MRS cluster, users must obtain the access permission which is defined by MRS cluster objects. A cluster role is a set of one or more permissions. For example, the permission to access a directory in HDFS needs to be configured in the specified directory and saved in a role.

Manager provides the user permission management function for MRS clusters, facilitating permission and user management.

- Permission management: adopts the role-based access control (RBAC) mode. In this mode, permissions are granted by role to form a permission set. After one or more roles are allocated to a user, the user can obtain the permissions of the roles.
- User management: uses MRS Manager to uniformly manage users, adopts the Kerberos protocol for user identity verification, and employs Lightweight Directory Access Protocol (LDAP) to store user information.

Permission Management

Permissions provided by MRS clusters include the O&M permissions of Manager and components (such as HDFS, HBase, Hive, and Yarn). In actual application, permissions must be assigned to each user based on service scenarios. To facilitate permission management, Manager introduces the role function to allow administrators to select and assign specified permissions. Permissions are centrally viewed and managed in permission sets, enhancing user experience.

A role is a logical entity that contains one or more permissions. Permissions are assigned to roles, and users can be granted the permissions by obtaining the roles.

A role can have multiple permissions, and a user can be bound to multiple roles.

- Role 1: is assigned operation permissions A and B. After role 1 is allocated to users a and b, users a and b can obtain operation permissions A and B.
- Role 2: is assigned operation permission C. After role 2 is allocated to users c and d, users c and d can obtain operation permission C.
- Role 3: is assigned operation permissions D and F. After role 3 is allocated to user a, user a can obtain operation permissions D and F.

For example, if an MRS user is bound to the administrator role, the user becomes an administrator of the MRS cluster.

Table 10-43 lists the roles that are created by default on Manager.

Table 10-43 Default roles and description

Default Role	Description
default	Tenant role
Manager_administrator	Manager administrator: This role has the permission to manage MRS Manager.
Manager_auditor	Manager auditor: This role has the permission to view and manage auditing information.
Manager_operator	Manager operator: This role has all permissions except tenant, configuration, and cluster management permissions.
Manager_viewer	Manager viewer: This role has the permission to view the information about systems, services, hosts, alarms, and auditing logs.
System_administrator	System administrator: This role has the permissions of Manager administrators and all service administrators.
Manager_tenant	Manager tenant viewer: This role has the permission to view information on the **Tenant** page on MRS Manager.

When creating a role on Manager, you can perform rights management for Manager and components, as shown in **Table 10-44**.

Table 10-44 Manager and component permission management

Permission	Description
Manager	Manager access and login permission.
HBase	HBase administrator permission and permission for accessing HBase tables and column families.
HDFS	HDFS directory and file permission.

Permission	Description
Hive	- Hive Admin Privilege Hive administrator permission. - Hive Read Write Privileges Hive data table management permission to set and manage the data of created tables.
Hue	Storage policy administrator permissions.
Yarn	- Cluster Admin Operations Yarn administrator permission. - Scheduler Queue Queue resource management permission.

User Management

MRS clusters that support Kerberos authentication use the Kerberos protocol and LDAP for user management.

- Kerberos verifies the identity of the user when a user logs in to Manager or uses a component client. Identity verification is not required for clusters with Kerberos authentication disabled.
- LDAP is used to store user information, including user records, user group information, and permission information.

MRS clusters can automatically update Kerberos and LDAP user data when users are created or modified on Manager. They can also automatically perform user identity verification and authentication and obtain user information when a user logs in to Manager or uses a component client. This ensures the security of user management and simplifies the user management tasks. Manager also provides the user group function for managing one or multiple users by type:

- A user group is a set of users, which can be used to manage users by type. Users in the system can exist independently or in a user group.
- After a user is added to a user group to which roles are allocated, the role permission of the user group is assigned to the user.

Table 10-45 lists the user groups that are created by default on MRS Manager in MRS 3.x or earlier.

For details about the default user groups displayed on FusionInsight Manager of MRS 3.*x* or later, see **User group**.

Table 10-45 Default user groups and description

User Group	Description
hadoop	Users added to this user group have the permission to submit tasks to all Yarn queues.

User Group	Description
hbase	Common user group. Users added to this user group will not have any additional permission.
hive	Users added to this user group can use Hive.
spark	Common user group. Users added to this user group will not have any additional permission.
supergroup	Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.
flume	Common user group. Users added to this user group will not have any additional permission.
kafka	Kafka common user group. Users added to this group need to be granted with read and write permission by users in the **kafkaadmin** group before accessing the desired topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
storm	Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
stormadmin	Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.

User **admin** is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.

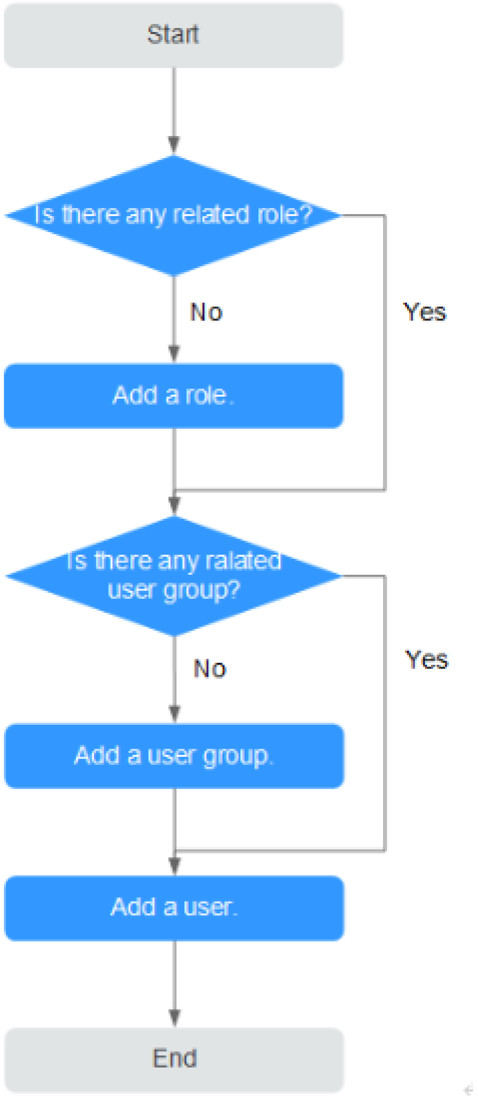
Process Overview

In practice, MRS cluster users must understand the service scenarios of big data and plan user permissions. Then, create roles and assign permissions to the roles on MRS Manager to meet service requirements. Manager provides the user group function for administrators to create user groups for managing users of one or multiple service scenarios of the same type.

NOTE

If a role has the permission of HDFS, HBase, Hive, or Yarn respectively, the role can only use the corresponding functions of the component. To use Manager, the corresponding Manager permission must be added to the role.

Figure 10-1 Process of creating a user



10.13.2 Default Users of Clusters with Kerberos Authentication Enabled

User Classification

The MRS cluster provides the following three types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System user	● User created on Manager for MRS cluster O&M and service scenarios. There are two types of users: – **Human-machine** user: used for Manager O&M scenarios and component client operation scenarios. – **Machine-machine** user: used for MRS cluster application development scenarios. ● User who runs OMS processes.
Internal system user	Internal user who performs process communications, saves user group information, and associates user permissions.
Database user	● User who manages OMS database and accesses data. ● User who runs the database of service components (Hive, Hue, Loader, and DBService)

System User

NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

Type	Username	Initial Password	Description
System administrator of the MRS cluster	admin	Specified by the user during the cluster creation.	Manager administrator with the following permissions: ● Common HDFS and ZooKeeper user permissions. ● Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI. ● Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service. ● Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service.
MRS cluster node OS user	omm	Randomly generated by the system.	Internal running user of the MRS cluster system. This user is an OS user generated on all nodes and does not require a unified password.
MRS cluster node OS user	root	Set by the user.	User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.

Internal System Users

NOTE

Do not delete the following internal system users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
Component running user	hdfs	Hdfs@123	This user is the HDFS system administrator and has the following permissions: 1. File system operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. ● Views and sets disk quotas for users. 2. HDFS management operation permissions: ● Views the web UI status. ● Views and sets the active and standby HDFS status. ● Enters and exits the HDFS in security mode. ● Checks the HDFS file system.

Type	Default User	Initial Password	Description
	hbase	Hbase@123	This user is the HBase system administrator and has the following permissions: ● Cluster management permission: **Enable** and **Disable** operations on tables to trigger MajorCompact and ACL operations. ● Grants and revokes permissions, and shuts down the cluster. ● Table management permission: Creates, modifies, and deletes tables. ● Data management permission: Reads and writes data in tables, column families, and columns. ● Accesses the HBase web UI.
	mapred	Mapred@123	This user is the MapReduce system administrator and has the following permissions: ● Submits, stops, and views the MapReduce tasks. ● Modifies the Yarn configuration parameters. ● Accesses the Yarn and MapReduce web UI.
	spark	Spark@123	This user is the Spark system administrator and has the following permissions: ● Accesses the Spark web UI. ● Submits Spark tasks.

User Group Information

Default User Group	Description
hadoop	Users added to this user group have the permission to submit tasks to all Yarn queues.
hbase	Common user group. Users added to this user group will not have any additional permission.
hive	Users added to this user group can use Hive.
spark	Common user group. Users added to this user group will not have any additional permission.
supergroup	Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.
check_sec_ldap	Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components.
Manager_tenant	Tenant system user group, which is an internal system user group used only between components.
System_administrator	MRS cluster system administrator group, which is an internal system user group used only between components.
Manager_viewer	MRS Manager system viewer group, which is an internal system user group used only between components.
Manager_operator	MRS Manager system operator group, which is an internal system user group used only between components.
Manager_auditor	MRS Manager system auditor group, which is an internal system user group used only between components.
Manager_administrator	MRS Manager system administrator group, which is an internal system user group used only between components.
compcommon	Internal system group for accessing public resources in a cluster. All system users and system running users are added to this user group by default.
default_1000	User group created for tenants, which is an internal system user group used only between components.

Default User Group	Description
kafka	Kafka common user group. Users added to this group need to be granted with read and write permission by users in the **kafkaadmin** group before accessing the desired topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
storm	Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
stormadmin	Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
opentsdb	Common user group. Users added to this user group will not have any additional permission.
presto	Common user group. Users added to this user group will not have any additional permission.
flume	Common user group. Users added to this user group will not have any additional permission.
launcher-job	MRS internal group, which is used to submit jobs using V2 APIs.

OS User Group	Description
wheel	Primary group of MRS internal running user **omm**.
ficommon	MRS cluster common group that corresponds to **compcommon** for accessing public resource files stored in the OS of the cluster.

Database User

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping applications.
	omm	ChangeMe@123456	User for accessing OMS database data.
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component.
	hive	HiveUser@	User for Hive to connect to the DBService database.
	hue	HueUser@123	User for Hue to connect to the DBService database.
	sqoop	SqoopUser@	User for Loader to connect to the DBService database.
	ranger	RangerUser@	User for Ranger to connect to the DBService database.

10.13.3 Creating a Role

Scenario

This section describes how to create a role on Manager and authorize and manage Manager and components.

Up to 1000 roles can be created on Manager.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Managing Roles**.

Prerequisites

- You have learned service requirements.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, choose **System** > **Manage Role**.

Step 3 Click **Create Role** and fill in **Role Name** and **Description**.

Role Name is mandatory and contains 3 to 30 characters. Only digits, letters, and underscores (_) are allowed. **Description** is optional.

Step 4 In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

NOTE

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click 🔍. The search result is displayed.
- The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive. Results of the next page can be searched.

Table 10-46 Manager permission description

Resource Supporting Permission Management	Permission Setting
Alarm	Authorizes the Manager alarm function. You can select **View** to view alarms and **Management** to manage alarms.
Audit	Authorizes the Manager audit log function. You can select **View** to view audit logs and **Management** to manage audit logs.
Dashboard	Authorizes the Manager overview function. You can select **View** to view the cluster overview.
Hosts	Authorizes the node management function. You can select **View** to view node information and **Management** to manage nodes.
Services	Authorizes the service management function. You can select **View** to view service information and **Management** to manage services.
System_cluster_management	Authorizes the MRS cluster management function. You can select **Management** to use the MRS patch management function.
System_configuration	Authorizes the MRS cluster configuration function. You can select **Management** to configure MRS clusters on Manager.
System_task	Authorizes the MRS cluster task function. You can select **Management** to manage periodic tasks of MRS clusters on Manager.

Resource Supporting Permission Management	Permission Setting
Tenant	Authorizes the Manager multi-tenant management function. You can select **Management** to manage multi-tenants.

Table 10-47 HBase permission description

Resource Supporting Permission Management	Permission Setting
SUPER_USER_GROUP	Grants you HBase administrator permissions.
Global	HBase resource type, indicating the whole HBase.
Namespace	HBase resource type, indicating namespace, which is used to store HBase tables. It has the following permissions: ● **Admin** permission to manage the namespace ● **Create**: permission to create HBase tables in the namespace ● **Read**: permission to access the namespace ● **Write**: permission to write data to the namespace ● **Execute**: permission to execute the coprocessor (Endpoint)
Table	HBase resource type, indicating a data table, which is used to store data. It has the following permissions: ● **Admin**: permission to manage a data table ● **Create**: permission to create column families and columns in a data table ● **Read**: permission to read a data table ● **Write**: permission to write data to a data table ● **Execute**: permission to execute the coprocessor (Endpoint)
ColumnFamily	HBase resource type, indicating a column family, which is used to store data. It has the following permissions: ● **Create**: permission to create columns in a column family ● **Read**: permission to read a column family ● **Write**: permission to write data to a column family

Resource Supporting Permission Management	Permission Setting
Qualifier	HBase resource type, indicating a column, which is used to store data. It has the following permissions: ● **Read**: permission to read a column ● **Write**: permission to write data to a column

By default, permissions of an HBase resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Read** and **Write** permissions are added to the **default** namespace, they are automatically added to the tables, column families, and columns in the namespace. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 10-48 HDFS permission description

Resource Supporting Permission Management	Permission Setting
Folder	HDFS resource type, indicating an HDFS directory, which is used to store files or subdirectories. It has the following permissions: ● **Read**: permission to access the HDFS directory ● **Write**: permission to write data to the HDFS directory ● **Execute**: permission to perform an operation. It must be selected when you add access or write permission.
Files	HDFS resource type, indicating a file in HDFS. It has the following permissions: ● **Read**: permission to access the file ● **Write**: permission to write data to the file ● **Execute**: permission to perform an operation. It must be selected when you add access or write permission.

Permissions of an HDFS directory of each level are not shared by directory types of sub-levels by default. For example, if **Read** and **Execute** permissions are added to the **tmp** directory, you must select **Recursive** for permissions to be added to subdirectories.

Table 10-49 Hive permission description

Resource Supporting Permission Management	Permission Setting
Hive Admin Privilege	Grants you Hive administrator permissions.
Database	Hive resource type, indicating a Hive database, which is used to store Hive tables. It has the following permissions: ● **Select**: permission to query the Hive database ● **Delete**: permission to perform the deletion operation in the Hive database ● **Insert**: permission to perform the insertion operation in the Hive database ● **Create**: permission to perform the creation operation in the Hive database
Table	Hive resource type, indicating a Hive table, which is used to store data. It has the following permissions: ● **Select**: permission to query the Hive table ● **Delete**: permission to perform the deletion operation in the Hive table ● **Update**: permission to perform the update operation in the Hive table ● **Insert**: permission to perform the insertion operation in the Hive table ● **Grant of Select**: permission to grant the **Select** permission to other users using Hive statements ● **Grant of Delete**: permission to grant the **Delete** permission to other users using Hive statements ● **Grant of Update**: permission to grant the **Update** permission to other users using Hive statements ● **Grant of Insert**: permission to grant the **Insert** permission to other users using Hive statements

By default, permissions of a Hive resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Select** and **Insert** permissions are added to the **default** database, they are automatically added to the tables and columns in the database. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 10-50 Yarn permission description

Resource Supporting Permission Management	Permission Setting
Cluster Admin Operations	Grants you Yarn administrator permissions.
root	Root queue of Yarn. It has the following permissions: ● **Submit**: permission to submit jobs in the queue ● **Admin**: permission to manage permissions of the current queue
Parent Queue	Yarn resource type, indicating a parent queue containing sub-queues. A root queue is a type of a parent queue. It has the following permissions: ● **Submit**: permission to submit jobs in the queue ● **Admin**: permission to manage permissions of the current queue
Leaf Queue	Yarn resource type, indicating a leaf queue. It has the following permissions: ● **Submit**: permission to submit jobs in the queue ● **Admin**: permission to manage permissions of the current queue

By default, permissions of a Yarn resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if the **Submit** permission is added to the **root** queue, it is automatically added to the sub-queue. Permissions inherited by sub-queues will not be displayed as selected in the **Permission** table. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 10-51 Hue permission description

Resource Supporting Permission Management	Permission Setting
Storage Policy Admin	Grants you storage policy administrator permissions.

Step 5 Click **OK**. Return to **Manage Role**.

----End

Related Tasks

Modifying a role

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage Role**.

Step 3 In the row of the role to be modified, click **Modify** to modify role information.

NOTE

If you modify permissions assigned by the role, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a role

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage Role**.

Step 3 In the row of the role to be deleted, click **Delete**.

Step 4 Click **OK**. The role is deleted.

----End

10.13.4 Creating a User Group

Scenario

This section describes how to create user groups and specify their operation permissions on Manager. Management of single or multiple users can be unified in the user groups. After being added to a user group, users can obtain operation permissions owned by the user group.

Manager supports a maximum of 100 user groups.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Managing User Groups**.

Prerequisites

- You have learned service requirements and created roles required by service scenarios.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User Group**.

Step 4 Above the user group list, click **Create User Group**.

Step 5 Input **Group Name** and **Description**.

Group Name is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (_) are allowed. **Description** is optional.

Step 6 In **Role**, click **Select and Add Role** to select and add specified roles.

If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

Step 7 Click **OK**.

----End

Related Tasks

Modifying a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of a user group to be modified, click **Modify**.

NOTE

If you change role permissions assigned to the user group, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be deleted, click **Delete**.

Step 4 Click **OK**. The user group is deleted.

----End

10.13.5 Creating a User

Scenario

This section describes how to create users on Manager based on site requirements and specify their operation permissions to meet service requirements.

Up to 1000 users can be created on Manager.

If a new password policy needs to be used for a new user's password, follow instructions in **Modifying a Password Policy** to modify the password policy and then perform the following operations to create a user.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Creating a User**.

Prerequisites

- You have learned service requirements and created roles and role groups required by service scenarios.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 Above the user list, click **Create User**.

Step 5 Configure parameters as prompted and enter a username in **Username**.

NOTE

- A username that differs only in alphabetic case from an existing username is not allowed. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the exactly correct username, which is case-sensitive.
- **Username** is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (_) are allowed.
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

Step 6 Set **User Type** to either **Human-machine** or **Machine-machine**.

- **Human-machine** user: used for MRS Manager O&M scenarios and component client operation scenarios. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-machine** users: used for MRS application development scenarios. If you select this user type, you do not need to enter a password, because the password is randomly generated.

Step 7 In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

NOTE

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager_tenant** role and the role corresponding to the tenant.
- Users created on Manager cannot be added to the user group synchronized using the IAM user synchronization function.

Step 8 In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

Step 9 In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on onsite service requirements.

NOTE

- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user rights.
- A new user can access web UIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

Step 10 In **Description**, provide description based on onsite service requirements.

Description is optional.

Step 11 Click **OK**.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed. For details, see **Changing the Password of an Operation User**.

----End

10.13.6 Modifying User Information

Scenario

This section describes how to modify user information on Manager, including information about the user group, primary group, role, and description.

This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Modifying User Information**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row of a user to be modified, click **Modify**.

NOTE

If you change user groups for a user or assign role permissions to a user, it takes 3 minutes to make new configurations take effect.

Step 5 Click **OK**. The modification is complete.

----End

10.13.7 Locking a User

This section describes how to lock users in MRS clusters. A locked user cannot log in to Manager or perform security authentication in the cluster. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

A locked user can be unlocked by manually or until the lock duration expires. You can lock a user by using either of the following methods:

- Automatic lock: Set **Number of Password Retries** in **Configure Password Policy**. If user login attempts exceed the parameter value, the user is automatically locked. For details, see **Modifying a Password Policy**.
- Manual lock: manually locks a user.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Locking a User**.

The following describes how to manually lock a user. **Machine-machine** users cannot be locked.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row of a user you want to lock, click **Lock User**.

Step 5 In the window that is displayed, click **OK** to lock the user.

----End

10.13.8 Unlocking a User

If a user is locked because the number of login attempts exceeds the value of **Number of Password Retries**, or the user is manually locked, you can unlock the user on Manager. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Unlocking a User**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row of a user to be unlocked, click **Unlock User**.

Step 5 In the window that is displayed, click **OK** to unlock the user.

----End

10.13.9 Deleting a User

You can delete an MRS cluster user that is not required on MRS Manager. Deleting a user is allowed only in clusters with Kerberos authentication enabled or normal clusters with the EIP function enabled.

NOTE

If you want to create a new user with the same name as user A after deleting user A who has submitted a job on the client or MRS console, you need to delete user A's residual folders when deleting user A. Otherwise, the newly created user A may fail to submit a job.

To delete residual folders, log in to each Core node in the MRS cluster and run the following commands. In the following commands, **$user** indicates the folder named after the username.

```
cd /srv/BigData/hadoop/data1/nm/localdir/usercache/
```

```
rm -rf $user
```

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Deleting a User**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row that contains the user to be deleted, choose **More** > **Delete**.

Step 5 Click **OK**.

----End

10.13.10 Changing the Password of an Operation User

Scenario

Passwords of **Human-machine** system users must be regularly changed to ensure MRS cluster security. This section describes how to change passwords on MRS Manager.

If a new password policy needs to be used for the password modified by the user, follow instructions in **Modifying a Password Policy** to modify the password policy and then perform the following operations to modify the password.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Changing a User Password**.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after modifying the password of the MRS cluster user.

Prerequisites

- You have obtained the current password policies.
- You have obtained the MRS Manager access address.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, move the mouse cursor to in the upper right corner.

On the menu that is displayed, select **Change Password**.

Step 3 Fill in the **Old Password**, **New Password**, and **Confirm Password**. Click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

10.13.11 Initializing the Password of a System User

Scenario

This section describes how to initialize a password on Manager if a user forgets the password or the password of a public account needs to be changed regularly. After password initialization, the user must change the password upon the first login. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Initializing a Password**.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

Initializing the Password of a Human-Machine User

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 Locate the row that contains the user whose password is to be initialized, choose **More** > **Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password of the current user and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

Initializing the Password of a Machine-Machine User

Step 1 Prepare a client based on service conditions and log in to the node with the client installed.

Step 2 Run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

kadmin -p kadmin/admin

Step 6 Run the following command to reset the password of a component running user. This operation takes effect on all servers:

cpw *Component running user name*

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

10.13.12 Downloading a User Authentication File

Scenario

When a user develops big data applications and runs them in an MRS cluster that supports Kerberos authentication, the user needs to prepare a **Machine-machine** user authentication file for accessing the MRS cluster. The keytab file in the authentication file can be used for user authentication.

This section describes how to download a **Machine-machine** user authentication file and export the keytab file on Manager. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

Before downloading a **Human-machine** user authentication file, change the password for the user on MRS Manager to make the initial password invalid. Otherwise, the exported keytab file cannot be used. For details, see **Changing the Password of an Operation User**.

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Exporting an Authentication Credential File**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row of a user for whom you want to export the keytab file, choose **More** > **Download authentication credential** to download the authentication file. After the file is automatically generated, save it to a specified path and keep it secure.

Step 5 Open the authentication file with a decompression program.

- **user.keytab** indicates a user keytab file used for user authentication.
- **krb5.conf** indicates the configuration file of the authentication server. The application connects to the authentication server according to this configuration file information when authenticating users.

----End

10.13.13 Modifying a Password Policy

Scenario

NOTICE

Because password policies are critical to the user management security, modify them based on service security requirements. Otherwise, security risks may be incurred.

This section describes how to set password and user login security rules as well as user lock rules. Password policies set on MRS Manager take effect for **Human-machine** users only, because the passwords of **Machine-machine** users are randomly generated. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

If a new password policy needs to be used for a new user's password or the password modified by the user, perform the following operations to modify the password policy first, and then follow instructions in **Creating a User** or **Changing the Password of an Operation User**.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Configuring Password Policies**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 Click **Configure Password Policy**.

Step 4 Modify password policies as prompted. For parameter details, see **Table 10-52**.

Table 10-52 Password policy parameter description

Parameter	Description
Minimum Password Length	Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is **8**.
Number of Character Types	Indicates the minimum number of character types a password contains. The character types include uppercase letters, lowercase letters, digits, spaces, and special characters (~`!?,.:;-_'(){}[]/<>@#$%^&*+|\=). The value can be **3** or **4**. The default value **3** indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces.
Password Validity Period (days)	Indicates the validity period (days) of a password. The value ranges from 0 to 90. Value **0** means that the password is permanently valid. The default value is **90**.
Password Expiration Notification Days	Indicates the number of days to notify password expiration in advance. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to MRS Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from **0** to *X* (*X* must be set to the half of the password validity period and rounded down). Value **0** indicates that no notification is sent. The default value is **5**.

Parameter	Description
Interval of Resetting Authentication Failure Count (min)	Indicates the interval (minutes) of retaining incorrect password attempts. The value ranges from 0 to 1440. Value **0** indicates that the number of incorrect password attempts are permanently retained and value **1440** indicates that the number of incorrect password attempts are retained for one day. The default value is **5**.
Number of Password Retries	Indicates the number of consecutive wrong passwords allowed before the system locks the user. The value ranges from 3 to 30. The default value is **5**.
Account Lock Duration (min)	Indicates the time period for which a user is locked when the user lockout conditions are met. The value ranges from 5 to 120. The default value is **5**.

----End

10.13.14 Configuring Cross-Cluster Mutual Trust Relationships

Scenario

If cluster A needs to access the resources of cluster B, the mutual trust relationship must be configured between these two clusters.

If no trust relationship is configured, resources of a cluster are available only for users in this cluster. MRS automatically assigns a unique **domain name** for each cluster to define the scope of resources for users.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Configuring Cross-Manager Mutual Trust Between Clusters**.

Impact on the System

- After cross-cluster mutual trust is configured, resources of a cluster become available for users in other cluster. User permission in the clusters must be regularly checked based on service and security requirements.
- After cross-cluster mutual trust is configured, the KrbServer service needs to be restarted and the cluster becomes unavailable during the restart.
- After cross-cluster mutual trust is configured, internal users **krbtgt/***Local cluster domain name***@***External cluster domain name* and **krbtgt/***External cluster domain name***@***Local cluster domain name* are added to the two

clusters. The internal users cannot be deleted. The default password is **Crossrealm@123**.

Procedure

Step 1 On the MRS management console, query all security groups of the two clusters.

- If the security groups of the two clusters are the same, go to **Step 3**.
- If the security groups of the two clusters are different, go to **Step 2**.

Step 2 On the VPC management console, add rules for each security group.

Set **Protocol** to **ANY**, **Transfer Direction** to **Inbound**,

and **Source** to **Security Group**. The source is the security group of the peer cluster.

- For cluster A, add inbound rules to the security group, set **Source** to the security groups of cluster B (the peer cluster of cluster A).
- For cluster B, add inbound rules to the security group, set **Source** to the security groups of cluster A (the peer cluster of cluster B).

NOTE

For a common cluster with Kerberos authentication disabled, perform step **Step 1** to **Step 2** to configure cross-cluster mutual trust. For a security cluster with Kerberos authentication enabled, after completing the preceding steps, proceed to the following steps for configuration.

Step 3 Log in to MRS Manager of the two clusters separately. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**. Click **Service** and check whether the **Health Status** of all components is **Good**.

- If yes, go to **Step 4**.
- If no, contact technical support personnel for troubleshooting.

Step 4 Query configuration information.

1. On MRS Manager of the two clusters, choose **Services** > **KrbServer** > **Instance**. Query the **OM IP Address** of the two KerberosServer hosts.
2. Click **Service Configuration**. Set **Type** to **All**. Choose **KerberosServer** > **Port** in the navigation tree on the left. Query the value of **kdc_ports**. The default value is **21732**.
3. Click **Realm** and query the value of **default_realm**.

Step 5 On MRS Manager of either cluster, modify the **peer_realms** parameter.

Table 10-53 Parameter description

Parameter	Description
realm_name	Domain name of the mutual-trust cluster, that is, the value of **default_realm** obtained in step **4**.

Parameter	Description
ip_port	KDC address of the peer cluster. Format: *IP address of a KerberosServer node in the peer cluster:kdc_port* The addresses of the two KerberosServer nodes are separated by a comma. For example, if the IP addresses of the KerberosServer nodes are 10.0.0.1 and 10.0.0.2 respectively, the value of this parameter is **10.0.0.1:21732,10.0.0.2:21732**.

NOTE

- To deploy trust relationships with multiple clusters, click ⊕ to add items and specify relevant parameters. To delete an item, click ⊗.
- A cluster can have trust relationships with a maximum of 16 clusters. By default, no trust relationship exists between different clusters that are trusted by a local cluster.

Step 6 Click **Save Configuration**. In the dialog box that is displayed, select **Restart the affected services or instances** and click **OK**. If you do not select **Restart the affected services or instances**, manually restart the affected services or instances.

After **Operation successful** is displayed, click **Finish**.

Step 7 Exit MRS Manager and log in to it again. If the login is successful, the configurations are valid.

Step 8 Log in to MRS Manager of the other cluster and repeat step **Step 5** to **Step 7**.

----End

Follow-up Operations

After cross-cluster mutual trust is configured, the service configuration parameters are modified on MRS Manager and the service is restarted. Therefore, you need to prepare the client configuration file again and update the client.

Scenario 1:

Cluster A and cluster B (peer cluster and mutually trusted cluster) are the same type, for example, analysis cluster or streaming cluster. Follow instructions in **Updating a Client (Versions Earlier Than 3.x)** to update the client configuration files of cluster A and B respectively.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Scenario 2:

Cluster A and cluster B (peer cluster and mutually trusted cluster) are the different type. Perform the following steps to update the configuration files.

- Update the client configuration file of cluster A to cluster B.
- Update the client configuration file of cluster B to cluster A.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Step 1 Log in to MRS Manager of cluster A.

Step 2 Click **Services**, and then **Download Client**.

Step 3 Set **Client Type** to **Only configuration files**.

Step 4 Set **Download to** to **Remote host**.

Step 5 Set **Host IP Address** to the IP address of the active Master node of cluster B, **Host Port** to 22, and **Save Path** to **/tmp**.

- If the default port **22** for logging in to cluster B using SSH is changed, set **Host Port** to a new port.
- The value of **Save Path** contains a maximum of 256 characters.

Step 6 Set **Login User** to **root**.

If another user is used, ensure that the user has permissions to read, write, and execute the save path.

Step 7 Click **OK** to generate a client file.

If the following information is displayed, the client file is saved. Click **Close**.

```
Client files downloaded to the remote host successfully.
```

If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to **Step 2** to download the client again.

```
Failed to connect to the server. Please check the network connection or parameter settings.
```

Step 8 Log in to the ECS of cluster B using VNC. For details, see **Instances** > **Logging In to a Windows ECS > Login Using VNC** in the *Elastic Cloud Server User Guide*

Log in to the ECS. For details, see **Login Using an SSH Key**. Set the ECS password and log in to the ECS in VNC mode.

Step 9 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 10 Run the following command to update the client configuration of cluster A to cluster B:

sh refreshConfig.sh *Client installation directory Full path of the client configuration file package*

For example, run the following command:

sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS_Services_Client.tar

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.
Succeed to refresh components client config.
```

NOTE

You can also refer to method 2 in **Updating a Client (Versions Earlier Than 3.x)** to perform operations in **Step 1** to **Step 10**.

Step 11 Repeat step **Step 1** to **Step 10** to update the client configuration file of cluster B to cluster A.

Step 12 Follow instructions in **Updating a Client (Versions Earlier Than 3.x)** to update the client configuration file of the local cluster.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

----End

10.13.15 Configuring Users to Access Resources of a Trusted Cluster

Scenario

After cross-cluster mutual trust is configured, permission must be configured for users in the local cluster, so that the users can access the same resources in the peer cluster as the users in the peer cluster.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured**.

Prerequisites

The mutual trust relationship has been configured between two clusters (clusters A and B). The clients of the clusters have been updated.

Procedure

Step 1 Log in to MRS Manager of cluster A and choose **System** > **Manage User**. Check whether cluster A has accounts that are the same as those of cluster B.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Click ⌄ on the left side of the username to unfold the detailed user information. Check whether the user group and role to which the user belongs meet the service requirements.

For example, user **admin** of cluster A has the permission to access and create files in the **/tmp** directory of cluster A. Then go to **Step 4**.

Step 3 Create the accounts in cluster A and bind the accounts to the user group and roles required by the services. Then go to **Step 4**.

Step 4 Choose **Service** > **HDFS** > **Instance**. Query the **OM IP Address** of **NameNode (Active)**.

Step 5 Log in to the client of cluster B.

For example, if you have updated the client on the Master2 node, log in to the Master2 node to use the client. For details, see **Using an MRS Client**.

Step 6 Run the following command to access the **/tmp** directory of cluster A.

hdfs dfs -ls hdfs://192.168.6.159:9820/tmp

In the preceding command, **192.168.6.159** is the IP address of the active NameNode of cluster A; **9820** is the default port for communication between the client and the NameNode.

Step 7 Run the following command to create a file in the **/tmp** directory of cluster A:

hdfs dfs -touchz hdfs://192.168.6.159:9820/tmp/mrstest.txt

If you can query the **mrstest.txt** file in the **/tmp** directory of cluster A, the cross-cluster mutual trust is configured successfully.

----End

10.13.16 Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS

When fine-grained permission control is enabled, you can configure OBS access permissions to implement access control on directories in OBS file systems.

NOTE

This section applies only to MRS 2.*x* or earlier (excluding MRS 1.9.2).

This function enables you to control MRS users' access to OBS resources. For example, if you allow user group A to only access log files in a specified OBS file system, perform the following operations:

1. Configure an agency with OBS access permissions for an MRS cluster so that OBS can be accessed using the temporary AK/SK automatically obtained by the ECS. This prevents the AK/SK from being exposed in the configuration file.
2. Create a policy on the IAM console to allow access to log files in a specified OBS file system, and create an agency bound to the policy permission.
3. In the MRS cluster, bind the new agency to user group A so that user group A only has the permission to access log files in the specified OBS file system.

In the following scenarios, the username used for submitting jobs is an internal username so that MRS multi-user access to OBS is not supported.

- For spark-beeline, the internal username used for submitting jobs is **spark** in a security cluster and **omm** in a normal cluster.
- For the HBase shell, the internal username used for submitting jobs is **hbase** in a security cluster and **omm** in a normal cluster.
- For Presto, the internal username used for submitting jobs in the security cluster is **omm** or **hive**, and that in the normal cluster is **omm**. (Choose **Components** > **Presto** > **Service Configuration**. Change **Basic** to **All** in the

parameter type drop-down box.) Then, search for and change the value of **hive.hdfs.impersonation.enabled** to **true** to enable MRS multi-user to access OBS with fine-grained permissions.

Prerequisites

- Fine-grained permission control has been enabled. For details about permissions management, see **Creating an MRS User**.
- You have a basic knowledge of and OBS fine-grained policies.

Step 1: Configuring an Agency with OBS Access Permission for a Cluster

Step 1 Follow instructions in **Configuring a Storage-Compute Decoupled Cluster (Agency)** to configure an agency with OBS access permissions.

The agency takes effect for all users (including internal users) and user groups in the cluster. To control the permissions of users and user groups in the cluster to access OBS, perform the following operations.

----End

Step 2: Creating a Policy and an Agency on IAM

Create policies with different access permissions and bind the policies to the agency. For details, see **Creating a Policy and an Agency on IAM**.

Step 3: Configuring OBS Permission Control Mappings on the MRS Cluster Details Page

Step 1 On the MRS management console, choose **Clusters** > **Active Clusters** and click the cluster name.

Step 2 In the **Basic Information** area on the **Dashboard** tab page, click **Manage** next to **OBS Permission Control**.

Step 3 Click **Add Mapping** and set parameters according to **Table 10-54**.

Table 10-54 OBS permission control parameters

Parameter	Description
IAM Agency	Select the agency created in **Step 2**.
Type	● **User**: User-level mapping ● **Group**: User group-level mapping NOTE ● User-level mapping takes priority over user group-level mapping. If you select **Group**, you are advised to enter the primary group name in **MRS User (User Group)**. ● Do not use the same username (user group) for multiple mapping records.

Parameter	Description
MRS User (User Group)	Use commas (,) to separate multiple names of users or user groups. **NOTE** ● If OBS permission control is not configured for a user and no AK and SK are configured, the permission in **MRS_ECS_DEFAULT_AGENCY** will be used for accessing OBS. You are advised not to bind the internal user of a component to an agency. ● If you need to configure an agency for the internal user of a component when submitting a job in the following scenarios, the requirements are as follows: – To control permissions on spark-beeline operations, set the username to **spark** for a security cluster and **omm** for a normal cluster. – To control permissions on HBase shell operations, set the username to **hbase** for a security cluster and **omm** for a normal cluster. – To control permissions on Presto, set the username to **omm**, **hive**, and the username used for logging in to the client for a security cluster and **omm** and the username used for logging in to the client for a normal cluster. – If you want to use Hive to create tables in beeline mode, set the username to the internal user **hive**.

Step 4 Click **OK**.

Step 5 Select **I agree to authorize the trust relationships between MRS Users (Groups) and IAM agencies**, and click **OK**. The mapping between the MRS user and OBS permission is added.

If ✓ appears next to **OBS Permission Control** on the **Dashboard** tab page or the mapping table has been updated for OBS permission control, the mapping takes effect. It takes about 1 minute to for the mapping to take effect.

In the **Operation** column of the mapping list, you can edit or delete the added mapping.

NOTE

- If OBS permission control is not configured for a user and no AK and SK are configured, the permissions owned by the agency configured for the cluster in the **Object Storage Service (OBS)** project will be used to access OBS.
- Regardless of whether OBS permission control is configured, AK/SK permission is used for accessing OBS once it is configured.
- Security Administrator permission is required to modify, create, or delete a mapping.
- To enable mapping changes to take effect in spark-line, hive beeline and Presto respectively, you need to restart Spark, exit beeline and enter again, and restart Presto respectively.

----End

Component Access to OBS When OBS Permission Control Is Enabled

Step 1 Log in to any node in a cluster as user **root** using the password set during cluster creation.

Step 2 Set environment variables (The default client installation path for MRS 3.x or later is /opt/Bigdata/client, and for versions earlier than MRS 3.x is /opt/client. Configure the path based on site requirements.).

source /opt/Bigdata/client/bigdata_env

Step 3 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

Example: **kinit admin**

Step 4 If the Kerberos authentication is disabled for the current cluster, run the following commands to log in. Note that you should create a user that belongs to the **supergroup** group by referring to **Creating a User** and replace *XXXX* with the username:

mkdir /home/XXXX

chown XXXX /home/XXXX

su - XXXX

Step 5 Access OBS. You do not need to configure the AK, SK, and endpoint. The OBS path format is **obs://buck_name/*XXX***.

Example: **hadoop fs -ls "obs://obs-example/job/hadoop-mapreduce-examples-3.1.2.jar"**

NOTE

- If you want to use **hadoop fs** to delete files on OBS, use **hadoop fs -rm -skipTrash** to delete the files.
- If data import is not involved when a table is created using spark-sql and spark-beeline, OBS will not be accessed. That is, if you create a table in an OBS directory on which you do not have permission, the **CREATE TABLE** operation will still be successful, but the error message "**403 AccessDeniedException**" is displayed when you insert data.

----End

Creating a Policy and an Agency on IAM

Step 1 Create a policy on IAM.

1. Log in to the IAM console.
2. Choose **Permissions**. On the displayed page, click **Create Custom Policy**.
3. Set parameters according to **Table 10-55**. Obtain the customized OBS policy samples that are frequently used by referring to .

Table 10-55 Policy parameters

Parameter	Description
Policy Name	Only letters, digits, spaces, and special characters (-_.,) are allowed.
Scope	Select **Global services**, because OBS is a global service.
Policy View	Select **Visual editor**.

Parameter	Description
Policy Content	1. **Allow**: Select **Allow**. 2. **Select service**: Select **Object Storage Service (OBS)**. 3. **Select action**: Select **WriteOnly**, **ReadOnly**, and **ListOnly**. 4. **Specific resources**: a. Set **object** to **Specify resource path**, click **Add Resource Path**, and enter *obs_bucket_name*/**tmp/** and *obs_bucket_name*/**tmp/***. The **/tmp** directory is used as an example. If you need to add permissions for other directories, perform the following steps to add the directories and resource paths of all objects in the directories. b. Set **bucket** to **Specify resource path**, click **Add Resource Path**, and enter *obs_bucket_name*. 5. (Optional) Add request condition, which does not need to be added currently.
Description	(Optional) Brief description about the policy.

NOTE

If the data write operation of each component is implemented in **rename** mode, the permission to delete objects must be configured when data is written.

4. Click **OK** to save the policy.

Step 2 Create an agency on IAM.

1. Log in to the IAM console.
2. Choose **Agencies**. On the displayed page, click **Create Agency**.
3. Set parameters according to **Table 10-56**.

Table 10-56 Agency parameters

Parameter	Description
Agency Name	Only letters, digits, spaces, and special characters (-_.,) are allowed.

Parameter	Description
Agency Type	Select **Common account**.
Delegated Account	Enter your cloud account, that is, the account you register using your mobile phone number. It cannot be a federated user or an IAM user created using your cloud account.
Validity Period	Set this parameter as required.
Description	(Optional) Brief description about the agency.
Permissions	1. In the **Project [Region]** column, locate the row where **OBS** is, click **Attach Policy**. 2. Select the policy created in **Step 1** to display it in **Selected Policies**. 3. Click **OK**.

4. Click **OK** to save the agency.

NOTE

If you modify an agency and policies bound to it after using the agency to access OBS, the modification will take effect within 15 minutes.

----End

10.14 Patch Operation Guide

10.14.1 Patch Operation Guide for Versions Earlier than MRS 1.7.0

If you obtain patch information from the following sources, upgrade the patch according to actual requirements.

- You obtain information about the patch released by MRS from a message pushed by the message center service.
- You obtain information about the patch by accessing the cluster and viewing patch information.

Preparing for Patch Installation

- Follow instructions in **Performing a Health Check** to check cluster status. If the cluster health status is normal, install a patch.
- You have uploaded the cluster patch package to the server. For details, see **Uploading the Patch Package**.

- You need to confirm the target patch to be installed according to the patch information in the patch content.

Uploading the Patch Package

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 Choose **System** > **Manage Patch**. The **Manage Patch** page is displayed.

Step 3 Click **Upload Patch** and set the following parameters.

- **Patch File Path**: Folder created in the OBS file system where the patch package is stored, for example, **MRS_1.6.2/MRS_1_6_2_11.tar.gz**
- **Bucket**: Name of the OBS file system where the patch package is stored, for example, **mrs_patch**

NOTE

You can obtain the file system name and patch file path on the **Patch Information** tab page. The value of the **Patch Path** is in the following format: [File system name]/[Patch file path].

- **AK**: For details, see .
- **SK**: For details, see .

Step 4 Click **OK** to upload the patch.

----End

Installing a Patch

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 Choose **System** > **Manage Patch**. The **Manage Patch** page is displayed.

Step 3 In the **Operation** column, click **Install**.

Step 4 In the displayed dialog box, click **OK** to install the patch.

Step 5 After the patch is installed, you can view the installation status in the progress bar. If the installation fails, contact the MRS cluster administrator.

NOTE

For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

Uninstalling a Patch

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 Choose **System** > **Manage Patch**. The **Manage Patch** page is displayed.

Step 3 In the **Operation** column, click **Uninstall**.

NOTE

For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

10.14.2 Patch Operation Guide for Versions

If you obtain patch information from the following sources, upgrade the patch according to actual requirements.

- You obtain information about the patch released by MRS from a message pushed by the message center service.
- You obtain information about the patch by accessing the cluster and viewing patch information.

Preparing for Patch Installation

- Follow instructions in **Performing a Health Check** to check cluster status. If the cluster health status is normal, install a patch.
- You need to confirm the target patch to be installed according to the patch information in the patch content.

Installing a Patch

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patch Information** page, click **Install** in the **Operation** column to install the target patch.

NOTE

- For details about rolling patch operations, see **Supporting Rolling Patches**.
- For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

Uninstalling a Patch

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patch Information** page, click **Uninstall** in the **Operation** column to uninstall the target patch.

NOTE

- For details about rolling patch operations, see **Supporting Rolling Patches**.
- For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

10.14.3 Supporting Rolling Patches

The rolling patch function indicates that patches are installed or uninstalled for one or more services in a cluster by performing a rolling service restart (restarting services or instances in batches), without interrupting the services or within a minimized service interruption interval. Services in a cluster are divided into the following three types based on whether they support rolling patch:

- Services supporting rolling patch installation or uninstallation: All businesses or part of them (varying depending on different services) of the services are not interrupted during patch installation or uninstallation.
- Services not supporting rolling patch installation or uninstallation: Businesses of the services are interrupted during patch installation or uninstallation.
- Services with some roles supporting rolling patch installation or uninstallation: Some businesses of the services are not interrupted during patch installation or uninstallation.

Table 10-57 provides services and instances that support or do not support rolling restart in the MRS cluster.

Table 10-57 Services and instances that support or do not support rolling restart

Service	Instance	Whether to Support Rolling Restart
HDFS	NameNode	Yes
	ZKFC	
	JournalNode	
	HttpFS	
	DataNode	
Yarn	ResourceManager	Yes
	NodeManager	
Hive	MetaStore	Yes
	WebHCat	
	HiveServer	
MapReduce	JobHistoryServer	Yes
HBase	HMaster	Yes

Service	Instance	Whether to Support Rolling Restart
	RegionServer	
	ThriftServer	
	RESTServer	
Spark	JobHistory	Yes
	JDBCServer	
	SparkResource	No
Hue	Hue	No
Tez	TezUI	No
Loader	Sqoop	No
ZooKeeper	QuorumPeer	Yes
Kafka	Broker	Yes
	MirrorMaker	No
Flume	Flume	Yes
	MonitorServer	
Storm	Nimbus	Yes
	UI	
	Supervisor	
	LogViewer	

Installing a Patch

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patch Information** page, click **Install** in the **Operation** column.

Step 4 On the **Warning** page, enable or disable **Rolling Patch**.

NOTE

- Enabling the rolling patch installation function: Services are not stopped before patch installation, and rolling service restart is performed after the patch installation. This minimizes the impact on cluster services but takes more time than common patch installation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch installation function is not available in clusters with less than two Master nodes and three Core nodes.

Step 5 Click **OK** to install the target patch.

Step 6 View the patch installation progress.

1. Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.
2. Choose **System** > **Manage Patch**. On the **Manage Patch** page, you can view the patch installation progress.

NOTE

For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

Uninstalling a Patch

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patch Information** page, click **Uninstall** in the **Operation** column.

Step 4 On the **Warning** page, enable or disable **Rolling Patch**.

NOTE

- Enabling the rolling patch uninstallation function: Services are not stopped before patch uninstallation, and rolling service restart is performed after the patch uninstallation. This minimizes the impact on cluster services but takes more time than common patch uninstallation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch uninstallation function is not available in clusters with less than two Master nodes and three Core nodes.

Step 5 Click **OK** to uninstall the target patch.

Step 6 View the patch uninstallation progress.

1. Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

2. Choose **System** > **Manage Patch**. On the **Manage Patch** page, you can view the patch uninstallation progress.

NOTE

For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

10.15 Restoring Patches for the Isolated Hosts

If some hosts are isolated in a cluster, perform the following operations to restore patches for these isolated hosts after patch installation on other hosts in the cluster. After patch restoration, versions of the isolated host nodes are consistent with those are not isolated.

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 2 Choose **System** > **Manage Patch**. The **Manage Patch** page is displayed.

Step 3 In the **Operation** column, click **View Details**.

Step 4 On the patch details page, select host nodes whose **Status** is **Isolated**.

Step 5 Click **Select and Restore** to restore the isolated host nodes.

----End

10.16 Rolling Restart

After modifying the configuration items of a big data component, you need to restart the corresponding service to make new configurations take effect. If you use a normal restart mode, all services or instances are restarted concurrently, which may cause service interruption. To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted. Rolling restart takes longer than normal restart.

Table 10-58 provides services and instances that support or do not support rolling restart in the MRS cluster.

Table 10-58 Services and instances that support or do not support rolling restart

Service	Instance	Whether to Support Rolling Restart
HDFS	NameNode	Yes
	ZKFC	
	JournalNode	

Service	Instance	Whether to Support Rolling Restart
	HttpFS	
	DataNode	
Yarn	ResourceManager	Yes
	NodeManager	
Hive	MetaStore	Yes
	WebHCat	
	HiveServer	
MapReduce	JobHistoryServer	Yes
HBase	HMaster	Yes
	RegionServer	
	ThriftServer	
	RESTServer	
Spark	JobHistory	Yes
	JDBCServer	
	SparkResource	No
Hue	Hue	No
Tez	TezUI	No
Loader	Sqoop	No
ZooKeeper	Quorumpeer	Yes
Kafka	Broker	Yes
	MirrorMaker	No
Flume	Flume	Yes
	MonitorServer	
Storm	Nimbus	Yes
	UI	
	Supervisor	
	Logviewer	

Restrictions

- Perform a rolling restart during off-peak hours.
  - Otherwise, a rolling restart failure may occur. For example, if the throughput of Kafka is high (over 100 MB/s) during the Kafka rolling restart, the Kafka rolling restart may fail.
  - For example, if the requests per second of each RegionServer on the native interface exceed 10,000 during the HBase rolling restart, you need to increase the number of handles to prevent a RegionServer restart failure caused by heavy loads during the restart.
- Before the restart, check the number of current requests of HBase. If requests of each RegionServer on the native interface exceed 10,000, increase the number of handles to prevent a failure.
- If the number of Core nodes in a cluster is less than six, services may be affected for a short period of time.
- Preferentially perform a rolling instance or service restart and select **Only restart instances whose configurations have expired**.

Performing a Rolling Service Restart

Step 1 On MRS Manager, click **Services** and select a service for which you want to perform a rolling restart.

Step 2 On the **Service Status** tab page, click **More** and select **Perform Rolling Service Restart**.

Step 3 After you enter the administrator password, the **Perform Rolling Service Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.

Step 4 After the rolling restart task is complete, click **Finish**.

----End

Performing a Rolling Instance Restart

Step 1 On MRS Manager, click **Services** and select a service for which you want to perform a rolling restart.

Step 2 On the **Instance** tab page, select the instance to be restarted. Click **More** and select **Perform Rolling Instance Restart**.

Step 3 After you enter the password, the **Perform Rolling Instance Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the instance.

Step 4 After the rolling restart task is complete, click **Finish**.

----End

Perform a Rolling Cluster Restart

Step 1 On MRS Manager, click **Services**. The **Services** page is displayed.

Step 2 Click **More** and select **Perform Rolling Cluster Restart**.

Step 3 After you enter the password, the **Perform Rolling Cluster Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the cluster.

Step 4 After the rolling restart task is complete, click **Finish**.

----End

Rolling Restart Parameter Description

Table 10-59 describes rolling restart parameters.

Table 10-59 Rolling restart parameter description

Parameter	Description
Only restart instances whose configurations have expired	Specifies whether to restart only the modified instances in a cluster.
Data Node Instances to Be Batch Restarted	Specifies the number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is **1**. The value ranges from 1 to 20. This parameter is valid only for data nodes.
Batch Interval	Specifies the interval between two batches of instances for rolling restart. The default value is **0**. The value ranges from 0 to 2147483647. The unit is second. Note: Setting the batch interval parameter can increase the stability of the big data component process during the rolling restart. You are advised to set this parameter to a non-default value, for example, 10.
Batch Fault Tolerance Threshold	Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is **0**, which indicates that the rolling restart task ends after any batch of instances fails to be restarted. The value ranges from 0 to 214748364.

Procedure in a Typical Scenario

Step 1 On MRS Manager, click **Services** and select HBase. The HBase service page is displayed.

Step 2 Click the **Service Configuration** tab, and modify an HBase parameter. After the following dialog box is displayed, click **OK** to save the configurations.

NOTE

Do not select **Restart the affected services or instances**. This option indicates a normal restart. If you select this option, all services or instances will be restarted, which may cause service interruption.

Step 3 After saving the configurations, click **Finish**.

Step 4 Click the **Service Status** tab.

Step 5 On the **Service Status** tab page, click **More** and select **Perform Rolling Service Restart**.

Step 6 After you enter the password, the **Perform Rolling Service Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.

Step 7 After the rolling restart task is complete, click **Finish**.

----End

11 Security Description

11.1 Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled

The Hadoop community version provides two authentication modes: Kerberos authentication (security mode) and Simple authentication (normal mode). When creating a cluster, you can choose to enable or disable Kerberos authentication.

Clusters in security mode use the Kerberos protocol for security authentication.

In normal mode, MRS cluster components use a native open source authentication mechanism, which is typically Simple authentication. If Simple authentication is used, authentication is automatically performed by a client user (for example, user **root**) by default when a client connects to a server. The authentication is imperceptible to the MRS cluster administrator or service user. In addition, when being executed, the client may even pretend to be any user (including **superuser**) by injecting **UserGroupInformation**. Cluster resource management and data control APIs are not authenticated on the server and are easily exploited and attacked by hackers.

Therefore, in normal mode, network access permissions must be strictly controlled to ensure cluster security. You are advised to perform the following operations to ensure cluster security.

- Deploy service applications on ECSs in the same VPC and subnet and avoid accessing MRS clusters through an external network.
- Configure security group rules to strictly control the access scope. Do not configure access rules that allow **Any** or **0.0.0.0** for the inbound direction of MRS cluster ports.
- If you want to access the native pages of the components in the cluster from the external, follow instructions in **Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser** for configuration.

11.2 Security Authentication Principles and Mechanisms

Function

For clusters in security mode with Kerberos authentication enabled, security authentication is required during application development.

Kerberos, named after the ferocious three-headed guard dog of Hades from Greek mythology, is now used to a concept in authentication. The Kerberos protocol adopts a client–server model and cryptographic algorithms such as AES (Advanced Encryption Standard). It provides mutual authentication, that is, both the client and the server can verify each other's identity. Kerberos is used to prevent interception and replay attacks and protect data integrity. It is a system that manages keys by using a symmetric key mechanism.

Architecture

Kerberos architecture is shown in **Figure 11-1** and module description in **Table 11-1**.

Figure 11-1 Kerberos architecture

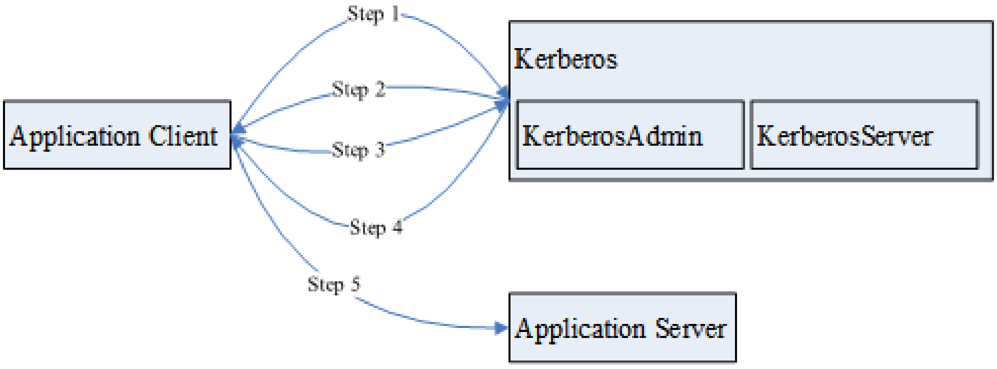


Table 11-1 Module description

Module	Description
Application Client	An application client, which is usually an application that submits tasks or jobs
Application Server	An application server, which is usually an application that an application client accesses
Kerberos	A service that provides security authentication

Module	Description
KerberosAdmin	A process that provides authentication user management
KerberosServer	A process that provides authentication ticket distribution

The process and principle are described as follows:

An application client can be a service in a cluster or a secondary development application of the customer. An application client can submit tasks or jobs to an application service.

1. Before submitting a task or job, the application client needs to apply for a ticket granting ticket (TGT) from the Kerberos service to establish a secure session with the Kerberos server.
2. After receiving the TGT request, the Kerberos service resolves parameters in the request to generate a TGT, and uses the key of the username specified by the client to encrypt the response.
3. After receiving the TGT response, the application client (based on the underlying RPC) resolves the response and obtains the TGT, and then applies for a server ticket (ST) of the application server from the Kerberos service.
4. After receiving the ST request, the Kerberos service verifies the TGT validity in the request and generates an ST of the application service, and then uses the application service key to encrypt the response.
5. After receiving the ST response, the application client packages the ST into a request and sends the request to the application server.
6. After receiving the request, the application server uses its local application service key to resolve the ST. After successful verification, the request becomes valid.

Basic Concepts

The following concepts can help users learn the Kerberos architecture quickly and understand the Kerberos service better. The following uses security authentication for HDFS as an example.

TGT

A TGT is generated by the Kerberos service and used to establish a secure session between an application and the Kerberos server. The validity period of a TGT is 24 hours. After 24 hours, the TGT expires automatically.

The following describes how to apply for a TGT (HDFS is used as an example):

1. Obtain a TGT through an API provided by HDFS.

```
/**
 * login Kerberos to get TGT, if the cluster is in security mode
 * @throws IOException if login is failed
 */
 private void login() throws IOException {
 // not security mode, just return
   if (! "kerberos".equalsIgnoreCase(conf.get("hadoop.security.authentication"))) {
       return;
   }

   //security mode
   System.setProperty("java.security.krb5.conf", PATH_TO_KRB5_CONF);

   UserGroupInformation.setConfiguration(conf);
   UserGroupInformation.loginUserFromKeytab(PRNCIPAL_NAME, PATH_TO_KEYTAB);
 }
```

2. Run shell commands on the client in kinit mode.

ST

An ST is generated by the Kerberos service and used to establish a secure session between an application and application service. An ST is valid only once.

In FusionInsight products, the generation of an ST is based on the Hadoop-RPC communication. The underlying RPC submits a request to the Kerberos server and the Kerberos server generates an ST.

Sample Authentication Code

```
package com.xxx.bigdata.hdfs.examples;

import java.io.IOException;

import org.apache.hadoop.conf.Configuration;
import org.apache.hadoop.fs.FileStatus;
import org.apache.hadoop.fs.FileSystem;
import org.apache.hadoop.fs.Path;
import org.apache.hadoop.security.UserGroupInformation;

public class KerberosTest {
    private static String PATH_TO_HDFS_SITE_XML = KerberosTest.class.getClassLoader().getResource("hdfs-site.xml")
            .getPath();
    private static String PATH_TO_CORE_SITE_XML = KerberosTest.class.getClassLoader().getResource("core-site.xml")
            .getPath();
    private static String PATH_TO_KEYTAB =
KerberosTest.class.getClassLoader().getResource("user.keytab").getPath();

    }

    /**
     * An example to access the HDFS
     * @throws IOException
     */
    private void doSth() throws IOException {
        Path path = new Path("/tmp");
        FileStatus fStatus = fs.getFileStatus(path);
        System.out.println("Status of " + path + " is " + fStatus);
        //other thing
    }

    public static void main(String[] args) throws Exception {
        KerberosTest test = new KerberosTest();
        test.initConf();
        test.login();
        test.initFileSystem();
        test.doSth();
    }
}
```

NOTE

1. During Kerberos authentication, you need to configure the file parameters required for configuring the Kerberos authentication, including the keytab path, Kerberos authentication username, and the **krb5.conf** configuration file of the client for Kerberos authentication.
2. Method **login()** indicates calling the Hadoop API to perform Kerberos authentication and generating a TGT.
3. Method **doSth** indicates calling the Hadoop API to access the file system. In this situation, the underlying RPC automatically carries the TGT to Kerberos for verification and then an ST is generated.

12 High-Risk Operations

Forbidden Operations

Table 12-1 lists forbidden operations during the routine cluster operation and maintenance process.

Table 12-1 Forbidden operations

Item	Risk
Delete ZooKeeper data directories.	ClickHouse, HDFS, Yarn, HBase, and Hive depend on ZooKeeper, which stores metadata. This operation has adverse impact on normal operating of related components.
Performing switchover frequently between active and standby JDBCServer nodes	This operation may interrupt services.
Delete Phoenix system tables and data (SYSTEM.CATALOG, SYSTEM.STATS, SYSTEM.SEQUENCE, and SYSTEM. FUNCTION).	This operation will cause service operation failures.
Manually modify data in the Hive metabase (hivemeta database).	This operation may cause Hive data parse errors. As a result, Hive cannot provide services.
Do not manually perform **INSERT** or **UPDATE** operations on Hive metadata tables.	This operation may cause Hive data parse errors. As a result, Hive cannot provide services.
Change permission on the Hive private file directory **hdfs:///tmp/hive-scratch**.	This operation may cause unavailable Hive services.
Modify **broker.id** in the Kafka configuration file.	This operation may cause invalid node data.

Item	Risk
Modify the host names of nodes.	Instances and upper-layer components on the host cannot provide services properly. The fault cannot be rectified.
Reinstall the OS of a node.	This operation will cause MRS cluster exceptions, leaving MRS clusters in abnormal status.
Use private images.	This operation will cause MRS cluster exceptions, leaving MRS clusters in abnormal status.

The following tables list the high-risk operations during the operation and maintenance of each component.

High-Risk Operations on a Cluster

Table 12-2 High-risk operations on a cluster

Operation	Risk	Severity	Workaround	Check Item
Modify the file directory or file permissions of user **omm** without permission.	This operation will lead to MRS service unavailability.	▲ ▲ ▲ ▲ ▲	Do not perform this operation.	Check whether the MRS cluster service is available.
Bind an EIP.	This operation exposes the Master node hosting MRS Manager of the cluster to the public network, increasing the risk of network attacks from the Internet.	▲ ▲ ▲ ▲ ▲	Ensure that the bound EIP is a trusted public IP address.	None

Operation	Risk	Severity	Workaround	Check Item
Enable security group rules for port 22 of a cluster.	This operation increases the risk of exploiting vulnerability of port 22.	▲ ▲ ▲ ▲ ▲	Configure a security group rule for port 22 to allow only trusted IP addresses to access the port. You are not advised to configure the inbound rule to allow 0.0.0.0 to access the port.	None
Delete a cluster or cluster data.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before deleting the data, confirm the necessity of the operation and ensure that the data has been backed up.	None
Scale in a cluster.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before scaling in the cluster, confirm the necessity of the operation and ensure that the data has been backed up.	None
Detach or format a data disk.	Data will get lost.	▲ ▲ ▲ ▲ ▲	Before performing this operation, confirm the necessity of the operation and ensure that the data has been backed up.	None

Manager High-Risk Operations

Table 12-3 Manager high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the OMS password.	This operation will restart all processes of OMSServer, which has adverse impact on cluster maintenance and management.	▲▲▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.
Import the certificate.	This operation will restart OMS processes and the entire cluster, which has adverse impact on cluster maintenance and management and services.	▲▲▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Perform an upgrade.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster. Strictly manage the user who is eligible to assign the cluster management permission to prevent security risks.	▲▲▲	Ensure that there is no other maintenance and management operations when the operation is performed.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Restore the OMS.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change an IP address.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲	Ensure that there is no other maintenance and management operations when the operation is performed and that the new IP address is correct.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change log levels.	If the log level is changed to **DEBUG**, Manager responds slowly.	▲ ▲	Before the modification, confirm the necessity of the operation and change it back to the default log level in time.	None

Operation	Risk	Severity	Workaround	Check Item
Replace a control node.	This operation will interrupt services deployed on the node. If the node is a management node, the operation will restart all OMS processes, affecting the cluster management and maintenance.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Replace a management node.	This operation will interrupt services deployed on the node. As a result, OMS processes will be restarted, affecting the cluster management and maintenance.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Restart the upper-layer service at the same time during the restart of a lower-layer service.	This operation will interrupt the upper-layer service, affecting the management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Modify the OLDAP port.	This operation will restart the LdapServer and Kerberos services and all associated services, affecting service running.	▲ ▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	None
Delete the **supergroup** group.	Deleting the **supergroup** group decreases user rights, affecting service access.	▲ ▲ ▲ ▲ ▲	Before the change, confirm the rights to be added. Ensure that the required rights have been added before deleting the **supergroup** rights to which the user is bound, ensuring service continuity.	None
Restart a service.	Services will be interrupted during the restart. If you select and restart the upper-layer service, the upper-layer services that depend on the service will be interrupted.	▲ ▲ ▲	Confirm the necessity of restarting the system before the operation.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

Operation	Risk	Severity	Workaround	Check Item
Change the default SSH port No.	After the default port (22) is changed, functions such as cluster creation, service/instance adding, host adding, and host reinstallation cannot be used, and results of cluster health check items for node mutual trust, **omm**/**ommdba** user password expiration, and others are incorrect.	▲ ▲ ▲	Before performing this operation, restore the SSH port to the default value.	None

ClickHouse High-Risk Operations

Table 12-4 ClickHouse high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete data directories.	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.
Remove ClickHouseServer instances.	The ClickHouseServer instance nodes in the same shard must be removed in at the same time. Otherwise, the topology information of the logical cluster is incorrect. Before performing this operation, check the database and data table information of each node in the logical cluster and perform scale-in pre-analysis to ensure that data is successfully migrated during the scale-in process to prevent data loss	▲ ▲ ▲ ▲ ▲	Before scale-in, collect information in advance to learn the status of the ClickHouse logical cluster and instance nodes.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.

Operation	Risk	Severity	Workaround	Check Item
Add ClickHouseServer instances.	When performing this operation, you must check whether a database or data table with the same name as that on the old node needs to be created on the new node. Otherwise, subsequent data migration, data balancing, scale-in, and decommissioning will fail.	▲ ▲ ▲ ▲ ▲	Before scale-out, confirm the function and purpose of new ClickHouseServer instances and determine whether to create related databases and data tables.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.
Decommission ClickHouseServer instances.	The ClickHouseServer instance nodes in the same shard must be decommissioned in at the same time. Otherwise, the topology information of the logical cluster is incorrect. Before performing this operation, check the database and data table information of each node in the logical cluster and perform decommissioning pre-analysis to ensure that data is successfully migrated during the decommissioning process to prevent data loss	▲ ▲ ▲ ▲ ▲	Before decommissioning, collect information in advance to learn the status of the ClickHouse logical cluster and instance nodes.	Check the ClickHouse logical cluster topology information, database and data table information in each ClickHouseServer instance, and data volume.
Recommission ClickHouseServer instances.	When performing this operation, you must select all nodes in the original shard. Otherwise, the topology information of the logical cluster is incorrect.	▲ ▲ ▲ ▲ ▲	Before recommissioning, you need to confirm the home information about the shards of the node to be recommissioned.	Check the ClickHouse logical cluster topology information.

Operation	Risk	Severity	Workaround	Check Item
Modify data directory content (file and folder creation).	This operation may cause the ClickHouse instance of the node faults.	▲ ▲ ▲	Do not create or modify files or folders in the data directories manually.	Check whether data directories are normal.
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop ZooKeeper, Kerberos, and LDAP basic components independently. Select related services when performing this operation.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.

DBService High-Risk Operations

Table 12-5 DBService high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the DBService password.	The services need to be restarted for the password change to take effect. The services are unavailable during the restart.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.
Restore DBService data.	After the data is restored, the data generated after the data backup and before the data restoration is lost. After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check whether there are uncleared alarms and whether the cluster management and maintenance are normal.

Operation	Risk	Severity	Workaround	Check Item
Perform active/standby DBService switchover.	During the DBServer switchover, DBService is unavailable.	▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	None
Change the DBService floating IP address.	The DBService needs to be restarted for the change to take effect. The DBService is unavailable during the restart. If the floating IP address has been used, the configuration will fail, and the DBService will fail to be started.	▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Flink High-Risk Operations

Table 12-6 Flink high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change log levels.	If the log level is modified to DEBUG, the task running performance is affected.	▲ ▲	Before the modification, confirm the necessity of the operation and change it back to the default log level in time.	None

Operation	Risk	Severity	Workaround	Check Item
Modify file permissions.	Tasks may fail.	▲ ▲ ▲	Confirm the necessity of the operation before the modification.	Check whether related service operations are normal.

Flume High-Risk Operations

Table 12-7 Flume high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the Flume instance start parameter **GC_OPTS**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Change the default value of **dfs.replication** from **3** to **1**.	This operation will have the following impacts: 1. The storage reliability deteriorates. If the disk becomes faulty, data will be lost. 2. NameNode fails to be restarted, and the HDFS service is unavailable.	▲ ▲ ▲ ▲	When modifying related configuration items, check the parameter description carefully. Ensure that there are more than two replicas for data storage.	Check whether the default replica number is not 1 and whether the HDFS service is normal.

HBase High-Risk Operations

Table 12-8 HBase high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify encryption configuration. ● hbase.regionserver.wal.encryption ● hbase.crypto.keyprovider.parameters.uri ● hbase.crypto.keyprovider.parameters.encryptedtext	Services cannot start properly.	▲▲▲▲	Strictly follow the prompt information when modifying related configuration items, which are associated. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Change the value of **hbase.regionserver.wal.encryption** to **false** or switch encryption algorithm from AES to SMS4.	This operation may cause start failures and data loss.	▲ ▲ ▲ ▲	When HFile and WAL are encrypted using an encryption algorithm and a table is created, do not close or switch the encryption algorithm randomly. If an encryption table (ENCRYPTION=>AES/SMS4) is not created, you can only switch the encryption algorithm.	None
Modify HBase instance start parameter **GC_OPTS** and **HBASE_HEAPSIZE**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid. GC_OPTS does not conflict with HBASE_HEAPSIZE.	Check whether services can be started properly.
Use **OfflineMetaRepair** tool	Services cannot start properly.	▲ ▲ ▲ ▲	This tool can be used only when HBase is offline and cannot be used in data migration scenarios.	Check whether HBase services can be started properly.

HDFS High-Risk Operations

Table 12-9 HDFS high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change HDFS NameNode data storage directory **dfs.namenode.name.dir** and data configuration directory **dfs.datanode.data.dir**.	Services cannot start properly.	▲▲▲▲▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Use the **-delete** parameter when you run the **hadoop distcp** command.	During DistCP copying, files that do not exist in the source cluster but exist in the destination cluster are deleted from the destination cluster.	▲▲	When using DistCP, determine whether to retain the redundant files in the destination cluster. Exercise caution when using the **-delete** parameter.	After DistCP copying is complete, check whether the data in the destination cluster is retained or deleted according to the parameter settings.

Operation	Risk	Severity	Workaround	Check Item
Modify the HDFS instance start parameter **GC_OPTS**, **HADOOP_HEAPSIZE**, and **GC_PROFILE**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid. GC_OPTS does not conflict with HADOOP_HEAPSIZE.	Check whether services can be started properly.
Change the default value of **dfs.replication** from **3** to **1**.	This operation will have the following impacts: 1. The storage reliability deteriorates. If the disk becomes faulty, data will be lost. 2. NameNode fails to be restarted, and the HDFS service is unavailable.	▲ ▲ ▲ ▲	When modifying related configuration items, check the parameter description carefully. Ensure that there are more than two replicas for data storage.	Check whether the default replica number is not 1 and whether the HDFS service is normal.
Change the remote procedure call (RPC) channel encryption mode (**hadoop.rpc.protection**) of each module in Hadoop.	This operation causes service faults and service exceptions.	▲ ▲ ▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether HDFS and other services that depend on HDFS can properly start and provide services.

Hive High-Risk Operations

Table 12-10 Hive high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the Hive instance start parameter **GC_OPTS**.	This operation may cause Hive instance start failures.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Delete all MetaStore instances.	This operation may cause Hive metadata loss. As a result, Hive cannot provide services.	▲ ▲ ▲	Do not perform this operation unless ensure that Hive table information can be discarded.	Check whether services can be started properly.
Delete or modify files corresponding to Hive tables over HDFS interfaces or HBase interfaces.	This operation may cause Hive service data loss or tampering.	▲ ▲	Do not perform this operation unless ensure that the data can be discarded or that the operation meets service requirements.	Check whether Hive data is complete.

Operation	Risk	Severity	Workaround	Check Item
Delete or modify files corresponding to Hive tables or directory access permission over HDFS interfaces or HBase interfaces.	This operation may cause related service scenarios to be unavailable.	▲ ▲ ▲	Do not perform this operation.	Check whether related service operations are normal.
Delete or modify **hdfs:///apps/templeton/hive-3.1.0.tar.gz** over HDFS interfaces.	WebHCat fails to perform services due to this operation.	▲ ▲	Do not perform this operation.	Check whether related service operations are normal.
Export table data to overwrite the data at the local. For example, export the data of **t1** to **/opt/dir**. **insert overwrite local directory '/opt/dir' select * from t1;**	This operation will delete target directories. Incorrect setting may cause software or OS startup failures.	▲ ▲ ▲ ▲ ▲	Ensure that the path where the data is written does not contain any files or do not use the key word overwrite in the command.	Check whether files in the target path are lost.

Operation	Risk	Severity	Workaround	Check Item
Direct different databases, tables, or partition files to the same path, for example, default warehouse path **/user/hive/warehouse**.	The creation operation may cause disordered data. After a database, table, or partition is deleted, other object data will be lost.	▲ ▲ ▲ ▲ ▲	Do not perform this operation.	Check whether files in the target path are lost.

Kafka High-Risk Operations

Table 12-11 Kafka high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete Topic	This operation may delete existing topics and data.	▲ ▲ ▲	Kerberos authentication is used to ensure that authenticated users have operation permissions. Ensure that topic names are correct.	Check whether topics are processed properly.
Delete data directories.	This operation may cause service information loss.	▲ ▲ ▲	Do not delete data directories manually.	Check whether data directories are normal.

Operation	Risk	Severity	Workaround	Check Item
Modify data directory content (file and folder creation).	This operation may cause the Broker instance of the node faults.	▲ ▲ ▲	Do not create or modify files or folders in the data directories manually.	Check whether data directories are normal.
Modify the disk auto-adaptation function using the **disk.adapter.enable** parameter.	This operation adjusts the topic data retention period when the disk usage reaches the threshold. Historical data that does not fall within the storage retention may be deleted.	▲ ▲ ▲	If the retention period of some topics cannot be adjusted, add this topic to the value of **disk.adapter.topic.blacklist**.	Observe the data storage period on the Kafka topic monitoring page.
Modify data directory **log.dirs** configuration.	Incorrect operation may cause process faults.	▲ ▲ ▲	Ensure that the added or modified data directories are empty and that the directory permissions are right.	Check whether data directories are normal.
Reduce the capacity of the Kafka cluster.	This operation may cause quantity reduction of backups of some data duplicates of topic. As a result, some topics cannot be accessed.	▲ ▲	Perform backup operation and then reduce the capacity of the Kafka cluster.	Check whether backup nodes where partitions are located are activated to ensure data security.

Operation	Risk	Severity	Workaround	Check Item
Start or stop basic components independently.	This operation has adverse impact on the basic functions of some services. As a result, service failures occur.	▲ ▲ ▲	Do not start or stop ZooKeeper, Kerberos, and LDAP basic components independently. Select related services when performing this operation.	Check whether the service status is normal.
Restart or stop services.	This operation may interrupt services.	▲ ▲	Restart or stop services when necessary.	Check whether the service is running properly.
Modify configuration parameters.	This operation requires service restart for configuration to take effect.	▲ ▲	Modify configuration when necessary.	Check whether the service is running properly.
Delete or modify metadata.	Modifying or deleting Kafka metadata on ZooKeeper may cause the Kafka topic or service unavailability.	▲ ▲ ▲	Do not delete or modify Kafka metadata stored on ZooKeeper.	Check whether the Kafka topics or Kafka service is available.
Delete metadata backup files.	After Kafka metadata backup files are modified and used to restore Kafka metadata, Kafka topics or the Kafka service may be unavailable.	▲ ▲ ▲	Do not delete Kafka metadata backup files.	Check whether the Kafka topics or Kafka service is available.

KrbServer High-Risk Operations

Table 12-12 KrbServer high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the **KADMIN_PORT** parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲▲▲▲▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Modify the **kdc_ports** parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲▲▲▲▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Modify the **KPASSWD_PORT** parameter of KrbServer.	After this parameter is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲▲▲▲▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None

Operation	Risk	Severity	Workaround	Check Item
Modify the domain name of Manager system.	After the domain name is modified, if the KrbServer service and its associated services are not restarted in a timely manner, the configuration of KrbClient in the cluster is abnormal and the service running is affected.	▲▲▲▲▲	After this parameter is modified, restart the KrbServer service and all its associated services.	None
Configure cross-cluster mutual trust relationships.	This operation will restart the KrbServer service and all associated services, affecting the management and maintenance and services of the cluster.	▲▲▲▲▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.

LdapServer High-Risk Operations

Table 12-13 LdapServer high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the **LDAP_SERVER_PORT** parameter of LdapServer.	After this parameter is modified, if the LdapServer service and its associated services are not restarted in a timely manner, the configuration of LdapClient in the cluster is abnormal and the service running is affected.	▲▲▲▲▲	After this parameter is modified, restart the LdapServer service and all its associated services.	None

Operation	Risk	Severity	Workaround	Check Item
Restore LdapServer data.	This operation will restart Manager and the entire cluster, affecting management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Replace the Node where LdapServer is located.	This operation will interrupt services deployed on the node. If the node is a management node, the operation will restart all OMS processes, affecting the cluster management and maintenance.	▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	Check for uncleared alarms, and check whether the cluster management and maintenance and services are normal.
Change the password of LdapServer.	The LdapServer and Kerberos services need to be restarted during the password change, affecting the management, maintenance, and services of the cluster.	▲ ▲ ▲ ▲	Before performing the operation, ensure that the operation is necessary, and that no other management and maintenance operations are performed at the same time.	None

Operation	Risk	Severity	Workaround	Check Item
Restart the node where LdapServer is located.	Restarting the node without stopping the LdapServer service may cause LdapServer data damage.	▲▲▲▲▲	Restore LdapServer using LdapServer backup data	None

Loader High-Risk Operations

Table 12-14 Loader high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Change the floating IP address of a Loader instance (**loader.float.ip**).	Services cannot start properly.	▲▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether the Loader UI can be connected properly.
Modify the Loader instance start parameter **LOADER_GC_OPTS**.	Services cannot start properly.	▲▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Clear table contents when adding data to HBase.	This operation will clear original data in the target table.	▲▲	Ensure that the contents in the target table can be cleared before the operation.	Check whether the contents in the target table can be cleared before the operation.

Spark2x High-risk Operations

NOTE

Spark high-risk operations apply to MRS 3.x earlier versions.

Table 12-15 Spark2x high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the configuration item **spark.yarn.queue**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item **spark.driver.extraJavaOptions**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item **spark.yarn.cluster.driver.extraJavaOptions**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the configuration item **spark.eventLog.dir**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the configuration item **SPARK_DAEMON_JAVA_OPTS**.	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Delete all JobHistory2x instances.	The event logs of historical applications are lost.	▲ ▲	Reserve at least one JobHistory2x instance.	Check whether historical application information is included in JobHistory2x.
Delete or modify the **/user/spark2x/jars/8.1.0.1/spark-archive-2x.zip** file in HDFS.	JDBCServer2x fails to be started and service functions are abnormal.	▲ ▲ ▲	Delete **/user/spark2x/jars/8.1.0.1/spark-archive-2x.zip**, and wait for 10-15 minutes until the .zip package is automatically restored.	Check whether services can be started properly.

Storm High-Risk Operations

Table 12-16 Storm high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Modify the following plug-in related configuration items: ● storm.scheduler ● nimbus.authorizer ● storm.thrift.transport ● nimbus.blobstore.class ● nimbus.topology.validator ● storm.principal.tolocal	Services cannot start properly.	▲▲▲▲	Strictly follow the prompt information when modifying related configuration items. Ensure that the class names exist and are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the Storm instance **GC_OPTS** startup parameters, including: NIMBUS_GC_OPTS SUPERVISOR_GC_OPTS UI_GC_OPTS LOGVIEWER_GC_OPTS	Services cannot start properly.	▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.
Modify the user resource pool configuration parameter **resource.aware.scheduler.user.pools**.	Services cannot run properly.	▲ ▲ ▲	Strictly follow the prompt information when modifying related configuration items. Ensure that resources allocated to each user are appropriate and valid.	Check whether services can be started and run properly
Change data directories.	If this operation is not properly performed, services may be abnormal and unavailable.	▲ ▲ ▲ ▲	Do not manually change data directories.	Check whether data directories are normal.
Restart services or instances.	The service will be interrupted for a short period of time, and ongoing operations will be interrupted.	▲ ▲ ▲	Restart services or instances when necessary.	Check whether the service is running properly and whether interrupted operations are restored.

Operation	Risk	Severity	Workaround	Check Item
Synchronize configurations (by restarting the required service).	The service will be restarted, resulting in temporary service interruption. If Supervisor is restarted, ongoing operations will be interrupted for a short period of time.	▲ ▲ ▲	Modify configuration when necessary.	Check whether the service is running properly and whether interrupted operations are restored.
Stop services or instances.	The service will be stopped, and related operations will be interrupted.	▲ ▲ ▲	Stop services when necessary.	Check whether the services are properly stopped.
Delete or modify metadata.	If Nimbus metadata is deleted, services are abnormal and ongoing operations are lost.	▲ ▲ ▲ ▲ ▲	Do not manually delete Nimbus metadata files.	Check whether Nimbus metadata files are normal.
Modify file permissions.	If permissions on the metadata and log directories are incorrectly modified, service exceptions may occur.	▲ ▲ ▲ ▲	Do not manually modify file permissions.	Check whether the permissions on the data and log directories are correct.
Delete topologies.	Topologies in use will be deleted.	▲ ▲ ▲ ▲	Delete topologies when necessary.	Check whether the topologies are successfully deleted.

Yarn High-Risk Operations

Table 12-17 Yarn high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete or change data directories **yarn.nodemanager.local-dirs** and **yarn.nodemanager.log-dirs**	This operation may cause service information loss.	▲▲▲	Do not delete data directories manually.	Check whether data directories are normal.

ZooKeeper High-Risk Operations

Table 12-18 ZooKeeper high-risk operations

Operation	Risk	Severity	Workaround	Check Item
Delete or change ZooKeeper data directories.	This operation may cause service information loss.	▲▲▲	Follow the capacity expansion guide to change the ZooKeeper data directories.	Check whether services and associated components are started properly.
Modify the ZooKeeper instance start parameter **GC_OPTS**.	Services cannot start properly.	▲▲	Strictly follow the prompt information when modifying related configuration items. Ensure that new values are valid.	Check whether services can be started properly.

Operation	Risk	Severity	Workaround	Check Item
Modify the znode ACL information in ZooKeeper.	If znode permission is modified in ZooKeeper, other users may have no permission to access the znode and some system functions are abnormal.	▲ ▲ ▲ ▲	During the modification, strictly follow the ZooKeeper Configuration Guide and ensure that other components can use ZooKeeper properly after ACL information modification.	Check that other components that depend on ZooKeeper can properly start and provide services.

13 MRS Quick Start

13.1 How to Use MRS

MapReduce Service (MRS) is used to deploy and manage the Hadoop system and enables one-click Hadoop cluster deployment. MRS provides enterprise-level big data clusters on the cloud. Tenants can fully control the clusters and easily run big data components such as Hadoop, Spark, HBase, Kafka, and Storm in the clusters.

MRS is easy to use. You can execute various tasks and process or store PB-level data using computers connected in a cluster. The procedure of using MRS is as follows:

1. Upload local programs and data files to OBS.
2. Create a cluster by following instructions in **Creating a Custom Cluster**. You can choose a cluster type for offline data analysis or stream processing or both, and set ECS instance specifications, instance count, data disk type (common I/O, high I/O, and ultra-high I/O), and components to be installed such as Hadoop, Spark, HBase, Hive, Kafka, and Storm in a cluster. You can use a **bootstrap action** to execute a script on a specified node before or after the cluster is started to install additional third-party software, modify the cluster running environment, and perform other customizations.
3. **Manage jobs**. MRS provides a platform for executing programs you develop. You can submit, execute, and monitor such programs on MRS.
4. **Manage clusters**. MRS provides you with MRS Manager, an enterprise-level unified management platform of big data clusters, helping you quickly know health status of services and hosts. Through graphical metric monitoring and customization, you can obtain critical system information in a timely manner. In addition, you can modify service attribute configurations based on service performance requirements, and start or stop clusters, services, and role instances in one click.
5. **Terminate a cluster**. You can terminate an MRS cluster that is no longer use after job execution is complete.

13.2 Creating a Cluster

The first step of using MRS is to create a cluster. This section describes how to create a cluster on the MRS management console.

Procedure

Step 1 Log in to the MRS console.

Step 2

NOTE

When creating a cluster, pay attention to quota notification. If a resource quota is insufficient, increase the resource quota as prompted and create a cluster.

Step 3 On the page for create a cluster, click the **Custom Config** tab.

Step 4 Configure cluster software information.

- **Region**: Use the default value.
- **Cluster Name**: You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs_20180321**.
- **Cluster Version**: Select the latest version, which is the default value.
- **Cluster Type**: Use the default **Analysis Cluster**.
- **Component**: Select components such as Spark2x, HBase, and Hive for the analysis cluster. For a streaming cluster, select components such as Kafka and Storm. For a hybrid cluster, you can select the components of the analysis cluster and streaming cluster based on service requirements.
- **Metadata**: Retain the default value.

  NOTE

  For versions earlier than MRS 3.x, select components such as Spark, HBase, and Hive for the analysis cluster.

Step 5 Click **Next**.

- **AZ**: Use the default value.
- **VPC**: Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet**: Use the default value.
- **Security Group**: Select **Auto create**.
- **EIP**: Select **Bind later**.
- **Instance Specifications**: Select General Computing S3 -> 8 vCPUs | 16 GB (s3.2xlarge.2) for both Master and Core nodes.
- **System Disk**: Select **Common I/O** and retain the default settings.
- **Data Disk**: Select **Common I/O** and retain the default settings.
- **Instance Count**: The default number of Master nodes is 2, and that of Core nodes is 3.

Step 6 Click **Next**. The **Set Advanced Options** tab page is displayed. Configure the following parameters. Retain the default settings for the other parameters.

- Kerberos authentication:
  - **Kerberos Authentication**: Disable Kerberos authentication.
  - **Username**: name of the Manager administrator. **admin** is used by default.
  - **Password**: password of the Manager administrator.
- **Key Pair**: Select a key pair from the drop-down list. Select **"I acknowledge that I have obtained private key file** ***SSHkey-xxx*** **and that without this file I will not be able to log in to my ECS."** If you have never created a key pair, click **View Key Pair** to create or import a key pair. And then, obtain a private key file.
- **Secure Communications**: Select **Enable**.

Step 7 Click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

Step 8 Click **Back to Cluster List** to view the cluster status.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

----End

13.3 Uploading Data and Programs

Through the **Files** tab page, you can create, delete, import, export, delete files in the analysis cluster.

Background

MRS clusters process data from OBS or HDFS. OBS provides customers with the data storage capabilities that are massive, secure, reliable, and cost-effective. MRS can directly process data in OBS. You can browse, manage, and use data on the web page of the management console and OBS Client.

Importing Data

Currently, MRS can only import data from OBS to HDFS. The file upload rate decreases with the increase of the file size. This mode applies to scenarios where the data volume is small.

You can perform the following steps to import files and directories:

1. Log in to the MRS console.
2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's information.
3. Click the **Files** tab to go to the file management page.

4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd_app1**.

   The **bd_app1** directory is only an example. You can use any directory on the page or create a new one.

   The requirements for creating a folder are as follows:

   – The folder name contains a maximum of 255 characters
   – The folder name cannot be empty.
   – The folder name cannot contain the following special characters: /:*?"<>|\;&,'`!{}[]$%+
   – The value cannot start or end with a period (.).
   – The spaces at the beginning and end are ignored.
6. Click **Import Data** and configure the HDFS and OBS paths correctly. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
   – OBS path
     ■ The path must start with **obs://**.
     ■ Files or programs encrypted by KMS cannot be imported.
     ■ An empty folder cannot be imported.
     ■ The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters ;|&>,<'$*?\
     ■ The directory and file name cannot start or end with a space, but can contain spaces between them.
     ■ The OBS full path contains a maximum of characters.
   – HDFS path
     ■ The path starts with **/user** by default.
     ■ The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'$*?\:
     ■ The directory and file name cannot start or end with a space, but can contain spaces between them.
     ■ The HDFS full path contains a maximum of characters.
7. Click **OK**.

   You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data import operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

Exporting Data

After the data analysis and computing are completed, you can store the data in HDFS or export them to OBS.

You can perform the following steps to export files and directories:

1. Log in to the MRS console.
2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.
3. Click the **Files** tab to go to the file management page.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd_app1**.
6. Click **Export Data** and configure the OBS and HDFS paths. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
   - OBS path
     - The path must start with **obs://**.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters ;|&>,<'$*?\
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The OBS full path contains a maximum of characters.
   - HDFS path
     - The path starts with **/user** by default.
     - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ;|&>,<'$*?\:
     - The directory and file name cannot start or end with a space, but can contain spaces between them.
     - The HDFS full path contains a maximum of characters.

   NOTE

   When a folder is exported to OBS, a label file named **folder name_$folder$** is added to the OBS path. Ensure that the exported folder is not empty. If the exported folder is empty, OBS cannot display the folder and only generates a file named **folder name_ $folder$**.
7. Click **OK**.

   You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data export operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

13.4 Creating a Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results.

This section describes how to submit a job (take a MapReduce job as an example) on the MRS management console. MapReduce jobs are used to submit JAR programs to quickly process massive amounts of data in parallel and create a distributed data processing and execution environment.

If the job and file management functions are not supported on the cluster details page, submit the jobs in the background.

Before creating a job, you need to upload local data to OBS for data computing and analyzing. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the analyzing and computing are complete, you can store the data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

Submitting a Job on the GUI

Step 1 Log in to the MRS console.

Step 2 Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

Step 3 If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see **Synchronizing IAM Users to MRS**.

NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

Step 4 Click the **Jobs** tab.

Step 5 Click **Create**. The **Create Job** page is displayed.

NOTE

If the IAM username contains spaces (for example, **admin 01**), a job cannot be created.

Step 6 In **Type**, select **MapReduce**. Configure other job information.

- Configure MapReduce job information by referring to **Table 13-3** if the cluster version is earlier than MRS 2.1.0.

Table 13-1 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. **NOTE** You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: ● Contains a maximum of 1,023 characters, excluding special characters such as ;|&><'$. The parameter value cannot be empty or full of spaces. ● The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. – OBS: The path must start with **obs://**. Example: **obs://wordcount/program/*xxx*.jar** – HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**. ● For SparkScript and HiveScript, the path must end with **.sql**. For MapReduce, the path must end with **.jar**. For Flink and SparkSubmit, the path must end with **.jar** or **.py**. The **.sql**, **.jar**, and **.py** are case-insensitive.
Parameters	(Optional) It is the key parameter for program execution. Multiple parameters are separated by space. Configuration method: *Program class name Data input path Data output path* ● Program class name: It is specified by a function in your program. MRS is responsible for transferring parameters only. ● Data input path: Click **HDFS** or **OBS** to select a path or manually enter a correct path. ● Data output path: Enter a directory that does not exist. The parameter contains a maximum of 150,000 characters. It cannot contain special characters ;|&><'$, but can be left blank. **CAUTION** If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.
Service Parameter	(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in **Configuring Service Parameters**. To add multiple parameters, click ⊕ on the right. To delete a parameter, click **Delete** on the right. **Table 13-2** lists the common service configuration parameters.

Parameter	Description
Command Reference	Command submitted to the background for execution when a job is submitted.

Table 13-2 Service Parameter parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

Table 13-3 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. **NOTE** You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: ● Contains a maximum of 1,023 characters, excluding special characters such as ;|&><'$. The parameter value cannot be empty or full of spaces. ● The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. – OBS: The path must start with **s3a://**. Example: **s3a://wordcount/program/xxx.jar** – HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**. ● For SparkScript, the path must end with **.sql**. For MapReduce and Spark, the path must end with **.jar**. The **.sql** and **.jar** are case-insensitive.

Parameter	Description
Parameters	Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space. Configuration method: *Package name*.*Class name* The parameter contains a maximum of 150,000 characters. It cannot contain special characters ;|&><'$, but can be left blank. **NOTE** When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext. When you view job information on the MRS management console, the sensitive information is displayed as *****. Example: **username=admin @password=admin_123**
Import From	Path for inputting data Data can be stored in HDFS or OBS. The path varies depending on the file system. ● OBS: The path must start with **s3a://**. ● HDFS: The path must start with **/user**. For details about how to import data to HDFS, see **Importing Data**. The parameter contains a maximum of 1,023 characters, excluding special characters such as ;|&>,<'$, and can be left blank.
Export To	Path for outputting data **NOTE** ● When setting this parameter, select **OBS** or **HDFS**. Select a file directory or manually enter a file directory, and click **OK**. ● If you add the **hadoop-mapreduce-examples-x.x.x.jar** sample program or a program similar to **hadoop-mapreduce-examples-x.x.x.jar**, enter a directory that does not exist. Data can be stored in HDFS or OBS. The path varies depending on the file system. ● OBS: The path must start with **s3a://**. (Supported only in MRS 1.8.10 and earlier versions) ● HDFS: The path must start with **/user**. The parameter contains a maximum of 1,023 characters, excluding special characters such as ;|&>,<'$, and can be left blank.

Parameter	Description
Log Path	Path for storing job logs that record job running status. Data can be stored in HDFS or OBS. The path varies depending on the file system. ● OBS: The path must start with **s3a://**. ● HDFS: The path must start with **/user**. The parameter contains a maximum of 1,023 characters, excluding special characters such as ;|&>,<'$, and can be left blank.

Step 7 Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

Submitting a Job in the Background

The default client installation path for MRS 3.x or later is /opt/Bigdata/client, and for versions earlier than MRS 3.x is /opt/client. Configure the path based on site requirements.

Step 1 Log in to a Master node. For details, see **Logging In to an ECS**.

Step 2 Run the following command to initialize environment variables:

source /opt/Bigdata/client/bigdata_env

Step 3 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Example: **kinit admin**

Step 4 Run the following command to copy the program in the OBS file system to the Master node in the cluster:

hadoop fs -Dfs.obs.access.key=AK -Dfs.obs.secret.key=SK -copyToLocal source_path.jar target_path.jar

Example: **hadoop fs -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX -copyToLocal "obs://mrs-word/program/hadoop-mapreduce-examples-XXX.jar" "/home/omm/hadoop-mapreduce-examples-XXX.jar"**

You can log in to OBS Console using AK/SK. To obtain AK/SK information, click the username in the upper right corner of the management console and choose **My Credentials** > **Access Keys**.

Step 5 Run the following command to submit a wordcount job. If data needs to be read from OBS or outputted to OBS, the AK/SK parameters need to be added.

source /opt/Bigdata/client/bigdata_env;hadoop jar execute_jar wordcount input_path output_path

Example: **source /opt/Bigdata/client/bigdata_env;hadoop jar /home/omm/hadoop-mapreduce-examples-XXX.jar wordcount -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX "obs://mrs-word/input/*" "obs://mrs-word/output/"**

In the preceding command, **input_path** indicates a path for storing job input files on OBS. **output_path** indicates a path for storing job output files on OBS and needs to be set to a directory that does not exist

----End

13.5 Using Clusters with Kerberos Authentication Enabled

This section instructs you to use security clusters and run MapReduce, Spark, and Hive programs.

The Presto component of MRS 3.x does not support Kerberos authentication.

You can get started by reading the following topics:

1. **Creating a Security Cluster and Logging In to Manager**
2. **Creating a Role and a User**
3. **Running a MapReduce Program**
4. **Running a Spark Program**
5. **Running a Hive Program**

Creating a Security Cluster and Logging In to Manager

Step 1 Create a security cluster. For details, see **Creating a Custom Cluster**. Enable **Kerberos Authentication**, set **Password**, and confirm the password. This password is used to log in to Manager. Keep it secure.

Step 2 Log in to the MRS console.

Step 3 In the navigation pane on the left, choose **Active Clusters** and click the target cluster name on the right to access the cluster details page.

Step 4 Click **Access Manager** on the right of **MRS Manager** to log in to Manager.

- If you have bound an EIP when creating the cluster, perform the following operations:

  a. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

     NOTE

     - It is normal that the automatically generated public IP address is different from your local IP address and no action is required.
     - If port 9022 is a Knox port, you need to enable the permission to access port 9022 of Knox for accessing Manager.

  b. Select **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address.**

- If you have not bound an EIP when creating the cluster, perform the following operations:

    a. Select an available EIP from the drop-down list or click **Manage EIP** to create one.

    b. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

    NOTE

    - It is normal that the automatically generated public IP address is different from the local IP address and no action is required.
    - If port 9022 is a Knox port, you need to enable the permission of port 9022 to access Knox for accessing MRS Manager.

    c. Select **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address.**

Step 5 Click **OK**. The Manager login page is displayed. To assign permissions to other users to access Manager, add their public IP addresses as trusted ones by referring to **Accessing MRS Manager MRS 2.x or Earlier)**.

Step 6 Enter the default username **admin** and the password you set when creating the cluster, and click **Log In**.

----End

Creating a Role and a User

For clusters with Kerberos authentication enabled, perform the following steps to create a user and assign permissions to the user to run programs.

Step 1 On Manager, choose **System** > **Permission** > **Role**.

Step 2 Click **Create Role**. For details, see **Creating a Role**.

Specify the following information:

- Enter a role name, for example, **mrrole**.
- In **Configure Resource Permission**, select the cluster to be operated, choose **Yarn** > **Scheduler Queue** > **root**, and select **Submit** and **Admin** in the **Permission** column. After you finish configuration, do not click **OK** but click the name of the target cluster shown in the following figure and then configure other permissions.
- Choose **HBase** > **HBase Scope**. Locate the row that contains **global**, and select **create**, **read**, **write**, and **execute** in the **Permission** column. After you finish configuration, do not click **OK** but click the name of the target cluster shown in the following figure and then configure other permissions.
- Choose **HDFS** > **File System** > **hdfs://hacluster/** and select **Read**, **Write**, and **Execute** in the **Permission** column. After you finish configuration, do not click **OK** but click the name of the target cluster shown in the following figure and then configure other permissions.
- Choose **Hive** > **Hive Read Write Privileges**, select **Select**, **Delete**, **Insert**, and **Create** in the **Permission** column, and click **OK**.

Step 3 Choose **System**. In the navigation pane on the left, choose **Permission** > **User Group** > **Create User Group** to create a user group for the sample project, for example, **mrgroup**. For details, see **Creating a User Group**.

Step 4 Choose **System**. In the navigation pane on the left, choose **Permission** > **User** > **Create** to create a user for the sample project. For details, see **Creating a User**.

- Enter a username, for example, **test**. If you want to run a Hive program, enter **hiveuser** in **Username**.
- Set **User Type** to **Human-Machine**.
- Enter a password. This password will be used when you run the program.
- In **User Group**, add **mrgroup** and **supergroup**.
- Set **Primary Group** to **supergroup** and bind the **mrrole** role to obtain the permission.

  Click **OK**.

Step 5 Choose **System**. In the navigation pane on the left, choose **Permission** > **User**, locate the row where user **test** locates, and select **Download Authentication Credential** from the **More** drop-down list. Save the downloaded package and decompress it to obtain the **keytab** and **krb5.conf** files.

----End

Running a MapReduce Program

This section describes how to run a MapReduce program in security cluster mode.

Prerequisites

You have compiled the program and prepared data files, for example, **mapreduce-examples-1.0.jar**, **input_data1.txt**, and **input_data2.txt**..

Procedure

Step 1 Use a remote login software (for example, MobaXterm) to log in to the master node of the security cluster using SSH (using the EIP).

Step 2 After the login is successful, run the following commands to create the **test** folder in the **/opt/Bigdata/client** directory and create the **conf** folder in the **test** directory:

```
cd /opt/Bigdata/client
mkdir test
cd test
mkdir conf
```

Step 3 Use an upload tool (for example, WinSCP) to copy **mapreduce-examples-1.0.jar**, **input_data1.txt**, and **input_data2.txt** to the **test** directory, and copy the **keytab** and **krb5.conf** files obtained in **Step 5** in **Creating Roles and Users** to the **conf** directory.

Step 4 Run the following commands to configure environment variables and authenticate the created user, for example, **test**:

```
cd /opt/Bigdata/client
source bigdata_env
export YARN_USER_CLASSPATH=/opt/Bigdata/client/test/conf/
kinit test
```

Enter the password as prompted. If no error message is displayed (you need to change the password as prompted upon the first login), Kerberos authentication is complete.

Step 5 Run the following commands to import data to the HDFS:

```
cd test
hdfs dfs -mkdir /tmp/input
hdfs dfs -put input_data* /tmp/input
```

Step 6 Run the following commands to run the program:

```
yarn jar mapreduce-examples-1.0.jar com.huawei.bigdata.mapreduce.examples.FemaleInfoCollector /tmp/
input /tmp/mapreduce_output
```

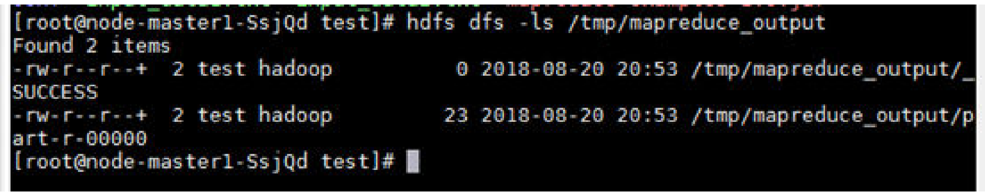
In the preceding commands:

/tmp/input indicates the input path in the HDFS.

/tmp/mapreduce_output indicates the output path in the HDFS. This directory must not exist. Otherwise, an error will be reported.

Step 7 After the program is executed successfully, run the **hdfs dfs -ls /tmp/mapreduce_output** command. The following command output is displayed.

Figure 13-1 Program running result



```
[root@node-master1-SsjQd test]# hdfs dfs -ls /tmp/mapreduce_output
Found 2 items
-rw-r--r--+  2 test hadoop          0 2018-08-20 20:53 /tmp/mapreduce_output/_
SUCCESS

[root@node-master1-SsjQd test]#
```

----End

Running a Spark Program

This section describes how to run a Spark program in security cluster mode.

Prerequisites

You have compiled the program and prepared data files, for example, **FemaleInfoCollection.jar**, **input_data1.txt**, and **input_data2.txt**..

Procedure

Step 1 Use a remote login software (for example, MobaXterm) to log in to the master node of the security cluster using SSH (using the EIP).

Step 2 After the login is successful, run the following commands to create the **test** folder in the **/opt/Bigdata/client** directory and create the **conf** folder in the **test** directory:

```
cd /opt/Bigdata/client
mkdir test
cd test
mkdir conf
```

Step 3 Use an upload tool (for example, WinSCP) to copy **FemaleInfoCollection.jar**, **input_data1.txt**, and **input_data2.txt** to the **test** directory, and copy the **keytab** and **krb5.conf** files obtained in **Step 5** in section **Creating Roles and Users** to the **conf** directory.

Step 4 Run the following commands to configure environment variables and authenticate the created user, for example, **test**:

```
cd /opt/Bigdata/client
source bigdata_env
export YARN_USER_CLASSPATH=/opt/Bigdata/client/test/conf/
kinit test
```

Enter the password as prompted. If no error message is displayed, Kerberos authentication is complete.

Step 5 Run the following commands to import data to the HDFS:

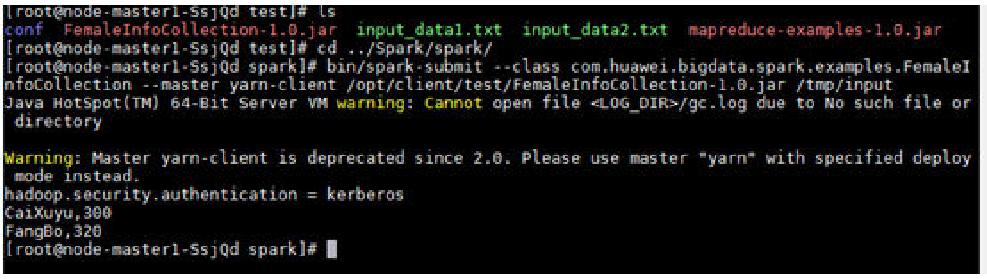
```
cd test
hdfs dfs -mkdir /tmp/input
hdfs dfs -put input_data* /tmp/input
```

Step 6 Run the following commands to run the program:

```
cd /opt/Bigdata/client/Spark/spark
bin/spark-submit --class com.huawei.bigdata.spark.examples.FemaleInfoCollection --master yarn-client /opt/
Bigdata/client/test/FemaleInfoCollection-1.0.jar /tmp/input
```

Step 7 After the program is run successfully, the following information is displayed.

Figure 13-2 Program running result



```
[root@node-master1-SsjQd test]# ls
conf  FemaleInfoCollection-1.0.jar  input_data1.txt  input_data2.txt  mapreduce-examples-1.0.jar
[root@node-master1-SsjQd test]# cd ../Spark/spark/
[root@node-master1-SsjQd spark]# bin/spark-submit --class com.huawei.bigdata.spark.examples.FemaleI
nfoCollection --master yarn-client /opt/client/test/FemaleInfoCollection-1.0.jar /tmp/input
Java HotSpot(TM) 64-Bit Server VM warning: Cannot open file <LOG_DIR>/gc.log due to No such file or
 directory

Warning: Master yarn-client is deprecated since 2.0. Please use master "yarn" with specified deploy
 mode instead.
hadoop.security.authentication = kerberos
CaiXuyu,300
FangBo,320
[root@node-master1-SsjQd spark]# 
```

----End

Running a Hive Program

This section describes how to run a Hive program in security cluster mode.

Prerequisites

You have compiled the program and prepared data files, for example, **hive-examples-1.0.jar**, **input_data1.txt**, and **input_data2.txt**..

Procedure

Step 1 Use a remote login software (for example, MobaXterm) to log in to the master node of the security cluster using SSH (using the EIP).

Step 2 After the login is successful, run the following commands to create the **test** folder in the **/opt/Bigdata/client** directory and create the **conf** folder in the **test** directory:

```
cd /opt/Bigdata/client
mkdir test
cd test
mkdir conf
```

Step 3 Use an upload tool (for example, WinSCP) to copy **FemaleInfoCollection.jar**, **input_data1.txt**, and **input_data2.txt** to the **test** directory, and copy the **keytab**

and **krb5.conf** files obtained in **Step 5** in section **Creating Roles and Users** to the **conf** directory.

Step 4 Run the following commands to configure environment variables and authenticate the created user, for example, **test**:

```
cd /opt/Bigdata/client
source bigdata_env
export YARN_USER_CLASSPATH=/opt/Bigdata/client/test/conf/
kinit test
```

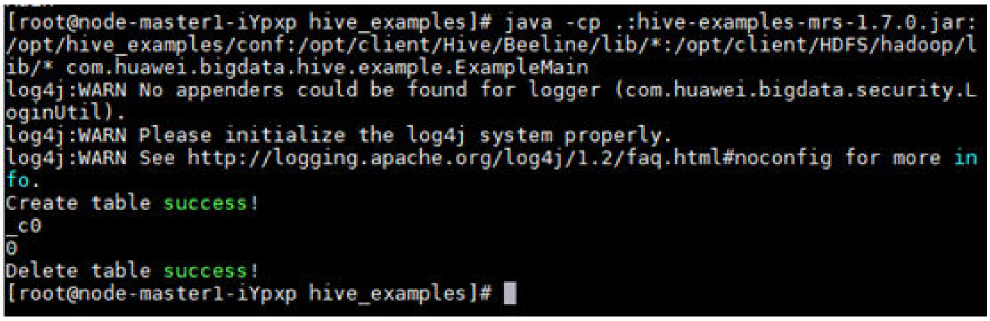
Enter the password as prompted. If no error message is displayed, Kerberos authentication is complete.

Step 5 Run the following command to run the program:

```
chmod +x /opt/hive_examples -R   cd /opt/hive_examples   java -cp .:hive-examples-1.0.jar:/opt/
hive_examples/conf:/opt/Bigdata/client/Hive/Beeline/lib/*:/opt/Bigdata/client/HDFS/hadoop/lib/*
com.huawei.bigdata.hive.example.ExampleMain
```

Step 6 After the program is run successfully, the following information is displayed.

Figure 13-3 Program running result



```
[root@node-master1-iYpxp hive_examples]# java -cp .:hive-examples-mrs-1.7.0.jar:
/opt/hive_examples/conf:/opt/client/Hive/Beeline/lib/*:/opt/client/HDFS/hadoop/l
ib/* com.huawei.bigdata.hive.example.ExampleMain
log4j:WARN No appenders could be found for logger (com.huawei.bigdata.security.L
oginUtil).
log4j:WARN Please initialize the log4j system properly.
log4j:WARN See http://logging.apache.org/log4j/1.2/faq.html#noconfig for more in
fo.
Create table success!

0
Delete table success!
[root@node-master1-iYpxp hive_examples]#
```

----End

13.6 Terminating a Cluster

You can terminate an MRS cluster that is no longer use after job execution is complete.

Background

You can manually terminate a cluster after data analysis is complete or when the cluster encounters an exception. A cluster failed to be deployed will be automatically terminated.

Procedure

Step 1 Log in to the MRS management console.

Step 2 In the navigation pane on the left, choose **Clusters** > **Active Clusters**.

Step 3 In the cluster list, locate the row containing the cluster to be terminated, and click **Terminate** in the **Operation** column.

The cluster status changes from **Running** to **Terminating**, and finally to **Terminated**. You can view the terminated cluster in **Cluster History**.

----End

14 FAQ

Released On	What's New
2021-06-30	This issue is the fifth official release. Released MRS 3.1.0-LTS.1. For details, see **Creating a Custom Cluster**.
2020-10-24	This issue is the fourth official release. Added the following sections: ● **Methods of Creating MRS Clusters** ● **Quick Creation of a Hadoop Analysis Cluster** ● **Quick Creation of an HBase Analysis Cluster** ● **Quick Creation of a Kafka Streaming Cluster** Modified the following sections: ● **Creating a Custom Cluster** ● **Viewing Basic Cluster Information** ● **Viewing Information of a Historical Cluster**
2020-01-17	This issue is the third official release. Modified the following sections: ● **Creating a Custom Cluster** ● **Viewing Basic Cluster Information** ● **Viewing Information of a Historical Cluster**

Released On	What's New
2019-03-20	This issue is the second official issue. Added the following sections: ● **Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled** ● **Authorizing O&M** ● **Authorizing O&M** ● **Adding a Tag to a Cluster** ● **Installing Third-Party Software Using Bootstrap Actions** ● **Restoring Patches for the Isolated Hosts** ● **Rolling Restart** Modified the following sections: ● **Creating a Custom Cluster** ● **Viewing Basic Cluster Information** ● **Configuring an Auto Scaling Rule** ● **Viewing Information of a Historical Cluster**
2018-10-12	This issue is the first official release.

14.1 MRS Overview

14.1.1 What Is MRS Used For?

MapReduce Service (MRS) is an enterprise-grade big data platform that allows you to quickly build and operate economical, secure, full-stack, cloud-native big data environments on the cloud. It provides engines such as ClickHouse, Spark, Flink, Kafka, and HBase, and supports convergence of data lake, data warehouse, business intelligence (BI), and artificial intelligence (AI). Fully compatible with open-source components, MRS helps you rapidly innovate and expand service growth.

14.1.2 What Types of Distributed Storage Does MRS Support?

MRS supports Hadoop 3.1.*x* and will soon support other mainstream Hadoop versions released by the community. **Table 14-1** lists the component versions supported by MRS.

Table 14-1 MRS component versions

Component	MRS 1.9.2 (Applicable to MRS 1.9.*x*)	MRS 3.1.0
Alluxio	2.0.1	N/A

Component	MRS 1.9.2 (Applicable to MRS 1.9.*x*)	MRS 3.1.0
CarbonData	1.6.1	2.0.1
DBService	1.0.0	2.7.0
Flink	1.7.0	1.12.0
Flume	1.6.0	1.9.0
HBase	1.3.1	2.2.3
HDFS	2.8.3	3.1.1
Hive	2.3.3	3.1.0
Hudi	N/A	0.7.0
Hue	3.11.0	4.7.0
Impala	N/A	3.4.0
Kafka	1.1.0	2.11-2.4.0
KafkaManager	1.3.3.1	N/A
KrbServer	1.15.2	1.17
Kudu	N/A	1.12.1
LdapServer	1.0.0	2.7.0
Loader	2.0.0	N/A
MapReduce	2.8.3	3.1.1
Oozie	N/A	5.1.0
Opentsdb	2.3.0	N/A
Presto	0.216	333
Phoenix (integrated with HBase)	N/A	5.0.0
Ranger	1.0.1	2.0.0
Spark	2.2.2	N/A
Spark2x	N/A	2.4.5
Sqoop	N/A	1.4.7
Storm	1.2.1	N/A
Tez	0.9.1	0.9.2
YARN	2.8.3	3.1.1
ZooKeeper	3.5.1	3.5.6

Component	MRS 1.9.2 (Applicable to MRS 1.9.*x*)	MRS 3.1.0
MRS Manager	1.9.2	N/A
FusionInsight Manager	N/A	8.1.0

14.1.3 How Do I Create an MRS Cluster Using a Custom Security Group?

If you want to use a self-defined security group when buying a cluster, you need to enable port 9022 or select **Auto create** in **Security Group** on the MRS console.

14.1.4 How Do I Use MRS?

MapReduce Service (MRS) is a service you can use to deploy and manage Hadoop-based components on the Cloud. It enables you to deploy Hadoop clusters with a few clicks. MRS provides enterprise-ready big data clusters in the cloud. Tenants can fully control the clusters and easily run big data components such as Hadoop, Spark, HBase, Kafka, and Storm in the clusters.

MRS is easy to use. You can execute various tasks and process or store PB-scale data using computers connected in a cluster. To use MRS, do as follows:

1. Upload local programs and data files to OBS.
2. Create a cluster. You need to specify the cluster type (for example, analysis or streaming), and set ECS instance specifications, number of instances, data disk type (common I/O, high I/O, and ultra-high I/O), and components to be installed, such as Hadoop, Spark, HBase, Hive, Kafka, and Storm, in a cluster. You can use a bootstrap action to install third-party software or modify the cluster running environment on a node before or after the cluster is started.
3. Use MRS to submit, execute, and monitor your programs.
4. Manage clusters on MRS Manager, an enterprise-level unified management platform of big data clusters. You can learn about the health status of services and hosts, obtain critical system information in a timely manner from graphical metric monitoring and customization, modify service attributes based on performance requirements, and start or stop clusters, services, and role instances.
5. Terminate any MRS cluster that you do not require after job execution is complete.

14.1.5 How Does MRS Ensure Security of Data and Services?

MRS is a big data management and analytic platform featuring high security. It ensures data and service security from the following aspects:

- Network isolation

  The public cloud network is divided into service plane and management plane. The two planes are physically isolated to ensure network security.

  - Service plane: provides a network plane for running cluster components. The service plane provides service channels, and implements data access and storage, job submission, and computing.
  - Management plane: provides a public cloud management console that you can use to purchase and manage MRS.
- Host security

  You can deploy third-party antivirus software based on service requirements. MRS provides the following measures to improve security of OSs and ports:

  - OS kernel security hardening
  - OS patch update
  - OS permission control
  - OS port management
  - OS protocol and port attack defense
- Data security

  MRS enables data storage on OBS, thereby ensuring data security.
- Data integrity

  MRS transmits the processed data to OBS using SSL, thereby ensuring data integrity.

14.1.6 Can I Configure a Phoenix Connection Pool?

Phoenix does not support connection pool configuration. You are advised to write code to implement a tool class for managing connections and simulate a connection pool.

14.1.7 Does MRS Support Change of the Network Segment?

You can change the network segment. On the cluster **Dashboard** page of MRS console, click **Change Subnet** to the right of **Default Subnet**, and select a subnet in the VPC of the cluster to expand subnet IP addresses. Selecting a new subnet will not change the IP addresses and subnets of existing nodes.

14.1.8 Can I Downgrade the Specifications of an MRS Cluster Node?

You cannot downgrade the specifications of an MRS cluster node by using the console. If you want to downgrade an MRS cluster node's specifications, contact technical support.

14.1.9 What Is the Relationship Between Hive and Other Components?

- Hive and HDFS

  Hive is an Apache Hadoop project. Hive uses Hadoop Distributed File System (HDFS) as its file storage system. Hive parses and processes structured data stored on HDFS. All data files in the Hive database are stored in HDFS, and all data operations on Hive are also performed using HDFS APIs.
- Hive and MapReduce

All data computing of Hive depends on MapReduce. MapReduce, also an Apache Hadoop project, is a parallel computing framework based on HDFS. During data analysis, Hive parses HiveQL statements submitted by users into MapReduce tasks and submits the tasks for MapReduce to execute.

- Hive and DBService

  MetaStore (metadata service) of Hive processes the structure and attribute information about Hive databases, tables, and partitions that are stored in a relational database. In MRS, the relational database is maintained by DBService.

- Hive and Spark

  Hive data computing can also be implemented on Spark. Spark, also an Apache project, is an in-memory distributed computing framework. During data analysis, Hive parses HiveQL statements submitted by users into Spark tasks and submits the tasks for Spark to execute.

14.1.10 Does an MRS Cluster Support Hive on Spark?

- Clusters of MRS 1.9.*x* support Hive on Spark.
- Clusters of MRS 3.*x* or later support Hive on Spark.
- You can use Hive on Tez for the clusters of other versions.

14.1.11 What Are the Differences Between Hive Versions?

Hive 3.1 has the following differences when compared with Hive 1.2:

- String cannot be converted to int.
- The user-defined functions (UDFs) of the **Date** type are changed to Hive built-in UDFs.
- Hive 3.1 does not provide the index function anymore.
- Hive 3.1 uses the UTC time in time functions, while Hive 1.2 uses the local time zone.
- The JDBC drivers in Hive 3.1 and Hive 1.2 are incompatible.
- In Hive 3.1, column names in ORC files are case-sensitive and underscores-sensitive.
- Hive 3.1 does not allow columns named **time**.

14.1.12 Which MRS Cluster Version Supports Hive Connection and User Synchronization?

MRS cluster 2.0.5 or later supports Hive connections on DataLake Governance Center (DGC) and provides the IAM user synchronization function.

14.1.13 What Are the Differences Between OBS and HDFS in Data Storage?

The data processed by MRS is from OBS or HDFS. OBS is an object-based storage service that provides secure, reliable, and cost-effective storage of huge amounts of data. MRS can directly process data in OBS. You can view, manage, and use data by using the OBS console or OBS client. In addition, you can use REST APIs independently or integrate APIs to service applications to manage and access data.

- Data stored in OBS: Data storage is decoupled from compute. The cluster storage cost is low, and storage capacity is not limited. Clusters can be deleted at any time. However, the computing performance depends on the OBS access performance and is lower than that of HDFS. OBS is recommended for applications that do not demand a lot of computation.
- Data stored in HDFS: Data storage is not decoupled from compute. The cluster storage cost is high, and storage capacity is limited. The computing performance is high. You must export data before you delete clusters. HDFS is recommended for computing-intensive scenarios.

14.1.14 How Do I Obtain the Hadoop Pressure Test Tool?

Download it from **https://github.com/Intel-bigdata/HiBench**.

14.1.15 What Is the Relationship Between Impala and Other Components?

- Impala and HDFS

  Impala uses HDFS as its file storage system. Impala parses and processes structured data, while HDFS provides reliable underlying storage. Impala provides fast data access without moving data in HDFS.
- Impala and Hive

  Impala uses Hive metadata, Open Database Connectivity (ODBC) driver, and SQL syntax. Unlike Hive, which is over MapReduce, Impala implements a distributed architecture based on daemon and handles all query executions on the same node. Therefore, Impala is faster than Hive by reducing the latency caused by MapReduce.
- Impala and MapReduce

  None
- Impala and Spark

  None
- Impala and Kudu

  Kudu can be closely integrated with Impala to replace the combination of Impala, HDFS, and Parquet. You can insert, query, update, and delete data in Kudu tablets using Impala's SQL syntax. In addition, you can use JDBC or ODBC to connect to Kudu for data operations, using Impala as the broker.
- Impala and HBase

  The default Impala tables use data files stored in HDFS, which is ideal for batch loading and query of full table scanning. However, HBase provides convenient and efficient query of OLTP-style organization data.

14.1.16 Statement About the Public IP Addresses in the Open-Source Third-Party SDK Integrated by MRS

The open-source third-party packages on which the open-source components integrated by MRS depend contain SDK usage examples. Public IP addresses such as 12.1.2.3, 54.123.4.56, 203.0.113.0, and 203.0.113.12 are example IP addresses. MRS will not initiate a connection to the public IP address or exchange data with the public IP address.

14.1.17 What Is the Relationship Between Kudu and HBase?

Kudu is designed based on the HBase structure and can implement fast random read/write and update functions that HBase is good at. Kudu and HBase are similar in architecture. The differences are as follows:

- HBase uses ZooKeeper to ensure data consistency, whereas Kudu uses the Raft consensus algorithm to ensure consistency.
- HBase uses HDFS for resilient data storage, whereas Kudu uses TServer to ensure strong data consistency and reliability.

14.1.18 Does MRS Support Running Hive on Kudu?

MRS does not support Hive on Kudu.

Currently, MRS supports only the following two methods to access Kudu:

- Access Kudu through Impala tables.
- Access and operate Kudu tables using the client application.

14.1.19 What Are the Solutions for processing 1 Billion Data Records?

- GaussDB (for MySQL) is recommended for scenarios, such as data updates, online transaction processing (OLTP), and complex analysis of 1 billion data records.
- Impala and Kudu in MRS also meet this requirement. Impala and Kudu can load all join tables to the memory in the join operation.

14.1.20 Can I Change the IP address of DBService?

MRS does not support the change of the DBService IP address.

14.1.21 Can I Clear MRS sudo Logs?

MRS sudo log files record operations performed by user **omm** and are helpful for fault locating. You can delete the logs of the earliest date to release storage space.

1. If the log file is large, add the log file directory to **/etc/logrotate.d/syslog** to enable the system to periodically delete logs.

   Method: Run **sed -i '3 a/var/log/sudo/sudo.log' /etc/logrotate.d/syslog**.
2. Set the maximum number and size of logs in **/etc/logrotate.d/syslog**. If the number or size of logs exceeds the threshold, the logs will be automatically deleted. By default, logs are aged based on the size and number of archived logs. You can use **size** and **rotate** to limit the size and number of archived logs, respectively. If required, you can also add **daily**/**weekly**/**monthly** to specify how often the logs are cleared.

14.1.22 Is the Storm Log also limited to 20 GB in MRS cluster 2.1.0?

In MRS cluster 2.1.0, the Storm log cannot exceed 20 GB. If the Storm log exceeds 20 GB, the log files will be deleted cyclically. Logs are stored on the system disk, therefore, the log space is limited. If you want to keep the log for longer time, mount the log directory to storage media.

14.1.23 What Is Spark ThriftServer?

ThriftServer is a JDBC API. You can use JDBC to connect to ThriftServer to access SparkSQL data. Therefore, you can see JDBCServer in Spark components, but not ThriftServer.

14.1.24 What Access Protocols Are Supported by Kafka?

Kafka supports PLAINTEXT, SSL, SASL_PLAINTEXT, and SASL_SSL.

14.1.25 What Is the Compression Ratio of zstd?

Zstandard (zstd) is an open-source fast lossless compression algorithm. The compression ratio of zstd is twice that of orc. For details, see **https://github.com/L-Angel/compress-demo**. CarbonData does not support lzo, and MRS has zstd integrated.

14.1.26 Why Are the HDFS, YARN, and MapReduce Components Unavailable When an MRS Cluster Is ?

The HDFS, YARN, and MapReduce components are integrated in Hadoop. If the three components are unavailable when are MRS cluster is , select Hadoop instead. After an MRS cluster is created, HDFS, YARN, and MapReduce are available in the **Components** page.

14.1.27 Why Is the ZooKeeper Component Unavailable When an MRS Cluster Is ?

If you create a cluster of a version earlier than MRS 3.*x*, ZooKeeper is installed by default and is not displayed on the GUI.

If you create a cluster of MRS 3.*x* or later, ZooKeeper is available on the GUI and is selected by default.

After the cluster is created, the ZooKeeper component is available on the **Components** page.

14.1.28 Which Python Versions Are Supported by Spark Tasks in an MRS 3.1.0 Cluster?

For MRS 3.1.0 clusters, Python 2.7 or 3.*x* is recommended for Spark tasks.

14.1.29 How Do I Enable Different Service Programs to Use Different YARN Queues?

Create a tenant on Manager.

Procedure

Step 1 Log in to FusionInsight Manager and choose **Tenant Resources**.

Step 2 In the tenant list on the left, select a parent tenant and click ⊕. On the page for adding a sub-tenant, set attributes for the sub-tenant according to **Table 14-2**.

Table 14-2 Sub-tenant parameters

Parameter	Description
Cluster	Indicates the cluster to which the parent tenant belongs.
Parent Tenant Resource	Indicates the name of the parent tenant.
Name	● Indicates the name of the current tenant. The value consists of 3 to 50 characters, including digits, letters, and underscores (_). ● Plan a sub-tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
Tenant Type	Specifies whether the tenant is a leaf tenant. ● When **Leaf Tenant** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. ● When **Non-leaf Tenant** is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels.
Computing Resource	Specifies the dynamic computing resources for the current tenant. ● When **Yarn** is selected, the system automatically creates a queue in Yarn and the queue is named the same as the sub-tenant name. – A leaf tenant can directly submit jobs to the queue. – A non-leaf tenant cannot directly submit jobs to the queue. However, Yarn adds an extra queue (hidden) named **default** for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue. ● If **Yarn** is not selected, the system does not automatically create a queue.
Default Resource Pool Capacity (%)	Indicates the percentage of computing resources used by the current tenant. The base value is the total resources of the parent tenant.

Parameter	Description
Default Resource Pool Max Capacity (%)	Indicates the maximum percentage of computing resources used by the current tenant. The base value is the total resources of the parent tenant.
Storage Resource	Specifies storage resources for the current tenant. ● When **HDFS** is selected, the system automatically creates a folder named after the sub-tenant in the HDFS parent tenant directory. ● When **HDFS** is not selected, the system does not automatically allocate storage resources.
Quota	Indicates the quota for files and directories.
Space Quota	Indicates the quota for the HDFS storage space used by the current tenant. ● If the unit is set to **MB**, the value ranges from **1** to **8796093022208**. If the unit is set to **GB**, the value ranges from **1** to **8589934592**. ● This parameter indicates the maximum HDFS storage space that can be used by the tenant, but not the actual space used. ● If its value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk. ● If this quota is greater than the quota of the parent tenant, the actual storage space does not exceed the quota of the parent tenant.
Storage Path	Indicates the HDFS storage directory for the tenant. ● The system automatically creates a folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is **ta1s** and the parent directory is **/tenant/ta1**, the storage path for the sub-tenant is then **/tenant/ta1/ta1s**. ● The storage path is customizable in the parent directory.
Description	Indicates the description of the current tenant.

NOTE

Roles, computing resources, and storage resources are automatically created when tenants are created.

- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System** > **Permission** > **Role**. The role name is in the format of *Tenant name_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see **Adding a User and Binding the User to a Tenant Role**.
- The sub-tenant can further allocate the resources of its parent tenant. The sum of the resource percentages of direct sub-tenants under a parent tenant at each level cannot exceed 100%. The sum of the computing resource percentages of all level-1 tenants cannot exceed 100%.

Step 3 Check whether the current tenant needs to be associated with resources of other services.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Click **Associate Service** to configure other service resources used by the current tenant.

1. Set **Services** to **HBase**.
2. Set **Association Type** as follows:
   - **Exclusive** indicates that the service resources are used by the tenant exclusively and cannot be associated with other tenants.
   - **Shared** indicates that the service resources can be shared with other tenants.

NOTE

- Only HBase can be associated with a new tenant. However, HDFS, HBase, and Yarn can be associated with existing tenants.
- To associate an existing tenant with service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Associate Service** to configure resources to be associated with the tenant.
- To disassociate an existing tenant from service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Delete** in the **Operation** column. In the displayed dialog box, select **I have read the information and understand the impact** and click **OK**.

3. Click **OK**.

Step 5 Click **OK**. Wait until the system displays a message indicating that the tenant is successfully created.

----End

14.1.30 Differences and Relationships Between the MRS Management Console and Cluster Manager

You can access Manager from the MRS management console.

Manager is classified as MRS Manager and FusionInsight Manager.

- MRS Manager is the manager page of MRS 2.*x* or earlier clusters.
- FusionInsight Manager is the manager page of MRS 3.*x* or later clusters.

The following table lists the differences and relationships between the management console and FusionInsight Manager.

Common Operation	MRS Console	FusionInsight Manager
Changing subnets, adding security group rules, controlling OBS permissions, managing agencies, and synchronizing IAM users	Supported	Not supported
Adding node groups, scaling out, scaling in, and upgrading specifications	Supported	Not supported
Isolating hosts, starting all roles, and stopping all roles	Supported	Supported
Downloading the client, starting services, stopping services, and perform rolling restart of services	Supported	Supported
Viewing the instance status of services, configuring parameters, and synchronizing configurations	Supported	Supported
Viewing cleared alarms and events	Supported	Supported
Viewing the alarm help	Not supported	Supported
Setting thresholds	Not supported	Supported
Adding message subscription specifications	Supported	Not supported
Managing files	Supported	Not supported
Managing jobs	Supported	Not supported
Managing tenants	Supported	Supported
Managing tags	Supported	Not supported

Common Operation	MRS Console	FusionInsight Manager
Managing permissions (adding and deleting users, user groups, and roles, and changing passwords)	Not supported	Supported
Performing backup and restoration	Not supported	Supported
Auditing	Not supported	Supported
Monitoring resources and logging	Supported	Supported

14.1.31 How Do I Unbind an EIP from an MRS Cluster Node?

Symptom

After an EIP is bound on the console, the EIP cannot be unbound in the EIP module of the VPC service.

A dialog box is displayed, indicating that the operation cannot be performed because the EIP is being used by MapReduce.

Procedure

Step 1 Log in to the VPC console and choose **Virtual Private Cloud** > **My VPCs**. Find the target VPC in the VPC list.

Step 2 Click the VPC name to go to the **Summary** tab page and click the number next to **Subnets** in the **Networking Components** area to find the subnet to which the cluster belongs.

Step 3 In the subnet list, click the target subnet name. Click the **IP Addresses** tab, locate the target public IP address and click **Unbind from EIP** in the **Operation** column.

----End

14.2 Account and Password

14.2.1 What Is the Account for Logging In to Manager?

The default account for logging in to Manager is **admin**, and the password is the one you set when you created the cluster.

14.2.2 How Do I Query and Change the Password Validity Period of an Account?

Querying the Password Validity Period

Querying the password validity period of a component running user (human-machine user or machine-machine user):

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Run the following command and enter the password of user **kadmin/admin** to log in to the kadmin console:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **Admin@123**. Change the password upon your first login or as prompted and keep the new password secure.

Step 5 Run the following command to view the user information:

getprinc *Internal system username*

Example: **getprinc user1**

```
kadmin:  getprinc user1
......
Expiration date: [never]
Last password change: Sun Oct 09 15:29:54 CST 2022
Password expiration date: [never]
......
```

----End

Querying the password validity period of an OS user:

Step 1 Log in to any master node in the cluster as user **root**.

Step 2 Run the following command to view the password validity period (value of **Password expires**):

chage -l *Username*

For example, to view the password validity period of user **root**, run the **chage -l root** command. The command output is as follows:

```
[root@xxx ~]#chage -l root
Last password change                                    : Sep 12, 2021
Password expires                                        : never
Password inactive                                       : never
Account expires                                         : never
Minimum number of days between password change          : 0
```

```
Maximum number of days between password change         : 99999
Number of days of warning before password expires       : 7
```

----End

Changing the Password Validity Period

- The password of a machine-machine user is randomly generated and never expires by default.
- The password validity period of a human-machine user can be changed by modifying the password policy on Manager.

14.3 Accounts and Permissions

14.3.1 Does an MRS Cluster Support Access Permission Control If Kerberos Authentication Is not Enabled?

For MRS cluster 2.1.0 or earlier, choose **System** > **Configuration** > **Permission** on MRS Manager.

For MRS cluster 3.*x* or later, choose **System** > **Permission** on FusionInsight Manager.

14.3.2 How Do I Assign Tenant Management Permission to a New Account?

You can assign tenant management permission only in analysis or hybrid clusters, but not in streaming clusters.

The operations vary depending on the MRS cluster version:

Procedure for versions earlier than MRS cluster 3.x:

Step 1 Log in to MRS Manager as user **admin**.

Step 2 Choose **System** > **Manage User**. Select the new account, and click **Modify** in the **Operation** column.

Step 3 In **Assign Rights by Role**, click **Select and Add Role**.

- If you bind the **Manager_tenant** role to the account, the account will have permission to view tenant management information.
- If you bind the **Manager_administrator** role to the account, the account will have permission to view and perform tenant management.

Step 4 Click **OK**.

----End

Procedure for MRS cluster 3.x and later versions:

Step 1 Log in to FusionInsight Manager and choose **System** > **Permission** > **User**.

Step 2 Locate the user and click **Modify**.

Modify the parameters based on service requirements.

If you bind the **Manager_tenant** role to the account, the account will have permission to view tenant management information. If you bind the **Manager_administrator** role to the account, the account will have permission to perform tenant management and view related information.

NOTE

It takes about three minutes for the settings to take effect after user group or role permission are modified.

Step 3 Click **OK**.

----End

14.3.3 How Do I Customize an MRS Policy?

1. On the IAM console, choose **Permissions** in the navigation pane, and click **Create Custom Policy**.
2. Set a policy name in **Policy Name**.
3. Set **Scope** to **Project-level service** for MRS.
4. Specify **Policy View**. The following options are supported:
   - **Visual editor**: Select cloud services, actions, resources, and request conditions from the navigation pane to customize the policy. You do not require knowledge of JSON syntax.
   - **JSON**: Edit JSON policies from scratch or based on an existing policy.

   You can also click **Select Existing Policy/Role** in the **Policy Content** area to select an existing policy as the template for modification.
5. (Optional) Enter a brief description in the **Description** area.
6. Click **OK**.
7. Attach the policy to a user group. Users in the group then inherit the permissions defined in this policy.

14.3.4 Why Is the Manage User Function Unavailable on the System Page on MRS Manager?

Check whether you have the **Manager_administrator** permission. If you do not have this permission, **Manage User** will not be available on the **System** page of MRS Manager.

14.3.5 Does Hue Support Account Permission Configuration?

Hue does not provide an entry for configuring account permissions on its web UI. However, you can configure user roles and user groups for Hue accounts on the **System** tab on Manager.

14.4 Client Usage

14.4.1 How Do I Configure Environment Variables and Run Commands on a Component Client?

1. Log in to any Master node as user **root**.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **cd /opt/client** command to switch to the client.
4. Run the **source bigdata_env** command to configure environment variables.

   If Kerberos authentication is enabled for the current cluster, run the **kinit** *Component service user* command to authenticate the user. If Kerberos authentication is disabled, skip this step.
5. After the environment variables are configured, run the client command of the component. For example, to view component information, you can run the HDFS client command **hdfs dfs -ls /** to view the HDFS root directory file.

14.4.2 How Do I Disable ZooKeeper SASL Authentication?

Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper**, click the **Configurations** tab and then **All Configurations**. In the navigation pane on the left, choose **quorumpeer(Role)** > **Customization**, add the **set zookeeper.sasl.disable** parameter, and set its value to **false**. Save the configuration and restart the ZooKeeper service.

14.4.3 An Error Is Reported When the kinit Command Is Executed on a Client Node Outside an MRS Cluster

Symptom

After the client is installed on a node outside an MRS cluster and the **kinit** command is executed, the following error information is displayed:

```
-bash kinit Permission denied
```

The following error information is displayed when the **java** command is executed:

```
-bash: /xxx/java: Permission denied
```

After running the **ll /***Java installation path***/JDK/jdk/bin/java** command, it is found that the file execution permission is correct.

Fault Locating

Run the **mount | column -t** command to check the status of the mounted partition. It is found that the partition status of the mount point where the Java execution file is located is **noexec**. In the current environment, the data disk where the MRS client is installed is set to **noexec**, that is, binary file execution is prohibited. As a result, Java commands cannot be executed.

Solution

1. Log in to the node where the MRS client is located as user **root**.
2. Remove the configuration item **noexec** of the data disk where the MRS client is located from the **/etc/fstab** file.

3. Run the **umount** command to detach the data disk, and then run the **mount -a** command to remount the data disk.

14.5 Web Page Access

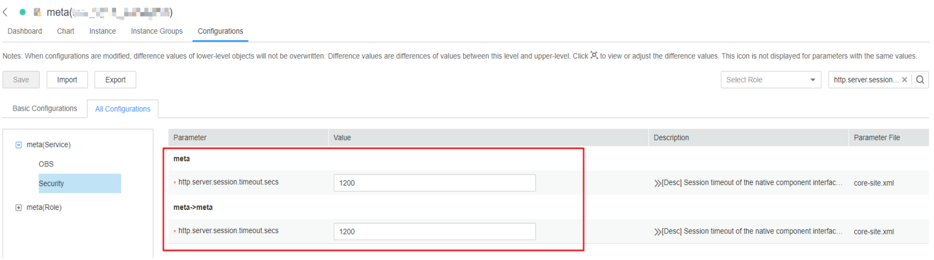
14.5.1 How Do I Change the Session Timeout Duration for an Open Source Component Web UI?

You need to set a proper web session timeout duration for security purposes. To change the session timeout duration, do as follows:

Checking Whether the Cluster Supports Session Timeout Duration Adjustment

- For MRS cluster versions earlier than 3.x:
  a. On the cluster details page, choose **Components** > **meta** > **Service Configuration**.
  b. Switch **Basic** to **All**, and search for the **http.server.session.timeout.secs**.

     If **http.server.session.timeout.secs** does not exist, the cluster does not support change of the session timeout duration. If the parameter exists, perform the following steps to modify it.
- MRS 3.x and later: Log in to FusionInsight Manager and choose **Cluster** > **Services** > **meta**. On the displayed page, click **Configurations** and select **All Configurations**. Search for the **http.server.session.timeout.secs** configuration item. If this configuration item exists, perform the following steps to modify it. If the configuration item does not exist, the version does not support dynamic adjustment of the session duration.



Notes: When configurations are modified, difference values of lower-level objects will not be overwritten. Difference values are differences of values between this level and upper-level. Click to view or adjust the difference values. This icon is not displayed for parameters with the same values.

Parameter	Value	Description	Parameter File
meta			
* http.server.session.timeout.secs	1200	[Desc] Session timeout of the native component interfac...	core-site.xml
meta->meta			
* http.server.session.timeout.secs	1200	[Desc] Session timeout of the native component interfac...	core-site.xml

You are advised to set all session timeout durations to the same value. Otherwise, the settings of some parameters may not take effect due to value conflict.

Modifying the Timeout Duration on Manager and the Authentication Center Page

For clusters of versions earlier than MRS 3.*x*:

1. Log in to each master node in the cluster and perform 2 to 4.
2. Change the value of **<session-timeout>20</session-timeout>** in the **/opt/Bigdata/apache-tomcat-7.0.78/webapps/cas/WEB-INF/web.xml** file. **<session-timeout>20</session-timeout>** indicates the session timeout duration, in minutes. Change it based on service requirements. The maximum value is 480 minutes.

3. Change the value of **<session-timeout>20</session-timeout>** in the **/opt/Bigdata/apache-tomcat-7.0.78/webapps/web/WEB-INF/web.xml** file. **<session-timeout>20</session-timeout>** indicates the session timeout duration, in minutes. Change it based on service requirements. The maximum value is 480 minutes.
4. Change the values of **p:maxTimeToLiveInSeconds="${tgt.maxTimeToLiveInSeconds:1200}"** and **p:timeToKillInSeconds="${tgt.timeToKillInSeconds:1200}"** in the **/opt/Bigdata/apache-tomcat-7.0.78/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml** file. The maximum value is 28,800 seconds.
5. Restart the Tomcat node on the active master node.
   a. On the active master node, run the **netstat -anp |grep 28443 |grep LISTEN | awk '{print $7}'** command as user **omm** to query the Tomcat process ID.
   b. Run the **kill -9** *{pid}* command, in which *{pid}* indicates the Tomcat process ID obtained in **5.a**.
   c. Wait until the process automatically restarts. You can run the **netstat -anp |grep 28443 |grep LISTEN** command to check whether the process is successfully restarted. If the process can be queried, the process is successfully restarted. If the process cannot be queried, query the process again later.

For clusters of MRS 3.*x* or later

1. Log in to each master node in the cluster and perform **2** to **3** on each master node.
2. Change the value of **<session-timeout>20</session-timeout>** in the **/opt/Bigdata/om-server_xxx/apache-tomcat-xxx/webapps/web/WEB-INF/web.xml** file. **<session-timeout>20</session-timeout>** indicates the session timeout duration, in minutes. Change it based on service requirements. The maximum value is 480 minutes.
3. Add **ticket.tgt.timeToKillInSeconds=28800** to the **/opt/Bigdata/om-server_xxx/apache-tomcat-8.5.63/webapps/cas/WEB-INF/classes/config/application.properties** file. **ticket.tgt.timeToKillInSeconds** indicates the validity period of the authentication center, in seconds. Change it based on service requirements. The maximum value is 28,800 seconds.
4. Restart the Tomcat node on the active master node.
   a. On the active master node, run the **netstat -anp |grep 28443 |grep LISTEN | awk '{print $7}'** command as user **omm** to query the Tomcat process ID.
   b. Run the **kill -9** *{pid}* command, in which *{pid}* indicates the Tomcat process ID obtained in **4.a**.
   c. Wait until the process automatically restarts.

      You can run the **netstat -anp |grep 28443 |grep LISTEN** command to check whether the process is successfully restarted. If the process is displayed, the process is successfully restarted. If the process is not displayed, query the process again later.

Modifying the Timeout Duration for an Open-Source Component Web UI

1. Access the **All Configurations** page.
   - For MRS cluster versions earlier than MRS 3.x:

     On the cluster details page, choose **Components > Meta > Service Configuration**.
   - For MRS cluster version 3.*x* or later:

     Log in to FusionInsight Manager and choose **Cluster** > **Services** > **meta**. On the displayed page, click **Configurations** and select **All Configurations**.
2. Change the value of **http.server.session.timeout.secs** under **meta** as required. The unit is second.
3. Save the settings, deselect **Restart the affected services or instances**, and click **OK**.

   You are advised to perform the restart during off-peak hours.
4. (Optional) If you need to use the Spark web UI, search for **spark.session.maxAge** on the **All Configurations** page of Spark and change the value (in seconds).

   Save the settings, deselect **Restart the affected services or instances**, and click **OK**.
5. Restart the meta service and components on web UI, or restart the cluster during off-peak hours.

   To prevent service interruption, restart the service during off-peak hours or perform a rolling restart.

14.5.2 Why Cannot I Refresh the Dynamic Resource Plan Page on MRS Tenant Tab?

Step 1 Log in to the Master1 and Master2 nodes as user **root**.

Step 2 Run the **ps -ef |grep aos** command to check the AOS process ID.

Step 3 Run the **kill -9** *AOS process ID* command to end the AOS process.

Step 4 Wait until the AOS process is automatically restarted.

You can run the **ps -ef |grep aos** command to check whether the AOS process restarts successfully. If the process exists, the restart is successful and the **Dynamic Resource Plan** page will be refreshed. If the process does not exist, retry later.

----End

14.5.3 What Do I Do If the Kafka Topic Monitoring Tab Is Unavailable on Manager?

Step 1 Log in to each Master node of the cluster and switch to user **omm**.

Step 2 Go to the **/opt/Bigdata/apache-tomcat-7.0.78/webapps/web/WEB-INF/lib/components/Kafka/** directory.

Step 3 Run the **cp /opt/share/zookeeper-3.5.1-mrs-2.0/zookeeper-3.5.1-mrs-2.0.jar ./** command to copy the ZooKeeper package.

Step 4 Restart the Tomcat process.

sh /opt/Bigdata/apache-tomcat-7.0.78/bin/shutdown.sh

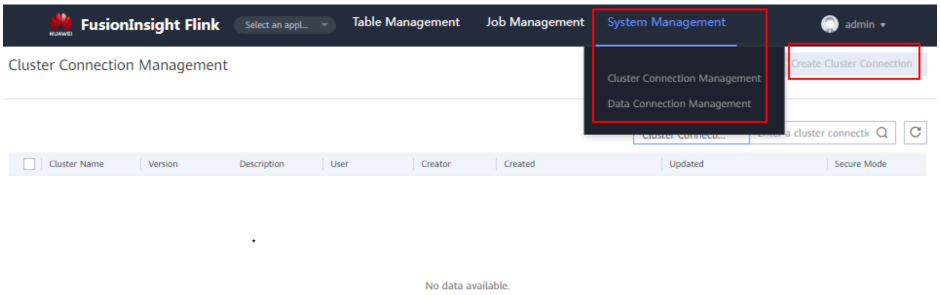
sh /opt/Bigdata/apache-tomcat-7.0.78/bin/startup.sh

----End

14.5.4 How Do I Do If an Error Is Reported or Some Functions Are Unavailable When I Access the Web UIs of HDFS, Hue, YARN, and Flink?

Users who access the web UIs of components such as HDFS, Hue, YARN, and Flink do not have required management permissions. As a result, an error is reported or some functions are unavailable. The following are some examples:

- After you log in to the web UI of Flink as the current user, some content cannot be displayed, and you do not have the permission to create applications, cluster connections, or data connections.

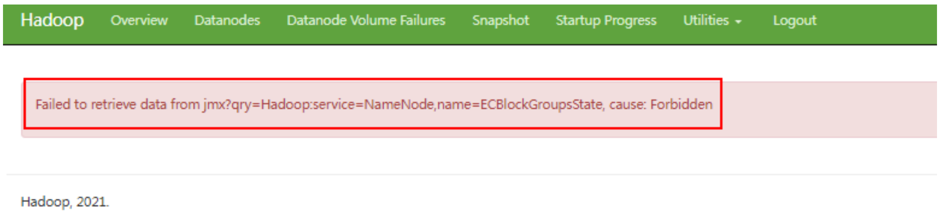


Cluster Connection Management

☐	Cluster Name	Version	Description	User	Creator	Created	Updated	Secure Mode

No data available.

- After you log in to the web UI of HDFS as the current user, error message "Failed to retrieve data from /jmx?qry=java.lang:type=Memory, cause: Forbidden" is displayed.



Failed to retrieve data from jmx?qry=Hadoop:service=NameNode,name=ECBlockGroupsState, cause: Forbidden

Hadoop, 2021.

- After you log in to the web UI of YARN as the current user, you cannot view job information.

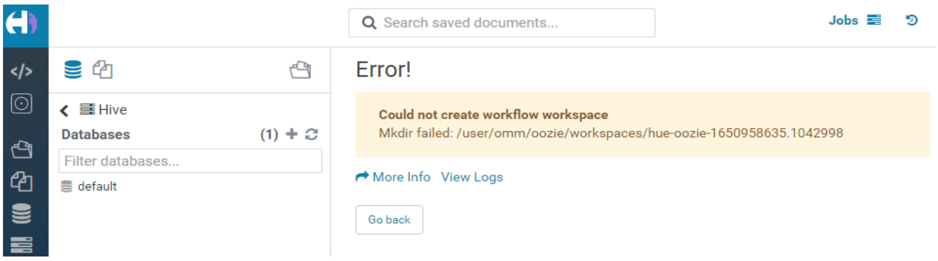
Showing 0 to 0 of 0 entries First Previous Next Last

- After you log in to the web UI of Hue as the current user, click ⊙ in the navigation pane on the left, and select **Workflow**, an error message is displayed.



Could not create workflow workspace
Mkdir failed: /user/omm/oozie/workspaces/hue-oozie-1650958635.1042998

You are advised to log in to the web UIs of the components as a user with corresponding management permissions. For example, you can create a service user who has the management permissions on HDFS and you can log in to the web UI of HDFS as the created user.

14.6 Alarm Monitoring

14.6.1 In an MRS Streaming Cluster, Can the Kafka Topic Monitoring Function Send Alarm Notifications?

The Kafka topic monitoring function cannot send alarms by email or SMS message. However, you can view alarm information on Manager.

14.7 Performance Tuning

14.7.1 Does an MRS Cluster Support System Reinstallation?

An MRS cluster does not support system reinstallation.

14.7.2 Can I Change the OS of an MRS Cluster?

The OS of an MRS cluster cannot be changed.

14.7.3 How Do I Improve the Resource Utilization of Core Nodes in a Cluster?

1. Go to the Yarn service configuration page.
   - For versions earlier than MRS 2.0.1, log in to MRS Manager, choose **Services** > **Yarn** > **Service Configuration**, and select **All** from the **Basic** drop-down list.
   - For MRS 2.0.1 or later, click the cluster name on the MRS console, choose **Components** > **Yarn** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

- For MRS 3.x or later, log in to FusionInsight Manager. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations**.

2. Search for **yarn.nodemanager.resource.memory-mb**, and increase the value based on the actual memory of the cluster nodes.
3. Save the change and restart the affected services or instances.

14.7.4 How Do I Stop the Firewall Service?

Step 1 Log in to each node of a cluster as user **root**.

Step 2 Check whether the firewall service is started.

For example, to check the firewall status on EulerOS, run the **systemctl status firewalld.service** command.

Step 3 Stop the firewall service.

For example, to stop the firewall service on EulerOS, run the **systemctl stop firewalld.service** command.

----End

14.8 Job Development

14.8.1 How Do I Get My Data into OBS or HDFS?

MRS can process data in OBS and HDFS. You can get your data into OBS or HDFS as follows:

1. Upload local data to OBS.
   a. Log in to the OBS console.
   b. Create a parallel file system named **userdata** on OBS and create the **program**, **input**, **output**, and **log** folders in the file system.
      i. Choose **Parallel File System** > **Create Parallel File System**, and create a file system named **userdata**.
      ii. In the OBS file system list, click the file system name **userdata**, choose **Files** > **Create Folder**, and create the **program**, **input**, **output**, and **log** folders.
   c. Upload data to the **userdata** file system.
      i. Go to the **program** folder and click **Upload File**.
      ii. Click **add file** and select a user program.
      iii. Click **Upload**.
      iv. Upload the user data file to the **input** directory using the same method.

2. Import OBS data to HDFS.

   You can import OBS data to HDFS only when **Kerberos Authentication** is disabled and the cluster is running.

   a. Log in to the MRS console.
   b. Click the name of the cluster.
   c. On the page displayed, select the **Files** tab page and click **HDFS File List**.
   d. Select a data directory, for example, **bd_app1**.

      The **bd_app1** directory is only an example. You can use any directory on the page or create a new one.

   e. Click **Import Data** and click **Browse** to select an OBS path and an HDFS path.
   f. Click **OK**.

      You can view the file upload progress on the **File Operation Records** tab page.

14.8.2 What Types of Spark Jobs Can Be Submitted in a Cluster?

MRS clusters support Spark jobs submitted in Spark, Spark Script, or Spark SQL mode.

14.8.3 Can I Run Multiple Spark Tasks at the Same Time After the Minimum Tenant Resources of an MRS Cluster Is Changed to 0?

You can run only one Spark task at a time after the minimum tenant resources of an MRS cluster is changed to 0.

14.8.4 What Are the Differences Between the Client Mode and Cluster Mode of Spark Jobs?

You need to understand the concept ApplicationMaster before understanding the essential differences between Yarn-client and Yarn-cluster.

In Yarn, each application instance has an ApplicationMaster process, which is the first container started by the application. It interacts with ResourceManager and requests resources. After obtaining resources, it instructs NodeManager to start containers. The essential difference between the Yarn-cluster and Yarn-client modes lies in the ApplicationMaster process.

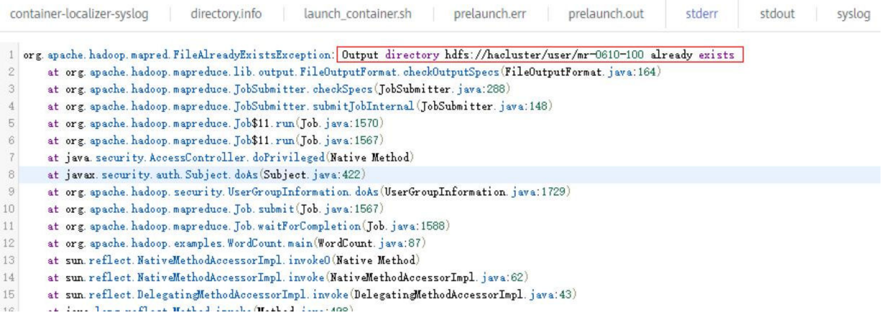
In Yarn-cluster mode, Driver runs in ApplicationMaster, which requests resources from Yarn and monitors the running status of a job. After a user submits a job, the client can be stopped and the job continues running on Yarn. Therefore, the Yarn-cluster mode is not suitable for running interactive jobs.

In Yarn-client mode, ApplicationMaster requests only Executor from Yarn. The client communicates with the requested containers to schedule tasks. Therefore, the client cannot be stopped.

14.8.5 How Do I View MRS Job Logs?

Step 1 On the **Jobs** page of the MRS console, you can view logs of each job, including launcherJob and realJob logs.

- Generally, error logs are printed in **stderr** and **stdout** for launcherJob jobs, as shown in the following figure:



```
org.apache.hadoop.mapred.FileAlreadyExistsException: Output directory hdfs://hacluster/user/mr-0610-100 already exists
    at org.apache.hadoop.mapreduce.lib.output.FileOutputFormat.checkOutputSpecs(FileOutputFormat.java:164)
    at org.apache.hadoop.mapreduce.JobSubmitter.checkSpecs(JobSubmitter.java:288)
    at org.apache.hadoop.mapreduce.JobSubmitter.submitJobInternal(JobSubmitter.java:148)
    at org.apache.hadoop.mapreduce.Job$11.run(Job.java:1570)
    at org.apache.hadoop.mapreduce.Job$11.run(Job.java:1567)
    at java.security.AccessController.doPrivileged(Native Method)
    at javax.security.auth.Subject.doAs(Subject.java:422)
    at org.apache.hadoop.security.UserGroupInformation.doAs(UserGroupInformation.java:1729)
    at org.apache.hadoop.mapreduce.Job.submit(Job.java:1567)
    at org.apache.hadoop.mapreduce.Job.waitForCompletion(Job.java:1588)
    at org.apache.hadoop.examples.WordCount.main(WordCount.java:87)
    at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
    at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:62)
    at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:43)
```

- You can view realJob logs on the ResourceManager web UI provided by the Yarn service on MRS Manager.

Aggregate Resource Allocation: 36359 MB-seconds, 59 vcore-seconds
Aggregate Preempted Resource Allocation: 0 MB-seconds, 0 vcore-seconds

Attempt ID	Started	Node	Logs	Nodes blacklisted by the app	Nodes blacklisted by the system
appattempt_1591770054316_0326_000001	Fri Jun 12 10:44:21 +0800 2020	https://node-ana-corezUam0002:8044	Logs	0	0

Step 2 Log in to the Master node of the cluster to obtain the job log files in **Step 1**. The HDFS path is **/tmp/logs/***{submit_user}***/logs/***{application_id}*.

Step 3 After the job is submitted, if the job application ID cannot be found on the Yarn web UI, the job fails to be submitted. You can log in to the active Master node of the cluster and view the job submission process log **/var/log/executor/logs/exe.log**.

----End

14.8.6 How Do I Do If the Message "The current user does not exist on MRS Manager. Grant the user sufficient permissions on IAM and then perform IAM user synchronization on the Dashboard tab page." Is Displayed?

If IAM synchronization is not performed when a job is submitted in a security cluster, the error message "The current user does not exist on MRS Manager. Grant the user sufficient permissions on IAM and then perform IAM user synchronization on the Dashboard tab page." is displayed.

Before submitting a job, on the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

14.8.7 LauncherJob Job Execution Is Failed And the Error Message "jobPropertiesMap is null." Is Displayed

The cause of the launcherJob failure is that the user who submits the job does not have the write permission on the **hdfs /mrs/job-properties** directory.

This problem is fixed in the 2.1.0.6 patch. You can also grant the write permission on the **/mrs/job-properties** directory to the synchronized user who submits the job on MRS Manager.

14.8.8 How Do I Do If the Flink Job Status on the MRS Console Is Inconsistent with That on Yarn?

To save storage space, the Yarn configuration item **yarn.resourcemanager.max-completed-applications** is modified to reduce the number of historical job records stored on Yarn. Flink jobs are long-term jobs. The realJob is still running on Yarn, but the launcherJob has been deleted. As a result, the launcherJob cannot be found on Yarn, and the job status fails to be updated. This problem is fixed in the 2.1.0.6 patch.

Workaround: Terminate the job whose launcherJob cannot be found. The status of the job submitted later will be updated.

14.8.9 How Do I Do If a SparkStreaming Job Fails After Being Executed Dozens of Hours and the OBS Access 403 Error is Reported?

When a user submits a job that needs to read and write OBS, the job submission program adds the temporary access key (AK) and secret key (SK) for accessing OBS by default. However, the temporary AK and SK have expiration time.

If you want to run long-term jobs such as Flink and SparkStreaming, you can enter the AK and SK in **Service Parameter** to ensure that the jobs will not fail to be executed due to key expiration.

14.8.10 How Do I Do If an Alarm Is Reported Indicating that the Memory Is Insufficient When I Execute a SQL Statement on the ClickHouse Client?

Symptom

The ClickHouse client restricts the memory used by GROUP BY statements. When a SQL statement is executed on the ClickHouse client, the following error information is displayed:

```
Progress: 1.83 billion rows, 85.31 GB (68.80 million rows/s., 3.21 GB/s.)        6%Received exception from
server:
Code: 241. DB::Exception: Received from localhost:9000, 127.0.0.1.
DB::Exception: Memory limit (for query) exceeded: would use 9.31 GiB (attempt to allocate chunk of
1048576 bytes), maximum: 9.31 GiB:
(while reading column hits):
```

Solution

- Run the following command before executing an SQL statement on condition that the cluster has sufficient memory:
  ```
  SET max_memory_usage = 128000000000; #128G
  ```
- If no sufficient memory is available, ClickHouse enables you to overflow data to disk to free up the memory: You are advised to set the value of **max_memory_usage** to twice the size of **max_bytes_before_external_group_by**.
  ```
  set max_bytes_before_external_group_by=20000000000; #20G
  set max_memory_usage=40000000000; #40G
  ```

14.8.11 Why Submitted Yarn Job Cannot Be Viewed on the Web UI?

After a Yarn job is created, it cannot be viewed if you log in to the web UI as the **admin** user.

- The **admin** user is a user on the cluster management page. Check whether the user has the **supergroup** permission. Generally, only the user with the **supergroup** permission can view jobs.
- Log in to Yarn as the user who submits jobs to view jobs on Yarn. Do not view the jobs using the **admin** user.

14.8.12 How Do I Modify the HDFS NameSpace (fs.defaultFS) of an Existing Cluster?

You can modify or add the HDFS NameSpace (fs.defaultFS) of the cluster by modifying the **core-site.xml** and **hdfs-site.xml** files on the client. However, you are not advised to perform this operation on the server.

14.8.13 How Do I Do If the launcher-job Queue Is Stopped by YARN due to Insufficient Heap Size When I Submit a Flink Job on the Management Plane?

Symptom

The launcher-job queue is stopped by YARN when a Flink job is submitted on the management plane.

Solution

Increase the heap size of the launcher-job queue.

1. Log in to the active OMS node as user **omm**.
2. Change the value of **job.launcher.resource.memory.mb** in **/opt/executor/webapps/executor/WEB-INF/classes/servicebroker.xml** to **2048**.
3. Run the **sh /opt/executor/bin/restart-executor.sh** command to restart the executor process.

14.9 Cluster Upgrade/Patching

14.9.1 Can I Upgrade an MRS Cluster?

You cannot upgrade an MRS cluster. However, you can create a cluster of the target version and migrate data from the old cluster to the new cluster.

14.9.2 Can I Change the MRS Cluster Version?

You cannot change the version of an MRS cluster. However, you can terminate the current cluster and create an MRS cluster of the version you require.

14.10 Cluster Access

14.10.1 Can I Switch Between the Two Login Modes of MRS?

No. You can select the login mode when creating the cluster. You cannot change the login mode after you created the cluster.

14.10.2 How Can I Obtain the IP Address and Port Number of a ZooKeeper Instance?

You can obtain the IP address and port number of a ZooKeeper instance through the MRS console or FusionInsight Manager.

Method 1: Obtaining the IP address and port number of a ZooKeeper through the MRS console

1. On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.
2. Click the **Components** tab and choose **ZooKeeper**. On the displayed page, click **Instances** to view the business IP address of a ZooKeeper instance.
3. Click the **Service Configuration** tab. On the displayed page, search for the **clientPort** parameter to view the port number of the ZooKeeper instance.

Method 2: Obtaining the IP address and port number of a ZooKeeper through FusionInsight Manager

1. Log in to FusionInsight Manager. For details, see .
2. Perform the following operations to obtain the IP address and port number of a ZooKeeper instance.
   - For clusters of MRS 3.*x* or earlier
     1. Choose **Services** > **ZooKeeper**. On the displayed page, click the **Instance** tab to view the business IP address of a ZooKeeper instance.
     2. Click the **Service Configuration** tab. On the displayed page, search for the **clientPort** parameter to view the port number of the ZooKeeper instance.

– For clusters of MRS 3.*x* or later

i. Choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click the **Instance** tab to view the business IP address of a ZooKeeper instance.

ii. Click the **Configurations** tab. On the displayed page, search for the **clientPort** parameter to view the port number of the ZooKeeper instance.

14.10.3 How Do I Do If a New Node Cannot Be logged In to as a Linux User?

If you can log in to an existing node as the Linux user but fail to log in to the newly added node, log in to the newly added node as the root user.

14.10.4 How Do I Access an MRS Cluster from a Node Outside the Cluster?

Creating a Linux ECS Outside the Cluster to Access the MRS Cluster

Step 1 Create an ECS outside the cluster.

Set **AZ**, **VPC**, and **Security Group** of the ECS to the same values as those of the cluster to be accessed.

Step 2 On the VPC management console, apply for an EIP and bind it to the ECS.

Step 3 Configure security group rules for the cluster.

1. On the **Dashboard** tab page, click **Add Security Group Rule**. In the **Add Security Group Rule** dialog box that is displayed, click **Manage Security Group Rule**.
2. Click the **Inbound Rules** tab, and click **Add Rule**. In the **Add Inbound Rule** dialog box, configure the IP address of the ECS and enable all ports.
3. After the security group rule is added, you can download and install the client on the ECS..
4. Use the client.

   Log in to the client node as the client installation user and run the following command to switch to the client directory:

   cd /opt/hadoopclient

   Run the following command to load environment variables:

   source bigdata_env

   If Kerberos authentication is enabled for the cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, authentication is not required.

   kinit *MRS cluster user*

   Example:

   kinit admin

   Run the client command of a component.

Example:

Run the following command to view files in the HDFS root directory:

hdfs dfs -ls /

```
Found 15 items
drwxrwx--x   - hive       hive              0 2021-10-26 16:30 /apps
drwxr-xr-x   - hdfs       hadoop            0 2021-10-18 20:54 /datasets
drwxr-xr-x   - hdfs       hadoop            0 2021-10-18 20:54 /datastore
drwxrwx---+  - flink      hadoop            0 2021-10-18 21:10 /flink
drwxr-x---   - flume      hadoop            0 2021-10-18 20:54 /flume
drwxrwx--x   - hbase      hadoop            0 2021-10-30 07:31 /hbase
...
```

----End

14.11 Big Data Service Development

14.11.1 Can MRS Run Multiple Flume Tasks at a Time?

The Flume client supports multiple independent data flows. You can configure and link multiple sources, channels, and sinks in the **properties.properties** configuration file. These components can be linked to form multiple flows.

The following is an example of configuring two data flows in a configuration file:

```
server.sources = source1 source2
server.sinks = sink1 sink2
server.channels = channel1 channel2

#dataflow1
server.sources.source1.channels = channel1
server.sinks.sink1.channel = channel1

#dataflow2
server.sources.source2.channels = channel2
server.sinks.sink2.channel = channel2
```

14.11.2 How Do I Change FlumeClient Logs to Standard Logs?

1. Log in to the node where FlumeClient is running.
2. Go to the FlumeClient installation directory.

   For example, if the FlumeClient installation directory is **/opt/FlumeClient**, run the following command:

   cd /opt/FlumeClient/fusioninsight-flume-1.9.0/bin
3. Run the **./flume-manage.sh stop** command to stop FlumeClient.
4. Run the **vi /log4j.properties** command to open the **log4j.properties** file and change the value of **flume.root.logger** to **${flume.log.level},console**.
5. Run the **vim /flume-manager.sh** command to open the **flume-manager.sh** script in the **bin** directory in the Flume installation directory.
6. Comment out the following information in the **flume-manager.sh** script:

   >/dev/null 2>&1 &
7. Run the **./flume-manage.sh start** command to restart FlumeClient.

8. After the modification, check whether the Docker configuration is correct.

14.11.3 Where Are the .jar Files and Environment Variables of Hadoop Located?

- The **hadoopstreaming.jar** file is stored in the **/opt/share/hadoop-streaming-*** directory. ***** indicates the Hadoop version.
- The JDK environment variables are stored in **/opt/client/JDK/component_env**.
- The Hadoop environment variables are stored in **/opt/client/HDFS/component_env**.
- The Hadoop client path is **/opt/client/HDFS/hadoop**.

14.11.4 What Compression Algorithms Does HBase Support?

HBase supports the Snappy, LZ4, and gzip compression algorithms.

14.11.5 Can MRS Write Data to HBase Through the HBase External Table of Hive?

No. Hive on HBase supports only data query.

14.11.6 How Do I View HBase Logs?

1. Log in to the Master node in the cluster as user **root**.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **cd /var/log/Bigdata/hbase/** command to go to the **/var/log/Bigdata/hbase/** directory and view HBase logs.

14.11.7 How Do I Set the TTL for an HBase Table?

- Set the time to live (TTL) when creating a table:

  Create the **t_task_log** table, set the column family to **f**, and set the TTL to **86400** seconds.

  ```
  create 't_task_log',{NAME => 'f', TTL=>'86400'}
  ```
- Set the TTL for an existing table:

  ```
  disable "t_task_log" #Disable the table (services must be stopped).
  alter "t_task_log",NAME=>'data',TTL=>'86400' # Set the TTL value for the column family data.
  enable "t_task_log" #Restore the table.
  ```

14.11.8 How Do I Balance HDFS Data?

1. Log in to the master node of the cluster and run the corresponding command to configure environment variables. **/opt/client** indicates the client installation directory. Replace it with the actual one.

   source /opt/client/bigdata_env

   kinit Component service user (If Kerberos authentication is enabled for the cluster, run this command to authenticate the user. Skip this step if the Kerberos authentication is disabled.)
2. Run the following command to start the balancer:

/opt/client/HDFS/hadoop/sbin/start-balancer.sh -threshold 5

3. View the log.

   After you execute the balance task, the **hadoop-root-balancer-***Host name***.log** log file will be generated in the client installation directory **/opt/client/HDFS/hadoop/logs**.

4. (Optional) If you do not want to perform data balancing, run the following commands to stop the balancer:

   source /opt/client/bigdata_env

   kinit Component service user (If Kerberos authentication is enabled for the cluster, run this command to authenticate the user. Skip this step if the Kerberos authentication is disabled.)

   /opt/client/HDFS/hadoop/sbin/stop-balancer.sh -threshold 5

14.11.9 How Do I Change the Number of HDFS Replicas?

1. Go to the HDFS service configuration page.
   - For versions earlier than MRS 2.0.1, log in to MRS Manager, choose **Services** > **HDFS** > **Service Configuration**, and select **All** from the **Basic** drop-down list.
   - For MRS 2.0.1 or later, click the cluster name on the MRS console, choose **Components** > **HDFS** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

     NOTE

     If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)
   - MRS 3.*x* or later: Log in to FusionInsight Manager. And choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**.
2. Search for **dfs.replication**, change the value (value range: 1 to 16), and restart the HDFS instance.

14.11.10 What Is the Port for Accessing HDFS Using Python?

The default port of open source HDFS is **50070** for versions earlier than MRS 3.0.0, and **9870** for MRS 3.0.0 or later. **Common HDFS Ports** describes the common ports of HDFS.

Common HDFS Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
dfs.namenode.rpc.port	- 9820 (versions earlier than MRS 3.*x*) - 8020 (MRS 3.*x* and later)	NameNode RPC port This port is used for: 1. Communication between the HDFS client and NameNode 2. Connection between the DataNode and NameNode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.namenode.http.port	9870	HDFS HTTP port (NameNode) This port is used for: 1. Point-to-point NameNode checkpoint operations. 2. Connecting the remote web client to the NameNode UI **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.namenode.https.port	9871	HDFS HTTPS port (NameNode) This port is used for: 1. Point-to-point NameNode checkpoint operations 2. Connecting the remote web client to the NameNode UI **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
dfs.datanode.ipc.port	9867	IPC server port of DataNode This port is used for: Connection between the client and DataNode to perform RPC operations. **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.datanode.port	9866	DataNode data transmission port This port is used for: 1. Transmitting data from HDFS client from or to the DataNode 2. Point-to-point DataNode data transmission **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.datanode.http.port	9864	DataNode HTTP port This port is used for: Connecting to the DataNode from the remote web client in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
dfs.datanode.https.port	9865	HTTPS port of DataNode This port is used for: Connecting to the DataNode from the remote web client in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.JournalNode.rpc.port	8485	RPC port of JournalNode This port is used for: Client communication to access multiple types of information **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.journalnode.http.port	8480	JournalNode HTTP port This port is used for: Connecting to the JournalNode from the remote web client in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Parameter	Default Port	Port Description
dfs.journalnode.https.port	8481	HTTPS port of JournalNode This port is used for: Connecting to the JournalNode from the remote web client in security mode **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
httpfs.http.port	14000	Listening port of the HttpFS HTTP server This port is used for: Connecting to the HttpFS from the remote REST API **NOTE** The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

14.11.11 How Do I Modify the HDFS Active/Standby Switchover Class?

If the **org.apache.hadoop.hdfs.server.namenode.ha.AdaptiveFailoverProxyProvider** class is unavailable when a cluster of MRS 3.*x* connects to NameNodes using HDFS, the cause is that the HDFS active/standby switchover class of the cluster is configured improperly. To solve the problem, perform the following operations:

- Method 1: Add the **hadoop-plugins-*xxx*.jar** package to the **classpath** or **lib** directory of your program.

  The **hadoop-plugins-*xxx*.jar** package is stored in the HDFS client directory, for example, **$HADOOP_HOME/share/hadoop/common/lib/hadoop-plugins-8.0.2-302023.jar**.

- Method 2: Change the configuration item of HDFS to the corresponding open source class, as shown in the follows:

  dfs.client.failover.proxy.provider.hacluster=org.apache.hadoop.hdfs.server.namenode.ha.ConfiguredFailoverProxyProvider

14.11.12 What Is the Recommended Number Type of DynamoDB in Hive Tables?

smallint is recommended.

14.11.13 Can the Hive Driver Be Interconnected with DBCP2?

The Hive driver cannot be interconnected with the DBCP2 database connection pool. The DBCP2 database connection pool invokes the **isValid** method to check whether a connection is available. However, Hive directly throws an exception when implementing this method.

14.11.14 How Do I View the Hive Table Created by Another User?

Versions earlier than MRS 3.*x*:

1. Log in to MRS Manager and choose **System** > **Permission** > **Manage Role**.
2. Click **Create Role**, and set **Role Name** and **Description**.
3. In the **Permission** table, choose **Hive** > **Hive Read Write Privileges**.
4. In the database list, click the name of the database where the table created by user B is stored. The table is displayed.
5. In the **Permission** column of the table created by user B, select **SELECT**.
6. Click **OK**, and return to the **Role** page.
7. Choose **System** > **Manage User**. Locate the row containing user A, click **Modify** to bind the new role to user A, and click **OK**. After about 5 minutes, user A can access the table created by user B.

MRS 3.*x* or later:

1. Log in to FusionInsight Manager and choose **Cluster** > **Services**. On the page that is displayed, choose **Hive**. On the displayed page, choose **More**, and check whether **Enable Ranger** is grayed out.
   - If yes, go to **9**.
   - If no, perform **2** to **8**.
2. Log in to FusionInsight Manager and choose **System** > **Permission** > **Role**.
3. Click **Create Role**, and set **Role Name** and **Description**.
4. In the **Configure Resource Permission** table, choose *Name of the desired cluster* > **Hive** > **Hive Read Write Privileges**.
5. In the database list, click the name of the database where the table created by user B is stored. The table is displayed.
6. In the **Permission** column of the table created by user B, select **Select**.
7. Click **OK**, and return to the **Role** page.
8. Choose **Permission** > **User**. On the **Local User** page that is displayed, locate the row containing user A, click **Modify** in the **Operation** column to bind the new role to user A, and click **OK**. After about 5 minutes, user A can access the table created by user B.
9. Perform the following steps to add the Ranger access permission policy of Hive:

a. Log in to FusionInsight Manager as a Hive administrator and choose **Cluster** > **Services**. On the page that is displayed, choose **Ranger**. On the displayed page, click the URL next to **Ranger WebUI** to go to the Ranger management page.

b. On the home page, click the component plug-in name in the **HADOOP SQL** area, for example, **Hive**.

c. On the **Access** tab page, click **Add New Policy** to add a Hive permission control policy.

d. In the **Create Policy** dialog box that is displayed, set the following parameters:

   - **Policy Name**: Enter a policy name, for example, **table_test_hive**.
   - **database**: Enter or select the database where the table created by user B is stored, for example, **default**.
   - **table**: Enter or select the table created by user B, for example, **test**.
   - **column**: Enter and select a column, for example, *****.
   - In the **Allow Conditions** area, click **Select User**, select user A, click **Add Permissions**, and select **select**.
   - Click **Add**.

10. Perform the following steps to add the Ranger access permission policy of HDFS:

a. Log in to FusionInsight Manager as user **rangeradmin** and choose **Cluster** > **Services**. On the page that is displayed, choose **Ranger**. On the displayed page, click the URL next to **Ranger WebUI** to go to the Ranger management page.

b. On the home page, click the component plug-in name in the **HDFS** area, for example, **hacluster**.

c. Click **Add New Policy** to add a HDFS permission control policy.

d. In the **Create Policy** dialog box that is displayed, set the following parameters:

   - **Policy Name**: Enter a policy name, for example, **tablehdfs_test**.
   - **Resource Path**: Set this parameter to the HDFS path where the table created by user B is stored, for example, **/user/hive/warehouse/***Database name***/***Table name*.
   - In the **Allow Conditions** area, select user A for **Select User**, click **Add Permissions** in the **Permissions** column, and select **Read** and **Execute**.
   - Click **Add**.

11. View basic information about the policy in the policy list. After the policy takes effect, user A can view the table created by user B.

14.11.15 Can I Export the Query Result of Hive Data?

Run the following statement to export the query result of Hive data:

```
insert overwrite local directory "/tmp/out/" row format delimited fields terminated by "\t" select * from
table;
```

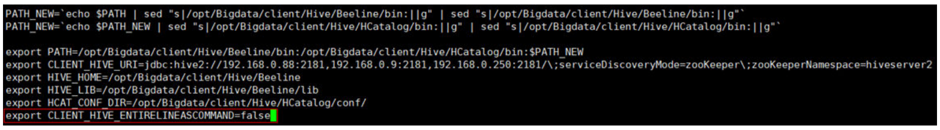
14.11.16 How Do I Do If an Error Occurs When Hive Runs the beeline -e Command to Execute Multiple Statements?

When Hive of MRS 3.*x* runs the **beeline -e " use default;show tables;"** command, the following error message is displayed: Error while compiling statement: FAILED: ParseException line 1:11 missing EOF at ';' near 'default' (state=42000,code=40000).

Solutions:

- Method 1: Replace the **beeline -e " use default;show tables;"** command with **beeline --entirelineascommand=false -e "use default;show tables;"**.
- Method 2:
  a. In the **/opt/Bigdata/client/Hive** directory on the Hive client, change **export CLIENT_HIVE_ENTIRELINEASCOMMAND=true** in the **component_env** file to **export CLIENT_HIVE_ENTIRELINEASCOMMAND=false**.

     Figure 14-1 Changing the **component_env** file

```
PATH_NEW=`echo $PATH | sed "s|/opt/Bigdata/client/Hive/Beeline/bin:||g" | sed "s|/opt/Bigdata/client/Hive/Beeline/bin:||g"`
PATH_NEW=`echo $PATH_NEW | sed "s|/opt/Bigdata/client/Hive/HCatalog/bin:||g" | sed "s|/opt/Bigdata/client/Hive/HCatalog/bin:||g"`

export PATH=/opt/Bigdata/client/Hive/Beeline/bin:/opt/Bigdata/client/Hive/HCatalog/bin:$PATH_NEW
export CLIENT_HIVE_URI=jdbc:hive2://192.168.0.88:2181,192.168.0.9:2181,192.168.0.250:2181/\;serviceDiscoveryMode=zooKeeper\;zooKeeperNamespace=hiveserver2
export HIVE_HOME=/opt/Bigdata/client/Hive/Beeline
export HIVE_LIB=/opt/Bigdata/client/Hive/Beeline/lib
export HCAT_CONF_DIR=/opt/Bigdata/client/Hive/HCatalog/conf/
export CLIENT_HIVE_ENTIRELINEASCOMMAND=false
```

  b. Run the following command to verify the configuration:

     source /opt/Bigdata/client/bigdata_env

     beeline -e " use default;show tables;"

14.11.17 How Do I Do If a "hivesql/hivescript" Job Fails to Submit After Hive Is Added?

This issue occurs because the **MRS CommonOperations** permission bound to the user group to which the user who submits the job belongs does not include the Hive permission after being synchronized to Manager. To solve this issue, perform the following operations:

1. Add the Hive service.
2. Log in to the IAM console and create a user group. The policy bound to the user group is the same as that of the user group to which the user who submits the job belongs.
3. Add the user who submits the job to the new user group.
4. Refresh the cluster details page on the MRS console. The status of IAM user synchronization is **Not synchronized**.
5. Click **Synchronize** on the right of **IAM User Sync**. Go back to the previous page. In the navigation pane on the left, choose **Operation Logs** and check whether the user is changed.
   - If yes, submit the Hive job again.

- If no, check whether all the preceding operations are complete.
  - If yes, contact the O&M personnel.
  - If no, submit the Hive job after the preceding operations are complete.

14.11.18 What If an Excel File Downloaded on Hue Failed to Open?

1. Log in to a Master node as user **root** and switch to user **omm**.

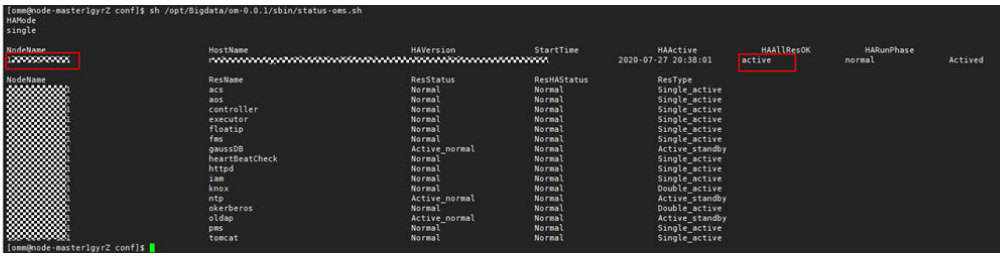
   su - omm

2. Check whether the current node is the active OMS node.

   sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh

   If **active** is displayed in the command output, the node is the active node. Otherwise, log in to the other Master node.

   Figure 14-2 Active OMS node



```
[omm@node-master1gyrZ conf]$ sh /opt/Bigdata/om-0.0.1/sbin/status-oms.sh
HAMode
single

NodeName              HostName              HAVersion        StartTime             HAActive     HAAllResOK     HARunPhase
[redacted]            [redacted]                             2020-07-27 20:38:01   active       normal         Actived

[omm@node-master1gyrZ conf]$
```

3. Go to the **${BIGDATA_HOME}/Apache-httpd-*/conf** directory.

   cd ${BIGDATA_HOME}/Apache-httpd-*/conf

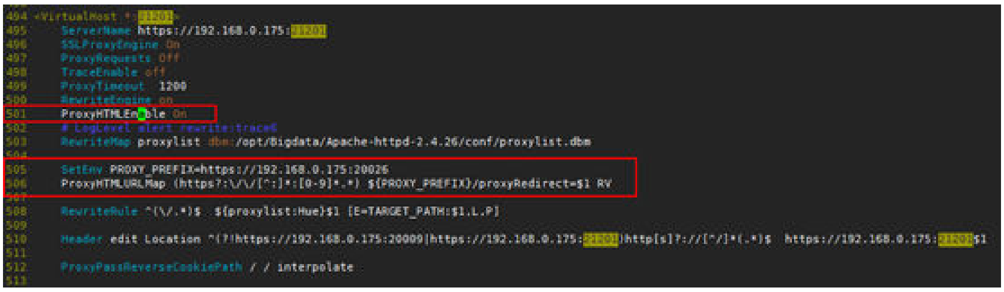
4. Open the **httpd.conf** file.

   vim httpd.conf

5. Search for **21201** in the file and delete the following content from the file (The values of *proxy_ip* and *proxy_port* in **Figure 14-3** are examples only):

```
ProxyHTMLEnable On
SetEnv PROXY_PREFIX=https://[proxy_ip]:[proxy_port]
ProxyHTMLURLMap (https?:\/\/[^:]*:[0-9]*.*) ${PROXY_PREFIX}/proxyRedirect=$1 RV
```

   Figure 14-3 Content to be deleted



```
<VirtualHost *:21201>
    ServerName https://192.168.0.175:21201
    SSLProxyEngine On
    ProxyRequests Off
    TraceEnable off
    ProxyTimeout  1200
    RewriteEngine on
    ProxyHTMLEnable On
    # LogLevel alert rewrite:trace6
    RewriteMap proxylist dbm:/opt/Bigdata/Apache-httpd-2.4.26/conf/proxylist.dbm

    SetEnv PROXY_PREFIX=https://192.168.0.175:20026
    ProxyHTMLURLMap (https?:\/\/[^:]*:[0-9]*.*) ${PROXY_PREFIX}/proxyRedirect=$1 RV

    RewriteRule ^(\/.*)$  ${proxylist:Hue}$1 [E=TARGET_PATH:$1,L,P]

    Header edit Location ^(?!https://192.168.0.175:20009|https://192.168.0.175:21201)http[s]?://[^/]*(.*)$  https://192.168.0.175:21201$1

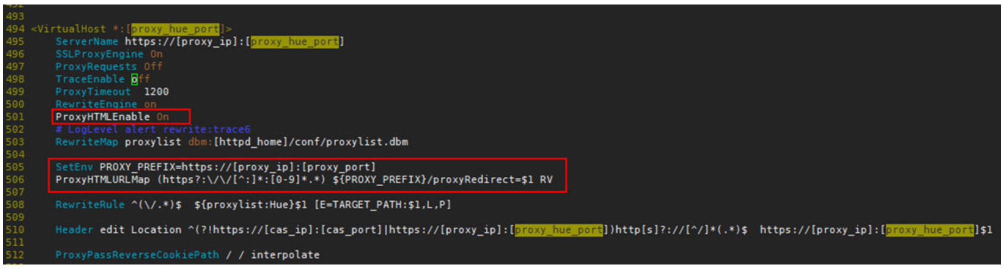
    ProxyPassReverseCookiePath / / interpolate
```

6. Save the modification and exit.

7. Open the **httpd.conf** file again, search for **proxy_hue_port**, and delete the following content:

```
ProxyHTMLEnable On
SetEnv PROXY_PREFIX=https://[proxy_ip]:[proxy_port]
ProxyHTMLURLMap (https?:\/\/[^:]*:[0-9]*.*) ${PROXY_PREFIX}/proxyRedirect=$1 RV
```

Figure 14-4 Content to be deleted



```
<VirtualHost *:[proxy_hue_port]>
    ServerName https://[proxy_ip]:[proxy_hue_port]
    SSLProxyEngine On
    ProxyRequests Off
    TraceEnable Off
    ProxyTimeout  1200
    RewriteEngine on
    ProxyHTMLEnable On
    # LogLevel alert rewrite:trace6
    RewriteMap proxylist dbm:[httpd_home]/conf/proxylist.dbm

    SetEnv PROXY_PREFIX=https://[proxy_ip]:[proxy_port]
    ProxyHTMLURLMap (https?:\/\/[^:]*:[0-9]*.*) ${PROXY_PREFIX}/proxyRedirect=$1 RV

    RewriteRule ^(\/.*)$  ${proxylist:Hue}$1 [E=TARGET_PATH:$1,L,P]

    Header edit Location ^(?!https://[cas_ip]:[cas_port]|https://[proxy_ip]:[proxy_hue_port])http[s]?://[^/]*(.*)$  https://[proxy_ip]:[proxy_hue_port]$1

    ProxyPassReverseCookiePath / / interpolate
```

8. Save the modification and exit.
9. Run the following command to restart the **httpd** process:

   sh ${BIGDATA_HOME}/Apache-httpd-*/setup/restarthttpd.sh
10. Check whether the **httpd.conf** file on the standby Master node is modified. If the file is modified, no further action is required. If the file is not modified, modify the **httpd.conf** file on the standby Master node in the same way. You do not need to restart the **httpd** process.
11. Download the Excel file again. You can open the file successfully.

14.11.19 How Do I Do If Sessions Are Not Released After Hue Connects to HiveServer and the Error Message "over max user connections" Is Displayed?

Applicable versions: MRS 3.1.0 and earlier

1. Modify the following file on the two Hue nodes:

   /opt/Bigdata/FusionInsight_Porter_8.*/install/FusionInsight-Hue-*/hue/apps/beeswax/src/beeswax/models.py
2. Change the configurations in lines 396 and 404.

   Change **q Changed = self.filter(owner=user, application=application).exclude(guid='').exclude(secret='')** to **q = self.filter(owner=user, application=application).exclude(guid=None).exclude(secret=None)**.

14.11.20 How Do I Reset Kafka Data?

You can reset Kafka data by deleting Kafka topics.

- Delete a topic: **kafka-topics.sh --delete --zookeeper** *ZooKeeper Cluster service IP address*:**2181/kafka --topic *topicname***

- Query all topics: **kafka-topics.sh --zookeeper** *ZooKeeper cluster service IP address*:**2181/kafka --list**

After the deletion command is executed, empty topics will be deleted immediately. If a topic has data, the topic will be marked for deletion and will be deleted by Kafka later.

14.11.21 How Do I Obtain the Client Version of MRS Kafka?

Run the **--bootstrap-server** command to query the information about the client.

14.11.22 What Access Protocols Are Supported by Kafka?

Kafka supports PLAINTEXT, SSL, SASL_PLAINTEXT, and SASL_SSL.

14.11.23 How Do I Do If Error Message "Not Authorized to access group xxx" Is Displayed When a Kafka Topic Is Consumed?

This issue is caused by the conflict between the Ranger authentication and ACL authentication of a cluster. If a Kafka cluster uses ACL for permission access control and Ranger authentication is enabled for the Kafka component, all authentications of the component are managed by Ranger. The permissions set by the original authentication plug-in are invalid. As a result, ACL authorization does not take effect. You can disable Ranger authentication of Kafka and restart the Kafka service to rectify the fault. The procedure is as follows:

1. Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kafka**.
2. In the upper right corner of the **Dashboard** page, click **More** and choose **Disable Ranger**. In the displayed dialog box, enter the password and click **OK**. After the operation is successful, click **Finish**.
3. In the upper right corner of the **Dashboard** page, click **More** and choose **Restart Service** to restart the Kafka service.

14.11.24 What Compression Algorithms Does Kudu Support?

Kudu supports **Snappy**, **LZ4**, and **zlib**. **LZ4** is used by default.

14.11.25 How Do I View Kudu Logs?

1. Log in to the Master node in the cluster.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **cd /var/log/Bigdata/kudu/** command to go to the **/var/log/Bigdata/kudu/** directory and view Kudu logs.

14.11.26 How Do I Handle the Kudu Service Exceptions Generated During Cluster Creation?

Viewing the Kudu Service Exception Logs

1. Log in to the MRS console.

2. Click the name of the cluster.
3. On the page displayed, choose **Components** > **Kudu** > **Instances** and locate the IP address of the abnormal instance.

   If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)
4. Log in to the node where the abnormal instance resides, and view the Kudu log.
   ```
   cd /var/log/Bigdata/Kudu
   [root@node-master1AERu kudu]# ls
   healthchecklog  runninglog  startlog
   ```
   You can find the Kudu health check logs in the **healthchecklog** directory, the startup logs in the **startlog** directory, and the Kudu process run logs in the **runninglog** directory.
   ```
   [root@node-master1AERu logs]# pwd
   /var/log/Bigdata/kudu/runninglog/master/logs
   [root@node-master1AERu logs]# ls -al
   kudu-master.ERROR   kudu-master.INFO   kudu-master.WARNING
   ```
   Run logs are classified into three types: ERROR, INFO, and WARNING. Each type of run logs is recorded in the corresponding file. You can run the **cat** command to view run logs of each type.

Handling Kudu Service Exceptions

The **/var/log/Bigdata/kudu/runninglog/master/logs/kudu-master.INFO** file contains the following error information:

```
"Unable to init master catalog manager: not found: Unable to initialize catalog manager: Failed to initialize sys tables async: Unable to load consensus metadata for tablet 0000000000000000000000: xxx"
```

If this exception occurs when the Kudu service is installed for the first time, the KuduMaster service is not started. The data inconsistency causes the startup failure. To solve the problem, perform the following steps to clear the data directories and restart the Kudu service. If the Kudu service is not installed for the first time, clearing the data directories will cause data loss. In this case, migrate data and clear the data directory.

1. Search for the data directories **fs_data_dir**, **fs_wal_dir**, and **fs_meta_dir**.

   find /opt -name master.gflagfile

   cat /opt/Bigdata/FusionInsight_Kudu_*/*_KuduMaster/etc/master.gflagfile | grep fs_
2. On the cluster details page, choose **Components** > **Kudu** and click **Stop Service**.
3. Clear the Kudu data directories on all KuduMaster and KuduTserver nodes. The following command uses two data disks as an example.

   rm -Rvf /srv/Bigdata/data1/kudu, rm -Rvf /srv/Bigdata/data2/kudu
4. On the cluster details page, choose **Components** > **Kudu** and choose **More** > **Restart Service**.
5. Check the Kudu service status and logs.

14.11.27 Does OpenTSDB Support Python APIs?

OpenTSDB supports Python APIs. OpenTSDB provides HTTP-based RESTful APIs that are language-independent. Any language that supports HTTP requests can interconnect to OpenTSDB.

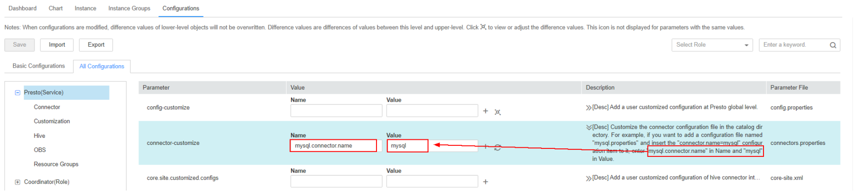
14.11.28 How Do I Configure Other Data Sources on Presto?

In this section, MySQL is used as an example.

- For MRS 1.*x* and 3.*x* clusters, do the following:
  a. Log in to the MRS management console.
  b. Click the name of the cluster to go to its details page.
  c. Click the **Components** tab and then **Presto** in the component list. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab.
  d. On the Presto configuration page that is displayed, find **connector-customize**.
  e. Set **Name** and **Value** as follows:

     Name: **mysql.connector.name**

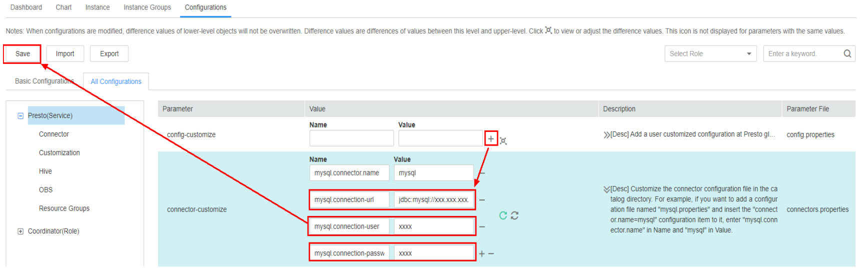
     Value: **mysql**



Notes: When configurations are modified, difference values of lower-level objects will not be overwritten. Difference values are differences of values between this level and upper-level. Click ⌘ to view or adjust the difference values. This icon is not displayed for parameters with the same values.

Parameter	Value	Description	Parameter File
config-customize	Name: Value:	[Desc] Add a user customized configuration at Presto global level.	config.properties
connector-customize	Name: mysql.connector.name Value: mysql	[Desc] Customize the connector configuration file in the catalog directory. For example, if you want to add a configuration file named "mysql.properties" and insert the "connector.name=mysql" configuration item to it, enter "mysql.connector.name" in Name and "mysql" in Value.	connectors.properties
core.site.customized.configs	Name: Value:	[Desc] Add a user customized configuration of hive connector int...	core-site.xml

  f. Click the plus sign (+) to add three more fields and set **Name** and **Value** according to the table below. Then click **Save**.



Notes: When configurations are modified, difference values of lower-level objects will not be overwritten. Difference values are differences of values between this level and upper-level. Click ⌘ to view or adjust the difference values. This icon is not displayed for parameters with the same values.

Parameter	Value	Description	Parameter File
config-customize	Name: Value:	[Desc] Add a user customized configuration at Presto gl...	config.properties
connector-customize	mysql.connector.name = mysql mysql.connection-url = jdbc:mysql://xxx.xxx.xxx. mysql.connection-user = xxxx mysql.connection-passw = xxxx	[Desc] Customize the connector configuration file in the catalog directory. For example, if you want to add a configuration file named "mysql.properties" and insert the "connector.name=mysql" configuration item to it, enter "mysql.connector.name" in Name and "mysql" in Value.	connectors.properties

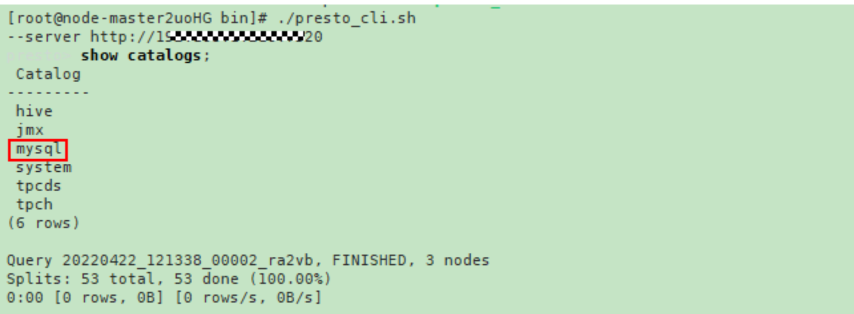
Name	Value	Description
mysql.connection-url	jdbc:mysql://xxx.xxx.xxx.xxx:3306	Database connection pool
mysql.connection-user	xxxx	Database username
mysql.connection-password	xxxx	Database password

  g. Restart the Presto service.

h. Run the following command to connect to the Presto Server of the cluster:

presto_cli.sh --*krb5-config-path* {krb5.conf path} --*krb5-principal* {User principal} --*krb5-keytab-path* {user.keytab path} --*user* {presto username}

i. Log in to Presto and run the **show catalogs** command to check whether the data source list mysql of Presto can be queried.



```
[root@node-master2uoHG bin]# ./presto_cli.sh
--server http://1[redacted]20
presto> show catalogs;
 Catalog
---------
 hive
 jmx
 mysql
 system
 tpcds
 tpch
(6 rows)

Query 20220422_121338_00002_ra2vb, FINISHED, 3 nodes
Splits: 53 total, 53 done (100.00%)
0:00 [0 rows, 0B] [0 rows/s, 0B/s]
```

Run the **show schemas from mysql** command to query the MySQL database.

- For MRS 2.*x* clusters, do the following:

  a. Create the **mysql.properties** configuration file containing the following content:

  connector.name=mysql

  connection-url=jdbc:mysql://mysqlIp:3306

  connection-user=Username

  connection-password=Password

  NOTE

  - **mysqlIp** indicates the IP address of the MySQL instance, which must be able to communicate with the MRS network.
  - The username and password are those used to log in to the MySQL database.

  b. Upload the configuration file to the **/opt/Bigdata/MRS_Current/1_14_Coordinator/etc/catalog/** directory on the master node (where the Coordinator instance resides) and the **/opt/Bigdata/MRS_Current/1_14_Worker/etc/catalog/** directory on the core node (depending on the actual directory in the cluster), and change the file owner group to **omm:wheel**.

  c. Restart the Presto service.

14.11.29 How Do I Connect to Spark Shell from MRS?

1. Log in to the Master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env

3. If Kerberos authentication is enabled for the cluster, authenticate the user. If Kerberos authentication is disabled, skip this step.

   Command: **kinit** *MRS cluster user*

   Example:

- If the user is a machine-machine user, run **kinit -kt user.keytab sparkuser**.
- If the user is a human-machine user, run **kinit sparkuser**.

4. Run the following command to connect to Spark shell:

   spark-shell

14.11.30 How Do I Connect to Spark Beeline from MRS?

1. Log in to the master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env

3. If Kerberos authentication is enabled for the cluster, authenticate the user. If Kerberos authentication is disabled, skip this step.

   Command: **kinit** *MRS cluster user*

   Example:

   - If the user is a machine-machine user, run **kinit -kt user.keytab sparkuser**.
   - If the user is a human-machine user, run **kinit sparkuser**.

4. Run the following command to connect to Spark Beeline:

   spark-beeline

5. Run commands on Spark Beeline. For example, create the table **test** in the **obs://mrs-word001/table/** directory.

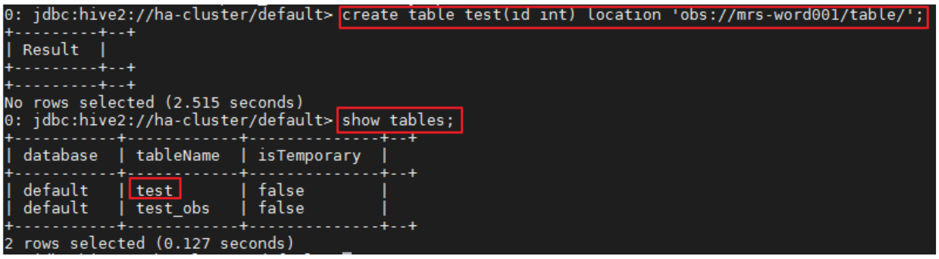
   create table test(id int) location 'obs://mrs-word001/table/';

6. Query all tables.

   show tables;

   If the table **test** is displayed in the command output, OBS is successfully accessed.

   Figure 14-5 Returned table name



```
0: jdbc:hive2://ha-cluster/default> create table test(id int) location 'obs://mrs-word001/table/';
+---------+--+
| Result  |
+---------+--+
+---------+--+
No rows selected (2.515 seconds)
0: jdbc:hive2://ha-cluster/default> show tables;
+-----------+------------+--------------+--+
| database  | tableName  | isTemporary  |
+-----------+------------+--------------+--+
| default   | test       | false        |
| default   | test_obs   | false        |
+-----------+------------+--------------+--+
2 rows selected (0.127 seconds)
```

7. Press **Ctrl+C** to exit the Spark Beeline.

14.11.31 Where Are the Execution Logs of Spark Jobs Stored?

- Logs of unfinished Spark jobs are stored in the **/srv/BigData/hadoop/data1/nm/containerlogs/** directory on the Core node.
- Logs of finished Spark jobs are stored in the **/tmp/logs/***username***/logs** directory of HDFS.

14.11.32 How Do I Specify a Log Path When Submitting a Task in an MRS Storm Cluster?

You can modify the **/opt/Bigdata/MRS_*XXX* /1_*XX* _Supervisor/etc/worker.xml** file on the streaming Core node of MRS, set the value of **filename** to the path, and restart the corresponding instance on Manager.

You are advised not to modify the default log configuration of MRS. Otherwise, the log system may become abnormal.

14.11.33 How Do I Check Whether the ResourceManager Configuration of Yarn Is Correct?

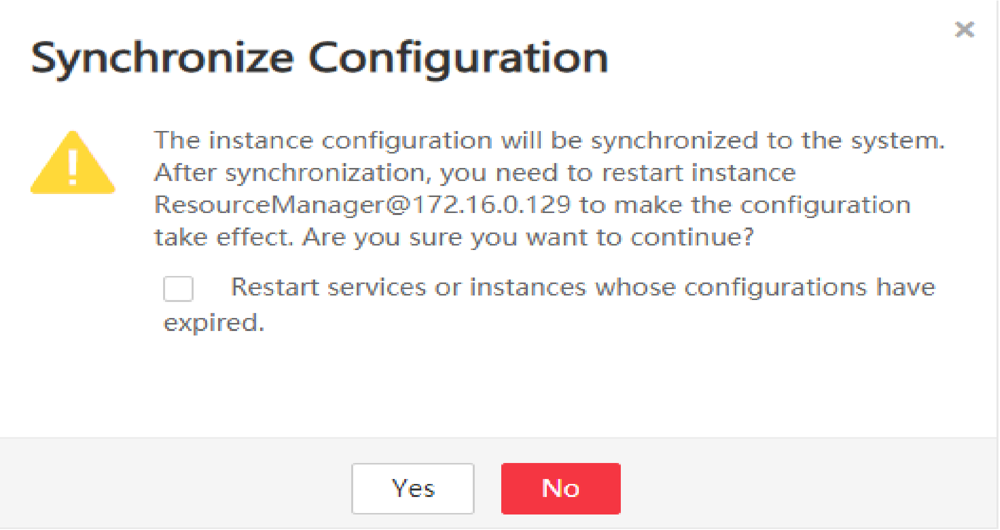
Step 1 Log in to MRS Manager and choose **Services** > **Yarn** > **Instance**.

Step 2 Synchronize the configuration between the two ResourceManager nodes.

Perform the following steps on each ResourceManager node:

1. Click the name of the ResourceManager node, and choose **More** > **Synchronize Configuration**.
2. In the dialog box displayed, deselect **Restart services or instances whose configurations have expired** and click **Yes**.

Figure 14-6 Synchronization configurations



Synchronize Configuration

The instance configuration will be synchronized to the system. After synchronization, you need to restart instance ResourceManager@172.16.0.129 to make the configuration take effect. Are you sure you want to continue?

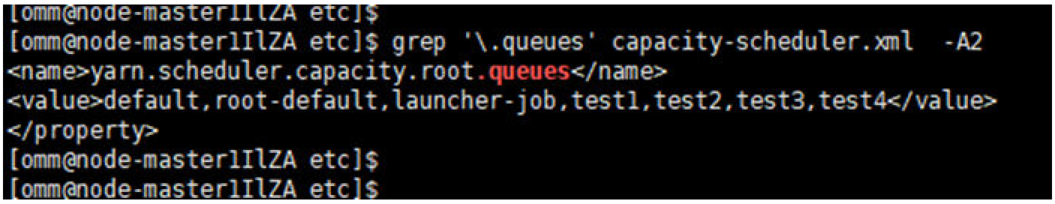
□ Restart services or instances whose configurations have expired.

Step 3 Log in to the Master nodes as user **root**.

Step 4 Run the **cd /opt/Bigdata/MRS_Current/*_*_ResourceManager/etc_UPDATED/** command to go to the **etc_UPDATED** directory.

Step 5 Run the **grep '\.queues' capacity-scheduler.xml -A2** command to display all configured queues and check whether the queues are consistent with those displayed on Manager.

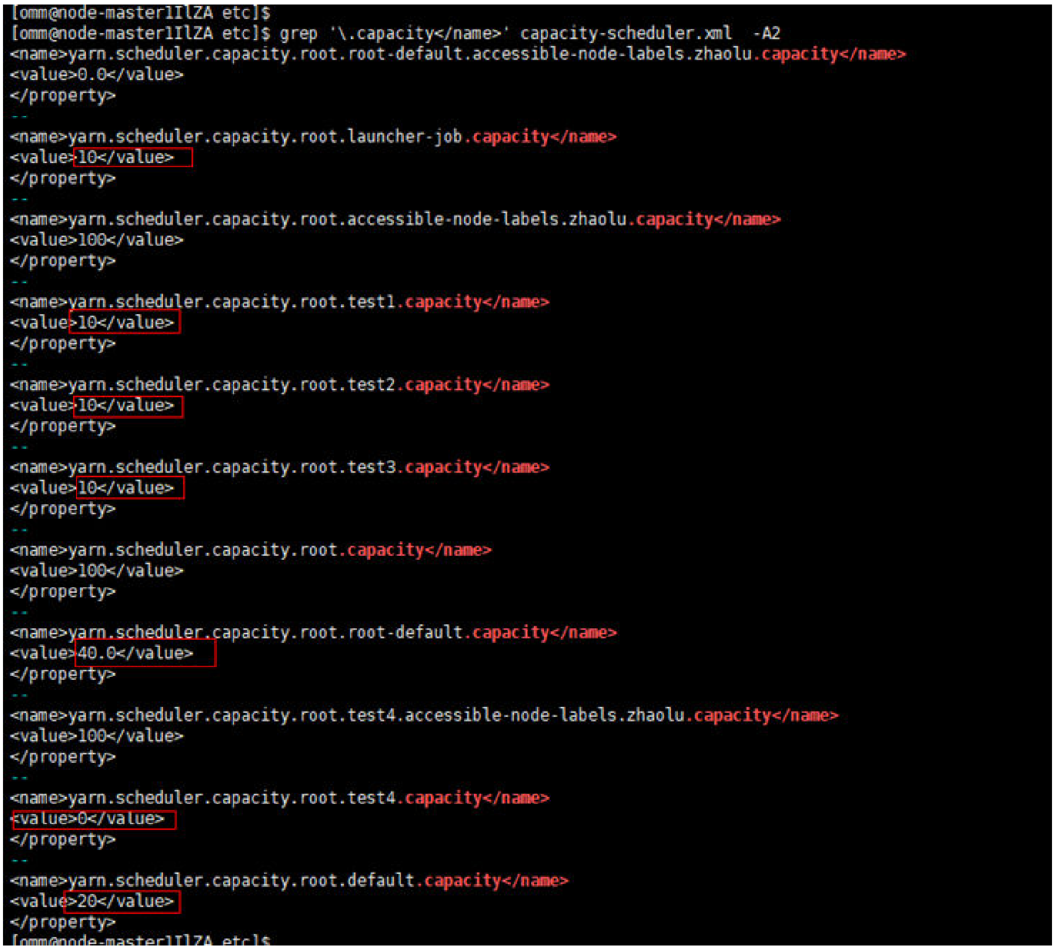
root-default is hidden on the Manager page.



```
[omm@node-master1IlZA etc]$
[omm@node-master1IlZA etc]$ grep '\.queues' capacity-scheduler.xml  -A2
<name>yarn.scheduler.capacity.root.queues</name>
<value>default,root-default,launcher-job,test1,test2,test3,test4</value>
</property>
[omm@node-master1IlZA etc]$
[omm@node-master1IlZA etc]$
```

Step 6 Run the **grep '\.capacity</name>' capacity-scheduler.xml -A2** command to display the value of each queue and check whether the value of each queue is the same as that displayed on Manager. Check whether the sum of the values configured for all queues is **100**.

- If the sum is **100**, the configuration is correct.
- If the sum is not **100**, the configuration is incorrect. Perform the following steps to rectify the fault.



```
[omm@node-master1IlZA etc]$
[omm@node-master1IlZA etc]$ grep '\.capacity</name>' capacity-scheduler.xml  -A2
<name>yarn.scheduler.capacity.root.root-default.accessible-node-labels.zhaolu.capacity</name>
<value>0.0</value>
</property>
--
<name>yarn.scheduler.capacity.root.launcher-job.capacity</name>
<value>10</value>
</property>
--
<name>yarn.scheduler.capacity.root.accessible-node-labels.zhaolu.capacity</name>
<value>100</value>
</property>
--
<name>yarn.scheduler.capacity.root.test1.capacity</name>
<value>10</value>
</property>
--
<name>yarn.scheduler.capacity.root.test2.capacity</name>
<value>10</value>
</property>
--
<name>yarn.scheduler.capacity.root.test3.capacity</name>
<value>10</value>
</property>
--
<name>yarn.scheduler.capacity.root.capacity</name>
<value>100</value>
</property>
--
<name>yarn.scheduler.capacity.root.root-default.capacity</name>
<value>40.0</value>
</property>
--
<name>yarn.scheduler.capacity.root.test4.accessible-node-labels.zhaolu.capacity</name>
<value>100</value>
</property>
--
<name>yarn.scheduler.capacity.root.test4.capacity</name>
<value>0</value>
</property>
--
<name>yarn.scheduler.capacity.root.default.capacity</name>
<value>20</value>
</property>
[omm@node-master1IlZA etc]$
```

Step 7 Log in to MRS Manager, and select **Hosts**.

Step 8 Determine the active Master node. The host name of the active Master node starts with a solid pentagon.

Step 9 Log in to the active Master node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **sh /opt/Bigdata/om-0.0.1/sbin/restart-controller.sh** command to restart the controller when no operation is being performed on Manager.

Restarting the controller will not affect the big data component services.

Step 12 Repeat **Step 1** to **Step 6** to synchronize ResourceManager configurations and check whether the configurations are correct.

If the latest configuration has not been loaded after the configuration synchronization is complete, a message will be displayed on the Manager page indicating that the configuration has expired. However, this will not affect services. The latest configuration will be automatically loaded when the component restarts.

----End

14.11.34 How Do I Modify the allow_drop_detached Parameter of ClickHouse?

Step 1 Log in to the node where the ClickHouse client is located as user **root**.

Step 2 Run the following commands to go to the client installation directory and set the environment variables:

cd /opt/*Client installation directory*

source bigdata_env

Step 3 If Kerberos authentication is enabled for the cluster, run the following command to authenticate the user. If Kerberos authentication is disabled, skip this step.

kinit *MRS cluster user*

NOTE

The user must have the ClickHouse administrator permissions.

Step 4 Run the **clickhouse client --host** *192.168.42.90* **--secure -m** command, in which *192.168.42.90* indicates the IP address of the ClickHouseServer instance node. The command output is as follows:

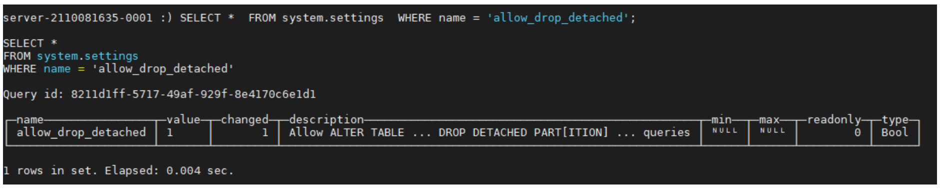
```
[root@server-2110082001-0017 hadoopclient]# clickhouse client --host 192.168.42.90 --secure -m
ClickHouse client version 21.3.4.25.
Connecting to 192.168.42.90:21427.
Connected to ClickHouse server version 21.3.4 revision 54447.
```

Step 5 Run the following command to set the value of the **allow_drop_detached** parameter, for example, **1**:

set allow_drop_detached=1;

Step 6 Run the following command to query the value of the **allow_drop_detached** parameter:

SELECT * FROM system.settings WHERE name = 'allow_drop_detached';



```
server-2110081635-0001 :) SELECT *  FROM system.settings  WHERE name = 'allow_drop_detached';

SELECT *
FROM system.settings
WHERE name = 'allow_drop_detached'

Query id: 8211d1ff-5717-49af-929f-8e4170c6e1d1

┌─name────────────────┬─value─┬─changed─┬─description─────────────────────────────────────────────┬─min──┬─max──┬─readonly─┬─type─┐
│ allow_drop_detached │ 1     │       1 │ Allow ALTER TABLE ... DROP DETACHED PART[ITION] ... queries │ NULL │ NULL │        0 │ Bool │
└─────────────────────┴───────┴─────────┴─────────────────────────────────────────────────────────┴──────┴──────┴──────────┴──────┘

1 rows in set. Elapsed: 0.004 sec.
```

Step 7 Run the **q;** command to exit the ClickHouse client.

----End

14.11.35 How Do I Do If an Alarm Indicating Insufficient Memory Is Reported During Spark Task Execution?

Symptom

When a Spark task is executed, an alarm indicating insufficient memory is reported. The alarm ID is 18022. As a result, no available memory can be used.

Procedure

Set the executor parameters in the SQL script to limit the number of cores and memory of an executor.

For example, the configuration is as follows:

```
set hive.execution.engine=spark;
set spark.executor.cores=2;
set spark.executor.memory=4G;
set spark.executor.instances=10;
```

Change the values of the parameters as required.

14.11.36 How Do I Do If ClickHouse Consumes Excessive CPU Resources?

Symptom

A user performs a large number of update operations using ClickHouse. This operation on a ClickHouse consumes a large number of resources. In addition, the operation will be executed again if it fails. As a result, retries of those failed operations occupy too many CPU resources.

Procedure

Delete existing data from ZooKeeper and release delete the update statement.

14.11.37 How Do I Enable the Map Type on ClickHouse?

Step 1 Log in to the active Master node as user **root**.

Step 2 Run the following command to modify the **/opt/Bigdata/components/current/ClickHouse/configurations.xml** configuration file to enable user parameter customization:

vim /opt/Bigdata/components/current/ClickHouse/configurations.xml

Change **hidden** to **advanced**, as shown in the following information in bold. Then save the configuration and exit.

```
<property type="hidden" scope="all" classification="Customization"
classdesc="RESID_CLICKHOUSE_CONF_0056">
        <name>_clickhouse.custom_content.key</name>
        <value>_user-xml-content</value>
</property>
<property type="advanced" scope="all" classification="Customization"
classdesc="RESID_CLICKHOUSE_CONF_0056">
       <name>_user-xml-content</name>
       <value vType="text" checker="clickhouse.xmlformat">&lt;yandex&gt;&lt;/yandex&gt;</value>
       <description>RESID_CLICKHOUSE_CONF_0025</description>
</property>
```

Step 3 Run the following commands to switch to user **omm** and restart the controller service:

su - omm

sh /opt/Bigdata/om-server/om/sbin/restart-controller.sh

Step 4 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab. Click **ClickHouseServer(Role)** > **Customization**, and add the following content to the **_user-xml-content** configuration item in the right pane:

```
<yandex>
  <profiles>
    <default>
   <allow_experimental_map_type>1</allow_experimental_map_type>
    </default>
  </profiles>
</yandex>
```

Step 5 Click **Save**.

Step 6 Choose **Cluster** > **Services** > **ClickHouse**. In the upper right corner, choose **More** > **Restart Service** to restart the ClickHouse service.

----End

14.11.38 A Large Number of OBS APIs Are Called When Spark SQL Accesses Hive Partitioned Tables

Symptom

When Spark SQL is used to access Hive partitioned tables stored in OBS, the acces speed is slow and a large number of OBS query APIs are called.

Example SQL:

```
select a,b,c from test where b=xxx
```

Fault Locating

According to the configuration, the task should scan only the partition whose b is *xxx*. However, the task logs show that the task scans all partitions and then calculates the data whose b is *xxx*. As a result, the task calculation is slow. In addition, a large number of OBS requests are sent because all files need to be scanned.

By default, the execution plan optimization based on partition statistics is enabled on MRS, which is equivalent to automatic execution of Analyze Table. (The default configuration method is to set **spark.sql.statistics.fallBackToHdfs** to **true**. You can set this parameter to **false**.) After this function is enabled, table partition statistics are scanned during SQL execution and used as cost estimation in the execution plan. For example, small tables identified during cost evaluation are broadcast to each node in the memory for join operations, significantly reducing shuffle time. This function greatly optimizes performance in join scenarios, but increases the number of OBS calls.

Procedure

Set the following parameter in Spark SQL and then run the SQL statement:

```
set spark.sql.statistics.fallBackToHdfs=false;
```

Alternatively, run the **--conf** command to set this parameter to **false** before startup.

```
--conf spark.sql.statistics.fallBackToHdfs=false
```

14.12 API

14.12.1 How Do I Configure the node_id Parameter When Using the API for Adjusting Cluster Nodes?

When you use the API for adjusting cluster nodes, the value of **node_id** is fixed to **node_orderadd**.

14.13 Cluster Management

14.13.1 How Do I View All Clusters?

You can view all MRS clusters on the **Clusters** page. You can view clusters in different status.

- **Active Clusters**: all clusters except clusters in **Failed** and **Terminated** states.
- **Cluster History**: clusters in the **Terminated** state. Only the clusters terminated within the last six months are displayed. If you want to view clusters terminated more than six months ago, contact technical support engineers.
- **Failed Tasks**: tasks in **Failed** state. The failed tasks include the following:
  - Tasks failed to create clusters
  - Tasks failed to terminate clusters
  - Tasks failed to scale out clusters
  - Tasks failed to scale in clusters

14.13.2 How Do I View Log Information?

You can view operation logs of clusters and jobs on the **Operation Logs** page. The MRS operation logs record the following operations:

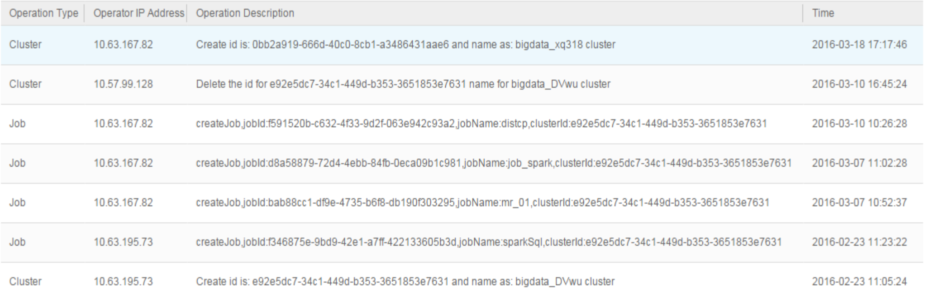
- Cluster operations

- Create, terminate, and scale out or in clusters
- Create directories and delete directories or files

- Job operations: Create, stop, and delete jobs
- Data operations: IAM user tasks, add users, and add user groups

Figure 14-7 shows the operation logs.

Figure 14-7 Log information



Operation Type	Operator IP Address	Operation Description	Time
Cluster	10.63.167.82	Create id is: 0bb2a919-666d-40c0-8cb1-a3486431aae6 and name as: bigdata_xq318 cluster	2016-03-18 17:17:46

Cluster	10.63.195.73	Create id is: e92e5dc7-34c1-449d-b353-3651853e7631 and name as: bigdata_DVwu cluster	2016-02-23 11:05:24

14.13.3 How Do I View Cluster Configuration Information?

- After a cluster is created, click the cluster name on the MRS console. On the page displayed, you can view basic configuration information about the cluster. The instance specifications and node capacity determine the data analysis and processing capability. Higher instance specifications and larger capacity enable faster data processing at a higher cost.
- On the basic information page, click **Access Manager** to access the MRS cluster management page. On MRS Manager, you can view and handle alarms, and modify cluster configuration.

14.13.4 How Do I Install Kafka and Flume in an MRS Cluster?

You cannot install the Kafka and Flume components for a created cluster of MRS 3.1.0 or earlier. Kafka and Flume are components for a streaming cluster. To install Kafka and Flume, create a streaming or hybrid cluster, and install Kafka and Flume.

14.13.5 How Do I Stop an MRS Cluster?

To stop an MRS cluster, stop each node in the cluster on the ECS. Click the name of each node on the **Nodes** tab page to go to the **Elastic Cloud Server** page and click **Stop**.

14.13.6 Can I Expand Data Disk Capacity for MRS?

You can expand data disk capacity for MRS during off-peak hours.

Expand the EVS disk capacity, and then log in to the ECS and expand the partitions and file system. MRS nodes are installed using public images and support the capacity expansion of in-use EVS disks.

14.13.7 Can I Add Components to an Existing Cluster?

You cannot add or remove any component to and from a created cluster of MRS 3.1.0. However, you can create an MRS cluster that contains the required components.

14.13.8 Can I Delete Components Installed in an MRS Cluster?

You cannot delete any component from a created MRS cluster of MRS 3.1.0. If a component is not required, log in to MRS Manager and stop the component on the **Services** page.

14.13.9 Can I Change MRS Cluster Nodes on the MRS Console?

You cannot change MRS cluster nodes on the MRS console. You are also advised not to change MRS cluster nodes on the ECS console. Manually stopping or deleting an ECS, modifying or reinstalling the ECS OS, or modifying ECS specifications for a cluster node on the ECS console will affect the cluster stability.

If an ECS is deleted, the ECS OS is modified or reinstalled, or the ECS specifications are modified on the ECS console, MRS will automatically identify and delete the node. You can log in to the MRS console and restore the deleted node through scale-out. Do not perform operations on the nodes that are being scaled out.

14.13.10 How Do I Shield Cluster Alarm/Event Notifications?

1. Log in to the MRS console.
2. Click the name of the cluster.
3. On the page displayed, choose **Alarms** > **Notification Rules**.
4. Locate the row that contains the rule you want to modify, click **Edit** in the **Operation** column, and deselect the alarm or event severity levels.
5. Click **OK**.

14.13.11 Why Is the Resource Pool Memory Displayed in the MRS Cluster Smaller Than the Actual Cluster Memory?

In an MRS cluster, MRS allocates 50% of the cluster memory to Yarn by default. You manage Yarn nodes logically by resource pool. Therefore, the total memory of the resource pool displayed in the cluster is only 50% of the total memory of the cluster.

14.13.12 How Do I Configure the knox Memory?

Step 1 Log in to a Master node of the cluster as user **root**.

Step 2 Run the following command on the Master node to open the **gateway.sh** file:

```
su omm
```

```
vim /opt/knox/bin/gateway.sh
```

Step 3 Change **APP_MEM_OPTS=""** to **APP_MEM_OPTS="-Xms256m -Xmx768m"**, save the file, and exit.

Step 4 Run the following command on the Master node to restart the knox process:

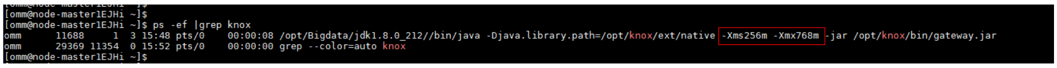
sh /opt/knox/bin/gateway.sh stop

sh /opt/knox/bin/gateway.sh start

Step 5 Repeat the preceding steps on each Master node.

Step 6 Run the **ps -ef |grep knox** command to check the configured memory.

Figure 14-8 knox memory



```
[omm@node-master1EJHi ~]$
[omm@node-master1EJHi ~]$ ps -ef |grep knox
omm      11688     1  3 15:48 pts/0    00:00:08 /opt/Bigdata/jdk1.8.0_212//bin/java -Djava.library.path=/opt/knox/ext/native -Xms256m -Xmx768m -jar /opt/knox/bin/gateway.jar
omm      29369 11354  0 15:52 pts/0    00:00:00 grep --color=auto knox
[omm@node-master1EJHi ~]$
```

----End

14.13.13 What Is the Python Version Installed for an MRS Cluster?

Log in to a Master node as user **root** and run the **Python3** command to query the Python version.

14.13.14 How Do I View the Configuration File Directory of Each Component?

The configuration file paths of commonly used components are as follows:

Component	Configuration File Directory
ClickHouse	*Client installation directory*/**ClickHouse/clickhouse/config**
Flink	*Client installation directory*/**Flink/flink/conf**
Flume	*Client installation directory*/**fusioninsight-flume-***xxx***/conf**
HBase	*Client installation directory*/**HBase/hbase/conf**
HDFS	*Client installation directory*/**HDFS/hadoop/logs/hadoop.log**
Hive	*Client installation directory*/**Hive/config**
Hudi	*Client installation directory*/**Hudi/hudi/conf**
Kafka	*Client installation directory*/**Kafka/kafka/config**

Component	Configuration File Directory
Loader	- *Client installation directory*/**Loader/loader-tools-xxx/loader-tool/conf** - *Client installation directory*/**Loader/loader-tools-xxx/schedule-tool/conf** - *Client installation directory*/**Loader/loader-tools-xxx/shell-client/conf** - *Client installation directory*/**Loader/loader-tools-xxx/sqoop-shell/conf**
Oozie	*Client installation directory*/**Oozie/oozie-client-***xxx***/conf**
Spark2x	*Client installation directory/Spark2x/spark/conf*
Yarn	*Client installation directory/Yarn/config*
ZooKeeper	*Client installation directory/Zookeeper/zookeeper/conf*

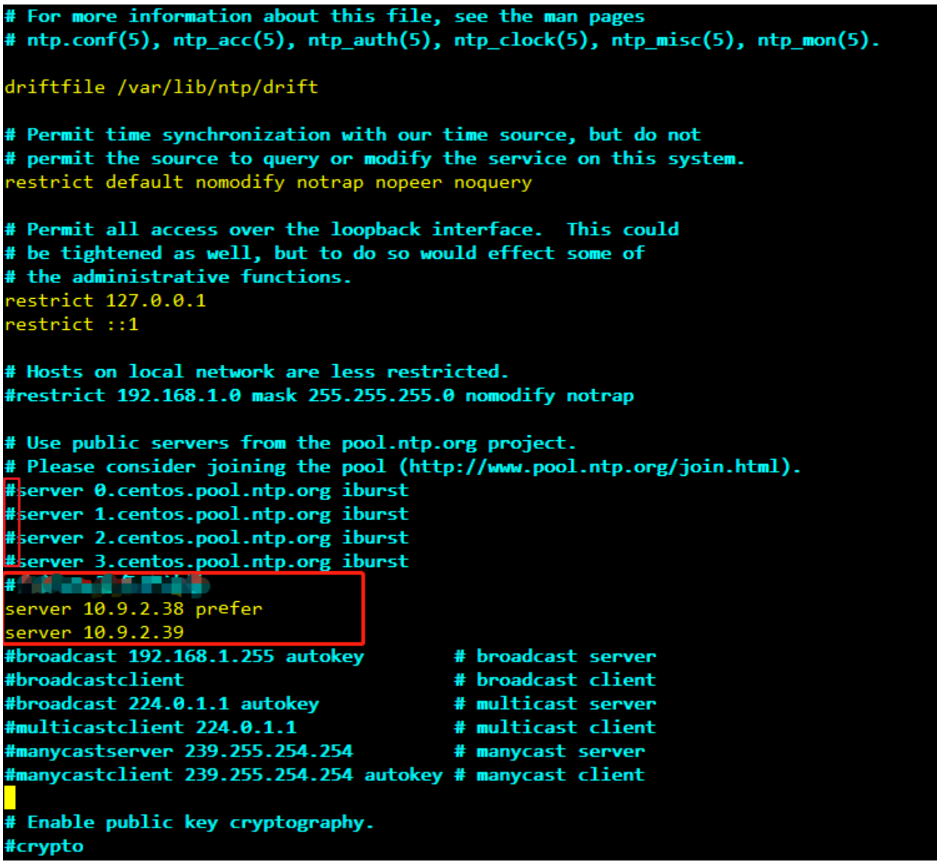
14.13.15 How Do I Do If the Time on MRS Nodes Is Incorrect?

- If the time on a node inside the cluster is incorrect, log in to the node and rectify the fault from 2.
- If the time on a node inside the cluster is different from that on a node outside the cluster, log in to the node and rectify the fault from 1.

1. Run the **vi /etc/ntp.conf** command to edit the NTP client configuration file, add the IP addresses of the master node in the MRS cluster, and comment out the IP address of other servers.

```
server master1_ip prefer
server master2_ip
```

Figure 14-9 Adding the master node IP addresses



```
# For more information about this file, see the man pages
# ntp.conf(5), ntp_acc(5), ntp_auth(5), ntp_clock(5), ntp_misc(5), ntp_mon(5).

driftfile /var/lib/ntp/drift

# Permit time synchronization with our time source, but do not
# permit the source to query or modify the service on this system.
restrict default nomodify notrap nopeer noquery

# Permit all access over the loopback interface.  This could
# be tightened as well, but to do so would effect some of
# the administrative functions.
restrict 127.0.0.1

#manycastclient 239.255.254.254 autokey # manycast client

# Enable public key cryptography.
#crypto
```

2. Run the **service ntpd stop** command to stop the NTP service.
3. Run the **/usr/sbin/ntpdate** *IP address of the active master node* command to manually synchronize time.
4. Run the **service ntpd start** or **systemctl restart ntpd** command to start the NTP service.
5. Run the **ntpstat** command to check the time synchronization result:

14.13.16 How Do I Query the Startup Time of an MRS Node?

Log in to the target node and run the following command to query the startup time:

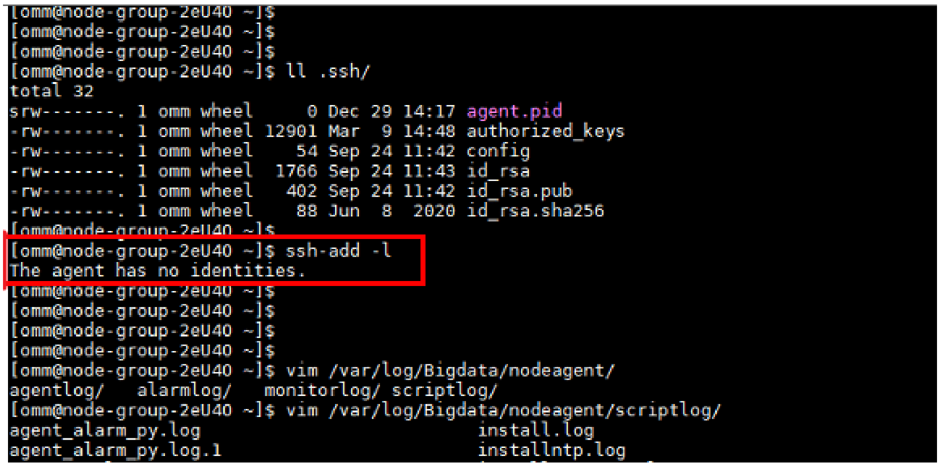
date -d "$(awk -F. '{print $1}' /proc/uptime) second ago" +"%Y-%m-%d %H:%M:%S"

```
[root@server-2110082001-0018 ~]#date -d "$(awk -F. '{print $1}' /proc/uptime) second ago" +"%Y-%m-%d %H:%M:%S"
2021-12-13 15:56:23
```

14.13.17 How Do I Do If Trust Relationships Between Nodes Are Abnormal?

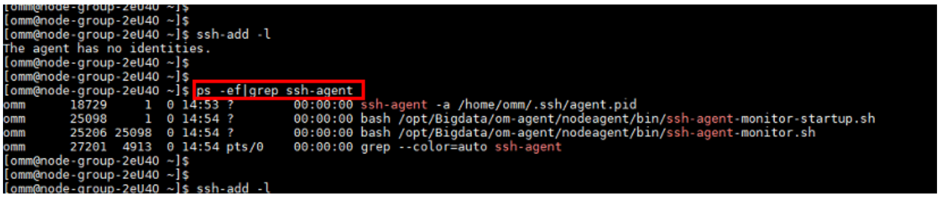
If "ALM-12066 Inter-Node Mutual Trust Fails" is reported on Manager or there is no SSH trust relationship between nodes, rectify the fault by performing the following operations:

1. Run the **ssh-add -l** command on both nodes of the trusted cluster to check whether there are identities.



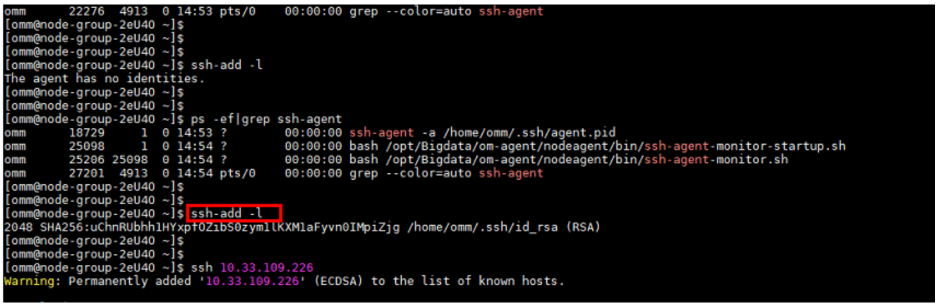
```
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ll .ssh/
total 32
srw-------. 1 omm wheel     0 Dec 29 14:17 agent.pid
-rw-------. 1 omm wheel 12901 Mar  9 14:48 authorized_keys
-rw-------. 1 omm wheel    54 Sep 24 11:42 config
-rw-------. 1 omm wheel  1766 Sep 24 11:43 id_rsa
-rw-------. 1 omm wheel   402 Sep 24 11:42 id_rsa.pub
-rw-------. 1 omm wheel    88 Jun  8  2020 id_rsa.sha256
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ vim /var/log/Bigdata/nodeagent/
agentlog/   alarmlog/   monitorlog/ scriptlog/
[omm@node-group-2eU40 ~]$ vim /var/log/Bigdata/nodeagent/scriptlog/
agent_alarm_py.log                           install.log
agent_alarm_py.log.1                         installntp.log
```

2. If no identities are displayed, run the **ps -ef|grep ssh-agent** command to find the ssh-agent process, kill the process, and wait for the process to automatically restart.



```
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ps -ef|grep ssh-agent
omm      18729     1  0 14:53 ?        00:00:00 ssh-agent -a /home/omm/.ssh/agent.pid
omm      25098     1  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor-startup.sh
omm      25206 25098  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor.sh
omm      27201  4913  0 14:54 pts/0    00:00:00 grep --color=auto ssh-agent
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
```

3. Run the **ssh-add -l** command to check whether the identities have been added. If yes, manually run the **ssh** command to check whether the trust relationship is normal.



```
omm      22276  4913  0 14:53 pts/0    00:00:00 grep --color=auto ssh-agent
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ps -ef|grep ssh-agent
omm      18729     1  0 14:53 ?        00:00:00 ssh-agent -a /home/omm/.ssh/agent.pid
omm      25098     1  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor-startup.sh
omm      25206 25098  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor.sh
omm      27201  4913  0 14:54 pts/0    00:00:00 grep --color=auto ssh-agent
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
2048 SHA256:uChnRUbhh1HYxpf0ZibS0zym1lKXMlaFyvn0IMpiZjg /home/omm/.ssh/id_rsa (RSA)
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh 10.33.109.226
Warning: Permanently added '10.33.109.226' (ECDSA) to the list of known hosts.
```

4. If identities exist, check whether the **authorized_keys** file in the **/home/omm/.ssh** directory contains the information in the **id_rsa.pub** file in the **/home/omm/.ssh** of the peer node. If no, manually add the information about the peer node.
5. Check whether the permissions on the files in **/home/omm/.ssh** directory are correct.
6. Check the **/var/log/Bigdata/nodeagent/scriptlog/ssh-agent-monitor.log** file.
7. If the **home** directory of user **omm** is deleted, contact MRS support personnel.

14.13.18 How Do I Adjust the Memory Size of the manager-executor Process?

Symptom

The **manager-executor** process runs either on the Master1 or Master2 node in the MRS cluster in active/standby mode. This process is used to encapsulate the MRS management and control plane's operations on the MRS cluster, such as job submission, heartbeat reporting, certain alarm reporting, as well as cluster creation, scale-out, and scale-in. When you submit jobs on the MRS management and control plane, the Executor memory may become insufficient as the tasks increase or the number of concurrent tasks increases. As a result, the CPU usage is high and the Executor process experiences out-of-memory (OOM) errors.

Procedure

1. Log in to either the Master1 or Master2 node as user **root** and run the following command to switch to user **omm**:

   su - omm

2. Run the following command to modify the **catalina.sh** script. Specifically, search for **JAVA_OPTS** in the script, find the configuration items similar to **JAVA_OPTS="-Xms1024m -Xmx4096m**, and change the values of the items to desired ones, and save the modification.

   vim /opt/executor/bin/catalina.sh

   
   ```
   JAVA_OPTS="-Xms1024m -Xmx4096m"
   JAVA_OPTS="$JAVA_OPTS $JSSE_OPTS"
   LOG4J_PROPERTIES_PATH="${CATALINA_HOME}/lib/log4j.properties"
   CATALINA_OPTS="-XX:+PrintGC -XX:+PrintGCDetails -XX:+PrintGCTimeStamps -XX:+PrintGCApplicationStoppedTime \
   -XX:+PrintHeapAtGC -Xloggc:/var/log/executor/logs/gc.log -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 \
   -XX:GCLogFileSize=20M -XX:OnOutOfMemoryError=\"kill -9 %p\" -XX:+HeapDumpOnOutOfMemoryError \
   -XX:HeapDumpPath=/var/log/executor/logs/executor-dump.hprof"
   ```

3. The **manager-executor** process only runs on either the Master1 or Master2 node in active/standby mode. Check whether it exists on the node before restarting it.

   a. Log in to the Master1 and Master2 nodes and run the following command to check whether the process exists. If any command output is displayed, the process exists.

      ps -ef | grep "/opt/executor" | grep -v grep

      
      ```
      [omm@[redacted]~]$ ps -ef | grep "/opt/executor" | grep -v grep
      omm      16654     1  0 Feb25 ?        00:07:44 /opt/Bigdata/common/runtime0/jdk1.8.0_272//bin/java -Djava.util.logging.config.file=/opt/executor/conf/logging.properties -Djava.util.logging.manager=org.apache.juli.ClassLoaderLogManager -Xms1
      024m -Xmx4096m -Djdk.tls.ephemeralDHKeySize=2048 -Dorg.apache.catalina.security.SecurityListener.UMASK=0027 -Djava.security.krb5.conf=/opt/Bigdata/client/KrbClient/kerberos/var/krb5kdc/krb5.conf -Dorg.apache.catalina.connector.RECYCLE_FACADE
      S=true -XX:+PrintGC -XX:+PrintGCDetails -XX:+PrintGCTimeStamps -XX:+PrintGCApplicationStoppedTime -XX:+PrintHeapAtGC -Xloggc:/var/log/executor/logs/gc.log -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=20M -XX:OnOutOfM
      emoryError=kill -9 %p -XX:+HeapDumpOnOutOfMemoryError -XX:HeapDumpPath=/var/log/executor/logs/executor-dump.hprof -Dignore.endorsed.dirs= -classpath :/opt/Bigdata/client/Spark2x/spark/conf/:/opt/executor/bin/bootstrap.jar:/opt/executor/bin/t
      omcat-juli.jar -Dcatalina.base=/opt/executor -Dcatalina.home=/opt/executor -Djava.io.tmpdir=/opt/executor/temp -Dlog4j.configuration=file:/opt/executor/lib/log4j.properties org.apache.catalina.startup.Bootstrap start
      [omm@[redacted] ~]$
      ```

   b. Run the following command to restart the process:

      sh /opt/executor/bin/shutdown.shsh /opt/executor/bin/startup.sh

14.14 Kerberos Usage

14.14.1 How Do I Change the Kerberos Authentication Status of a Created MRS Cluster?

You cannot change the Kerberos service after an MRS cluster is created.

14.14.2 What Are the Ports of the Kerberos Authentication Service?

The Kerberos authentication service uses ports 21730 (TCP), 21731 (TCP/UDP), and 21732 (TCP/UDP).

14.14.3 How Do I Deploy the Kerberos Service in a Running Cluster?

The MRS cluster does not support customized Kerberos installation and deployment, and the Kerberos authentication cannot be set up between components. To enable Kerberos authentication, you need to create a cluster with Kerberos enabled and migrate data.

14.14.4 How Do I Access Hive in a Cluster with Kerberos Authentication Enabled?

1. Log in to the master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env
3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user:

   kinit *MRS cluster user*

   Example: **kinit hiveuser**

   The current user must have the permission to create Hive tables..
4. Run the client command of the Hive component.

   beeline
5. Run the Hive command in Beeline, for example:

   create table test_obs(a int, b string) row format delimited fields terminated by "," stored as textfile location "obs://test_obs";
6. Press **Ctrl+C** to exit the Hive Beeline.

14.14.5 How Do I Access Presto in a Cluster with Kerberos Authentication Enabled?

1. Log in to the Master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env
3. Access Presto in a cluster with Kerberos authentication enabled.
   a. Log in to MRS Manager and create a role with the **Hive Admin Privilege** permission, for example, **prestorerole**.
   b. Create a user, for example, **presto001**, who belongs to the **Presto** and **Hive** groups, and bind the user to the role created in **3.a**.
   c. Authenticate user **presto001**.

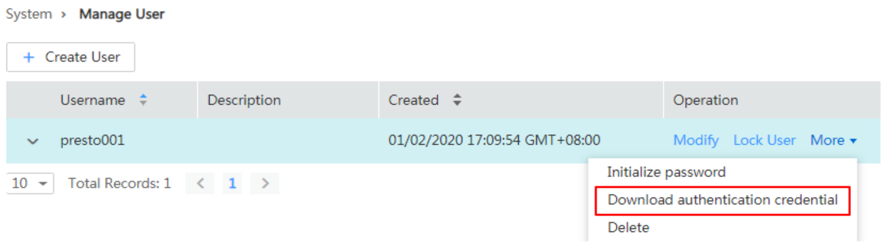
      kinit presto001

d. Download the user authentication credential.

- Operations on MRS Manager:

  Log in to MRS Manager, choose **System** > **Manage User**. Locate the user, and choose **More** > **Download authentication credential**.

  Figure 14-10 Downloading the Presto user authentication credential



Username	Description	Created	Operation
presto001		01/02/2020 17:09:54 GMT+08:00	Modify Lock User More

- Operations on FusionInsight Manager:

  Log in to FusionInsight Manager, choose **System** > **Permission** > **User**. On the displayed page, locate the row that contains the user, choose **More** > **Download Authentication Credential**.

e. Decompress the downloaded user credential file, and save the obtained **krb5.conf** and **user.keytab** files to the client directory, for example, /opt/**client/Presto/**.

f. Run the following command to obtain the user principal:

   klist -kt /opt/client/Presto/user.keytab

g. Run the following command to connect to the Presto Server of the cluster:

   presto_cli.sh --krb5-config-path *{krb5.conf file path}* **--krb5-principal** *{User's principal}* **--krb5-keytab-path** *{user.keytab file path}* **--user** *{presto username}*

- **krb5.conf** *file path*: file path set in 3.e, for example, **/opt/client/Presto/krb5.conf**.
- **user.keytab** *file path*: file path set in 3.e, for example, **/opt/client/Presto/user.keytab**.
- *User's principal*: principal obtained in 3.f.
- *presto username*: user created in 3.b, for example, **presto001**.

   Example: **presto_cli.sh --krb5-config-path /opt/client/Presto/krb5.conf --krb5-principal prest001@xxx_xxx_xxx_xxx.COM --krb5-keytab-path /opt/client/Presto/user.keytab --user presto001**

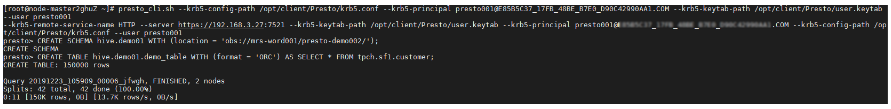
h. On the Presto client, run the following statement to create a schema:

   CREATE SCHEMA hive.demo01 WITH (location = 'obs://presto-demo002/');

i. Create a table in the schema. The table data is stored in the OBS bucket, as shown in the following example:

   CREATE TABLE hive.demo01.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;

Figure 14-11 Return result



```
[root@node-master2ghuZ ~]# presto_cli.sh --krb5-config-path /opt/client/Presto/krb5.conf --krb5-principal presto001@E85B5C37_17FB_48BE_B7E0_D90C42990AA1.COM --krb5-keytab-path /opt/client/Presto/user.keytab
--user presto001
--krb5-remote-service-name HTTP --server https://192.168.3.27:7521 --krb5-keytab-path /opt/client/Presto/user.keytab --krb5-principal presto001@[redacted].COM --krb5-config-path /opt/client/Presto/krb5.conf --user presto001
presto> CREATE SCHEMA hive.demo01 WITH (location = 'obs://mrs-word001/presto-demo002/');
CREATE SCHEMA
presto> CREATE TABLE hive.demo01.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;
CREATE TABLE: 150000 rows

Query 20191223_105909_00006_jfwgh, FINISHED, 2 nodes
Splits: 42 total, 42 done (100.00%)
0:11 [150K rows, 0B] [13.7K rows/s, 0B/s]
```

j. Run **exit** to exit the client.

14.14.6 How Do I Access Spark in a Cluster with Kerberos Authentication Enabled?

1. Log in to the master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source /opt/client/bigdata_env
3. If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user.

   kinit *MRS cluster user*

   Example:

   If the development user is a machine-machine user, run **kinit -kt user.keytab sparkuser**.

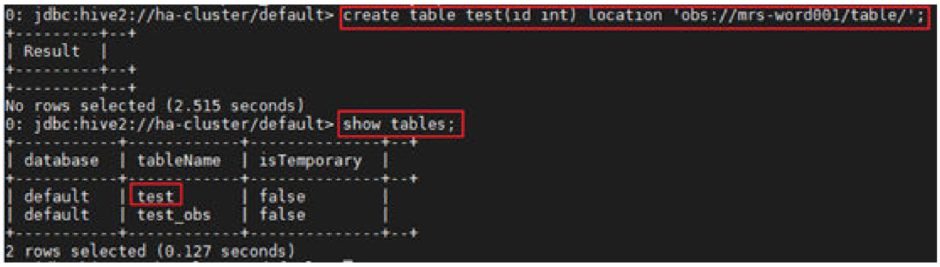
   If the development user is a human-machine user, run **kinit sparkuser**.
4. Run the following command to connect to Spark Beeline:

   spark-beeline
5. Run commands on Spark Beeline. For example, create the table **test** in the **obs://mrs-word001/table/** directory.

   create table test(id int) location 'obs://mrs-word001/table/';
6. Run the following command to query all tables. If table **test** is displayed in the command output, OBS access is successful.

   show tables;

   Figure 14-12 Returned table name

```
0: jdbc:hive2://ha-cluster/default> create table test(id int) location 'obs://mrs-word001/table/';
+---------+--+
| Result  |
+---------+--+
+---------+--+
No rows selected (2.515 seconds)
0: jdbc:hive2://ha-cluster/default> show tables;
+-----------+------------+--------------+--+
| database  | tableName  | isTemporary  |
+-----------+------------+--------------+--+
| default   | test       | false        |
| default   | test_obs   | false        |
+-----------+------------+--------------+--+
2 rows selected (0.127 seconds)
```

7. Press **Ctrl+C** to exit Spark Beeline.

14.14.7 How Do I Prevent Kerberos Authentication Expiration?

- Java applications:

  Before connecting to HBase, HDFS, or other big data components, call loginUserFromKeytab() to create a UGI. Then, start a scheduled thread to periodically check whether the Kerberos Authentication expires. Log in to the system again before the Kerberos Authentication expires.

```
private static void startCheckKeytabTgtAndReloginJob() {
//The credential is checked every 10 minutes, and updated before the expiration time.
        ThreadPool.updateConfigThread.scheduleWithFixedDelay(() -> {
            try {
                UserGroupInformation.getLoginUser().checkTGTAndReloginFromKeytab();
                logger.warn("get tgt:{}", UserGroupInformation.getLoginUser().getTGT());
                logger.warn("Check Kerberos Tgt And Relogin From Keytab Finish.");
            } catch (IOException e) {
                logger.error("Check Kerberos Tgt And Relogin From Keytab Error", e);
            }
        }, 0, 10, TimeUnit.MINUTES);
        logger.warn("Start Check Keytab TGT And Relogin Job Success.");
    }
```

- Tasks executed in shell mode:

  a. Run the **kinit** command to authenticate the user.

  b. Create a scheduled task of the operating system or any other scheduled task to run the **kinit** command to authenticate the user periodically.

  c. Submit jobs to execute big data tasks.

- Spark jobs:

  If you submit jobs using spark-shell, spark-submit, or spark-sql, you can specify **Keytab** and **Principal** in the command to perform authentication and periodically update the login credential and authorization tokens to prevent authentication expiration.

  Example:

  spark-shell --principal spark2x/hadoop.<*System domain name*>@<*System domain name*> **--keytab ${BIGDATA_HOME}/FusionInsight_Spark2x_8.1.0.1/install/FusionInsight-Spark2x-2.4.5/keytab/spark2x/SparkResource/spark2x.keytab --master yarn**

14.15 Metadata Management

14.15.1 Where Can I View Hive Metadata?

- If Hive metadata is stored in GaussDB of an MRS cluster, log in to the master DBServer node of the cluster, switch to user **omm**, and run the **gsql -p 20051 -U {USER} -W {PASSWD} -d hivemeta** command to view the metadata.
- If Hive metadata is stored in an external relational database, perform the following steps:

  a. On the cluster **Dashboard** page, click **Manage** on the right of **Data Connection**.

  b. On the displayed page, obtain the value of **Data Connection ID**.

  c. On the MRS console, click **Data Connections**.

  d. In the data connection list, locate the data connection based on the data connection ID obtained in **b**.

  e. Click **Edit** in the **Operation** column of the data connection.

     The **RDS Instance** and **Database** indicate the relational database in which the Hive metadata is stored.

15 Troubleshooting

Released On	What's New
2021-06-30	This issue is the fifth official release. Released MRS 3.1.0-LTS.1. For details, see **Creating a Custom Cluster**.
2020-10-24	This issue is the fourth official release. Added the following sections: ● **Methods of Creating MRS Clusters** ● **Quick Creation of a Hadoop Analysis Cluster** ● **Quick Creation of an HBase Analysis Cluster** ● **Quick Creation of a Kafka Streaming Cluster** Modified the following sections: ● **Creating a Custom Cluster** ● **Viewing Basic Cluster Information** ● **Viewing Information of a Historical Cluster**
2020-01-17	This issue is the third official release. Modified the following sections: ● **Creating a Custom Cluster** ● **Viewing Basic Cluster Information** ● **Viewing Information of a Historical Cluster**

Released On	What's New
2019-03-20	This issue is the second official issue. Added the following sections: ● **Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled** ● **Authorizing O&M** ● **Authorizing O&M** ● **Adding a Tag to a Cluster** ● **Installing Third-Party Software Using Bootstrap Actions** ● **Restoring Patches for the Isolated Hosts** ● **Rolling Restart** Modified the following sections: ● **Creating a Custom Cluster** ● **Viewing Basic Cluster Information** ● **Configuring an Auto Scaling Rule** ● **Viewing Information of a Historical Cluster**
2018-10-12	This issue is the first official release.

15.1 Accessing the Web Pages

15.1.1 Failed to Access MRS Manager

Symptom

The MRS Manager is not accessible after a cluster is created.

Possible Cause

- MRS can be accessed from an external network only after an EIP is bound to an MRS node.
- Port 9022 is disabled. Add a security group rule to enable the port.

Procedure

Step 1 Log in to the MRS management console, locate the cluster to be accessed in the active cluster list, and click the cluster name.

Step 2 On the node information page, click the name of the node to be accessed, and choose **EIPs** > **Bind EIP**.

Step 3 On the **Bind EIP** page, select a NIC from the **Select NIC** drop-down list, select an EIP from the **Select EIP** list, and click **OK**.

Step 4 After the EIP is bound, enable port 9022 in a security group rule.

Click the **Security Groups** tab. Then, click **Change Security Group**.

You can select an existing security group, or click **Create Security Group** to add a security group rule to enable port 9022 for accessing through the public IP address.

Step 5 After the EIP is added, you can access MRS through **https://***Elastic IP address***: 9022/mrsmanager/**. If the fault still persists, contact technical support for assistance.

----End

15.1.2 Failed to Log In to MRS Manager After the Python Upgrade

Issue

Failed to log in to MRS Manager after Python is upgraded.

Symptom

After Python is upgraded, MRS Manager fails to be accessed using the **admin** account and the correct password.

Possible Cause

When upgrading Python to Python 3.*x*, the user modifies the file directory permission of **openssl**. As a result, the LdapServer service cannot be started, causing a login authentication failure.

Procedure

Step 1 Log in to the Master node in the cluster as user **root**.

Step 2 Run the **chmod 755 /usr/bin/openssl** command to modify the file directory permission of **/usr/bin/openssl** to **755**.

Step 3 Run the **su omm** command to switch to user **omm**.

Step 4 Run the **openssl** command to check whether the **openssl** mode can be entered.

If it can be entered, the permission has been modified successfully. If it cannot be entered, the permission fails to be modified.

If the permission fails to be modified, check whether the command is correct or contact O&M personnel.

Step 5 After the permission is modified, the LdapServer service will be restarted. After the LdapServer service is restarted, log in to MRS Manager again.

----End

Summary and Suggestions

It is recommended that software installed by the user be separated from system software. A system software upgrade may cause compatibility problems.

15.1.3 Failed to Log In to MRS Manager After Changing the Domain Name

Symptom

After changing the domain name, the user cannot log in to MRS Manager through the console, or fails to log in to MRS Manager.

Possible Causes

After the domain name is changed, the **keytab** file of user **executor** is not updated. As a result, the executor process repeatedly performs authentication after the authentication fails, causing memory overflow of the ACS process.

Solution

Step 1 Restart the acs process.

1. Log in to the active management node (master node marked a solid star on the **Nodes** tab of the MRS cluster) as user **root**.
2. Run the following commands to restart the acs process:

   su - omm

   ps -ef|grep =acs (Query the PID of the acs process.)

   kill -9 *PID* (Replace *PID* with the acs process ID to kill the acs process.)
3. Wait for several minutes and run the **ps -ef|grep =acs** command to check whether the acs process is automatically started.

Step 2 Replace the **keytab** file of user **executor**.

1. Log in to MRS Manager and choose **System** > **User**. In the **Operation** column where user **executor** resides, click **Download Authentication Credential**. Decompress the package to obtain the **keytab** file.
2. Log in to the active management node as user **root** and replace the **/opt/executor/webapps/executor/WEB-INF/classes/user.keytab** file with the file obtained in **Step 2.1**.

Step 3 Replace the **keytab** and **conf** files of user **knox**.

1. Log in to MRS Manager and choose **System** > **User**. In the **Operation** column where user **knox** resides, click **Download Authentication Credential**. Decompress the package to obtain the **keytab** and **conf** files.
2. Log in to the active management node as user **root** and replace the **/opt/knox/conf/user.keytab** with the file obtained in **Step 3.1**.
3. Change the **principal** value in the **/opt/knox/conf/krb5JAASLogin.conf** file to the new domain name.
4. Replace the **/opt/knox/conf/krb5.conf** file with the **krb5.conf** file obtained in **Step 3.1**.

Step 4 Back up the original client directory.

mv *{Client directory}* **/opt/client_init**

Step 5 Reinstall the client.

Step 6 Log in to the active and standby management nodes as user **root** and run the following commands to restart the knox process:

su - omm

ps -ef | grep gateway | grep -v grep (Search for the PID of the knox process.)

kill -9 *PID* (Replace *PID* with the ID of the knox process to kill the knox process.)

/opt/knox/bin/restart-knox.sh (Start the knox process.)

Step 7 Log in to the active and standby management nodes as user **root** and run the following commands to restart the executor process:

su - omm

netstat -anp |grep 8181 |grep LISTEN (Search for the PID of the executor process.)

kill -9 *PID* (Replace *PID* with the ID of the executor process to kill the executor process.)

/opt/executor/bin/startup.sh (Start the executor process.)

----End

15.1.4 A Blank Page Is Displayed Upon Login to Manager

Issue

After a user logs in to FusionInsight Manager, the page displayed is blank.

Symptom

After a user logs in to FusionInsight Manager, the page displayed is blank.

Cause Analysis

Login to FusionInsight Manager fails, and the browser cache needs to be cleared.

Procedure

Step 1 Open the browser (using Google Chrome as an example), and press **Ctrl+Shift +Delete**. The dialog box for clearing browsing data is displayed.

Step 2 Select the browsing records to be cleared and click **Clear Data**.

----End

15.1.5 Failed to Download Authentication Credentials When the Username Is Too Long

Issue

In MRS clusters 3.0.2 to 3.1.0, a maximum of 32 characters are allowed in the username when a user is added. However, if the username contains more than 20 characters, the user fails to download the Keytab file, and status code "400 Bad Request" is displayed.

Symptom

In MRS clusters 3.0.2 to 3.1.0, a maximum of 32 characters are allowed in the username when a user is added. However, if the username contains more than 20 characters, the user fails to download the Keytab file, and status code "400 Bad Request" is displayed.

Cause Analysis

The **validate-common-config.xml**, **validate-rule-session.xml**, and **validate-rule-user.xml** configuration files in the **/opt/Bigdata/om-server_*/apache-tomcat-*/webapps/web/WEB-INF/validate** directory of the master node are incorrect and need to be modified.

Procedure

Step 1 Log in to the master node as user **omm** and switch to the **/opt/Bigdata/om-server_*/apache-tomcat-*/webapps/web/WEB-INF/validate** directory.

cd /opt/Bigdata/om-server_*/apache-tomcat-*/webapps/web/WEB-INF/validate

Step 2 Modify the **validate-common-config.xml** file.

vi validate-common-config.xml

Change the **maxLength** value of the username from **32** to **64**.

```
<!-- Username -->
<validators alias="USER_NAME">
      <validator name="RANGE_LENGTH_VALIDATOR" minLength="3"
         maxLength="64" />
      <validator name="REGEXP_VALIDATOR" rule="^[_a-zA-Z0-9\- ]+$"
</validators>
```

Step 3 Modify the **validate-rule-session.xml** file.

vi validate-rule-session.xml

Change the **rule** value from **20** to **64**.

```
 <!-- Download the credentials of the current user -->
 <param_validator url="/api/v2/session/user/keytab/download" method="get"
errorHandler="com.xxx.bigdata.om.web.api.validate.SpecialValidatorErrorHandler" dataPattern="form">
            <!-- Parameter name: File name -->
            <!--Validation rule: userName_13-digit number_keytab.tar; case sensitive-->
            <parameter name="file_name" required="true" errorKey="13-4000005"
errorMessage="RESID_OM_API_SESSION_0013">
```

```
                    <validator name="REGEXP_VALIDATOR" rule="[\-\w ]{3,64}_\d{13}_keytab\.tar" 
caseSensitive="true" />
 </parameter>
```

Step 4 Modify the **validate-rule-user.xml** file.

vi validate-rule-user.xml

Change the **rule** value from **20** to **64**.

```
<!--Download the user credentials  -->
   <param_validator url="/api/v2/permission/users/keytab/download" method="get" 
errorHandler="com.xxx.bigdata.om.web.api.validate.SpecialValidatorErrorHandler" dataPattern="form">
           <!--Mandatory; userName_13-digit number_keytab.tar; case sensitive-->
           <parameter name="file_name" required="true" errorKey="12-4000005" 
errorMessage="RESID_OM_API_AUTHORITY_0005">
                  <validator name="REGEXP_VALIDATOR" rule="[\-\w ]{3,64}_\d{13}_keytab\.tar" 
caseSensitive="true" />
           </parameter>
    </param_validator>
```

Step 5 Restart Tomcat and wait until the startup is successful.

1. Run the following command as user **omm** to query the PID of the Tomcat process:

   ps -ef|grep apache-tomcat

2. Run the **kill -9** *PID* command to forcibly stop the specified Tomcat process. For example:

   kill -9 1203

3. Run the following command to restart Tomcat:

   sh ${BIGDATA_HOME}/om-server/tomcat/bin/startup.sh

Step 6 Download the authentication credentials again.

----End

15.2 Cluster Management

15.2.1 Failed to Reduce Task Nodes

Issue

A user fails to scale in an MRS 2.*x* cluster by reducing the number of task nodes to **0** on the MRS console.

Symptom

When the number of task nodes in an MRS cluster is reduced on the MRS console, the following information is displayed:

This operation is not allowed because the number of instances of NodeManager will be less than the minimum configuration after scale-in, which may cause data loss.

Cause Analysis

The NodeManager service of the core node is stopped. If the number of task nodes is changed to **0**, there will be no NodeManager in the cluster and the Yarn service will be unavailable. Therefore, MRS allows the reduction of task nodes only when the number of NodeManagers is greater than or equal to **1**.

Procedure

Step 1 Choose **Services** > **Yarn** > **Instances**.

- For versions earlier than MRS 2.0.1: Log in to MRS Manager, and choose **Services** > **Yarn** > **Instance**.
- For MRS 2.0.1 or later: Click the cluster name on the MRS console and choose **Components** > **Yarn** > **Instances**.
- For MRS 3.*x* or later: Log in to FusionInsight Manager, choose **Cluster**, click the name of the target cluster, and choose **Services** > **Yarn** > **Instance**.

Step 2 Select the NodeManager instance of the core node, click **More**, and select **Start Instance**.

Step 3 Reduce the number of task nodes on the cluster details page.

1. Click the cluster name, and select the **Nodes** tab.
2. Locate the row that contains the task node group and click **Scale In** in the **Operation** column.
3. Click **OK**. In the displayed dialog box, click **Yes**.

Step 4 After the scale-in is successful, stop NodeManager of the core node if you do not need it.

----End

Summary and Suggestions

You are advised not to stop NodeManager of the core node.

15.2.2 Adding a New Disk to an MRS Cluster

Issue

MRS HBase is unavailable.

Symptom

A high disk usage of the user's host causes service faults.

Cause Analysis

The service becomes unavailable due to insufficient disk capacity of the core node.

Procedure

Step 1 Purchase an EVS disk.

Step 2 Attach the EVS disk.

- If the EVS disk has been attached, go to **Step 6**.
- If an ECS cannot be selected when you attach the EVS disk on the EVS console, go to **Step 3**.

Step 3 Log in to the ECS console and click the name of the ECS to which the new disk is to be attached.

Step 4 On the **Disks** tab, click **Attach Disk**.

Step 5 Select the new disk to be attached and click **OK**.

Step 6 Initialize a Linux data disk.

NOTE

- The mount point directory is the existing DataNode instance ID plus one. For example, if you run the **df -h** command and find that the existing ID is **/srv/BigData/hadoop/data1**, the new mount point is then **/srv/BigData/hadoop/data2**. When initializing a Linux data disk to create a mount point, name the mount point **/srv/BigData/hadoop/data2** and mount a new partition to the mount point. For example:

```
mkdir /srv/BigData/hadoop/data2
mount /dev/xvdb1 /srv/BigData/hadoop/data2
```

About the **/srv/BigData/hadoop/data2** path: Change **/srv/BigData/hadoop/data2** mentioned below according to the following scenarios:

- In 3.*x*: Change it to **/srv/BigData/data2**.
- In versions earlier than 3.*x* : Change it to **/srv/BigData/hadoop/data2**.

Step 7 Run the following command to grant user **omm** the permissions to access the new disk:

chown omm:wheel *New mount point*

Example: **chown omm:wheel /srv/BigData/hadoop/data2**

Step 8 Run the following command to grant the execution permission on the new mount point directory:

chmod 701 *New mount point*

Example: **chmod 701 /srv/BigData/hadoop/data2**

NOTE

In this command, **701** is only an example. Replace it with the value of the existing data disk **data1**.

Step 9 Log in to Manager and add data disks to DataNode and NodeManager instances.

Step 10 Modify the DataNode instance configuration.

MRS Manager: Log in to MRS Manager, choose **Services** > **HDFS** > **Instance**, click the target DataNode instance, and click **Instance Configuration**. On the displayed page, set **Type** to **All**.

FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the desired cluster and choose **Service** > **HDFS** > **Instance**. Click the target DataNode instance, click **Instance Configuration**, and select **All Configurations**.

- Method 1: Manually modify the DataNode instance configuration on the current node.
  - Enter **dfs.datanode.fsdataset.volume.choosing.policy** in the search box and change the parameter value to **org.apache.hadoop.hdfs.server.datanode.fsdataset.AvailableSpaceVolumeChoosingPolicy**.
  - Enter **dfs.datanode.data.dir** in the search box and change the parameter value to **/srv/BigData/hadoop/data1/dn,/srv/BigData/hadoop/data2/dn**.

  If the values of the two parameters have been changed, click **Save Configuration** and select **Restart role instance** to restart the DataNode instance.
- Method 2: Automatically synchronize the DataNode instance configuration on the current node.
  1. Click **Synchronize Configuration** to enable the new configuration for the HDFS service.
  2. After the synchronization is complete, restart the instance for the configuration to take effect.

NOTE

- If HDFS is not used and you want to quickly restart the instance, select **Restart role instance**.
- If a task is using HDFS, you must select rolling restart to prevent data exceptions or task failures.

Step 11 Modify the Yarn NodeManager instance configuration.

MRS Manager: Log in to MRS Manager, choose **Services** > **Yarn** > **Instance**, click the target NodeManager instance, and click **Instance Configuration**. On the displayed page, set **Type** to **All**.

FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the desired cluster and choose **Service** > **Yarn** > **Instance**. Click the target NodeManager instance, click **Instance Configuration**, and select **All Configurations**.

- Method 1: Manually modify the Yarn NodeManager instance configuration on the current node.
  - Enter **yarn.nodemanager.local-dirs** in the search box and change the parameter value to **/srv/BigData/hadoop/data1/nm/localdir,/srv/BigData/hadoop/data2/nm/localdir**.
  - Enter **yarn.nodemanager.log-dirs** in the search box and change the parameter value to **/srv/BigData/hadoop/data1/nm/containerlogs,/srv/BigData/hadoop/data2/nm/containerlogs**.

    If the values of the two parameters have been changed, click **Save Configuration** and select **Restart role instance** to restart the NodeManager instance.
- Method 2: Automatically synchronize the Yarn NodeManager instance configuration on the current node.

a. Click **Synchronize Configuration** to enable the new configuration for the Yarn service.

b. After the synchronization is complete, restart the instance for the configuration to take effect.

NOTE

- If Yarn is not used and you want to quickly restart the instance, select **Restart role instance**.
- If a task is using Yarn, you must select rolling restart to prevent data exceptions or task failures.

Step 12 Check whether the capacity expansion is successful.

MRS Manager: Log in to MRS Manager, choose **Services** > **HDFS** > **Instance**, and click the target DataNode instance.

FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the desired cluster, choose **Service** > **HDFS** > **Instance**, and click the target DataNode instance.

In the **Chart** area, check whether the total disk capacity in real-time monitoring item **DataNode Storage** is increased. If **DataNode Storage** does not exist in the **Chart** area, click **Customize** to add it.

- If the total disk capacity has been increased, the capacity expansion is complete.
- If the total disk capacity does not increase, contact technical support.

Step 13 (Optional) Add data disks to a Kafka instance.

Modify the Kafka instance configuration.

1. Navigate to the parameter settings of the target Kafka Broker node.

   MRS Manager: Log in to MRS Manager, choose **Services** > **Kafka** > **Instance**, click the target Broker instance, and click **Instance Configuration**. On the displayed page, set **Type** to **All**.

   FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the desired cluster and choose **Service** > **Kafka** > **Instance**. Click the target Broker instance, click **Instance Configuration**, and select **All Configurations**.

2. Enter **log.dirs** in the search box, add information about the disks to be added, and use commas (,) to separate them.

   For example, if there is only one existing Kafka data disk and a new one is added, change **/srv/BigData/kafka/data1/kafka-logs** to **/srv/BigData/kafka/data1/kafka-logs,/srv/BigData/kafka/data2/kafka-logs**.

3. Save the configuration and select **Restart role instance** to restart the instance as prompted.

4. Check whether the capacity expansion is successful.

   MRS Manager: Log in to MRS Manager, choose **Services** > **Kafka** > **Instance**, and click the target Broker instance.

   FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the desired cluster, choose **Service** > **Kafka** > **Instance**, and click the target Broker instance.

Check whether the total disk capacity in real-time monitoring item **Capacity of Broker Disks** is increased.

----End

NOTICE

After the disk capacity of a cluster node is expanded, if a new node is added to the cluster, you need to add disks to the new node by referring to the preceding procedure. Otherwise, data may be lost.

Summary and Suggestions

- If the disk usage exceeds 85%, you are advised to expand disk capacity and attach the newly purchased disks to ECSs to associate with the cluster.
- The procedure for attaching disks and setting parameters may vary depending on the site environment.

15.2.3 Replacing a Disk in an MRS Cluster (Applicable to 2.x and Earlier)

Issue

A disk is not accessible.

Symptom

A user created an MRS cluster with local disks. A disk of a core node in this cluster is damaged, resulting in file read failures.

Cause Analysis

The disk hardware is faulty.

Procedure

NOTE

This procedure is applicable to analysis clusters earlier than MRS 3.*x*. If you need to replace disks for a streaming cluster or hybrid cluster, contact technical support.

Step 1 Log in to .

Step 2 Choose **Hosts**, click the name of the host to be decommissioned, click **RegionServer** in the **Roles** list, click **More**, and select **Decommission**.

Step 3 Choose **Hosts**, click the name of the host to be decommissioned, click **DataNode** in the **Roles** list, click **More**, and select **Decommission**.

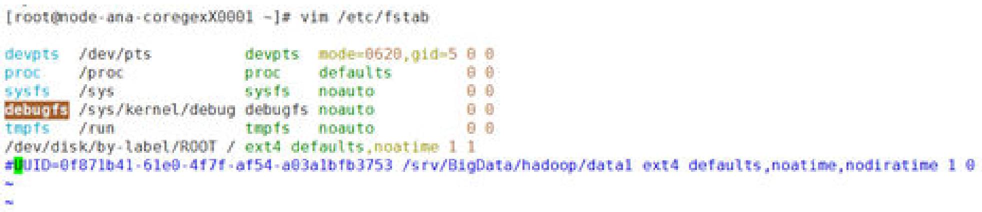
Step 4 Choose **Hosts**, click the name of the host to be decommissioned, click **NodeManager** in the **Roles** list, click **More**, and select **Decommission**.

NOTE

If this host still runs other instances, perform the similar operation to decommission the instances.

Step 5 Run the **vim /etc/fstab** command to comment out the mount point of the faulty disk.

Figure 15-1 Commenting out the mount point of the faulty disk



```
[root@node-ana-coregexX0001 ~]# vim /etc/fstab

devpts   /dev/pts          devpts  mode=0620,gid=5 0 0
proc     /proc             proc    defaults        0 0
sysfs    /sys              sysfs   noauto          0 0
debugfs  /sys/kernel/debug debugfs noauto          0 0
tmpfs    /run              tmpfs   noauto          0 0
/dev/disk/by-label/ROOT / ext4 defaults,noatime 1 1
#UUID=0f871b41-61e0-4f7f-af54-a03a1bfb3753 /srv/BigData/hadoop/data1 ext4 defaults,noatime,nodiratime 1 0
~
~
```

Step 6 Migrate the user data on the faulty disk (for example, **/srv/BigData/hadoop/data1/**).

Step 7 Log in to the MRS console.

Step 8 On the cluster details page, click the **Nodes** tab.

Step 9 Click the node whose disk is to be replaced to go to the ECS console. Click **Stop** to stop the node.

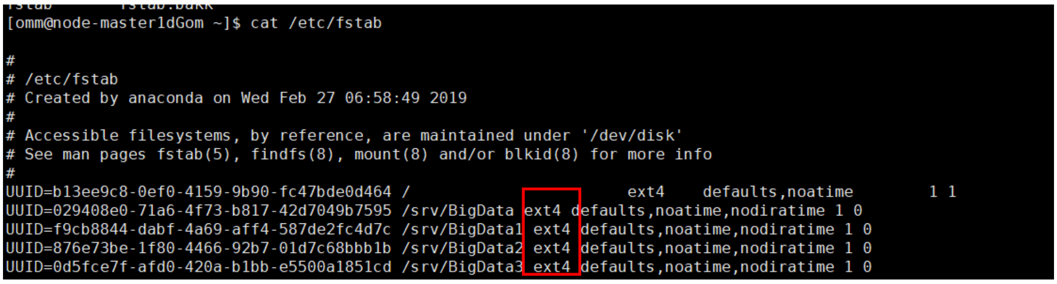
Step 10 Contact technical support to replace the disk in the background.

Step 11 On the ECS console, click **Start** to start the node where the disk has been replaced.

Step 12 Run the **fdisk -l** command to view the new disk.

Step 13 Run the **cat /etc/fstab** command to obtain the drive letter.

Figure 15-2 Obtaining the drive letter



```
fstab       fstab.bakk
[omm@node-master1dGom ~]$ cat /etc/fstab

#
# /etc/fstab
# Created by anaconda on Wed Feb 27 06:58:49 2019
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
UUID=b13ee9c8-0ef0-4159-9b90-fc47bde0d464 /                       ext4    defaults,noatime        1 1
UUID=029408e0-71a6-4f73-b817-42d7049b7595 /srv/BigData ext4 defaults,noatime,nodiratime 1 0
UUID=f9cb8844-dabf-4a69-aff4-587de2fc4d7c /srv/BigData1 ext4 defaults,noatime,nodiratime 1 0
UUID=876e73be-1f80-4466-92b7-01d7c68bbb1b /srv/BigData2 ext4 defaults,noatime,nodiratime 1 0
UUID=0d5fce7f-afd0-420a-b1bb-e5500a1851cd /srv/BigData3 ext4 defaults,noatime,nodiratime 1 0
```

Step 14 Use the corresponding drive letter to format the new disk.

Example: **mkfs.ext4 /dev/sdh**

Step 15 Run the following command to attach the new disk.

mount *New disk Mount point*

Example: **mount /dev/sdh /srv/BigData/hadoop/data1**

Step 16 Run the following command to grant the **omm** user permission to the new disk:

chown omm:wheel *Mount point*

Example: **chown -R omm:wheel /srv/BigData/hadoop/data1**

Step 17 Add the UUID of the new disk to the **fstab** file.

1. Run the **blkid** command to check the UUID of the new disk.

   
   ```
   [root@node-ana-coreKpoT0003 ~]# blkid
   /dev/vda1: LABEL="ROOT" UUID="2aa97872-11ec-422e-9513-0f28b925ad5e" TYPE="ext4"
   /dev/vdb: UUID="e5f652c3-f9af-427f-89da-f2545618688d" TYPE="ext4"
   [root@node-ana-coreKpoT0003 ~]#
   ```

2. Open the **/etc/fstab** file and add the following information:

   UUID=*New disk UUID* **/srv/BigData/hadoop/data1 ext4 defaults,noatime,nodiratime 1 0**

Step 18 (Optional) Create a log directory.

mkdir -p /srv/BigData/Bigdata

chown omm:ficommon /srv/BigData/Bigdata

chmod 770 /srv/BigData/Bigdata

NOTE

Run the following command to check whether symbolic links to **Bigdata** logs exist. If yes, skip this step.

ll /var/log

Step 19 Log in to .

Step 20 Choose **Hosts**, click the name of the host to be recommissioned, click **RegionServer** in the **Roles** list, click **More**, and select **Recommission**.

Step 21 Choose **Hosts**, click the name of the host to be recommissioned, click **DataNode** in the **Roles** list, click **More**, and select **Recommission**.

Step 22 Choose **Hosts**, click the name of the host to be recommissioned, click **NodeManager** in the **Roles** list, click **More**, and select **Recommission**.

NOTE

If this host still runs other instances, perform the similar operation to recommission the instances.

Step 23 Choose **Services** > **HDFS**. In the **HDFS Summary** area on the **Service Status** page, check whether **Missing Blocks** is **0**.

- If **Missing Blocks** is **0**, no further action is required.
- If **Missing Blocks** is not **0**, contact technical support.

----End

15.2.4 Replacing a Disk in an MRS Cluster (Applicable to 3.x)

Issue

A disk is not accessible.

Symptom

A user created an MRS cluster with local disks. A disk of a core node in this cluster is damaged, resulting in file read failures.

Cause Analysis

The disk hardware is faulty.

Procedure

NOTE

This procedure is applicable to troubleshooting disk hardware faults of core and task nodes in MRS clusters using local disks (ECSs of D, I, IR, and KI series).

Kafka does not support disk replacement. If the node that stores Kafka data is faulty, contact technical support.

Step 1 Log in to .

Step 2 Choose **Hosts** and click the name of the faulty host. In the **Instance** area, click **DataNode**. Then on the page that is displayed, click **More** and select **Decommission**.

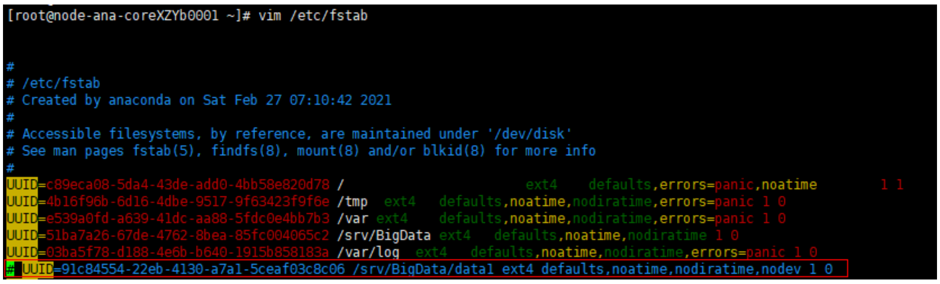
NOTE

- If this host accommodates DataNode, NodeManager, RegionServer, and ClickHouseServer instances, decommission these instances by referring to this step.
- In versions later than MRS 3.1.2, the ClickHouseServer role instance can be decommissioned.

Step 3 Choose **Hosts**, select the faulty host, click **More**, and select **Stop All Instances**.

Step 4 Run the **vim /etc/fstab** command to comment out the mount point of the faulty disk.

Figure 15-3 Commenting out the mount point of the faulty disk



```
[root@node-ana-coreXZYb0001 ~]# vim /etc/fstab

#
# /etc/fstab
# Created by anaconda on Sat Feb 27 07:10:42 2021
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
UUID=c89eca08-5da4-43de-add0-4bb58e820d78 /                       ext4    defaults,errors=panic,noatime        1 1
UUID=4b16f96b-6d16-4dbe-9517-9f63423f9f6e /tmp  ext4   defaults,noatime,nodiratime,errors=panic 1 0
UUID=e539a0fd-a639-41dc-aa88-5fdc0e4bb7b3 /var ext4    defaults,noatime,nodiratime,errors=panic 1 0
UUID=51ba7a26-67de-4762-8bea-85fc004065c2 /srv/BigData ext4   defaults,noatime,nodiratime 1 0
UUID=03ba5f78-d188-4e6b-b640-1915b858183a /var/log  ext4   defaults,noatime,nodiratime,errors=panic 1 0
# UUID=91c84554-22eb-4130-a7a1-5ceaf03c8c06 /srv/BigData/data1 ext4 defaults,noatime,nodiratime,nodev 1 0
```

Step 5 If the old disk is still accessible, migrate user data on the old disk (for example, **/srv/BigData/data1/**).

cp -r ***Mount point of the old disk Temporary data storage directory***

Example: **cp -r /srv/BigData/data1 /tmp/**

Step 6 Log in to the MRS console.

Step 7 On the cluster details page, click the **Nodes** tab.

Step 8 Click the node whose disk is to be replaced to go to the ECS console. Click **Stop** to stop the node.

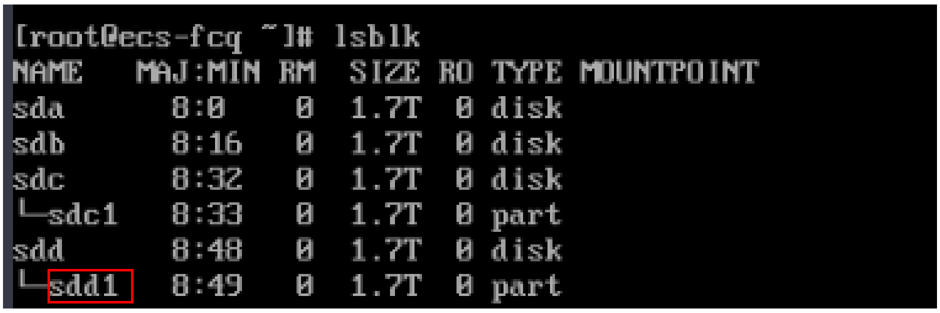
Step 9 Contact technical support to replace the disk in the background.

Step 10 On the ECS console, click **Start** to start the node where the disk has been replaced.

Step 11 Initialize the Linux data disk.

Step 12 Run the **lsblk** command to view information about the new disk partition.

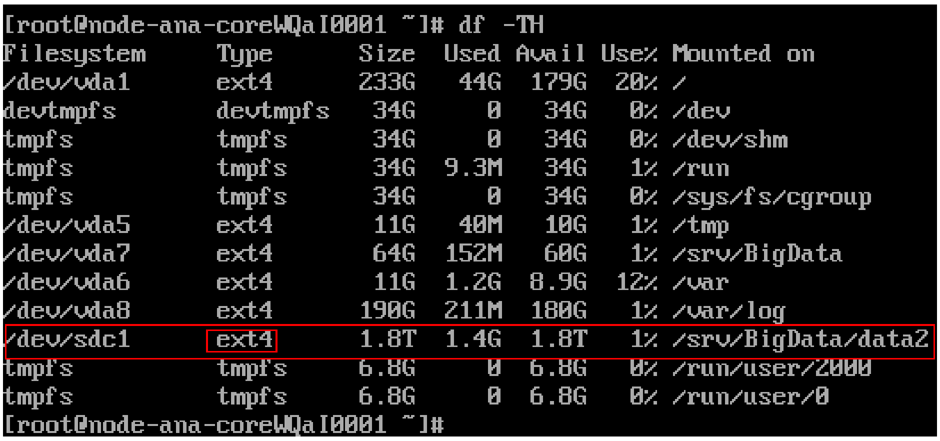
Figure 15-4 Viewing the new disk partition



```
[root@ecs-fcq ~]# lsblk
NAME    MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
sda       8:0    0  1.7T  0 disk
sdb       8:16   0  1.7T  0 disk
sdc       8:32   0  1.7T  0 disk
└─sdc1    8:33   0  1.7T  0 part
sdd       8:48   0  1.7T  0 disk
└─sdd1    8:49   0  1.7T  0 part
```

Step 13 Run the **df -TH** command to obtain the file system type.

Figure 15-5 Obtaining the file system type



```
[root@node-ana-coreWQaI0001 ~]# df -TH
Filesystem     Type      Size  Used Avail Use% Mounted on
/dev/vda1      ext4      233G   44G  179G  20% /
devtmpfs       devtmpfs   34G     0   34G   0% /dev
tmpfs          tmpfs      34G     0   34G   0% /dev/shm
tmpfs          tmpfs      34G  9.3M   34G   1% /run
tmpfs          tmpfs      34G     0   34G   0% /sys/fs/cgroup
/dev/vda5      ext4       11G   40M   10G   1% /tmp
/dev/vda7      ext4       64G  152M   60G   1% /srv/BigData
/dev/vda6      ext4       11G  1.2G  8.9G  12% /var
/dev/vda8      ext4      190G  211M  180G   1% /var/log
/dev/sdc1      ext4      1.8T  1.4G  1.8T   1% /srv/BigData/data2
tmpfs          tmpfs     6.8G     0  6.8G   0% /run/user/2000
tmpfs          tmpfs     6.8G     0  6.8G   0% /run/user/0
[root@node-ana-coreWQaI0001 ~]#
```

Step 14 Format the new disk partition based on the obtained file system type.

Example: **mkfs.ext4 /dev/sdd1**

Step 15 Run the following command to mount the new disk:

mount *New disk Mount point*

Example: **mount /dev/sdd1 /srv/BigData/data1**

NOTE

If the disk cannot be mounted, run the following command to reload the configuration and mount it again:

systemctl daemon-reload

Step 16 Run the following command to grant the **omm** user permission to the new disk:

chown omm:wheel *Mount point*

Example: **chown -R omm:wheel /srv/BigData/data1**

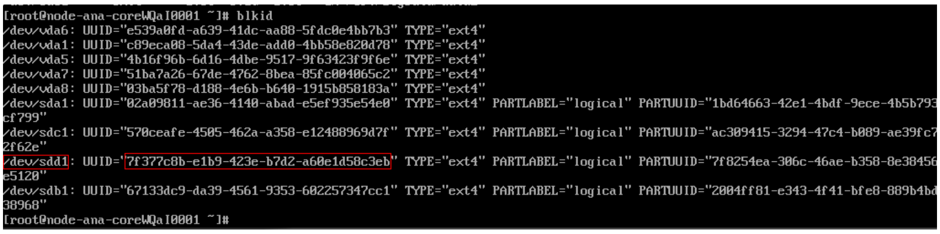
Step 17 Migrate user data from the old disk (for example, **/srv/BigData/data1/**) to the new disk.

cp -r*Temporary data storage directory Mount point of the new disk*

Example: **cp -r /tmp/data1/* /srv/BigData/data1/**

Step 18 Add the UUID of the new disk to the **fstab** file.

1. Run the **blkid** command to check the UUID of the new disk.



```
[root@node-ana-coreWQaI0001 ~]# blkid
/dev/vda6: UUID="e539a0fd-a639-41dc-aa88-5fdc0e4bb7b3" TYPE="ext4"
/dev/vda1: UUID="c89eca08-5da4-43de-add0-4bb58e820d78" TYPE="ext4"
/dev/vda5: UUID="4b16f96b-6d16-4dbe-9517-9f63423f9f6e" TYPE="ext4"
/dev/vda7: UUID="51ba7a26-67de-4762-8bea-85fc004065c2" TYPE="ext4"
/dev/vda8: UUID="03ba5f78-d188-4e6b-b640-1915b858183a" TYPE="ext4"
/dev/sda1: UUID="02a09811-ae36-4140-abad-e5ef935e54e0" TYPE="ext4" PARTLABEL="logical" PARTUUID="1bd64663-42e1-4bdf-9ece-4b5b793
cf799"
/dev/sdc1: UUID="570ceafe-4505-462a-a358-e12488969d7f" TYPE="ext4" PARTLABEL="logical" PARTUUID="ac309415-3294-47c4-b089-ae39fc7
2f62e"
/dev/sdd1: UUID="7f377c8b-e1b9-423e-b7d2-a60e1d58c3eb" TYPE="ext4" PARTLABEL="logical" PARTUUID="7f8254ea-306c-46ae-b358-8e38456
e5120"
/dev/sdb1: UUID="67133dc9-da39-4561-9353-602257347cc1" TYPE="ext4" PARTLABEL="logical" PARTUUID="2004ff81-e343-4f41-bfe8-889b4bd
38968"
[root@node-ana-coreWQaI0001 ~]#
```

2. Open the **/etc/fstab** file and add the following information:
UUID=*UUID of the new disk* /srv/BigData/data1 ext4 defaults,noatime,nodiratime,nodev 1 0

Step 19 Log in to .

Step 20 Choose **Hosts** and click the name of the host to be recommissioned. In the **Instance** area, click **DataNode**. Then on the page that is displayed, click **More** and select **Recommission**.

NOTE

- If this host accommodates DataNode, NodeManager, RegionServer, and ClickHouseServer instances, recommission these instances by referring to this step.
- In versions later than MRS 3.1.2, the ClickHouseServer role instance can be recommissioned.

Step 21 Choose **Hosts**, select the faulty host, click **More**, and select **Start All Instances**.

Step 22 Choose **Cluster** > **HDFS**. In the **Basic Information** area on the **Dashboard** page, check whether **Missing Blocks** is **0**.

- If **Missing Blocks** is **0**, no further action is required.
- If **Missing Blocks** is not **0**, contact technical support.

----End

15.2.5 MRS Backup Failure

Issue

MRS backup keeps failing.

Symptom

MRS backup keeps failing.

Cause Analysis

The backup directory is connected to the system disk using a soft link. As a result, if the system disk is full, the backup fails.

Procedure

Step 1 Check whether the backup directory is connected to the system disk using a soft disk.

1. Log in to the active and standby Master nodes in the cluster as user **root**.
2. Run the **df -h** command to check the storage usage of the system disk.
3. Run the **ll /srv/BigData/LocalBackup** command to check whether the backup directory is connected to **/opt/Bigdata/LocalBackup** using a soft link.

   Check whether the backup file is connected to the system disk using a soft link and whether the system disk has sufficient space. If the soft link is used for connecting to the system disk and the system disk space is insufficient, go to **Step 2**. If the soft link is not used, the failure is not caused by insufficient system disk space. Contact technical support for troubleshooting.

Step 2 Move historical backup data to a new directory on the data disk.

1. Log in to the Master node as user **root**.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **rm -rf /srv/BigData/LocalBackup** command to delete the soft link of the backup directory.
4. Run the **mkdir -p /srv/BigData/LocalBackup** command to create a backup directory.
5. Run the **mv /opt/Bigdata/LocalBackup/* /srv/BigData/LocalBackup/** command to move the historical backup data to the new directory.

----End

15.2.6 Inconsistency Between df and du Command Output on the Core Node

Issue

The capacity displayed in the **df** command output on the Core node is inconsistent with that displayed in the **du** command output.

Symptom

After the **df** and **du** commands are executed, the values of the Core node capacity displayed are different.

The disk usage of the **/srv/BigData/hadoop/data1/** directory queried by running the **df -h** command differs greatly from that queried by running the **du -sh /srv/BigData/hadoop/data1/** command. The difference is greater than 10 GB.

Cause Analysis

The **lsof |grep deleted** command output indicates that a large number of log files in the directory are in the deleted state.

When some Spark tasks are running for a long time, some containers in the tasks keep running and logs are continuously generated. When printing logs, the executor of Spark uses the log4j log scrolling function to output logs to the **stdout** file. The container also monitors this file. As a result, the file is monitored by two processes at the same time. When one process scrolls according to the configuration, the earliest log file is deleted, but the other process still occupies the file handle. As a result, a file in the deleted state is generated.

Procedure

Change the output directory name for executor logs of Spark.

1. Open the log configuration file. By default, the configuration file is located in *<Client address>***/Spark/spark/conf/log4j-executor.properties**.
2. Change the name of the log output file.

   For example, change **log4j.appender.sparklog.File = ${spark.yarn.app.container.log.dir}/stdout** to **log4j.appender.sparklog.File = ${spark.yarn.app.container.log.dir}/stdout.log**.
3. Save the configuration and exit.
4. Submit the tasks again.

15.2.7 Disassociating a Subnet from the ACL Network

Scenarios

You can disassociate a subnet from the ACL network when necessary.

Procedure

Step 1 Log in to the management console.

Step 2 On the console homepage, under **Network**, click **Virtual Private Cloud**.

Step 3 In the navigation tree on the left, choose **Network ACL**.

Step 4 Locate the target network ACL in the right pane, and click the network ACL name to switch to the network ACL details page.

Step 5 On the displayed page, click the **Associated Subnets** tab.

Step 6 On the **Associated Subnets** page, locate the target network ACL and click **Disassociate** in the **Operation** column.

Step 7 Click **OK**.

----End

15.2.8 MRS Becomes Abnormal After hostname Modification

Issue

What should I do if MRS becomes abnormal after **hostname** is modified?

Symptom

MRS becomes abnormal after **hostname** is modified.

Possible Cause

The **hostname** modification causes compatibility problems and faults.

Procedure

Step 1 Log in to any node in the cluster as user **root**.

Step 2 Run the **cat /etc/hosts** command on the node to check the value of **hostname** of each node and set the **newhostname** variable based on the value.

Step 3 Run the **sudo hostnamectl set-hostname ${newhostname}** command on the node where **hostname** is modified to restore the correct hostname.

NOTE

${newhostname}: new value of **hostname**

Step 4 After the modification, log in to the node where **hostname** is modified, and check whether the new hostname takes effect.

----End

15.2.9 DataNode Restarts Unexpectedly

Symptom

A DataNode is restarted unexpectedly, but no manual restart operation is performed for the DataNode.

Cause Analysis

Possible causes:

- **OOM of the Java process is killed.**

  In general, the OMM Killer is configured for Java processes to detect and kill OOM. The OOM log is printed in the out log. In this case, you can view the run log (for example, the DataNode's log path is **/var/log/Bigdata/hdfs/dn/hadoop-omm-datanode-*hostname*.log**) to check whether OutOfMemory is printed.

- **DataNode is manually killed or killed by another process.**

  Check the DataNode run log file **/var/log/Bigdata/hdfs/dn/hadoop-omm-datanode-*hostname*.log**. It is found that the health check fails after "RECEIVED SIGNAL 15" is received. In the following example, the DataNode is killed at 11:04:48 and then started at 11:06:52 two minutes later.

  ```
  2018-12-06 11:04:48,433 | ERROR | SIGTERM handler | RECEIVED SIGNAL 15: SIGTERM |
  LogAdapter.java:69
  2018-12-06 11:04:48,436 | INFO  | Thread-1 | SHUTDOWN_MSG:
  /************************************************************
  SHUTDOWN_MSG: Shutting down DataNode at 192-168-235-85/192.168.235.85
  ************************************************************/ | LogAdapter.java:45
  2018-12-06 11:06:52,744 | INFO  | main | STARTUP_MSG:
  ```

  According to the logs, DataNode was closed and then the health check reported the exception. After 2 minutes, NodeAgent started the DataNode process.

Procedure

Add the rule for recording the kill command in the audit log of the operating system. The process that delivers the kill command will be recorded in the audit log.

Operation impact

- Printing audit logs affects operating system performance. However, analysis result shows that the impact is less than 1%.
- Printing audit log occupies some disk space. The logs to be printed are within megabytes. By default, the aging mechanism and the mechanism for checking the remaining disk space are configured. Therefore, the disk space will not be used up.

Locating Method

Perform the following operations on nodes that may restart the DataNode process:

Step 1 Log in to the node as the **root** user and run the **service auditd status** command to check the service status.

```
Checking for service auditd  running
```

If the service is not started, run the **service auditd restart** command to restart the service. The command execution takes less than 1 second and has no impact on the system.

```
Shutting down auditd done
Starting auditd done
```

Step 2 The audit rule of the **kill** command is temporarily added to audit logs.

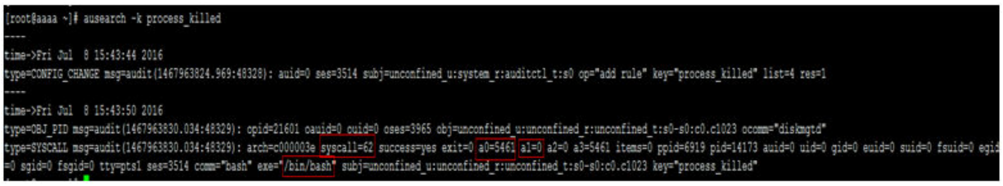
Add an audit rule:

auditctl -a exit,always -F arch=b64 -S kill -S tkill -S tgkill -F a1!=0 -k process_killed

View the rule:

auditctl -l

Step 3 If a process is killed due to an exception, you can run the **ausearch -k process_killed** command to query the kill history.



```
[root@aaaa ~]# ausearch -k process_killed
----
time->Fri Jul  8 15:43:44 2016
type=CONFIG_CHANGE msg=audit(1467963824.969:48328): auid=0 ses=3514 subj=unconfined_u:system_r:auditctl_t:s0 op="add rule" key="process_killed" list=4 res=1
----
time->Fri Jul  8 15:43:50 2016
type=OBJ_PID msg=audit(1467963830.034:48329): opid=21601 oauid=0 ouid=0 oses=3965 obj=unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023 ocomm="diskmgtd"
type=SYSCALL msg=audit(1467963830.034:48329): arch=c000003e syscall=62 success=yes exit=0 a0=5461 a1=0 a2=0 a3=5461 items=0 ppid=6919 pid=14173 auid=0 uid=0 gid=0 euid=0 suid=0 fsuid=0 egid

```

NOTE

a0 is the PID (hexadecimal) of the process that is killed, and **a1** is the semaphore of the kill command.

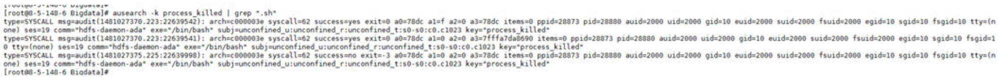
----End

Verification

Step 1 Restart an instance of the node on MRS Manager, for example, DataNode.

Step 2 Run the **ausearch -k process_killed** command to check whether logs are printed.

The following is an example of the **ausearch -k process_killed |grep ".sh"** command. The command output indicates that the **hdfs-daemon-ada*** script closed the DataNode process.



```
[root@8-5-148-6 Bigdata]# ausearch -k process_killed | grep ".sh"
type=SYSCALL msg=audit(1481027370.223:22639542): arch=c000003e syscall=62 success=yes exit=0 a0=78dc a1=f a2=0 a3=78dc items=0 ppid=28873 pid=28880 auid=2000 uid=2000 gid=10 euid=2000 suid=2000 fsuid=2000 egid=10 sgid=10 fsgid=10 tty=(n
one) ses=19 comm="hdfs-daemon-ada" exe="/bin/bash" subj=unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023 key="process_killed"
type=SYSCALL msg=audit(1481027370.223:22639541): arch=c000003e syscall=62 success=yes exit=0 a0=78dc a1=0 a2=0 a3=7fffa7da8690 items=0 ppid=28873 pid=28880 auid=2000 uid=2000 gid=10 euid=2000 suid=2000 fsuid=2000 egid=10 sgid=10 fsgid=1
0 tty=(none) ses=19 comm="hdfs-daemon-ada" exe="/bin/bash" subj=unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023 key="process_killed"
type=SYSCALL msg=audit(1481027375.225:22639998): arch=c000003e syscall=62 success=no exit=-3 a0=78dc a1=0 a2=0 a3=78dc items=0 ppid=28873 pid=28880 auid=2000 uid=2000 gid=10 euid=2000 suid=2000 fsuid=2000 egid=10 sgid=10 fsgid=10 tty=(n
one) ses=19 comm="hdfs-daemon-ada" exe="/bin/bash" subj=unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023 key="process_killed"
[root@8-5-148-6 Bigdata]#
```

----End

Stop auditing the **kill** command.

Step 1 Run the **service auditd restart** command. The temporarily added kill command audit logs are cleared automatically.

Step 2 Run the **auditctl -l** command. If no information about killing a process is returned, the rule is cleared successfully.

----End

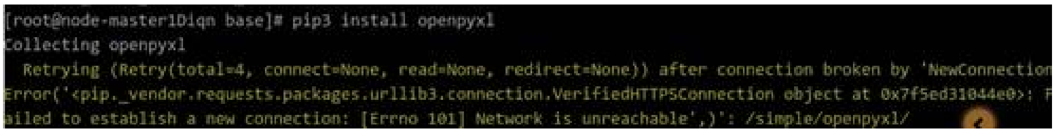
15.2.10 Network Is Unreachable When Using pip3 to Install the Python Package in an MRS Cluster

Issue

When the Python package is installed using pip3, an error message is displayed, indicating that the network is unreachable.

Symptom

When a user runs the pip3 install command to install the Python package, an error message is displayed, indicating that the network is unreachable. For details, see the following figure:



```
[root@node-master1Diqn base]# pip3 install openpyxl
Collecting openpyxl
  Retrying (Retry(total=4, connect=None, read=None, redirect=None)) after connection broken by 'NewConnection
Error('<pip._vendor.requests.packages.urllib3.connection.VerifiedHTTPSConnection object at 0x7f5ed31044e0>: F
ailed to establish a new connection: [Errno 101] Network is unreachable',)': /simple/openpyxl/
```

Cause Analysis

The customer does not bind an EIP to the Master node.

Procedure

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters**, select the faulty cluster, and click its name to check the **Basic Information** on the **Dashboard** tab page.

Step 3 On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.

Step 4 Click the **EIPs** tab and click **Bind EIP** to bind an EIP to the ECS.

Step 5 Log in to the Master node and run the **pip3 install** command to install the Python package.

----End

15.2.11 Failed to Download the MRS Cluster Client

Issue

On the local Master host, a user attempts to download an MRS cluster client for another remote host. However, the system displays a message indicating that the network or parameter is abnormal.

Symptom

On the local Master host, a user attempts to download an MRS cluster client for another remote host. However, the system displays a message indicating that the network or parameter is abnormal.

Cause Analysis

- The two hosts are in different VPCs.
- The password is incorrect.
- The firewall is enabled on the remote host.

Procedure

- The two hosts are in different VPCs.

  Enable port 22 of the remote host.
- The password is incorrect.

  Check whether the password is correct. The password cannot contain special characters.
- The firewall is enabled on the remote host.

  Download the MRS cluster client to the server and run the **scp** command provided by Linux to remotely send the client to the remote host.

15.2.12 Failed to Scale Out an MRS Cluster

Issue

The MRS console is accessible and functions properly, but the MRS cluster fails to be scaled out.

Symptom

The MRS console is normal, and no alarm or error message is displayed on MRS Manager. However, an error message is displayed during cluster scale-out, indicating that the MRS cluster contains nodes that are not running.

Cause Analysis

An MRS cluster can be scaled in or out only when it is running properly. According to the error message, the possible cause is that the cluster status in the database is abnormal or is not updated. As a result, the nodes in the cluster are not in the running state.

Procedure

Step 1 Log in to the MRS console and click the cluster name to go to the cluster details page. Check that the cluster is in the **Running** state.

Step 2 Click **Nodes** to view the status of all nodes. Ensure that all nodes are in the **Running** state.

Step 3 Log in to the podMaster node in the cluster, switch to the MRS deployer node, and view the **api-gateway.log** file.

1. Run the **kubectl get pod -n mrs** command to view the **pod** of the MRS deployer node.
2. Run the **kubectl exec -ti ${***Pod of the deployer node***} -n mrs /bin/bash** command to log in to the pod. For example, run the **kubectl exec -ti mrsdeployer-78bc8c76cf-mn9ss -n mrs /bin/bash** command to access the deployer container of MRS.
3. In the **/opt/cloud/logs/apigateway** directory, view the latest **api-gateway.log** file and search for the required keyword (such as **ERROR**, **scaling**, **clusterScaling**, **HostState**, **state-check**, or the cluster ID) in the file to check the error type.
4. Rectify the fault based on the error information and perform the scale-out again.
   - If the scale-out is successful, no further action is required.
   - If the scale-out fails, go to **Step 4**.

Step 4 Run the **/opt/cloud/mysql -u${***Username***} -P${***Port***} -h${***Address***} -p${***Password***}** command to log in to the database.

Step 5 Run the **select cluster_state from cluster_detail where cluster_id=***Cluster ID***";** command to check the value of **cluster_state**.

- If the value of **cluster_state** is **2**, the cluster status is normal. Go to **Step 6**.
- If the value of **cluster_state** is not **2**, the cluster status in the database is abnormal. You can run the **update cluster_detail set cluster_state=2 where cluster_id="***Cluster ID***";** command to update the cluster status and then check the value of **cluster_state**.
  - If the value of **cluster_state** is **2**, the cluster status is normal. Go to **Step 6**.
  - If the value of **cluster_state** is not **2**, contact technical support.

Step 6 Run the **select host_status from host where cluster_di="***Cluster ID***";** command to query the cluster host status.

- If the host is in the started state, no further action is required.
- If the host is not in the started state, run the **update host set host_status='started' where cluster_id="***Cluster ID***";** command to update the host status to the database.

- If the host is in the started state, no further action is required.
- If the host is not in the started state, contact technical support.

----End

15.2.13 Error Occurs When MRS Executes the Insert Command Using Beeline

Issue

An error occurs when MRS executes the insert command using Beeline.

Symptom

When the **insert into** statement is executed in Beeline of Hive, the following error is reported:

```
Mapping run in Tez on Hive transactional table fails when data volume is high with error:
"org.apache.hadoop.hive.ql.lockmgr.LockException Reason: Transaction... already aborted, Hive SQL state
[42000]."
```

Cause Analysis

This problem is caused by improper cluster configuration and Tez resource setting.

Procedure

This problem can be solved by setting configuration parameters on Beeline.

Step 1 Set the following properties to optimize performance (you are advised to change them at the cluster level):

- Set **hive.auto.convert.sortmerge.join** to **true**.
- Set **hive.optimize.bucketmapjoin** to **true**.
- Set **hive.optimize.bucketmapjoin.sortedmerge** to **true**.

Step 2 Modify the following content to adjust the resources of Tez:

- Set **hive.tez.container.size** to the size of the Yarn container.
- Set **hive.tez.container.size** to the Yarn container size **yarn.scheduler.minimum-allocation-mb** or a smaller value (for example, a half or quarter of the Yarn container size). Ensure that the value does not exceed **yarn.scheduler.maximum-allocation-mb**.

----End

15.2.14 How Do I Upgrade EulerOS to Fix Vulnerabilities in an MRS Cluster?

Issue

EulerOS has vulnerabilities at the underlying layer. This section describes how to upgrade the OS to fix vulnerabilities for an MRS cluster.

Symptom

When the NSFOCUS software is used to test the cluster, vulnerabilities are found at the underlying layer in the EulerOS.

Cause Analysis

When the NSFOCUS software is used to test the cluster, it is found that vulnerabilities exist at the underlying layer in the EulerOS. The MRS service is deployed in the EulerOS. Therefore, the system needs to be upgraded to fix the vulnerabilities.

Procedure

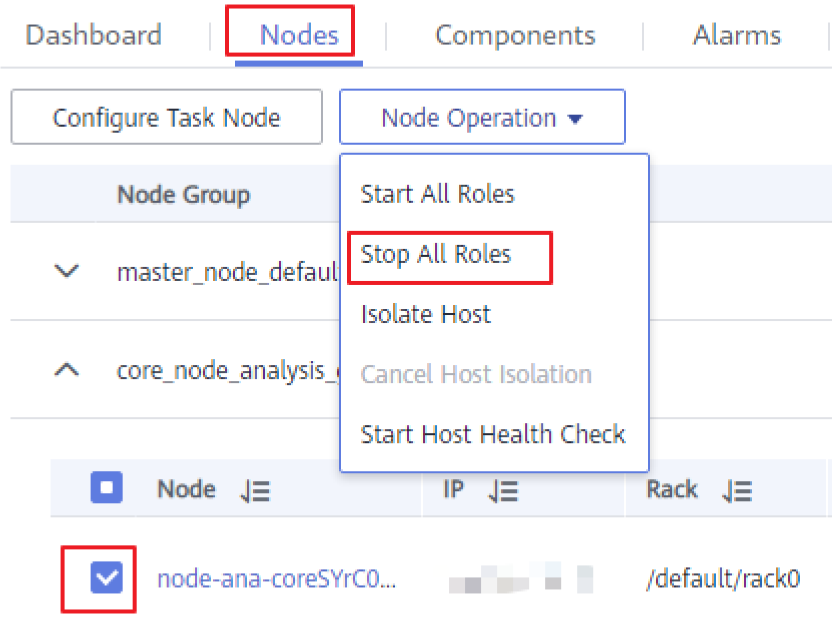
NOTE

Before fixing the vulnerability, check whether Host Security Service (HSS) is enabled. If yes, disable HSS from monitoring the MRS cluster. After the vulnerability is fixed, enable HSS again.

Step 1 Log in to the MRS console.

Step 2 Click the cluster name. On the cluster details page, click the **Nodes** tab.

Step 3 In the core node group, select a core node, click **Node Operation**, and select **Stop All Roles**.



Step 4 Remotely log in to the core node and configure the yum repository.

Step 5 Run the **uname –r** or **rpm –qa |grep kernel** command to query and record the kernel version of the current node.

Step 6 Run the **yum update –y --skip-broken --setopt=protected_multilib=false** command to update the patch.

Step 7 After the update is complete, query the kernel version and run the **rpm -e** *Old kernel version* command to delete the old kernel version.

Step 8 On the cluster details page, click the **Nodes** tab.

Step 9 In the core node group, click the name of the core node whose patch has been updated. The ECS console is displayed.

Step 10 In the upper right corner of the page, click **Restart** to restart the core node.

Step 11 On the **Nodes** tab of the cluster details page, select the core node, click **Node Operation**, and select **Start All Roles**.

Step 12 Repeat **Step 1** to **Step 11** to upgrade other core nodes.

Step 13 After all core nodes are upgraded, upgrade the standby master node and then the active master node. For details, see **Step 1** to **Step 11**.

----End

15.2.15 Using CDM to Migrate Data to HDFS

Issue

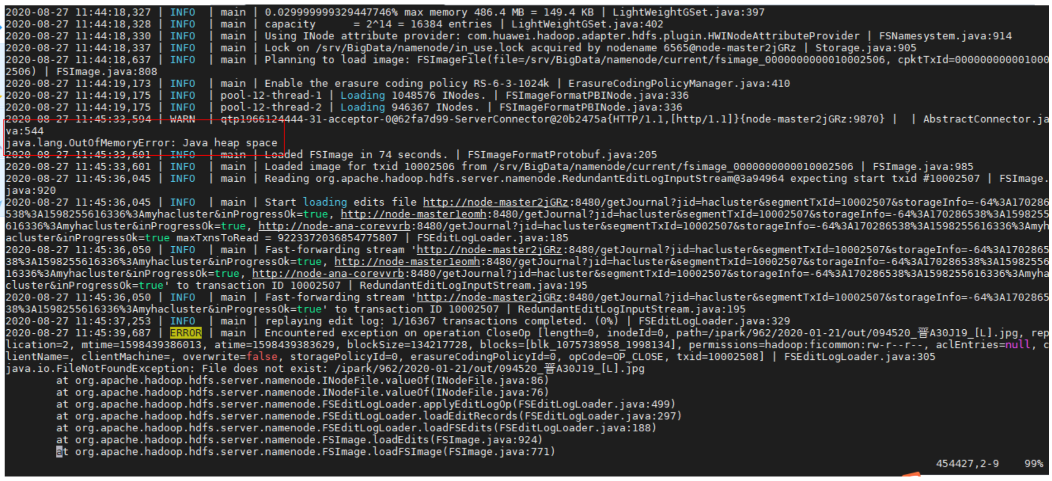
A user failed to use CDM to migrate data from an old cluster to HDFS of a new cluster.

Symptom

When CDM is used to import data from the source HDFS to the destination HDFS, the destination MRS cluster is faulty and the NameNode cannot be started.

The logs show that the **Java heap space** error is reported during the startup. The JVM parameter of the NameNode needs to be modified.

Figure 15-6 Fault logs



```

Cause Analysis

When the user uses CDM to migrate data, the HDFS data volume is too large. As a result, a stack exception occurs when metadata is merged.

Procedure

Step 1 Go to the HDFS service configuration page.

- For versions earlier than MRS 2.0.1: Log in to MRS Manager, choose **Services** > **HDFS** > **Service Configuration**, and select **All** from the **Basic** drop-down list.
- For MRS 2.0.1 or later: Click the cluster name on the MRS console, choose **Components** > **HDFS** > **Service Configuration**, and select **All** from the **Basic** drop-down list.
- For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the target cluster and choose **Services** > **HDFS** > **Configurations** > **All Configurations**.

Step 2 Search for the **GC_OPTS** parameter in **HDFS->NameNode** and increase the values of **-Xms512M** and **-Xmx512M** based on service requirements.

Step 3 Save the configuration and restart the affected services or instances.

----End

15.2.16 Alarms Are Frequently Generated in the MRS Cluster

Issue

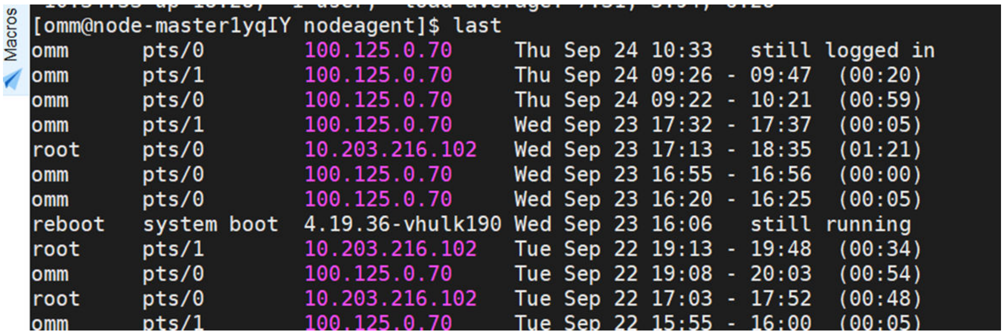
The cluster frequently reports alarms indicating that the heartbeat between the active and standby Manager nodes is interrupted, the heartbeat between the active and standby DBService nodes is interrupted, and the node is faulty. As a result, Hive is occasionally unavailable.

Symptom

The cluster frequently reports alarms indicating that the heartbeat between the active and standby Manager nodes is interrupted, the heartbeat between the active and standby DBService nodes is interrupted, and the node is faulty. As a result, Hive is occasionally unavailable, affecting customer services

Cause Analysis

1. When the alarm is generated, the VM is restarted. The alarm is generated because the VM is restarted.



```

2. According to the OS analysis, the cause of the VM restart is that the node does not have available memory. Memory overflow triggers oom-killer. When the process is invoked, the process enters the **disk sleep** state. As a result, the VM restarts.

3. Check the processes that occupy the memory. It is found that the processes that occupy the memory are normal service processes.

Conclusion: The VM memory cannot meet service requirements.

Procedure

- You are advised to expand the node memory.
- You are advised to disable unnecessary services to avoid this problem.

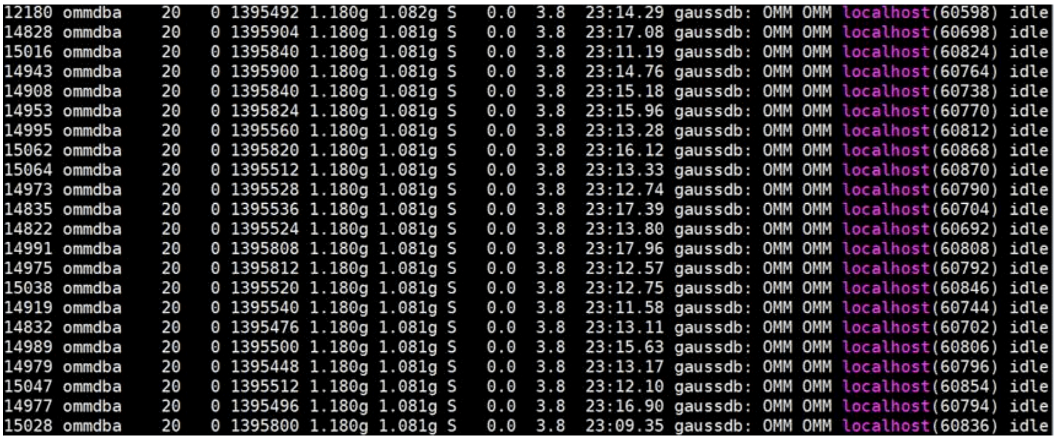
15.2.17 Memory Usage of the PMS Process Is High

Issue

What can I do if the memory usage of the active Master node is high?

Symptom

The memory usage of the active Master node is high. The **top -c** command output shows that the following idle processes occupy a large amount of memory:



```
12180 ommdba    20   0 1395492 1.180g 1.082g S   0.0  3.8  23:14.29 gaussdb: OMM OMM localhost(60598) idle
14828 ommdba    20   0 1395904 1.180g 1.081g S   0.0  3.8  23:17.08 gaussdb: OMM OMM localhost(60698) idle

15028 ommdba    20   0 1395800 1.180g 1.081g S   0.0  3.8  23:09.35 gaussdb: OMM OMM localhost(60836) idle
```

Cause Analysis

- PostgreSQL cache: In addition to common execution plan cache and data cache, PostgreSQL provides cache mechanisms such as **catalog** and **relation** to improve the efficiency of generating execution plans. In the persistent connection scenario, some of the caches are not released. As a result, the persistent connection may occupy a large amount of memory.
- PMS is a monitoring process of MRS. This process frequently creates table partitions or new tables. The PostgreSQL caches the metadata of the objects accessed by the current session, and the connections in the database connection pool of the PMS exist for a long time. Therefore, the memory occupied by the connections gradually increases.

Procedure

Step 1 Log in to the active Master node as user **root**.

Step 2 Run the following command to query the PMS process ID:

ps -ef | grep =pmsd |grep -v grep

Step 3 Run the following command to stop the PMS process. In the command, **PID** indicates the PMS process ID obtained in **Step 2**.

kill -9 PID

Step 4 Wait for the PMS process to automatically start.

It takes 2 to 3 minutes to start PMS. PMS is a monitoring process. Restarting PMS does not affect big data services.

----End

15.2.18 High Memory Usage of the Knox Process

Issue

The memory usage of the knox process is high.

Symptom

The memory usage of the active Master node is high. The **top -c** command output shows that the memory usage of the knox process exceeds 4 GB.

Cause Analysis

The memory is not separately configured for the knox process. The process automatically allocates available memory based on the system memory size. As a result, the knox process occupies a large amount of memory.

Procedure

Step 1 Log in to the Master nodes as user **root**.

Step 2 Open the **/opt/knox/bin/gateway.sh** file. Search for **APP_MEM_OPTS**, and set its value to **-Xms3072m -Xmx4096m**.

Step 3 Log in to Manager and click **Hosts**. Find the IP address of the active Master node (that is, the node with a solid star before the hostname), and log in to the background of the node.

Step 4 Run the following commands to restart the process:

su - omm

sh /opt/knox/bin/restart-knox.sh

----End

15.2.19 It Takes a Long Time to Access HBase from a Client Installed on a Node Outside the Security Cluster

Issue

The cluster client is installed on a node outside the security cluster. When a user runs the **hbase shell** command on the client to access HBase, it is found that the access is very slow.

Symptom

A user creates a security cluster, installs a cluster client on a node outside the cluster, and runs the **hbase shell** command to access HBase. It is found that the access to HBase is very slow.

Cause Analysis

Kerberos authentication is required for a security cluster. You need to configure the **hosts** file on the client node to ensure that the access speed is not affected. An example of the **hosts** configuration is as follows:

```
1.1.1.1 hadoop.782670e3_1364_47e2_8c70_1b61bb80479c.com
1.1.1.1 hadoop.hadoop.com
1.1.1.1 hacluster
1.1.1.1 haclusterX
1.1.1.1 haclusterX1
```

```
1.1.1.1 haclusterX2
1.1.1.1 haclusterX3
1.1.1.1 haclusterX4
1.1.1.1 ClusterX
1.1.1.1 manager
ip1 hostname1
ip2 hostname2
ip3 hostname3
ip4 hostname4
```

Procedure

Copy the content of the **hosts** file on the cluster node to the **hosts** file on the node where the client is installed.

15.2.20 How Do I Locate a Job Submission Failure?

Symptom

A user cannot submit jobs through DGC or on the MRS console.

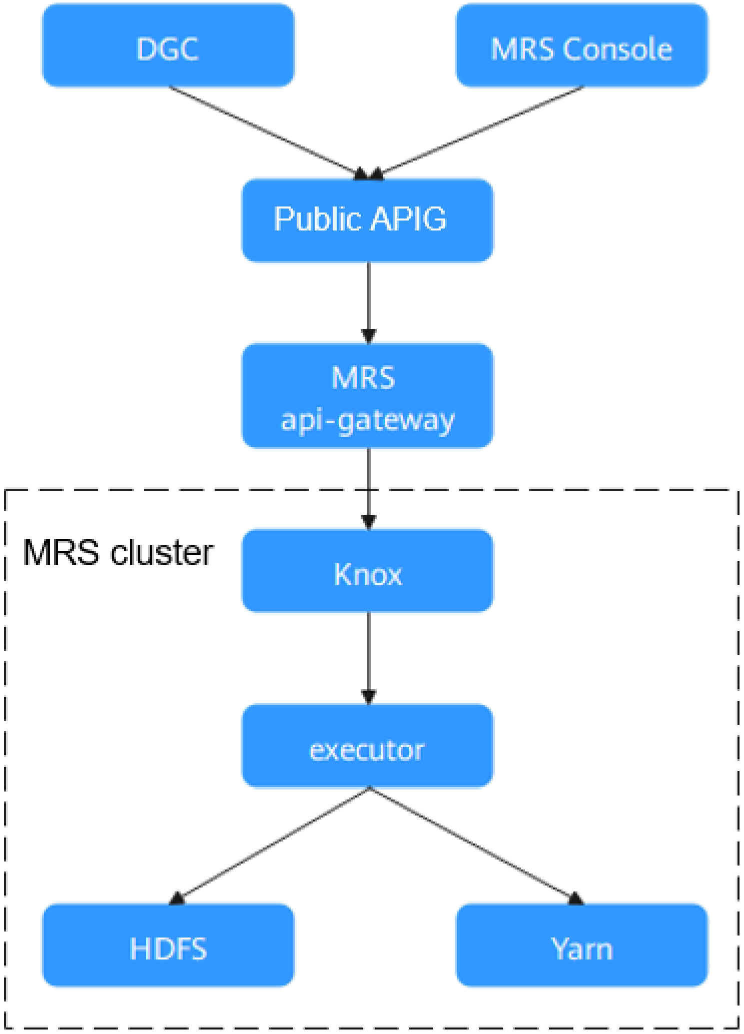
Impact

Jobs cannot be submitted, and services are interrupted.

Introduction to the Operation Process

1. All requests pass through APIG gateway and are restricted by the flow control configured on APIG.
2. APIG forwards the request to the api-gateway of the MRS management plane.
3. The API node on the MRS management plane polls the Knox of the active and standby OMS nodes to determine the Knox of the active OMS node.
4. MRS management-plane API submits a task to Knox of the active OMS.
5. Knox forwards requests to the Executor process on the current node.
6. The executor process submits a task to Yarn.

Figure 15-7 Job process



Procedure

Make preparations:

- Check whether the job is submitted through DGC or on the MRS console.
- Prepare the information listed in **Table 15-1**.

Table 15-1 Items to be prepared before the rectification

No.	Projects	Operation Mode
1	Cluster account information	Apply for **password** of user **admin** in the cluster.
2	Node account information	Apply for the passwords of users **omm** and **root** of cluster nodes.

No.	Projects	Operation Mode
3	Secure Shell (SSH) remote login tool	Prepare such tools as PuTTY or SecureCRT.
4	Client	Install the client.

Step 1 Locate the cause of the exception.

View the error code received in the job log and check whether the error code belongs to APIG or MRS.

- If the error code is a public APIG error code (starting with "APIGW"), contact public APIG maintenance personnel.
- If an error occurs on MRS, go to the next step.

Step 2 Check the running status of services and processes.

1. Log in to Manager and check whether a service fault occurs. If a job-related service fault or an underlying basic service fault occurs, rectify the fault.
2. Check whether a critical alarm is generated.
3. Log in to the active Master node.
4. Run the following command to check whether the OMS status is normal and whether the executor and knox processes on the active OMS node are normal: The knox is in active-active mode, and the executor is in single-active mode.

   /opt/Bigdata/om-0.0.1/sbin/status-oms.sh
5. Run the **jmap -heap** *PID* command as user **omm** to check the memory usage of the Knox and Executor processes. If the old-generation memory usage is 99.9%, the memory overflow occurs.

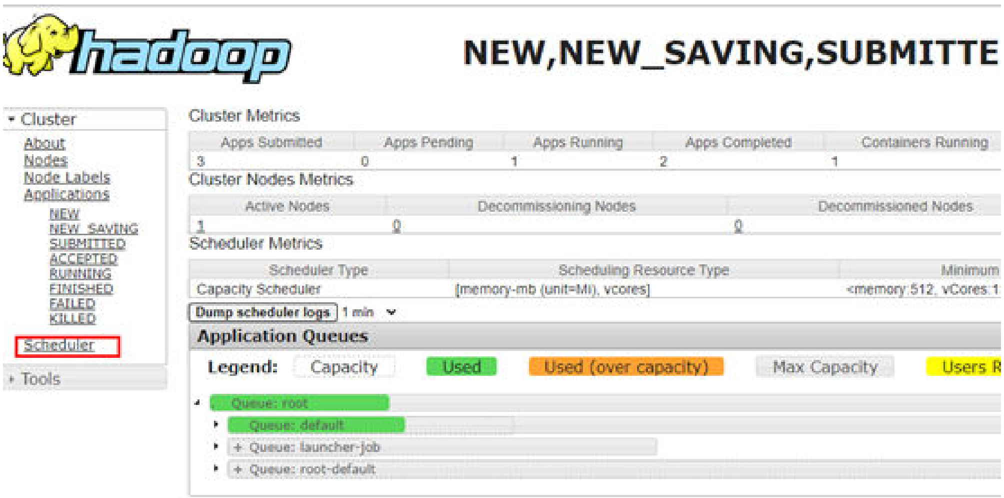
   Run the **netstat -anp | grep 8181 | grep LISTEN** command to query the PID of the executor process.

   Run the **ps -ef|grep knox | grep -v grep** command to query the PID of the knox process.

   If the memory overflows, run the **jmap -dump:format=b,file=/home/omm/temp.bin** *PID* command to export the memory information and restart the process.
6. View the native Yarn page to check the queue resource usage and whether the task is submitted to Yarn.

   On the native Yarn page: choose **Components** > **Yarn** > **ResourceManager WebUI** > **ResourceManager (Active)**.

Figure 15-8 Queue resource usage on the Yarn page



Cluster Metrics

Apps Submitted	Apps Pending	Apps Running	Apps Completed	Containers Running
3	0	1	2	1

Cluster Nodes Metrics

Active Nodes	Decommissioning Nodes	Decommissioned Nodes
1	0	0

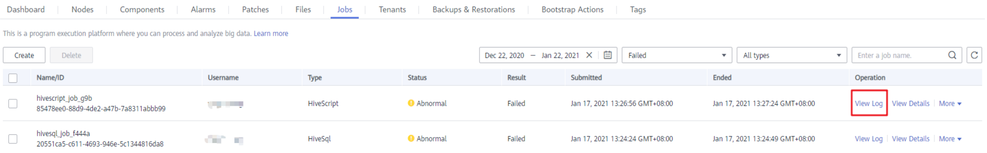
Scheduler Metrics

Scheduler Type	Scheduling Resource Type	Minimum
Capacity Scheduler	[memory-mb (unit=Mi), vcores]	<memory:512, vCores:1

Step 3 Locate the fault causing the task submission failure.

1. Log in to the MRS management console and click the cluster name to go to the cluster details page.
2. On the **Jobs** tab page, locate the row that contains the target job and click **View Log** in the **Operation** column.

Figure 15-9 View the logs



This is a program execution platform where you can process and analyze big data. Learn more

Name/ID	Username	Type	Status	Result	Submitted	Ended	Operation
hivescript_job_g9b 85478ee0-88d9-4de2-a47b-7a8311abbb99	[redacted]	HiveScript	Abnormal	Failed	Jan 17, 2021 13:26:56 GMT+08:00	Jan 17, 2021 13:27:24 GMT+08:00	View Log | View Details | More
hivesql_job_f444a 20551ca5-c611-4693-946e-5c1344816da8	[redacted]	HiveSql	Abnormal	Failed	Jan 17, 2021 13:24:24 GMT+08:00	Jan 17, 2021 13:24:49 GMT+08:00	View Log | View Details | More

3. If there is no log or the log information is not detailed, copy the job ID in the **Name/ID** column.
4. Run the following command on the active OMS node to check whether the task request is sent to the KNOX. If the request is not sent to the KNOX, the KNOX may be faulty. In this case, restart the KNOX to rectify the fault.

   grep "mrsjob" /var/log/Bigdata/knox/logs/gateway-audit.log | tail -10
5. Search for the job ID in the Executor log and view the error information.

   Log file path: **/var/log/Bigdata/executor/logs/exe.log**
6. Modify the **/opt/executor/webapps/executor/WEB-INF/classes/log4j.properties** file to enable the debug log of the executor. Submit the test task and view the executor log. Confirm the error reported during job submission.

   Log file path: **/var/log/Bigdata/executor/logs/exe.log**
7. If an error occurs in the executor, run the following command to print the jstack information of the executor and check the current execution status of the thread:

   jstack PID > xxx.log
8. On the cluster details page, click the **Jobs** tab. Locate the row that contains the target job, and click **View Details** in the **Operation** column to obtain the actual job ID (**applicationID**).

9. On the cluster details page, choose **Components** > **Yarn** > **ResourceManager WebUI** > **ResourceManager (Active)**. On the native Yarn page that is displayed, click **applicationID**.

15.2.21 OS Disk Space Is Insufficient Due to Oversized HBase Log Files

Issue

The space of the **/var/log** partition on the system disk is insufficient.

Symptom

The **/var/log/Bigdata/hbase/*/hbase-omm-*.out** log file is too large, causing insufficient space of the **/var/log** partition on the system disk.

Cause Analysis

During the long-term running of HBase, the OS periodically deletes the **/tmp/.java_pid*** files created by the JVM. The HBase memory monitoring uses the **jinfo** command, which depends on the **/tmp/.java_pid*** file. If the file does not exist, the **jinfo** command runs **kill -3** to print the jstack information to the **.out** log file. As a result, the **.out** log file becomes oversize as time goes by.

Procedure

On each node hosting the HBase instance, deploy a scheduled task to periodically clear the **.out** log file. For example, log in to the HBase instance node and run the **crontab -e** command to add a scheduled task to clear the **.out** log file at 00:00:00 every day.

crontab -e

00 00 * * * for file in `ls /var/log/Bigdata/hbase/*/hbase-omm-*.out`; do echo "" > $file; done

NOTE

If large **.out** files are generated frequently, you can clear the files multiple times every day or adjust the automatic clearing policy of the OS.

15.2.22 Failed to Delete a New Tenant on FusionInsight Manager

Symptom

A user fails to delete a tenant created on the **Tenant Resources** page of FusionInsight Manager, and an error message is displayed.

Cause Analysis

When a tenant is created, its role is generated. The role will be deleted first when the tenant is deleted. If the component that supports permission configuration is abnormal, the resource permission of the role fails to be deleted.

Procedure

Step 1 Log in to FusionInsight Manager and choose **System** > **Permission** > **Role**.

Step 2 Click **Create Role**. In the **Configure Resource Permission** area, click the cluster name to check the components available for resource permission configuration.

Step 3 Choose **Cluster** > **Services** and check that the running status of these components is **Normal**.

Step 4 (Optional) If the running status is not **Normal**, start or repair the component until its running status becomes **Normal**.

Step 5 Delete the tenant again.

----End

15.3 Using Alluixo

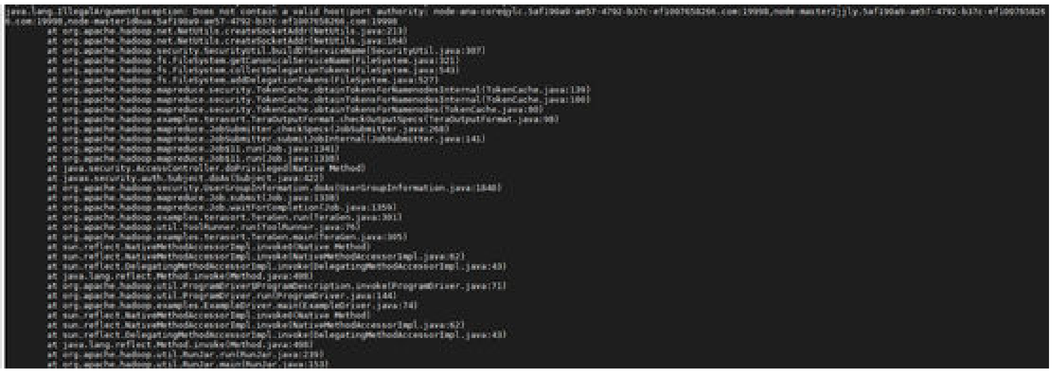
15.3.1 Error Message "Does not contain a valid host:port authority" Is Reported When Alluixo Is in HA Mode

Issue

Error message "Does not contain a valid host:port authority" is reported for Alluixo in HA mode in a security cluster.

Symptom

Error message "Does not contain a valid host:port authority" is reported for Alluixo in HA mode in a security cluster.



```
java.lang.IllegalArgumentException: Does not contain a valid host:port authority: node-ana-coreglc.5af190a9-ae57-4792-b37c-ef1007658266.com:19998,node-master2jjly.5af190a9-ae57-4792-b37c-ef100765826

        at org.apache.hadoop.util.RunJar.main(RunJar.java:153)
```

Cause Analysis

org.apache.hadoop.security.SecurityUtil.buildDTServiceName does not support multiple alluxiomaster addresses in the URI.

Procedure

Use **alluxio:///** or **alluxio://<***IP address or hostname of the active AlluxioMaster***>: 19998/** for access.

15.4 Using ClickHouse

15.4.1 ClickHouse Fails to Start Due to Incorrect Data in ZooKeeper

Symptom

An instance node in the ClickHouse cluster fails to start. The startup log of the instance node contains error information similar to the following:

```
2021.03.15 21:01:19.816593 [ 11111 ] {} <Error> Application: DB::Exception:
The local set of parts of table DEFAULT.lineorder doesn't look like the set ofdoesn't look like the set of
parts in ZooKeeper: 59.99 million rows of 59.99 million total rows in
filesystem are suspicious. There are 30 unexpected parts with 59986052 rows
(14 of them is not just-written with 59986052 rows), 0 missing parts (with 0
blocks).: Cannot attach table `DEFAULT`.`lineorder` from metadata file
...
: while loading database
```

Cause Analysis

When a ClickHouse instance is abnormal, the ReplicatedMergeTree engine table is repeatedly created in the cluster, and then deleted. The creation and deletion of the ReplicatedMergeTree engine table causes data error in ZooKeeper, which causes a start failure of ClickHouse.

Solution

Step 1 Back up all data tables in the database of the faulty node to another directory.

- Back up table data:

  cd /srv/BigData/data1/clickhouse/data/*Database name*

  mv *Table name Directory to be backed up/***data***1*

  NOTE

  If there are multiple disks, back up data of **data1** to **dataN**.

- Back up metadata information:

  cd /srv/BigData/data1/clickhouse_path/metadata

  mv *Table name***.sql** *Directory to be backed up*

For example, to back up the lineorder table in the default database to the **/home/backup** directory, run the following command.

cd /srv/BigData/data1/clickhouse/data/default

mv lineorder /home/backup/data1

cd /srv/BigData/data1/clickhouse_path/metadata

mv lineorder.sql /home/backup

Step 2 Log in to MRS Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**, select the target instance node, and click **Start Instance**.

Step 3 After the instance is started, use the ClickHouse client to log in to the faulty node.

clickhouse client --host *Clickhouse instance IP address* **--user** *User name* **--password** *Password*

Step 4 Run the following command to obtain the ZooKeeper path **zookeeper_path** of the current table and **replica_num** of the corresponding node.

SELECT zookeeper_path FROM system.replicas WHERE database = '*Database name***' AND table = '***Table name***';**

SELECT replica_num,host_name FROM system.clusters;

Step 5 Run the following command to access the ZooKeeper command line interface:

zkCli.sh -server *IP address of the ZooKeeper node***:2181**

Step 6 Locate the ZooKeeper path corresponding to the table data of the faulty node.

ls *zookeeper_path***/replicas/***replica_num*

NOTE

zookeeper_path indicates the value of **zookeeper_path** obtained in **Step 4**.

replica_num indicates the value of **replica_num** corresponding to the host in **Step 4**.

Step 7 Run the following command to delete the replica data from ZooKeeper:

deleteall *zookeeper_path***/replicas/***replica_num*

Step 8 Use the ClickHouse client to log in to the node and create the ReplicatedMergeTree engine table of the cluster.

clickhouse client --host *Clickhouse instance IP address* **--multiline --user** *Username* **--password** *Password*

CREATE TABLE *Database name.Table name* **ON CLUSTER** *Cluster name*

...

ENGINE = ReplicatedMergeTree ...

The following error message is displayed on other replica nodes, which is normal and can be ignored.

```
Received exception from server (version 20.8.7):
Code: 57. DB::Exception: Received from x.x.x.x:9000. DB::Exception:
There was an error on [x.x.x.x:9000]: Code: 57, e.displayText() =
DB::Exception: Table DEFAULT.lineorder already exists. (version 20.8.11.17
(official build)).
```

After the table is successfully created, the table data on the faulty node will be automatically synchronized. The data restoration is complete.

----End

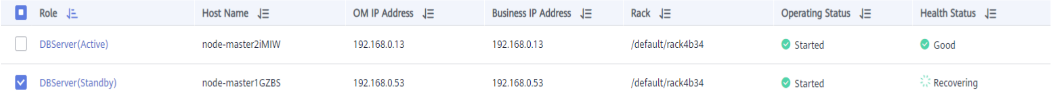
15.5 Using DBService

15.5.1 DBServer Instance Is in Abnormal Status

Symptom

A DBServer instance is in the **Concerning** state for a long period of time.

Figure 15-12 DBServer instance status

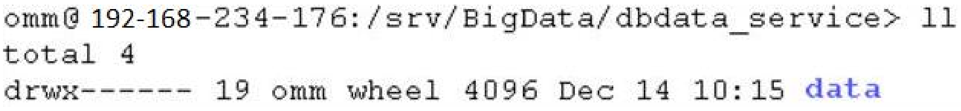


☐ Role	Host Name	OM IP Address	Business IP Address	Rack	Operating Status	Health Status
☐ DBServer(Active)	node-master2iMIW	192.168.0.13	192.168.0.13	/default/rack4b34	✓ Started	✓ Good
☑ DBServer(Standby)	node-master1GZBS	192.168.0.53	192.168.0.53	/default/rack4b34	✓ Started	Recovering

Cause Analysis

The permission for files or directories in the data directory is incorrect. GaussDB requires that the file permission be at least 600 and directory permission be at least 700.

Figure 15-13 Directory permission list



```
omm@ 192-168-234-176:/srv/BigData/dbdata_service> ll
total 4
drwx------ 19 omm wheel 4096 Dec 14 10:15 data

```

Solution

Step 1 Modify the permissions on the files and directories based on the permission list in **Figure 15-13** and **Figure 15-14**.

Step 2 Restart the DBServer instance.

----End

15.5.2 DBServer Instance Remains in the Restoring State

Symptom

A DBServer instance remains in the **Restoring** state. The status cannot be recovered even after a restart.

Cause Analysis

1. DBService monitors the **${BIGDATA_HOME}/MRS_***XXX***/install/dbservice/ha/module/harm/plugin/script/gsDB/.startGS.fail** file. *XXX* indicates the product version.
2. If the value in the file is greater than 3, the startup fails. The NodeAgent keeps trying to restart the instance. In this case, the startup still fails and the value is incremented by 1 each time the startup fails.

Solution

Step 1 Log in to MRS Manager.

Step 2 Stop the DBServer instance.

Step 3 Log in to the node where the DBServer instance is abnormal as user **omm**.

Step 4 Change the value of in the **${BIGDATA_HOME}/MRS_***XXX***/install/dbservice/ha/module/harm/plugin/script/gsDB/.startGS.fail** file to **0**. *XXX* indicates the product version.

Step 5 Start the DBServer instance.

----End

15.5.3 Default Port 20050 or 20051 Is Occupied

Symptom

DBService restart fails, and information indicating that port 20050 or 20051 is occupied is displayed in the printed fault log.

Cause Analysis

1. The default port 20050 or 20051 used by DBService is occupied by another process.
2. The DBService process is not stopped, and the port used by DBService is not released.

Solution

This solution uses port 20051 as an example. The solution to the problem that port 20050 is occupied is similar.

Step 1 Log in to the node where the error is reported as user **root**, and run the **netstat -nap | grep 20051** command to check the process that occupies port 20051.

Step 2 Run the **kill** command to forcibly stop the process that uses port 20051.

Step 3 About 2 minutes later, run the **netstat -nap | grep 20051** command again to check whether any process uses the port.

Step 4 Check the service to which the process belongs and change the port for the service.

Step 5 Run the **find . -name "*20051*"** command in the **/tmp** and **/var/run/MRS-DBService/** directories, and delete all files found.

Step 6 Log in to Manager and restart DBService.

----End

15.5.4 DBServer Instance Is Always in the Restoring State Because the Incorrect /tmp Directory Permission

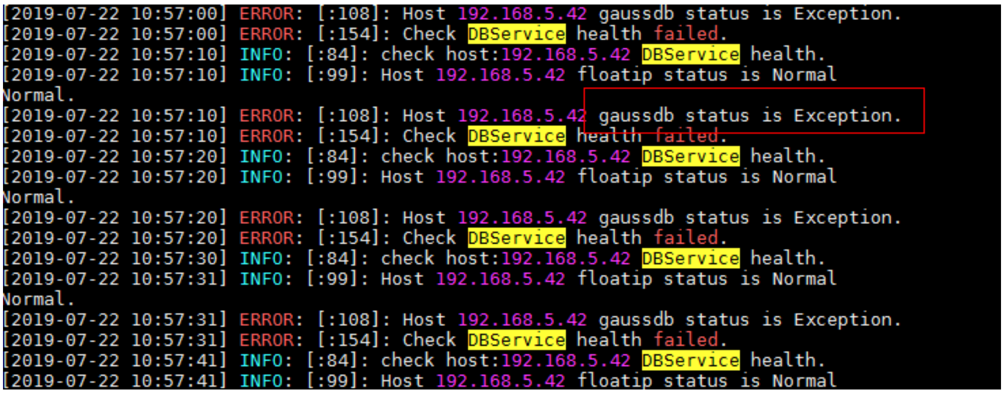
Symptom

A DBServer instance remains in the **Restoring** state. The status cannot be recovered even after a restart.

Cause Analysis

1. Check **/var/log/Bigdata/dbservice/healthCheck/dbservice_processCheck.log**. It is found that GaussDB is abnormal.

Figure 15-15 GaussDB exception



```
[2019-07-22 10:57:00] ERROR: [:108]: Host 192.168.5.42 gaussdb status is Exception.

omm@hadoopc1h2:~> exit
logout
Connection to [redacted] closed.
omm@hadoopc1h1:~> ssh [redacted]
ssh: connect to host [redacted] port 22: Connection refused
```

Solution

Step 1 If the network is faulty, contact network engineers.

Step 2 Perform backup operations again after the network fault is rectified.

----End

15.5.6 Components Failed to Connect to DBService in Normal State

Symptom

Upper-layer components fail to connect to DBService. The DBService component and two instances are normal.

Figure 15-18 DBService status

□	Role	Host Name	OM IP	Business IP	Rack	Operating Status	Health Status	Configuration Status
□	DBServer(Active)	189-120-85-102	[redacted]	[redacted]	/default/rack0	✓ Started	✓ Good	✓ Synchronized
□	DBServer(Standby)	189-120-85-141	[redacted]	[redacted]	/default/rack0	✓ Started	✓ Good	✓ Synchronized

Cause Analysis

1. The upper-layer component is DBService connected through **dbservice.floatip**.
2. Run the **netstat -anp | grep 20051** command on the node where DBServer resides. It is found that the Gauss process of DBService is not bound to the floating IP address during startup, and only the local IP address 127.0.0.1 is listened.

Solution

Step 1 Restart the DBService service.

Step 2 Run the **netstat -anp | grep 20051** command on the active DBServer node to check whether **dbservice.floatip** is bound.

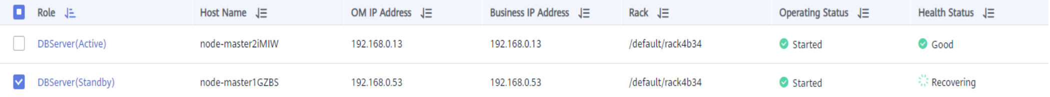
----End

15.5.7 DBServer Failed to Start

Symptom

DBService fails to be started and restarts also fail. The instance keeps in the **Recovering** state.

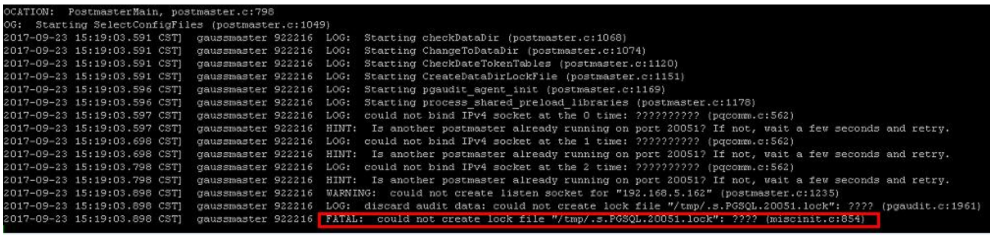
Figure 15-19 DBService status



■ Role	Host Name	OM IP Address	Business IP Address	Rack	Operating Status	Health Status
□ DBServer(Active)	node-master2iMIW	192.168.0.13	192.168.0.13	/default/rack4b34	✓ Started	✓ Good
☑ DBServer(Standby)	node-master1GZBS	192.168.0.53	192.168.0.53	/default/rack4b34	✓ Started	Recovering

Cause Analysis

1. Check the DBService logs in **/var/log/Bigdata/dbservice/DB/gs_ctl-current.log**. The following error message is displayed:



```
OCATION:  PostmasterMain, postmaster.c:798
OG:  Starting SelectConfigFiles (postmaster.c:1049)
2017-09-23 15:19:03.591 CST]  gaussmaster 922216  LOG:  Starting checkDataDir (postmaster.c:1068)

drwxr-xr-x  13 root  root     4096 Apr 22  2014 usr
```

Solution

Step 1 Modify the **/tmp** permission by changing the value to **777**.

Step 2 Restart DBService.

----End

15.5.8 DBService Backup Failed Because the Floating IP Address Is Unreachable

Symptom

The default DBService backup fails, but backups of NameNode, LdapServer, and OMS are successful.

Cause Analysis

1. Check the error information on the DBService backup page:

   ```
   Clear temporary files at backup checkpoint DBService_test_DBService_DBService_20180326155921
   that fialed last time.
   Temporoyary files at backup checkpoint DBService_test_DBService_DBService20180326155921 that
   failed last time are cleared successfully.
   ```

   
   ```
   Start executing the backup task.
   The backup of configuration DBService is started.
   Check the backup available disk space.
   Backup initialization succeeded for configuration DBService.
   Clear temporary files at backup checkpoint DBService_test_DBService_DBService_20180326155921 that failed last time.
   Temporary files at backup checkpoint DBService_test_DBService_DBService_20180326155921 that failed last time are cleared successfully.
   Checkpoint DBService_test_DBService_DBService_20180326162235 is verified successfully before backup.
   Temporary files are cleared successfully before backup checkpoint DBService_test_DBService_DBService_20180326162235.
   Prestart backup succeeded for checkpoint DBService_test_DBService_DBService_20180326162235.
   The snapshot is created successfully for checkpoint DBService_test_DBService_DBService_20180326162235 before backup.
   Backup is being performed for checkpoint DBService_test_DBService_DBService_20180326162235.
   Backup execution failed. Task ID: 2
   Detail: DBService backup task failed, please view details in logs.
   Temporary files are cleared successfully after backup checkpoint DBService_test_DBService_DBService_20180326162235.
   checkpoint DBService_test_DBService_DBService_20180326162235 is deleted successfully after backup failure.
   Failed to backup configuration DBService.
   ```

2. Check the **/var/log/Bigdata/dbservice/scriptlog/backup.log** file. It is found that the log printing stops and no related backup information is found.

3. Check the **/var/log/Bigdata/controller/backupplugin.log** file on the active OMS node. The following error information is found:

   ```
   result error is ssh:connect to host 172.16.4.200 port 22: Connection refused (172.16.4.200 is the
   floating IP address of DBService)
   DBService backup failed.
   ```

   
   ```

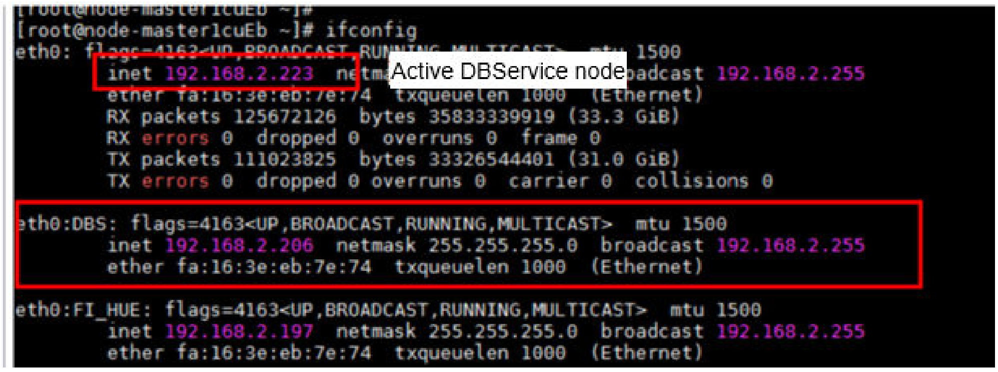
   2018-03-27 07:00:40,868 INFO  [pool-1-thread-5] query backup taskId is 6. com.huawei.bigdata.om.dbservice.backup.BackupRecoveryPlugin.getBackupProgress(BackupRecoveryPlugin.java:247)
   ```

Solution

Step 1 Log in to the active DBService node (the Master node bound with the DBService floating IP address).



```
[root@node-master1cuEb ~]#
[root@node-master1cuEb ~]# ifconfig
eth0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 192.168.2.223  netm                     adcast 192.168.2.255
        ether fa:16:3e:eb:7e:74  txqueuelen 1000  (Ethernet)
        RX packets 125672126  bytes 35833339919 (33.3 GiB)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 111023825  bytes 33326544401 (31.0 GiB)
        TX errors 0  dropped 0 overruns 0  carrier 0  collisions 0

eth0:DBS: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 192.168.2.206  netmask 255.255.255.0  broadcast 192.168.2.255
        ether fa:16:3e:eb:7e:74  txqueuelen 1000  (Ethernet)

eth0:FI_HUE: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 192.168.2.197  netmask 255.255.255.0  broadcast 192.168.2.255
        ether fa:16:3e:eb:7e:74  txqueuelen 1000  (Ethernet)
```

Step 2 Add the DBService floating IP address to **ListenAddress** or comment out **ListenAddress** in the **/etc/ssh/sshd_config** file.

Step 3 Run the following command to restart the SSHD service:

service sshd restart

Step 4 Check whether the next DBServie backup is successful.

----End

15.5.9 DBService Failed to Start Due to the Loss of the DBService Configuration File

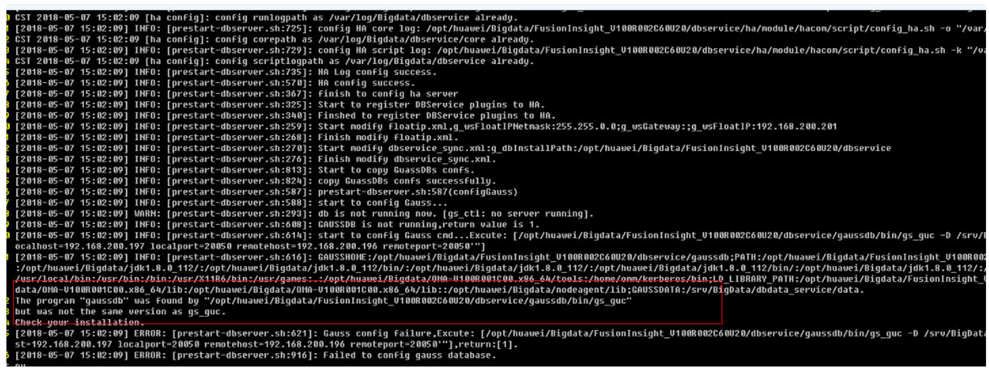
Symptom

The nodes are powered off unexpectedly, and the standby DBService node fails to be restarted.

Cause Analysis

1. The **/var/log/Bigdata/dbservice/DB/gaussdb.log** file is viewed, which contains no information.
2. The **/var/log/Bigdata/dbservice/scriptlog/preStartDBService.log** file is viewed. This file contains the following information, indicating that the configuration information is lost:

```
The program "gaussdb" was found by "
/opt/Bigdata/MRS_xxx/install/dbservice/gaussdb/bin/gs_guc)
But not was not the same version as gs_guc.
Check your installation.
```



```

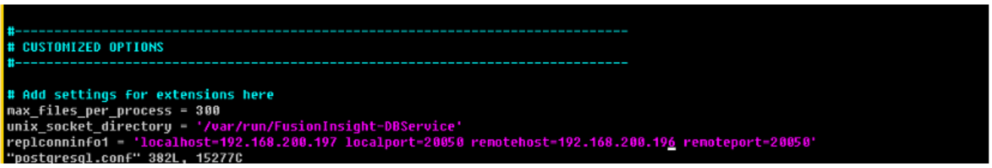
Solution

Step 1 Copy the content in the **/srv/BigData/dbdata_service/data** directory on the active node to the standby node and ensure that the file permission and owner group are the same as those on the active node.

Step 2 Modify configuration in **postgresql.conf**. Set **localhost** to the IP of the local node and **remotehost** to the IP of the peer node.



```
#------------------------------------------------------------------------------
# CUSTOMIZED OPTIONS
#------------------------------------------------------------------------------

# Add settings for extensions here
max_files_per_process = 300
unix_socket_directory = '/var/run/FusionInsight-DBService'
replconninfo1 = 'localhost=192.168.200.197 localport=20050 remotehost=192.168.200.196 remoteport=20050'
"postgresql.conf" 382L, 15277C
```

Step 3 Log in to Manager and restart the standby DBServer node.

----End

15.6 Using Flink

15.6.1 "IllegalConfigurationException: Error while parsing YAML configuration file: "security.kerberos.login.keytab" Is Displayed When a Command Is Executed on an Installed Client

Symptom

After the client is successfully installed, an error message "IllegalConfigurationException: Error while parsing YAML configuration file:"security.kerberos.login.keytab" is displayed when the command (for example, **yarn-session.sh**) on the client is executed.

```
[root@8-5-131-10 bin]# yarn-session.sh
2018-10-25 01:22:06,454 | ERROR | [main] | Error while trying to split key and value in configuration
file /opt/flinkclient/Flink/flink/conf/flink-conf.yaml:80: "security.kerberos.login.keytab: " |
org.apache.flink.configuration.GlobalConfiguration (GlobalConfiguration.java:160)
Exception in thread "main" org.apache.flink.configuration.IllegalConfigurationException: Error while parsing
YAML configuration file :80: "security.kerberos.login.keytab: "
```

```
        at org.apache.flink.configuration.GlobalConfiguration.loadYAMLResource(GlobalConfiguration.java:
161)
        at org.apache.flink.configuration.GlobalConfiguration.loadConfiguration(GlobalConfiguration.java:112)
        at org.apache.flink.configuration.GlobalConfiguration.loadConfiguration(GlobalConfiguration.java:79)
        at org.apache.flink.yarn.cli.FlinkYarnSessionCli.main(FlinkYarnSessionCli.java:482)
[root@8-5-131-10 bin]#
```

Cause Analysis

In a secure cluster environment, Flink requires security authentication. The security authentication is not configured on the current client.

1. The following two authentication modes are available for Flink.
   - Kerberos authentication: Flink Yarn client, Yarn ResourceManager, JobManager, HDFS, TaskManager, Kafka, and ZooKeeper
   - Internal authentication mechanism of Yarn: The internal authentication used between YarnResource Manager and Application Master (AM).
2. If a security cluster is required, the Kerberos authentication and security cookie authentication are mandatory. As shown in the logs, it is found that the **security.kerberos.login.keytab** setting in the configuration file is incorrect and the security configuration is not performed.

Solution

Step 1 Download the keytab file from MRS and save it in a folder on a host where the Flink client resides.

Step 2 Configure following parameters in the **flink-conf.yaml** file:

1. Keytab path

   ```
   security.kerberos.login.keytab: /home/flinkuser/keytab/abc222.keytab
   ```

   NOTE

   - **/home/flinkuser/keytab/abc222.keytab** indicates the user directory, which is the directory saves the keytab file in **Step 1**.
   - Ensure that the client user has the permission on the corresponding directory.

2. Principal name

   ```
   security.kerberos.login.principal: abc222
   ```

3. In HA mode, if Zookeeper is configured, the ZooKeeper Kerberos authentication configuration items must be configured as follows:

   ```
   zookeeper.sasl.disable: false
   security.kerberos.login.contexts: Client
   ```

4. If Kerberos authentication is required between the Kafka client and Kafka broker, configure it as follows:

   ```
   security.kerberos.login.contexts: Client,KafkaClient
   ```

----End

15.6.2 "IllegalConfigurationException: Error while parsing YAML configuration file" Is Displayed When a Command Is Executed After Configurations of the Installed Client Are Changed

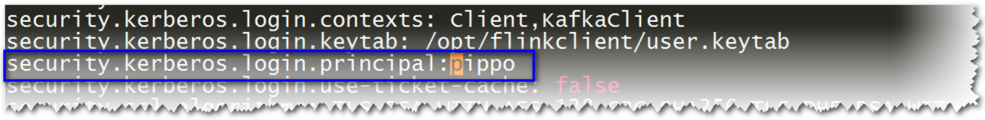
Symptom

After the client is successfully installed, an error message "IllegalConfigurationException: Error while parsing YAML configuration file: 81: "security.kerberos.login.principal:pippo " is displayed when the command (for example, **yarn-session.sh**) on the client is executed.

```
[root@8-5-131-10 bin]# yarn-session.sh
2018-10-25 19:27:01,397 | ERROR | [main] | Error while trying to split key and value in configuration
file /opt/flinkclient/Flink/flink/conf/flink-conf.yaml:81: "security.kerberos.login.principal:pippo " |
org.apache.flink.configuration.GlobalConfiguration  (GlobalConfiguration.java:160)
Exception in thread "main" org.apache.flink.configuration.IllegalConfigurationException: Error while parsing
YAML configuration file :81: "security.kerberos.login.principal:pippo "
        at org.apache.flink.configuration.GlobalConfiguration.loadYAMLResource(GlobalConfiguration.java:
161)
        at org.apache.flink.configuration.GlobalConfiguration.loadConfiguration(GlobalConfiguration.java:112)
        at org.apache.flink.configuration.GlobalConfiguration.loadConfiguration(GlobalConfiguration.java:79)
        at org.apache.flink.yarn.cli.FlinkYarnSessionCli.main(FlinkYarnSessionCli.java:482)
```

Cause Analysis

The **security.kerberos.login.principal:pippo** item in the **flink-conf.yaml** configuration file was faulty.

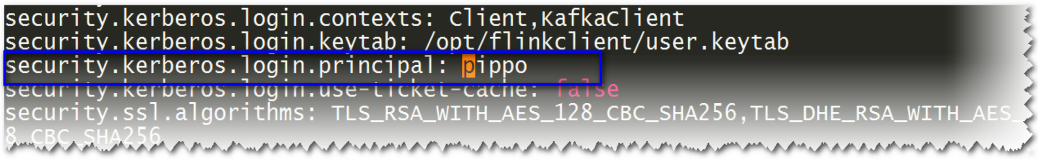


```
security.kerberos.login.contexts: Client,KafkaClient
security.kerberos.login.keytab: /opt/flinkclient/user.keytab
security.kerberos.login.principal:pippo
security.kerberos.login.use-ticket-cache: false
```

Solution

Modify the configuration in the **flink-conf.yaml** file.

Note: The configuration item name and value must be separated by a space.



```
security.kerberos.login.contexts: Client,KafkaClient
security.kerberos.login.keytab: /opt/flinkclient/user.keytab
security.kerberos.login.principal: pippo
security.kerberos.login.use-ticket-cache: false
security.ssl.algorithms: TLS_RSA_WITH_AES_128_CBC_SHA256,TLS_DHE_RSA_WITH_AES_
8_CBC_SHA256
```

15.6.3 The yarn-session.sh Command Fails to Be Executed When the Flink Cluster Is Created

Symptom

During the creation of the Flink cluster, an error message is displayed after the **yarn-session.sh** command execution is suspended.

```

Caused by: java.util.concurrent.TimeoutException: Futures timed out after [10000 milliseconds]
```

Possible Causes

The SSL communication encryption is enabled for Flink, but no correct SSL certificate is configured.

Solution

For MRS 2.*x* or earlier, perform the following operations:

Method 1:

Run the following command to disable the Flink SSL communication encryption, and modify the client configuration file **conf/flink-conf.yaml**.

```
security.ssl.internal.enabled: false
```

Method 2:

Enable the Flink SSL communication encryption and retain the default value of **security.ssl.internal.enabled**. Configure the SSL as follows:

- If the KeyStore or TrustStore file is a relative path, and the Flink client directory where the command is executed can directly access this relative path.

  ```
  security.ssl.internal.keystore: ssl/flink.keystore
  security.ssl.internal.truststore: ssl/flink.truststore
  ```

  Add **-t** option to the CLI **yarn-session.sh** command of Flink to transmit the KeyStore and TrustStore files to each execution node. Example:

  ```
  yarn-session.sh -t ssl/ 2
  ```

- If the keystore or truststore file path is an absolute path, the keystore or truststore files must exist in the absolute path on Flink Client and all nodes.

  ```
  security.ssl.internal.keystore: /opt/client/Flink/flink/conf/flink.keystore
  security.ssl.internal.truststore: /opt/client/Flink/flink/conf/flink.truststore
  ```

For MRS 3.*x* or later, perform the following operations:

Method 1:

Run the following command to disable the Flink SSL communication encryption, and modify the client configuration file **conf/flink-conf.yaml**.

```
security.ssl.enabled: false
```

Method 2:

Enable the Flink SSL communication encryption and retain the default value of **security.ssl.enabled**. Configure the SSL as follows:

- If the KeyStore or TrustStore file is a relative path, and the Flink client directory where the command is executed can directly access this relative path.
```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```
  Add **-t** option to the CLI **yarn-session.sh** command of Flink to transmit the KeyStore and TrustStore files to each execution node. Example:
```
yarn-session.sh -t ssl/ 2
```
- If the keystore or truststore file path is an absolute path, the keystore or truststore files must exist in the absolute path on Flink Client and all nodes.
```
security.ssl.keystore: /opt/Bigdata/client/Flink/flink/conf/flink.keystore
security.ssl.truststore: /opt/Bigdata/client/Flink/flink/conf/flink.truststore
```

15.6.4 Failed to Create a Cluster by Executing the yarn-session Command When a Different User Is Used

Symptom

Two users **testuser** and **bdpuser** with the same rights are used to create the Flink cluster.

When user **testuser** is used to create a Flink cluster, no error message is displayed. While user **bdpuser** is used to create a Flink cluster, an error message is displayed during the **yarn-session.sh** command execution:

```
2019-01-02 14:28:09,098 | ERROR | [main] | Ensure path threw exception |
org.apache.flink.shaded.curator.org.apache.curator.framework.imps.CuratorFrameworkImpl
(CuratorFrameworkImpl.java:566)
org.apache.flink.shaded.zookeeper.org.apache.zookeeper.KeeperException$NoAuthException:
KeeperErrorCode = NoAuth for /flink/application_1545397824912_0022
```

Possible Causes

The HA configuration item is not modified. In the Flink configuration file, the default value of **high-availability.zookeeper.client.acl** is **creator**, indicating that only the creator has the access permission. A new user cannot access the directory on ZooKeeper. As a result, the **yarn-session.sh** command execution fails.

Solution

Step 1 Modify the value of **high-availability.zookeeper.path.root** in the **conf/flink-conf.yaml** file. For example, run the following command:

```
high-availability.zookeeper.path.root: flink2
```

Step 2 Submit the tasks again.

----End

15.6.5 Flink Service Program Fails to Read Files on the NFS Disk

Issue

The Flink service program cannot read files on the NFS disk mounted to the cluster node.

Symptom

The Flink service program developed by a user needs to read the user-defined configuration file. The configuration file is stored on the NFS disk. The NFS disk is mounted to the cluster node and can be accessed by all nodes in the cluster. After the user submits the Flink program, the service code cannot access the user-defined configuration file. As a result, the service program fails to be started.

Cause Analysis

The root cause is that the permission on the root directory of the NFS disk is insufficient. As a result, the Flink program cannot access the directory after being started.

Flink tasks of MRS are running on Yarn. If the cluster is a common cluster, the user who runs the tasks on Yarn is **yarn_user**. If the user-defined configuration file is used after the tasks are started, **yarn_user** must be allowed to access the file and the parent directory of the file (parent directory of the file on the NFS, not the soft link on the cluster node). Otherwise, the program cannot obtain the file content. If the cluster is a cluster with Kerberos authentication enabled, the file permission must allow the user who submits the program to access the file.

Procedure

Step 1 Log in to the Master node in the cluster as user **root**.

Step 2 Run the following command to check the permission on the parent directory of the user-defined configuration file:

ll <*Parent directory of the file path***>**

Step 3 Go to the directory of the file to be accessed on the NFS disk and change the permission of the parent directory of the user-defined configuration file to 755.

chmod 755 -R /<*Path of the parent directory of the file***>**

Step 4 Check whether the Core or Task node can access the configuration file.

1. Log in to the Core or Task node as the **root** user.

   If Kerberos authentication is enabled for the current cluster, log in to the Core node as user **root**.

2. Run **su - yarn_user** to switch to user **yarn_user**.

   If Kerberos authentication is enabled for the cluster, run the **su -** *User who submits the job* command to switch the user.

3. Run the following command to check the user permission. The file path must be the absolute path of the file.

ll <*File path*>

----End

Summary and Suggestions

When a user-defined configuration file needs to be accessed in the submitted task, especially when the NFS disk is mounted, you need to check whether the permission of the parent directory of the file is correct in addition to the file permission. When an NFS disk is mounted to an MRS cluster node, a soft link is created to the NFS directory. In this case, you need to check whether the directory permission on the NFS is correct.

15.6.6 Failed to Customize the Flink Log4j Log Level

Issue

The customized level for Flink Log4j logs of an MRS 3.1.0 cluster does not take effect.

Symptom

1. When analyzing data using Flink of an MRS 3.1.0 cluster, a user changes the log level in the **log4j.properties** file in the **$Flink_HOME/conf** directory to **INFO**.
2. However, after the task is submitted successfully, the log level displayed on the console is still **ERROR**, rather than **INFO**.

Cause Analysis

The **log4j.properties** file in the **$Flink_HOME/conf** directory controls the log output of in JobManager and TaskManager operators, and the logs are printed to the corresponding Yarn containers. You can view the logs on the Yarn web UI. In MRS 3.1.0 and later versions, the default log framework of Flink 1.12.0 is Log4j2. The configuration method is different from that of Log4j. For example, Log4j log rules do not take effect.

Procedure

For details about configuring Log4j2 log specifications, see the official open-source document at **http://logging.apache.org/log4j/2.x/manual/configuration.html#Properties**.

15.7 Using Flume

15.7.1 Class Cannot Be Found After Flume Submits Jobs to Spark Streaming

Issue

After Flume submits jobs to Spark Streaming, the class cannot be found.

Symptom

After the Spark Streaming code is packed into a JAR file and submitted to the cluster, an error message is displayed indicating that the class cannot be found. The following two methods are not useful:

1. When submitting a Spark job, run the **--jars** command to reference the JAR file of the class.
2. Import the JAR file where the class resides to the JAR file of Spark Streaming.

Cause Analysis

Some JAR files cannot be loaded during Spark job execution, resulting that the class cannot be found.

Procedure

Step 1 Run the **--jars** command to load the **flume-ng-sdk-{version} .jar** dependency package.

Step 2 Modify the two configuration items in the **spark-default.conf** file:

spark.driver.extraClassPath=$PWD/*: {Add the original value}

spark.executor.extraClassPath =$PWD/*

Step 3 Run the job successfully. If an error is reported, check which JAR is not loaded and perform step 1 and step 2 again.

----End

15.7.2 Failed to Install a Flume Client

Symptom

A Flume client fails to be installed, and "JAVA_HOME is null" or "flume has been installed" is displayed.

```
CST 2016-08-31 17:02:51 [flume-client install]: JAVA_HOME is null in current user,please install the JDK and set the JAVA_HOME
CST 2016-08-31 17:02:51 [flume-client install]: check environment failed.
CST 2016-08-31 17:02:51 [flume-client install]: check param failed.
CST 2016-08-31 17:02:51 [flume-client install]: install flume client failed.
```

```
CST 2016-08-31 17:03:58 [flume-client install]: flume has been installed
CST 2016-08-31 17:03:58 [flume-client install]: check path failed.
CST 2016-08-31 17:03:58 [flume-client install]: check param failed.
CST 2016-08-31 17:03:58 [flume-client install]: install flume client failed.
```

Cause Analysis

- Environment variables are checked during Flume client installation. If no Java is available, an error message is displayed stating "JAVA_HOME is null" and the installation quits.
- If Flume has been installed in the specified directory, an error message is displayed stating "flume has been installed" during client installation and the installation quits.

Solution

Step 1 Run the following command if an error message is displayed stating "JAVA_HOME is null":

export JAVA_HOME=*Java path*

Set **JAVA_HOME** and execute the installation script again.

Step 2 If a Flume client has been installed under the specified directory, uninstall the client and use another directory.

----End

15.7.3 A Flume Client Cannot Connect to the Server

Symptom

A user installs a Flume client and sets an Avro sink to communicate with the server. However, the Flume server cannot be connected.

Cause Analysis

1. The server is incorrectly configured and the monitoring port fails to be started up. For example, an incorrect IP address or an occupied port is configured for the Avro source of the server. View Flume run logs.

```
2016-08-31 17:28:42,092 | ERROR | [lifecycleSupervisor-1-9] |  Unable to start
EventDrivenSourceRunner: { source:Avro source avro_source: { bindAddress: 10.120.205.7, port:
21154 } } - Exception follows.  | org.apache.flume.lifecycle.LifecycleSupervisor
$MonitorRunnable.run(LifecycleSupervisor.java:253)
java.lang.RuntimeException: org.jboss.netty.channel.ChannelException: Failed to bind to: /
192.168.205.7:21154
```

2. If encrypted transmission is used, the certificate or password is incorrect.

```
2016-08-31 17:15:59,593 | ERROR | [conf-file-poller-0] |  Source avro_source has been removed due to
an error during configuration  |
org.apache.flume.node.AbstractConfigurationProvider.loadSources(AbstractConfigurationProvider.java:
388)
org.apache.flume.FlumeException: Avro source configured with invalid keystore: /opt/Bigdata/
MRS_XXX/install/FusionInsight-Flume-1.9.0/flume/conf/flume_sChat.jks
```

3. The network connection between the client and the server is abnormal.

```
PING 192.168.85.55 (10.120.85.55) 56(84) bytes of data.
From 192.168.85.50 icmp_seq=1 Destination Host Unreachable
From 192.168.85.50 icmp_seq=2 Destination Host Unreachable
From 192.168.85.50 icmp_seq=3 Destination Host Unreachable
From 192.168.85.50 icmp_seq=4 Destination Host Unreachable
```

Solution

Step 1 Set a correct IP address (an IP address of the local host). If the port has been occupied, configure another free port.

Step 2 Configure a correct certificate path.

Step 3 Contact the network administrator to restore the network.

----End

15.7.4 Flume Data Fails to Be Written to the Component

Symptom

After the Flume process is started, Flume data cannot be written to the corresponding component. (The following uses writing data from the server to HDFS as an example.)

Cause Analysis

1. HDFS is not started or is faulty. View Flume run logs.

```
2019-02-26 11:16:33,564 | ERROR | [SinkRunner-PollingRunner-DefaultSinkProcessor] |  opreation the
hdfs file errors.  | org.apache.flume.sink.hdfs.HDFSEventSink.process(HDFSEventSink.java:414)
2019-02-26 11:16:33,747 | WARN  | [hdfs-CCCC-call-runner-4] |  A failover has occurred since the start
of call #32795 ClientNamenodeProtocolTranslatorPB.getFileInfo over
192-168-13-88/192.168.13.88:25000  | org.apache.hadoop.io.retry.RetryInvocationHandler
$ProxyDescriptor.failover(RetryInvocationHandler.java:220)
2019-02-26 11:16:33,748 | ERROR | [hdfs-CCCC-call-runner-4] |  execute hdfs error. {}  |
org.apache.flume.sink.hdfs.HDFSEventSink$3.call(HDFSEventSink.java:744)
java.net.ConnectException: Call From 192-168-12-221/192.168.12.221 to 192-168-13-88:25000 failed
on connection exception: java.net.ConnectException: Connection refused; For more details see:  http://
wiki.apache.org/hadoop/ConnectionRefused
```

2. The HDFS sink is not started. Check the Flume run log. It is found that the Flume current metrics file does not contain sink information.

```
2019-02-26 11:46:05,501 | INFO  | [pool-22-thread-1] |  flume current metrics:{"CHANNEL.BBBB":
{"ChannelCapacity":"10000","ChannelFillPercentage":"0.0","Type":"CHANNEL","ChannelStoreSize":"0","
EventProcessTimedelta":"0","EventTakeSuccessCount":"0","ChannelSize":"0","EventTakeAttemptCount":
"0","StartTime":"1551152734999","EventPutAttemptCount":"0","EventPutSuccessCount":"0","StopTime
":"0"},"SOURCE.AAAA":
{"AppendBatchAcceptedCount":"0","EventAcceptedCount":"0","AppendReceivedCount":"0","MonTime":
"0","StartTime":"1551152735503","AppendBatchReceivedCount":"0","EventReceivedCount":"0","Type":"
SOURCE","TotalFilesCount":"1001","SizeAcceptedCount":"0","UpdateTime":"605410241202740","Appen
dAcceptedCount":"0","OpenConnectionCount":"0","MovedFilesCount":"1001","StopTime":"0"}}  |
org.apache.flume.node.Application.getRestartComps(Application.java:467)
```

Solution

Step 1 If the component to which Flume writes data is not started, start the component. If the component is abnormal, contact technical support.

Step 2 If the sink is not started, check whether the configuration file is correctly configured. If the configuration file is incorrectly configured, modify the configuration file and restart the Flume process. If the configuration file is correctly configured, view the error information in the log and rectify the fault based on the error information.

----End

15.7.5 Flume Server Process Fault

Symptom

After Flume runs for a period of time, the Flume instance is in the faulty state on Manager.

Cause Analysis

If the Flume file or folder permission is abnormal, the following information is displayed on MRS Manager after the restart:

```
[2019-02-26 13:38:02]RoleInstance prepare to start failure [{ScriptExecutionResult=ScriptExecutionResult
[exitCode=126, output=, errMsg=sh: line 1: /opt/Bigdata/MRS_XXX/install/FusionInsight-Flume-1.9.0/
flume/bin/flume-manage.sh: Permission denied
```

Solution

Compare the file and folder permissions with those for the Flume node that is running properly and correct the file or folder permissions.

15.7.6 Flume Data Collection Is Slow

Symptom

After Flume is started, it takes a long time for Flume to collect data.

Cause Analysis

1. The heap memory of Flume is not properly set. As a result, the Flume process keeps in the GC state. View Flume run logs.
   ```
   2019-02-26T13:06:20.666+0800: 1085673.512: [Full GC:[CMS: 3849339k->3843458K(3853568K),
   2.5817610 secs] 4153654K->3843458K(4160256K), [CMS Perm : 27335K->27335K(45592K),2.5820080
   SECS] [Times: user=2.63, sys0.00, real=2.59 secs]
   ```
2. The **deletePolicy** policy configured for the Spooldir source is **immediate**.

Solution

Step 1 Increase the size of the heap memory (**xmx**).

Step 2 Change the **deletePolicy** policy of the Spooldir source to **never**.

----End

15.7.7 Failed to Start Flume

Symptom

The Flume service fails to be installed or restarted.

Cause Analysis

1. The heap memory of Flume is greater than the remaining memory of the server. The Flume startup log shows the following information:

```
[CST 2019-02-26 13:31:43][INFO] [[checkMemoryValidity:124]] [GC_OPTS is invalid:
Xmx(40960000MB) is bigger than the free memory(56118MB) in system.] [9928]
```

2. The permission on the Flume file or folder is abnormal. The following information is displayed on the GUI or in the background:

```
[2019-02-26 13:38:02]RoleInstance prepare to start failure
[{ScriptExecutionResult=ScriptExecutionResult [exitCode=126, output=, errMsg=sh: line 1: /opt/Bigdata/
MRS_XXX/install/FusionInsight-Flume-1.9.0/flume/bin/flume-manage.sh: Permission denied
```

3. The **JAVA_HOME** is incorrectly configured. The Flume agent startup log shows the following information:

```
Info: Sourcing environment configuration script /opt/FlumeClient/fusioninsight-flume-1.9.0/conf/
flume-env.sh
+ '[' -n '' ']'
+ exec /tmp/MRS-Client/MRS_Flume_ClientConfig/JDK/jdk-8u18/bin/java '-
XX:OnOutOfMemoryError=bash /opt/FlumeClient/fusioninsight-flume-1.9.0/bin/
out_memory_error.sh /opt/FlumeClient/fusioninsight-flume-1.9.0/conf %p' -Xms2G -Xmx4G -

Dlog4j.configuration=log4j.properties -Dflume_log_dir=/var/log/Bigdata//flume-client-1/flume/ -
Dflume.service.id=flume-client-1 -Dbeetle.application.home.path=/opt/FlumeClient/fusioninsight-
flume-1.9.0/conf/service -Dflume.called.from.service -Dflume.conf.dir=/opt/FlumeClient/fusioninsight-
flume-1.9.0/conf -Dflume.metric.conf.dir=/opt/FlumeClient/fusioninsight-flume-1.9.0/conf -
Dflume.script.home=/opt/FlumeClient/fusioninsight-flume-1.9.0/bin -cp '/opt/FlumeClient/
fusioninsight-flume-1.9.0/conf:/opt/FlumeClient/fusioninsight-flume-1.9.0/lib/*:/opt/FlumeClient/
fusioninsight-flume-1.9.0/conf/service/' -Djava.library.path=/opt/FlumeClient/fusioninsight-flume-1.9.0/
plugins.d/native/native org.apache.flume.node.Application --conf-file /opt/FlumeClient/fusioninsight-
flume-1.9.0/conf/properties.properties --name client
/opt/FlumeClient/fusioninsight-flume-1.9.0/bin/flume-ng: line 233: /tmp/FusionInsight-Client/Flume/
FusionInsight_Flume_ClientConfig/JDK/jdk-8u18/bin/java: No such file or directory
```

Solution

Step 1 Increase the size of the heap memory (**xmx**).

Step 2 Compare the file and folder permissions with those for node where Flume is started properly and change the incorrect file or folder permissions.

Step 3 Reconfigure **JAVA_HOME**. On the client, replace the value of **JAVA_HOME** in the **${install_home}/fusioninsight-flume-***Flume version***/conf/ENV_VARS** file. On the server, replace the value of **JAVA_HOME** in the **ENV_VARS** file in the **etc** directory.

To obtain the value of **JAVA_HOME**, log in to the node where Flume is properly started and run the **echo ${JAVA_HOME}** command.

NOTE

${install_home} is the installation path of the Flume client.

----End

15.8 Using HBase

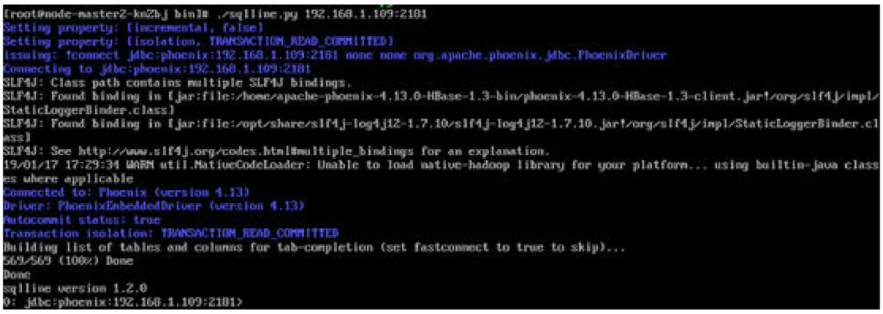
15.8.1 Slow Response to HBase Connection

Issue

Under the same VPC network, response is slow when an external cluster connects to HBase through Phoenix.

Symptom

Under the same VPC network, response is slow when an external cluster connects to HBase through Phoenix.



```
[root@node-master2-knZbj bin]# ./sqlline.py 192.168.1.109:2181

0: jdbc:phoenix:192.168.1.109:2181>
```

Possible Cause

DNS has been configured. When a client connects to HBase, DNS resolves the server first, causing slow response.

Procedure

Step 1 Log in to the Master node as user **root**.

Step 2 Run the **vi /etc/resolv.conf** command to open the **resolv.conf** file and comment out the address of the DNS server, for example, #1.1.1.1.

----End

15.8.2 Failed to Authenticate the HBase User

Issue

Failed to authenticate the HBase user.

Symptom

Failed to authenticate the HBase user on the client. The following error information is displayed:

```
2019-05-13 10:53:09,975 ERROR [localhost-startStop-1] xxxConfig.LoginUtil: login failed with hbaseuser
and /usr/local/linoseyc/hbase-tomcat/webapps/bigdata_hbase/WEB-INF/classes/user.keytab.
2019-05-13 10:53:09,975 ERROR [localhost-startStop-1] xxxConfig.LoginUtil: perhaps cause 1 is (wrong
password) keytab file and user not match, you can kinit -k -t keytab user in client server to check.
2019-05-13 10:53:09,975 ERROR [localhost-startStop-1] xxxConfig.LoginUtil: perhaps cause 2 is (clock
skew) time of local server and remote server not match, please check ntp to remote server.
2019-05-13 10:53:09,975 ERROR [localhost-startStop-1] xxxConfig.LoginUtil: perhaps cause 3 is (aes256 not
support) aes256 not support by default jdk/jre, need copy local_policy.jar and US_export_policy.jar from
remote server in path ${BIGDATA_HOME}/jdk/jre/lib/security.
```

Cause Analysis

The version of the JAR file in the JDK used by the user is different from that of the JAR file authenticated by MRS.

Procedure

Step 1 Log in to the Master1 node as user **root**.

Step 2 Run the following command to check the JAR file authenticated by MRS:

ll /opt/share/local_policy/local_policy.jar

ll /opt/Bigdata/jdk{version}/jre/lib/security/local_policy.jar

Step 3 Download the JAR package queried in step 2 to the local host.

Step 4 Copy the downloaded JAR package to the local JDK directory **/opt/Bigdata/jdk/jre/lib/security**.

Step 5 Run the **cd /opt/client/HBase/hbase/bin** command to go to the **bin** directory of HBase.

Step 6 Run the **sh start-hbase.sh** command to restart HBase.

----End

15.8.3 RegionServer Failed to Start Because the Port Is Occupied

Symptom

RegionServer is in the **Restoring** state on Manager.

Cause Analysis

1. View the RegionServer log (**/var/log/Bigdata/hbase/rs/hbase-omm-xxx.log**).
2. Run the **lsof -i:21302** command (the port number of MRS 1.7.X and later versions is 16020) to view the PID. Based on the PID, check the process. It is found that the RegionServer port is occupied by DFSZkFailoverController.
3. The value of **/proc/sys/net/ipv4/ip_local_port_range** is **9000 65500**. The temporary port range and the MRS port range overlap. This is because the preinstall operation is not performed during installation.

Solution

Step 1 Run the **kill -9** *DFSZkFailoverController pid* command to ensure that another port is bound with after a restart and restart the RegionServer in the **Restoring** state.

----End

15.8.4 HBase Failed to Start Due to Insufficient Node Memory

Symptom

The RegionServer service of HBase is always in the **Restoring** state.

Cause Analysis

1. Check the RegionServer log (**/var/log/Bigdata/hbase/rs/hbase-omm-XXX.out**). It is found that the following information is printed:

   ```
   There is insufficient memory for the Java Runtime Environment to continue.
   ```

2. Run the **free** command to check the memory. It is found that the available memory of the node is insufficient.

Solution

Step 1 Locate why the memory is insufficient. It is found that some processes occupy too much memory or the server does not have sufficient memory.

----End

15.8.5 HBase Service Unavailable Due to Poor HDFS Performance

Symptom

The HBase component intermittently reports alarms indicating that the service is unavailable.

Cause Analysis

HDFS performance is low, causing health check timeout and the alarm is generated accordingly. You can perform the following operations:

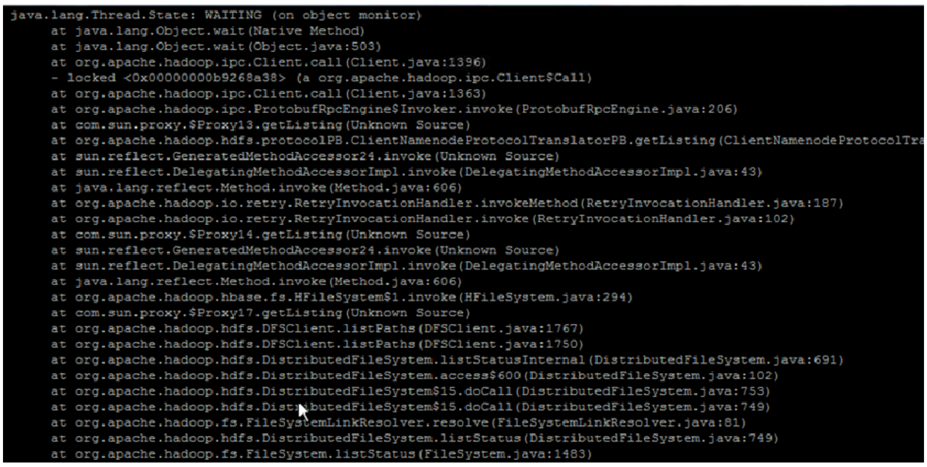
1. View the HMaster log (**/var/log/Bigdata/hbase/hm/hbase-omm-xxx.log**) and check that **system pause**, **jvm**, and other GC-related information is not frequently printed in the log.
2. Determine whether the fault is caused by poor HDFS performance using either of the following methods:
   a. Run **hbase shell** to access the HBase shell, and run the **list** command to check whether it takes a long period of time to list all tables in HBase.
   b. Enable printing of the debug logs of HDFS, and check whether it takes a long period of time to list the content of a large number of directories by running the **hadoop fs –ls** */XXX/XXX* command.
   c. Print the Java stack information about a specified HMaster process.

      su - omm

      jps

      jstack pid
3. Check the jstack information. The following figure shows that the process is stuck at the **DFSClient.listPaths** state.

Figure 15-20 Exception



```
java.lang.Thread.State: WAITING (on object monitor)
      at java.lang.Object.wait(Native Method)

```

Solution

Step 1 If this alarm is caused by poor HDFS performance, check whether Impala is of an earlier version or JournalNode was incorrectly deployed during the initial deployment (more than three JournalNode nodes are deployed).

----End

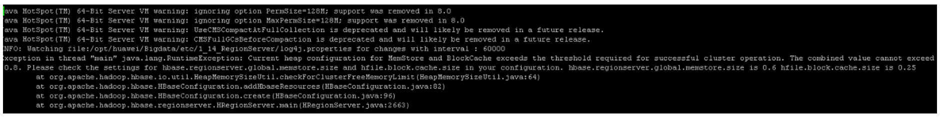
15.8.6 HBase Failed to Start Due to Inappropriate Parameter Settings

Symptom

After some parameters are modified, HBase cannot be started.

Cause Analysis

1. Check the HMaster log (**/var/log/Bigdata/hbase/hm/hbase-omm-*xxx*.log**). It is found that the total of **hbase.regionserver.global.memstore.size** and **hfile.block.cache.size** is greater than 0.8, which causes the startup failure. Therefore, adjust the parameter values to make sure that the total value is less than 0.8.



```
ava HotSpot(TM) 64-Bit Server VM warning: ignoring option PermSize=128M; support was removed in 8.0
ava HotSpot(TM) 64-Bit Server VM warning: ignoring option MaxPermSize=128M; support was removed in 8.0
ava HotSpot(TM) 64-Bit Server VM warning: UseCMSCompactAtFullCollection is deprecated and will likely be removed in a future release.
ava HotSpot(TM) 64-Bit Server VM warning: CMSFullGCsBeforeCompaction is deprecated and will likely be removed in a future release.
NFO: Watching file:/opt/huawei/Bigdata/etc/1_14_RegionServer/log4j.properties for changes with interval : 60000
xception in thread "main" java.lang.RuntimeException: Current heap configuration for MemStore and BlockCache exceeds the threshold required for successful cluster operation. The combined value cannot exceed
0.8. Please check the settings for hbase.regionserver.global.memstore.size and hfile.block.cache.size in your configuration. hbase.regionserver.global.memstore.size is 0.6 hfile.block.cache.size is 0.25
        at org.apache.hadoop.hbase.io.util.HeapMemorySizeUtil.checkForClusterFreeMemoryLimit(HeapMemorySizeUtil.java:64)
        at org.apache.hadoop.hbase.HBaseConfiguration.addHbaseResources(HBaseConfiguration.java:82)
        at org.apache.hadoop.hbase.HBaseConfiguration.create(HBaseConfiguration.java:96)
        at org.apache.hadoop.hbase.regionserver.HRegionServer.main(HRegionServer.java:2663)
```

2. Check the HMaster and RegionServer out logs (**/var/log/Bigdata/hbase/hm/hbase-omm-*xxx*.out/var/log/Bigdata/hbase/rs/hbase-omm-*xxx*.out**). It is found that **Unrecognized VM option** is displayed.

```
Unrecognized VM option
Error: Could not create the Java Virtual Machine.
Error: A fatal exception has occurred. Program will exit.
```

Check the **GC_OPTS** parameters. It is found that the parameters contain unnecessary spaces, for example, **-D sun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFFE**.

Solution

Step 1 After the **MemStore** and **cache** parameters are modified, the HBase service is restarted successfully.

Step 2 After the **GC_OPTS** parameters are modified, the HBase service is restarted successfully.

----End

15.8.7 RegionServer Failed to Start Due to Residual Processes

Symptom

The HBase service fails to start, and an error is reported during the health check.

Cause Analysis

Check detailed information about HBase startup on the MRS Manager page. It is found that **the previous process is not quit** is displayed.

Solution

Step 1 Log in to the node and run the **ps -ef | grep HRegionServer** command in the background. A residual process is found.

Step 2 After confirming that the process can be killed, kill the process. If the process cannot be stopped by running the **kill** command, run the **kill -9** command to forcibly stop the process.

Step 3 Restart the HBase service.

----End

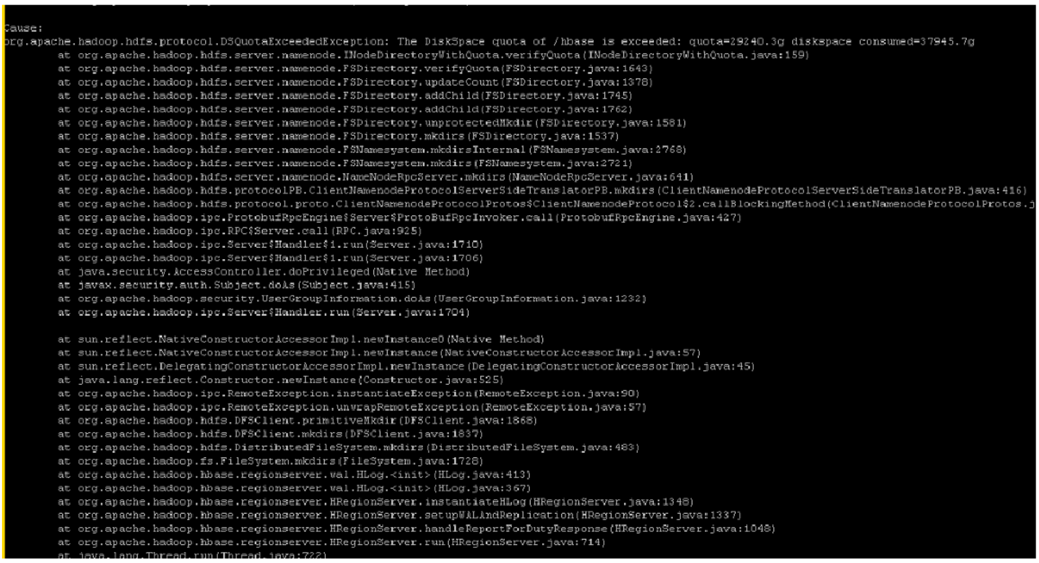
15.8.8 HBase Failed to Start Due to a Quota Set on HDFS

Symptom

HBase fails to start.

Cause Analysis

Check the HMaster log (**/var/log/Bigdata/hbase/hm/hbase-omm-*xxx*.log**). It is found that "The DiskSpace quota of /hbase is exceeded" is displayed.



```
Cause:
org.apache.hadoop.hdfs.protocol.DSQuotaExceededException: The DiskSpace quota of /hbase is exceeded: quota=29240.3g diskspace consumed=37945.7g

        at org.apache.hadoop.hbase.regionserver.HRegionServer.run(HRegionServer.java:714)
        at java.lang.Thread.run(Thread.java:722)
```

Solution

Step 1 Run the **df -h** command to check data directory space. It is found that the directory space is full. Delete unnecessary data to free up space.

Step 2 Expand the node to ensure that the data directory space is sufficient.

----End

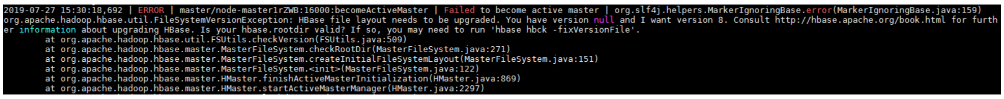
15.8.9 HBase Failed to Start Due to Corrupted Version Files

Symptom

HBase fails to start.

Cause Analysis

1. The **hbase.version** file is read during HBase startup. However, the log indicates that a reading exception occurs.



```
2019-07-27 15:30:18,692 | ERROR | master/node-master1rZWB:16000:becomeActiveMaster | Failed to become active master | org.slf4j.helpers.MarkerIgnoringBase.error(MarkerIgnoringBase.java:159)
org.apache.hadoop.hbase.util.FileSystemVersionException: HBase file layout needs to be upgraded. You have version null and I want version 8. Consult http://hbase.apache.org/book.html for furth
er information about upgrading HBase. Is your hbase.rootdir valid? If so, you may need to run 'hbase hbck -fixVersionFile'.
        at org.apache.hadoop.hbase.util.FSUtils.checkVersion(FSUtils.java:509)
        at org.apache.hadoop.hbase.master.MasterFileSystem.checkRootDir(MasterFileSystem.java:271)
        at org.apache.hadoop.hbase.master.MasterFileSystem.createInitialFileSystemLayout(MasterFileSystem.java:151)
        at org.apache.hadoop.hbase.master.MasterFileSystem.<init>(MasterFileSystem.java:122)
        at org.apache.hadoop.hbase.master.HMaster.finishActiveMasterInitialization(HMaster.java:869)
        at org.apache.hadoop.hbase.master.HMaster.startActiveMasterManager(HMaster.java:2297)
```

2. The file cannot be viewed by running the **hadoop fs -cat /hbase/hbase.version** command. The file is corrupted.

Solution

Step 1 Run the **hbase hbck -fixVersionFile** command to restore the file.

Step 2 If the problem persists after performing **Step 1**, obtain the **hbase.version** file from another cluster of the same version and upload the file to replace the original one.

Step 3 Restart the HBase service.

----End

15.8.10 High CPU Usage Caused by Zero-Loaded RegionServer

Symptom

The CPU usage of RegionServer is high, but there is no service running on RegionServer.

Cause Analysis

1. Run the **top** command to obtain the CPU usage of RegionServer processes and check the IDs of processes with high CPU usage.
2. Obtain the CPU usage of threads under these processes based on the RegionServer process IDs.

   Run the **top -H -p** *<PID>* (replace it with the actual RegionServer process ID). As shown in the following figure, the CPU usage of some threads reaches 80%.

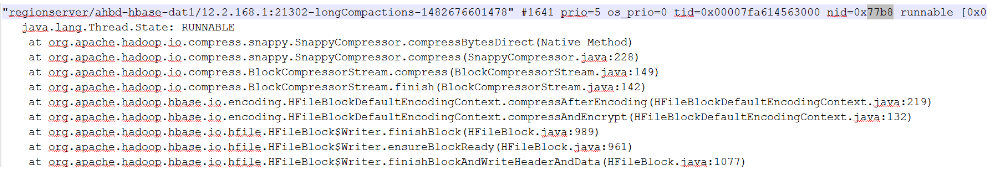
```
PID USER      PR  NI    VIRT    RES    SHR S %CPU %MEM     TIME+ COMMAND
75706 omm      20   0 6879444  1.0g  25612 S  90.4  1.6   0:00.00 java
75716 omm      20   0 6879444  1.0g  25612 S  90.4  1.6   0:04.74 java
75720 omm      20   0 6879444  1.0g  25612 S  88.6  1.6   0:01.93 java
75721 omm      20   0 6879444  1.0g  25612 S  86.8  1.6   0:01.99 java
75722 omm      20   0 6879444  1.0g  25612 S  86.8  1.6   0:01.94 java
75723 omm      20   0 6879444  1.0g  25612 S  86.8  1.6   0:01.96 java
75724 omm      20   0 6879444  1.0g  25612 S  86.8  1.6   0:01.97 java
75725 omm      20   0 6879444  1.0g  25612 S  81.5  1.6   0:02.06 java
75726 omm      20   0 6879444  1.0g  25612 S  79.7  1.6   0:02.01 java
75727 omm      20   0 6879444  1.0g  25612 S  79.7  1.6   0:01.95 java
75728 omm      20   0 6879444  1.0g  25612 S  78.0  1.6   0:01.99 java
```

3. Obtain the thread stack information based on the ID of the RegionServer process.

   jstack 12345 >allstack.txt (Replace it with the actual RegionServer process ID.)
4. Convert the thread ID into the hexadecimal format:

   printf "%x\n" 30648

   In the command output, the TID is **77b8**.
5. Search the thread stack based on the hexadecimal TID. It is found that the compaction operation is performed.



```
"regionserver/ahbd-hbase-dat1/12.2.168.1:21302-longCompactions-1482676601478" #1641 prio=5 os_prio=0 tid=0x00007fa614563000 nid=0x77b8 runnable [0x0

    - locked <0x00000004de9535c8> (a org.apache.hadoop.hdfs.client.HdfsDataOutputStream)
    at java.io.FilterOutputStream.write(FilterOutputStream.java:97)
```

Solution

This is a normal phenomenon.

The threads that consume a large number of CPU resources are compaction threads. Some threads invoke the Snappy compression algorithm, and some threads invoke HDFS data writing and reading. Each region has massive sets of data and numerous data files and uses the Snappy compression algorithm. For this reason, the compaction operations consume a large number of CPU resources.

Fault Locating Methods

Step 1 Run the **top** command to check the process with high CPU usage.

Step 2 Check the threads with high CPU usage in the process.

Run the **top -H -p** *<PID>* command to print CPU usage of threads under the process.

Obtain the thread with the highest CPU usage from the query result. You can also obtain the thread by running the following command:

Or run the **ps -mp** *<PID>* **-o THREAD,tid,time | sort -rn** command.

View the command output to obtain the ID of the thread with the highest CPU usage.

Step 3 Obtain the stack of the faulty thread.

The jstack tool is the most effective and reliable tool for locating Java problems.

You can obtain the jstack tool from the **java/bin** directory.

jstack <PID> > allstack.txt

Obtain the process stack and output it to a local file.

Step 4 Convert the thread ID into the hexadecimal format:

printf "%x\n" <PID>

The process ID in the command output is the TID.

Step 5 Run the following command to obtain the TID and output it to a local file:

jstack <PID> | grep <TID> > Onestack.txt

If you want to view the TID in the CLI only, run the following command:

jstack <PID> | grep <TID> -A 30

-A 30 indicates that 30 lines are displayed.

----End

15.8.11 HBase Failed to Started with "FileNotFoundException" in RegionServer Logs

Symptom

HBase fails to start, and the RegionServer stays in the **Restoring** state.

Cause Analysis

1. Check the RegionServer log (**/var/log/Bigdata/hbase/rs/hbase-omm-*XXX*.out**). It is found that the following information is printed:

```
 | ERROR | RS_OPEN_REGION-ab-dn01:21302-2 | ABORTING region server ab-

2. Run the **hdfs** command on the client. It is found that the following file does not exist:

   hdfs://hacluster/kylin/kylin_metadata/coprocessor/kylin-coprocessor-1.6.0-SNAPSHOT-0.jar

3. When configuring the coprocessor for HBase, make sure that the path of the corresponding JAR package is correct. Otherwise, HBase cannot be started.

Solution

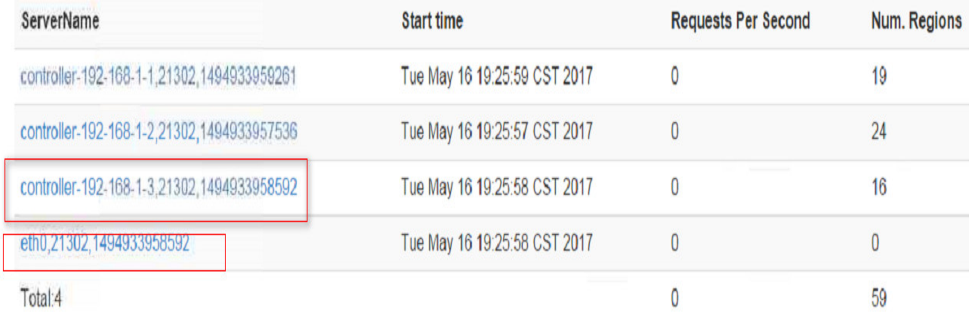
Use the Apache Kylin engine to interconnect with MRS and make sure that the JAR file of the Kylin engine exists.

15.8.12 The Number of RegionServers Displayed on the Native Page Is Greater Than the Actual Number After HBase Is Started

Symptom

After HBase is started, the number of RegionServers displayed on the HMaster native page is greater than the actual number.

The HMaster native page shows that four RegionServers are online, as shown in the following figure.



ServerName	Start time	Requests Per Second	Num. Regions
controller-192-168-1-1,21302,1494933959261	Tue May 16 19:25:59 CST 2017	0	19

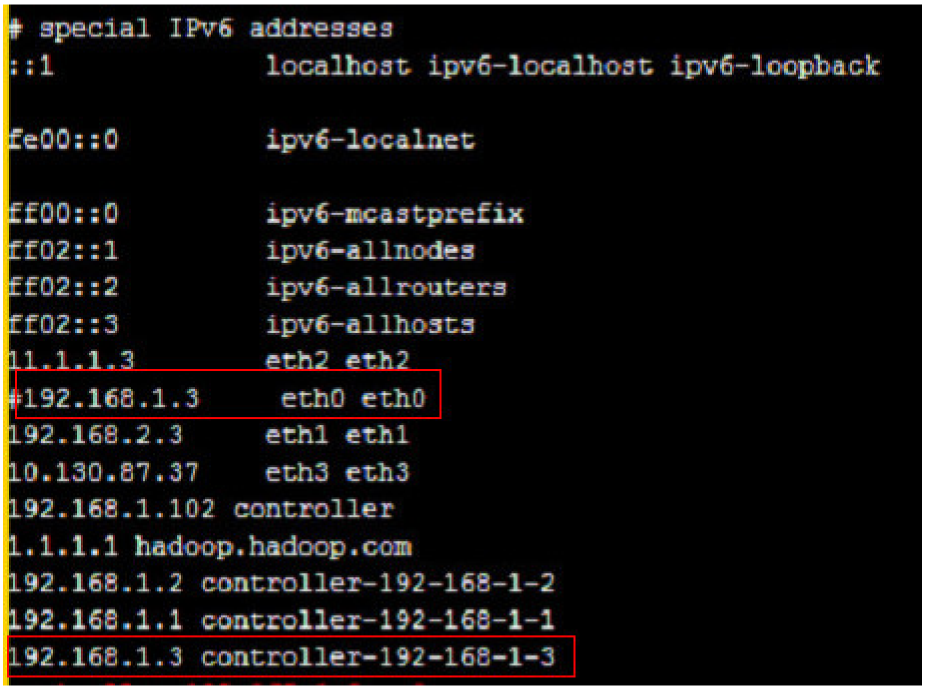
eth0,21302,1494933958592	Tue May 16 19:25:58 CST 2017	0	0
Total:4		0	59

Cause Analysis

As shown in the following figure, the hostname of the node in the third row is **controller-192-168-1-3** and that of the fourth row is **eth0**. The two carry the same information reported by RegionServer. Then, log in to the corresponding nodes to check the **/etc/hosts** file. It is found that the same IP address is configured for the two hostnames. For details, see the following figure:



```
# special IPv6 addresses
::1             localhost ipv6-localhost ipv6-loopback

fe00::0         ipv6-localnet

ff00::0         ipv6-mcastprefix
ff02::1         ipv6-allnodes
ff02::2         ipv6-allrouters
ff02::3         ipv6-allhosts
11.1.1.3        eth2 eth2
#192.168.1.3     eth0 eth0
192.168.2.3     eth1 eth1
10.130.87.37    eth3 eth3
192.168.1.102 controller
1.1.1.1 hadoop.hadoop.com
192.168.1.2 controller-192-168-1-2
192.168.1.1 controller-192-168-1-1
192.168.1.3 controller-192-168-1-3
```

Solution

Log in to the node where RegionServer resides, and modify the **/etc/hosts** file. Make sure that the same IP address can correspond to only one hostname.

15.8.13 RegionServer Instance Is in the Restoring State

Symptom

HBase fails to start, and the RegionServer stays in the **Restoring** state.

Cause Analysis

Check the running log (**/var/log/Bigdata/hbase/rs/hbase-omm-*XXX*.log**) of the abnormal RegionServer instance. It is found that the following information is displayed: **ClockOutOfSyncException..., Reported time is too far out of sync with master**.

```
2017-09-18 11:16:23,636 | FATAL | regionserver21302 | Master rejected startup because clock is out of sync | 
org.apache.hadoop.hbase.regionserver.HRegionServer.reportForDuty(HRegionServer.java:2059)
org.apache.hadoop.hbase.ClockOutOfSyncException: org.apache.hadoop.hbase.ClockOutOfSyncException: 
Server nl-bi-fi-datanode-24-65,21302,1505726180086 has been rejected; Reported time is too far out of 
sync with master.  Time difference of 152109ms > max allowed of 30000ms
at org.apache.hadoop.hbase.master.ServerManager.checkClockSkew(ServerManager.java:354)
...

...
2017-09-18 11:16:23,858 | ERROR | main | Region server exiting | 
org.apache.hadoop.hbase.regionserver.HRegionServerCommandLine.start(HRegionServerCommandLine.java:
70)
java.lang.RuntimeException: HRegionServer Aborted
```

This log indicates that the time difference between the abnormal RegionServer instance and the HMaster instance is greater than the allowed time difference 30s (specified by the **hbase.regionserver.maxclockskew** parameter and the default value is **30000 ms**). As a result, the RegionServer instance is abnormal.

Solution

Adjust the node time to ensure that the time difference between nodes is less than 30s.

15.8.14 HBase Failed to Start in a Newly Installed Cluster

Symptom

HBase of a newly installed cluster fails to start. The RegionServer log contains the following error information:

```
2018-02-24 16:53:03,863 | ERROR | regionserver/host3/187.6.71.69:21302 | Master passed us a different
hostname to use; was=host3, but now=187-6-71-69 |
org.apache.hadoop.hbase.regionserver.HRegionServer.handleReportForDutyResponse(HRegionServer.java:
1386)
```

Cause Analysis

In the **/etc/hosts** file, an IP address maps multiple hostnames.

Solution

Step 1 Modify the mapping between the IP address and hostnames in the **/etc/host** file.

Step 2 Restart HBase.

----End

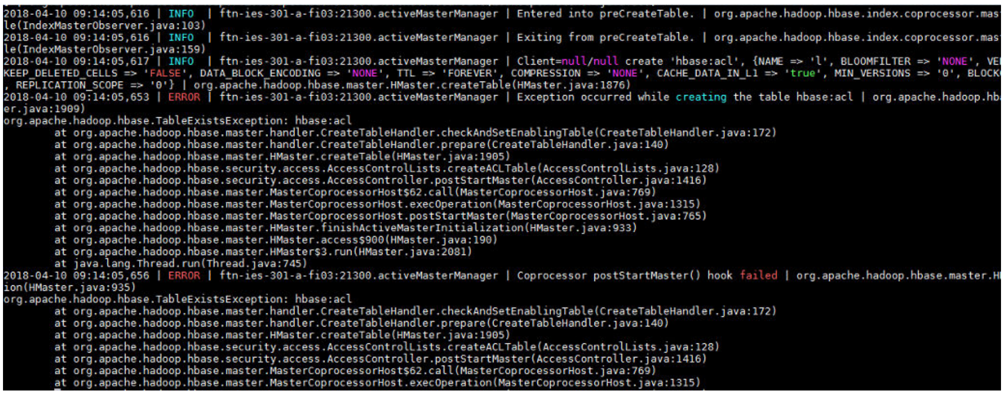
15.8.15 HBase Failed to Start Due to the Loss of the ACL Table Directory

Symptom

The HBase cluster fails to start.

Cause Analysis

1. Check the HMaster log of HBase. The following error information is displayed:



```
2018-04-10 09:14:05,616 | INFO  | ftn-ies-301-a-fi03:21300.activeMasterManager | Entered into preCreateTable. | org.apache.hadoop.hbase.index.coprocessor.mas
le(IndexMasterObserver.java:103)
2018-04-10 09:14:05,616 | INFO  | ftn-ies-301-a-fi03:21300.activeMasterManager | Exiting from preCreateTable. | org.apache.hadoop.hbase.index.coprocessor.mas
le(IndexMasterObserver.java:159)

        at org.apache.hadoop.hbase.master.HMaster.createTable(HMaster.java:1905)
        at org.apache.hadoop.hbase.security.access.AccessControlLists.createACLTable(AccessControlLists.java:128)
        at org.apache.hadoop.hbase.security.access.AccessController.postStartMaster(AccessController.java:1416)
        at org.apache.hadoop.hbase.master.MasterCoprocessorHost$62.call(MasterCoprocessorHost.java:769)
        at org.apache.hadoop.hbase.master.MasterCoprocessorHost.execOperation(MasterCoprocessorHost.java:1315)
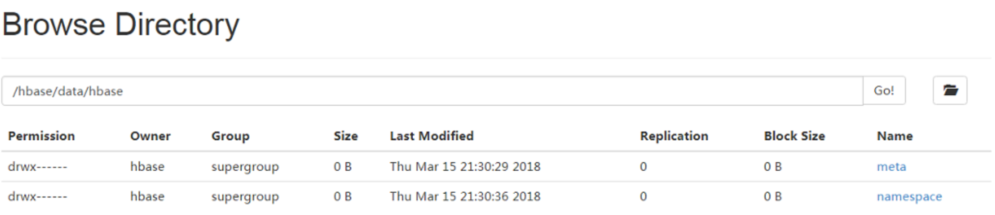
```

2. The HBase directory in HDFS is checked, which shows that the ACL table directory is lost.



Browse Directory

/hbase/data/hbase

Permission	Owner	Group	Size	Last Modified	Replication	Block Size	Name
drwx------	hbase	supergroup	0 B	Thu Mar 15 21:30:29 2018	0	0 B	meta
drwx------	hbase	supergroup	0 B	Thu Mar 15 21:30:36 2018	0	0 B	namespace

Solution

Step 1 Stop HBase.

Step 2 Log in to the HBase client as the **hbase** user and run the following command.

Example:

```
hadoop03:~ # source /opt/client/bigdata_env
hadoop03:~ # kinit hbase
Password for hbase@HADOOP.COM:
hadoop03:~ # hbase zkcli
```

Step 3 Delete the ACL table information from the ZooKeeper.

Example:

```
[zk: hadoop01:24002,hadoop02:24002,hadoop03:24002(CONNECTED) 0] deleteall /hbase/table/hbase:acl
[zk: hadoop01:24002,hadoop02:24002,hadoop03:24002(CONNECTED) 0] deleteall /hbase/table-lock/
hbase:acl
```

Step 4 Start HBase.

----End

15.8.16 HBase Failed to Start After the Cluster Is Powered Off and On

Symptom

After the ECS in the cluster is stopped and restarted, HBase fails to start.

Cause Analysis

Check the HMaster run logs. A large number of errors are reported, as shown below:

```
2018-03-26 11:10:54,185 | INFO  | hadoopc1h3,21300,1522031630949_splitLogManager__ChoreService_1 |

(SplitLogManager.java:745)
```

The WAL splitting of RegionServer fails when the node is powered on and off.

Solution

Step 1 Stop HBase.

Step 2 Run the **hdfs fsck** command to check the health status of the **/hbase/WALs** file.

hdfs fsck /hbase/WALs

If the following command output is displayed, all files are normal. If any file is abnormal, rectify the fault, and then perform the subsequent operations.

```
The filesystem under path '/hbase/WALs' is HEALTHY
```

Step 3 Back up the **/hbase/WALs** file.

hdfs dfs -mv /hbase/WALs /hbase/WALs_old

Step 4 Run the following command to create the **/hbase/WALs** directory.

hdfs dfs -mkdir /hbase/WALs

Make sure that the permission on the directory is **hbase:hadoop**.

Step 5 Start HBase.

----End

15.8.17 Failed to Import HBase Data Due to Oversized File Blocks

Symptom

Error Message "NotServingRegionException" is displayed when data is imported to HBase.

Cause Analysis

When a block is greater than 2 GB, a read exception occurs during the seek operation of the HDFS. A full GC occurs when data is frequently written to the RegionServer. As a result, the heartbeat between the HMaster and RegionServer becomes abnormal, and the HMaster marks the RegionServer as dead, and the RegionServer is forcibly restarted. After the restart, the servercrash mechanism is triggered to roll back WALs. Currently, the **splitwal** file has reached 2.1 GB and has only one block. As a result, the HDFS seek operation becomes abnormal and the WAL file splitting fails. However, the RegionServer detects that the WAL needs to be split and triggers the splitwal mechanism, causing a loop between WAL splitting and the splitting failure. In this case, the regions on the RegionServer node cannot be brought online, and an exception is thrown indicating that the region is not online when a region on the RegionServer is queried.

Procedure

Step 1 Go to the HBase service page.

- For versions earlier than MRS 2.0.1: Log in to MRS Manager and choose **Services** > **HBase**.
- For MRS 2.0.1 or later: Click the cluster name on the MRS console and choose **Components** > **HBase**.

  NOTE

  If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)
- For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the desired cluster, and choose **Services** > **HBase**.

Step 2 On the right of **HMaster Web UI**, click **HMaster (Active)** to go to the HBase Web UI page.

Step 3 On the **Procedures** page, view the node where the problem occurs.

Step 4 Log in to the faulty node as user **root** and run the **hdfs dfs -ls** command to view all block information.

Step 5 Run the **hdfs dfs -mkdir** command to create a directory for storing faulty blocks.

Step 6 Run the **hdfs dfs -mv** command to move the faulty block to the new directory.

----End

Summary and Suggestions

The following is provided for your reference:

- If data blocks are corrupted, run the **hdfs fsck /tmp -files -blocks -racks** command to check the health information about data blocks.
- If you perform data operations when a region is being split, **NotServingRegionException** is thrown.

15.8.18 Failed to Load Data to the Index Table After an HBase Table Is Created Using Phoenix

Symptom

A user fails to run commands to load data to the index table after creating an HBase table using Phoenix. The following error information is displayed:

- MRS 2.x or earlier: Mutable secondary indexes must have the hbase.regionserver.wal.codec property set to org.apache.hadoop.hbase.regionserver.wal.IndexedWALEditCodec in the hbase-sites.xml of every region server. tableName=MY_INDEX (state=42Y88,code=1029)

        at org.apache.phoenix.mapreduce.JsonBulkLoadTool.main(JsonBulkLoadTool.java:51)
[root@node-master1Hypi ~]#
```

Procedure

Step 1 For MRS 2.x or earlier, perform the following operations:

1. Log in to MRS Manager as user **admin**, choose **Services**, and click **HBase**. On the **Service Configuration** tab, select **All** from the **Type** drop-down list, choose **HMaster** > **Customization**, and add a configuration item for parameter **hbase.hmaster.config.expandor** with name **hbase.regionserver.wal.codec** and value **org.apache.hadoop.hbase.regionserver.wal.IndexedWALEditCodec**.

2. Choose **RegionServer** > **Customization**, add a configuration item for parameter **hbase.regionserver.config.expandor** with name **hbase.regionserver.wal.codec** and value **org.apache.hadoop.hbase.regionserver.wal.IndexedWALEditCodec**, and click **Save Configuration**. Then enter the password of the current user and click **OK**.
3. On the **Service Status** page, click **More** and select **Restart Service**. Enter the password of the current user and click **OK** to restart the HBase service.

Step 2 For MRS 3.x or later, perform the following operations:

1. Log in to FusionInsight Manager as user **admin** and choose **Cluster** > **Services** > **HBase**. On the HBase page, choose **Configurations** > **All Configurations** > **RegionServer** > **Customization**. In the right pane, add a configuration item for parameter **hbase.regionserver.config.expandor** with name **hbase.regionserver.wal.codec** and value **org.apache.hadoop.hbase.regionserver.wal.IndexedWALEditCodec**.
2. Choose **HMaster** > **Customization**, and add a configuration item for parameter **hbase.hmaster.config.expandor** with name **hbase.regionserver.wal.codec** and value **org.apache.hadoop.hbase.regionserver.wal.IndexedWALEditCodec**.
3. Click **Save**. In the dialog box that is displayed, click **OK** to save the configuration.
4. On the **Dashboard** page, click **More** and select **Restart Service**. Enter the password of the current user and click **OK** to restart the HBase service.

----End

15.8.19 Failed to Run the hbase shell Command on the MRS Cluster Client

Issue

A user fails to run the **hbase shell** command on the MRS cluster client.

Cause Analysis

- Environment variables have not been configured before the **hbase shell** command is executed.
- The HBase client is not installed in the MRS cluster.

Procedure

Step 1 Log in to the node where the client is installed as user **root**, switch to the client installation directory, and check whether the HBase client is installed.

- If yes, go to **Step 2**.
- If no, download and install the client.

Step 2 Run the following command to set environment variables:

source bigdata_env

Step 3 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *MRS cluster user*

Step 4 Run the HBase client command.

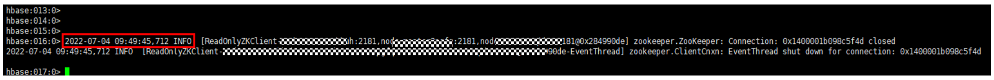
hbase shell

----End

15.8.20 Disordered Information Display on the HBase Shell Client Console Due to Printing of the INFO Information

Issue

When the HBase shell is used, INFO information is printed on the console, causing disordered information display. Before entering a command, the user has to press **Enter** to clean the console. The following figure provides an example.

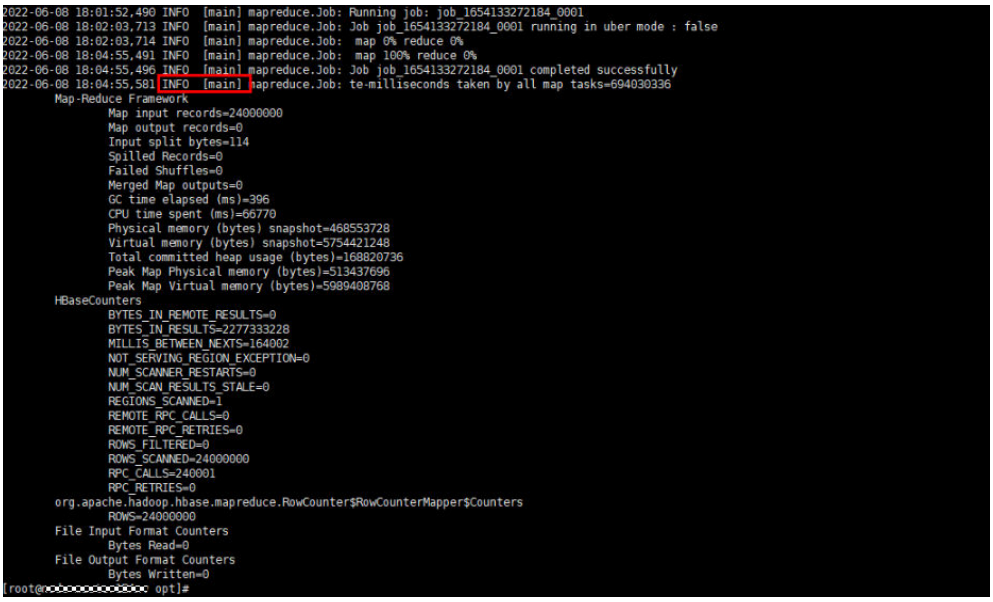


```
hbase:013:0>
hbase:014:0>
hbase:015:0>
hbase:016:0> 2022-07-04 09:49:45,712 INFO  [ReadOnlyZKClient-[redacted]uh:2181,nod[redacted]:2181,nod[redacted]181@0x284990de] zookeeper.ZooKeeper: Connection: 0x1400001b098c5f4d closed
2022-07-04 09:49:45,712 INFO  [ReadOnlyZKClient-[redacted]90de-EventThread] zookeeper.ClientCnxn: EventThread shut down for connection: 0x1400001b098c5f4d

hbase:017:0>
```

Cause Analysis

- By default, the log printing function of the HBase client is set to **INFO,console**. Therefore, INFO logs will be printed to the console, affecting the information display on the HBase shell console.
- The HBase client supports many commands, such as **hbase shell**, **hbase hbck**, and **hbase org.apache.hadoop.hbase.mapreduce.RowCounter**, and will support more in the future. The output type of some commands is **INFO**. If **INFO** is disabled, the output of these commands will be lost. For example, the output of **RowCounter** is of the **INFO** type.



```

[root@[redacted] opt]#
```

Procedure

Step 1 Log in to the node where the HBase client is installed as user **root**.

Step 2 Add the following information to the *HBase client installation directory***/HBase/component_env** file:

export HBASE_ROOT_LOGGER=INFO,RFA

Logs are exported to log files. If you run the **hbase org.apache.hadoop.hbase.mapreduce.RowCounter** command, you can view the execution result in the *HBase client installation directory***/HBase/hbase/logs/hbase.log** file.

Step 3 Switch to the HBase client installation directory and run the following commands for the configuration to take effect:

cd *HBase client installation directory*

source HBase/component_env

----End

15.8.21 HBase Failed to Start Due to Insufficient RegionServer Memory

Issue

The HBase service fails to start because the remaining RegionServer memory is insufficient.

Cause Analysis

The troubleshooting process is as follows:

1. Log in to the master node, go to the **/var/log/Bigdata** directory, and search for the HBase log. The log contains error message "connect regionserver timeout".
2. Log in to the RegionServer node in 1 that cannot be connected to HMaster and go to the **/var/log/Bigdata** directory to search for the HBase log. The RegionServer reports error message "error='Cannot allocate memory'(errno=12)".
3. According to the error message in 2, the startup failure is caused by insufficient RegionServer memory.

Procedure

Step 1 Log in to the RegionServer node where the error is reported and run the following command to check the remaining memory of the node:

free -g

Step 2 Run the **top** command to check the memory usage of the node.

Step 3 Stop the memory-consuming processes (not the processes of the MRS components) as prompted and restart the HBase service.

NOTE

Besides MRS components, jobs on Yarn are allocated to core nodes in the cluster, thereby occupying node memory. If the startup failure is caused by memory-consuming Yarn jobs, you are advised to expand the capacity of core nodes.

----End

15.9 Using HDFS

15.9.1 All NameNodes Become the Standby State After the NameNode RPC Port of HDFS Is Changed

Issue

After the NameNode RPC port is changed on the page and HDFS is restarted, all NameNodes are in the standby state, causing a cluster exception.

Symptom

All NameNodes are in the standby state, causing a cluster exception.

Cause Analysis

After the cluster is installed and started, if the NameNode RPC port is changed, the Zkfc service must be formatted to update node information on ZooKeeper.

Procedure

Step 1 Log in to Manager and stop the HDFS service.

NOTE

Do not stop related services when stopping HDFS.

Step 2 After the services are stopped, log in to the Master node whose RPC port is changed.

NOTE

If the RPC port is changed on both Master nodes, you can log in to either of the Master nodes.

Step 3 Run the **su - omm** command to switch to user **omm**.

NOTE

For a security cluster, run the **kinit hdfs** command for authentication.

Step 4 Run the following command to load the environment variable script to the environment:

cd ${BIGDATA_HOME}/*MRS_X.X.X***/***1_8_***Zkfc/etc**

source ${BIGDATA_HOME}/*MRS_X.X.X***/install/FusionInsight-Hadoop-3.1.1/hadoop/sbin/exportENV_VARS.sh**

NOTE

In the preceding command, *MRS_X.X.X* and *1_8* vary depending on the actual version.

Step 5 After the loading is complete, run the following command to format the Zkfc:

cd ${HADOOP_HOME}/bin

./hdfs zkfc -formatZK

Step 6 After the formatting is successful, restart HDFS on Manager.

NOTE

If the RPC port of the NameNode is changed, the configuration file must be updated for all clients that have been installed.

----End

15.9.2 An Error Is Reported When the HDFS Client Is Used After the Host Is Connected Using a Public Network IP Address

Issue

When the host is connected using a public network IP address, the HDFS client cannot be used and the message "**-bash: hdfs: command not found**" is displayed when the HDFS is running.

Symptom

When the host is connected using a public network IP address, the HDFS client cannot be used and the message "**-bash: hdfs: command not found**" is displayed when the HDFS is running.

Possible Causes

The environment variables are not set before the user logs in to the Master node and runs the command.

Procedure

Step 1 Log in to any Master node as user **root**.

Step 2 Run the **source /opt/client/bigdata_env** command to configure environment variables.

Step 3 Run the **hdfs** command to use the HDFS client.

----End

15.9.3 Failed to Use Python to Remotely Connect to the Port of HDFS

Issue

Failed to use Python to remotely connect to the port of HDFS.

Symptom

Failed to use Python to remotely connect to port 50070 of HDFS.

Cause Analysis

The default port of open source HDFS is 50070 for versions earlier than 3.0.0 and is 9870 for version 3.0.0 or later. The port used by the user does not match the HDFS version.

Step 1 Log in to the active Master node in the cluster.

Step 2 Run the **su - omm** command to switch to user **omm**.

Step 3 Run the **/opt/Bigdata/om-0.0.1/sbin/queryVersion.sh** command to check the HDFS version in the cluster.

Determine the port number of the open-source component based on the version number.

Step 4 Run the **netstat -anp|grep ${port}** command to check whether the default port number of the component exists.

If it does not exist, the default port number is changed. Change the port to the default port and reconnect to HDFS.

If it exists, contact technical support.

NOTE

- **${port}**: indicates the default port number corresponding to the component version.
- If you have changed the default port number, use the new port number to connect to HDFS. You are advised not to change the default port number.

----End

15.9.4 HDFS Capacity Usage Reaches 100%, Causing Unavailable Upper-layer Services Such as HBase and Spark

Issue

The HDFS capacity usage of the cluster reaches 100%, and the HDFS service status is read-only. As a result, upper-layer services such as HBase and Spark are unavailable.

Symptom

The HDFS capacity usage is 100%, the disk capacity usage is only about 85%, and the HDFS service status is read-only. As a result, upper-layer services such as HBase and Spark are unavailable.

Cause Analysis

Currently, NodeManager and DataNode share data disks. By default, MRS reserves 15% of data disk space for non-HDFS. You can change the percentage of data disk space by setting the HDFS parameter **dfs.datanode.du.reserved.percentage**.

If the HDFS disk usage is 100%, you can set **dfs.datanode.du.reserved.percentage** to a smaller value to restore services and then expand disk capacity.

Procedure

Step 1 Log in to any Master node in the cluster.

Step 2 Run the **source /opt/client/bigdata_env** command to initialize environment variables.

NOTE

If it is a security cluster, run the **kinit -kt <keytab file> <pricipal name>** command for authentication.

Step 3 Run the **hdfs dfs –put ./startDetail.log /tmp** command to check whether HDFS fails to write files.

```
19/05/12 10:07:32 WARN hdfs.DataStreamer: DataStreamer Exception
org.apache.hadoop.ipc.RemoteException(java.io.IOException): File /tmp/startDetail.log._COPYING_ could
only be replicated to 0 nodes instead of minReplication (=1).  There are 3 datanode(s) running and no
node(s) are excluded in this operation.
```

Step 4 Run the **hdfs dfsadmin -report** command to check the used HDFS capacity. The command output shows that the HDFS capacity usage has reached 100%.

```
Configured Capacity: 5389790579100 (4.90 TB)
Present Capacity: 5067618628404 (4.61 TB)
DFS Remaining: 133350196 (127.17 MB)
DFS Used: 5067485278208 (4.61 TB)
DFS Used%: 100.00%
Under replicated blocks: 10
Blocks with corrupt replicas: 0
Missing blocks: 0
Missing blocks (with replication factor 1): 0
Pending deletion blocks: 0
```

Step 5 When the HDFS capacity usage reaches 100%, change the percentage of data disk space by setting the HDFS parameter **dfs.datanode.du.reserved.percentage**.

1. Go to the service configuration page.
   - MRS Manager: Log in to MRS Manager and choose **Services** > **HDFS** > **Configuration**.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **HDFS** > **Configurations**.
2. Select **All Configurations** and search for **dfs.datanode.du.reserved.percentage** in the search box.

3. Change the value of this parameter to **10**.

Step 6 After the modification, increase the number of disks of the Core node.

----End

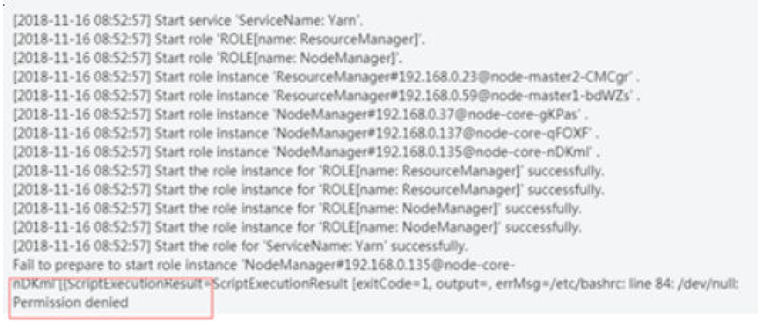
15.9.5 An Error Is Reported During HDFS and Yarn Startup

Issue

An error is reported during HDFS and Yarn startup.

Symptom

HDFS and Yarn fail to be started. The following error information is displayed: **/dev/null Permission denied**



```
[2018-11-16 08:52:57] Start service 'ServiceName: Yarn'.
[2018-11-16 08:52:57] Start role 'ROLE[name: ResourceManager]'.
[2018-11-16 08:52:57] Start role 'ROLE[name: NodeManager]'.
[2018-11-16 08:52:57] Start role instance 'ResourceManager#192.168.0.23@node-master2-CMCgr' .
[2018-11-16 08:52:57] Start role instance 'ResourceManager#192.168.0.59@node-master1-bdWZs' .

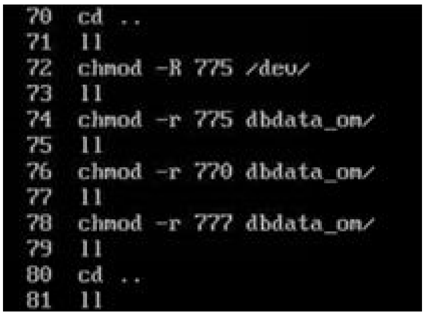
[2018-11-16 08:52:57] Start role instance 'NodeManager#192.168.0.137@node-core-qFOXF' .
[2018-11-16 08:52:57] Start role instance 'NodeManager#192.168.0.135@node-core-nDKml' .
[2018-11-16 08:52:57] Start the role instance for 'ROLE[name: ResourceManager]' successfully.
[2018-11-16 08:52:57] Start the role instance for 'ROLE[name: ResourceManager]' successfully.
[2018-11-16 08:52:57] Start the role instance for 'ROLE[name: NodeManager]' successfully.
[2018-11-16 08:52:57] Start the role instance for 'ROLE[name: NodeManager]' successfully.
[2018-11-16 08:52:57] Start the role for 'ServiceName: Yarn' successfully.
Fail to prepare to start role instance 'NodeManager#192.168.0.135@node-core-
nDKml' [[ScriptExecutionResult=ScriptExecutionResult [exitCode=1, output=, errMsg=/etc/bashrc: line 84: /dev/null:
Permission denied
```

Cause Analysis

The customer changed the permission value of **/dev/null** of the VM system to **775**.



```
70  cd ..
71  ll
72  chmod -R 775 /dev/
73  ll
74  chmod -r 775 dbdata_om/
75  ll
76  chmod -r 770 dbdata_om/
77  ll
78  chmod -r 777 dbdata_om/
79  ll
80  cd ..
81  ll
```

Procedure

Step 1 Log in to any Master node in the cluster as user **root**.

Step 2 After successful login, run the **chmod 666 /dev/null** command to modify the permission value of **/dev/null** to **666**.

Step 3 Run the **ls -al /dev/null** command to check whether the new permission value of **/dev/null** is **666**. If it is not, change the value to **666**.

Step 4 After the modification is successful, restart HDFS and Yarn.

----End

15.9.6 HDFS Permission Setting Error

Issue

When using MRS, a user has the permission to delete or create files in another user's HDFS directory.

Symptom

When using MRS, a user has the permission to delete or create files in another user's HDFS directory.

Cause Analysis

The user has the permission for the **ficommon** group and therefore can perform any operations on the HDFS. You need to remove the user's **ficommon** group permission.

Procedure

Step 1 Log in to the master node in the cluster as user **root**.

Step 2 Run the **id ${Username}** command to check whether the user has the **ficommon** group permission.

If the user has the **ficommon** group permission, go to **Step 3**. If the user does not have the **ficommon** group permission, contact technical support.

NOTE

${Username} indicates the name of the user whose HDFS permission is incorrectly set.

Step 3 Run the **gpasswd -d ${Username} ficommon** command to delete the user's **ficommon** group permission.

NOTE

${Username} indicates the name of the user whose HDFS permission is incorrectly set.

Step 4 Modify parameters on Manager.

MRS Manager (applicable to versions earlier than MRS 3.*x*):

1. Log in to MRS Manager and choose **Services** > **HDFS** > **Service Configuration**.
2. Set **Type** to **All**, enter **dfs.permissions.enabled** in the search box, and change the parameter value to **true**.
3. Click **Save Configuration** and restart the HDFS service.

FusionInsight Manager (applicable to MRS 3.*x* or later):

1. Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **HDFS** > **Configurations** > **All Configurations**.
2. Enter **dfs.permissions.enabled** in the search box and change the value to **true**.

3. After the modification is complete, click **Save** and restart the HDFS service.

MRS console (applicable to MRS 2.0.1 or later):

1. Log in to the MRS console and choose **Components** > **HDFS** > **Service Configuration**.
2. Set **Type** to **All**, enter **dfs.permissions.enabled** in the search box, and change the parameter value to **true**.
3. Click **Save Configuration** and restart the HDFS service.

----End

15.9.7 A DataNode of HDFS Is Always in the Decommissioning State

Issue

A DataNode of HDFS is in the **Decommissioning** state for a long period of time.

Symptom

A DataNode of HDFS fails to be decommissioned (or the Core node fails to be scaled in), but the DataNode remains in the Decommissioning state.

Cause Analysis

During the decommissioning of a DataNode (or scale-in of the Core node) in HDFS, the decommissioning or scale-in task fails and the blacklist is not cleared because the Master node is restarted or the NodeAgent process exits unexpectedly. In this case, the DataNode remains in the **Decommissioning** state. The blacklist needs to be cleared manually.

Procedure

Step 1 Go to the service instance page.

MRS Manager:

Log in to MRS Manager and choose **Services** > **HDFS** > **Instance**.

FusionInsight Manager:

MRS 3.x or later: Log in to FusionInsight Manager and choose **Cluster** > **Service** > **HDFS** > **Instance**.

Log in to the MRS console and choose **Components** > **HDFS** > **Instances**.

MRS cluster 2.0.1 or later: Log in to the MRS console and choose **Components** > **HDFS** > **Instances**.

Step 2 Check the HDFS service instance status, locate the DataNode that is in the decommissioning state, and copy the IP address of the DataNode.

Step 3 Log in to the Master1 node and run the **cd ${BIGDATA_HOME}/MRS_*/1_*_NameNode/etc/** command to go to the blacklist directory.

Step 4 Run the **sed -i "/^*IP*$/d" excludeHosts** command to clear the faulty DataNode information from the blacklist. Replace the IP address in the command with the IP address of the faulty DataNode queried in **Step 2**. The IP address cannot contain spaces.

Step 5 If there are two Master nodes, perform **Step 3** and **Step 4** on Master2.

Step 6 Run the following command on the Master1 node to initialize environment variables:

source /opt/client/bigdata_env

Step 7 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

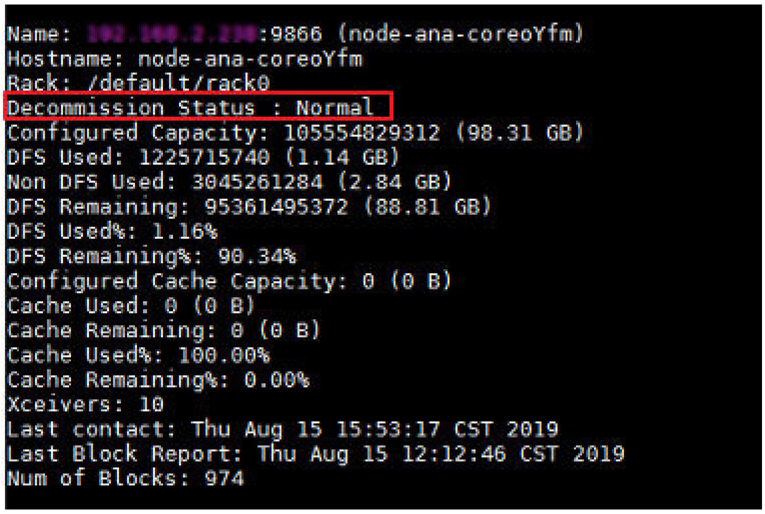
Example: **kinit admin**

Step 8 Run the following command on the Master1 node to update the HDFS blacklist:

hdfs dfsadmin -refreshNodes

Step 9 Run the **hdfs dfsadmin -report** command to check the status of each DataNode. Ensure that the DataNode corresponding to the IP address obtained in has been restored to the **Normal** state.

Figure 15-21 DataNode status



```
Name: [redacted]:9866 (node-ana-coreoYfm)
Hostname: node-ana-coreoYfm
Rack: /default/rack0
Decommission Status : Normal
Configured Capacity: 105554829312 (98.31 GB)
DFS Used: 1225715740 (1.14 GB)
Non DFS Used: 3045261284 (2.84 GB)
DFS Remaining: 95361495372 (88.81 GB)
DFS Used%: 1.16%
DFS Remaining%: 90.34%
Configured Cache Capacity: 0 (0 B)
Cache Used: 0 (0 B)
Cache Remaining: 0 (0 B)
Cache Used%: 100.00%
Cache Remaining%: 0.00%
Xceivers: 10
Last contact: Thu Aug 15 15:53:17 CST 2019
Last Block Report: Thu Aug 15 12:12:46 CST 2019
Num of Blocks: 974
```

Step 10 Go to the service instance page.

MRS Manager:

Log in to MRS Manager and choose **Services** > **HDFS** > **Instances**.

FusionInsight Manager:

MRS 3.x or later: Log in to FusionInsight Manager and choose **Cluster** > **Service** > **HDFS** > **Instance**.

MRS cluster 2.0.1 or later: Log in to the MRS console and choose **Components** > **HDFS** > **Instances**.

Step 11 Select the DataNode instance that is in the decommissioning state and choose **More** > **Restart Instance**.

Step 12 Wait until the restart is complete and check whether the DataNode is restored.

----End

Summary and Suggestions

Do not perform high-risk operations, such as restarting nodes, during decommissioning (or scale-in).

Related Information

None

15.9.8 HDFS Failed to Start Due to Insufficient Memory

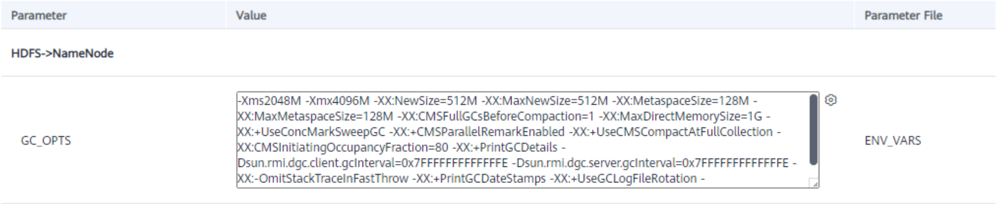
Symptom

After the HDFS service is restarted, HDFS is in the Bad state, the NameNode instance status is abnormal, and the system cannot exit the security mode for a long time.

Cause Analysis

1. In the NameNode run log (**/var/log/Bigdata/hdfs/nn/hadoop-omm-namendoe-XXX.log**), search for **WARN**. It is found that GC takes 63 seconds.
```
2017-01-22 14:52:32,641 | WARN  | org.apache.hadoop.util.JvmPauseMonitor$Monitor@1b39fd82 |
Detected pause in JVM or host machine (eg GC): pause of approximately 63750ms
GC pool 'ParNew' had collection(s): count=1 time=0ms
GC pool 'ConcurrentMarkSweep' had collection(s): count=1 time=63924ms | JvmPauseMonitor.java:189
```
2. Analyze the NameNode log **/var/log/Bigdata/hdfs/nn/hadoop-omm-namendoe-XXX.log**. It is found that the NameNode is waiting for block reporting and the total number of blocks is too large. In the following example, the total number of blocks is 36.29 million.
```
2017-01-22 14:52:32,641 | INFO  | IPC Server handler 8 on 25000 | STATE* Safe mode ON.
The reported blocks 29715437 needs additional 6542184 blocks to reach the threshold 0.9990 of total
blocks 36293915.
```
3. On Manager, check the **GC_OPTS** parameter of the NameNode:

Figure 15-22 Checking the GC_OPTS parameter of the NameNode



Parameter	Value	Parameter File
HDFS->NameNode		
GC_OPTS	-Xms2048M -Xmx4096M -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -XX:CMSFullGCsBeforeCompaction=1 -XX:MaxDirectMemorySize=1G -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:+UseCMSCompactAtFullCollection -XX:CMSInitiatingOccupancyFraction=80 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -	ENV_VARS

4. For details about the mapping between the NameNode memory configuration and data volume, see **Table 15-2**.

Table 15-2 Mapping between NameNode memory configuration and data volume

Number of File Objects	Reference Value
10,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
20,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
50,000,000	-Xms32G -Xmx32G -XX:NewSize=2G -XX:MaxNewSize=3G
100,000,000	-Xms64G -Xmx64G -XX:NewSize=4G -XX:MaxNewSize=6G
200,000,000	-Xms96G -Xmx96G -XX:NewSize=8G -XX:MaxNewSize=9G
300,000,000	-Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Solution

Step 1 Modify the NameNode memory parameter based on the specifications. If the number of blocks is 36 million, change the parameter value to **-Xms32G -Xmx32G -XX:NewSize=2G -XX:MaxNewSize=3G**.

Step 2 Restart a NameNode and check that the NameNode can be started normally.

Step 3 Restart the other NameNode and check that the page status is restored.

----End

15.9.9 A Large Number of Blocks Are Lost in HDFS due to the Time Change Using ntpdate

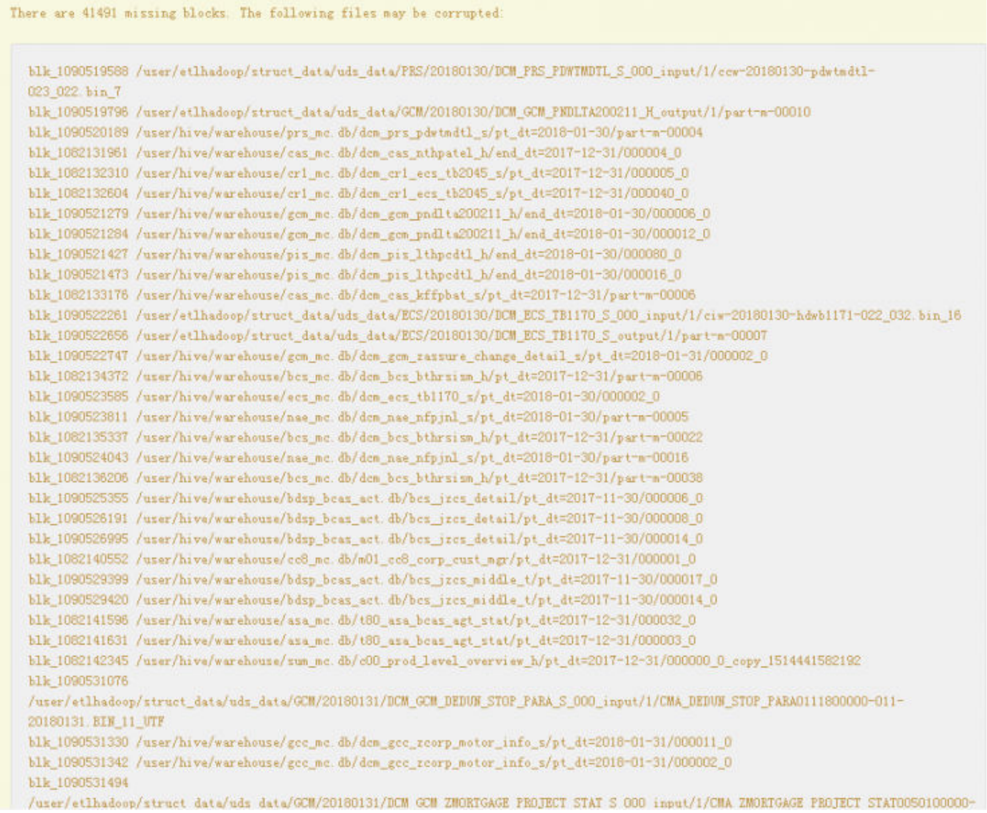
Symptom

1. A user uses **ntpdate** to change the time for a cluster that is not stopped. After the time is changed, HDFS enters the safe mode and cannot be started.
2. After the system exits the safe mode and starts, about 1 TB data is lost during the **hfck** check.

Cause Analysis

1. A large number of blocks are lost on the native NameNode page.

Figure 15-23 Block loss



```
There are 41491 missing blocks. The following files may be corrupted:

blk_1090519588 /user/etlhadoop/struct_data/uds_data/PRS/20180130/DCM_PRS_PDWTMDTL_S_000_input/1/ccw-20180130-pdwtmdtl-

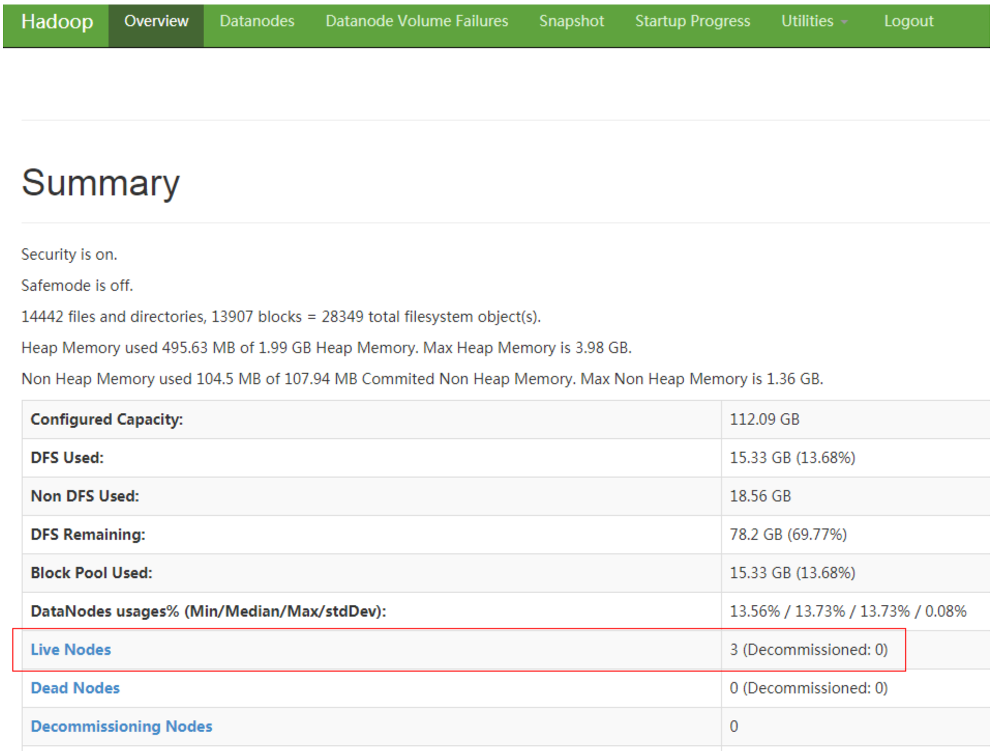
2. DataNode information on the native page shows that the number of displayed DataNode nodes is 10 less than that of actual DataNode nodes.

Figure 15-24 Checking the number of DataNodes



Summary

Security is on.

Safemode is off.

14442 files and directories, 13907 blocks = 28349 total filesystem object(s).

Heap Memory used 495.63 MB of 1.99 GB Heap Memory. Max Heap Memory is 3.98 GB.

Non Heap Memory used 104.5 MB of 107.94 MB Commited Non Heap Memory. Max Non Heap Memory is 1.36 GB.

Configured Capacity:	112.09 GB
DFS Used:	15.33 GB (13.68%)
Non DFS Used:	18.56 GB
DFS Remaining:	78.2 GB (69.77%)
Block Pool Used:	15.33 GB (13.68%)
DataNodes usages% (Min/Median/Max/stdDev):	13.56% / 13.73% / 13.73% / 0.08%
Live Nodes	3 (Decommissioned: 0)
Dead Nodes	0 (Decommissioned: 0)
Decommissioning Nodes	0

3. Check the DataNode run log file **/var/log/Bigdata/hdfs/dn/hadoop-omm-datanode-*hostname*.log**. The following error information is displayed:

   Major error information: Clock skew too great

```

Solution

Step 1 Check DataNode memory configuration and whether the remaining server memory is sufficient.

Step 2 Increase DataNode memory and restart the DataNode.

----End

15.9.11 Manually Performing Checkpoints When a NameNode Is Faulty for a Long Time

Symptom

If the standby NameNode is faulty for a long time, a large amount of editlog will be accumulated. In this case, if the HDFS or active NameNode is restarted, the active NameNode reads a large amount of unmerged editlog. As a result, the HDFS or active NameNode takes a long time to restart and even fails to restart.

Cause Analysis

The standby NameNode periodically combines editlog files and generates the fsimage file. This process is called checkpoint. After the fsimage file is generated, the standby NameNode transfers it to the active NameNode.

NOTE

As the standby NameNode periodically combines editlog files, it cannot combine them when it becomes abnormal. As a result, the active NameNode needs to load many editlog files during its next startup, which occupies much memory and takes a long time.

The period of metadata combination is determined by the following parameters. If the NameNode runs for 30 minutes or one million counts of operations are performed on HDFS, the checkpoint is implemented.

- **dfs.namenode.checkpoint.period**: specifies the checkpoint period. The default value is **1800s**.
- dfs.namenode.checkpoint.txns: specifies the times of operations for triggering the checkpoint execution. The default value is **1000000**.

Solution

Before restarting the HDFS or active NameNode, perform checkpoint manually to merge metadata of the active NameNode.

Step 1 Stop workloads.

Step 2 Obtain the hostname of the active NameNode.

Step 3 Run the following commands on the client:

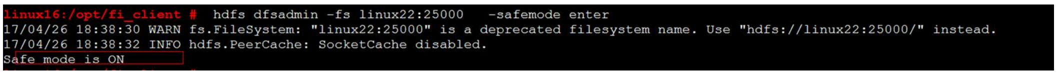
source /opt/client/bigdata_env

kinit *Component user*

Note: Replace **/opt/client** with the actual installation path of the client.

Step 4 Run the following command to enable the safe mode for the active NameNode (replace **linux22** with the hostname of the active NameNode):

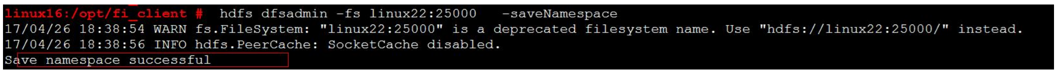
hdfs dfsadmin -fs linux22:25000 -safemode enter



```
linux16:/opt/fi_client #  hdfs dfsadmin -fs linux22:25000   -safemode enter
17/04/26 18:38:30 WARN fs.FileSystem: "linux22:25000" is a deprecated filesystem name. Use "hdfs://linux22:25000/" instead.
17/04/26 18:38:32 INFO hdfs.PeerCache: SocketCache disabled.
Safe mode is ON
```

Step 5 Run the following command to merge editlog on the active NameNode:

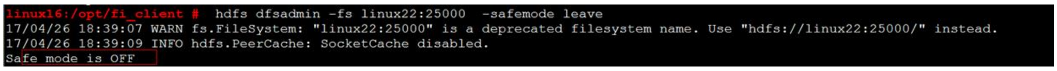
hdfs dfsadmin -fs linux22:25000 -saveNamespace



```
linux16:/opt/fi_client #  hdfs dfsadmin -fs linux22:25000   -saveNamespace
17/04/26 18:38:54 WARN fs.FileSystem: "linux22:25000" is a deprecated filesystem name. Use "hdfs://linux22:25000/" instead.
17/04/26 18:38:56 INFO hdfs.PeerCache: SocketCache disabled.
Save namespace successful
```

Step 6 Run the following command to make the active NameNode exit the safe mode:

hdfs dfsadmin -fs linux22:25000 -safemode leave

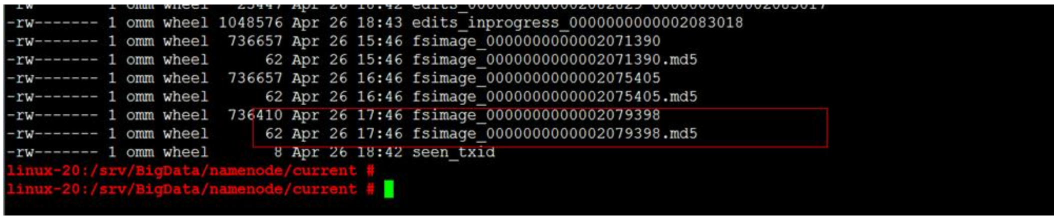


```
linux16:/opt/fi_client #  hdfs dfsadmin -fs linux22:25000  -safemode leave
17/04/26 18:39:07 WARN fs.FileSystem: "linux22:25000" is a deprecated filesystem name. Use "hdfs://linux22:25000/" instead.
17/04/26 18:39:09 INFO hdfs.PeerCache: SocketCache disabled.
Safe mode is OFF
```

Step 7 Check whether the combination is complete.

cd /srv/BigData/namenode/current

Check whether the time of the first generated fsimage is the current time. If yes, the combination is complete.



```
-rw------- 1 omm wheel 1048576 Apr 26 18:43 edits_inprogress_0000000000002083018
-rw------- 1 omm wheel  736657 Apr 26 15:46 fsimage_0000000000002071390

linux-20:/srv/BigData/namenode/current #
linux-20:/srv/BigData/namenode/current #
```

----End

15.9.12 Common File Read/Write Faults

Symptom

When a user performs a write operation on HDFS, the message "Failed to place enough replicas:expected..." is displayed.

Cause Analysis

- The data receiver of the DataNode is unavailable.

  The DataNode log is as follows:

  ```
  2016-03-17 18:51:44,721 | WARN |
  org.apache.hadoop.hdfs.server.datanode.DataXceiverServer@5386659f |
  hadoopc1h2:25009:DataXceiverServer: | DataXceiverServer.java:158
  java.io.IOException: Xceiver count 4097 exceeds the limit of concurrent xcievers: 4096
  at org.apache.hadoop.hdfs.server.datanode.DataXceiverServer.run(DataXceiverServer.java:140)
  at java.lang.Thread.run(Thread.java:745)
  ```

- The disk space configured for the DataNode is insufficient.
- DataNode heartbeats are delayed.

Solution

- If the DataNode data receiver is unavailable, add the value of the HDFS parameter **dfs.datanode.max.transfer.threads** on Manager.
- If disk space or CPU resources are insufficient, add DataNodes or ensure that disk space and CPU resources are available.
- If the network is faulty, ensure that the network is available.

15.9.13 Maximum Number of File Handles Is Set to a Too Small Value, Causing File Reading and Writing Exceptions

Symptom

The maximum number of file handles is set to a too small value, causing insufficient file handles. Writing files to HDFS is slow or file writing fails.

Cause Analysis

1. The DataNode log **/var/log/Bigdata/hdfs/dn/hadoop-omm-datanode-XXX.log** contains exception information "java.io.IOException: Too many open files."

   ```
   2016-05-19 17:18:59,126 | WARN  |

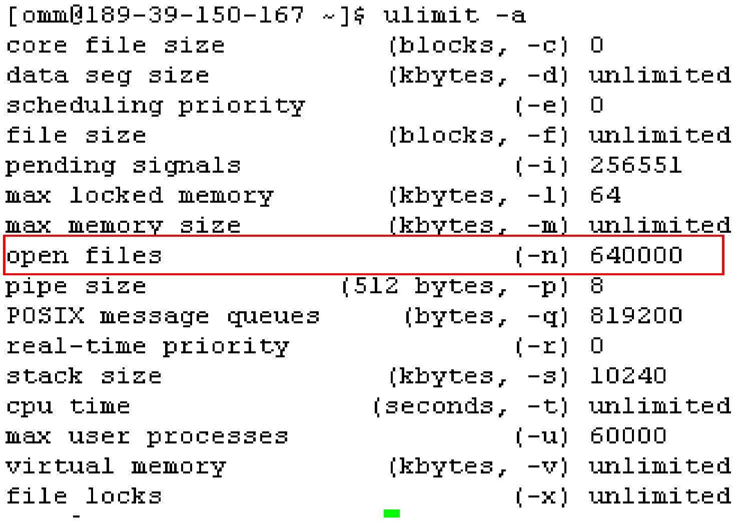
at java.lang.Thread.run(Thread.java:745)
```

2. The error indicates insufficient file handles. File handles cannot be opened and data is written to other DataNodes. As a result, writing files is slow or fails.

Solution

Step 1 Run the **ulimit -a** command to check the maximum number of file handles set for the involved node. If the value is small, change it to **640000**.

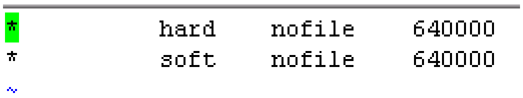
Figure 15-29 Check the number of file handles.



```
[omm@189-39-150-167 ~]$ ulimit -a
core file size          (blocks, -c) 0
data seg size           (kbytes, -d) unlimited
scheduling priority             (-e) 0
file size               (blocks, -f) unlimited
pending signals                 (-i) 256551
max locked memory       (kbytes, -l) 64
max memory size         (kbytes, -m) unlimited
open files                      (-n) 640000
pipe size            (512 bytes, -p) 8
POSIX message queues     (bytes, -q) 819200
real-time priority              (-r) 0
stack size              (kbytes, -s) 10240
cpu time               (seconds, -t) unlimited
max user processes              (-u) 60000
virtual memory          (kbytes, -v) unlimited
file locks                      (-x) unlimited
```

Step 2 Run the **vi /etc/security/limits.d/90-nofile.conf** command to edit this file. Set the number of file handles to **64000**. If the file does not exist, create one and modify the file as follows:

Figure 15-30 Changing the number of file handles



```
*          hard    nofile    640000
*          soft    nofile    640000
~
```

Step 3 Open another terminal. Run the **ulimit -a** command to check whether the modification is successful. If the modification fails, perform the preceding operations again.

Step 4 Restart the DataNode instance on Manager.

----End

15.9.14 A Client File Fails to Be Closed After Data Writing

Symptom

A client file fails to be closed after data is written to the file. A message is displayed indicating that the data block does not have enough replicas.

Client log:

```
2015-05-27 19:00:52.811 [pool-2-thread-3] ERROR: /tsp/nedata/collect/UGW/ugwufdr/
20150527/10/6_20150527105000_20150527105500_SR5S14_1432723806338_128_11.pkg.tmp143272380633

at java.lang.Thread.run(Thread.java:745)
```

Cause Analysis

1. The HDFS client starts to write blocks.

   For example, the HDFS client starts to write **/20150527/10/6_20150527105000_20150527105500_SR5S14_1432723806338_128_11.pkg.tmp1432723806338 at 2015-05-27 18:50:24,232**. The allocated block is **blk_1099105501_25370893**:

   ```
   2015-05-27 18:50:24,232 | INFO  | IPC Server handler 30 on 25000 | BLOCK* allocateBlock: /
   20150527/10/6_20150527105000_20150527105500_SR5S14_1432723806338_128_11.pkg.tmp1432723
   806338. BP-1803470917-192.168.57.33-1428597734132
   blk_1099105501_25370893{blockUCState=UNDER_CONSTRUCTION, primaryNodeIndex=-1,
   replicas=[ReplicaUnderConstruction[[DISK]DS-b2d7b7d0-f410-4958-8eba-6deecbca2f87:NORMAL|
   RBW], ReplicaUnderConstruction[[DISK]DS-76bd80e7-ad58-49c6-bf2c-03f91caf750f:NORMAL|RBW]]}
   | org.apache.hadoop.hdfs.server.namenode.FSNamesystem.saveAllocatedBlock(FSNamesystem.java:
   3166)
   ```

2. After the writing is complete, the HDFS client invokes **fsync**:

   ```
   2015-05-27 19:00:22,717 | INFO  | IPC Server handler 22 on 25000 | BLOCK* fsync:
   20150527/10/6_20150527105000_20150527105500_SR5S14_1432723806338_128_11.pkg.tmp1432723
   806338 for DFSClient_NONMAPREDUCE_-120525246_15 |
   org.apache.hadoop.hdfs.server.namenode.FSNamesystem.fsync(FSNamesystem.java:3805)
   ```

3. The HDFS client invokes **close** to close the file. After receiving the close request from the client, the NameNode uses the checkFileProgress function to check the completion status of the last block and closes the file only when enough DataNodes report that the last block is complete:

   ```
   2015-05-27 19:00:27,603 | INFO  | IPC Server handler 44 on 25000 | BLOCK* checkFileProgress:
   blk_1099105501_25370893{blockUCState=COMMITTED, primaryNodeIndex=-1,
   replicas=[ReplicaUnderConstruction[[DISK]DS-ef5fd3c9-5088-4813-ae9a-34a0714ec3a3:NORMAL|

has not reached minimal replication 1 |
org.apache.hadoop.hdfs.server.namenode.FSNamesystem.checkFileProgress(FSNamesystem.java:3197)
```

4. The NameNode prints **CheckFileProgress** multiple times because the HDFS client retries to close the file for several times. The file closing fails because the block status is not complete. The number of retries is determined by the **dfs.client.block.write.locateFollowingBlock.retries** parameter. The default value is **5**. Therefore, **CheckFileProgress** is printed six times in the NameNode log.
5. After 0.5 seconds, the DataNodes report that the block has been successfully written.

```
2015-05-27 19:00:40,608 | INFO  | IPC Server handler 60 on 25000 | BLOCK* addStoredBlock:
blockMap updated: 192.168.10.21:25009 is added to

size 11837530 |
org.apache.hadoop.hdfs.server.blockmanagement.BlockManager.logAddStoredBlock(BlockManager.java
:2393)
2015-05-27 19:00:48,297 | INFO  | IPC Server handler 37 on 25000 | BLOCK* addStoredBlock:
blockMap updated: 192.168.10.10:25009 is added to blk_1099105501_25370893 size 11837530 |
org.apache.hadoop.hdfs.server.blockmanagement.BlockManager.logAddStoredBlock(BlockManager.java
:2393)
```

6. The block write success notification is delayed because of network bottlenecks or CPU bottlenecks.
7. If close is invoked again or the number of file closing retries increases, a closing success message will be displayed. You are advised to increase the value of **dfs.client.block.write.locateFollowingBlock.retries**. The default parameter value is 5 and retry intervals are 400 ms, 800 ms, 1600 ms, 3200 ms, 6400 ms, and 12800 ms. Therefore, the result of the close function can be returned after a maximum of 25.2 seconds.

Solution

Step 1 Solution:

Set the value of **dfs.client.block.write.locateFollowingBlock.retries** to **6**. The retry intervals are 400 ms, 800 ms, 1600 ms, 3200 ms, 6400 ms, and 12800 ms.

Therefore, the result of the close function can be returned after a maximum of 50.8 seconds.

----End

Remarks

Generally, this fault occurs when the cluster workload is heavy. Adjusting the parameter can only temporarily avoid the fault. You are advised to reduce the cluster workload, for example, do not allocate all CPU resources to MapReduce.

15.9.15 File Fails to Be Uploaded to HDFS Due to File Errors

Symptom

The **hadoop dfs -put** command is used to copy local files to HDFS.

After some files are uploaded, an error occurs. The size of the temporary files no long changes on the native NameNode page.

Cause Analysis

1. Check the NameNode log **/var/log/Bigdata/hdfs/nn/hadoop-omm-namenode-*hostname*.log**. It is found that the file is being written until a failure occurs.
```
2015-07-13 10:05:07,847 | WARN  | org.apache.hadoop.hdfs.server.namenode.LeaseManager
$Monitor@36fea922 | DIR* NameSystem.internalReleaseLease: Failed to release lease for file /hive/
order/OS_ORDER._8.txt._COPYING_. Committed blocks are waiting to be minimally replicated. Try
again later. | FSNamesystem.java:3936
2015-07-13 10:05:07,847 | ERROR | org.apache.hadoop.hdfs.server.namenode.LeaseManager
$Monitor@36fea922 | Cannot release the path /hive/order/OS_ORDER._8.txt._COPYING_ in the lease
[Lease.  Holder: DFSClient_NONMAPREDUCE_-1872896146_1, pendingcreates: 1] | LeaseManager.java:
459
org.apache.hadoop.hdfs.protocol.AlreadyBeingCreatedException: DIR*
NameSystem.internalReleaseLease: Failed to release lease for file /hive/order/
OS_ORDER._8.txt._COPYING_. Committed blocks are waiting to be minimally replicated. Try again
later.
at FSNamesystem.internalReleaseLease(FSNamesystem.java:3937)
```
2. Root cause: The uploaded files are damaged.
3. Verification: The cp or scp operation fails to be performed for the copied files. Therefore, the files are damaged.

Solution

Step 1 Upload normal files.

----End

15.9.16 After dfs.blocksize Is Configured and Data Is Put, Block Size Remains Unchanged

Symptom

After **dfs.blocksize** is set to **268435456** on the interface and data is put, the original block size keeps unchanged.

Cause Analysis

The **dfs.blocksize** value in the **hdfs-site.xml** file of the client is not changed, and the value prevails.

Solution

Step 1 Ensure that the **dfs.blocksize** value is a multiple of 512.

Step 2 Download a client or modify the client configuration.

Step 3 **dfs.blocksize** is configured on the client and is subject to the client. Otherwise, the value configured on the server prevails.

----End

15.9.17 Failed to Read Files, and "FileNotFoundException" Is Displayed

Symptom

In MapReduce tasks, all Map tasks are successfully executed, but Reduce tasks fail. The error message "FileNotFoundException...No lease on...File does not exist" is displayed in the logs.

```
Error: org.apache.hadoop.ipc.RemoteException(java.io.FileNotFoundException): No lease on /user/sparkhive/
warehouse/daas/dsp/output/_temporary/1/_temporary/attempt_1479799053892_17075_r_000007_0/part-
r-00007 (inode 6501287): File does not exist. Holder
DFSClient_attempt_1479799053892_17075_r_000007_0_-1463597952_1 does not have any open files.
at org.apache.hadoop.hdfs.server.namenode.FSNamesystem.checkLease(FSNamesystem.java:3350)
at org.apache.hadoop.hdfs.server.namenode.FSNamesystem.completeFileInternal(FSNamesystem.java:3442)
at org.apache.hadoop.hdfs.server.namenode.FSNamesystem.completeFile(FSNamesystem.java:3409)
at org.apache.hadoop.hdfs.server.namenode.NameNodeRpcServer.complete(NameNodeRpcServer.java:789)
```

Cause Analysis

"FileNotFoundException...No lease on...File does not exist" indicates that the file is deleted during the operation.

1. Search for the file name in the NameNode audit log of HDFS (**/var/log/Bigdata/audit/hdfs/nn/hdfs-audit-namenode.log** of the active NameNode) to confirm the creation time of the file.
2. Search the NameNode audit logs that are generated within the time range from the file creation to the time of exception occurrence and determine whether the file is deleted or moved to another directory.
3. If the file is not deleted or moved, the parent directory of the file may be deleted or moved. You need to search the upper-layer directory. In this example, the parent directory of the file's parent directory is deleted.
   ```
   2017-05-31 02:04:08,286 | INFO  | IPC Server handler 30 on 25000 | allowed=true
   ugi=appUser@HADOOP.COM (auth:TOKEN) ip=/192.168.1.22     cmd=delete      src=/user/sparkhive/
   warehouse/daas/dsp/output/_temporary      dst=null    perm=null proto=rpc | FSNamesystem.java:8189
   ```

NOTE

- The preceding log indicates that the **appUser** user of the 192.168.1.22 node deletes **/user/sparkhive/warehouse/daas/dsp/output/_temporary**.
- Run the **zgrep "***file name***" *.zip** command to search for the contents of the .zip package.

Solution

Step 1 Check the service to find out why the file or the parent directory of the file is deleted.

----End

15.9.18 Failed to Write Files to HDFS, and "item limit of / is exceeded" Is Displayed

Symptom

The client or upper-layer component logs indicate that a file fails to be written to a directory on HDFS. The error information is as follows:

The directory item limit of /tmp is exceeded: limit=5 items=5.

Cause Analysis

1. The run log file **/var/log/Bigdata/hdfs/nn/hadoop-omm-namenode-XXX.log** of the client or NameNode contains error information "The directory item limit of /tmp is exceeded:." The error message indicates that the number of files in the **/tmp** directory exceeds 1048576.
```
2018-03-14 11:18:21,625 | WARN  | IPC Server handler 62 on 25000 | DIR* NameSystem.startFile: /tmp/
test.txt The directory item limit of /tmp is exceeded: limit=1048576 items=1048577 |
FSNamesystem.java:2334
```
2. The **dfs.namenode.fs-limits.max-directory-items** parameter specifies the maximum number of directories or files that are not in recursion relationship in a single directory. The default value is **1048576**. The value ranges from 1 to 6400000.

Solution

Step 1 Check whether it is normal that the directory contains more than one million files that are not in recursion relationship. If it is normal, increase the value of the HDFS parameter **dfs.namenode.fs-limits.max-directory-items** and restart the HDFS NameNode for the modification to take effect.

Step 2 If it is abnormal, delete unnecessary files.

----End

15.9.19 Adjusting the Log Level of the Shell Client

- **Temporary adjustment**: After the Shell client window is closed, the log is restored to the default value.

a. Run the **export HADOOP_ROOT_LOGGER** command to adjust the log level of the client.

b. Run the **export HADOOP_ROOT_LOGGER=***log level***,console** command to adjust the log level of the Shell client.

Run the **export HADOOP_ROOT_LOGGER=DEBUG,console** command to adjust the log level to **Debug**.

Run the **export HADOOP_ROOT_LOGGER=ERROR,console** command to adjust the log level to **Error**.

- **Permanent adjustment**

a. Add **export HADOOP_ROOT_LOGGER=***log level***,console** to the HDFS client's environment variable configuration file **/opt/client/HDFS/component_env** (replace **/opt/client** with the actual client path).

b. Run the **source /opt/client/bigdata_env** command.

c. Run the command on the client again.

15.9.20 File Read Fails, and "No common protection layer" Is Displayed

Symptom

HDFS fails to be operated on the Shell client or other clients, and the error message "No common protection layer between client and server" is displayed.

Running any **hadoop** command, such as **hadoop fs -ls /**, on a node outside the cluster fails. The bottom-layer error message is displayed stating "No common protection layer between client and server."

```
2017-05-13 19:14:19,060 | ERROR | [pool-1-thread-1] |  Server startup failure  |

...
        at org.apache.hadoop.ipc.Client$Connection.setupIOstreams(Client.java:720)
```

Cause Analysis

1. The RPC protocol is used for data transmission between the client and server of HDFS. The protocol has multiple encryption modes and the hadoop.rpc.protection parameter specifies the mode to use.

2. If the value of the **hadoop.rpc.protection** parameter on the client is different from that on the server, the "No common protection layer between client and server" error is reported.

   NOTE

   hadoop.rpc.protection indicates that data can be transmitted between nodes in any of the following modes:

   - **privacy**: Data is transmitted after authentication and encryption. This mode reduces the performance.
   - **authentication**: Data is transmitted after authentication without encryption. This mode ensures performance but has security risks.
   - **integrity**: Data is transmitted without encryption or authentication. To ensure data security, exercise caution when using this mode.

Solution

Step 1 Download the client again. If the client is an application, update the configuration file in the application.

----End

15.9.21 Failed to Write Files Because the HDFS Directory Quota Is Insufficient

Symptom

After quota is set for a directory, writing files to the directory fails. The "The DiskSpace quota of /tmp/tquota2 is exceeded" error message is displayed.

```
[omm@189-39-150-115 client]$ hdfs dfs -put switchuser.py  /tmp/tquota2
put: The DiskSpace quota of /tmp/tquota2 is exceeded: quota = 157286400 B = 150 MB but diskspace
consumed = 402653184 B = 384 MB
```

Possible Causes

The remaining space configured for the directory is less than the space required for writing files.

Cause Analysis

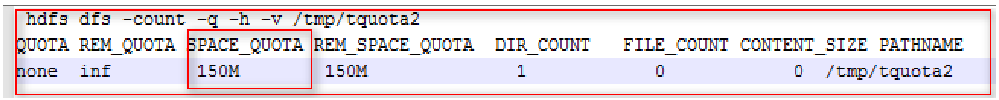
1. The HDFS supports setting the quota for a specific directory, that is, the maximum space occupied by files in a directory can be set. For example, the following command is used to set a maximum of 150 MB files to be written to the **/tmp/tquota** directory. (Space = Block size x Number of copies)

   hadoop dfsadmin -setSpaceQuota 150M /tmp/tquota2

2. Run the following command to check the configured quota for the directory. **SPACE_QUOTA** is the configured space quota, and **REM_SPACE_QUOTA** is the remaining space.

   hdfs dfs -count -q -h -v /tmp/tquota2

   Figure 15-31 Viewing the quota set for a directory



```
 hdfs dfs -count -q -h -v /tmp/tquota2
QUOTA REM_QUOTA SPACE_QUOTA REM_SPACE_QUOTA  DIR_COUNT   FILE_COUNT CONTENT_SIZE PATHNAME
none  inf        150M       150M                 1           0            0  /tmp/tquota2
```

3. Analyze logs. The following log indicates that writing the file requires 384 MB space, but the current space quota is only 150 MB. Therefore, the space is insufficient. Before a file is written, the required remaining space is as follows: Block size x Number of copies. 128 MB x 3 copies = 384 MB.

```
[omm@189-39-150-115 client]$
[omm@189-39-150-115 client]$ hdfs dfs -put switchuser.py  /tmp/tquota2
put: The DiskSpace quota of /tmp/tquota2 is exceeded: quota = 157286400 B = 150 MB but diskspace
consumed = 402653184 B = 384 MB
```

Solution

Step 1 Set a proper quota for the directory.

hadoop dfsadmin -setSpaceQuota 150G /*directory name*

Step 2 Run the following command to clear the quota:

hdfs dfsadmin -clrSpaceQuota /*directory name*

----End

15.9.22 Balancing Fails, and "Source and target differ in block-size" Is Displayed

Symptom

When the **distcp** command is executed to copy files across clusters, the message "Source and target differ in block-size." is displayed, indicating that some files fail to be copied. Use -pb to preserve block-sizes during copy. "

```
 Caused by: java.io.IOException: Check-sum mismatch between hdfs://10.180.144.7:25000/kylin/
kylin_default_instance_prod/parquet/f2e72874-f01c-45ff-b219-207f3a5b3fcb/c769cd2d-575a-4459-837b-

b219-207f3a5b3fcb/.distcp.tmp.attempt_1523424430246_0004_m_000019_2. Source and target differ in
block-size. Use -pb to preserve block-sizes during copy. Alternatively, skip checksum-checks altogether,
using -skipCrc. (NOTE: By skipping checksums, one runs the risk of masking data-corruption during file-
transfer.)        at
org.apache.hadoop.tools.mapred.RetriableFileCopyCommand.compareCheckSums(RetriableFileCopyComman
d.java:214)
```

Possible Causes

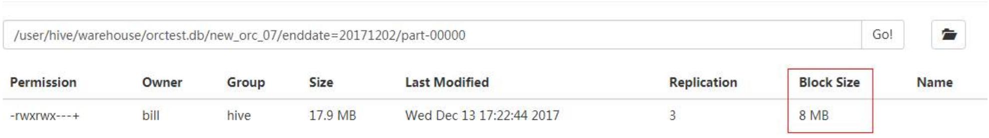
This is not a version-related problem. When you run the **distcp** command to copy files, the block size of the source file is not recorded by default. As a result, the verification fails when the block size of the source file is not 128 MB. In this case, you need to add parameter **-pb** to the **distcp** command.

Cause Analysis

1. The block size is set when data is written to HDFS. The default block size is 128 MB. The size of files written by some components or service programs may not be 128 MB, for example, 8 MB.

```
<name>dfs.blocksize</name>
<value>134217728</value>
```

Figure 15-32 Size of files written by some components or service programs



/user/hive/warehouse/orctest.db/new_orc_07/enddate=20171202/part-00000 Go!

Permission	Owner	Group	Size	Last Modified	Replication	Block Size	Name
-rwxrwx---+	bill	hive	17.9 MB	Wed Dec 13 17:22:44 2017	3	8 MB	

2. DistCp reads the file from a source cluster and writes it to a destination cluster. By default, the value of dfs.blocksize in the MapReduce task is used as the block size, whose default value is 128 MB.
3. After DistCp finishes writing a file, the system performs verification based on the physical size of the block. Because the block size of the file in the source cluster is different from that of the file in the destination cluster, the splitting sizes are different. As a result, the verification fails.

   For example, in the preceding file, there are three blocks (17.9/8 MB = 3 blocks) in the old cluster and one block (17.9/128 MB = 1 block) in the new cluster. Therefore, the verification fails because the physical size of the disk is divided.

Solution

Add parameter **-pb** in the **distcp** command. This parameter is used to reserve the block size when **distcp** is used to ensure that the block size of the new cluster is the same as that of the old cluster.

Figure 15-33 Size of the reserved block during **distcp** command execution

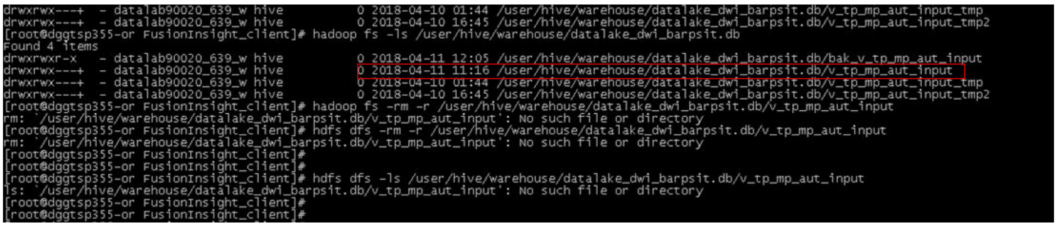
```
[root@189-39-235-118 clientu10]#
[root@189-39-235-118 clientu10]#hadoop distcp -pb  hdfs://haclusterX/user hdfs://hacluster/tmp/test
```

15.9.23 A File Fails to Be Queried or Deleted, and the File Can Be Viewed in the Parent Directory (Invisible Characters)

Symptom

A file fails to be queried or deleted using the HDFS Shell client. The file can be viewed in the parent directory.

Figure 15-34 List of files in the parent directory



```
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 01:44 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp

drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 01:44 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 16:45 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp2
[root@dggtsp355-or FusionInsight_client]# hadoop fs -rm -r /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
rm: `/user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input': No such file or directory
[root@dggtsp355-or FusionInsight_client]# hdfs dfs -rm -r /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
rm: `/user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input': No such file or directory
[root@dggtsp355-or FusionInsight_client]#
[root@dggtsp355-or FusionInsight_client]#
[root@dggtsp355-or FusionInsight_client]# hdfs dfs -ls /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
ls: `/user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input': No such file or directory
[root@dggtsp355-or FusionInsight_client]#
[root@dggtsp355-or FusionInsight_client]#
```

Cause Analysis

The possible cause is that invisible characters are written to the file. You can write the file name to the local text and run the **vi** command to open the file.

hdfs dfs -ls *parent directory* **> /tmp/t.txt**

vi /tmp/t.txt

Run the **:set list** command to display invisible characters in the file name. For example, the file name contains **^M**, which is invisible.

Figure 15-35 Displaying invisible characters

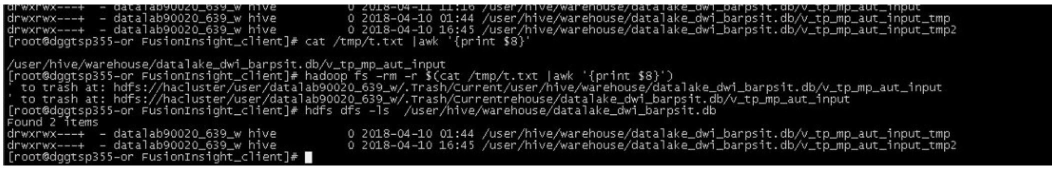
```
Found 1 items$
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-11 11:16 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input^M$
~
~
~
```

Solution

Step 1 Run the Shell command to read the file name recorded in the text. Ensure that the following command output contains the full path of the file in HDFS.

cat /tmp/t.txt |awk '{print $8}'

Figure 15-36 File path



```
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-11 11:16 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 01:44 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 16:45 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp2
[root@dggtsp355-or FusionInsight_client]# cat /tmp/t.txt |awk '{print $8}'

/user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
[root@dggtsp355-or FusionInsight_client]# hadoop fs -rm -r $(cat /tmp/t.txt |awk '{print $8}')
' to trash at: hdfs://hacluster/user/datalab90020_639_w/.Trash/Current/user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
' to trash at: hdfs://hacluster/user/datalab90020_639_w/.Trash/Currentrehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input
[root@dggtsp355-or FusionInsight_client]# hdfs dfs -ls  /user/hive/warehouse/datalake_dwi_barpsit.db
Found 2 items
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 01:44 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp
drwxrwx---+  - datalab90020_639_w hive          0 2018-04-10 16:45 /user/hive/warehouse/datalake_dwi_barpsit.db/v_tp_mp_aut_input_tmp2
[root@dggtsp355-or FusionInsight_client]# █
```

Step 2 Run the following command to delete the file:

hdfs dfs -rm $(cat /tmp/t.txt |awk '{print $8}')

Step 3 Verify that the file has been deleted.

hdfs dfs -ls *parent directory*

----End

15.9.24 Uneven Data Distribution Due to Non-HDFS Data Residuals

Symptom

Data distribution is uneven. A disk is full while other disks have sufficient space.

The data storage directory of HDFS DataNode is set to **/export/data1/dfs--/export/data12/dfs**. A large volume of data is stored to **/export/data1/dfs** but data is evenly distributed to other disks.

Cause Analysis

The customer's disk is reinstalled. However, a directory is not thoroughly deleted during disk uninstallation, that is, the added disk is unformatted and historical junk data remains.

Solution

Manually delete data residuals.

15.9.25 Uneven Data Distribution Due to the Client Installation on the DataNode

Symptom

Data is unevenly distributed on HDFS DataNodes. Disk usage of a node is high or even reaches 100% while disks on other nodes have sufficient idle space.

Cause Analysis

In the HDFS data replica mechanism, the first replica is stored to the local node where the client is stored. As a result, disks of the node run out while disks of other nodes have sufficient idle space.

Solution

Step 1 For the existing data unevenly distributed, run the following command to balance data:

/opt/client/HDFS/hadoop/sbin/start-balancer.sh -threshold 10

/opt/client indicates the actual client installation directory.

Step 2 For new data, install the client on the node without DataNode.

----End

15.9.26 Handling Unbalanced DataNode Disk Usage on Nodes

Symptom

The disk usage of each DataNode on a node is uneven.

Example:

```
189-39-235-71:~ # df -h
Filesystem  Size  Used Avail Use% Mounted on
/dev/xvda  360G  92G   250G  28% /
/dev/xvdb  700G  900G   200G  78% /srv/BigData/hadoop/data1
/dev/xvdc  700G  900G   200G  78% /srv/BigData/hadoop/data2
/dev/xvdd  700G  900G   200G  78% /srv/BigData/hadoop/data3
/dev/xvde  700G  900G   200G  78% /srv/BigData/hadoop/data4
/dev/xvdf  10G   900G   890G  2% /srv/BigData/hadoop/data5
189-39-235-71:~ #
```

Possible Causes

Some disks are faulty and are replaced with new ones. The new disk usage is low.

Disks are added. For example, the original four data disks are expanded to five disks.

Cause Analysis

There are two policies for writing data to Block disks on DataNodes: 1. Round Robin (default value) and 2. Preferentially writing data to the disk with the more available space.

Description of the **dfs.datanode.fsdataset.volume.choosing.policy** parameter

Possible values:

- Polling: **org.apache.hadoop.hdfs.server.datanode.fsdataset.RoundRobinVolumeChoosingPolicy**
- Preferentially writing data to the disk with more available space: **org.apache.hadoop.hdfs.server.datanode.fsdataset.AvailableSpaceVolumeChoosingPolicy**

Solution

Change the value of **dfs.datanode.fsdataset.volume.choosing.policy** to **org.apache.hadoop.hdfs.server.datanode.fsdataset.AvailableSpaceVolumeChoosingPolicy**, save the settings, and restart the affected services or instances.

In this way, the DataNode preferentially selects a node with the most available disk space to store data copies.

NOTE

- Data written to the DataNode will be preferentially written to the disk with more available disk space.
- The high usage of some disks can be relieved with the gradual deletion of aging data from the HDFS.

15.9.27 Locating Common Balance Problems

Problem 1: Lack of Permission to Execute the balance Task (Access denied).

Problem details: After the **start-balancer.sh** command is executed, the " hadoop-root-balancer-hostname.out" log displays "Access denied for user test1. Superuser privilege is required."

```
cat /opt/client/HDFS/hadoop/logs/hadoop-root-balancer-host2.out
Time Stamp               Iteration#  Bytes Already Moved  Bytes Left To Move  Bytes Being Moved
INFO: Watching file:/opt/client/HDFS/hadoop/etc/hadoop/log4j.properties for changes with interval : 60000
org.apache.hadoop.ipc.RemoteException(org.apache.hadoop.security.AccessControlException): Access denied
for user test1.
Superuser privilege is required
at
org.apache.hadoop.hdfs.server.namenode.FSPermissionChecker.checkSuperuserPrivilege(FSPermissionChecker
.java:122)
at org.apache.hadoop.hdfs.server.namenode.FSNamesystem.checkSuperuserPrivilege(FSNamesystem.java:
5916)
```

Cause analysis:

The administrator account is required for executing the balance task.

Solution

- Secure version

  Perform authentication for user **hdfs** or a user in the **supergroup** group and then execute the balance task.
- General version

Run the **su - hdfs** command on the client before running the **balance** command on HDFS.

Problem 2: The balance command fails to be executed, and the /system/balancer.id file is abnormal.

Problem details:

A user starts a balance process on the HDFS client. After the process is stopped unexpectedly, the user performs the balance operation again. The operation fails.

```
org.apache.hadoop.ipc.RemoteException(org.apache.hadoop.protocol.RecoveryInProgressException): Failed
to APPEND_FILE /system/balancer.id for DFSClient because lease recovery is in progress. Try again later.
```

Cause analysis:

Generally, after the balance operation is complete in HDFS, the **/system/balancer.id** file is automatically released and the balance operation can be performed again.

In the preceding scenario, the first balance operation is stopped abnormally. Therefore, when the balance operation is performed for the second time, the **/system/balancer.id** file still exists. As a result, the **append /system/balancer.id** operation is triggered and the balance operation fails.

Solution

Method 1: After the hard lease period exceeds one hour, release the lease on the original client and perform the balance operation again.

Method 2: Delete the **/system/balancer.id** file from HDFS and perform the balance operation again.

15.9.28 HDFS Displays Insufficient Disk Space But 10% Disk Space Remains

Symptom

1. The alarm "HDFS Disk Usage Exceeds the Threshold" is reported.
2. On the HDFS page, high disk space usage is displayed.

Cause Analysis

The **dfs.datanode.du.reserved.percentage** parameter is set in HDFS, indicating the percentage of the reserved space of each disk to the total disk space. The DataNode reserves space you set for NodeManager running and computing of other components, for example, Yarn, or for upgrades.

As 10% disk space is reserved, the HDFS DataNode regards that there is no available disk space when the disk usage reaches 90%.

Solution

Step 1 Expand the HDFS DataNode disk capacity when its usage reaches 80%.

Step 2 If the disk capacity cannot be expanded in time, delete useless data in HDFS to release disk space.

----End

15.9.29 An Error Is Reported When the HDFS Client Is Installed on the Core Node in a Common Cluster

Issue

In a common cluster, an error message is displayed when a user is created on the Core node to install the client.

Symptom

In a common cluster, the following error message is displayed when a user is created on the Core node to install the client:

```
2020-03-14 19:16:17,166 WARN shortcircuit.DomainSocketFactory: error creating DomainSocket
java.net.ConnectException: connect(2) error: Permission denied when trying to connect to '/var/run/MRS-
HDFS/dn_socket'
at org.apache.hadoop.net.unix.DomainSocket.connect0(Native Method)
at org.apache.hadoop.net.unix.DomainSocket.connect(DomainSocket.java:256)
at org.apache.hadoop.hdfs.shortcircuit.DomainSocketFactory.createSocket(DomainSocketFactory.java:168)
at org.apache.hadoop.hdfs.client.impl.BlockReaderFactory.nextDomainPeer(BlockReaderFactory.java:799)
...
```

Cause Analysis

A user runs the **useradd** command to create a user. The default user group of the user does not contain the **ficommmon** user group. As a result, the preceding error is reported when the **get** command of HDFS is executed.

Procedure

Run the **usermod -a -G ficommon username** command to add the user to the **ficommon** user group.

15.9.30 Client Installed on a Node Outside the Cluster Fails to Upload Files Using hdfs

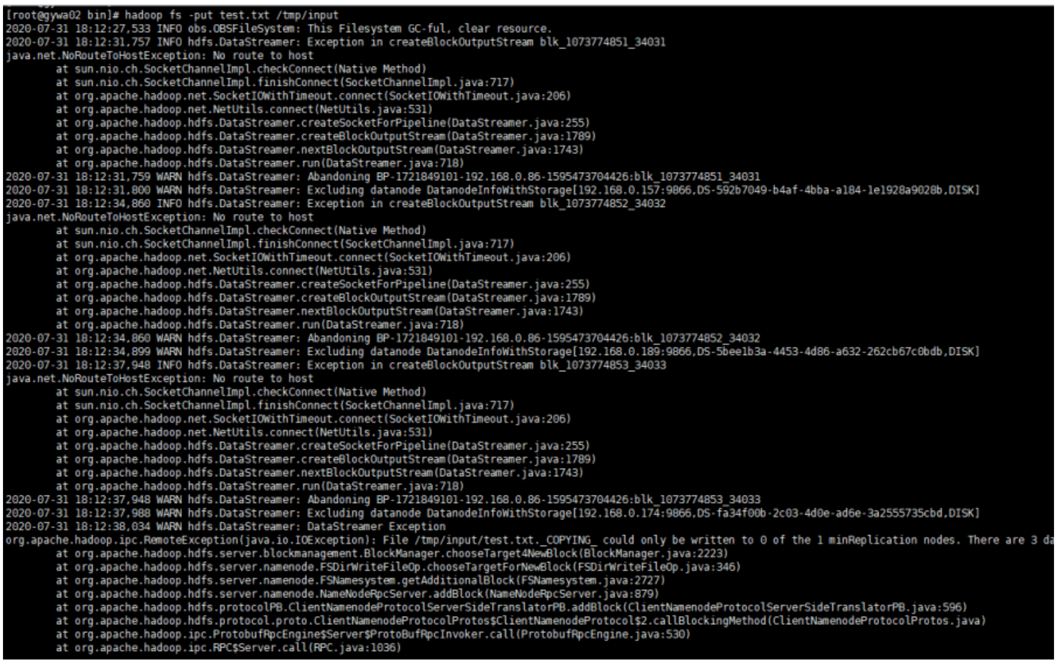
Issue

A client installed on a node outside the cluster fails to upload files using hdfs.

Symptom

After a client is installed on a cluster node and a file is uploaded using the **hdfs** command, the following error is reported:

Figure 15-37 An error is reported during file upload.



```
[root@gywa02 bin]# hadoop fs -put test.txt /tmp/input

        at org.apache.hadoop.ipc.RPC$Server.call(RPC.java:1036)
```

Cause Analysis

The error message "no route to host" is displayed, and the IP address 192.168 is contained in the error message. That is, the internal network route from the client node to the DataNode in the cluster is unreachable. As a result, the file fails to be uploaded.

Procedure

In the client directory of the client node, find the **hdfs-site.xml** file in the HDFS client configuration directory. Add the **dfs.client.use.datanode.hostname** configuration item to the configuration file, and set the value to **true**.

15.9.31 Insufficient Number of Replicas Is Reported During High Concurrent HDFS Writes

Symptom

File writes to HDFS fail occasionally.

The operation log is as follows:

```
105 | INFO  | IPC Server handler 23 on 25000 | IPC Server handler 23 on 25000, call
org.apache.hadoop.hdfs.protocol.ClientProtocol.addBlock from 192.168.1.96:47728 Call#1461167 Retry#0 |
Server.java:2278
java.io.IOException: File /hive/warehouse/000000_0.835bf64f-4103 could only be replicated to 0 nodes
instead of minReplication (=1).  There are 3 datanode(s) running and 3 node(s) are excluded in this
operation.
```

Cause Analysis

- HDFS has a reservation mechanism for file writing: each block to be written is 128 MB no matter whether the file is 10 MB or 1 GB. If a 10 MB file needs to be written, the file occupies 10 MB of the first block and about 118 MB space will be released. If a 1 GB file needs to be written, HDFS writes the file block by block and releases unused space after the file is written.

- If there are a large number of files to be written concurrently, the disk space for reserved write blocks is insufficient. As a result, the file fails to be written.

Solution

Step 1 Log in to the HDFS WebUI and go to the JMX page of the DataNode.

1. On the native HDFS page, choose **Datanodes**.
2. Locate the target DataNode and click the HTTP address to go to the DataNode details page.
3. Change **datanode.html** in **url** to **jmx**.

Step 2 Search for the **XceiverCount** indicator. If the value of this indicator multiplied by the block size exceeds the DataNode disk capacity, the disk space reserved for block write is insufficient.

Step 3 You can use either of the following methods to solve the problem:

Method 1: Reduce the service concurrency.

Method 2: Combine multiple files into one file to reduce the number of files to be written.

----End

15.9.32 HDFS Client Failed to Delete Overlong Directories

Symptom

When a user runs the **hadoop fs -rm -r -f obs://***<obs_path>* command to delete an OBS directory with an overlong path name, the following error message is displayed:

```
2022-02-28 17:12:45,605 INFO internal.RestStorageService: OkHttp cost 19 ms to apply http request

```

Cause Analysis

When you run the **rm** command to delete some content from the HDFS, the files or directories are not deleted immediately. Instead, they are moved to the **current** directory (**/user/***${Username}***/.Trash/current**) in the recycle bin.

Solution

You can run the **skipTrash** command to skip the HDFS recycle bin and directly delete the data. Set the **dfs.client.skipTrash.enabled=true** configuration item of the HDFS client.

Step 1 Log in to any master node in the cluster as user **root**.

Step 2 Run the following command to edit the **hdfs-site.xml** file used by HDFS:

vim *Client installation directory***/HDFS/hadoop/etc/hadoop/hdfs-site.xml**

Step 3 Add the following content to the **hdfs-site.xml** file:

```
<property>
<name>dfs.client.skipTrash.enabled</name>
<value>true</value>
</property>
```

Step 4 Run the following command to delete the overlong OBS directory:

hadoop fs -rm -r -f –skipTrash obs://*<obs_path>*

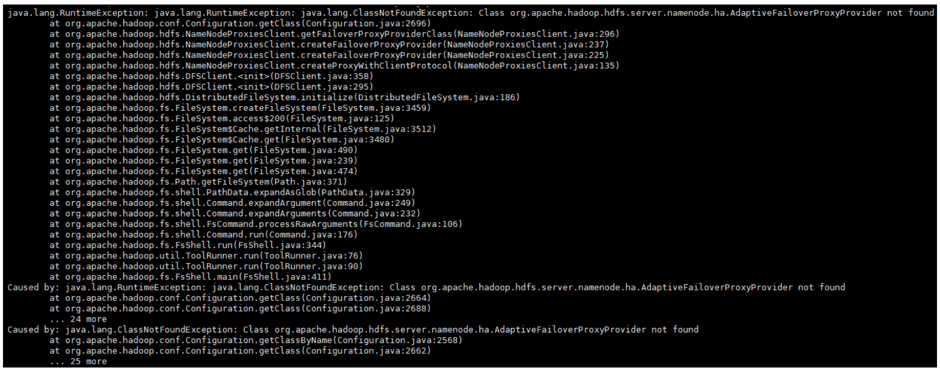
Step 5 Log in to the other master nodes in the cluster and repeat **Step 2** to **Step 4** one by one until the operations are complete on all master nodes.

----End

15.9.33 An Error Is Reported When a Node Outside the Cluster Accesses MRS HDFS

Symptom

When a node outside the MRS cluster accesses HDFS in the cluster, the following error message is reported: Class org.apache.hadoop.hdfs.server.namenode.ha.AdaptiveFailoverProxyProvider not found



```
java.lang.RuntimeException: java.lang.RuntimeException: java.lang.ClassNotFoundException: Class org.apache.hadoop.hdfs.server.namenode.ha.AdaptiveFailoverProxyProvider not found

        at org.apache.hadoop.conf.Configuration.getClass(Configuration.java:2662)
        ... 25 more
```

Cause Analysis

The possible causes are as follows:

- An error is reported when an open-source HDFS client accesses HDFS of an MRS cluster.
- An error is reported when the JAR package is used to connect to HDFS of the MRS cluster (including connection to HDFS during task submission).

Procedure

Method 1:

Step 1 Locate the HDFS configuration file **hdfs-site.xml** used by the command or JAR package.

Step 2 Modify the **dfs.client.failover.proxy.provider.hacluster** configuration as follows:

```
<property>
<name>dfs.client.failover.proxy.provider.hacluster</name>
<value>org.apache.hadoop.hdfs.server.namenode.ha.ConfiguredFailoverProxyProvider</value>
</property>
```

NOTE

You can also delete the preceding configuration items.

Step 3 Save the file and access MRS HDFS again.

----End

Method 2:

Step 1 Download the hadoop-plugins matching the MRS cluster version from the Maven repository.

Step 2 Add the downloaded JAR package to the dependency of the command or JAR package.

----End

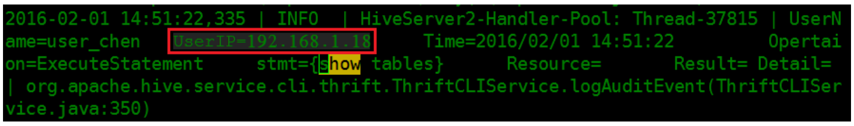
15.10 Using Hive

15.10.1 Content Recorded in Hive Logs

Audit log

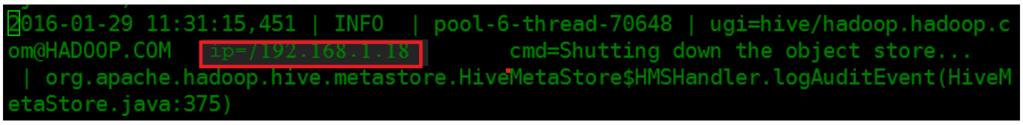
An audit log records at what time a user sends a request to HiveServer and MetaStore from which IP address with what statement.

The following HiveServer audit log shows that at 14:51:22 on February 1, 2016, **user_chen** sent a **show tables** request to HiveServer from the 192.168.1.18 IP address.



```
2016-02-01 14:51:22,335 | INFO  | HiveServer2-Handler-Pool: Thread-37815 | UserN
ame=user_chen   UserIP=192.168.1.18      Time=2016/02/01 14:51:22         Opertai
on=ExecuteStatement     stmt={show tables}      Resource=       Result= Detail=
| org.apache.hive.service.cli.thrift.ThriftCLIService.logAuditEvent(ThriftCLISer
vice.java:350)
```

The following MetaStore audit log shows that user **hive** sent a **shutdown** request to MetaStore from the 192.168.1.18 IP address at 11:31:15 on January 29, 2016.



```
2016-01-29 11:31:15,451 | INFO  | pool-6-thread-70648 | ugi=hive/hadoop.hadoop.c
om@HADOOP.COM   ip=/192.168.1.18        cmd=Shutting down the object store...
 | org.apache.hadoop.hive.metastore.HiveMetaStore$HMSHandler.logAuditEvent(HiveM
etaStore.java:375)
```

Generally, the audit log does not play a role in actual error location. However, the audit log must be checked to solve the following problems:

1. There is no response after a client sends a request. The audit log can be used to check whether the task suspends on the client or server. If the audit log has no related information, the task suspends on the client. If the audit log has related information, view the run log to locate where the program suspends.
2. The audit log can be used to check the number of requests in a specified period of time. You can view the number of requests in a specified period in audit logs.

HiveServer Run Log

HiveServer receives requests from a client (SQL statement), compile and execute the statement (submitted to Yarn or local MapReduce), and interact with MetaStore to obtain metadata information. The HiveServer run log records a complete SQL execution process.

Generally, if SQL statement running fails, check the HiveServer run log first.

MetaStore Run Log

Typically, if the HiveServer run log contains MetaException or MetaStore connection failure, check the MetaStore run log.

GC Log

Both HiveServer and MetaStore have GC logs. If GC-related problems occur, view the GC logs to quickly locate the cause. For example, if HiveServer or MetaStore frequently restarts, check its GC log.

15.10.2 Causes of Hive Startup Failure

The most common cause of the Hive startup failure is that the MetaStore instance cannot connect to DBService. You can view the detailed error information in the MetaStore logs. The reasons for the failure to connect to DBService are as follows:

Possible Cause 1

DBService does not properly initialize the Hive metabase hivemeta.

Procedure 1

Step 1 Run the following commands:

source /opt/Bigdata/MRS_*XXX*/install/dbservice/.dbservice_profile

gsql -h *DBservice floating IP* **-p 20051 -d hivemeta -U hive -W HiveUser@**

Step 2 If the interaction interface cannot be properly displayed, database initialization fails. If the following error information is displayed, the hivemeta configuration may be lost in the configuration file of the node where DBService is located.

```
org.postgresql.util.PSQLException: FATAL: no pg_hba.conf entry for host "192.168.0.146", database
"HIVEMETA"
```

Step 3 Edit **/srv/BigData/dbdata_service/data/pg_hba.conf** by adding **host hivemeta hive 0.0.0.0/0 sha256** to the file.

Step 4 Run the **source /opt/Bigdata/MRS_*XXX*/install/dbservice/.dbservice_profile** command to configure environment variables.

Step 5 Run **gs_ctl -D $GAUSSDATA reload #** to make new configurations take effect.

----End

Possible Cause 2

The floating IP address of DBService is incorrect. As a result, the IP address of the MetaStore node fails to connect to or build mutual trust with the floating IP address, causing MetaStore startup failure.

Procedure 2

The floating IP address of DBService must be an IP address that is not used in the same network segment and cannot be pinged before configuration. Modify the floating IP address of DBService.

15.10.3 "Cannot modify *xxx* at runtime" Is Reported When the set Command Is Executed in a Security Cluster

Symptom

The following error is reported when running the **set** command:

```
0: jdbc:hive2://192.168.1.18:21066/> set mapred.job.queue.name=QueueA;
 Error: Error while processing statement: Cannot modify mapred.job.queue.name at list of params that are
allowed to be modified at runtime (state=42000,code=1)
```

Procedure

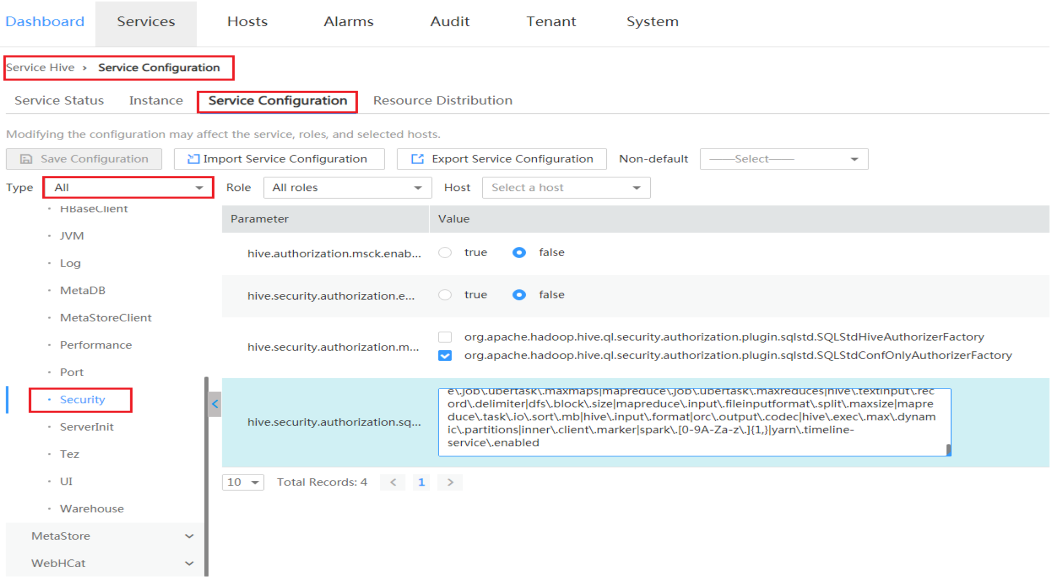
Solution 1:

Step 1 Log in to Manager and modify Hive parameters.

- MRS Manager: Log in to MRS Manager and choose **Services** > **Hive** > **Service Configuration**. Set **Type** to **All** and choose **HiveServer** > **Security**.
- FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Services** > **Hive** > **Configurations** > **All Configurations** > **HiveServer** > **Security**.

Step 2 Add the command parameters to be executed to the **hive.security.authorization.sqlstd.confwhitelist.append** configuration item.

Step 3 Click **Save** and restart **HiveServer**.



Modifying the configuration may affect the service, roles, and selected hosts.

Non-default: ——Select——

Type: All   Role: All roles   Host: Select a host

Parameter / Value

hive.authorization.msck.enab... ○ true ● false

```

10   Total Records: 4   < 1 >

----End

Solution 2:

Step 1 Log in to Manager and modify Hive parameters.

- MRS Manager: Log in to MRS Manager and choose **Services** > **Hive** > **Service Configuration**. Set **Type** to **All** and choose **HiveServer** > **Security**.
- FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Services** > **Hive** > **Configurations** > **All Configurations** > **HiveServer** > **Security**.

Step 2 Locate **hive.security.whitelist.switch** and select **OFF**. Click **Save** and restart HiveServer.

----End

15.10.4 How to Specify a Queue When Hive Submits a Job

Symptom

How do I specify a queue when Hive submits a job?

Procedure

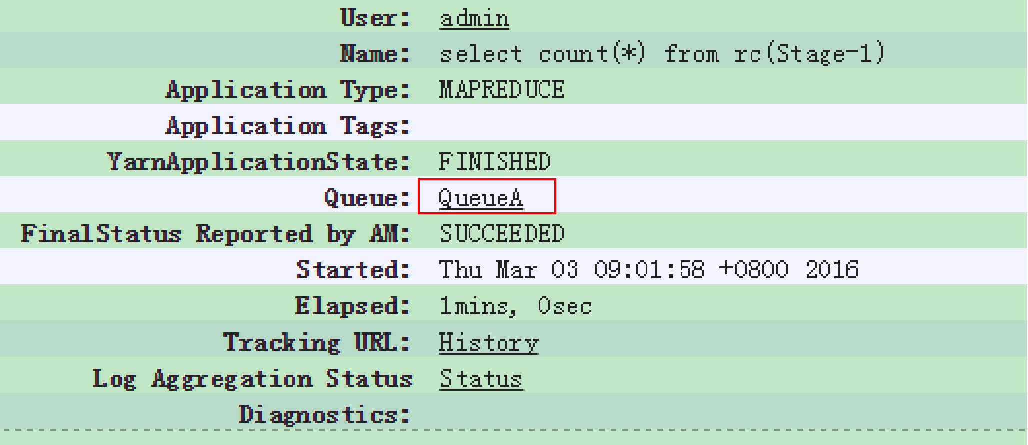
Step 1 Before submitting the job, set the job queue, for example, submitting the job to QueueA.

```
set mapred.job.queue.name=QueueA;
select count(*) from rc;
```

NOTE

The queue name is case sensitive. For example, in this example, **queueA** and **Queuea** are invalid. In addition, the queue must be a leaf queue, and jobs cannot be submitted to a non-leaf queue.

Step 2 After job submission, go to the Yarn page to check the job. The job has been submitted to QueueA.



User:	admin
Name:	select count(*) from rc(Stage-1)
Application Type:	MAPREDUCE
Application Tags:	
YarnApplicationState:	FINISHED
Queue:	QueueA
FinalStatus Reported by AM:	SUCCEEDED

Tracking URL:	History
Log Aggregation Status	Status
Diagnostics:	

----End

15.10.5 How to Set Map and Reduce Memory on the Client

Symptom

How do I set Map and Reduce memory on the client?

Procedure

Before SQL statement execution, run the set command to set parameters of clients related to Map/Reduce.

The following parameters are related to Map and Reduce memory:

```
set mapreduce.map.memory.mb=4096; //Memory required by each Map task
set mapreduce.map.java.opts=-Xmx3276M; //Maximum memory used by the JVM of each Map task
set mapreduce.reduce.memory.mb=4096; //Memory required by each Reduce task
set mapreduce.reduce.java.opts=-Xmx3276M; //Maximum memory used by the JVM of each Reduce task
set mapred.child.java.opts=-Xms1024M -Xmx3584M; // This parameter is a global parameter, which is used
to set Map and Reduce in a unified manner.
```

NOTE

Parameter settings take effect for the current session only.

15.10.6 Specifying the Output File Compression Format When Importing a Table

Question

How do I specify an output file compression format when importing a table?

Procedure

Hive supports the following compression formats:

```
org.apache.hadoop.io.compress.BZip2Codec
org.apache.hadoop.io.compress.Lz4Codec
org.apache.hadoop.io.compress.DeflateCodec
org.apache.hadoop.io.compress.SnappyCodec
org.apache.hadoop.io.compress.GzipCodec
```

- If global settings are required, that is, all tables need to be compressed, you can perform the following global settings for Hive service configuration parameters on the Manager page:
  - Set **hive.exec.compress.output** to **true**.
  - Set **mapreduce.output.fileoutputformat.compress.codec** to **org.apache.hadoop.io.compress.BZip2Codec**.

  NOTE

  The following parameters take effect only when **hive.exec.compress.output** is set to **true**.
- If it needs to be set at the session level, configure the parameters as follows before command execution:

  ```
  set hive.exec.compress.output=true;
  set mapreduce.output.fileoutputformat.compress.codec=org.apache.hadoop.io.compress.SnappyCodec;
  ```

15.10.7 desc Table Cannot Be Completely Displayed

Symptom

How do I make sure that the description is completely displayed when the desc table is too long?

Procedure

Step 1 When starting Beeline of Hive, set **maxWidth** to **20000**.

```
[root@192-168-1-18 logs]# beeline --maxWidth=20000
scan complete in 3ms
Connecting to
...
Beeline version 1.1.0 by Apache Hive
```

Step 2 (Optional) Run the **beeline -help** command to view the client display settings.

```
 -u <database url>              the JDBC URL to connect to
 -n <username>                  the username to connect as
 -p <password>                  the password to connect as
 -d <driver class>              the driver class to use
 -i <init file>                 script file for initialization
 -e <query>                     query that should be executed
 -f <exec file>                 script file that should be executed
```

```
  --hiveconf property=value       Use value for given property
  --color=[true/false]             control whether color is used for display
  --showHeader=[true/false]       show column names in query results
  --headerInterval=ROWS;          the interval between which heades are displayed
  --fastConnect=[true/false]       skip building table/column list for tab-completion
  --autoCommit=[true/false]       enable/disable automatic transaction commit
  --verbose=[true/false]           show verbose error messages and debug info
  --showWarnings=[true/false]     display connection warnings
  --showNestedErrs=[true/false]    display nested errors
  --numberFormat=[pattern]        format numbers using DecimalFormat pattern
  --force=[true/false]             continue running script even after errors
  --maxWidth=MAXWIDTH            the maximum width of the terminal
  --maxColumnWidth=MAXCOLWIDTH    the maximum width to use when displaying columns
  --silent=[true/false]            be more silent
  --autosave=[true/false]          automatically save preferences
  --outputformat=[table/vertical/csv2/tsv2/dsv/csv/tsv]  format mode for result display
                                  Note that csv, and tsv are deprecated - use csv2, tsv2 instead
  --truncateTable=[true/false]    truncate table column when it exceeds length
  --delimiterForDSV=DELIMITER     specify the delimiter for delimiter-separated values output format
(default: |)
  --isolation=LEVEL                set the transaction isolation level
  --nullemptystring=[true/false]  set to true to get historic behavior of printing null as empty string
  --socketTimeOut=n                socket connection timeout interval, in second. The default value is 300.
```

----End

15.10.8 NULL Is Displayed When Data Is Inserted After the Partition Column Is Added

Symptom

1. Run the following command to create a table:

   ```
   create table test_table(
   col1 string,
   col2 string
   )
   PARTITIONED BY(p1 string)
   STORED AS orc tblproperties('orc.compress'='SNAPPY');
   ```

2. Modify the table structure, add partitions, and insert data.

   ```
   alter table test_table add partition(p1='a');
   insert into test_table partition(p1='a') select col1,col2 from temp_table;
   ```

3. Modify the table structure, add columns, and insert data.

   ```
   alter table test_table add columns(col3 string);
   insert into test_table partition(p1='a') select col1,col2,col3 from temp_table;
   ```

4. Query data in the **test_table** table. In the returned result, the values in the **col3** column are all NULL.

   ```
   select * from test_table where p1='a'
   ```

5. Add a table partition and insert data.

   ```
   alter table test_table add partition(p1='b');
   insert into test_table partition(p1='b') select col1,col2,col3 from temp_table;
   ```

6. Query data in the **test_table** table. In the returned result, the value of **col3** is not all NULL.

   ```
   select * from test_table where p1='b'
   ```

Cause Analysis

RESTRICT is the default option for altering a table. In the RESTRICT mode, only the metadata is changed, while the table's partition structure created before the altering operation remains unchanged. However, new partitions created after the altering operation are changed. Therefore, when values of the old partitions are queried, they are all NULL.

Procedure

Add the **cascade** keyword when adding columns, for example:

```
alter table test_table add columns(col3 string) cascade;
```

15.10.9 A Newly Created User Has No Query Permissions

Symptom

When a user is created, an error message is displayed indicating that the user does not have permissions to query data.

```
Error: Error while compiling statement: FAILED: HiveAccessControlException Permission denied: Principal
[name=hive, type=USER] does not have following privileges for operation QUERY [[SELECT] on Object
[type=TABLE_OR_VIEW, name=default.t1]] (state=42000,code=40000)
```

Cause Analysis

The newly created user does not have the permission to operate the Hive component.

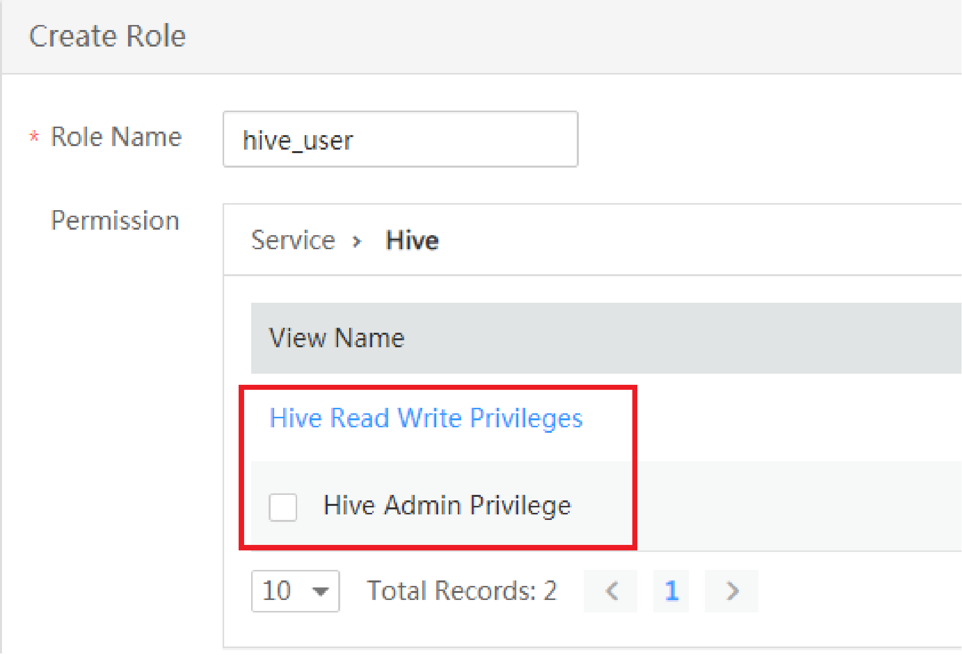
Solution

MRS Manager:

Step 1 Log in to MRS Manager and choose **System** > **Manage Role** > **Create Role**.

Step 2 Enter a role name.

Step 3 In the **Permission** area, select **Hive**. The Hive administrator permission and the read and write permission for Hive tables are displayed.



* Role Name: hive_user

Step 4 Select **Hive Read Write Privileges**. All databases in the Hive column are displayed.

Step 5 Select the permissions required by the role and click **OK**.

Step 6 On MRS Manager, choose **System** > **Manage User**.

Step 7 Locate the row that contains the created user, and click **Modify** in the **Operation** column.

Step 8 Click **Select and Join User Group**. To use the Hive service, you must add a Hive group.

Step 9 Click **Select and Add Role** and select the role created in **Step 5**.

Step 10 Click **OK**.

----End

FusionInsight Manager:

Step 1 Log in to FusionInsight Manager. Choose **System** > **Permission** > **Role**.

Step 2 Click **Create Role**, and set **Role name** and **Description**.

Step 3 Set **Configure Resource Permission** for the role and select **Hive Read and Write Permission** for the Hive table. All databases in the Hive column are displayed.

Step 4 Select the permissions required by the role and click **OK**.

Step 5 On FusionInsight Manager, choose **System** > **Permission** > **User**.

Step 6 Locate the row that contains the created user, and click **Modify** in the **Operation** column.

Step 7 Click **Add** on the right of **User Group**. To use the Hive service, you must add a Hive group.

Step 8 Click **Add** on the right of **Role** and select the role created in 4.

Step 9 Click **OK**.

----End

15.10.10 An Error Is Reported When SQL Is Executed to Submit a Task to a Specified Queue

Symptom

The following error is reported when executing SQL to submit a task to Yarn:

```
Failed to submit application_1475400939788_0033 to YARN :
org.apache.hadoop.security.AccessControlException: User newtest cannot submit applications to queue
root.QueueA
```

Cause Analysis

The current login user does not have the permission to submit the YARN queue.

Solution

Grant the submission permission of the specified Yarn queue to the user. On Manager, choose **System** > **Permission** > **User** and bind a role with the queue submission permission to the user.

15.10.11 An Error Is Reported When the "load data inpath" Command Is Executed

Symptom

The following errors are reported when the **load data inpath** command is executed:

- Error 1:
  ```
  HiveAccessControlException Permission denied. Principal [name=user1, type=USER] does not have
  following privileges on Object [type=DFS_URI, name=hdfs://hacluster/tmp/input/mapdata] for
  operation LOAD : [OBJECT OWNERSHIP]
  ```
- Error 2:
  ```
  HiveAccessControlException Permission denied. Principal [name=user1, type=USER] does not have
  following privileges on Object [type=DFS_URI, name=hdfs://hacluster/tmp/input/mapdata] for
  operation LOAD : [INSERT, DELETE]
  ```
- Error 3:
  ```
  SemanticException [Error 10028]: Line 1:17 Path is not legal ''file:///tmp/input/mapdata'': Move from:
  file:/tmp/input/mapdata to: hdfs://hacluster/user/hive/warehouse/tmp1 is not valid. Please check that
  values for params "default.fs.name" and "hive.metastore.warehouse.dir" do not conflict.
  ```

Cause Analysis

The current login user does not have the permission to operate the directory or the file directory format is incorrect.

Solution

Hive has the following requirements on the **load data inpath** command:

- The file owner must be the user who executes the command.
- The current user must have read and write permissions for the file.
- The current user must have permissions to execute the directory of the file.
- The current user must have the write permission on the directory of the table, because the load operation moves the file to the directory.
- The file format must be the same as the storage format specified by the table. For example, if **stored as rcfile** is specified during table creation but the file format is TXT, it is unsatisfied.
- The file must be stored in HDFS. Files in the local file system cannot be specified using the **file://** form.
- The file name cannot start with an underscore (_) or period (.). A file whose name starts with an underscore (_) or period (.) will be ignored.

  The following shows permissions required when user **test_hive** loads data.

  ```
  [root@192-168-1-18 duan]# hdfs dfs -ls /tmp/input2
  16/03/21 14:45:07 INFO hdfs.PeerCache: SocketCache disabled.
  Found 1 items
  -rw-r--r--   3 test_hive hive          6 2016-03-21 14:44 /tmp/input2/input.txt
  ```

15.10.12 An Error Is Reported When the "load data local inpath" Command Is Executed

Symptom

The following errors are reported when the **load data local inpath** command is executed:

- Error 1:
  ```
  HiveAccessControlException Permission denied. Principal [name=user1, type=USER] does not have following privileges on Object [type=LOCAL_URI, name=file:/tmp/input/mapdata] for operation LOAD : [SELECT, INSERT, DELETE]
  ```
- Error 2:
  ```
  HiveAccessControlException Permission denied. Principal [name=user1, type=USER] does not have following privileges on Object [type=LOCAL_URI, name=file:/tmp/input/mapdata] for operation LOAD : [OBJECT OWNERSHIP]
  ```
- Error 3:
  ```
  SemanticException Line 1:23 Invalid path ''/tmp/input/mapdata'': No files matching path file:/tmp/input/mapdata
  ```

Cause Analysis

The current user does not have the permission to operate the directory or the directory does not exist on the node where HiveServer is located.

Solution

NOTE

Generally, you are not advised to use local files to load data to Hive tables. You are advised to store local files in HDFS and then load data from the cluster.

Hive has the following requirements on the **load data local inpath** command:

- The file must be stored on the HiveServer node, because all commands are sent to the active HiveServer for execution.
- User **omm** must have the read permission for the file and read and execution permissions for the directory where the file is located, because the HiveServer process is started by user **omm** in the OS.
- The file owner must be the user who executes the command.
- The current user must have read and write permissions for the file.
- The file format must be the same as the storage format specified by the table. For example, if **stored as rcfile** is specified during table creation but the file format is TXT, it is unsatisfied.
- The file name cannot start with an underscore (_) or period (.). A file whose name starts with an underscore (_) or period (.) will be ignored.

15.10.13 An Error Is Reported When the "create external table" Command Is Executed

Symptom

The following error is reported when the **create external table** *xx(xx int)* **stored as textfile location '/tmp/aaa/aaa'** command is executed.

```
Permission denied. Principal [name=fantasy, type=USER] does not have following privileges on Object
[type=DFS_URI, name=/tmp/aaa/aaa] for operation CREATETABLE : [SELECT, INSERT, DELETE, OBJECT
OWNERSHIP] (state=42000,code=40000)
```

Cause Analysis

The current login user does not have the read and write permissions for the directory or its parent directory. When an external table is created, whether the current user is checked for its read and write permissions for the specified directory and its subdirectories and subfiles. If the specified directory does not exist, permissions for the parent directory are checked, and so on. If the check results show that the user has no permissions on any directory, "insufficient permission" is reported instead of "The specified directory does not exist".

Solution

Check whether the current user has read and write permissions for the **/tmp/aaa/aaa** path. If the path does not exist, check whether the user has read and write permissions for its parent directory.

15.10.14 An Error Is Reported When the dfs -put Command Is Executed on the Beeline Client

Symptom

Run the following command:

dfs -put /opt/kv1.txt /tmp/kv1.txt

The following error is reported:

```
Permission denied. Principal [name=admin, type=USER] does not have following privileges
onObject[type=COMMAND_PARAMS,name=[-put, /opt/kv1.txt, /tmp/kv1.txt]] for operation DFS : [ADMIN
PRIVILEGE] (state=,code=1)
```

Cause Analysis

The current login user does not have the permissions to run the command.

Solution

If the current user has the **admin** role, run the **set role admin** command to switch to the **admin** role. If the user does not have the admin role, bind the user with the permissions of the corresponding role on the Manager page.

15.10.15 Insufficient Permissions to Execute the set role admin Command

Symptom

When a user runs the following command:

set role admin

The following error is reported:

```
0: jdbc:hive2://192.168.42.26:21066/> set role admin;
Error: Error while processing statement: FAILED: Execution Error, return code 1 from
org.apache.hadoop.hive.ql.exec.DDLTask. dmp_B doesn't belong to role admin (state=08S01,code=1)
```

Cause Analysis

The current user does not have the permissions of the **admin** role of Hive.

Solution

Step 1 Log in to Manager.

- For versions earlier than MRS 3.x, go to **Step 7**.
- For MRS 3.x or later, choose **Cluster** > **Services** > **Hive**. In the upper right corner of the **Dashboard** page, click **More** and check whether **Enable Ranger** is unavailable.
  - If yes, go to **Step 2**.
  - If no, go to **Step 7**.

Step 2 Choose **Cluster** > **Services** > **Ranger** and click **RangerAdmin** in the **Basic Information** area. The Ranger web UI is displayed.

Step 3 Click the username in the upper right corner, select **Log Out** to log out of the system, and log in to the system as user **rangeradmin**.

Step 4 On the homepage, click **Settings** and choose **Roles**.

Step 5 Click the role with **Role Name** set to **admin**. In the **Users** area, click **Select User** and select a username.

Step 6 Click **Add Users**, select **Is Role Admin** in the row where the username is located, and click **Save**.

Step 7 Choose **System** > **Permission** > **Role** and add a role with the Hive administrator permission.

Step 8 On FusionInsight Manager, choose **System** > **Permission** > **User**.

Step 9 In the **Operation** column of the user, click **Modify**.

Step 10 Bind a role that has the Hive administrator permissions to the user and click **OK**.

----End

15.10.16 An Error Is Reported When UDF Is Created Using Beeline

Symptom

Run the following command:

create function fn_test3 as 'test.MyUDF' using jar 'hdfs:///tmp/udf2/MyUDF.jar'

The following error is reported:

```
Error: Error while compiling statement: FAILED: HiveAccessControlException Permission denied: Principal
[name=admin, type=USER] does not have following privileges for operation CREATEFUNCTION [[ADMIN
PRIVILEGE] on Object [type=DATABASE, name=default], [ADMIN PRIVILEGE] on Object [type=FUNCTION,
name=default.fn_test3]] (state=42000,code=40000)
```

Cause Analysis

To create a permanent function in Hive, role **admin** is required.

Solution

Run the **set role admin** command before running the statement.

15.10.17 Difference Between Hive Service Health Status and Hive Instance Health Status

Question

What is the difference between Hive service health status and Hive instance health status?

Solution

The Hive service health status is displayed on the **Services** page and has four values: **Good**, **Bad**, **Partially Healthy**, and **Unknown**. It depends not only on Hive service availability but also the service status of other related components. Simple SQL is used to check Hive service availability.

Hive instances consist of HiveServer and MetaStore. Their health status is determined by communications between instances and JMX and can be **Good** (normal communications), **Concerning** (abnormal communications), or **Unknown** (no communications).

15.10.18 Hive Alarms and Triggering Conditions

Hive Alarms

Alarm ID	Alarm Severity	Auto Clear	Alarm Name	Alarm Type
16000	Minor	TRUE	Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold	Fault alarm
16001	Minor	TRUE	Hive Warehouse Space Usage Exceeds the Threshold	Fault alarm
16002	Minor	TRUE	The Successful Hive SQL Operations Lower than The Threshold	Fault alarm
16004	Critical	TRUE	Hive Service Unavailable	Fault alarm

Alarm Triggering Scenarios

- 16000: An alarm is triggered when the ratio of the number of sessions connected to HiveServer to the allowed total number of sessions exceeds the threshold. For example, if the number of connected sessions is 9, the allowed total number of sessions is 12, and the threshold is 70%, an alarm is triggered, because 9/12 > 70%.
- 16001: An alarm is triggered when the ratio of HDFS capacities used by Hive to total HDFS capacities allocated to Hive exceeds the threshold. For example, if 500 GB is allocated to Hive, Hive uses 400 GB, and the threshold is 75%, an alarm is triggered, because 400/500 > 75%.
- 16002: An alarm is triggered when SQL execution success rate is lower than the threshold. If two out of four SQL statements are executed successfully and the threshold is 60%, an alarm is triggered, because 2/4 < 60%.
- 16004: An alarm is triggered when the health status of the Hive service changes to Bad.

NOTE

- MRS Manager: To set the alarm threshold, alarm severity, and alarm triggering time segment, choose **System > Configure Alarm Threshold** on MRS Manager.FusionInsight Manager: Choose **O&M** > **Alarm** > **Thresholds** to set the alarm threshold, alarm severity, and alarm triggering time range.
- Metrics related to Hive running can be viewed on the Hive monitoring interface.

15.10.19 "authentication failed" Is Displayed During an Attempt to Connect to the Shell Client

Symptom

In clusters in security mode, the **beeline** command fails to be executed on the Shell client when the HiveServer service is normal, and the system prompts "authentication failed". The following information is displayed.

```
Debug is true storeKey false useTicketCache true useKeyTab false doNotPrompt false ticketCache is null
isInitiator true KeyTab is null refreshKrb5Config is false principal is null tryFirstPass is false useFirstPass is
false storePass is false clearPass is false
Acquire TGT from Cache
Credentials are no longer valid
Principal is null
null credentials from Ticket Cache
[Krb5LoginModule] authentication failed
No password provided
```

Cause Analysis

- The client user does not perform security authentication.
- Kerberos authentication expired.

Solution

Step 1 Log in to the node where the Hive client is installed.

Step 2 Run the **source** *Cluster client installation directory***/bigdata_env** command.

Run the **klist** command to check whether there is a valid ticket in the local end. The following information shows that the ticket became valid at 14:11:42 on December 24, 2016, and expired at 14:11:40 on December 25, 2016. In the period of time, the ticket was available.

```
klist
Ticket cache: FILE:/tmp/krb5cc_0
Default principal: xxx@HADOOP.COM
Valid starting     Expires            Service principal
12/24/16 14:11:42  12/25/16 14:11:40  krbtgt/HADOOP.COM@HADOOP.COM
```

Step 3 Run the **kinit** ***username*** command for authentication and log in to the client again.

----End

15.10.20 Failed to Access ZooKeeper from the Client

Symptom

In clusters in security mode, when the HiveServer service is normal and SQL is executed by using the JDBC interface to connect to HiveServer, "The ZooKeeper client is AuthFailed" is reported.

```
14/05/19 10:52:00 WARN utils.HAClientUtilDummyWatcher: The ZooKeeper client is AuthFailed
 14/05/19 10:52:00 INFO utils.HiveHAClientUtil: Exception thrown while reading data from znode.The
possible reason may be connectionless. This is recoverable. Retrying..
 14/05/19 10:52:16 WARN utils.HAClientUtilDummyWatcher: The ZooKeeper client is AuthFailed
 14/05/19 10:52:32 WARN utils.HAClientUtilDummyWatcher: The ZooKeeper client is AuthFailed
 14/05/19 10:52:32 ERROR st.BasicTestCase: Exception: Could not establish connection to active hiveserver
 java.sql.SQLException: Could not establish connection to active hiveserver
```

Or an error is reported stating "Unable to read HiveServer2 configs from ZooKeeper":

```
Exception in thread "main" java.sql.SQLException: org.apache.hive.jdbc.ZooKeeperHiveClientException:
Unable to read HiveServer2 configs from ZooKeeper
at org.apache.hive.jdbc.HiveConnection.<init>(HiveConnection.java:144)

at org.apache.curator.framework.imps.GetChildrenBuilderImpl.forPath(GetChildrenBuilderImpl.java:38)
```

Cause Analysis

- When the client connects to HiveServer, the HiveServer address is automatically obtained from ZooKeeper. If ZooKeeper connection authentication is abnormal, the HiveServer address cannot be obtained from ZooKeeper correctly.
- During ZooKeeper connection authentication, **krb5.conf**, **principal**, **keytab**, and related information must be loaded to the client. Authentication failure causes are as follows:
  - The **user.keytab** path is incorrectly entered.
  - **user.principal** is incorrectly entered.
  - The cluster has switched the domain name. However, the old principal is used when the client combines the URL.

– The client cannot pass Kerberos authentication due to firewall settings. Ports 21730 (TCP), 21731 (TCP/UDP), and 21732 (TCP/UDP) need to be opened for Kerberos.

Solution

Step 1 Ensure that the user can properly access the **user.keytab** file in related paths on the client node.

Step 2 Ensure that the user's **user.principal** corresponds to the specified **keytab** file.

Run the **klist -kt keytabpath/user.keytab** command to check the file.

Step 3 If the cluster has switched the domain name, the **principal** field used in the URL must be the new domain name.

For example, the default value is **hive/hadoop.hadoop.com@HADOOP.COM**. If the cluster has switched the domain name, the field must be changed accordingly. For example, if the domain name is **abc.com**, enter **hive/hadoop.abc.com@ABC.COM**.

Step 4 Ensure that authentication is normal and HiveServer can be connected.

Run the following commands on the client:

source *Client installation directory***/bigdata_env**

kinit *username*

Run the **beeline** command on the client to ensure normal running.

----End

15.10.21 "Invalid function" Is Displayed When a UDF Is Used

Symptom

When a UDF is created on the Hive client using Spark, "Error 10011" indicating "invalid function" is reported:

```
Error: Error while compiling statement: FAILED: SemanticException [Error 10011]: Line 1:7 Invalid function
'test_udf' (state=42000,code=10011)
```

The preceding problem occurs when multiple HiveServers use a UDF. For example, if metadata is not synchronized in time when the UDF created on HiveServer2 is used on HiveServer1, the preceding error is reported when clients on HiveServer1 are connected.

Cause Analysis

Metadata shared by multiple HiveServers or Hive and Spark is not synchronized, causing memory data inconsistency between different HiveServer instances and invalid UDF.

Solution

Synchronize new UDF information to HiveServer and reload the function.

15.10.22 Hive Service Status Is Unknown

Cause Analysis

The Hive service stops.

Solution

Restart the Hive service.

15.10.23 Health Status of a HiveServer or MetaStore Instance Is Unknown

Symptom

The health status of a HiveServer or MetaStore instance is unknown.

Cause Analysis

The HiveServer or MetaStore instance is stopped.

Solution

Restart the HiveServer or MetaStore instance.

15.10.24 Health Status of a HiveServer or MetaStore Instance Is Concerning

Symptom

The health status of the HiveServer or MetaStore instance is **Concerning**.

Cause Analysis

The HiveServer or MetaStore instance cannot be normally started. For example, when modifying the MetaStore/HiveServer GC parameter, you can view the startup log of the corresponding process, for example, the **hiveserver.out(hadoop-omm-jar-192-168-1-18.out)** file. The following exception occurs:

Error: Could not find or load main class Xmx2048M

The preceding information indicates that **Xmx2048M** is used as the startup parameter of the Java process instead of the JVM during the startup of the Java virtual machine. As shown in the following information, the hyphen (-) is deleted mistakenly.

```
METASTORE_GC_OPTS=Xms1024M Xmx2048M -DIgnoreReplayReqDetect
-XX\:CMSFullGCsBeforeCompaction\=1 -XX\:+UseConcMarkSweepGC
-XX\:+CMSParallelRemarkEnabled -XX\:+UseCMSCompactAtFullCollection
-XX\:+ExplicitGCInvokesConcurrent -server -XX\:MetaspaceSize\=128M
-XX\:MaxMetaspaceSize\=256M
```

Solution

Check the latest changes to detect incorrect settings.

```
METASTORE_GC_OPTS=Xms1024M -Xmx2048M -DIgnoreReplayReqDetect
-XX\:CMSFullGCsBeforeCompaction\=1 -XX\:+UseConcMarkSweepGC
-XX\:+CMSParallelRemarkEnabled -XX\:+UseCMSCompactAtFullCollection
-XX\:+ExplicitGCInvokesConcurrent -server -XX\:MetaspaceSize\=128M
-XX\:MaxMetaspaceSize\=256M
```

15.10.25 Garbled Characters Returned upon a select Query If Text Files Are Compressed Using ARC4

Symptom

If a Hive query result table is compressed and stored using the ARC4 algorithm, garbled characters are returned after the select * query is conducted in the result table.

Cause Analysis

The default Hive compression format is not ARC4 or output compression is disabled.

Solution

Step 1 If garbled characters are returned after the SETECT query, set the following in Beeline:

set mapreduce.output.fileoutputformat.compress.codec=org.apache.hadoop.io.encryption.arc4.ARC4BlockCodec;

set hive.exec.compress.output=true;

Step 2 Import the table to a new table using block decompression.

insert overwrite table tbl_result select * from tbl_source;

Step 3 Perform the query again.

select * from tbl_result;

----End

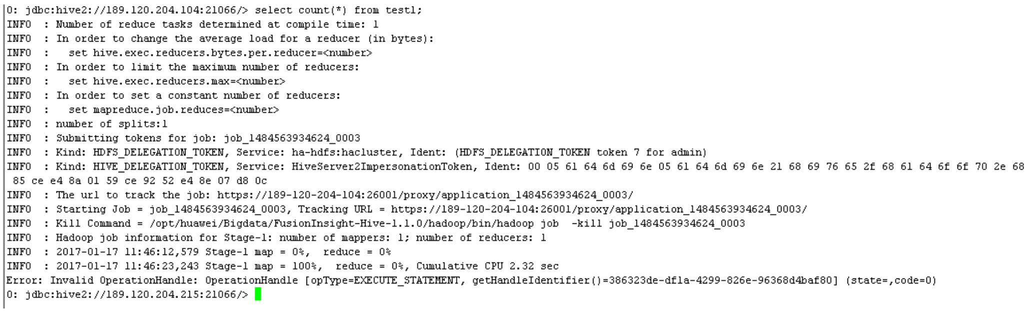
15.10.26 Hive Task Failed to Run on the Client But Successful on Yarn

Symptom

When Hive task running fails, an error similar to the following is reported on the client:

```
Error:Invalid OperationHandler:OperationHander
[opType=EXECUTE_STATEMENT,getHandleIdentifier()=XXX](state=,code=0)
```

However, the MapReduce task that is submitted by the task to Yarn is successfully executed.



```
0: jdbc:hive2://189.120.204.104:21066/> select count(*) from testl;

INFO  : 2017-01-17 11:46:12,579 Stage-1 map = 0%,  reduce = 0%
INFO  : 2017-01-17 11:46:23,243 Stage-1 map = 100%,  reduce = 0%, Cumulative CPU 2.32 sec
Error: Invalid OperationHandle: OperationHandle [opType=EXECUTE_STATEMENT, getHandleIdentifier()=386323de-df1a-4299-826e-96368d4baf80] (state=,code=0)
0: jdbc:hive2://189.120.204.215:21066/>
```

Cause Analysis

The cluster where the error occurs has two HiveServer instances. The error in the log of one HiveServer instance is the same as the error (Error: Invalid OperationHandler) reported on the client. In the log of the other HiveServer instance, **START_UP** information similar to the following is printed when the error occurs, which indicates that the process is killed and restarted during that time. Because the HiveServer instance the task process plans to connect to is killed, it connects to the other healthy one, causing the error.

```
2017-02-15 14:40:11,309 | INFO  | main | STARTUP_MSG:
/************************************************************
STARTUP_MSG: Starting HiveServer2
STARTUP_MSG:   host = XXX-120-85-154/XXX.120.85.154
STARTUP_MSG:   args = []
STARTUP_MSG:   version = 1.3.0
```

Solution

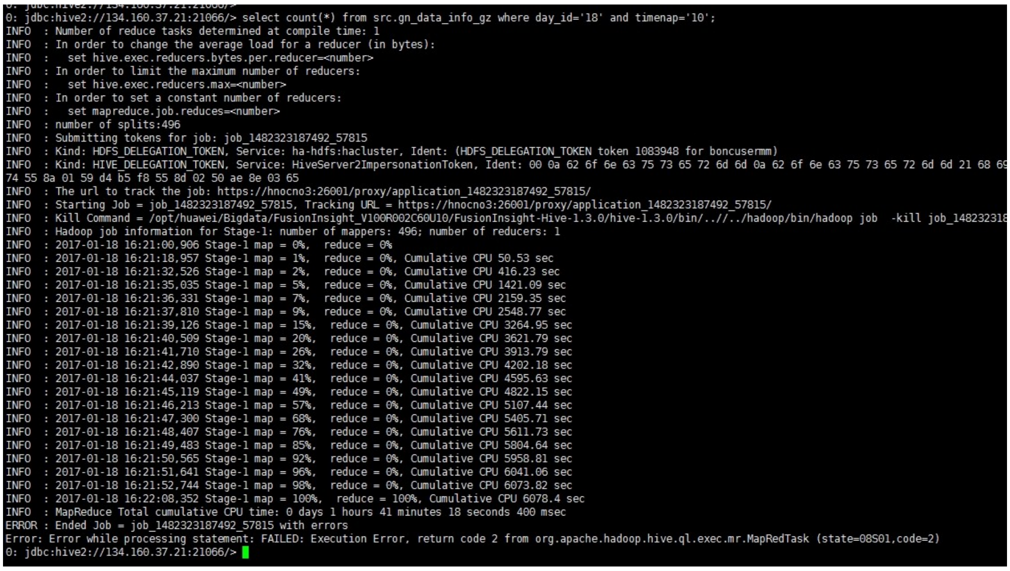
Submit the task again and ensure that the HiveServer process is not manually restarted during task execution.

15.10.27 An Error Is Reported When the select Statement Is Executed

Symptom

When the **select count(*) from XXX** statement is executed, the client reports the error "Error:Error while processing statement :FAILED:Execution Error,return code 2 from...".

return code 2 indicates that the task fails because an error is reported during the execution of the MapReduce task.



```
0: jdbc:hive2://134.160.37.21:21066/>
0: jdbc:hive2://134.160.37.21:21066/> select count(*) from src.gn_data_info_gz where day_id='18' and timenap='10';

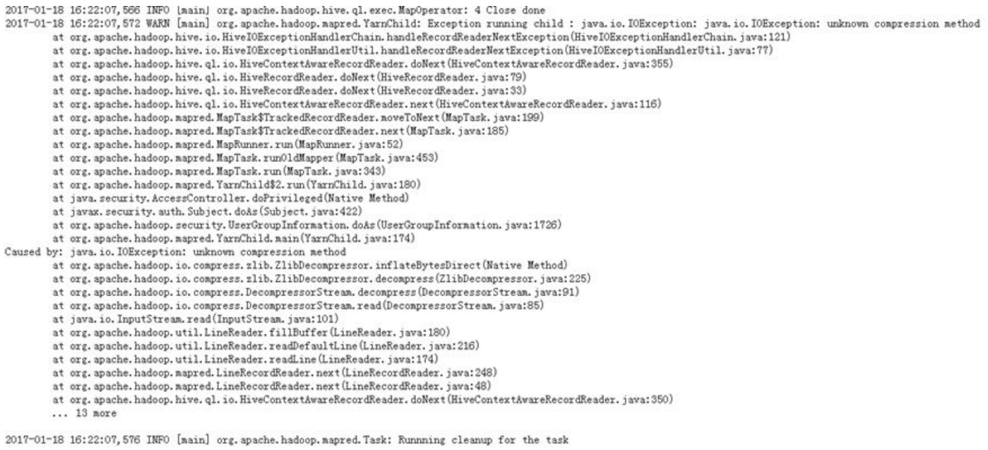
ERROR : Ended Job = job_1482323187492_57815 with errors
Error: Error while processing statement: FAILED: Execution Error, return code 2 from org.apache.hadoop.hive.ql.exec.mr.MapRedTask (state=08S01,code=2)
0: jdbc:hive2://134.160.37.21:21066/>
```

Cause Analysis

1. Go to the native Yarn page to check the MapReduce task logs. The check result shows that the error occurs due to unidentified compression mode. The file name suffix is **.gzip** but the stack reports **.zlib**.



```
2017-01-18 16:22:07,566 INFO [main] org.apache.hadoop.hive.ql.exec.MapOperator: 4 Close done

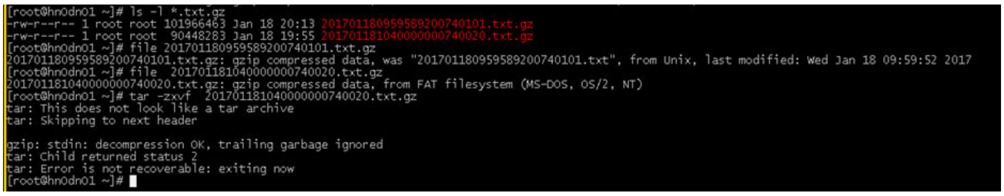
```

2. Therefore, the HDFS file corresponding to the table that is queried may be incorrect. According to the file name printed in the map log, download the file from HDFS to the local end. The file whose name is suffixed with **.gz** fails to be decompressed by running the **tar** command because its format is incorrect. Run the **file** command to check the file property. The command output shows that the file is compressed from the FAT system instead of UNIX.



```
[root@hn0dn01 ~]# ls -l *.txt.gz
-rw-r--r-- 1 root root 101966463 Jan 18 20:13 20170118095958920074O101.txt.gz
-rw-r--r-- 1 root root  90448283 Jan 18 19:55 20170118104000000740020.txt.gz
[root@hn0dn01 ~]# file 20170118095958920074O101.txt.gz
20170118095958920074O101.txt.gz: gzip compressed data, was "20170118095958920074O101.txt", from Unix, last modified: Wed Jan 18 09:59:52 2017
[root@hn0dn01 ~]# file  20170118104000000740020.txt.gz
20170118104000000740020.txt.gz: gzip compressed data, from FAT filesystem (MS-DOS, OS/2, NT)
[root@hn0dn01 ~]# tar -zxvf  20170118104000000740020.txt.gz
tar: This does not look like a tar archive
tar: Skipping to next header

gzip: stdin: decompression OK, trailing garbage ignored
tar: Child returned status 2
tar: Error is not recoverable: exiting now
[root@hn0dn01 ~]#
```

Solution

Delete the file with an incorrect format from the HDFS directory or replace it with a correct one.

15.10.28 Failed to Drop a Large Number of Partitions

Symptom

When the **drop partition** operation is performed, the following information is displayed:

```
MetaStoreClient lost connection. Attempting to reconnect. |
org.apache.hadoop.hive.metastore.RetryingMetaStoreClient.invoke(RetryingMetaStoreClient.java:187)
org.apache.thrift.transport.TTransportException
at org.apache.thrift.transport.TIOStreamTransport.read(TIOStreamTransport.java:132)
at org.apache.thrift.transport.TTransport.xxx(TTransport.java:86)
at org.apache.thrift.transport.TSaslTransport.readLength(TSaslTransport.java:376)
at org.apache.thrift.transport.TSaslTransport.readFrame(TSaslTransport.java:453)
at org.apache.thrift.transport.TSaslTransport.read(TSaslTransport.java:435)
...
```

As indicated by the MetaStore log, StackOverFlow occurs.

```
2017-04-22 01:00:58,834 | ERROR | pool-6-thread-208 | java.lang.StackOverflowError
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:330)
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:339)
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:339)
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:339)
at org.datanucleus.store.rdbms.sql.SQLText.toSQL(SQLText.java:339)
```

Cause Analysis

The processing logic of the drop partition operation is to find all the partitions that meet the conditions, combine them, and delete them together. However, because the number of partitions is too large and the data stack for deleting metadata is deep, StackOverFlow errors occur.

Solution

Delete partitions in batches.

15.10.29 Failed to Start a Local Task

Symptom

1. When operations such as JOIN are performed for a small amount of data, a local task will be started. However, the execution fails and reports the following error:

```
jdbc:hive2://10.*.*.*:21066/> select a.name ,b.sex from student a join student1 b on (a.name = b.name);
ERROR : Execution failed with exit status: 1
ERROR : Obtaining error information

        at java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:617)
        at java.lang.Thread.run(Thread.java:745)
```

3. The **hs_err_pid_*****.log** file in the HiveServer log directory **/var/log/Bigdata/hive/hiveserver** contains an error about insufficient memory.

```
# There is insufficient memory for the Java Runtime Environment to continue.
# Native memory allocation (mmap) failed to map 20776943616 bytes for committing reserved
memory.
  ...
```

Cause Analysis

When Hive executes JOIN for a small amount of data, MapJoin is generated. During MapJoin execution, a local task is started. JVM memory launched by the local task inherits the memory of the parent process.

When multiple JOIN operations are executed, multiple local tasks are started. If the host is out of memory, the local tasks fail to start.

Solution

Step 1 Go to the Hive configuration page.

- For versions earlier than MRS 2.0.1: Log in to MRS Manager, choose **Services** > **Hive** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

- For MRS 2.0.1 or later: Click the cluster name on the MRS console, choose **Components** > **Hive** > **Service Configuration**, and select **All** from the **Basic** drop-down list

  NOTE

  If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

- For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the target cluster, and choose **Services** > **Hive** > **Configurations** > **All Configurations**.

Step 2 Search for the **hive.auto.convert.join** parameter and change the value of **hive.auto.convert.join** in Hive to **false**. Save the configuration and restart the service.

The value change may deteriorate service performance. You can perform the next step to avoid adverse impacts on the performance.

Step 3 Search for the **HIVE_GC_OPTS** parameter and decrease the value of **Xms** based on service requirements. The minimum value is half that of **Xmx**. After the modification, save the configuration and restart the service.

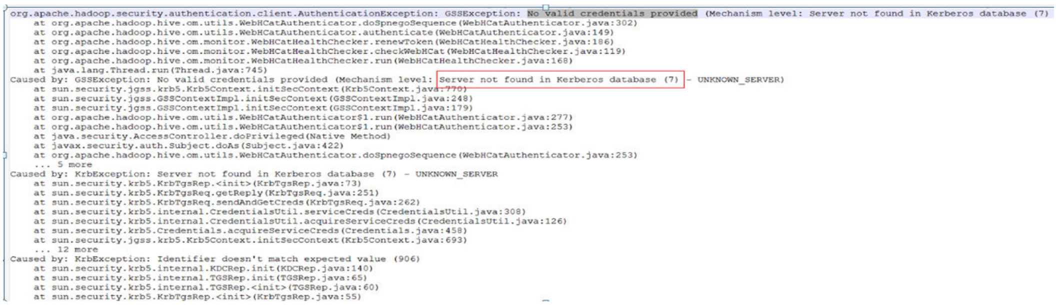
----End

15.10.30 Failed to Start WebHCat

Symptom

WebHCat fails to be started after the hostname is changed.

The following error is reported in the WebHCat startup log (**/var/log/Bigdata/hive/webhcat/hive.log**) of the corresponding node:



```
org.apache.hadoop.security.authentication.client.AuthenticationException: GSSException: No valid credentials provided (Mechanism level: Server not found in Kerberos database (7)

```

Cause Analysis

1. The server account of the MRS WebHCat role involves the hostname. If you change the hostname after the installation, WebHCat fails to start.
2. The one-to-many or many-to-one association between IP addresses and hostnames is configured in the **/etc/hosts** file. As a result, the IP address and hostname cannot be obtained correctly after the **hostname** and **hostname -i** commands are executed.

Solution

Step 1 Change the hostname of the modified node to the hostname before the cluster is installed.

Step 2 Check whether the **/etc/hosts** of the node where WebHCat is located is correctly configured.

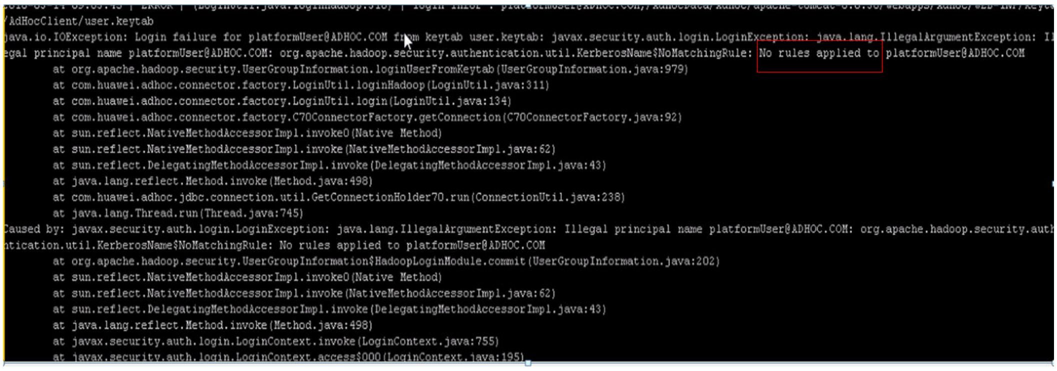
Step 3 Restart WebHCat.

----End

15.10.31 Sample Code Error for Hive Secondary Development After Domain Switching

Symptom

In the sample code for Hive secondary development, an error "No rules applied to ****" is reported:



```
/AdHocClient/user.keytab
java.io.IOException: Login failure for platformUser@ADHOC.COM from keytab user.keytab: javax.security.auth.login.LoginException: java.lang.IllegalArgumentException: Il
egal principal name platformUser@ADHOC.COM: org.apache.hadoop.security.authentication.util.KerberosName$NoMatchingRule: No rules applied to platformUser@ADHOC.COM

        at java.lang.reflect.Method.invoke(Method.java:498)
        at javax.security.auth.login.LoginContext.invoke(LoginContext.java:755)
        at javax.security.auth.login.LoginContext.access$000(LoginContext.java:195)
```

Cause Analysis

1. The sample code for Hive secondary development loads **core-site.xml** file that is loaded through classload by default. Therefore, you need to put the configuration file to the **classpath** directory of the startup program.
2. If the domain name of the cluster is changed, the **core-site.xml** file will change. You need to download the latest **core-site.xml** file and save it to the **classpath** directory where the sample code for Hive secondary development is located.

Solution

Step 1 Download the latest client of the Hive cluster to obtain the latest **core-site.xml** file.

Step 2 Save the **core-site.xml** file to the **classpath** directory where the sample code process for Hive secondary development is located.

----End

15.10.32 MetaStore Exception Occurs When the Number of DBService Connections Exceeds the Upper Limit

Symptom

By default, the maximum number of connections to DBService is 300. If the number of connections is greater than 300 due to heavy traffic, an exception occurs in MetaStore and error "slots are reserved for non-replication superuser connections" is reported.

```
2018-04-26 14:58:55,657 | ERROR | BoneCP-pool-watch-thread | Failed to acquire connection to

    at java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:617)
    at java.lang.Thread.run(Thread.java:745)
```

Cause Analysis

Heavy service traffic causes more than 300 connections to DBService, and the maximum number of connections to DBService needs to be increased.

Solution

Step 1 Go to the DBService configuration page.

- For versions earlier than MRS 2.0.1: Log in to MRS Manager, choose **Services** > **DBService** > **Service Configuration**, and select **All** from the **Basic** drop-down list.
- For MRS 2.0.1 or later: Click the cluster name on the MRS console, choose **Components** > **DBService** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

  NOTE

  If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)
- For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the target cluster and choose **Services** > **DBService** > **Configurations** > **All Configurations**.

Step 2 Search for **dbservice.database.max.connections** and set it to a proper value not greater than **1000**.

Step 3 Save the configuration and restart the affected services or instances.

Step 4 If the fault persists, check the service code for any connection leaks.

----End

15.10.33 "Failed to execute session hooks: over max connections" Reported by Beeline

Symptom

The default maximum connections to HiveServer are 200. When the number of connections exceeds 200, Beeline reports error "Failed to execute session hooks: over max connections."

    at com.sun.proxy.$Proxy4.FetchResults(Unknown Source)
    at org.apache.hive.jdbc.HiveQueryResultSet.next(HiveQueryResultSet.java:358)
Error: Error retrieving next row (state=,code=0)
```

Cause Analysis

- The data volume is excessively large.
- Users use the **select * from table_name;** statement for query in the whole table. There is a large amount of data in the table.
- The default startup memory of Beeline is 128 MB. The returned result set is too large during query, overloading Beeline.

Solution

Step 1 Before running **select count(*) from table_name;**, check the amount of data to be queried and determine whether to display data of this magnitude in Beeline.

Step 2 If a certain amount of data needs to be displayed, adjust the JVM parameter of the Hive client. Add **export HIVE_OPTS=-Xmx1024M** (change the value based on service requirements) to **component_env** in the **/Hive** directory of the Hive client. Run the **source** command to obtain the **/bigdata_env** directory on the client.

----End

15.10.35 Task Execution Fails Because the Input File Number Exceeds the Threshold

Symptom

When Hive performs a query operation, error message "Job Submission failed with exception 'java.lang.RuntimeException(input file number exceeded the limits in the conf;input file num is: 2380435,max heap memory is: 16892035072,the limit conf is: 500000/4)'" is displayed. The value in the error message varies depending on the actual situation. The error details are as follows:

```
ERROR : Job Submission failed with exception 'java.lang.RuntimeException(input file numbers exceeded the
limits in the conf;
 input file num is: 2380435 ,
 max heap memory is: 16892035072 ,
 the limit conf is: 500000/4)'
java.lang.RuntimeException: input file numbers exceeded the limits in the conf;

Error: Error while processing statement: FAILED: Execution Error, return code 1 from
org.apache.hadoop.hive.ql.exec.mr.MapRedTask (state=08S01,code=1)
```

Cause Analysis

MRS uses the ratio of maximum files to the maximum HiveServer heap memory to determine the number of input files allowed in a MapReduce job submission. Default value **500000/4** indicates that each 4 GB of heap memory allows a maximum of 500,000 input files. An error occurs if the number of input files exceeds this limit.

Solution

Step 1 Go to the Hive configuration page.

- For versions earlier than MRS 2.0.1: Log in to MRS Manager, choose **Services** > **Hive** > **Service Configuration**, and select **All** from the **Basic** drop-down list.
- For MRS 2.0.1 or later: Click the cluster name on the MRS console, choose **Components** > **Hive** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

  NOTE

  If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

- For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the target cluster and choose **Services** > **Hive** > **Configurations** > **All Configurations**.

----End

Step 1 Search for **hive.mapreduce.input.files2memory** and set it to a proper value based on the actual memory and task.

Step 2 Save the configuration and restart the affected services or instances.

Step 3 If the fault persists, adjust the GC parameter of the HiveServer based on service requirements.

----End

15.10.36 Task Execution Fails Because of Stack Memory Overflow

Symptom

When Hive performs a query operation, error "Error running child: java.lang.StackOverflowError" is reported. The error details are as follows:

```
FATAL [main] org.apache.hadoop.mapred.YarnChild: Error running child : java.lang.StackOverflowError

```

Cause Analysis

Error "java.lang.StackOverflowError" indicates the memory overflow of the thread stack. It may occur if there are multiple levels of calls (for example, infinite recursive calls) or the thread stack is too small.

Solution

Adjust the stack memory in the JVM parameters of the Map and Reduce stages during execution of a MapReduce job, that is, **mapreduce.map.java.opts** (adjusting the stack memory of Map) and **mapreduce.reduce.java.opts** (adjusting the stack memory of Reduce). The following uses the **mapreduce.map.java.opts** parameter as an example.

- To increase the Map memory temporarily (only valid for Beeline):

  Run the **set mapreduce.map.java.opts=-Xss8G;** command on the Beeline client. (Change the value as required.)

- To permanently increase the Map memory specified by the **mapreduce.map.memory.mb** and **mapreduce.map.java.opts** parameters:

  a. Go to the Hive configuration page.

     - For versions earlier than MRS 2.0.1: Log in to MRS Manager, choose **Services** > **Hive** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

     - For MRS 2.0.1 or later: Click the cluster name on the MRS console, choose **Components** > **Hive** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

       NOTE

       If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

     - For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the target cluster and choose **Services** > **Hive** > **Configurations** > **All Configurations**.

  b. Add custom parameter **mapreduce.map.java.opts** and set it to a proper value.

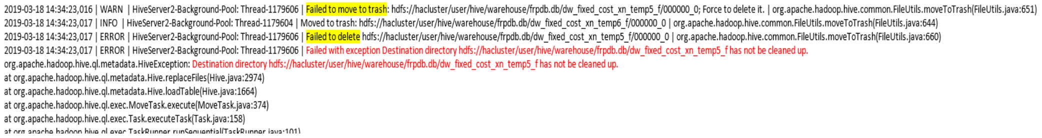
  c. Save the configuration and restart the affected services or instances.

     Note that the modification takes effect after a service restart. During the restart, the Hive service is unavailable.

15.10.37 Task Failed Due to Concurrent Writes to One Table or Partition

Symptom

When Hive executes an INSERT statement, an error is reported indicating that a file or directory already exists or is cleared in HDFS. The error details are as follows:



```
2019-03-18 14:34:23,016 | WARN  | HiveServer2-Background-Pool: Thread-1179606 | Failed to move to trash: hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp5_f/000000_0; Force to delete it. | org.apache.hadoop.hive.common.FileUtils.moveToTrash(FileUtils.java:651)
2019-03-18 14:34:23,017 | INFO  | HiveServer2-Background-Pool: Thread-1179604 | Moved to trash: hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp6_f/000000_0 | org.apache.hadoop.hive.common.FileUtils.moveToTrash(FileUtils.java:644)
2019-03-18 14:34:23,017 | ERROR | HiveServer2-Background-Pool: Thread-1179606 | Failed to delete hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp5_f/000000_0 | org.apache.hadoop.hive.common.FileUtils.moveToTrash(FileUtils.java:660)
2019-03-18 14:34:23,017 | ERROR | HiveServer2-Background-Pool: Thread-1179606 | Failed with exception Destination directory hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp5_f has not be cleaned up.
org.apache.hadoop.hive.ql.metadata.HiveException: Destination directory hdfs://hacluster/user/hive/warehouse/frpdb.db/dw_fixed_cost_xn_temp5_f has not be cleaned up.
at org.apache.hadoop.hive.ql.metadata.Hive.replaceFiles(Hive.java:2974)
at org.apache.hadoop.hive.ql.metadata.Hive.loadTable(Hive.java:1664)
at org.apache.hadoop.hive.ql.exec.MoveTask.execute(MoveTask.java:374)
at org.apache.hadoop.hive.ql.exec.Task.executeTask(Task.java:158)
at org.apache.hadoop.hive.ql.exec.TaskRunner.runSequential(TaskRunner.java:101)
```

Cause Analysis

1. Check the start time and end time of the task based on the HiveServer audit logs.
2. Check whether data is inserted into the same table or partition in the time segment.

3. Hive does not support concurrent data insertion for a table or partition. As a result, multiple tasks perform operations on the same temporary data directory, and one task moves the data of another task, causing task failure.

Solution

The service logic is modified so that data is inserted to the same table or partition in single thread mode.

15.10.38 Hive Task Failed Due to a Lack of HDFS Directory Permission

Symptom

An error message is displayed, indicating that the user does not have the permission to access the HDFS directory.

```
2019-04-09 17:49:19,845 | ERROR | HiveServer2-Background-Pool: Thread-3160445 | Job Submission failed

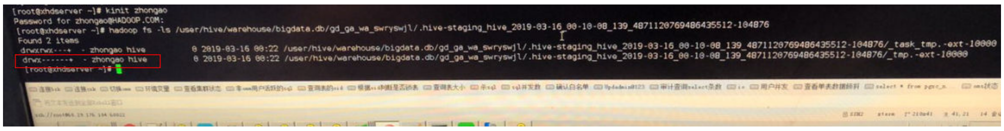
at org.apache.hadoop.security.UserGroupInformation.doAs(UserGroupInformation.java:1781)
at org.apache.hadoop.ipc.Server$Handler.run(Server.java:2254)
)'
```

Cause Analysis

1. According to the stack information, the permission on the subdirectory fails to be checked.

```
org.apache.hadoop.hdfs.server.namenode.FSPermissionChecker.checkSubAccess(FSPermissionChecker.ja
va:300)
```

2. Check the permission of all files and directories in HDFS. The permission of a directory is 700 (only the file owner can access the directory). It is confirmed that an abnormal directory exists.



```
[root@xhdserver ~]# kinit zhongao
Password for zhongao@HADOOP.COM:
[root@xhdserver ~]# hadoop fs -ls /user/hive/warehouse/bigdata.db/gd_ga_wa_swryswjl/.hive-staging_hive_2019-03-16_00-10-08_139_4871120769486435512-104876

drwx------+   - zhongao hive          0 2019-03-16 00:22 /user/hive/warehouse/bigdata.db/gd_ga_wa_swryswjl/.hive-staging_hive_2019-03-16_00-10-08_139_4871120769486435512-104876/_tmp.-ext-10000
[root@xhdserver ~]#
```

Solution

1. Check whether the file is imported manually. If not, delete the file or directory.
2. If the file or directory cannot be deleted, change the file or directory permission to 770.

15.10.39 Failed to Load Data to Hive Tables

Symptom

After creating a table, a user runs the **LOAD** command to import data to the table. However, the following problem occurs during the import:

```
.......
> LOAD DATA INPATH '/user/tester1/hive-data/data.txt' INTO TABLE employees_info;
Error: Error while compiling statement: FAILED: SemanticException Unable to load data to destination table.
Error: The file that you are trying to load does not match the file format of the destination table.
(state=42000,code=40000)
..........
```

Cause Analysis

1. The storage format is not specified during table creation, and the default format RCFile is used.
2. However, the data to be imported is in TEXTFILE format.

Solution

This problem is caused by an application defect. You can use a proper method based on site requirements only by ensuring that the storage format specified by the table is the same as the format of the data to be imported.

- Method 1:

  Specify the storage format when creating a table as a user who has the Hive table operation permission. For example:

  CREATE TABLE IF NOT EXISTS employees_info(name STRING,age INT) ROW FORMAT DELIMITED FIELDS TERMINATED BY ',' STORED AS TEXTFILE;

  Specify the format of the data to be imported as TEXTFILE.
- Method 2:

  Import RCFile data, but not TEXTFILE data.

15.10.40 HiveServer and HiveHCat Process Faults

Issue

The HiveServer and WebHCat processes in the customer cluster are faulty.

Symptom

The HiveServer and WebHCat processes on the Master2 node in the MRS cluster are faulty. After the restart, the processes are still faulty.

Cause Analysis

On Manager, start the faulty HiveServer process. Log in to the background and search for the error information at the corresponding time point in the **hiveserver.out** log file. The error information is as follows: **error parsing conf mapred-site.xml** and **Premature end of file**. Restart WebHCat. The same error is reported because the **mapred-site.xml** file fails to be parsed.

Procedure

1. Log in to the Master2 node as user **root**.
2. Run the **find / -name 'mapred-site.xml'** command to obtain the location of the **mapred-site.xml** file.
   - The path of HiveServer is **/opt/Bigdata/***Cluster version***/ 1_13_HiveServer/etc/mapred-site.xml**.
   - The path of WebHCat is **/opt/Bigdata/***Cluster version***/ 1_13_WebHCat/etc/mapred-site.xml**.
3. Check whether the **mapred-site.xml** file is normal. In this case, the configuration file is empty. As a result, the parsing fails.
4. Restore the **mapred-site.xml** file. Run the **scp** command to copy the configuration file in the corresponding directory on the Master1 node to the corresponding directory on the Master2 node to replace the original file.
5. Run the **chown omm:wheel mapred-site.xml** command to change the owner group and user.
6. On Manager, restart the faulty HiveServer and WebHCat processes.

15.10.41 An Error Occurs When the INSERT INTO Statement Is Executed on Hive But the Error Message Is Unclear

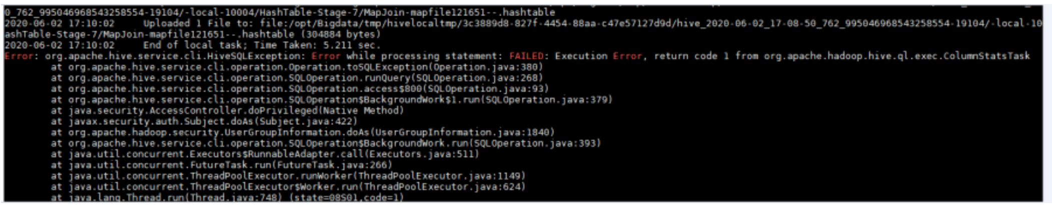
Issue

An error is reported when a user uses MRS Hive to execute a SQL statement.

Symptom

When a user uses MRS Hive to execute a SQL statement, the following error message is displayed.

Figure 15-38 Error reported when MRS Hive executes a SQL statement



```

2020-06-02 16:19:28,125 | INFO  | pool-12-thread-155 | 156: Cleaning up thread local RawStore... | org.apache.hadoop.hive.metastore.HiveMetaStore$HMSHandler.logInfo(HiveMetaStore.java:885)
```

The error context indicates that an error occurs during SQL statement execution, and the following information is displayed in the error message:

```
Caused by: org.postgresql.util.PSQLException: ERROR: value too long for type character varying(4000)
```

The SQL statement fails because the length of all columns exceeds 4000 bytes. The restriction needs to be modified.

Procedure

Step 1 Log in to any master node in the cluster as user **root** and run the **su - omm** command to switch to user **omm**.

Step 2 Run the following command to log in to GaussDB:

gsql -p 20051 -d hivemeta -U *username* -W *password*

Step 3 Run the following command to modify the restriction:

alter table PARTITION_PARAMS alter column PARAM_VALUE type varchar(6000);

----End

15.10.42 Timeout Reported When Adding the Hive Table Field

Issue

An error message is reported when adding the Hive table fields.

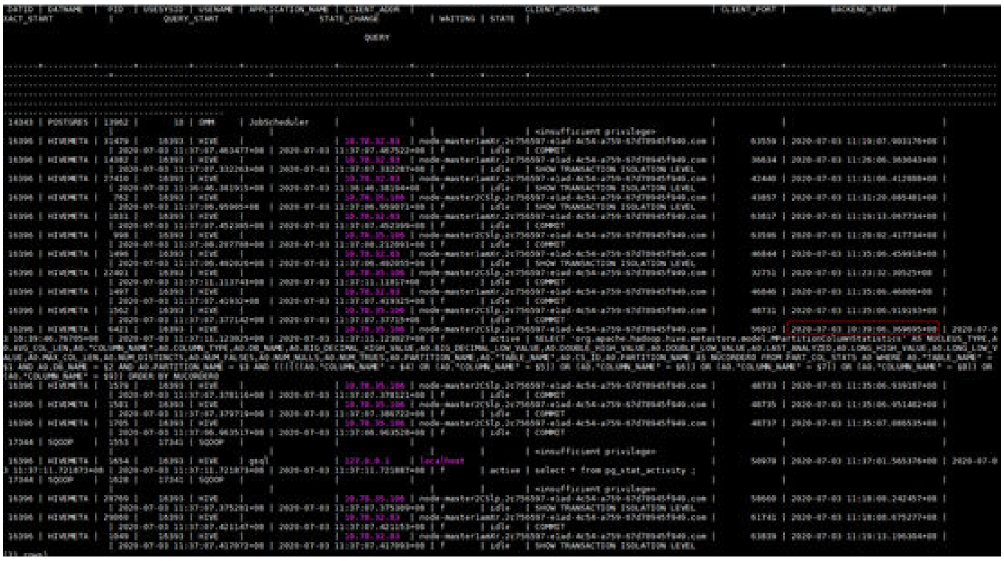
Symptom

Hive executes **ALTER TABLE table_name ADD COLUMNS(column_name string) CASCADE** on tables that contain more than 10,000 partitions. The error information is as follows:

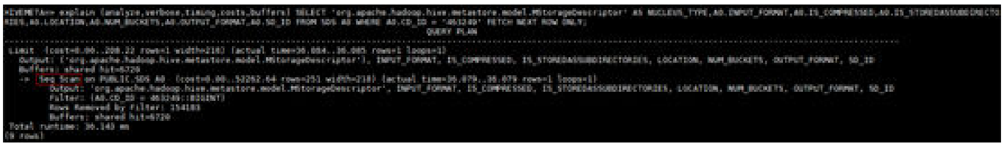
```
Timeout when executing method: alter_table_with_environment_context; 600525ms exceeds 600000ms
```

Cause Analysis

1. The MetaStore client connection times out. The default timeout interval for the connection between the MetaStore client and server is 600 seconds. On FusionInsight Manager, increase the value of **hive.metastore.client.socket.timeout** to **3600s**.
2. Another error is reported:
   ```
   Error: org.apache.hive.service.cli.HiveSQLException: Error while processing statement: FAILED:
   Execution Error, return code 1 from org.apache.hadoop.hive.ql.exec.DDLTask. Unable to alter table.
   java.net.SocketTimeoutException: Read timed out
   ```
   JDBC connection timeout interval of the MetaStore metadata. The default value is 60 ms.
3. Increase the value of **socketTimeout** in **javax.jdo.option.ConnectionURL** to **60000**. The initial error is still reported.
   ```
   Timeout when executing method: alter_table_with_environment_context;3600556ms exceeds
   3600000ms
   ```
4. Increase the values of parameters such as **hive.metastore.batch.retrieve.max**, **hive.metastore.batch.retrieve.table.partition.max**, and **dbservice.database.max.connections**. The problem persists.
5. It is suspected that the problem is caused by the GaussDB because adding a field will traverse each partition to execute **getPartitionColumnStatistics** and **alterPartition**.
6. Run the **gsql -p 20051 -U omm -W dbserverAdmin@123 -d hivemeta** command as user **omm** to log in to the Hive metabase.
7. Run **select * from pg_locks**. No lock wait is found.
8. Run **select * from pg_stat_activity;**. It is found that the process execution takes a long time.
   ```
   SELECT 'org.apache.hadoop.hive.metastore.model.MPartitionColumnStatistics'AS
   NUCLEUS_TYPE,A0.AVG_COL_LEN,A0."COLUMN_NAME",A0.COLUMN_TYPE,A0.DB_NAME,A0.BIG_DECI
   MAL_HIGH_VALUE,A0.BIG_DECIMAL_LOW_VALUE,A0.DOUBLE_HIGH_VALUE,A0.DOUBLE_LOW_VALUE,
   A0.LAST_ANALYZED,A0.LONG_HIGH_VALUE,A0.LONG_LOW_VALUE,A0.MAX_COL_LEN,A0.NUM_DISTIN
   CTS,A0.NUM_FALSES,A0.NUM_NULLS,A0.NUM_TRUES,A0.PARTITION_NAME,A0."TABLE_NAME",A0.CS_
   ID,A0.PARTITION_NAMEAS NUCORDER0 FROM PART_COL_STATS A0 WHERE A0."TABLE_NAME" =
   '$1' ANDA0.DB_NAME = '$2' AND A0.PARTITION_NAME = '$3' AND((((((A0."COLUMN_NAME" = '$4')
   OR (A0."COLUMN_NAME" ='$5')) OR (A0."COLUMN_NAME" = '$6')) OR (A0."COLUMN_NAME"
   ='$7')) OR (A0."COLUMN_NAME" = '$8')) OR (A0."COLUMN_NAME" ='$9')) ORDER BY NUCORDER0;
   ```



9. Run the **gs_guc reload -c log_min_duration_statement=100 -D /srv/BigData/dbdata_service/data/** command to start SQL recording. It is found that the execution duration of the **Run select * from pg_sta...** statement is **700 ms**, and more than 10,000 commands are executed because there are more than 10,000 partitions.
10. Add explain (analyze, verbose, timing, costs, buffers) before the SQL statement to analyze the execution plan. It is found that the entire table needs to be scanned during execution.



```
HIVEMETA=> explain (analyze,verbose,timing,costs,buffers) SELECT 'org.apache.hadoop.hive.metastore.model.MStorageDescriptor' AS NUCLEUS_TYPE,A0.INPUT_FORMAT,A0.IS_COMPRESSED,A0.IS_STOREDASSUBDIRECTO
RIES,A0.LOCATION,A0.NUM_BUCKETS,A0.OUTPUT_FORMAT,A0.SD_ID FROM SDS A0 WHERE A0.CD_ID = '463249' FETCH NEXT ROW ONLY;
                                                  QUERY PLAN
---------------------------------------------------------------------------------------------------------------------

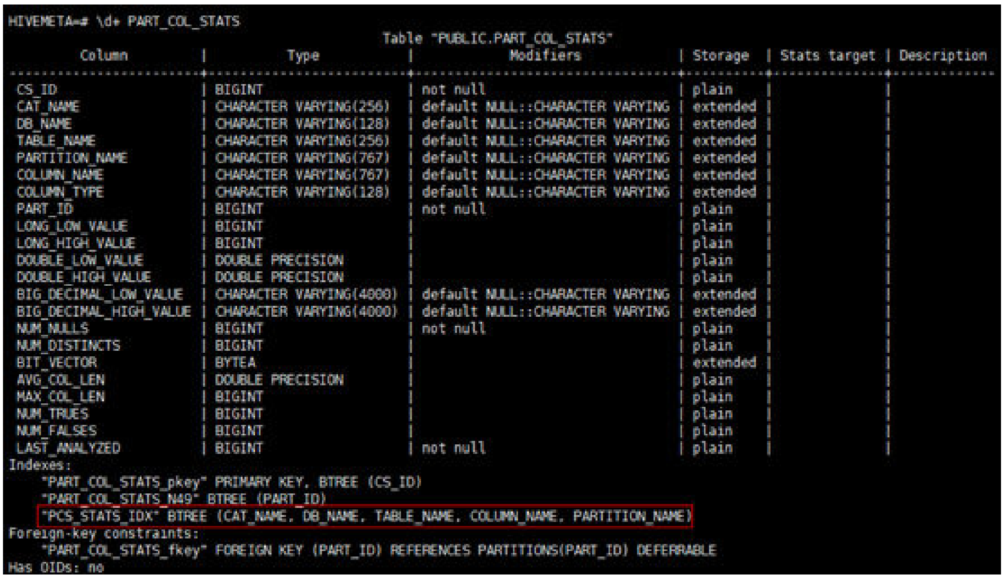
         Rows Removed by Filter: 154183
         Buffers: shared hit=6720
 Total runtime: 36.143 ms
(9 rows)
```

11. Check the index. It is found that the index does not meet the leftmost match rule.



```
HIVEMETA=# \d+ PART_COL_STATS
                                              Table "PUBLIC.PART_COL_STATS"

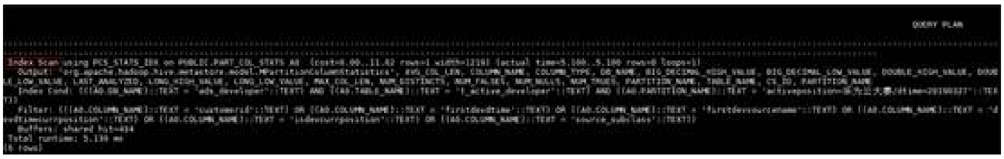
Indexes:
    "PART_COL_STATS_pkey" PRIMARY KEY, BTREE (CS_ID)
    "PART_COL_STATS_N49" BTREE (PART_ID)
    "PCS_STATS_IDX" BTREE (CAT_NAME, DB_NAME, TABLE_NAME, COLUMN_NAME, PARTITION_NAME)
Foreign-key constraints:
    "PART_COL_STATS_fkey" FOREIGN KEY (PART_ID) REFERENCES PARTITIONS(PART_ID) DEFERRABLE
Has OIDs: no
```

Procedure

1. Rebuild an index.

```
su – omm
gsql -p 20051 -U omm -W dbserverAdmin@123 -d hivemeta
DROP INDEX PCS_STATS_IDX;
CREATE INDEX PCS_STATS_IDX ON PART_COL_STATS(DB_NAME, TABLE_NAME, COLUMN_NAME,
PARTITION_NAME);
CREATE INDEX SDS_N50 ON SDS(CD_ID);
```

2. Check the execution plan again. It is found that the statement can be indexed and executed within 5 ms (the original execution time is 700 ms). Add fields to the Hive table again. The fields can be added successfully.



```
                                                                                                   QUERY PLAN
-------------------------------------------------------------------------------------------------------------------------------------

```

15.10.43 Failed to Restart the Hive Service

Issue

After the Hive service configuration is modified, the configuration fails to be saved. The configuration status of the Hive service on Manager is **Failed**.

Symptom

User A opens the Hive configuration file in the background of the MRS node and does not close the file. User B modifies the Hive configuration item in **Service Management** on the MRS Manager page, saves the configuration, and restarts the Hive service. However, the configuration fails to be saved and the Hive service fails to be started.

Cause Analysis

When user B modifies the configuration on the MRS Manager page, the configuration file is opened by user A in the background of an MRS node. As a result, the configuration file cannot be replaced and the Hive service fails to be started.

Procedure

Step 1 Manually close the Hive configuration file opened in the background of the cluster node.

Step 2 Modify the Hive configuration on MRS Manager and save the configuration.

Step 3 Restart the Hive service.

----End

15.10.44 Hive Failed to Delete a Table

Issue

Hive fails to delete a table.

Symptom

Partitioning a Hive table by two columns may eventually generate over 20,000 partition files. As a result, the user fails to execute the **truncate table ${TableName}** or **drop table ${TableName}** statement to delete table data.

Cause Analysis

The file deletion operations are executed by a single thread serially. If the Hive partitioned tables have too many partition files, a large amount of metadata is stored in the metadata database. It takes a long time to delete metadata when a statement is executed to delete table data. As a result, the deletion cannot be complete within the specified timeout period, and the operation fails.

NOTE

You can log in to FusionInsight Manager and choose **Cluster** > **Services** > **Hive**. On the Hive page, choose **Configuration** > **All Configurations**, choose **ServerInit** under **MetaStore(Role)** in the navigation tree, and view the **hive.metastore.client.socket.timeout** parameter value in the right pane. This value is the timeout period. You can view the default value in the **Description** column.

Procedure

Step 1 (Optional, perform this step for an internal table) Use **alter table ${TableName} set TBLPROPERTIES('EXTERNAL'='true')** to convert it into an external table. In this way, only its metadata but not data stored on the HDFS is deleted, saving the table deletion time.

Step 2 (Optional, perform this step to use the same table name) Run the **show create table ${TableName}** command to export the table structure, and then run the **ALTER TABLE ${TableName} RENAME TO ${new_table_name};** command to rename the table. In this way, you can create a table that is the same as the original one.

Step 3 Run the **hdfs dfs –rm –r –f ${hdfs_path}** command to delete table data from the HDFS.

Step 4 Use **alter table ${Table_Name} drop partition (${PartitionName}<'XXXX', ${PartitionName}>'XXXX');** in Hive to delete partitions and reduce the number of files. The deletion conditions can be flexibly configured.

Step 5 When the number of rest partitions is smaller than 1,000, run the **drop table ${TableName}** command to delete the table.

----End

Summary and Suggestions

Hive partitioning can improve query efficiency. However, you should properly plan the partitioning policies to prevent a large number of small files from being generated.

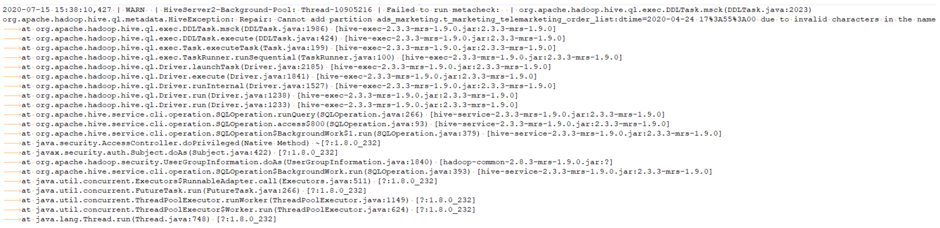
15.10.45 An Error Is Reported When msck repair table table_name Is Run on Hive

Symptom

When **msck repair table table_name** is run on Hive, the error message "FAILED: Execution Error, return code 1 from org.apache.hadoop.hive.ql.exec.DDLTask (state=08S01,code=1)" is displayed.

Possible Causes

A directory in the HiveServer log file **/var/log/Bigdata/hive/hiveserver/hive.log** does not comply with the partition format.



```
2020-07-15 15:38:10,427 | WARN  | HiveServer2-Background-Pool: Thread-10905216 | Failed to run metacheck:  | org.apache.hadoop.hive.ql.exec.DDLTask.msck(DDLTask.java:2023)

    at java.lang.Thread.run(Thread.java:748) [?:1.8.0_232]
```

Procedure

- Method 1: Delete the incorrect file or directory.
- Method 2: Run the **set hive.msck.path.validation=skip** command to skip invalid directories.

15.10.46 How Do I Release Disk Space After Dropping a Table in Hive?

Issue

After a user runs the **drop** command on the Hive CLI to drop a table and then uses the **hdfs dfsadmin -report** command to check the disk space, the command output shows that the table is not deleted.

Cause Analysis

The **drop** command executed on the Hive CLI deletes only the table structure of the external table, but not the table data stored in HDFS.

Procedure

Step 1 Log in to the node where the client is installed as user **root** and authenticate the component user.

cd *Client installation directory*

source bigdata_env

kinit *Component service user* (Skip this step for clusters with Kerberos authentication disabled.)

Step 2 Run the following command to delete the table stored in HDFS:

hadoop fs -rm hdfs://hacluster/*Path of the table*

----End

15.10.47 Connection Timeout During SQL Statement Execution on the Client

Symptom

The SQL statement fails to be executed on the client, and the error message "Timed out waiting for a free available connection" is displayed.

Possible Causes

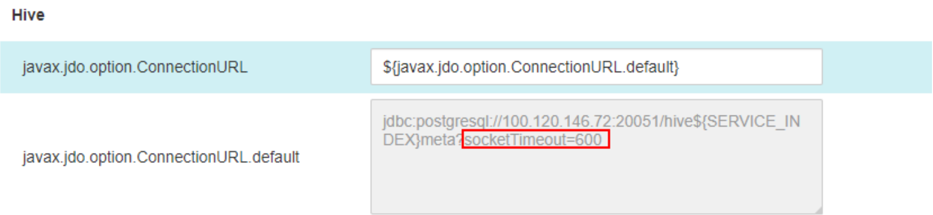
A large number of DBService connections exist, and obtaining connections times out.

Procedure

Step 1 Check whether the client uses the Spark-SQL client to execute SQL statements.

- If yes, check the timeout parameter in the URL, change the value to **600**, and go to **Step 7**.
- If the alarm is not cleared, go to **Step 2**.

Step 2 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Hive** > **Configuration** > **All Configurations**, search for **javax.jdo.option.ConnectionURL**, and check whether the value of the timeout parameter is less than **600**.



Hive

javax.jdo.option.ConnectionURL	${javax.jdo.option.ConnectionURL.default}
javax.jdo.option.ConnectionURL.default	jdbc:postgresql://100.120.146.72:20051/hive${SERVICE_INDEX}meta?socketTimeout=600

NOTE

This parameter exists in Hive, HiveServer, MetaStore, and WebHCat. Ensure that the parameter values are the same.

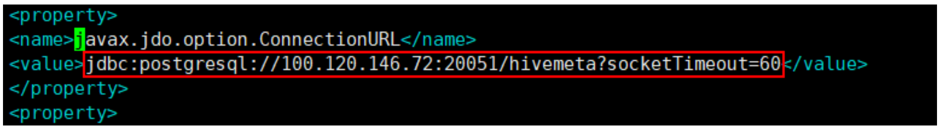
- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 Check whether the value of **javax.jdo.option.ConnectionURL** is **${javax.jdo.option.ConnectionURL.default}**.

- If yes, go to **Step 4**.
- If no, change the timeout parameter in the URL to **600**, click **Save**, and go to **Step 7**.

Step 4 Click **Instance**, select any HiveServer instance, and log in to the instance node as user **root**.

Step 5 Open the **${BIGDATA_HOME}/FusionInsight_Current/*HiveServer/etc/hivemetastore-site.xml** configuration file, find the **javax.jdo.option.ConnectionURL** parameter, and copy its value.



```
<property>
<name>javax.jdo.option.ConnectionURL</name>
<value>jdbc:postgresql://100.120.146.72:20051/hivemeta?socketTimeout=60</value>
</property>
<property>
```

Step 6 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Hive** > **Configuration** > **All Configurations**, search for **javax.jdo.option.ConnectionURL**, change its value to the URL copied in **Step 5**, change the timeout parameter to **600**, and click **Save**.

NOTE

This parameter exists in Hive, HiveServer, MetaStore, and WebHCat. Ensure that the parameter values are the same.

Step 7 Choose **Cluster** > **Services** > **Hive** > **Configuration** > **All Configurations**, search for **maxConnectionsPerPartition**, and check whether its value is less than **100**.

- If yes, change the value to **100**, click **Save**, and go to **Step 8**.
- If no, go to **Step 8**.

Step 8 If parameters are modified in the preceding steps, choose **Cluster** > **Services** > **Hive** > **Dashboard** and choose **More** > **Service Rolling Restart**. If the parameters are not modified, skip this step.

----End

15.10.48 WebHCat Failed to Start Due to Abnormal Health Status

Issue

The WebHCat instance fails to be started.

Symptom

On Manager, the health status of the WebHCat instance is **Faulty**, and alarm **ALM-12007 Process Fault** is generated for the WebHCat instance of the Hive service. An error is reported when the Hive service is restarted.

Error messages "Service not found in Kerberos database" and "Address already in use" are contained in the **/var/log/Bigdata/hive/webhcat/webhcat.log** file of the WebHCat instance.

Procedure

Step 1 Log in to each node where the WebHCat instance resides and check whether the mapping between IP addresses and hostnames in the **/etc/hosts** file is correct. The WebHCat configurations in the **/etc/hostname** and **/etc/HOSTNAME** files must be the same as those in the **/etc/hosts** file. If they are different, manually modify them.

NOTE

To view the mapping between the IP addresses and hostnames of the WebHCat instance, log in to FusionInsight Manager and choose **Cluster** > **Services** > **Hive** > **Instance**.

Step 2 Log in to any node where the WebHCat instance resides and run the following command to switch to user **omm**:

su - omm

Step 3 Run the following command to check whether the WebHCat process exists:

ps -ef|grep webhcat|grep -v grep

If it does, run the following command to kill it:

kill -9 ${webhcat_pid}

Step 4 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Hive** . On the page that is displayed, click the **Instance** tab. The select all WebHCat instances, click **More**, and select **Restart Instance**. Wait until WebHCat is restarted successfully.

----End

15.10.49 WebHCat Failed to Start Because the mapred-default.xml File Cannot Be Parsed

Issue

The Hive service of MRS is faulty. After the Hive service is restarted, the HiveServer and WebHCat processes on the Master2 node fail to start, but the processes on the Master1 node are normal.

Cause Analysis

Log in to the Master2 node and check the **/var/log/Bigdata/hive/hiveserver/hive.log** file. It is found that HiveServer keeps loading **/opt/Bigdata/*/*_HiveServer/etc/hive-site.xml**. Check the **/var/log/Bigdata/hive/hiveserver/hiveserver.out** log generated when HiveServer exits. It is found that an exception occurs when the **mapred-default.xml** file is parsed.

Procedure

Step 1 Log in to the Master2 node and run the following command to query the path of **mapred-default.xml**:

find /opt/ -name 'mapred-default.xml'

The configuration file is in the **/opt/Bigdata/*/*_WebHCat/etc/** directory but is empty.

Step 2 Log in to the Master1 node, copy the **/opt/Bigdata/*/*_WebHCat/etc/mapred-default.xml** file to the Master2 node, and change the owner group of the file to **omm:wheel**.

Step 3 Log in to Manager and restart the abnormal HiveServer and WebHCat instances.

----End

15.11 Using Hue

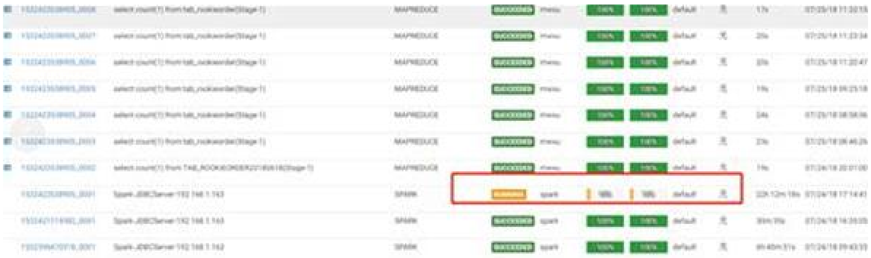
15.11.1 A Job Is Running on Hue

Issue

The customer finds that a job is running on Hue.

Symptom

After the customer's MRS is installed, the job is running on Hue but the running job is not operated by the customer.



Cause Analysis

This job is a permanent job generated when the system connects to JDBC after Spark is started.

Procedure

This is not a problem. No handling is required.

15.11.2 HQL Fails to Be Executed on Hue Using Internet Explorer

Symptom

Using Internet Explorer to access Hive Editor and execute all HQL statements on Hue fails and the system prompts "There was an error with your query".

Cause Analysis

Internet Explorer has functional problems and cannot process AJAX POST requests containing form data in 307 redirection. Use a compatible browser.

Solution

Use Google Chrome 21 or later.

15.11.3 Hue (Active) Cannot Open Web Pages

Symptom

The following information is displayed on the web UI of Hue (active):

```
Service Unavailable
The server is temporarily unable to service your request due to maintenance downtime or capacity
problems. Please try again later.
```

Cause Analysis

- The Hue configuration has expired.

- The configuration of the Hue service needs to be modified manually in a single-master cluster.

Solution

- If the Hue configuration has expired, restart the Hue service.
- Manually modify the Hue service configuration for a single-master cluster.
  a. Log in to the Master node.
  b. Run the **hostname -i** command to obtain the IP address of the local host.
  c. Run the following command to obtain the value of **HUE_FLOAT_IP**:

     grep "HUE_FLOAT_IP" ${BIGDATA_HOME}/*MRS*_Current/1_*/etc*/ENV_VARS,

     Replace *MRS* with the actual file name.
  d. Check whether the local IP address is the same as the value of **HUE_FLOAT_IP**. If they are different, change the value of **HUE_FLOAT_IP** to the local IP address.
  e. Restart the Hue service.

15.11.4 Failed to Access the Hue Web UI

Issue

An error page is displayed when the Hue web UI is accessed.

Symptom

The following error information is displayed on the Hue web UI:

```
503 Service Unavailable
The server is temporarily unable to service your requster due to maintenance downtime or capacity
problems.Please try again later.
```

Cause Analysis

- The Hue configuration has expired.
- The configuration of the Hue service needs to be modified manually in a single-master cluster.

Procedure

Step 1 Log in to the Master node.

Step 2 Run the **hostname -i** command to obtain the IP address of the local host.

Step 3 Run the following command to obtain the value of **HUE_FLOAT_IP**:

grep "HUE_FLOAT_IP" ${BIGDATA_HOME}/*MRS*_Current/1_*/etc*/ENV_VARS, where *MRS* is subject to the actual file name.

Step 4 Check whether the local IP address is the same as the value of **HUE_FLOAT_IP**. If they are different, change the value of **HUE_FLOAT_IP** to the local IP address.

Step 5 Restart the Hue service.

----End

15.11.5 HBase Tables Cannot Be Loaded on the Hue Web UI

Issue

After Hive data is imported to HBase on the Hue page, an error message is displayed, indicating that the HBase table cannot be detected.

Symptom

In the Kerberos cluster, the IAM sub-account does not have sufficient permissions. As a result, the HBase table cannot be loaded.

Cause Analysis

The IAM subaccount does not have sufficient permissions.

Procedure

MRS Manager:

Step 1 Log in to MRS Manager.

Step 2 Choose **System** > **Manage User**.

Step 3 Locate the row that contains the target user, and click **Modify**.

Step 4 Add the user to the **supergroup** group.

Step 5 Click **OK**. The modification is complete.

----End

FusionInsight Manager:

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the target user, and click **Modify**.

Step 4 Add the user to the **supergroup** group.

Step 5 Click **OK**. The modification is complete.

----End

Summary and Suggestions

If Kerberos authentication is enabled for a cluster, "No data available" is displayed on the page. In this case, check the permission first.

15.12 Using Impala

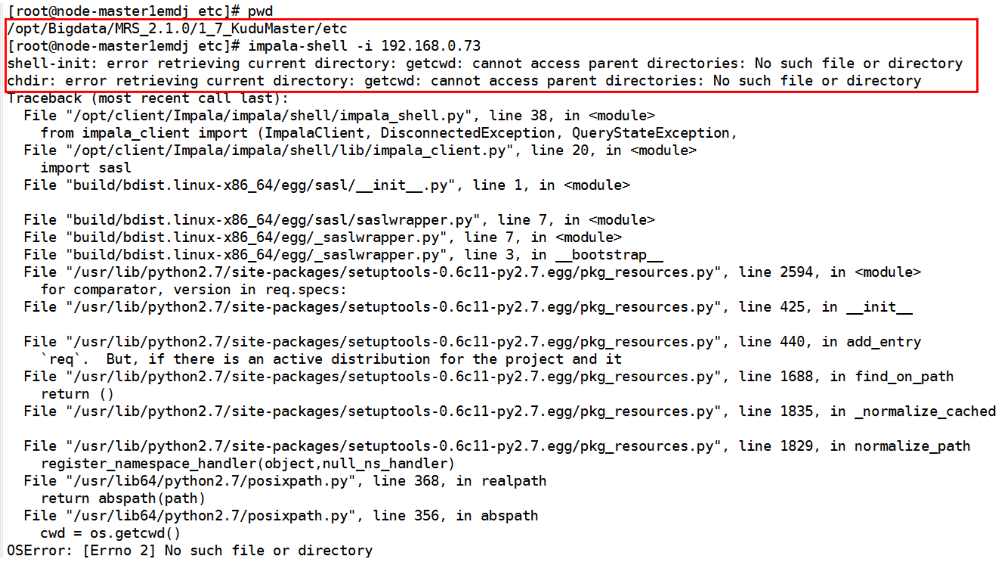
15.12.1 Failed to Connect to impala-shell

Issue

A user fails to connect to impala-shell.

Symptom

After a user modifies the configuration of any component on the component management page and restarts the service, the connection to impala-shell fails, and the error message "no such file/directory" is displayed.



```
[root@node-master1emdj etc]# pwd
/opt/Bigdata/MRS_2.1.0/1_7_KuduMaster/etc
[root@node-master1emdj etc]# impala-shell -i 192.168.0.73
shell-init: error retrieving current directory: getcwd: cannot access parent directories: No such file or directory
chdir: error retrieving current directory: getcwd: cannot access parent directories: No such file or directory
Traceback (most recent call last):

  File "/usr/lib64/python2.7/posixpath.py", line 356, in abspath
    cwd = os.getcwd()
OSError: [Errno 2] No such file or directory
```

Cause Analysis

After the service configuration is modified and the service is restarted, some directory structures of the service, such as the etc directory, are deleted and recreated. If the directory is etc or its subdirectory before the service is restarted, some system variables or parameters cannot be found when impala-shell is executed in the original directory because the directory is recreated after the service is restarted. As a result, impala-shell fails to be connected.

Procedure

Switch to any existing directory and reconnect to impala-shell.

15.12.2 Failed to Create a Kudu Table

Issue

An error occurs when a user creates a Kudu table.

Symptom

When a user creates table in a new cluster, the following error message is displayed: [Cloudera]ImpalaJDBCDriver ERROR processing query/statement. Error

Code: 0, SQL state: TStatus(statusCode:ERROR_STATUS, sqlState:HY000, errorMessage:AnalysisException: Table property 'kudu.master_addresses' is required when the impalad startup flag -kudu_master_hosts is not used.

Cause Analysis

The user does not specify **kudu.master_addresses** in the Impala SQL statement.

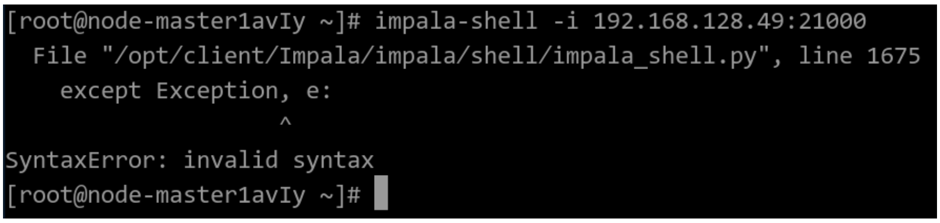
Procedure

Specify **kudu.master_addresses** when creating a Kudu table.

15.12.3 Failed to Log In to the Impala Client

Issue

Error information similar to the following is displayed when a user runs the Impala client.



```
[root@node-master1avIy ~]# impala-shell -i 192.168.128.49:21000
  File "/opt/client/Impala/impala/shell/impala_shell.py", line 1675
    except Exception, e:
                    ^
SyntaxError: invalid syntax
[root@node-master1avIy ~]# 
```

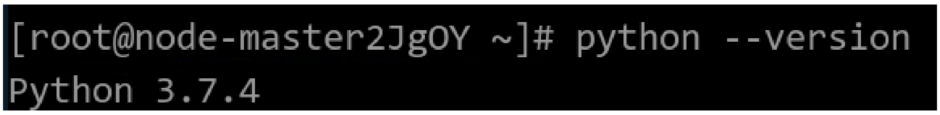
Cause Analysis

The latest MRS cluster uses EulerOS 2.9 or later, which provides only Python 3. However, the Impala client is implemented based on Python 2 and is incompatible with some syntax of Python 3. As a result, an error occurs when the Impala client is running. You can manually install Python 2 to solve this problem.

Procedure

Step 1 Log in to the Impala node as user **root** and run the following command to check its Python version:

python --version



```
[root@node-master2JgOY ~]# python --version
Python 3.7.4
```

Step 2 Run the **yum install make** command to check whether yum is available.

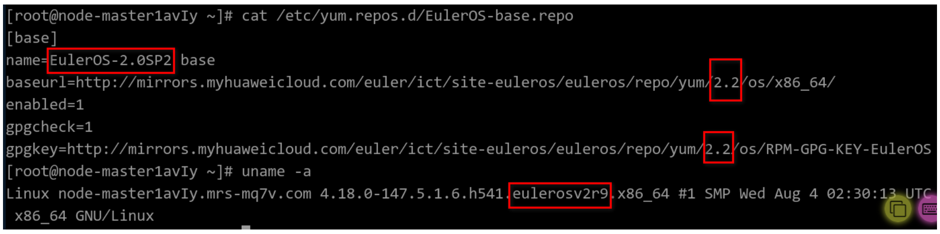
- If the following error is reported, the yum configuration is incorrect. Go to **Step 3**.

```
[root@node-master2JgOY ~]# yum install make
Error: There are no enabled repositories in "/etc/yum.repos.d", "/etc/yum/repos.d", "/etc/distro.repos.d".
```

- If no error is reported, go to **Step 4**.

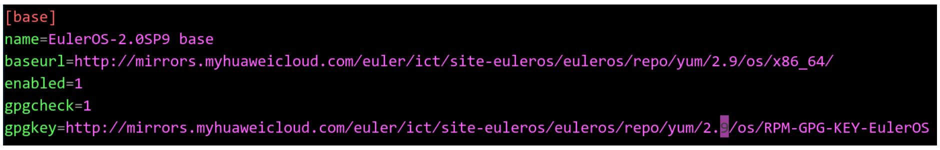
Step 3 Run the **cat /etc/yum.repos.d/EulerOS-base.repo** command to check whether the yum source matches the system version. If they do not match, modify them.

Before modification



```
[root@node-master1avIy ~]# cat /etc/yum.repos.d/EulerOS-base.repo
[base]
name=EulerOS-2.0SP2 base
baseurl=http://mirrors.myhuaweicloud.com/euler/ict/site-euleros/euleros/repo/yum/2.2/os/x86_64/
enabled=1
gpgcheck=1
gpgkey=http://mirrors.myhuaweicloud.com/euler/ict/site-euleros/euleros/repo/yum/2.2/os/RPM-GPG-KEY-EulerOS
[root@node-master1avIy ~]# uname -a
Linux node-master1avIy.mrs-mq7v.com 4.18.0-147.5.1.6.h541.eulerosv2r9.x86_64 #1 SMP Wed Aug 4 02:30:13 UTC
 x86_64 GNU/Linux
```

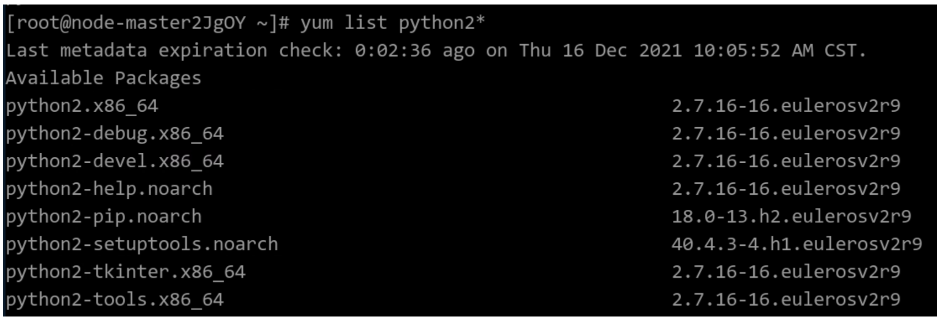
After modification



```
[base]
name=EulerOS-2.0SP9 base
baseurl=http://mirrors.myhuaweicloud.com/euler/ict/site-euleros/euleros/repo/yum/2.9/os/x86_64/
enabled=1
gpgcheck=1
gpgkey=http://mirrors.myhuaweicloud.com/euler/ict/site-euleros/euleros/repo/yum/2.9/os/RPM-GPG-KEY-EulerOS
```

Step 4 Run the following command to check for the software whose name starts with **python2** in the yum source:

yum list python2*



```
[root@node-master2JgOY ~]# yum list python2*
Last metadata expiration check: 0:02:36 ago on Thu 16 Dec 2021 10:05:52 AM CST.
Available Packages
python2.x86_64                                  2.7.16-16.eulerosv2r9

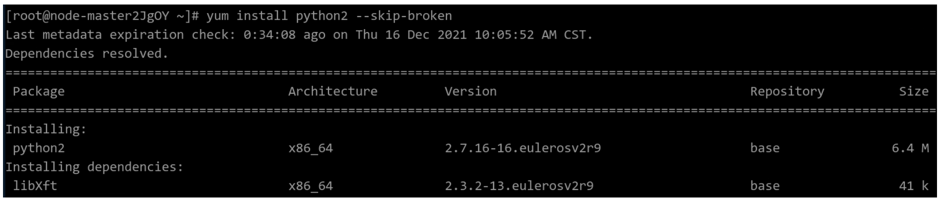
  - conflicting requests
(try to add '--allowerasing' to command line to replace conflicting packages or '--skip-broken' to skip uninstallable package
s or '--nobest' to use not only best candidate packages)
```

Python 3 has been installed in the current system. If you directly install Python 2, a conflict message is displayed.

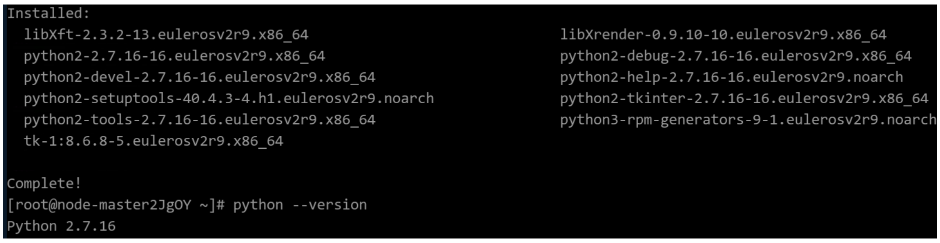
You can select **--allowerasing** or **--skip-broken** for the installation. For example:

yum install python2 --skip-broken



```
[root@node-master2JgOY ~]# yum install python2 --skip-broken
Last metadata expiration check: 0:34:08 ago on Thu 16 Dec 2021 10:05:52 AM CST.
Dependencies resolved.
=====================================================================================================================
 Package                            Architecture        Version                               Repository        Size
=====================================================================================================================
Installing:
 python2                            x86_64              2.7.16-16.eulerosv2r9                 base             6.4 M
Installing dependencies:
 libXft                             x86_64              2.3.2-13.eulerosv2r9                  base              41 k
```

After the installation is complete, the Python version is automatically changed to python2, as shown in the following figure.



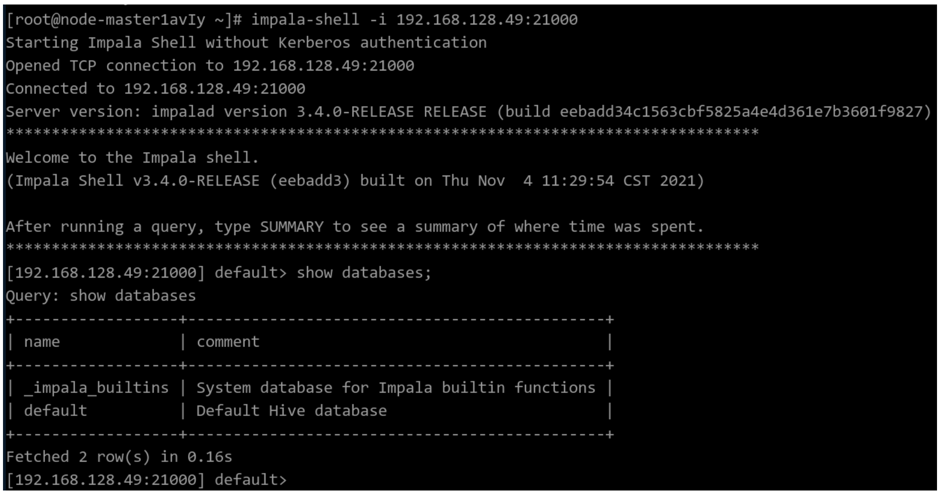
```
Installed:
  libXft-2.3.2-13.eulerosv2r9.x86_64                              libXrender-0.9.10-10.eulerosv2r9.x86_64
  python2-2.7.16-16.eulerosv2r9.x86_64                            python2-debug-2.7.16-16.eulerosv2r9.x86_64
  python2-devel-2.7.16-16.eulerosv2r9.x86_64                      python2-help-2.7.16-16.eulerosv2r9.noarch
  python2-setuptools-40.4.3-4.h1.eulerosv2r9.noarch               python2-tkinter-2.7.16-16.eulerosv2r9.x86_64
  python2-tools-2.7.16-16.eulerosv2r9.x86_64                      python3-rpm-generators-9-1.eulerosv2r9.noarch
  tk-1:8.6.8-5.eulerosv2r9.x86_64

Complete!
[root@node-master2JgOY ~]# python --version
Python 2.7.16
```

If Python 2 is installed successfully but the displayed Python version is incorrect, run the following command to create the **/usr/bin/python** soft link for **/usr/bin/python2**:

ln -s /usr/bin/python2 /usr/bin/python

Step 6 Verify that the Impala client is available.



```
[root@node-master1avIy ~]# impala-shell -i 192.168.128.49:21000
Starting Impala Shell without Kerberos authentication
Opened TCP connection to 192.168.128.49:21000
Connected to 192.168.128.49:21000

15.13 Using Kafka

15.13.1 An Error Is Reported When Kafka Is Run to Obtain a Topic

Issue

An Error is reported when Kafka is run to obtain a topic.

Symptom

An error is reported when the Kafka is run to obtain topics. The error information is as follows:

```
ERROR org.apache.kafka.common.errors.InvalidReplicationFactorException: Replication factor: 2 larger than
available brokers: 0.
```

Possible Cause

The variable for obtaining the ZooKeeper address is incorrect due to special characters.

Procedure

Step 1 Log in to any Master node.

Step 2 Run the **cat /opt/client/Kafka/kafka/config/server.properties |grep '^zookeeper.connect ='** command to check the variable of the Zookeeper address.

Step 3 Run Kafka again to obtain the topic. Do not add any character to the variables obtained in **Step 2**.

----End

15.13.2 Flume Normally Connects to Kafka But Fails to Send Messages

Symptom

An MRS cluster is installed, and ZooKeeper, Flume, and Kafka are installed in the cluster.

Flume fails to send data to Kafka.

Possible Causes

1. The Kafka service is abnormal.
2. The IP address for Flume to connect to Kafka is incorrect.
3. The size of the message sent from Flume to Kafka exceeds the upper limit.

Cause Analysis

The possible reasons why Flume fails to send data to Kafka may be related to Flume or Kafka.

1. Check the Kafka service status and monitoring metrics on Manager.
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.

2. Check the Flume log. The log contains **MessageSizeTooLargeException** information, as shown in the following:

```
2016-02-26 14:55:19,126 | WARN  | [SinkRunner-PollingRunner-DefaultSinkProcessor] |  Produce
request with correlation id 349829 failed due to [LOG,7]:
kafka.common.MessageSizeTooLargeException  | kafka.utils.Logging$class.warn(Logging.scala:83)
```

   The exception shows that the size of data written to Kafka by Flume exceeds the maximum message size specified by Kafka.

3. Check the maximum message size specified by Kafka on Manager.
   - MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.

   On the page that is displayed, set **Type** to **All**. All Kafka configurations are displayed. Enter **message.max.bytes** in the **Search** text box to search.

   In MRS, the maximum size of a message that can be received by the Kafka server is 1000012 bytes = 977 KB by default.

Solution

After confirmation with the customer, data sent by Flume contains messages over 1 MB. Adjust parameters on Kafka to enable the messages to be written to Kafka.

Step 1 Set **message.max.bytes** to a value that is larger than the current maximum size of the message to be written so that Kafka can receive all messages.

Step 2 Set **replica.fetch.max.bytes** to a value that is equal to or larger than the value of **message.max.bytes** so that replicas of partitions on different Brokers can be synchronized to all messages.

- MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
- FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.

On the page that is displayed, set **Type** to **All**. All Kafka configurations are displayed. Enter **replica.fetch.max.bytes** in the **Search** text box to search.

Step 3 Click **Save** and restart the Kafka service to make Kafka configurations take effect.

Step 4 Set **fetch.message.max.bytes** to a value that is equal to or larger than the value of **message.max.bytes** for Consumer service applications to ensure that Consumers can consume all messages.

----End

15.13.3 Producer Failed to Send Data and Threw "NullPointerException"

Symptom

An MRS cluster has ZooKeeper and Kafka installed.

When the Producer client sends data to Kafka, it fails and throws "NullPointerException".

Possible Causes

1. The Kafka service is abnormal.
2. The **jass** and **keytab** files configured on the Producer client are incorrect.

Cause Analysis

The possible causes may be related to Producer or Kafka.

1. Check the Kafka service status and monitoring metrics on Manager.
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the target cluster and choose **Service** > **Kafka**.

     Check the Kafka status. The status is good, and the monitoring metrics are correctly displayed.
2. Check the Producer client log. The log contains "NullPointerException", as shown in **Figure 15-42**.

   Figure 15-42 Producer client log

   
   ```
   [2016-12-06 02:04:05,906]-[schedule-C50D0717-4643-4D4E-9D6E-B940E4BD7159]-[kafka-producer-network-thread |
   SZX1000161910-10.21.219.222-bigdata-producer-5]-[1005]-[org.apache.kafka.clients.producer.internals.Sender.run
   thread:
   java.lang.NullPointerException
       at org.apache.kafka.common.network.Selector.pollSelectionKeys(Selector.java:302)
       at org.apache.kafka.common.network.Selector.poll(Selector.java:283)
       at org.apache.kafka.clients.NetworkClient.poll(NetworkClient.java:260)
       at org.apache.kafka.clients.producer.internals.Sender.run(Sender.java:229)
       at org.apache.kafka.clients.producer.internals.Sender.run(Sender.java:134)
       at java.lang.Thread.run(Thread.java:745)
   [2016-12-06 02:04:05,921]-[schedule-C50D0717-4643-4D4E-9D6E-B940E4BD7159]-[kafka-producer-network-thread |
   SZX1000161910-10.21.219.222-bigdata-producer-3]-[1005]-[org.apache.kafka.clients.producer.internals.Sender.run
   thread:
   java.lang.NullPointerException
       at org.apache.kafka.common.network.Selector.pollSelectionKeys(Selector.java:302)
       at org.apache.kafka.common.network.Selector.poll(Selector.java:283)
       at org.apache.kafka.clients.NetworkClient.poll(NetworkClient.java:260)
       at org.apache.kafka.clients.producer.internals.Sender.run(Sender.java:229)
       at org.apache.kafka.clients.producer.internals.Sender.run(Sender.java:134)
       at java.lang.Thread.run(Thread.java:745)
   ```

   Alternatively, the log contains only "NullPointerException" but no stack information. The problem is caused by JDK self-protection. If much information is printed for the same stack, the JDK self-protection is triggered and stack information is no longer printed, as shown in **Figure 15-43**.

   Figure 15-43 Error information

   
   ```
   [2016-11-23 04:06:53,973] [kafka-producer-network-thread | producer-1] [ERROR] [org.apache.kafka.clients.producer.internals.Sender] (run:130)- Uncaught error in kafka producer I/O thread:
   java.lang.NullPointerException
   [2016-11-23 04:06:53,973] [kafka-producer-network-thread | producer-1] [ERROR] [org.apache.kafka.clients.producer.internals.Sender] (run:130)- Uncaught error in kafka producer I/O thread:
   java.lang.NullPointerException
   [2016-11-23 04:06:53,973] [kafka-producer-network-thread | producer-1] [ERROR] [org.apache.kafka.clients.producer.internals.Sender] (run:130)- Uncaught error in kafka producer I/O thread:

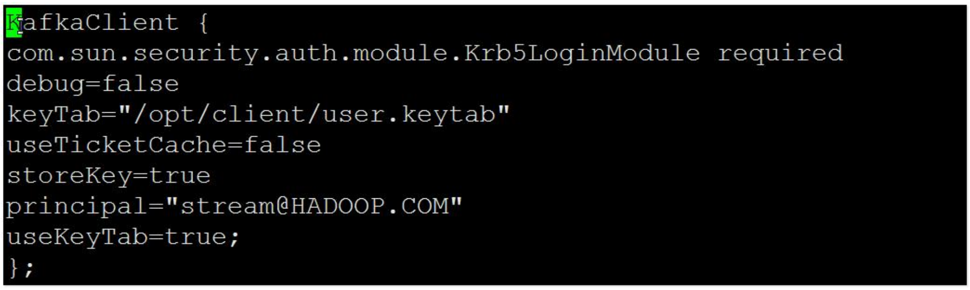
... 11 more
```

4. The authentication failure causes the failure to create the KafkaChannel. The KafkaChannel obtained through the **channel(key)** method is empty and "NullPointerException" is excessively printed. According to the preceding log, the authentication fails due to an incorrect password which does not match the username.
5. Check the **jaas** and **keytab** files. The **principal** is set to **stream** in the **jaas** file.

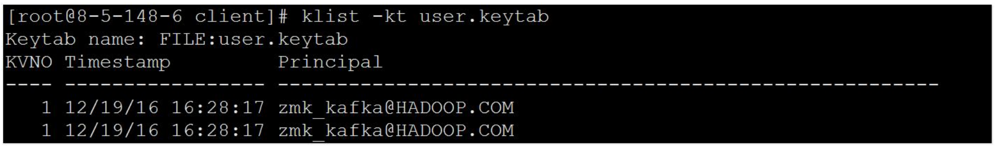
Figure 15-45 Checking the jaas file



```
KafkaClient {
com.sun.security.auth.module.Krb5LoginModule required
debug=false
keyTab="/opt/client/user.keytab"
useTicketCache=false
storeKey=true
principal="stream@HADOOP.COM"
useKeyTab=true;
};
```

The **principal** is set to **zmk_kafka** in the **user.keytab** file.

Figure 15-46 Checking the user.keytab file



```
[root@8-5-148-6 client]# klist -kt user.keytab
Keytab name: FILE:user.keytab
KVNO Timestamp         Principal
---- ----------------- --------------------------------------------------------
   1 12/19/16 16:28:17 zmk_kafka@HADOOP.COM
   1 12/19/16 16:28:17 zmk_kafka@HADOOP.COM
```

The **principal** in the **jaas** file is inconsistent with that in the **user.keytab** file.

The application automatically and periodically updates the **jaas** file. However, when two processes of the application update the **jaas** file, one process writes a correct **principal** whereas the other process writes an incorrect one. As a result, the application is abnormal sometimes.

Procedure

Step 1 Modify the **jaas** file to ensure that its **principal** exists in the **keytab** file.

----End

15.13.4 Producer Fails to Send Data and "TOPIC_AUTHORIZATION_FAILED" Is Thrown

Symptom

An MRS cluster is installed, and ZooKeeper and Kafka are installed in the cluster.

When Producer sends data to Kafka, the client throws "TOPIC_AUTHORIZATION_FAILED."

Possible Causes

1. The Kafka service is abnormal.
2. The Producer client adopts non-security access and access is disabled on the server.
3. The Producer client adopts non-security access and ACL is set for Kafka topics.

Cause Analysis

The possible reasons why Producer fails to send data to Kafka may be related to Producer or Kafka.

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. Check the Producer client logs. The logs contain the error information "TOPIC_AUTHORIZATION_FAILED."
   ```
   [root@10-10-144-2 client]# kafka-console-producer.sh --broker-list 10.5.144.2:9092 --topic test
   1
   [2017-01-24 16:58:36,671] WARN Error while fetching metadata with correlation id 0 :
   {test=TOPIC_AUTHORIZATION_FAILED} (org.apache.kafka.clients.NetworkClient)
   [2017-01-24 16:58:36,672] ERROR Error when sending message to topic test with key: null, value: 1
   bytes with error: Not authorized to access topics: [test]
   (org.apache.kafka.clients.producer.internals.ErrorLoggingCallback)
   ```
   Producer accesses Kafka using port 9092, which is a non-security port.
3. On Manager, check the current Kafka cluster configuration. It is found that the customized configuration **allow.everyone.if.no.acl.found**=**false** is not configured.
   - MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.
4. If ACL is set to **false**, port 9092 cannot be used for access.
5. Check the Producer client logs. The logs contain the error information "TOPIC_AUTHORIZATION_FAILED."
   ```
   [root@10-10-144-2 client]# kafka-console-producer.sh --broker-list 10.5.144.2:21005 --topic test_acl
   1
   ```

```
[2017-01-25 11:09:40,012] WARN Error while fetching metadata with correlation id 0 :
{test_acl=TOPIC_AUTHORIZATION_FAILED} (org.apache.kafka.clients.NetworkClient)
[2017-01-25 11:09:40,013] ERROR Error when sending message to topic test_acl with key: null, value:
1 bytes with error: Not authorized to access topics: [test_acl]
(org.apache.kafka.clients.producer.internals.ErrorLoggingCallback)
[2017-01-25 11:14:40,010] WARN Error while fetching metadata with correlation id 1 :
{test_acl=TOPIC_AUTHORIZATION_FAILED} (org.apache.kafka.clients.NetworkClient)
```

Producer accesses Kafka using port 21005, which is a non-security port.

6. Run the client command to check the ACL permission of the topic.

   ```
   [root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:24002/
   kafka --list --topic topic_acl
   Current ACLs for resource `Topic:topic_acl`:
    User:test_user has Allow permission for operations: Describe from hosts: *
   User:test_user has Allow permission for operations: Write from hosts: *
   ```

   If ACL is set for the topic, port 9092 cannot be used for access.

7. Check the Producer client logs. The logs contain the error information "TOPIC_AUTHORIZATION_FAILED."

   ```
   [root@10-10-144-2 client]# kafka-console-producer.sh --broker-list 10.5.144.2:21007 --topic topic_acl
   --producer.config /opt/client/Kafka/kafka/config/producer.properties
   1
   [2017-01-25 12:43:58,506] WARN Error while fetching metadata with correlation id 0 :
   {topic_acl=TOPIC_AUTHORIZATION_FAILED} (org.apache.kafka.clients.NetworkClient)
   [2017-01-25 12:43:58,507] ERROR Error when sending message to topic topic_acl with key: null,
   value: 1 bytes with error: Not authorized to access topics: [topic_acl]
   (org.apache.kafka.clients.producer.internals.ErrorLoggingCallback)
   ```

   Producer uses port 21007 to access Kafka.

8. Run the client command **klist** to query the current authenticated user.

   ```
   [root@10-10-144-2 client]# klist
   Ticket cache: FILE:/tmp/krb5cc_0
   Default principal: test@HADOOP.COM

   Valid starting     Expires            Service principal
   01/25/17 11:06:48  01/26/17 11:06:45  krbtgt/HADOOP.COM@HADOOP.COM
   ```

   The **test** user is used in this example.

9. Run the client command to check the ACL permission of the topic.

   ```
   [root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/
   kafka --list --topic topic_acl
   Current ACLs for resource `Topic:topic_acl`:
    User:test_user has Allow permission for operations: Describe from hosts: *
   User:test_user has Allow permission for operations: Write from hosts: *
   ```

   After ACL is set for the topic, user **test_user** has Producer permission. User **test** has no permission to perform Producer operations.

   For details about the solution, see 2.

10. Log in to Kafka Broker using SSH.

    Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

    Check the **kafka-authorizer.log** file. It shows that the user does not belong to the **kafka** or **kafkaadmin** group.

    ```
    2017-01-25 13:26:33,648 | INFO  | [kafka-request-handler-0] | The principal is test, belongs to Group :
    [hadoop, ficommon] | kafka.authorizer.logger (SimpleAclAuthorizer.scala:169)
    2017-01-25 13:26:33,648 | WARN  | [kafka-request-handler-0] | The user is not belongs to kafka or
    kafkaadmin group, authorize failed! | kafka.authorizer.logger (SimpleAclAuthorizer.scala:170)
    ```

    For details about the solution, see 3.

Solution

Step 1 Set **allow.everyone.if.no.acl.found** to **true** and restart the Kafka service.

Step 2 Use the account with permission for login.

Example:

kinit test_user

Alternatively, grant the user with related permission.

NOTICE

This operation must be performed by the Kafka administrator (belonging to the **kafkaadmin** group).

Example:

kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/kafka --topic topic_acl --producer --add --allow-principal User:test

```
[root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=8.5.144.2:2181/kafka --list --topic topic_acl
Current ACLs for resource `Topic:topic_acl`:
 User:test_user has Allow permission for operations: Describe from hosts: *
 User:test_user has Allow permission for operations: Write from hosts: *
  User:test has Allow permission for operations: Describe from hosts: *
  User:test has Allow permission for operations: Write from hosts: *
```

Step 3 Add the user to the **kafka** or **kafkaadmin** group.

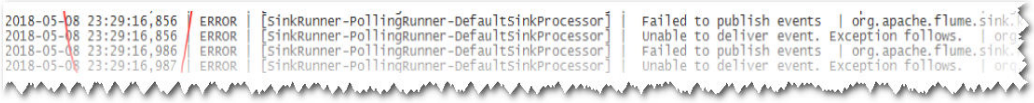
----End

15.13.5 Producer Occasionally Fails to Send Data and the Log Displays "Too many open files in system"

Symptom

When Producer sends data to Kafka, it is found that the client fails to send data.

Figure 15-47 Producer fails to send data.



```
2018-05-08 23:29:16,856 | ERROR | [SinkRunner-PollingRunner-DefaultSinkProcessor] | Failed to publish events  | org.apache.flume.sink.
2018-05-08 23:29:16,856 | ERROR | [SinkRunner-PollingRunner-DefaultSinkProcessor] | Unable to deliver event. Exception follows.  | org
2018-05-08 23:29:16,986 | ERROR | [SinkRunner-PollingRunner-DefaultSinkProcessor] | Failed to publish events  | org.apache.flume.sink.
2018-05-08 23:29:16,987 | ERROR | [SinkRunner-PollingRunner-DefaultSinkProcessor] | Unable to deliver event. Exception follows.  | org
```

Possible Causes

1. The Kafka service is abnormal.
2. The network is abnormal.
3. The Kafka topic is abnormal.

Cause Analysis

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. View the error topic information in the SparkStreaming log.

   Run the Kafka commands to obtain the topic assignment information and copy synchronization information, and check the return result.

   kafka-topics.sh --describe --zookeeper <zk_host:port/chroot>

   As shown in **Figure 15-48**, the topic status is normal. All partitions have normal leader information.

   Figure 15-48 Topic status

   
   ```
   Topic: STK6     Partition: 36  Leader: 3     Replicas: 3,5  Isr: 3,5
   Topic: STK6     Partition: 37  Leader: 4     Replicas: 4,6  Isr: 4,6
   Topic: STK6     Partition: 38  Leader: 5     Replicas: 5,7  Isr: 5,7
   Topic: STK6     Partition: 39  Leader: 6     Replicas: 6,8  Isr: 6,8
   Topic: STK6     Partition: 40  Leader: 7     Replicas: 7,9  Isr: 7,9
   Topic: STK6     Partition: 41  Leader: 8     Replicas: 8,1  Isr: 8,1
   Topic: STK6     Partition: 42  Leader: 9     Replicas: 9,2  Isr: 9,2
   Topic: STK6     Partition: 43  Leader: 1     Replicas: 1,3  Isr: 3,1
   Topic: STK6     Partition: 44  Leader: 2     Replicas: 2,4  Isr: 2,4
   Topic: STK6     Partition: 45  Leader: 3     Replicas: 3,6  Isr: 3,6
   Topic: STK6     Partition: 46  Leader: 4     Replicas: 4,7  Isr: 4,7
   Topic: STK6     Partition: 47  Leader: 5     Replicas: 5,8  Isr: 5
   Topic: STK6     Partition: 48  Leader: 6     Replicas: 6,9  Isr: 6,9
   Topic: STK6     Partition: 49  Leader: 7     Replicas: 7,1  Isr: 7,1
   Topic: STK6     Partition: 50  Leader: 8     Replicas: 8,2  Isr: 2,8
   Topic: STK6     Partition: 51  Leader: 9     Replicas: 9,3  Isr: 9,3
   Topic: STK6     Partition: 52  Leader: 1     Replicas: 1,4  Isr: 4,1
   Topic: STK6     Partition: 53  Leader: 2     Replicas: 2,5  Isr: 5,2
   Topic: STK6     Partition: 54  Leader: 3     Replicas: 3,7  Isr: 3,7
   Topic: STK6     Partition: 55  Leader: 4     Replicas: 4,8  Isr: 4,8
   Topic: STK6     Partition: 56  Leader: 5     Replicas: 5,9  Isr: 5,9
   Topic: STK6     Partition: 57  Leader: 6     Replicas: 6,1  Isr: 6,1
   Topic: STK6     Partition: 58  Leader: 7     Replicas: 7,2  Isr: 2,7
   ```
3. Run the **telnet** command to check whether the Kafka can be connected.

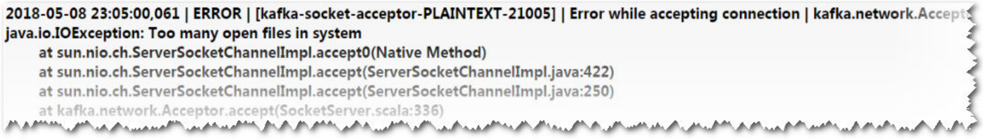
   telnet *Kafka service IP address Kafka service port*

   If telnet fails, check the network security group and ACL.
4. Log in to Kafka Broker using SSH.

   Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

   Check on **server.log** indicates that the error message is displayed in the log shown in the following figure.

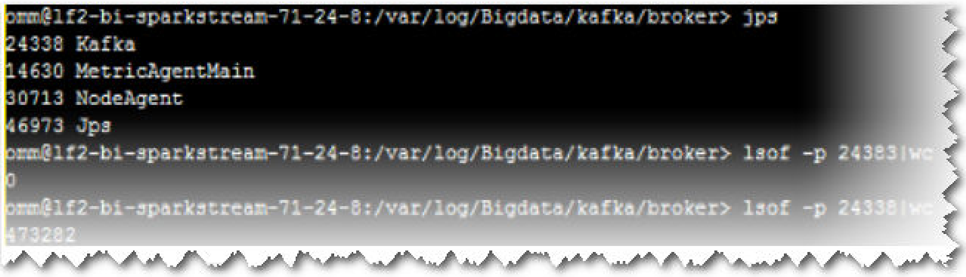
Figure 15-49 Log exception



```
2018-05-08 23:05:00,061 | ERROR | [kafka-socket-acceptor-PLAINTEXT-21005] | Error while accepting connection | kafka.network.Accept
java.io.IOException: Too many open files in system
        at sun.nio.ch.ServerSocketChannelImpl.accept0(Native Method)
        at sun.nio.ch.ServerSocketChannelImpl.accept(ServerSocketChannelImpl.java:422)
        at sun.nio.ch.ServerSocketChannelImpl.accept(ServerSocketChannelImpl.java:250)
        at kafka.network.Acceptor.accept(SocketServer.scala:336)
```

5. Output of the **lsof** command used to check the handle usage of the Kafka process on the current node shows that the number of handles used by the Kafka process reaches 470,000.

Figure 15-50 Handles



```
omm@1f2-bi-sparkstream-71-24-8:/var/log/Bigdata/kafka/broker> jps
24338 Kafka
14630 MetricAgentMain
30713 NodeAgent
46973 Jps
omm@1f2-bi-sparkstream-71-24-8:/var/log/Bigdata/kafka/broker> lsof -p 24383|wc
0
omm@1f2-bi-sparkstream-71-24-8:/var/log/Bigdata/kafka/broker> lsof -p 24338|wc
473282
```

6. Check the service code. It is found that the Producer object is frequently created and is not closed normally.

Solution

Step 1 Stop the current application to ensure that the number of handles on the server does not increase sharply, which affects the normal running of services.

Step 2 Optimize the application code to resolve the handle leakage problem.

Suggestion: Use one Producer object globally. After the use is complete, call the Close interface to close the handle.

----End

15.13.6 Consumer Is Initialized Successfully, But the Specified Topic Message Cannot Be Obtained from Kafka

Symptom

An MRS cluster is installed, and ZooKeeper, Flume, Kafka, Storm, and Spark are installed in the cluster.

The customer cannot consume any data using Storm, Spark, Flume or self-programmed Consumer code to consume messages of the specified Kafka topic.

Possible Causes

1. The Kafka service is abnormal.
2. The IP address for ZooKeeper connection is incorrectly set.
3. "ConsumerRebalanceFailedException" is thrown.

4. "ClosedChannelException" caused by network problems is thrown.

Cause Analysis

Storm, Spark, Flume or user-defined Consumer code can be called Consumer.

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. Check whether data can be normally consumed through the Kafka client.

   Suppose the client has been installed in the **/opt/client** directory, **test** is the topic name to be consumed, and the IP address of ZooKeeper is 192.168.234.231.

   ```
   cd /opt/client
   source bigdata_env
   kinit admin
   kafka-topics.sh --zookeeper 192.168.234.231:2181/kafka --describe --topic testkafka-console-
   consumer.sh --topic test --zookeeper 192.168.234.231:2181/kafka --from-beginning
   ```

   If data can be consumed, the cluster service is running properly.
3. Check Consumer configurations. The IP address for connecting to ZooKeeper is incorrect.
   - Flume

     ```
     server.sources.Source02.type=org.apache.flume.source.kafka.KafkaSource

     server.sources.Source02.zookeeperConnect=192.168.234.231:2181
     server.sources.Source02.topic = test
     server.sources.Source02.groupId = test_01
     ```
   - Spark

     ```
     val zkQuorum = "192.168.234.231:2181"
     ```
   - Storm

     ```
     BrokerHosts brokerHosts = new ZKHosts("192.168.234.231:2181");
     ```
   - Consumer API

     ```
     zookeeper.connect="192.168.234.231:2181"
     ```

   On MRS Manager, the root path of ZNode where Kafka is stored on ZooKeeper is **/kafka**, which is differentiated from the open source. The address for Kafka to connect to ZooKeeper is **192.168.234.231:2181/kafka**.

   However, the address for Consumer to connect to ZooKeeper is **192.168.234.231:2181**. Therefore, topic information about Kafka cannot be correctly obtained.

   For details about the solution, see **Step 1**.
4. Check Consumer logs. The logs contain "ConsumerRebalanceFailedException".

   ```
   2016-02-03 15:55:32,557 | ERROR | [ZkClient-EventThread-75- 192.168.234.231:2181/kafka] |  Error
   handling event ZkEvent[New session event sent to kafka.consumer.ZookeeperConsumerConnector
   $ZKSessionExpireListener@34b41dfe]  | org.I0Itec.zkclient.ZkEventThread.run(ZkEventThread.java:77)
   kafka.common.ConsumerRebalanceFailedException: pc-zjqbetl86-1454482884879-2ec95ed3 can't
   rebalance after 4 retries
   at kafka.consumer.ZookeeperConsumerConnector
   $ZKRebalancerListener.syncedRebalance(ZookeeperConsumerConnector.scala:633)
   ```

```
at kafka.consumer.ZookeeperConsumerConnector
$ZKSessionExpireListener.handleNewSession(ZookeeperConsumerConnector.scala:487)
at org.I0Itec.zkclient.ZkClient$4.run(ZkClient.java:472)
at org.I0Itec.zkclient.ZkEventThread.run(ZkEventThread.java:71)
```

The exception shows that the current Consumer does not complete rebalance within the specified retry times. As a result, Kafka Topic-Partition is not allocated to Consumer and Consumer cannot consume messages.

For details about the solution, see **Step 3**.

5. Check Consumer logs. The logs contain "Fetching topic metadata with correlation id 0 for topics [Set(test)] from broker [id:26,host: 192-168-234-231,port:9092] failed" and "ClosedChannelException".

```
[2016-03-04 03:33:53,047] INFO Fetching metadata from broker id:26,host: 192-168-234-231,port:
9092 with correlation id 0 for 1 topic(s) Set(test) (kafka.client.ClientUtils$)
[2016-03-04 03:33:55,614] INFO Connected to 192-168-234-231:21005 for producing
(kafka.producer.SyncProducer)
[2016-03-04 03:33:55,614] INFO Disconnecting from 192-168-234-231:21005
(kafka.producer.SyncProducer)
[2016-03-04 03:33:55,615] WARN Fetching topic metadata with correlation id 0 for topics [Set(test)]
from broker [id:26,host: 192-168-234-231,port:21005] failed (kafka.client.ClientUtils$)
java.nio.channels.ClosedChannelException
at kafka.network.BlockingChannel.send(BlockingChannel.scala:100)
at kafka.producer.SyncProducer.liftedTree1$1(SyncProducer.scala:73)
at kafka.producer.SyncProducer.kafka$producer$SyncProducer$$doSend(SyncProducer.scala:72)
at kafka.producer.SyncProducer.send(SyncProducer.scala:113)
at kafka.client.ClientUtils$.fetchTopicMetadata(ClientUtils.scala:58)
at kafka.client.ClientUtils$.fetchTopicMetadata(ClientUtils.scala:93)
at kafka.consumer.ConsumerFetcherManager
$LeaderFinderThread.doWork(ConsumerFetcherManager.scala:66)
at kafka.utils.ShutdownableThread.run(ShutdownableThread.scala:60)
[2016-03-04 03:33:55,615] INFO Disconnecting from 192-168-234-231:21005
(kafka.producer.SyncProducer)
```

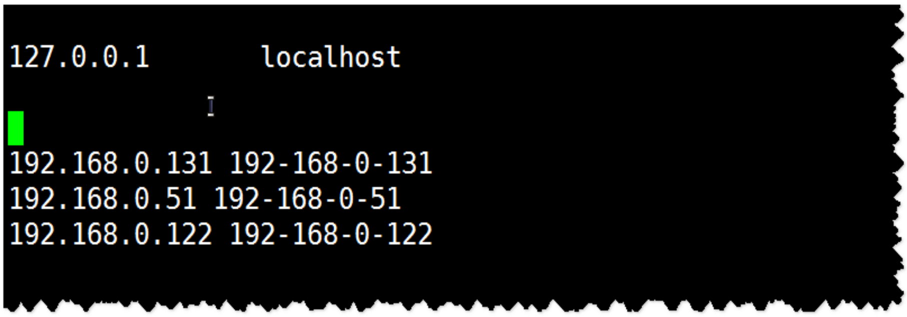
The exception shows that the current Consumer cannot obtain metadata from the Kafka Broker 192-168-234-231 node and cannot connect to the correct Broker for obtaining messages.

6. Check the network conditions. If the network is normal, check whether mapping between the host and the IP address is configured.

   – Linux

     Run the **cat /etc/hosts** command.

     Figure 15-51 Example 1



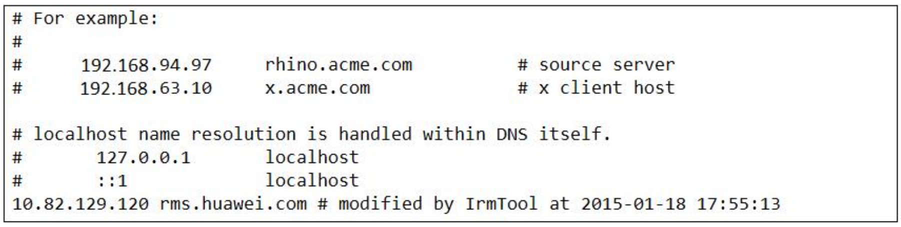
```
127.0.0.1       localhost

192.168.0.131 192-168-0-131
192.168.0.51 192-168-0-51
192.168.0.122 192-168-0-122
```

   – Windows

     Open **C:\Windows\System32\drivers\etc\hosts**.

Figure 15-52 Example 2



```
# For example:
#
#      192.168.94.97     rhino.acme.com          # source server
#      192.168.63.10     x.acme.com              # x client host

# localhost name resolution is handled within DNS itself.
#        127.0.0.1       localhost
#        ::1             localhost
10.82.129.120 rms.huawei.com # modified by IrmTool at 2015-01-18 17:55:13
```

For details about the solution, see **Step 4**.

Solution

Step 1 The IP address for connecting to ZooKeeper is incorrectly configured.

Step 2 Change the IP address for connecting to ZooKeeper in the Consumer configuration and make it consistent with MRS configuration.

- Flume

```
server.sources.Source02.type=org.apache.flume.source.kafka.KafkaSource
server.sources.Source02.zookeeperConnect=192.168.234.231:2181/kafka
server.sources.Source02.topic = test
server.sources.Source02.groupId = test_01
```

- Spark

```
val zkQuorum = "192.168.234.231:2181/kafka"
```

- Storm

```
BrokerHosts brokerHosts = new ZKHosts("192.168.234.231:2181/kafka");
```

- Consumer API

```
zookeeper.connect="192.168.234.231:2181/kafka"
```

Step 3 Rebalance is abnormal.

Multiple Consumers in the same consumer group are successively started and consume data of multiple partitions at the same time, load balancing is performed for Consumers when consumers are fewer than partitions.

The temporary node where the Consumer is stored on ZooKeeper determines read/write permission of which partition of which topic the Consumer has. The path is **/consumers/consumer-group-xxx/owners/topic-xxx/x**.

After the load balancing is triggered, the original Consumer will be recalculated and release occupied partitions, which takes a while. Therefore, new Consumers may fail to preempt the partitions.

Table 15-3 Parameters

Name	Function	Default Value
rebalance.max.retries	Maximum number of rebalance retries	4
rebalance.backoff.ms	Interval for each rebalance retry	2000

Name	Function	Default Value
zookeeper.session.timeout.ms	Maximum time allowed to create a session with ZooKeeper	15000

Set the preceding parameters to higher values. The following is for your reference:

```
zookeeper.session.timeout.ms = 45000
rebalance.max.retries = 10
rebalance.backoff.ms = 5000
```

Parameter setting must comply with the following rule:

rebalance.max.retries * rebalance.backoff.ms > zookeeper.session.timeout.ms

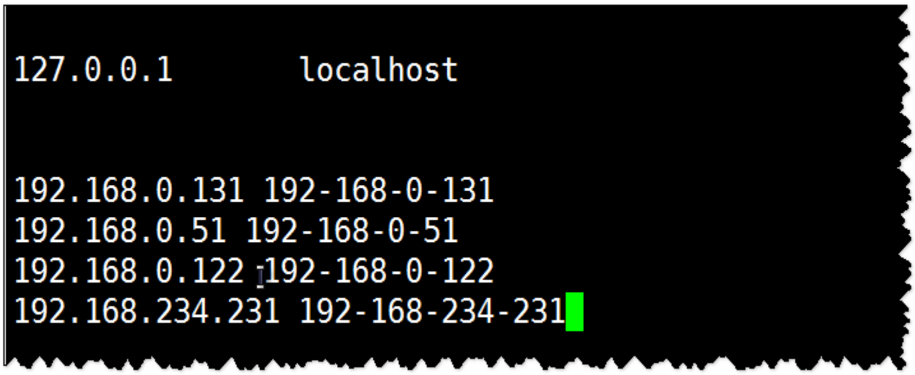
Step 4 The network is abnormal.

In the **hosts** file, mapping between the hostname and IP address is not configured. As a result, information cannot be obtained when using the hostname for access.

Step 5 Add the hostname to the **hosts** file and make it correspond to the IP address.

- Linux

Figure 15-53 Example 3

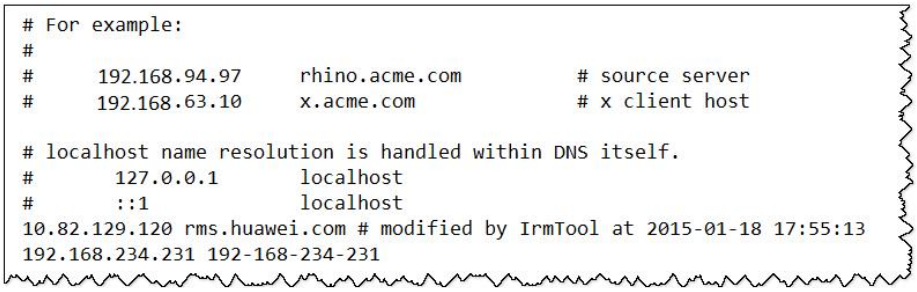


```
127.0.0.1       localhost

192.168.0.131 192-168-0-131
192.168.0.51 192-168-0-51
192.168.0.122 192-168-0-122
192.168.234.231 192-168-234-231
```

- Windows

Figure 15-54 Example 4



```
# For example:
#
#      192.168.94.97     rhino.acme.com          # source server
#      192.168.63.10     x.acme.com              # x client host

# localhost name resolution is handled within DNS itself.
#       127.0.0.1       localhost
#       ::1             localhost
10.82.129.120 rms.huawei.com # modified by IrmTool at 2015-01-18 17:55:13
192.168.234.231 192-168-234-231
```

----End

15.13.7 Consumer Fails to Consume Data and Remains in the Waiting State

Symptom

An MRS cluster is installed, and ZooKeeper and Kafka are installed in the cluster.

When the Consumer consumes data from Kafka, the client stays in the Waiting state.

Possible Causes

1. The Kafka service is abnormal.
2. The Consumer client adopts non-security access and access is disabled on the server.
3. The Consumer client adopts non-security access and ACL is set for Kafka topics.

Cause Analysis

The possible reasons why the Consumer fails to consume data from Kafka may be related to the Consumer or Kafka.

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. Check the Consumer client log. It is found that the information about the frequent connections and disconnections to the Broker node is printed, as shown in the following output.
   ```
   [root@10-10-144-2 client]# kafka-console-consumer.sh --topic test --zookeeper 10.5.144.2:2181/kafka
   --from-beginning

   [2017-03-07 09:22:00,658] INFO Fetching metadata from broker BrokerEndPoint(1,10.5.144.2,9092)
   with correlation id 26 for 1 topic(s) Set(test) (kafka.client.ClientUtils$)
   [2017-03-07 09:22:00,659] INFO Connected to 10.5.144.2:9092 for producing
   (kafka.producer.SyncProducer)
   [2017-03-07 09:22:00,659] INFO Disconnecting from 10.5.144.2:9092 (kafka.producer.SyncProducer)
   ```
   Consumer accesses Kafka using port 9092, which is a non-security port.
3. On Manager, check the current Kafka cluster configuration. It is found that the customized configuration **allow.everyone.if.no.acl.found**=**false** is not configured.
   - MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.

4. If ACL is set to **false**, port 9092 cannot be used for access.
5. Check the Consumer client log. It is found that the information about the frequent connections and disconnections to the Broker node is printed, as shown in the following output.
   ```
   [root@10-10-144-2 client]# kafka-console-consumer.sh --topic test_acl --zookeeper 10.5.144.2:2181/
   kafka --from-beginning

   [2017-03-07 09:49:16,992] INFO Fetching metadata from broker BrokerEndPoint(2,10.5.144.3,9092)
   with correlation id 16 for 1 topic(s) Set(topic_acl) (kafka.client.ClientUtils$)
   [2017-03-07 09:49:16,993] INFO Connected to 10.5.144.3:9092 for producing
   (kafka.producer.SyncProducer)
   [2017-03-07 09:49:16,994] INFO Disconnecting from 10.5.144.3:9092 (kafka.producer.SyncProducer)
   ```
   The Consumer accesses Kafka using port 21005, which is a non-security port.
6. Run the client command to check the ACL permission of the topic.
   ```
   [root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/
   kafka --list --topic topic_acl
   Current ACLs for resource `Topic:topic_acl`:
    User:test_user has Allow permission for operations: Describe from hosts: *
   User:test_user has Allow permission for operations: Write from hosts: *
   ```
   If ACL is set for the topic, port 9092 cannot be used for access.
7. The following information is printed in the Consumer client log:
   ```
   [root@10-10-144-2 client]# kafka-console-consumer.sh --topic topic_acl --bootstrap-server
   10.5.144.2:21007 --consumer.config /opt/client/Kafka/kafka/config/consumer.properties --from-
   beginning --new-consumer

   [2017-03-07 10:19:18,478] INFO Kafka version : 0.9.0.0 (org.apache.kafka.common.utils.AppInfoParser)
   [2017-03-07 10:19:18,478] INFO Kafka commitId : unknown
   (org.apache.kafka.common.utils.AppInfoParser)
   ```
   The Consumer uses port 21007 to access Kafka.
8. Run the client command **klist** to query the current authenticated user.
   ```
   [root@10-10-144-2 client]# klist
   Ticket cache: FILE:/tmp/krb5cc_0
   Default principal: test@HADOOP.COM

   Valid starting     Expires            Service principal
   01/25/17 11:06:48  01/26/17 11:06:45  krbtgt/HADOOP.COM@HADOOP.COM
   ```
   The **test** user is used in this example.
9. Run the client command to check the ACL permission of the topic.
   ```
   [root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:24002/
   kafka --list --topic topic_acl
   Current ACLs for resource `Topic:topic_acl`:
    User:test_user has Allow permission for operations: Describe from hosts: *
    User:test_user has Allow permission for operations: Write from hosts: *
    User:ttest_user has Allow permission for operations: Read from hosts: *
   ```
   If ACL is set for the topic, user **test** does not have the permission to perform the Consumer operation.

   For details about the solution, see **Step 2**.
10. Log in to Kafka Broker using SSH.

    Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

    Check the **kafka-authorizer.log** file. It shows that the user does not belong to the **kafka** or **kafkaadmin** group.
    ```
    2017-01-25 13:26:33,648 | INFO  | [kafka-request-handler-0] | The principal is test, belongs to Group :
    [hadoop, ficommon] | kafka.authorizer.logger (SimpleAclAuthorizer.scala:169)
    2017-01-25 13:26:33,648 | WARN  | [kafka-request-handler-0] | The user is not belongs to kafka or
    kafkaadmin group, authorize failed! | kafka.authorizer.logger (SimpleAclAuthorizer.scala:170)
    ```

For details about the solution, see **Step 3**.

Solution

Step 1 Set **allow.everyone.if.no.acl.found** to **true** and restart the Kafka service.

Step 2 Use the account with permission for login.

Example:

kinit test_user

Alternatively, grant the user with related permission.

NOTICE

This operation must be performed by the Kafka administrator (belonging to the **kafkaadmin** group).

Example:

kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/kafka --topic topic_acl --consumer --add --allow-principal User:test --group test

```
[root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=8.5.144.2:2181/kafka --
list --topic topic_acl
Current ACLs for resource `Topic:topic_acl`:
 User:test_user has Allow permission for operations: Describe from hosts: *
 User:test_user has Allow permission for operations: Write from hosts: *
  User:test has Allow permission for operations: Describe from hosts: *
  User:test has Allow permission for operations: Write from hosts: *
  User:test has Allow permission for operations: Read from hosts: *
```

Step 3 Add the user to the **kafka** or **kafkaadmin** group.

----End

15.13.8 SparkStreaming Fails to Consume Kafka Messages, and "Error getting partition metadata" Is Displayed

Symptom

When SparkStreaming is used to consume messages of a specified topic in Kafka, data cannot be obtained from Kafka. The message "Error getting partition metadata" is displayed.

```
Exception in thread "main" org.apache.spark.SparkException:  Error getting partition metadata for
'testtopic'. Does the topic exist?
org.apache.spark.streaming.kafka.KafkaCluster$$anonfun$checkErrors$1.apply(KafkaCluster.scala:366)
org.apache.spark.streaming.kafka.KafkaCluster$$anonfun$checkErrors$1.apply(KafkaCluster.scala:366)
scala.util.Either.fold(Either.scala:97)
org.apache.spark.streaming.kafka.KafkaCluster$.checkErrors(KafkaCluster.scala:365)

sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:62)
sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:43)
```

```
java.lang.reflect.Method.invoke(Method.java:498)
org.apache.spark.deploy.SparkSubmit$.org$apache$spark$deploy$SparkSubmit$
$runMain(SparkSubmit.scala:762)
org.apache.spark.deploy.SparkSubmit$.doRunMain$1(SparkSubmit.scala:183)
org.apache.spark.deploy.SparkSubmit$.submit(SparkSubmit.scala:208)
org.apache.spark.deploy.SparkSubmit$.main(SparkSubmit.scala:123)
org.apache.spark.deploy.SparkSubmit.main(SparkSubmit.scala)
```

Possible Causes

1. The Kafka service is abnormal.
2. The Consumer client adopts non-security access and access is disabled on the server.
3. The Consumer client adopts non-security access and ACL is set for Kafka topics.

Cause Analysis

1. Check the Kafka service status:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**.

     Check the Kafka status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. On Manager, check the current Kafka cluster configuration. It is found that **allow.everyone.if.no.acl.found** is not configured or is set to **false**.
   - MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka** > **Configuration**.
3. If it is set to **false**, the Kafka non-secure port 21005 cannot be used for access.
4. Run the client command to check the ACL permission of the topic.

   ```
   [root@10-10-144-2 client]# kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/
   kafka --list --topic topic_acl
   Current ACLs for resource `Topic:topic_acl`:
    User:test_user has Allow permission for operations: Describe from hosts: *
   User:test_user has Allow permission for operations: Write from hosts: *
   ```

   If an ACL is configured for a topic, the Kafka non-secure port 21005 cannot be used to access the topic.

Solution

Step 1 Add the customized configuration **allow.everyone.if.no.acl.found** or change its value to **true** and restart the Kafka service.

Step 2 Delete the ACL configured for the topic.

Example:

kinit test_user

NOTICE

This operation must be performed by the Kafka administrator (belonging to the **kafkaadmin** group).

Example:

kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/kafka --remove --allow-principal User:test_user --producer --topic topic_acl

kafka-acls.sh --authorizer-properties zookeeper.connect=10.5.144.2:2181/kafka --remove --allow-principal User:test_user --consumer --topic topic_acl --group test

----End

15.13.9 Consumer Fails to Consume Data in a Newly Created Cluster, and the Message " GROUP_COORDINATOR_NOT_AVAILABLE" Is Displayed

Symptom

A Kafka cluster is created, and two Broker nodes are deployed. The Kafka client can be used for production but cannot be used for consumption. The Consumer fails to consume data, and the message "GROUP_COORDINATOR_NOT_AVAILABLE" is displayed. The key log is as follows:

```
2018-05-12 10:58:42,561 | INFO | [kafka-request-handler-3] | [GroupCoordinator 2]: Preparing to restabilize group DemoConsumer with old generation 118 | kafka.coordinator.GroupCoordinator (Logging.scala:68)
2018-05-12 10:59:13,562 | INFO | [executor-Heartbeat] | [GroupCoordinator 2]: Preparing to restabilize group DemoConsumer with old generation 119 | kafka.coordinator.GroupCoordinator (Logging.scala:68)
```

Possible Causes

The **__consumer_offsets** cannot be created.

Cause Analysis

1. As indicated by the log, a large number of **_consumer_offset** creation operations failed.
2. The number of Brokers for the cluster is 2.
3. However, the number of replicas for the **_consumer_offset** topic is 3. Therefore, the creation fails.

			[Range]-1 to 32767
offsets.topic.replication.factor	3	server.properties	[Desc]The replication factor for the offsets topic (set higher to ensure availability). [Default]3 [Range]1 to 32767
* transaction.state.log.replication.factor	3	server.properties	[Desc]Specifies the number of replicas of a transaction topic. You are advised to set this parameter to a larger value to ensure high availability. [Default]3 [Range]1 to 32767

Solution

Expand the cluster to at least three streaming core nodes or perform the following steps to modify service configuration parameters:

Step 1 Go to the service configuration page.

- MRS Manager: Log in to MRS Manager, choose **Services** > **Kafka** > **Service Configuration**, and select **All** from **Type**.
- FusionInsight Manager: Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Kafka**. Click **Configurations** and select **All Configurations**.

Step 2 Search for **offsets.topic.replication.factor** and **transaction.state.log.replication.factor** and change their values to **2**.

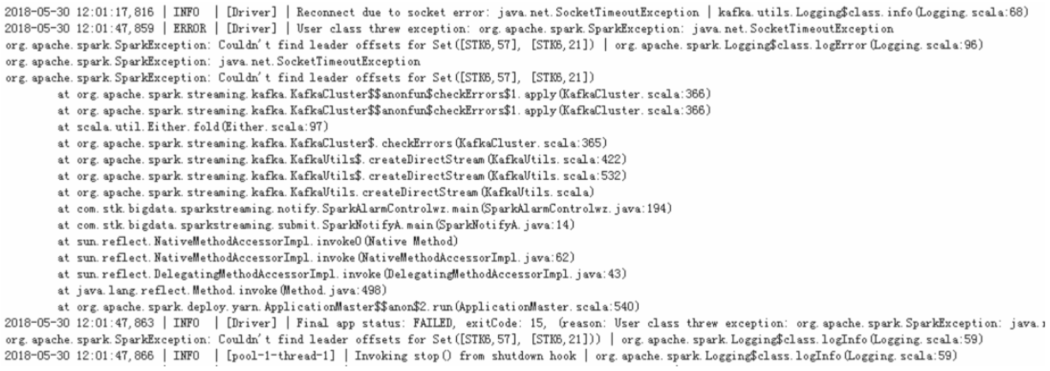
Step 3 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

----End

15.13.10 SparkStreaming Fails to Consume Kafka Messages, and the Message "Couldn't find leader offsets" Is Displayed

Symptom

When SparkStreaming is used to consume messages of a specified topic in Kafka, data cannot be obtained from Kafka. The following error message is displayed: Couldn't find leader offsets.



```
2018-05-30 12:01:17,816 | INFO  | [Driver] | Reconnect due to socket error: java.net.SocketTimeoutException | kafka.utils.Logging$class.info(Logging.scala:68)

org.apache.spark.SparkException: Couldn't find leader offsets for Set([STK6,57], [STK6,21])) | org.apache.spark.Logging$class.logInfo(Logging.scala:59)
2018-05-30 12:01:47,866 | INFO  | [pool-1-thread-1] | Invoking stop() from shutdown hook | org.apache.spark.Logging$class.logInfo(Logging.scala:59)
```

Possible Causes

- The Kafka service is abnormal.
- The network is abnormal.
- The Kafka topic is abnormal.

Cause Analysis

Step 1 On Manager, check the status of the Kafka cluster. The status is **Good**, and the monitoring metrics are correctly displayed.

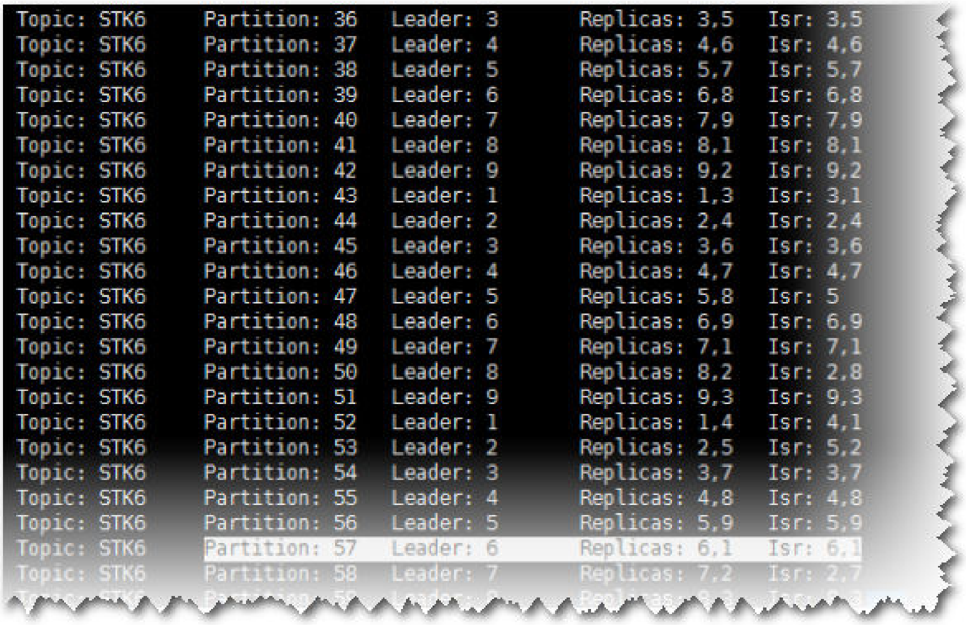
Step 2 View the error topic information in the SparkStreaming log.

Run the Kafka commands to obtain the topic assignment information and copy synchronization information, and check the return result.

kafka-topics.sh --describe --zookeeper <zk_host:port/chroot> --topic <topic name>

If information in the following figure is displayed, the topic is normal. All partitions have normal leader information.

Figure 15-55 Topic distribution information and copy synchronization information



```
Topic: STK6    Partition: 36   Leader: 3      Replicas: 3,5   Isr: 3,5
Topic: STK6    Partition: 37   Leader: 4      Replicas: 4,6   Isr: 4,6
Topic: STK6    Partition: 38   Leader: 5      Replicas: 5,7   Isr: 5,7
Topic: STK6    Partition: 39   Leader: 6      Replicas: 6,8   Isr: 6,8
Topic: STK6    Partition: 40   Leader: 7      Replicas: 7,9   Isr: 7,9
Topic: STK6    Partition: 41   Leader: 8      Replicas: 8,1   Isr: 8,1
Topic: STK6    Partition: 42   Leader: 9      Replicas: 9,2   Isr: 9,2
Topic: STK6    Partition: 43   Leader: 1      Replicas: 1,3   Isr: 3,1
Topic: STK6    Partition: 44   Leader: 2      Replicas: 2,4   Isr: 2,4
Topic: STK6    Partition: 45   Leader: 3      Replicas: 3,6   Isr: 3,6
Topic: STK6    Partition: 46   Leader: 4      Replicas: 4,7   Isr: 4,7
Topic: STK6    Partition: 47   Leader: 5      Replicas: 5,8   Isr: 5
Topic: STK6    Partition: 48   Leader: 6      Replicas: 6,9   Isr: 6,9
Topic: STK6    Partition: 49   Leader: 7      Replicas: 7,1   Isr: 7,1
Topic: STK6    Partition: 50   Leader: 8      Replicas: 8,2   Isr: 2,8
Topic: STK6    Partition: 51   Leader: 9      Replicas: 9,3   Isr: 9,3
Topic: STK6    Partition: 52   Leader: 1      Replicas: 1,4   Isr: 4,1
Topic: STK6    Partition: 53   Leader: 2      Replicas: 2,5   Isr: 5,2
Topic: STK6    Partition: 54   Leader: 3      Replicas: 3,7   Isr: 3,7
Topic: STK6    Partition: 55   Leader: 4      Replicas: 4,8   Isr: 4,8
Topic: STK6    Partition: 56   Leader: 5      Replicas: 5,9   Isr: 5,9
Topic: STK6    Partition: 57   Leader: 6      Replicas: 6,1   Isr: 6,1
Topic: STK6    Partition: 58   Leader: 7      Replicas: 7,2   Isr: 2,7
```

Step 3 Check whether the network connection between the client and Kafka cluster is normal. If no, contact the network team to rectify the fault.

Step 4 Log in to Kafka Broker using SSH.

Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

Check on **server.log** indicates that the error message is displayed in the log shown in the following figure.

```
2018-05-30 12:02:00,246 | ERROR | [kafka-network-thread-6-PLAINTEXT-3] | Processor got uncaught
exception. | kafka.network.Processor (Logging.scala:103)

 java.lang.OutOfMemoryError: Direct buffer memory
 at java.nio.Bits.reserveMemory(Bits.java:694)
 at java.nio.DirectByteBuffer.<init>(DirectByteBuffer.java:123)
 at java.nio.ByteBuffer.allocateDirect(ByteBuffer.java:311)
 at sun.nio.ch.Util.getTemporaryDirectBuffer(Util.java:241)
 at sun.nio.ch.IOUtil.read(IOUtil.java:195)
 at sun.nio.ch.SocketChannelImpl.read(SocketChannelImpl.java:380)
```

at org.apache.kafka.common.network.PlaintextTransportLayer.read(PlaintextTransportLayer.java:110)

Step 5 On Manager, check the configuration of the current Kafka cluster.

- MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka** > **Service Configuration**. Set **Type** to **All**. The value of **-XX:MaxDirectMemorySize** in **KAFKA_JVM_PERFORMANCE_OPTS** is **1G**.
- FusionInsight Manager: Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Kafka** > **Configurations** > **All Configurations**. The value of **-XX:MaxDirectMemorySize** in **KAFKA_JVM_PERFORMANCE_OPTS** is **1G**.

Step 6 If the direct memory is too small, an error is reported. Once the direct memory overflows, the node cannot process new requests. As a result, other nodes or clients fail to access the node due to timeout.

----End

Solution

Step 1 Log in to FusionInsight Manager and go to the Kafka configuration page.

- MRS Manager portal: Log in to MRS Manager and choose **Services** > **Kafka** > **Configuration**.
- FusionInsight Manager: Log in to FusionInsight Manager. Choose Cluster > **Services** > **Kafka** > **Configurations**.

Step 2 Set **Type** to **All**, and search for and change the value of **KAFKA_JVM_PERFORMANCE_OPTS**.

Step 3 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

----End

15.13.11 Consumer Fails to Consume Data and the Message " SchemaException: Error reading field 'brokers'" Is Displayed

Symptom

When a Consumer consumes messages of a specified topic in Kafka, the Consumer cannot obtain data from Kafka. The following error message is displayed: org.apache.kafka.common.protocol.types.SchemaException: Error reading field 'brokers': Error reading field 'host': Error reading string of length 28271, only 593 bytes available.

```
Exception in thread "Thread-0" org.apache.kafka.common.protocol.types.SchemaException: Error reading
field 'brokers': Error reading field 'host': Error reading string of length 28271, only 593 bytes available

360)
at org.apache.kafka.clients.consumer.internals.ConsumerNetworkClient.poll(ConsumerNetworkClient.java:
224)
at org.apache.kafka.clients.consumer.internals.ConsumerNetworkClient.poll(ConsumerNetworkClient.java:
192)
at org.apache.kafka.clients.consumer.internals.ConsumerNetworkClient.poll(ConsumerNetworkClient.java:
163)
atorg.apache.kafka.clients.consumer.internals.AbstractCoordinator.ensureCoordinatorReady(AbstractCoordina
tor.java:179)
at org.apache.kafka.clients.consumer.KafkaConsumer.pollOnce(KafkaConsumer.java:973)
at org.apache.kafka.clients.consumer.KafkaConsumer.poll(KafkaConsumer.java:937)
at KafkaNew.Consumer$ConsumerThread.run(Consumer.java:40)
```

Possible Causes

The JAR versions of the client and server are inconsistent.

Solution

Modify the Kafka JAR package in the Consumer application to ensure that it is the same as that on the server.

15.13.12 Checking Whether Data Consumed by a Customer Is Lost

Symptom

A Customer saves the consumed data to the database and finds that the data is inconsistent with the production data. Therefore, it is suspected that some of Kafka's consumed data is lost.

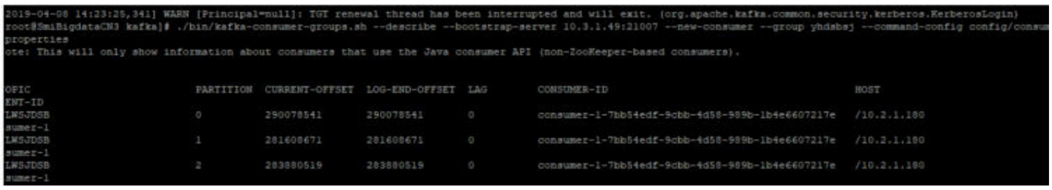
Possible Causes

- The customer code is incorrect.
- An exception occurs when Kafka production data is written.
- The Kafka consumption data is abnormal.

Solution

Check Kafka.

Step 1 Observe the changes of the written and consumed offset through **consumer-groups.sh**. (Produce a certain number of messages, and consume these messages on the client to observe the changes of the offset.)



```
2019-04-08 14:23:25,341] WARN [Principal=null]: TGT renewal thread has been interrupted and will exit. (org.apache.kafka.common.security.kerberos.KerberosLogin)
root@SmiBigdataCN3 kafka]# ./bin/kafka-consumer-groups.sh --describe --bootstrap-server 10.3.1.49:21007 --new-consumer --group yhdsbsj --command-config config/consum
properties
ote: This will only show information about consumers that use the Java consumer API (non-ZooKeeper-based consumers).

OPIC                    PARTITION  CURRENT-OFFSET  LOG-END-OFFSET  LAG        CONSUMER-ID                                       HOST
ENT-ID
LWSJDSB                 0          290078541       290078541       0          consumer-1-7bb54edf-9cbb-4d58-989b-1b4e6607217e   /10.2.1.180
sumer-1
LWSJDSB                 1          281608671       281608671       0          consumer-1-7bb54edf-9cbb-4d58-989b-1b4e6607217e   /10.2.1.180
sumer-1
LWSJDSB                 2          283880519       283880519       0          consumer-1-7bb54edf-9cbb-4d58-989b-1b4e6607217e   /10.2.1.180
sumer-1
```

Step 2 Create a consumption group, use the client to consume messages, and view the consumed messages.

new-consumer:

kafka-console-consumer.sh --topic <topic name> --bootstrap-server <IP1:PORT, IP2:PORT,...> --new-consumer --consumer.config <config file>

----End

Check the customer code.

Step 1 Check whether an error is reported when the offset is submitted on the client.

Step 2 If no error is reported, add a printing message to the API that is consumed, and print only the key to view the lost data.

----End

15.13.13 Failed to Start a Component Due to Account Lock

Symptom

In a new cluster, Kafka fails to be started. Authentication failure causes startup failure.

```
/home/omm/kerberos/bin/kinit -k -t /opt/XXXXXX/Bigdata/etc/2_15_ Broker /kafka.keytab kafka/
hadoop.hadoop.com -c /opt/XXXXXX/Bigdata/etc/2_15_ Broker /11846 failed.
export key tab file for kafka/hadoop.hadoop.com failed.export and check keytab file failed, errMsg=]}] for
Broker #192.168.1.92@192-168-1-92.
[2015-07-11 02:34:33] RoleInstance started failure for ROLE[name: Broker].
[2015-07-11 02:34:34] Failed to complete the instances start operation. Current operation entities: [Broker
#192.168.1.92@192-168-1-92], Failure entites : [Broker #192.168.1.92@192-168-1-92].Operation
Failed.Failed to complete the instances start operation. Current operation entities:
[Broker#192.168.1.92@192-168-1-92], Failure entites: [Broker #192.168.1.92@192-168-1-92].
```

Cause Analysis

Check the Kerberos log **/var/log/Bigdata/kerberos/krb5kdc.log**. It is found that IP addresses outside of the cluster uses the **kafka** account for connections, causing multiple authentication failures. As a result, the **kafka** account is locked.

```
Jul 11 02:49:16 192-168-1-91 krb5kdc[1863](info): AS_REQ (2 etypes {18 17}) 192.168.1.93:
NEEDED_PREAUTH: kafka/hadoop.hadoop.com@HADOOP.COM for krbtgt/HADOOP.COM@HADOOP.COM,
Additional pre-authentication required
Jul 11 02:49:16 192-168-1-91 krb5kdc[1863](info): preauth (encrypted_timestamp) verify failure: Decrypt
integrity check failed
Jul 11 02:49:16 192-168-1-91 krb5kdc[1863](info): AS_REQ (2 etypes {18 17}) 192.168.1.93:
PREAUTH_FAILED: kafka/hadoop.hadoop.com@HADOOP.COM for krbtgt/HADOOP.COM@HADOOP.COM,
Decrypt integrity check failed
```

Solution

Log in to a node outside the cluster (for example, 192.168.1.93 in the cause analysis example) and disable Kafka authentication. Wait 5 minutes for the account to be unlocked.

15.13.14 Kafka Broker Reports Abnormal Processes and the Log Shows "IllegalArgumentException"

Symptom

The Process Fault alarm is reported on Manager. Check whether the faulty process is Kafka Broker.

Possible Causes

Broker configuration is abnormal.

Cause Analysis

1. On Manager, obtain the host information on the alarm page.
2. Log in to Kafka Broker using SSH. Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory.

   Check the **server.log** file. It is found that the "IllegalArgumentException" exception is thrown in the following log stating "java.lang.IllegalArgumentException: requirement failed: replica.fetch.max.bytes should be equal or greater than message.max.bytes."

   ```
   2017-01-25 09:09:14,930 | FATAL | [main] |  | kafka.Kafka$ (Logging.scala:113)
   java.lang.IllegalArgumentException: requirement failed: replica.fetch.max.bytes should be equal or
   greater than message.max.bytes
           at scala.Predef$.require(Predef.scala:233)
           at kafka.server.KafkaConfig.validateValues(KafkaConfig.scala:959)
           at kafka.server.KafkaConfig.<init>(KafkaConfig.scala:944)
           at kafka.server.KafkaConfig$.fromProps(KafkaConfig.scala:701)
           at kafka.server.KafkaConfig$.fromProps(KafkaConfig.scala:698)
           at kafka.server.KafkaServerStartable$.fromProps(KafkaServerStartable.scala:28)
           at kafka.Kafka$.main(Kafka.scala:60)
           at kafka.Kafka.main(Kafka.scala)
   ```

   Kafka requires that **replica.fetch.max.bytes** be greater than or equal to **message.max.bytes**.
3. On the Kafka configuration page, select **All Configurations**. All Kafka configurations are displayed. Search for **message.max.bytes** and

   replica.fetch.max.bytes. It is found that the value of **replica.fetch.max.bytes** is less than that of **message.max.bytes**.

Solution

Step 1 Go to the Kafka configuration page.

- For versions earlier than MRS 3.*x*: Log in to MRS Manager and choose **Services** > **Kafka** > **Service Configuration** > **All Configurations**.
- For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kafka** > **Configurations** > **All Configurations**.

Step 2 Search for and modify the **replica.fetch.max.bytes** parameter to ensure that its value is greater than or equal to that of **message.max.bytes**. In this way, replicas of partitions on different brokers can be synchronized to all messages.

Step 3 Save the configuration and check whether there is any service whose configuration has expired in the cluster. If yes, restart the corresponding service or role instance for the configuration to take effect.

Step 4 Modify **fetch.message.max.bytes** in the Consumer service application to ensure that the value of **fetch.message.max.bytes** is greater than or equal to that of **message.max.bytes**.

----End

15.13.15 Kafka Topics Cannot Be Deleted

Symptom

When running the following command on the Kafka client to delete topics, it is found that the topics cannot be deleted.

```
kafka-topics.sh --delete --topic test --zookeeper 192.168.234.231:2181/kafka
```

Possible Causes

- The command for connecting the client to ZooKeeper is incorrect.
- Kafka is abnormal and some Kafka nodes are stopped.
- Perform the following operations when Kafka server configurations cannot be deleted.
- Perform the following operations when Kafka configurations are automatically created and the Producer is not stopped.

Cause Analysis

1. After the client command is run, the "ZkTimeoutException" exception is reported.

```
[2016-03-09 10:41:45,773] WARN Can not get the principle name from server 192.168.234.231
(org.apache.zookeeper.ClientCnxn)
Exception in thread "main" org.I0Itec.zkclient.exception.ZkTimeoutException: Unable to connect to
zookeeper server within timeout: 30000
at org.I0Itec.zkclient.ZkClient.connect(ZkClient.java:880)
at org.I0Itec.zkclient.ZkClient.<init>(ZkClient.java:98)
at org.I0Itec.zkclient.ZkClient.<init>(ZkClient.java:84)
at kafka.admin.TopicCommand$.main(TopicCommand.scala:51)
at kafka.admin.TopicCommand.main(TopicCommand.scala)
```

   For details about the solution, see **Step 1**.

2. Run the following query command on the client:

   kafka-topics.sh --list --zookeeper 192.168.0.122:2181/kafka

```
test - marked for deletion
```

   On Manager, check the running status of Kafka Broker instances.

   Run the **cd /var/log/Bigdata/kafka/broker** command to go to the log directory of node **RunningAsController**. Locate **ineligible for deletion: test** in the **controller.log** file.

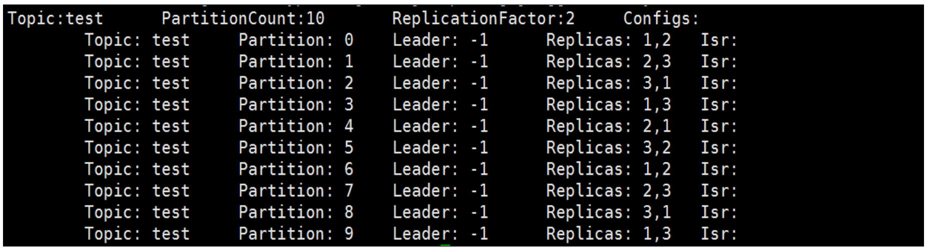
```
2016-03-09 11:11:26,228 | INFO  | [main] | [Controller 1]: List of topics to be deleted:  |
kafka.controller.KafkaController (Logging.scala:68)
2016-03-09 11:11:26,229 | INFO  | [main] | [Controller 1]: List of topics ineligible for deletion: test |
kafka.controller.KafkaController (Logging.scala:68)
```

3. On Manager, view the **delete.topic.enable** status of Broker.

   For details about the solution, see **Step 2**.

4. Run the following query command on the client:

```
kafka-topics.sh --describe –topic test --zookeeper 192.168.0.122:2181/kafka
```



```
Topic:test      PartitionCount:10       ReplicationFactor:2     Configs:
        Topic: test     Partition: 0    Leader: -1      Replicas: 1,2   Isr:
        Topic: test     Partition: 1    Leader: -1      Replicas: 2,3   Isr:
        Topic: test     Partition: 2    Leader: -1      Replicas: 3,1   Isr:
        Topic: test     Partition: 3    Leader: -1      Replicas: 1,3   Isr:
        Topic: test     Partition: 4    Leader: -1      Replicas: 2,1   Isr:
        Topic: test     Partition: 5    Leader: -1      Replicas: 3,2   Isr:
        Topic: test     Partition: 6    Leader: -1      Replicas: 1,2   Isr:
        Topic: test     Partition: 7    Leader: -1      Replicas: 2,3   Isr:
        Topic: test     Partition: 8    Leader: -1      Replicas: 3,1   Isr:
        Topic: test     Partition: 9    Leader: -1      Replicas: 1,3   Isr:
```

   Go to the log directory of node **RunningAsController**. Locate **marked ineligible for deletion** in the **controller.log** file.

```
2016-03-10 11:11:17,989 | INFO  | [delete-topics-thread-3] | [delete-topics-thread-3], Handling
deletion for topics test | kafka.controller.TopicDeletionManager$DeleteTopicsThread (Logging.scala:68)
2016-03-10 11:11:17,990 | INFO  | [delete-topics-thread-3] | [delete-topics-thread-3], Not retrying
```

```
deletion of topic test at this time since it is marked ineligible for deletion |
kafka.controller.TopicDeletionManager$DeleteTopicsThread (Logging.scala:68)
```

5. On Manager, query the Broker status.

   It can be seen that a Broker is in the Stopped state. In this case, delete the topic and ensure that Brokers where partitions of the topic reside must be in the Good state.

   For details about the solution, see **Step 3**.

6. Go to the log directory of node **RunningAsController**. Locate **Deletion successfully** in the **controller.log** file. If **New topics:[Set(test)]** is displayed again, it indicates that the topic is created again.

```
2016-03-10 11:33:35,208 | INFO  | [delete-topics-thread-3] | [delete-topics-thread-3], Deletion of topic
test successfully completed | kafka.controller.TopicDeletionManager$DeleteTopicsThread
(Logging.scala:68)

2016-03-10 11:33:38,501 | INFO  | [ZkClient-
EventThread-19-192.168.0.122:2181,160.172.0.52:2181,160.172.0.51:2181/kafka] |
[TopicChangeListener on Controller 3]: New topics: [Set(test)], deleted topics: [Set()], new partition
replica assignment
```

7. Use Manager to query the topic creation configuration of Broker.

   It is confirmed that the application that performs operations on the topic is not stopped.

   For details about the solution, see **Step 4**.

Solution

Step 1 Perform the following operations when connection to ZooKeeper fails.

When the connection between the Kafka client and ZooKeeper times out, run the ping command to check whether the Kafka client can connect to ZooKeeper. Check the network connection between the client and ZooKeeper.

If the network connection fails, check the ZooKeeper service information on Manager.

If ZooKeeper is improperly configured, change the ZooKeeper IP address in the client command.

Step 2 Perform the following operations when Kafka server configurations cannot be deleted.

On Manager, change the value of **delete.topic.enable** to **true**. Save the configurations and restart the service.

The client query command does not contain **Topic:test**.

```
kafka-topics.sh --list --zookeeper 192.168.0.122:24002/kafka
```

Go to the log directory of node **RunningAsController**. Locate **Deletion of topic test successfully** in the **controller.log** file.

```
2016-03-10 10:39:40,665 | INFO  | [delete-topics-thread-3] | [Partition state machine on Controller 3]:
Invoking state change to OfflinePartition for partitions [test,2],[test,15],[test,6],[test,16],[test,12],[test,7],
[test,10],[test,13],[test,9],[test,19],[test,3],[test,5],[test,1],[test,0],[test,17],[test,8],[test,4],[test,11],[test,14],
[test,18] | kafka.controller.PartitionStateMachine (Logging.scala:68)
2016-03-10 10:39:40,668 | INFO  | [delete-topics-thread-3] | [Partition state machine on Controller 3]:
Invoking state change to NonExistentPartition for partitions [test,2],[test,15],[test,6],[test,16],[test,12],[test,
7],[test,10],[test,13],[test,9],[test,19],[test,3],[test,5],[test,1],[test,0],[test,17],[test,8],[test,4],[test,11],[test,
14],[test,18] | kafka.controller.PartitionStateMachine (Logging.scala:68)
```

```
2016-03-10 10:39:40,977 | INFO  | [delete-topics-thread-3] | [delete-topics-thread-3], Deletion of topic test
successfully completed | kafka.controller.TopicDeletionManager$DeleteTopicsThread (Logging.scala:68)
```

Step 3 Some Kafka nodes are stopped or faulty.

Start the stopped Broker instances.

The client query command does not contain **Topic:test**.

```
kafka-topics.sh --list --zookeeper 192.168.0.122:24002/kafka
```

Go to the log directory of node **RunningAsController**. Locate **Deletion of topic test successfully** in the **controller.log** file.

```
2016-03-10 11:17:56,463 | INFO  | [delete-topics-thread-3] | [Partition state machine on Controller 3]:
Invoking state change to NonExistentPartition for partitions [test,4],[test,1],[test,8],[test,2],[test,5],[test,9],
[test,7],[test,6],[test,0],[test,3] | kafka.controller.PartitionStateMachine (Logging.scala:68)
2016-03-10 11:17:56,726 | INFO  | [delete-topics-thread-3] | [delete-topics-thread-3], Deletion of topic test
successfully completed | kafka.controller.TopicDeletionManager$DeleteTopicsThread (Logging.scala:68)
```

Step 4 Perform the following operations when Kafka configurations are automatically created and the Producer is not stopped.

Stop related applications, change the value of **auto.create.topics.enable** to **false** on Manager. Save the configuration and restart the service.

Step 5 Perform the delete operation again.

----End

15.13.16 Error "AdminOperationException" Is Displayed When a Kafka Topic Is Deleted

Symptom

When running the following command on the Kafka client to set the ACL for a topic, it is found that the ACL cannot be set.

```
kafka-topics.sh --delete --topic test4 --zookeeper 10.5.144.2:2181/kafka
```

The error message "ERROR kafka.admin.AdminOperationException: Error while deleting topic test4" is displayed.

Details are as follows:

```
Error while executing topic command : Error while deleting topic test4
[2017-01-25 14:00:20,750] ERROR kafka.admin.AdminOperationException: Error while deleting topic test4

at kafka.admin.TopicCommand$$anonfun$deleteTopic$1.apply(TopicCommand.scala:162)
at scala.collection.mutable.ResizableArray$class.foreach(ResizableArray.scala:59)
at scala.collection.mutable.ArrayBuffer.foreach(ArrayBuffer.scala:47)
at kafka.admin.TopicCommand$.deleteTopic(TopicCommand.scala:162)
at kafka.admin.TopicCommand$.main(TopicCommand.scala:68)
at kafka.admin.TopicCommand.main(TopicCommand.scala)
 (kafka.admin.TopicCommand$)
```

Possible Causes

The user does not belong to the **kafkaadmin** group. Kafka provides a secure access interface. Only users in the **kafkaadmin** group can delete topics.

Cause Analysis

1. After the client command is run, the "AdminOperationException" exception is reported.
2. Run the client command **klist** to query the current authenticated user.

   ```
   [root@10-10-144-2 client]# klist
   Ticket cache: FILE:/tmp/krb5cc_0
   Default principal: test@HADOOP.COM

   Valid starting     Expires            Service principal
   01/25/17 11:06:48  01/26/17 11:06:45  krbtgt/HADOOP.COM@HADOOP.COM
   ```

   The **test** user is used in this example.
3. Run the **id** command to query the user group information.

   ```
   [root@10-10-144-2 client]# id test
   uid=20032(test) gid=10001(hadoop) groups=10001(hadoop),9998(ficommon),10003(kafka)
   ```

Solution

MRS Manager:

Step 1 Log in to MRS Manager.

Step 2 Choose **System** > **Manage User**.

Step 3 In the **Operation** column of the user, click **Modify**.

Step 4 Add the user to the **kafkaadmin** group. Click **OK**.

Step 5 Run the **id** command to query the user group information.

```
[root@10-10-144-2 client]# id test
uid=20032(test) gid=10001(hadoop) groups=10001(hadoop),9998(ficommon),10002(kafkaadmin),
10003(kafka)
```

----End

FusionInsight Manager:

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **Permission** > **User**.

Step 3 Locate the row that contains the target user, and click **Modify**.

Step 4 Add the user to the **kafkaadmin** group. Click **OK**.

Step 5 Run the **id** command to query the user group information.

```
[root@10-10-144-2 client]# id test
uid=20032(test) gid=10001(hadoop) groups=10001(hadoop),9998(ficommon),10002(kafkaadmin),
10003(kafka)
```

----End

15.13.17 When a Kafka Topic Fails to Be Created, "NoAuthException" Is Displayed

Symptom

When running the following command on the Kafka client to create topics, it is found that the topics cannot be created.

```
kafka-topics.sh --create --zookeeper 192.168.234.231:2181/kafka --replication-factor 1 --partitions 2 --
topic test
```

Error messages "NoAuthException" and "KeeperErrorCode = NoAuth for /config/topics" are displayed.

Details are as follows:

```
Error while executing topic command org.apache.zookeeper.KeeperException$NoAuthException:
KeeperErrorCode = NoAuth for /config/topics
org.I0Itec.zkclient.exception.ZkException: org.apache.zookeeper.KeeperException$NoAuthException:

    at org.I0Itec.zkclient.ZkClient.retryUntilConnected(ZkClient.java:985)
    ... 8 more
 (kafka.admin.TopicCommand$)
```

Possible Causes

- The Kafka service is not running.
- The ZooKeeper address parameter in the client command is incorrectly configured.

Cause Analysis

1. After the client command is run, the "NoNodeException" exception is reported.

```
Error while executing topic command : org.apache.zookeeper.KeeperException$NoNodeException: 
KeeperErrorCode = NoNode for /brokers/ids
[2017-09-17 16:35:28,520] ERROR org.I0Itec.zkclient.exception.ZkNoNodeException: 
org.apache.zookeeper.KeeperException$NoNodeException: KeeperErrorCode = NoNode for /brokers/ids
    at org.I0Itec.zkclient.exception.ZkException.create(ZkException.java:47)
    at org.I0Itec.zkclient.ZkClient.retryUntilConnected(ZkClient.java:995)
    at org.I0Itec.zkclient.ZkClient.getChildren(ZkClient.java:675)
    at org.I0Itec.zkclient.ZkClient.getChildren(ZkClient.java:671)
    at kafka.utils.ZkUtils.getChildren(ZkUtils.scala:541)
    at kafka.utils.ZkUtils.getSortedBrokerList(ZkUtils.scala:176)
    at kafka.admin.AdminUtils$.createTopic(AdminUtils.scala:235)
    at kafka.admin.TopicCommand$.createTopic(TopicCommand.scala:105)
    at kafka.admin.TopicCommand$.main(TopicCommand.scala:60)
    at kafka.admin.TopicCommand.main(TopicCommand.scala)
```

2. Check whether the Kafka service is in the normal state on Manager.
3. Check whether the ZooKeeper address in the client command is correct. Check the Kafka information stored in ZooKeeper. The path (Znode) should be suffixed with **/kafka**. It is found that **/kafka** is missing in the configuration.

```
[root@10-10-144-2 client]#
kafka-topics.sh --create  --replication-factor 1 --partitions 2 --topic test --zookeeper 
192.168.234.231:2181
```

Solution

Step 1 Ensure that the Kafka service is normal.

Step 2 Add **/kafka** to the ZooKeeper address in the command.

```
[root@10-10-144-2 client]#
kafka-topics.sh --create  --replication-factor 1 --partitions 2 --topic test --zookeeper 
192.168.234.231:2181/kafka
```

----End

15.13.20 When a Kafka Topic Fails to Be Created, "replication factor larger than available brokers" Is Displayed

Symptom

When running the following command on the Kafka client to create topics, it is found that the topics cannot be created.

```
kafka-topics.sh --create  --replication-factor 2 --partitions 2 --topic test --zookeeper 
192.168.234.231:2181
```

The error message "replication factor larger than available brokers" is displayed.

See the following:

```
Error while executing topic command : replication factor: 2 larger than available brokers: 0
[2017-09-17 16:44:12,396] ERROR kafka.admin.AdminOperationException: replication factor: 2 larger than 
available brokers: 0
    at kafka.admin.AdminUtils$.assignReplicasToBrokers(AdminUtils.scala:117)
    at kafka.admin.AdminUtils$.createTopic(AdminUtils.scala:403)
    at kafka.admin.TopicCommand$.createTopic(TopicCommand.scala:110)
    at kafka.admin.TopicCommand$.main(TopicCommand.scala:61)
    at kafka.admin.TopicCommand.main(TopicCommand.scala)
 (kafka.admin.TopicCommand$)
```

Possible Causes

- The Kafka service is not running.

- The available Broker of the Kafka service is smaller than the configured **replication-factor**.
- The ZooKeeper address parameter in the client command is incorrectly configured.

Cause Analysis

1. After the client command is run, "replication factor larger than available brokers" is reported.
```
Error while executing topic command : replication factor: 2 larger than available brokers: 0
[2017-09-17 16:44:12,396] ERROR kafka.admin.AdminOperationException: replication factor: 2 larger
than available brokers: 0
    at kafka.admin.AdminUtils$.assignReplicasToBrokers(AdminUtils.scala:117)
    at kafka.admin.AdminUtils$.createTopic(AdminUtils.scala:403)
    at kafka.admin.TopicCommand$.createTopic(TopicCommand.scala:110)
    at kafka.admin.TopicCommand$.main(TopicCommand.scala:61)
    at kafka.admin.TopicCommand.main(TopicCommand.scala)
 (kafka.admin.TopicCommand$)
```
2. Check whether the Kafka service is in the normal state on Manager and whether the current available Broker is smaller than the configured **replication-factor**.
3. Check whether the ZooKeeper address in the client command is correct. Check the Kafka information stored in ZooKeeper. The path (Znode) should be suffixed with **/kafka**. It is found that **/kafka** is missing in the configuration.
```
[root@10-10-144-2 client]#
kafka-topics.sh --create  --replication-factor 2 --partitions 2 --topic test --zookeeper
192.168.234.231:2181
```

Solution

Step 1 Ensure that the Kafka service is in the normal state and the available Broker is not less than the configured **replication-factor**.

Step 2 Add **/kafka** to the ZooKeeper address in the command.
```
[root@10-10-144-2 client]#
kafka-topics.sh --create  --replication-factor 1 --partitions 2 --topic test --zookeeper
192.168.234.231:2181/kafka
```

----End

15.13.21 Consumer Repeatedly Consumes Data

Symptom

When the data volume is large, rebalance occurs frequently, causing repeated consumption. The key logs are as follows:

```
2018-05-12 10:58:42,561 | INFO | [kafka-request-handler-3] | [GroupCoordinator 2]: Preparing to restabilize

'__consumer_offsets-17' in 2 ms. | kafka.log.Log (Logging.scala:68)
```

In the logs, "Preparing to restabilize group DemoConsumer with old generation" indicates that rebalance occurs.

Possible Causes

The parameter settings are improper.

Cause Analysis

Cause: Due to improper parameter settings, the data processing time is too long when the data volume is large. Balance frequently occurs, and the offset cannot be submitted normally. As a result, the data is repeatedly consumed.

Principle: The offset is submitted only after the poll data is processed. If the processing duration after the poll data is processed exceeds the duration specified by **session.timeout.ms**, the rebalance occurs. As a result, the consumption fails and the offset of the consumed data cannot be submitted. Therefore, the data is consumed at the old offset next time. As a result, the data is repeatedly consumed.

Solution

Adjust the following service parameters on Manager:

request.timeout.ms=100000

session.timeout.ms=90000

max.poll.records=50

heartbeat.interval.ms=3000

Among the preceding parameters:

The value of **request.timeout.ms** is 10s greater than that of **session.timeout.ms**.

The value of **session.timeout.ms** must be within the values of **group.min.session.timeout.ms** and **group.max.session.timeout.ms** on the server.

Set the parameters as required. The **max.poll.records** parameter specifies the number of records for each poll. The purpose is to ensure that the processing time of poll data does not exceed the value of **session.timeout.ms**.

Related Information

- The post-poll data processing must be efficient and do not block the next poll.
- The poll method and data processing suggestion are processed asynchronously.

15.13.22 Leader for the Created Kafka Topic Partition Is Displayed as none

Symptom

When a user creates a topic using the Kafka client command, the leader for the created topic partition is displayed as **none**.

```
[root@10-10-144-2 client]#
kafka-topics.sh --create  --replication-factor 1 --partitions 2 --topic test --zookeeper 10.6.92.36:2181/
kafka

Created topic "test".
```

```
[root@10-10-144-2 client]#
kafka-topics.sh --describe --zookeeper 10.6.92.36:2181/kafka

Topic:test      PartitionCount:2        ReplicationFactor:2     Configs:
        Topic: test     Partition: 0    Leader: none       Replicas: 2,3   Isr:
        Topic: test     Partition: 1    Leader: none       Replicas: 3,1   Isr:
```

Possible Causes

- The Kafka service is not running.
- The user group information cannot be found.

Cause Analysis

1. Check the Kafka service status and monitoring metrics.
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Kafka**. Check the Kafka status. The status is **Good**, and the monitoring metrics are correctly displayed.
2. Obtain the Controller node information on the Kafka overview page.

3. Log in to the node where the Controller resides, and run the **cd /var/log/Bigdata/kafka/broker** command to go to the node log directory. The **state-change.log** contains "NoAuthException", which indicates that the ZooKeeper permission is incorrect.

```
2018-05-31 09:20:42,436 | ERROR | [ZkClient-
EventThread-34-10.6.92.36:24002,10.6.92.37:24002,10.6.92.38:24002/kafka] | Controller 4 epoch 6
initiated state change for partition [test,1] from NewPartition to OnlinePartition failed |
state.change.logger (Logging.scala:103)

 org.I0Itec.zkclient.exception.ZkException: org.apache.zookeeper.KeeperException$NoAuthException:
KeeperErrorCode = NoAuth for /brokers/topics/test/partitions
 at org.I0Itec.zkclient.exception.ZkException.create(ZkException.java:68)
 at org.I0Itec.zkclient.ZkClient.retryUntilConnected(ZkClient.java:1000)
 at org.I0Itec.zkclient.ZkClient.create(ZkClient.java:527)
 at org.I0Itec.zkclient.ZkClient.createPersistent(ZkClient.java:293)
```

4. Check on ZooKeeper audit logs recorded in the specified period also indicates that the permission is abnormal.

```
2018-05-31 09:20:42,421 | ERROR | CommitProcWorkThread-1 | session=0xc3000007015d5a18

hadoop.hadoop.com@HADOOP.COM    ip=10.6.92.39    operation=create znode
target=ZooKeeperServer    znode=/kafka/brokers/topics/test/partitions    result=failure
```

5. Run the **id -Gn kafka** command on each ZooKeeper instance node. It is found that user group information cannot be queried on a node.

```
[root @bdpsit3ap03 ~]# id -Gn kafka
id:  kafka: No such user
[root @bdpsit3ap03 ~]#
```

6. In an MRS cluster, user management is provided by the LDAP service and depends on the SSSD (Red Hat) and NSCD (SUSE) services of OSs. The process from creating a user to synchronizing the user to the SSSD service takes some time. If the user does not take effect or the SSSD version has bugs, the user may be invalid on the ZooKeeper node in some cases, which causes topic creation failures.

Solution

Step 1 Restart the SSD/NSCD service.

- RedHat

```
service sssd restart
```

- SUSE

```
sevice nscd restart
```

Step 2 After restarting related services, run the **id username** command on the active ResourceManager node to check whether the user information is valid.

----End

15.13.23 Safety Instructions on Using Kafka

Brief Introduction to API for Kafka

- New Producer API

  Indicates the API defined in org.apache.kafka.clients.producer.KafkaProducer. When kafka-console-producer.sh is used, the API is used by default.
- Old Producer API

  Indicates the API defined in kafka.producer.Producer. When kafka-console-producer.sh is used, the API is invoked to add --old-producer.
- New Consumer API

  Indicates the API defined in org.apache.kafka.clients.consumer.KafkaConsumer. When kafka-console-consumer.sh is used, the API is invoked to add --new-consumer.
- Old Consumer API

  Indicates the API defined in kafka.consumer.ConsumerConnector. When **kafka-console-consumer.sh** is used, the API is used by default.

NOTE

New Producer API and new Consumer API are called new API in general in the document.

Protocol Description for Accessing Kafka

The protocols used to access Kafka are as follows: PLAINTEXT, SSL, SASL_PLAINTEXT, and SASL_SSL.

When Kafka service is started, the listeners using the PLAINTEXT and SASL_PLAINTEXT protocols are started. You can set **ssl.mode.enable** to **true** in Kafka service configuration to start listeners using SSL and SASL_SSL protocols.

The following table describes the four protocols:

Protocol Type	Description	Supported API	Default Port
PLAINTEXT	Supports plaintext access without authentication.	New and old APIs	9092
SASL_PLAINTEXT	Supports plaintext access with Kerberos authentication.	New API	21007
SSL	Supports SSL-encrypted access without authentication.	New API	9093
SASL_SSL	Supports SSL-encrypted access with Kerberos authentication.	New API	21009

ACL Settings for Topic

Kafka supports secure access. Therefore, users can set the ACL for topics to control that different users access different topics. To view and set the permission information about a topic, run the kafka-acls.sh script on the Linux client.

- Scenarios

  Assign Kafka users with specific permissions for related topics based on service requirements.

  The following table describes default Kafka user groups.

User Group	Description
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.
kafka	Kafka common user group. If users in this group want to read data from and write data to a specific topic, the users in the kafkaadmin group must grant permissions to users in this group.

- Prerequisites
  1. The system administrator has understood service requirements and prepared a Kafka administrator (belonging to the kafkaadmin group).
  2. The Kafka client has been installed.
- Procedure
  1. Log in to the node where the Kafka client is installed as the client installation user.
  2. Switch to the Kafka client installation directory, for example, **/opt/kafkaclient**.

     cd /opt/kafkaclient
  3. Run the following command to configure environment variables:

     source bigdata_env
  4. Run the following command to perform user authentication (skip this step for a cluster in common mode):

     kinit *Component service user*
  5. Run the following command to switch to the Kafka client installation directory:

     cd Kafka/kafka/bin
  6. The following describes the commands commonly used for user authorization when **kafka-acl.sh** is used:

- View the permission control list of a topic:

  ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --list --topic <Topic name>

- Add the Producer permission for a user:

  ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --add --allow-principal User:<username> --producer --topic <Topic name>

- Remove the Producer permission from a user:

  ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --remove --allow-principal User:<username> --producer --topic <Topic name>

- Add the Consumer permission for a user:

  ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --add --allow-principal User:<username> --consumer --topic <Topic name> --group <consumer group name>

- Remove the Consumer permission from a user:

  ./kafka-acls.sh --authorizer-properties zookeeper.connect=<ZooKeeper cluster service IP:2181/kafka > --remove --allow-principal User:<username> --consumer --topic <Topic name> --group <consumer group name>

Use of New and Old Kafka APIs in Different Scenarios

- Scenario 1: accessing the topic with an ACL

Used API	User Group	Client Parameter	Server Parameter	Access Port
New API	Users need to meet one of the following conditions: ● In the administrator group ● In the **kafkaadmin** group ● In the **kafkasup**	security.protocol=SASL_PLAINTEXT sasl.kerberos.service.name = kafka	-	sasl.port (The default number is 21007.)

Used API	User Group	Client Parameter	Server Parameter	Access Port

	eruser group
	● In the **kafka** group and be authorized
		security.protocol=SASL_SSL
		sasl.kerberos.service.name = kafka
			Set ssl.mode.enable to true.	sasl-ssl.port (The default port number is 21009.)

Old API	N/A	N/A	N/A	N/A

- Scenario 2: accessing the topic without an ACL

Used API	User Group	Client Parameter	Server Parameter	Access Port

New API	Users need to meet one of the following conditions:
	● In the administrator group
	● In the **kafkaadmin** group
	● In the **kafkasuperuser** group
		security.protocol=SASL_PLAINTEXT
		sasl.kerberos.service.name = kafka
			-	sasl.port (The default number is 21007.)

	Users are in the **kafka** group.		Set **allow.everyone.if.no.acl.found** to **true**.	sasl.port (The default number is 21007.)

Used API	User Group	Client Parameter	Server Parameter	Access Port
	Users need to meet one of the following conditions: ● In the administrator group ● In the **kafkaadmin** group ● In the **kafkasuperuser** group	security.protocol=SASL_SSLsasl.kerberos.service.name = kafka	Set **ssl-enable** to **true**.	sasl-ssl.port (The default port number is 21009.)
	Users are in the **kafka** group.		Set **allow.everyone.if.no.acl.found** to **true**. Set **ssl-enable** to **true**.	sasl-ssl.port (The default port number is 21009.)
	-	security.protocol=PLAINTEXT	Set **allow.everyone.if.no.acl.found** to **true**.	port (The default number is 21005.)
	-	security.protocol=SSL	Set **allow.everyone.if.no.acl.found** to **true**. Set **ssl-enable** to **true**.	ssl.port (The default number is 21008.)
Old Producer	-	-	Set **allow.everyone.if.no.acl.found** to **true**.	port (The default number is 21005.)
Old Consumer	-	-	Set **allow.everyone.if.no.acl.found** to **true**.	ZooKeeper service port: clientPort (The default number is 24002.)

15.13.24 Obtaining Kafka Consumer Offset Information

Symptom

How do I obtain Kafka Consumer offset information when using Kafka Consumer to consume data?

Kafka APIs

- New Producer API

  Indicates the API defined in **org.apache.kafka.clients.producer.KafkaProducer**. When **kafka-console-producer.sh** is used, the API is used by default.
- Old Producer API

  Indicates the API defined in **kafka.producer.Producer**. When **kafka-console-producer.sh** is used, the API is invoked to add **--old-producer**.
- New Consumer API

  Indicates the API defined in **org.apache.kafka.clients.consumer.KafkaConsumer**. When **kafka-console-consumer.sh** is used, the API is invoked to add **--new-consumer**.
- Old Consumer API

  Indicates the API defined in **kafka.consumer.ConsumerConnector**. When **kafka-console-consumer.sh** is used, the API is used by default.

NOTE

New Producer API and new Consumer API are called new API in general in the document.

Procedure

Old Consumer API

- Prerequisites
  1. a. The system administrator has understood service requirements and prepared a Kafka administrator (belonging to the kafkaadmin group).
  2. b. The Kafka client has been installed.
- Procedure
  1. a. Log in to the node where the Kafka client is installed as the client installation user.
  2. b. Switch to the Kafka client installation directory, for example, **/opt/kafkaclient**.

     cd /opt/kafkaclient
  3. c. Run the following command to configure environment variables:

     source bigdata_env
  4. d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

     kinit *Component service user*

e. Run the following command to switch to the Kafka client installation directory:

   cd Kafka/kafka/bin

f. Run the following command to obtain Consumer offset metric information:

```
 bin/kafka-consumer-groups.sh --zookeeper <zookeeper_host:port>/kafka --list
```

```
bin/kafka-consumer-groups.sh --zookeeper <zookeeper_host:port>/kafka --describe --group
test-consumer-group
```

   Example:

```
kafka-consumer-groups.sh --zookeeper 192.168.100.100:2181/kafka --list
kafka-consumer-groups.sh --zookeeper 192.168.100.100:2181/kafka --describe --group test-
consumer-group
```

New Consumer API

- Prerequisites
  a. The system administrator has understood service requirements and prepared a Kafka administrator (belonging to the kafkaadmin group).
  b. The Kafka client has been installed.
- Procedure
  a. Log in to the node where the Kafka client is installed as the client installation user.
  b. Switch to the Kafka client installation directory, for example, **/opt/client**.

     cd /opt/client

  c. Run the following command to configure environment variables:

     source bigdata_env

  d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

     kinit *Component service user*

  e. Run the following command to switch to the Kafka client installation directory:

     cd Kafka/kafka/bin

  f. Run the following command to obtain Consumer offset metric information:

     kafka-consumer-groups.sh --bootstrap-server <broker_host:port> --describe --group my-group

     Example:

     kafka-consumer-groups.sh --bootstrap-server 192.168.100.100:9092 --describe --group my-group

15.13.25 Adding or Deleting Configurations for a Topic

Symptom

Configure or modify a specific topic when using Kafka.

Parameters that can be modified at the topic level:

```
cleanup.policy
compression.type
delete.retention.ms
file.delete.delay.ms
flush.messages
flush.ms

unclean.leader.election.enable
```

Procedure

- Prerequisites

  The Kafka client has been installed.

- Procedure

  a. Log in to the node where the Kafka client is installed as the client installation user.

  b. Switch to the Kafka client installation directory, for example, **/opt/client**.

     cd /opt/client

  c. Run the following command to configure environment variables:

     source bigdata_env

  d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

     kinit *Component service user*

  e. Run the following command to switch to the Kafka client installation directory:

     cd Kafka/kafka/bin

  f. Run the following commands to configure and delete a topic:

     kafka-topics.sh --alter --topic <topic_name> --zookeeper <zookeeper_host:port>/kafka --config <name=value>

     kafka-topics.sh --alter --topic <topic_name> --zookeeper <zookeeper_host:port>/kafka --delete-config <name>

     Example:

     kafka-topics.sh --alter --topic test1 --zookeeper 192.168.100.100:2181/kafka --config retention.ms=86400000

     kafka-topics.sh --alter --topic test1 --zookeeper 192.168.100.100:2181/kafka --delete-config retention.ms

  g. Run the following command to query topic information:

     kafka-topics.sh --describe -topic <topic_name> --zookeeper <zookeeper_host:port>/kafka

15.13.26 Reading the Content of the __consumer_offsets Internal Topic

Issue

How does Kafka save the offset of a Consumer to the **__consumer_offsets** of internal topics?

Procedure

Step 1 Log in to the node where the Kafka client is installed as the client installation user.

Step 2 Switch to the Kafka client installation directory, for example, **/opt/client**.

cd /opt/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 Run the following command to perform user authentication (skip this step for a cluster in common mode):

kinit *Component service user*

Step 5 Run the following command to switch to the Kafka client installation directory:

cd Kafka/kafka/bin

Step 6 Run the following command to obtain Consumer offset metric information:

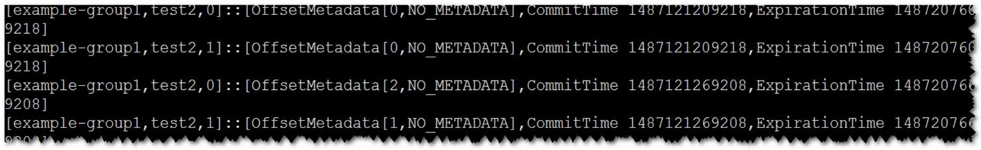
kafka-console-consumer.sh --topic __consumer_offsets --zookeeper <zk_host:port>/kafka --formatter "kafka.coordinator.group.GroupMetadataManager\$OffsetsMessageFormatter" --consumer.config <property file> --from-beginning

Add the following content to the <*property file*> configuration file:

```
exclude.internal.topics = false
```

Example:

kafka-console-consumer.sh --topic __consumer_offsets --zookeeper 10.5.144.2:2181/kafka --formatter "kafka.coordinator.group.GroupMetadataManager\$OffsetsMessageFormatter" --consumer.config ../config/consumer.properties --from-beginning



```
[example-group1,test2,0]::[OffsetMetadata[0,NO_METADATA],CommitTime 1487121209218,ExpirationTime 14872076
9218]
[example-group1,test2,1]::[OffsetMetadata[0,NO_METADATA],CommitTime 1487121209218,ExpirationTime 14872076
9218]
[example-group1,test2,0]::[OffsetMetadata[2,NO_METADATA],CommitTime 1487121269208,ExpirationTime 14872076
9208]
[example-group1,test2,1]::[OffsetMetadata[1,NO_METADATA],CommitTime 1487121269208,ExpirationTime 14872076
```

----End

15.13.27 Configuring Logs for Shell Commands on the Client

Issue

How do I set the log level for shell commands on the client?

Procedure

Step 1 Log in to the node where the Kafka client is installed as the client installation user.

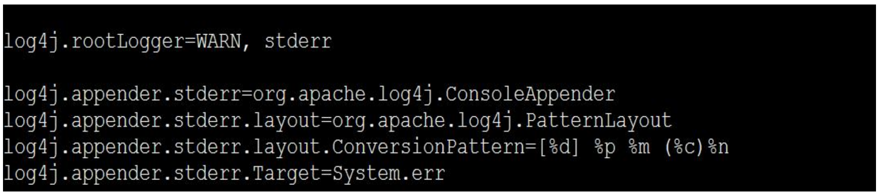
Step 2 Switch to the Kafka client installation directory, for example, **/opt/client**.

cd /opt/client

Step 3 Run the following command to switch to the Kafka client configuration directory:

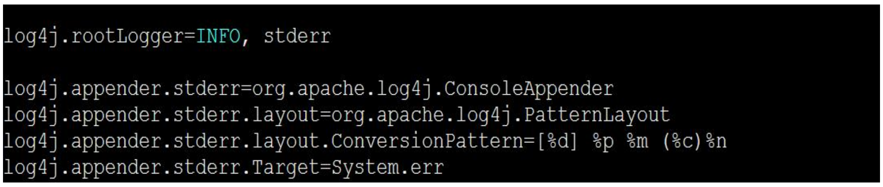
cd Kafka/kafka/config

Step 4 Open the **tools-log4j.properties** file, change **WARN** to **INFO**, and save the file.



```
log4j.rootLogger=WARN, stderr

log4j.appender.stderr=org.apache.log4j.ConsoleAppender
log4j.appender.stderr.layout=org.apache.log4j.PatternLayout
log4j.appender.stderr.layout.ConversionPattern=[%d] %p %m (%c)%n
log4j.appender.stderr.Target=System.err
```



```
log4j.rootLogger=INFO, stderr

log4j.appender.stderr=org.apache.log4j.ConsoleAppender
log4j.appender.stderr.layout=org.apache.log4j.PatternLayout
log4j.appender.stderr.layout.ConversionPattern=[%d] %p %m (%c)%n
log4j.appender.stderr.Target=System.err
```

Step 5 Switch to the Kafka client installation directory, for example, **/opt/client**.

cd /opt/client

Step 6 Run the following command to configure environment variables:

source bigdata_env

Step 7 Run the following command to perform user authentication (skip this step for a cluster in common mode):

kinit *Component service user*

Step 8 Run the following command to switch to the Kafka client installation directory:

cd Kafka/kafka/bin

Step 9 Run the following command to obtain the topic information. The log information can be viewed on the console.

```
kafka-topics.sh --list --zookeeper 10.5.144.2:2181/kafka
[2017-02-17 14:34:27,005] INFO JAAS File name: /opt/client/Kafka/./kafka/config/jaas.conf

15.13.28 Obtaining Topic Distribution Information

Issue

How do I obtain topic distribution information in a Broker instance?

Preparations

- Prerequisites

  The Kafka and ZooKeeper clients have been installed.

- Procedure

  a. Log in to the node where the Kafka client is installed as the client installation user.

  b. Switch to the Kafka client installation directory, for example, **/opt/client**.

     cd /opt/client

  c. Run the following command to configure environment variables:

     source bigdata_env

  d. Run the following command to perform user authentication (skip this step for a cluster in common mode):

     kinit *Component service user*

  e. Run the following command to switch to the Kafka client installation directory:

     cd Kafka/kafka/bin

  f. Run the Kafka commands to obtain the topic assignment information and copy synchronization information, and check the return result.

     kafka-topics.sh --describe --zookeeper <zk_host:port/chroot>

     Example:

     ```
     [root@mgtdat-sh-3-01-3 client]#kafka-topics.sh --describe --zookeeper 10.149.0.90:2181/
     kafka
     Topic:topic1    PartitionCount:2   ReplicationFactor:2     Configs:
     Topic: topic1   Partition: 0 Leader: 26 Replicas: 23,25 Isr: 26
     Topic: topic1   Partition: 1 Leader: 24 Replicas: 24,23 Isr: 24,23
     ```

     In the preceding information, **Replicas** indicates the replica assignment information and **Isr** indicates the replica synchronization information.

Solution 1

1. Query the Broker ID mapping in ZooKeeper.

   sh zkCli.sh -server <zk_host:port>

2. Run the following command on the ZooKeeper client:

   ls /kafka/brokers/ids

   get/kafka/brokers/ids/<queried Broker ID>

   Example:

```
[root@node-master1gAMQ kafka]# zkCli.sh -server node-master1gAMQ:2181
Connecting to node-master1gAMQ:2181
Welcome to ZooKeeper!
JLine support is enabled

WATCHER::

WatchedEvent state:SyncConnected type:None path:null
[zk: node-master1gAMQ:2181(CONNECTED) 0] ls /kafka/brokers/
ids      seqid    topics
[zk: node-master1gAMQ:2181(CONNECTED) 0] ls /kafka/brokers/ids
[1]
[zk: node-master1gAMQ:2181(CONNECTED) 1] get /kafka/brokers/ids/1
{"listener_security_protocol_map":{"PLAINTEXT":"PLAINTEXT","SSL":"SSL"},"endpoints":["PLAINTEXT://
192.168.2.242:9092","SSL://192.168.2.242:9093"],"rack":"/default/rack0","jmx_port":
21006,"host":"192.168.2.242","timestamp":"1580886124398","port":9092,"version":4}
[zk: node-master1gAMQ:2181(CONNECTED) 2]
```

Solution 2

Obtain the mapping between nodes and Broker IDs.

kafka-broker-info.sh --zookeeper <zk_host:port/chroot>

Example:

```
[root@node-master1gAMQ kafka]# bin/kafka-broker-info.sh --zookeeper 192.168.2.70:2181/kafka
Broker_ID     IP_Address
--------------------------
 1           192.168.2.242
```

15.13.29 Kafka HA Usage Description

Kafka High Reliability and Availability

Kafka message transmission assurance mechanism ensures message transmission after required parameters are set to meet different performance and reliability requirements.

- **Kafka high availability and high performance**

  If HA and high performance are required, configure parameters listed in the following table.

Parameter	Default Value	Description
unclean.leader.election.enable	true	Specifies whether a replica that is not in the ISR can be selected as the leader. If this parameter is set to **true**, data may be lost.
auto.leader.rebalance.enable	true	Specifies whether the leader automated balancing function is used. If this parameter is set to **true**, the controller periodically balances the leader of each partition on all nodes and assigns the leader to a replica with a higher priority.
acks	1	The leader needs to check whether the message has been received and determine whether the required operation has been processed. This parameter affects message reliability and performance. ● If this parameter is set to **0**, the Producer does not wait for any response from the server and the message is considered successful. ● If this parameter is set to **1**, when the leader of the copy verifies that data has been written into the cluster, the leader makes repose quickly without waiting until all the copies are written. In this case, if the leader is abnormal when the leader makes the confirmation but replica synchronization is not complete, data will be lost. ● If this parameter is set to **-1** (all), the synchronization is successful only after all synchronization copies are confirmed. If **min.insync.replicas** is also configured, multiple copies can be written successfully. In this case, as long as one copy remains active, the record is not lost. **NOTE** This parameter is configured in the Kafka client configuration file.
min.insync.replicas	1	Specifies the minimum number of replicas to which data is written when **acks** is set to **-1** for the Producer.

Impact of HA and high performance configurations:

NOTICE

After HA and high performance are configured, the data reliability decreases. Specifically, data may be lost of disks or nodes are faulty.

- **Kafka high reliability configuration**

  If high data reliability is required, configure parameters listed in the following table.

Parameter	Recommended Value	Description
unclean.leader.election.enable	false	Indicates whether a replica that is not in the ISR list can be elected as a leader.
acks	-1	The leader needs to check whether the message has been received and determine whether the required operation has been processed. If this parameter is set to **-1**, the message is successfully received only when all replicas in the ISR list have confirmed to receive the message. The **min.insync.replicas** parameter must also be set to ensure that multiple copies can be written successfully. As long as one copy is active, the record is not lost. **NOTE** This parameter is configured in the Kafka client configuration file.
min.insync.replicas	2	Specifies the minimum number of replicas to which data is written when **acks** is set to **-1** for the Producer. Ensure that the value of **Min.insync.replicas** is equal to or less than that of **replication.factor**.

Impact of high reliability configurations:

– Deteriorated performance

  All copies in the ISR list are required, and the writing of the minimum number of copies has been verified successful. As a result, the delay of a single message increases and the processing capability of the client decreases. The actual performance depends on the onsite test data.

– Reduced availability

  A replica that is not in the ISR list cannot be elected as a leader. If the leader goes offline and other replicas are not in the ISR list, the partition remains unavailable until the leader node recovers.

  All copies in the ISR list are required, and the writing of the minimum number of copies has been verified successful. When the node where a copy of a partition is located is faulty, the minimum number of successful copies cannot be met. As a result, service writing fails.

Configuration Impact

Evaluate reliability and performance requirements based on service scenarios and use proper parameter configuration.

NOTE

- For valuable data, you are advised to configure raid1 or raid5 for Kafka data directory disks to improve data reliability in case disk fault of a single disk.
- The **acks** parameter is named different for different Producer APIs.
  - New Producer API

    Indicates the interface defined in **org.apache.kafka.clients.producer.KafkaProducer**. The **acks** parameter name remains unchanged for this API.
  - Old Producer API

    Indicates the interface defined in **kafka.producer.Producer**. The **acks** parameter is named as **request.required.acks** for this API.
- For parameters that can be modified at the topic level, the service level configurations are used by default. These parameters can be separately configured based on topic reliability requirements.

  For example, you can configure the reliability parameters of the topic named **test**.

  kafka-topics.sh --zookeeper 192.168.1.205:2181/kafka --alter --topic test --config unclean.leader.election.enable=false --config min.insync.replicas=2

  192.168.1.205 indicates the ZooKeeper service IP address.
- If modification of the service-level requires the restart of Kafka, you are advised to modify the service-level configuration on the change page.

15.13.30 Kafka Producer Writes Oversized Records

Symptom

When a user develops a Kafka application and invokes the new interface (**org.apache.kafka.clients.producer.***) as a Producer to write data to Kafka, the size of a single record is 1100055, which exceeds the value (**1000012**) of **message.max.bytes** in the Kafka configuration file **server.properties**. After the values of **message.max.bytes** and **replica.fetch.max.bytes** in the Kafka service configuration are changed to **5242880**, the exception persists. The error information is as follows:

```
..........
14749 [Thread-0] INFO  com.XXXXXX.bigdata.kafka.example.NewProducer  - The ExecutionException 
occured : {}.
java.util.concurrent.ExecutionException: org.apache.kafka.common.errors.RecordTooLargeException: The 
message is 1100093 bytes when serialized which is larger than the maximum request size you have 
configured with the max.request.size configuration.
at org.apache.kafka.clients.producer.KafkaProducer$FutureFailure.<init>(KafkaProducer.java:739)
at org.apache.kafka.clients.producer.KafkaProducer.doSend(KafkaProducer.java:483)
at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:430)
at org.apache.kafka.clients.producer.KafkaProducer.send(KafkaProducer.java:353)
at com.XXXXXX.bigdata.kafka.example.NewProducer.run(NewProducer.java:150)
Caused by: org.apache.kafka.common.errors.RecordTooLargeException: The message is **** bytes when 
serialized which is larger than the maximum request size you have configured with the max.request.size 
configuration.
.......
```

Cause Analysis

When data is written to Kafka, the Kafka client compares the value of **max.request.size** with the size of the data to be written. If the size of the data to be written exceeds the default value of **max.request.size**, the preceding exception is reported.

Solution

Step 1 You can set the value of **max.request.size** when initializing the Kafka Producer instance.

For example, you can set this parameter to **5252880** as follows:

```
    // Protocol type: Currently, the SASL_PLAINTEXT or PLAINTEXT protocol types can be used.
    props.put(securityProtocol, kafkaProc.getValues(securityProtocol, "SASL_PLAINTEXT"));
     // Service name
    props.put(saslKerberosServiceName, "kafka");
    props.put("max.request.size", "5252880");
    .......
```

----End

15.13.31 Kafka Consumer Reads Oversized Records

Symptom

After data is written to Kafka, a user develops an application and invokes the interface (**org.apache.kafka.clients.consumer.***) to read data from Kafka as a Consumer. However, the reading fails and the following error is reported:

```
..........
1687 [KafkaConsumerExample] INFO  org.apache.kafka.clients.consumer.internals.AbstractCoordinator  - 
Successfully joined group DemoConsumer with generation 1
1688 [KafkaConsumerExample] INFO  org.apache.kafka.clients.consumer.internals.ConsumerCoordinator  - 
Setting newly assigned partitions [default-0, default-1, default-2] for group DemoConsumer
2053 [KafkaConsumerExample] ERROR com.XXXXXX.bigdata.kafka.example.NewConsumer  - 
[KafkaConsumerExample], Error due to 
org.apache.kafka.common.errors.RecordTooLargeException: There are some messages at [Partition=Offset]: 
{default-0=177} whose size is larger than the fetch size 1048576 and hence cannot be ever returned. 
Increase the fetch size on the client (using max.partition.fetch.bytes), or decrease the maximum message 
size the broker will allow (using message.max.bytes).
2059 [KafkaConsumerExample] INFO  com.XXXXXX.bigdata.kafka.example.NewConsumer  - 
[KafkaConsumerExample], Stopped
.......
```

Cause Analysis

When reading data, the Kafka client compares the size of the data to be read with the value of **max.partition.fetch.bytes**. If the size exceeds the value of **max.partition.fetch.bytes**, the preceding exception is reported.

Solution

Step 1 When creating a Kafka Consumer instance during initialization, set **max.partition.fetch.bytes**.

For example, you can set this parameter to **5252880** as follows:

```
......
// Security protocol type
```

```
props.put(securityProtocol, kafkaProc.getValues(securityProtocol, "SASL_PLAINTEXT"));
// Service name
props.put(saslKerberosServiceName, "kafka");

props.put("max.partition.fetch.bytes","5252880");
......
```

----End

15.13.32 High Usage of Multiple Disks on a Kafka Cluster Node

Issue

The usage of multiple disks on a node in the Kafka streaming cluster is high. The Kafka service will become unavailable if the usage reaches 100%.

Symptom

A node in the MRS Kafka streaming cluster created by the customer has multiple disks. Due to improper partitioning and service reasons, the usage of some disks is high. When the usage reaches 100%, Kafka becomes unavailable.

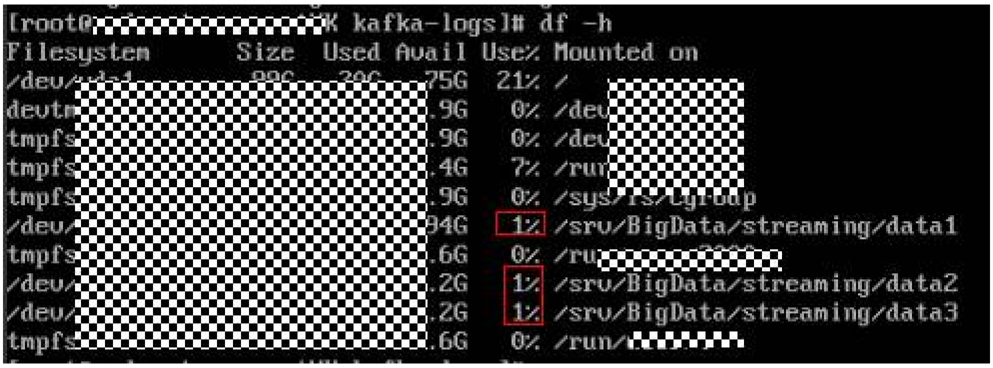
Cause Analysis

The disk data needs to be processed in a timely manner. After the value of **log.retention.hours** is changed, the service needs to be restarted. To ensure service continuity, you can shorten the aging time of a single data-intensive topic as required.

Procedure

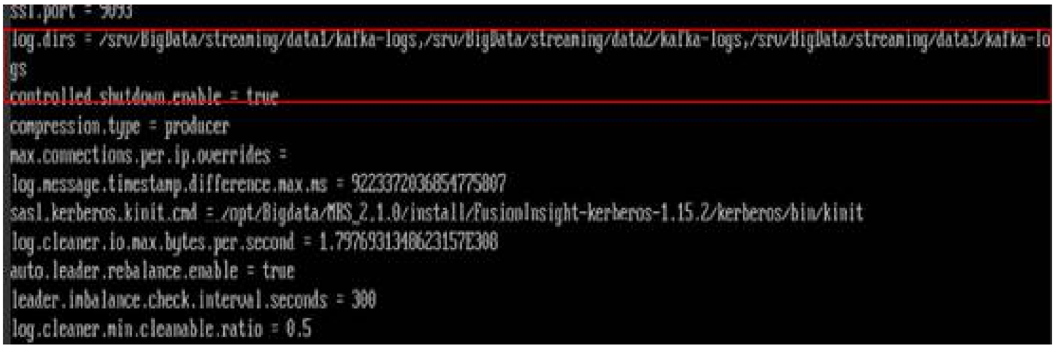
Step 1 Log in to the core node of the Kafka streaming cluster.

Step 2 Run the **df –h** command to check the disk usage.



```
[root@[redacted]K kafka-logs]# df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/[redacted]         75G  21% /
devtm[redacted]         .9G   0% /dev[redacted]
tmpfs[redacted]         .9G   0% /dev
tmpfs[redacted]         .4G   7% /run
tmpfs[redacted]         .9G   0% /sys/fs/cgroup
/dev/[redacted]         94G   1% /srv/BigData/streaming/data1
tmpfs[redacted]         .6G   0% /ru[redacted]
/dev/[redacted]         .2G   1% /srv/BigData/streaming/data2
/dev/[redacted]         .2G   1% /srv/BigData/streaming/data3
tmpfs[redacted]         .6G   0% /run/[redacted]
```

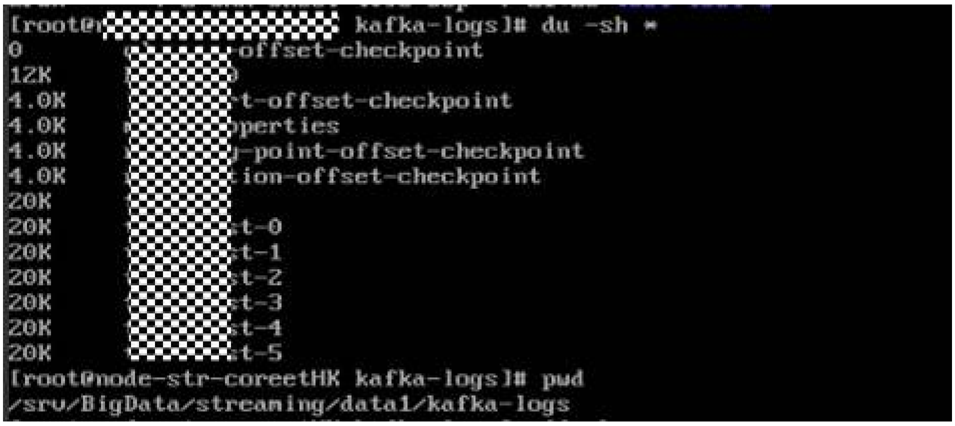
Step 3 Obtain the data storage directory from the **log.dirs** configuration item in the Kafka configuration file **opt/Bigdata/MRS_2.1.0/1_11_Broker/etc/server.properties**. Change the configuration file path based on the cluster version in the environment. If there are multiple disks, use commas (,) to separate multiple configuration items.



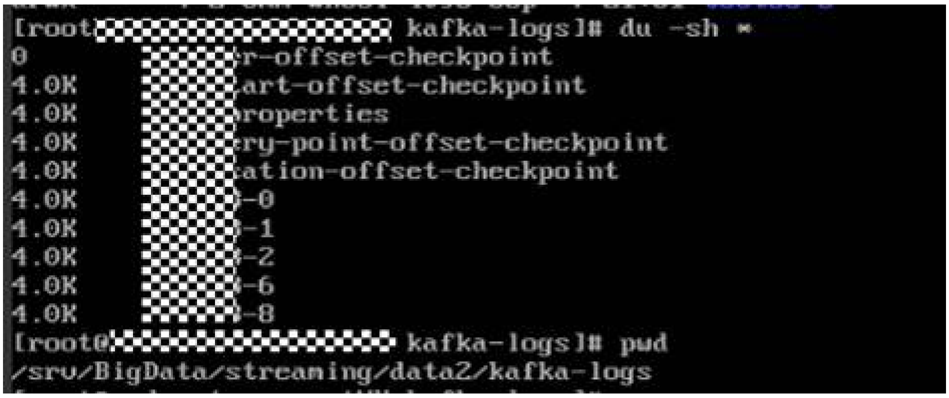
```
ssl.port = 9093
log.dirs = /srv/BigData/streaming/data1/kafka-logs,/srv/BigData/streaming/data2/kafka-logs,/srv/BigData/streaming/data3/kafka-lo
gs
controlled.shutdown.enable = true
compression.type = producer
max.connections.per.ip.overrides =
log.message.timestamp.difference.max.ms = 9223372036854775807
sasl.kerberos.kinit.cmd = /opt/Bigdata/MRS_2.1.0/install/FusionInsight-kerberos-1.15.2/kerberos/bin/kinit
log.cleaner.io.max.bytes.per.second = 1.7976931348623157E308
auto.leader.rebalance.enable = true
leader.imbalance.check.interval.seconds = 300
log.cleaner.min.cleanable.ratio = 0.5
```

Step 4 Run the **cd** command to go to the data storage directory obtained in **Step 3** of the disk with high usage.

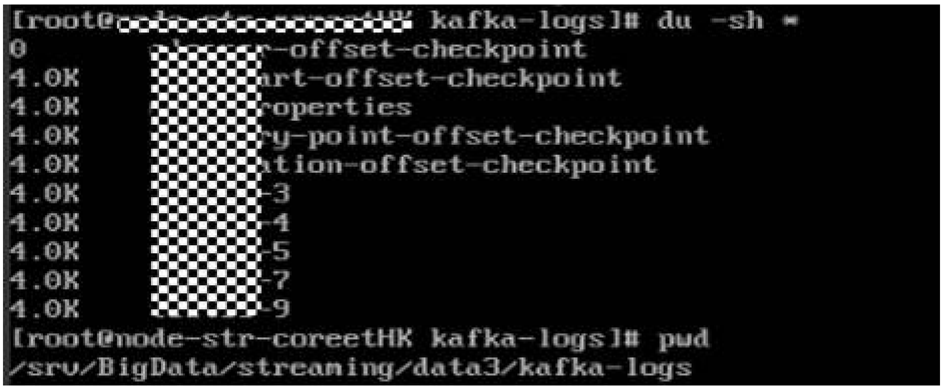
Step 5 Run the **du -sh *** command to print the name and size of the current topic.



```
[root@[redacted] kafka-logs]# du -sh *
0       [redacted]offset-checkpoint
12K     [redacted]
4.0K    [redacted]t-offset-checkpoint
4.0K    [redacted]perties
4.0K    [redacted]-point-offset-checkpoint
4.0K    [redacted]ion-offset-checkpoint
20K     [redacted]
20K     [redacted]t-0
20K     [redacted]t-1
20K     [redacted]t-2
20K     [redacted]t-3
20K     [redacted]t-4
20K     [redacted]t-5
[root@node-str-coreetHK kafka-logs]# pwd
/srv/BigData/streaming/data1/kafka-logs
```



```
[root[redacted] kafka-logs]# du -sh *
0       [redacted]r-offset-checkpoint
4.0K    [redacted]art-offset-checkpoint
4.0K    [redacted]roperties
4.0K    [redacted]ry-point-offset-checkpoint
4.0K    [redacted]ation-offset-checkpoint
4.0K    [redacted]-0
4.0K    [redacted]-1
4.0K    [redacted]-2
4.0K    [redacted]-6
4.0K    [redacted]-8
[root@[redacted] kafka-logs]# pwd
/srv/BigData/streaming/data2/kafka-logs
```



```
[root@[redacted] kafka-logs]# du -sh *
0       [redacted]r-offset-checkpoint
4.0K    [redacted]art-offset-checkpoint
4.0K    [redacted]roperties
4.0K    [redacted]ry-point-offset-checkpoint
4.0K    [redacted]ation-offset-checkpoint
4.0K    [redacted]-3
4.0K    [redacted]-4
4.0K    [redacted]-5
4.0K    [redacted]-7
4.0K    [redacted]-9
[root@node-str-coreetHK kafka-logs]# pwd
/srv/BigData/streaming/data3/kafka-logs
```

Step 6 Determine the method of changing the data retention period. The default global data retention period of Kafka is seven days. A large amount of data may be written to some topics, and these topics reside on the partitions on the disk with high usage.

- You can change the global data retention period to a smaller value to release disk space. This method requires a Kafka service restart, which may affect service running. For details, see **Step 7**.
- You can change the data retention period of a single topic to a smaller value to release disk space. This configuration takes effect without a Kafka service restart. For details, see **Step 8**.

Step 7 Log in to Manager. On the Kafka service configuration page, switch to **All Configurations** and search for the **log.retention.hours** configuration item. The default value is 7 days. Change it based on the site requirements.

Step 8 Change the data retention time of the topics on these disks.

1. Check the retention time of the topic data.

   bin/kafka-topics.sh --describe --zookeeper ***<ZooKeeper cluster service IP address>*****:2181/kafka --topic kktest**

   
   ```
   [root@[redacted]Nw kafka]# bin/kafka-topics.sh --describe --zookeeper 192.168.201.175:2181/kafka --topic kktest
   Topic:kktest    PartitionCount:1        ReplicationFactor:1     Configs:retention.ms=1000000
           Topic: kktest   Partition: 0    Leader: 1       Replicas: 1     Isr: 1
   ```

2. Set the topic data retention time. **--topic** indicates the topic name, and **retention.ms** indicates the data retention time, in milliseconds.

   kafka-topics.sh --zookeeper ***<ZooKeeper cluster service IP address>*****:2181/kafka --alter --topic kktest --config retention.ms=1000000**

   
   ```
   [root@node-master1nTNw kafka]# kafka-topics.sh --zookeeper 192.168.201.175:2181/kafka --alter --topic kktest --config retentic
   ms=1000000
   WARNING: Altering topic configuration from this script has been deprecated and may be removed in future releases.
            Going forward, please use kafka-configs.sh for this functionality
   Updated config for topic "kktest".
   ```

   After the data retention time is set, the deletion operation may not be performed immediately. The deletion operation starts after the time specified by **log.retention.check.interval.ms**. You can check whether the **delete** field exists in the **server.log** file of Kafka to determine whether the deletion operation takes effect. If the **delete** field exists, the deletion operation has taken effect. You can also run the **df –h** command to check the disk usage and determine whether the setting takes effect.

   
   ```
   log.retention.check.interval.ms = 300000
   ```

----End

15.14 Using Oozie

15.14.1 Oozie Jobs Do Not Run When a Large Number of Jobs Are Submitted Concurrently

Issue

When a large number of Oozie jobs are submitted concurrently, the jobs do not run.

Symptom

When a large number of Oozie jobs are submitted concurrently, the jobs do not run.

Cause Analysis

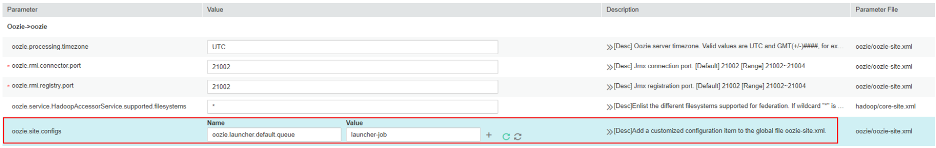
When Oozie submits a job, an oozie-launcher job is started first, and then the oozie-launcher job submits the real job for execution. By default, the oozie-launcher job and the real job are in the same queue.

When a large number of Oozie jobs are submitted concurrently, a large number of oozie-launcher jobs may be started, exhausting the resources of the queue. As a result, no more resources are available to start real jobs, and the jobs are not executed.

Procedure

Step 1 Create a queue for Oozie. For details, see **User Guide** > **Managing an Existing Cluster** > **Tenant Management** > **Creating a Tenant**. You can also use the launcher-job queue generated during MRS cluster creation.

Step 2 On Manager, choose **Cluster** > **Services** > **Oozie** > **Configurations**, search for **oozie.site.configs**, and add **oozie.launcher.default.queue** as the parameter name and **launcher-job** as the value.



Parameter	Value	Description	Parameter File
Oozie->oozie			
oozie.processing.timezone	UTC	»[Desc] Oozie server timezone. Valid values are UTC and GMT(+/-)####, for ex...	oozie/oozie-site.xml
* oozie.rmi.connector.port	21002	»[Desc] Jmx connection port. [Default] 21002 [Range] 21002~21004	oozie/oozie-site.xml
* oozie.rmi.registry.port	21002	»[Desc] Jmx registration port. [Default] 21002 [Range] 21002~21004	oozie/oozie-site.xml
oozie.service.HadoopAccessorService.supported.filesystems	*	»[Desc]Enlist the different filesystems supported for federation. If wildcard "*" is ...	hadoop/core-site.xml
oozie.site.configs	Name: oozie.launcher.default.queue Value: launcher-job	»[Desc]Add a customized configuration item to the global file oozie-site.xml.	oozie/oozie-site.xml

----End

15.15 Using Presto

15.15.1 During sql-standard-with-group Configuration, a Schema Fails to Be Created and the Error Message "Access Denied" Is Displayed

Issue

A schema fails to be created during sql-standard-with-group configuration and the error message "Access Denied" is displayed.

Symptom

```
CREATE SCHEMA hive.sf2 WITH (location = 'obs://obs-zy1234/sf2');Query 20200224_031203_00002_g6gzy
failed: Access Denied: Cannot create schema sf2
```

Cause Analysis

To create a schema in Presto, you must have the administrator permission of Hive.

Procedure

MRS Manager:

- Method 1:
  a. Log in to MRS Manager and choose **System** > **Manage User**.
  b. Locate the row that contains the target user, and click **Modify** in the **Operation** column.
  c. Click **Select and Add Role** to assign the **System_administrator** permission to the user.
  d. Click **OK**.
- Method 2:
  a. Log in to MRS Manager and choose **System** > **Manage Role**.
  b. Click **Create Role** and set the following parameters:
     - Enter a role name, for example, **hive_admin**.
     - Set **Permission** to **Hive** and select **Hive Admin Privilege**.
  c. Click **OK** to save the role.
  d. Choose **System** > **Manage User**.
  e. Locate the row that contains the target user, and click **Modify** in the **Operation** column.
  f. Click **Select and Add Role** to add the newly created hive_admin permission to the user.
  g. Click **OK**.

FusionInsight Manager:

- Method 1:
  a. Log in to FusionInsight Manager and choose **System** > **Permission** > **User**.
  b. Locate the row that contains the target user, and click **Modify** in the **Operation** column.
  c. Click **Add** next to the role to assign the **System_administrator** permission to the user.
  d. Click **OK**.
- Method 2:
  a. Log in to FusionInsight Manager and choose **System** > **Permission** > **Role**.
  b. Click **Create Role** and set the following parameters:
     - Enter a role name, for example, **hive_admin**.
     - To configure resource permissions, select **Hive** and **Hive Admin Permissions**.
  c. Click **OK** to save the role.
  d. Choose **System** > **Permission** > **User**.

e. Locate the row that contains the target user, and click **Modify** in the **Operation** column.

f. Click **Add** next to the role to add the **hive_admin** permission for the user.

g. Click **OK**.

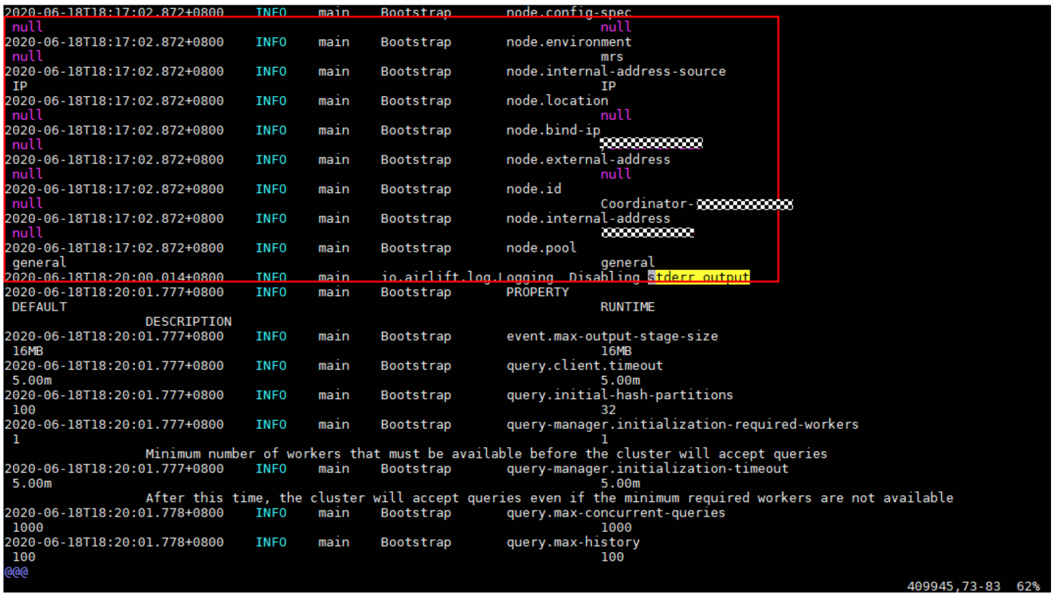
15.15.2 The Presto coordinator cannot be started properly.

Issue

The coordinator process of Presto is killed due to an unknown reason, or the coordinator process of Presto cannot be started.

Symptom

The Presto coordinator process cannot be started properly. On the Manager page, it is shown that the presto coordinator process is started properly and its status is normal. However, the background log shows that the coordinator process is not started. Only the following log is displayed:



```
2020-06-18T18:17:02.872+0800    INFO    main    Bootstrap       node.config-spec

```

The Presto coordinator is killed before being started, and no other logs are printed. Other Presto logs do not indicate the reason why the presto coordinator is killed.

Cause Analysis

The port check logic of the presto health check script does not distinguish ports.

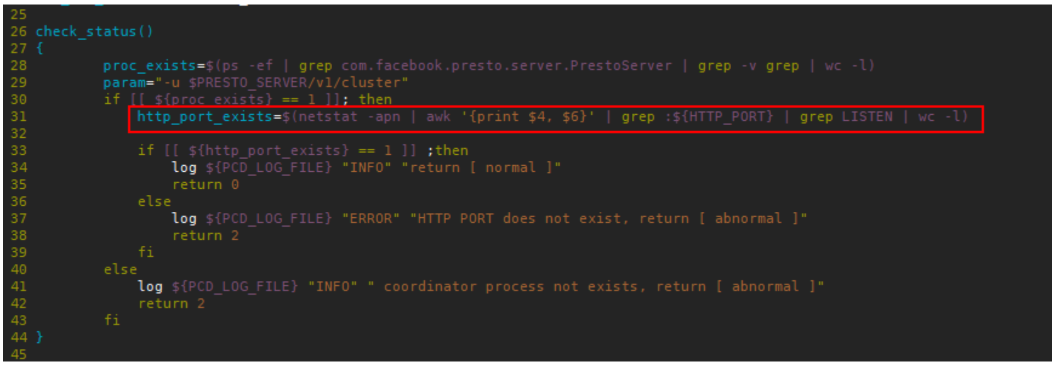
Procedure

Step 1 Use a tool to log in to the master nodes of the cluster and perform the following operations:

Step 2 Run the following command to edit the file:

vim /opt/Bigdata/MRS_xxx/install/FusionInsight-Presto-*/ha/module/harm/plugin/script/pcd.sh

Change line 31 in the file to **http_port_exists=$(netstat -apn | awk '{print $4, $6}' | grep :${HTTP_PORT} | grep LISTEN | wc -l)**.



```
25
26 check_status()
27 {
28         proc_exists=$(ps -ef | grep com.facebook.presto.server.PrestoServer | grep -v grep | wc -l)
29         param="-u $PRESTO_SERVER/v1/cluster"
30         if [[ ${proc_exists} == 1 ]]; then
31             http_port_exists=$(netstat -apn | awk '{print $4, $6}' | grep :${HTTP_PORT} | grep LISTEN | wc -l)
32
33             if [[ ${http_port_exists} == 1 ]] ;then
34                 log ${PCD_LOG_FILE} "INFO" "return [ normal ]"
35                 return 0
36             else
37                 log ${PCD_LOG_FILE} "ERROR" "HTTP PORT does not exist, return [ abnormal ]"
38                 return 2
39             fi
40         else
41             log ${PCD_LOG_FILE} "INFO" " coordinator process not exists, return [ abnormal ]"
42             return 2
43         fi
44 }
45
```

Step 3 Save the modification. On FusionInsight Manager, choose **Services** > **Presto** > **Instances** to restart the Coordinator process.

----End

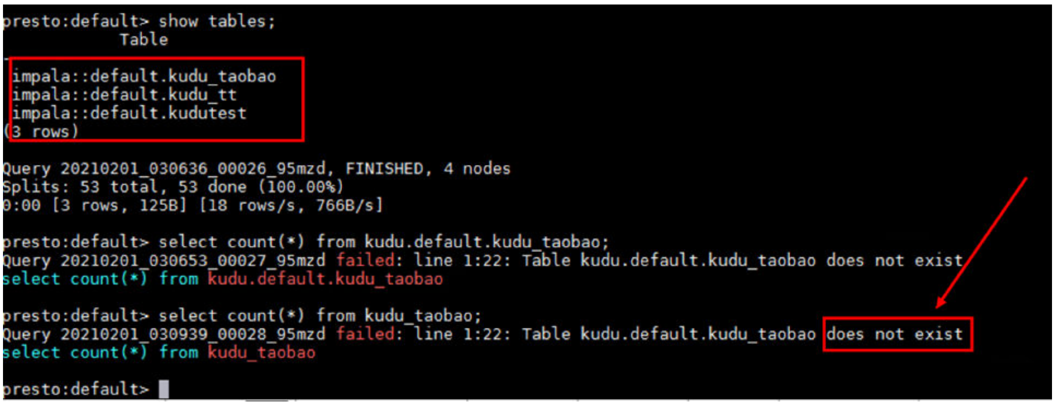
15.15.3 An Error Is Reported When Presto Is Used to Query a Kudu Table

Issue

An error is reported when Presto is used to query a Kudu table.

Symptom

When Presto is used to query a Kudu table, the following error message is displayed.



```
presto:default> show tables;
              Table
-
 impala::default.kudu_taobao

        at java.lang.Thread.run(Thread.java:748)
```

Cause Analysis

There are no Kudu configurations on the actually running node (node where the worker instance is located).

Procedure

Step 1 Add configuration file **kudu.properties** to all worker instance nodes in the Presto cluster.

Path for storing the configuration file: **/opt/Bigdata/MRS_xxx/1_x_Worker/etc/catalog/** (Change the path based on the actual cluster version.)

Configuration file content:

```
connector.name=kudu
kudu.client.master-addresses=KuduMasterIP1:port,KuduMasterIP2:port,KuduMasterIP3:port
```

NOTE

- Set the IP address and port number of the KuduMaster node based on the site requirements.
- Add the file permission and owner group that are the same as those of other files in the file save path to the configuration file.

Step 2 After the modification, choose **Components** > **Kudu** on the cluster details page, click **More**, and select **Restart Service**.

----End

15.15.4 No Data is Found in the Hive Table Using Presto

Issue

When Presto is used to query the Hive table, no data is found.

Symptom

Presto cannot query the data written by **union** statements executed by the Tez engine.

Cause Analysis

When Hive uses the Tez engine to execute the **union** statements, the output file is stored in the **HIVE_UNION_SUBDIR** directory. However, Presto does not access files in child directories by default. Therefore, data in the **HIVE_UNION_SUBDIR** directory is not read.

Procedure

Step 1 On the MRS console, click the cluster name, and choose **Components** > **Presto** > **Service Configuration**.

Step 2 Change **Basic** to **All**.

Step 3 In the navigation tree on the left, choose **Presto** > **Hive**. In the **catalog/hive.properties** file, add the **hive.recursive-directories** parameter and set it to **true**.

Step 4 Click **Save Configuration** and select **Restart the affected services or instances**.

----End

15.16 Using Spark

15.16.1 An Error Occurs When the Split Size Is Changed in a Spark Application

Issue

An error occurs when the split size is changed in a Spark application.

Symptom

A user needs to implement multiple mappers by changing the maximum split size to make the Spark application run faster. However, an error occurs when the user runs the **set $Parameter** command to modify the Hive configuration.

```
0: jdbc:hive2://192.168.1.18:21066/> set mapred.max.split.size=1000000;
Error: Error while processing statement: Cannot nodify mapred.max.split.size at runtime. It is not in list of
params that are allowed to be modified at runtime( state=42000,code=1)
```

Cause Analysis

- Before the **hive.security.whitelist.switch** parameter is set to enable or disable the whitelist in security mode, the allowed parameters must have been configured in **hive.security.authorization.sqlstd.confwhitelist**.
- The default whitelist does not contain the **mapred.max.split.size** parameter. Therefore, the system displays a message indicating that the maximum split size cannot be changed.

Procedure

Step 1 Go to the Hive configuration page.

- For versions earlier than MRS 2.0.1: Log in to MRS Manager, choose **Services** > **Hive** > **Service Configuration**, and select **All** from the **Basic** drop-down list.
- For MRS 2.0.1 or later: Click the cluster name on the MRS console, choose **Components** > **Hive** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

  NOTE

  If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)
- For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the target cluster and choose **Services** > **Hive** > **Configurations** > **All Configurations**.

Step 2 Search for **hive.security.authorization.sqlstd.confwhitelist.append**, and add **mapred.max.split.size** to **hive.security.authorization.sqlstd.confwhitelist.append**. For details, see **Component Operation Guide** > **Using Hive** > **Using Hive from Scratch**.

Step 3 Save the configuration and restart the Hive component.

Step 4 Run the **set mapred.max.split.size=1000000;** command. If no error occurs, the modification is successful.

----End

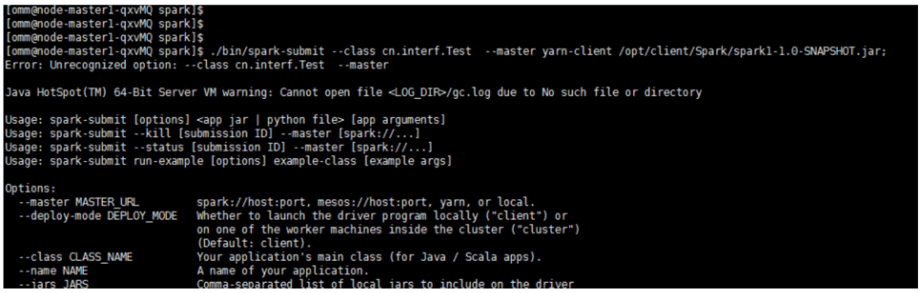
15.16.2 An Error Is Reported When Spark Is Used

Issue

When Spark is used, the cluster fails to run.

Symptom

When Spark is used, the cluster fails to run.



```
[omm@node-master1-qxvMQ spark]$
[omm@node-master1-qxvMQ spark]$
[omm@node-master1-qxvMQ spark]$
[omm@node-master1-qxvMQ spark]$ ./bin/spark-submit --class cn.interf.Test  --master yarn-client /opt/client/Spark/spark1-1.0-SNAPSHOT.jar;
Error: Unrecognized option: --class cn.interf.Test  --master

Java HotSpot(TM) 64-Bit Server VM warning: Cannot open file <LOG_DIR>/gc.log due to No such file or directory

Usage: spark-submit [options] <app jar | python file> [app arguments]
Usage: spark-submit --kill [submission ID] --master [spark://...]
Usage: spark-submit --status [submission ID] --master [spark://...]
Usage: spark-submit run-example [options] example-class [example args]

Options:
  --master MASTER_URL         spark://host:port, mesos://host:port, yarn, or local.
  --deploy-mode DEPLOY_MODE   Whether to launch the driver program locally ("client") or
                              on one of the worker machines inside the cluster ("cluster")
                              (Default: client).
  --class CLASS_NAME          Your application's main class (for Java / Scala apps).
  --name NAME                 A name of your application.
  --jars JARS                 Comma-separated list of local jars to include on the driver
```

Cause Analysis

- Invalid characters are added during command execution.
- The owner and owner group of the uploaded JAR file is incorrect.

Procedure

Step 1 Run **./bin/spark-submit --class cn.interf.Test --master yarn-client /opt/client/Spark/spark1-1.0-SNAPSHOT.jar;** to check whether invalid characters are imported.

Step 2 If they are imported, modify the invalid characters and run the command again.

Step 3 After the command is executed again, other errors occur. Both the owner and the owner group of the JAR file are **root**.

Step 4 Change the owner and the owner group of the JAR file to **omm:wheel**.

----End

15.16.3 A Spark Job Fails to Run Due to Incorrect JAR File Import

Issue

A Spark job fails to be executed.

Symptom

A Spark job fails to be executed.

Cause Analysis

The imported JAR file is incorrect when the Spark job is executed. As a result, the Spark job fails to be executed.

Procedure

Step 1 Log in to any Master node.

Step 2 Run the **cd /opt/Bigdata/MRS_*/install/FusionInsight-Spark-*/spark/examples/jars** command to view the JAR file of the sample program.

NOTE

A JAR file name contains a maximum of 1023 characters and cannot include special characters (;|&>,<'$). In addition, it cannot be left blank or full of spaces.

Step 3 Check the executable programs in the OBS bucket. The executable programs can be stored in HDFS or OBS. The paths vary according to file systems.

NOTE

- OBS storage path: starts with **obs://**, for example, **obs://wordcount/program/hadoop-mapreduce-examples-2.7.x.jar**.
- HDFS storage path: starts with **/user**. Spark Script must end with **.sql**, and MR and Spark must end with **.jar**. The **.sql** and **.jar** are case-insensitive.

----End

15.16.4 A Spark Job Is Pending Due to Insufficient Memory

Issue

Memory is insufficient to submit a Spark job. As a result, the job is in the pending state for a long time or out of memory (OMM) occurs during job running.

Symptom

The job is pending for a long time after being submitted. The following error information is displayed after the job is executed repeatedly:

```
Exception in thread "main" org.apache.spark.SparkException: Job aborted due to stage failure:
Aborting TaskSet 3.0 because task 0 (partition 0) cannot run anywhere due to node and executor blacklist.
Blacklisting behavior can be configured via spark.blacklist.*.
```

Cause Analysis

The memory is insufficient. As a result, the submitted Spark job is in the pending state for a long time.

Procedure

Step 1 Log in to the MRS console, click a cluster name on the **Active Clusters** page and view the node specifications of the cluster on the **Nodes** tab page.

Step 2 Add cluster resources owned by the **nodemanager** process.

MRS Manager:

1. Log in to MRS Manager and choose **Services** > **Yarn** > **Service Configuration**.
2. Set **Type** to **All**, and then search for **yarn.nodemanager.resource.memory-mb** in the search box to view the value of this parameter. You are advised to set the parameter value to 75% to 90% of the total physical memory of nodes.

FusionInsight Manager:

1. Log in to FusionInsight Manager. Choose **Cluster** > **Service** > **Yarn**.
2. Choose **Configurations** > **All Configurations**. Search for **yarn.nodemanager.resource.memory-mb** in the search box and check the parameter value. You are advised to set the parameter value to 75% to 90% of the total physical memory of nodes.

Step 3 Modify the Spark service configuration.

MRS Manager:

1. Log in to MRS Manager and choose **Services** > **Spark** > **Service Configuration**.
2. Set **Type** to **All**, and then search for **spark.driver.memory** and **spark.executor.memory** in the search box.

   Set these parameters to a larger or smaller value based on the complexity and memory requirements of the submitted Spark job. (Generally, the values need to be increased.)

FusionInsight Manager:

1. Log in to FusionInsight Manager. Choose **Cluster** > **Service** > **Spark**.
2. Choose **Configurations** > **All Configurations**. Search for **spark.driver.memory** and **spark.executor.memory** in the search box and increase or decrease the values based on actual requirements. Generally, increase the values based on the complexity and memory of the submitted Spark job.

NOTE

- If a SparkJDBC job is used, search for **SPARK_EXECUTOR_MEMORY** and **SPARK_DRIVER_MEMORY** and modify their values based on the complexity and memory requirements of the submitted Spark job. (Generally, the values need to be increased.)
- If the number of cores needs to be specified, you can search for **spark.driver.cores** and **spark.executor.cores** and modify their values.

Step 4 Scale out the cluster if the preceding requirements still cannot be met because Spark depends on the memory for computing.

----End

15.16.5 An Error Is Reported During Spark Running

Issue

The specified class cannot be found when a Spark job is running.

Symptom

The specified class cannot be found when a Spark job is running. The error message is as follows:

```
Exception encountered | org.apache.spark.internal.Logging$class.logError(Logging.scala:91)
org.apache.hadoop.hbase.DoNotRetryIOException: java.lang.ClassNotFoundException:
org.apache.phoenix.filter.SingleCQKeyValueComparisonFilter
```

Cause Analysis

The default path configured by the user is incorrect.

Procedure

Step 1 Log in to any Master node.

Step 2 Modify the configuration file in the Spark client directory.

Run the **vim /opt/client/Spark/spark/conf/spark-defaults.conf** command to open the **spark-defaults.conf** file and set **spark.executor.extraClassPath** to **${PWD}/***.

----End

15.16.6 Executor Memory Reaches the Threshold Is Displayed in Driver

Symptom

A Spark task fails to be submitted due to excessive memory usage.

Cause Analysis

The Driver log prints that the applied Executor memory exceeds the cluster limit.

```
16/02/06 14:11:25 INFO Client: Verifying our application has not requested more than the maximum
memory capability of the cluster (6144 MB per container)
16/02/06 14:11:29 ERROR SparkContext: Error initializing SparkContext.
java.lang.IllegalArgumentException: Required executor memory (10240+1024 MB) is above the max
threshold (6144 MB) of this cluster!
```

Spark tasks are submitted to Yarn and the resources used by the Executor to run tasks are managed by Yarn. From the error message, you can see that when a user starts the Executor, 10 GB memory is specified, which exceeds the upper memory limit of each Container set by Yarn. As a result, the task cannot be started.

Solution

Modify the Yarn configuration to increase the restriction on containers. For example, you can adjust parameter **yarn.scheduler.maximum-allocation-mb** to control the resources for starting the Executor. Restart the Yarn service after the modification.

You can modify the configuration as follows:

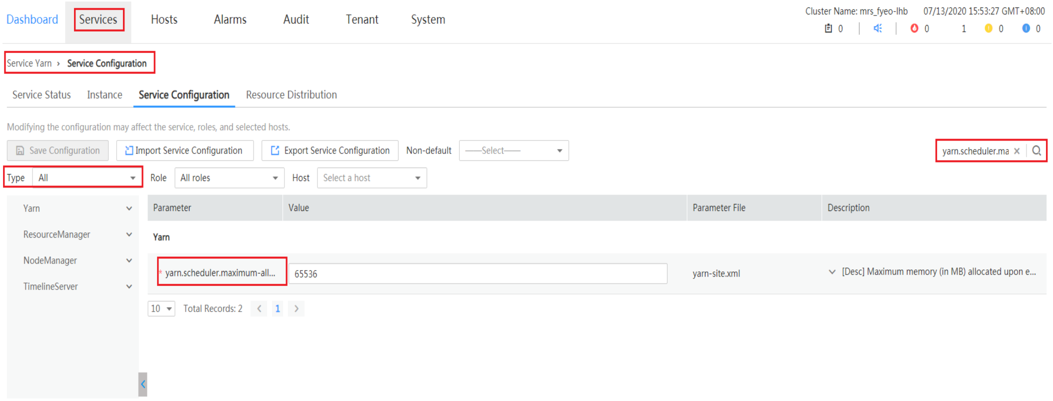
MRS Manager:

Step 1 Log in to MRS Manager.

Step 2 Choose **Services** > **Yarn** > **Service Configuration** and set **Type** to **All**.

Step 3 In **Search**, enter **yarn.scheduler.maximum-allocation-mb** to modify the parameter, save the configuration, and then restart the service. See the following figure.

Figure 15-56 Modifying Yarn service parameters



Cluster Name: mrs_fyeo-lhb 07/13/2020 15:53:27 GMT+08:00

Modifying the configuration may affect the service, roles, and selected hosts.

Non-default ——Select——

yarn.scheduler.ma

Type All Role All roles Host Select a host

Parameter	Value	Parameter File	Description
Yarn			
* yarn.scheduler.maximum-all...	65536	yarn-site.xml	[Desc] Maximum memory (in MB) allocated upon e...

Total Records: 2

----End

FusionInsight Manager:

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > **Service** > **Yarn**. Click **Configurations** and select **All Configurations**.

Step 3 In **Search**, enter **yarn.scheduler.maximum-allocation-mb** to modify the parameter, save the configuration, and then restart the service.

----End

15.16.7 Message "Can't get the Kerberos realm" Is Displayed in Yarn-cluster Mode

Symptom

A Spark task fails to be submitted due to an authentication failure.

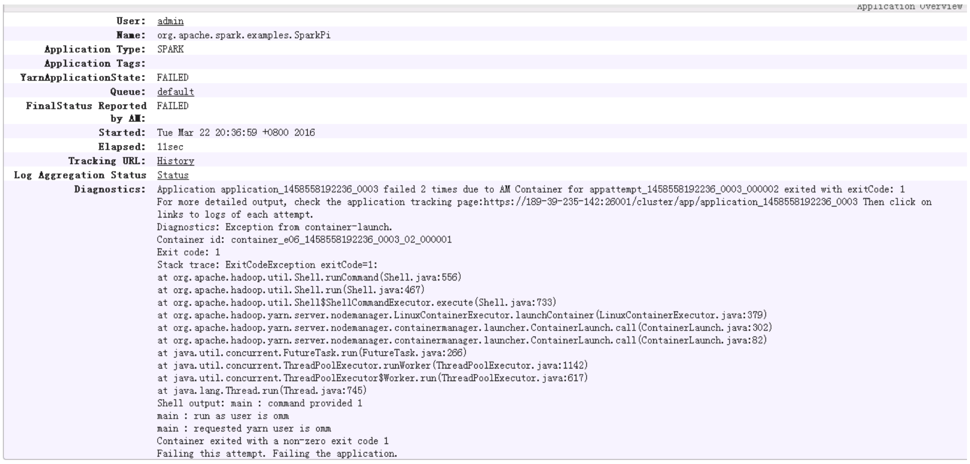
Cause Analysis

1. According to the exception printed in the driver log, the token used to connect to HDFS cannot be found.

```
16/03/22 20:37:10 WARN Client: Exception encountered while connecting to the server :
org.apache.hadoop.ipc.RemoteException(org.apache.hadoop.security.token.SecretManager
$InvalidToken): token (HDFS_DELEGATION_TOKEN token 192 for admin) can't be found in cache
16/03/22 20:37:10 WARN Client: Failed to cleanup staging dir .sparkStaging/
application_1458558192236_0003
org.apache.hadoop.ipc.RemoteException(org.apache.hadoop.security.token.SecretManager
$InvalidToken): token (HDFS_DELEGATION_TOKEN token 192 for admin) can't be found in cache
```

2. The native Yarn web UI shows that ApplicationMaster fails to be started twice and the task exits.

Figure 15-57 ApplicationMaster start failure



```
                 User:  admin
                 Name:  org.apache.spark.examples.SparkPi

                        Container exited with a non-zero exit code 1
                        Failing this attempt. Failing the application.
```

3. The ApplicationMaster log shows the following error information:

```
Exception in thread "main" java.lang.ExceptionInInitializerError
Caused by: org.apache.spark.SparkException: Unable to load YARN support
Caused by: java.lang.IllegalArgumentException: Can't get Kerberos realm
Caused by: java.lang.reflect.InvocationTargetException
Caused by: KrbException: Cannot locate default realm
Caused by: KrbException: Generic error (description in e-text) (60) - Unable to locate Kerberos realm
org.apache.hadoop.hive.metastore.MetaStoreUtils.newInstance(MetaStoreUtils.java:1410)
```

```
... 86 more
Caused by: javax.jdo.JDOFatalInternalException: Unexpected exception caught.
NestedThrowables:java.lang.reflect.InvocationTargetException
... 110 more
```

4. When you execute **./spark-submit --class yourclassname --master yarn-cluster /yourdependencyjars** to submit a task in Yarn-cluster mode, the driver is enabled in the cluster. Because the client's **spark.driver.extraJavaOptions** is loaded, you cannot find the **kdc.conf** file in the target path on the cluster node and cannot obtain information required for Kerberos authentication. As a result, the ApplicationMaster fails to be started.

Solution

When submitting a task on the client, configure the **spark.driver.extraJavaOptions** parameter in the CLI. In this way, the **spark.driver.extraJavaOptions** parameter in the **spark-defaults.conf** file is not automatically loaded from the client path. When starting a Spark task, use **--conf** to specify the driver configuration as follows (note that the quotation mark after **spark.driver.extraJavaOptions=** is mandatory):

./spark-submit -class yourclassname --master yarn-cluster --conf spark.driver.extraJavaOptions="

-Dlog4j.configuration=file:/opt/client/Spark/spark/conf/log4j.properties -Djetty.version=x.y.z -Dzookeeper.server.principal=zookeeper/hadoop.794bbab6_9505_44cc_8515_b4eddc84e6c1.com -Djava.security.krb5.conf=/opt/client/KrbClient/kerberos/var/krb5kdc/krb5.conf -Djava.security.auth.login.config=/opt/client/Spark/spark/conf/jaas.conf -Dorg.xerial.snappy.tempdir=/opt/client/Spark/tmp -Dcarbon.properties.filepath=/opt/client/Spark/spark/conf/carbon.properties" ../yourdependencyjars

15.16.8 Failed to Start spark-sql and spark-shell Due to JDK Version Mismatch

Symptom

The JDK version does not match. As a result, the client fails to start spark-sql and spark-shell.

Cause Analysis

1. The following error information is displayed on the Driver:

```
 Exception Occurs: BadPadding 16/02/22 14:25:38 ERROR Schema: Failed initialising database. Unable
to open a test connection to the given database. JDBC url = jdbc:postgresql://ip:port/sparkhivemeta,
username = spark. Terminating connection pool (set lazyInit to true if you expect to start your
database after your app).
```

2. When a SparkSQL task is used, DBService needs to be accessed to obtain metadata information. On the client, the ciphertext needs to be decrypted for access. During the use, the user does not follow the process or configure environment variables, and the default JDK version exists in the environment variables of the client. As a result, the decryption program invoked during decryption is abnormal, and the user is locked.

Solution

Step 1 Run the **which java** command to check whether the default Java command is the Java command of the client.

Step 2 If it is not, go to the next step.

source ${client_path}/bigdata_env

Run the **kinit** *username* command and enter the password corresponding to the username to start the task.

----End

15.16.9 ApplicationMaster Failed to Start Twice in Yarn-client Mode

Symptom

In Yarn-client mode, ApplicationMaster fails to start twice.

Cause Analysis

1. Driver exception:

```
16/05/11 18:10:56 INFO Client:
client token: N/A
diagnostics: Application application_1462441251516_0024 failed 2 times due to AM Container for
appattempt_1462441251516_0024_000002 exited with  exitCode: 10
For more detailed output, check the application tracking page:https://hdnode5:26001/cluster/app/
application_1462441251516_0024 Then click on links to logs of each attempt.
Diagnostics: Exception from container-launch.
Container id: container_1462441251516_0024_02_000001
```

2. The ApplicationMaster log file contains the following error information:

```
2016-05-12 10:21:23,715 | ERROR | [main] | Failed to connect to driver at 192.168.30.57:23867,
retrying ... | org.apache.spark.Logging$class.logError(Logging.scala:75)
2016-05-12 10:21:24,817 | ERROR | [main] | Failed to connect to driver at 192.168.30.57:23867,
retrying ... | org.apache.spark.Logging$class.logError(Logging.scala:75)
2016-05-12 10:21:24,918 | ERROR | [main] | Uncaught exception:  | org.apache.spark.Logging
$class.logError(Logging.scala:96)
org.apache.spark.SparkException: Failed to connect to driver!
at org.apache.spark.deploy.yarn.ApplicationMaster.waitForSparkDriver(ApplicationMaster.scala:426)
at org.apache.spark.deploy.yarn.ApplicationMaster.runExecutorLauncher(ApplicationMaster.scala:292)
...
2016-05-12 10:21:24,925 | INFO  | [Thread-1] | Unregistering ApplicationMaster with FAILED (diag
message: Uncaught exception: org.apache.spark.SparkException: Failed to connect to driver!) |
org.apache.spark.Logging$class.logInfo(Logging.scala:59)
```

   In Spark-client mode, the task Driver runs on a client node (usually a node outside the cluster). During the startup, the ApplicationMaster process is started in the cluster. After the process is started, information needs to be registered with the Driver process. The task can be continued only after the registration is successful. According to the ApplicationMaster log, the connection to the Driver fails, which causes the task failure.

Solution

Step 1 Check whether the IP address of the Driver process can be pinged.

Step 2 Start a SparkPI task. Information similar to the following is displayed on the console:

```
16/05/11 18:07:20 INFO Remoting: Remoting started; listening on addresses :[akka.tcp://
sparkDriver@192.168.1.100:23662]
16/05/11 18:07:20 INFO Utils: Successfully started service 'sparkDriver' on port 23662.
```

Step 3 Run the **netstat - anp | grep 23662** command on the node (192.168.1.100 in **Step 2**) to check whether the port is enabled. The following information indicates that the port is enabled.

```
tcp        0      0  ip:port    :::*                    LISTEN       107274/java
tcp        0      0  ip:port   ip:port                    ESTABLISHED 107274/java
```

Step 4 Run the **telnet 192.168.1.100 23662** command on the node where ApplicationMaster is started to check whether the port can be connected. Perform this operation as both the **root** and **omm** users. If information similar to **Escape character is '^]'** is displayed, the connection is normal. If **connection refused** is displayed, the connection fails and the related port cannot be connected.

If the port is enabled but cannot be connected from other nodes, check the network configuration.

NOTE

The port (port 23662 in this example) is randomly selected each time. Therefore, you need to test the port enabled by the task.

----End

15.16.10 Failed to Connect to ResourceManager When a Spark Task Is Submitted

Symptom

The connection to ResourceManager is abnormal. As a result, Spark tasks fail to be submitted.

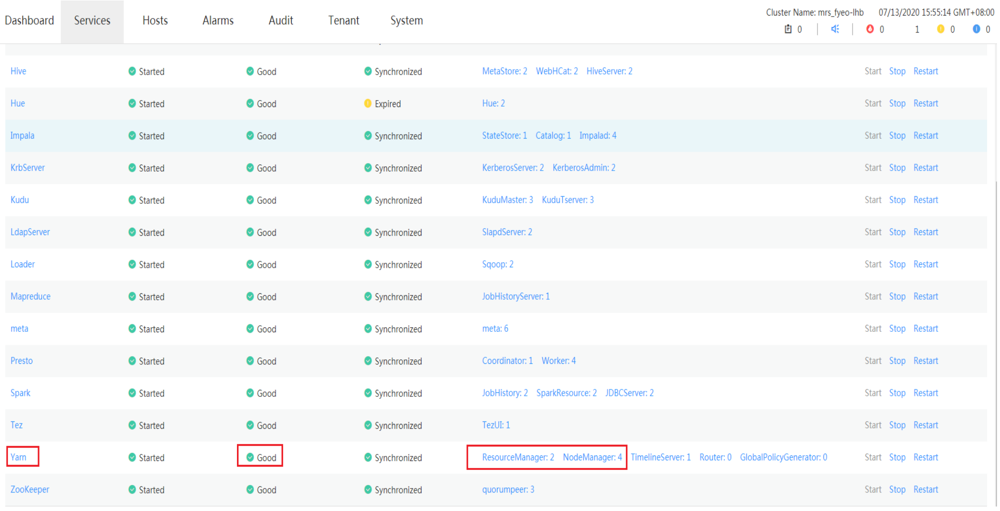
Cause Analysis

1. The following error information is displayed on the Driver, indicating that port 26004 connecting to the active and standby ResourceManager nodes is rejected:

```
15/08/19 18:36:16 INFO RetryInvocationHandler: Exception while invoking getClusterMetrics of class
ApplicationClientProtocolPBClientImpl over 33 after 1 fail over attempts. Trying to fail over after
sleeping for 17448ms.
 java.net.ConnectException: Call From ip0 to ip1:26004 failed on connection exception:
java.net.ConnectException: Connection refused.
INFO RetryInvocationHandler: Exception while invoking getClusterMetrics of class
ApplicationClientProtocolPBClientImpl over 32 after 2 fail over attempts. Trying to fail over after
sleeping for 16233ms.
 java.net.ConnectException: Call From ip0 to ip2:26004 failed on connection exception:
java.net.ConnectException: Connection refused;
```

2. On MRS Manager, check whether ResourceManager is running properly, as shown in **Figure 15-58**. If Yarn is faulty or an unknown exception occurs on a Yarn service instance, ResourceManager of the cluster may be abnormal.

Figure 15-58 Service status



Cluster Name: mrs_fyeo-lhb 07/13/2020 15:55:14 GMT+08:00

Hive	Started	Good	Synchronized	MetaStore: 2 WebHCat: 2 HiveServer: 2	Start Stop Restart
Hue	Started	Good	Expired	Hue: 2	Start Stop Restart
Impala	Started	Good	Synchronized	StateStore: 1 Catalog: 1 Impalad: 4	Start Stop Restart
KrbServer	Started	Good	Synchronized	KerberosServer: 2 KerberosAdmin: 2	Start Stop Restart
Kudu	Started	Good	Synchronized	KuduMaster: 3 KuduTserver: 3	Start Stop Restart
LdapServer	Started	Good	Synchronized	SlapdServer: 2	Start Stop Restart
Loader	Started	Good	Synchronized	Sqoop: 2	Start Stop Restart
Mapreduce	Started	Good	Synchronized	JobHistoryServer: 1	Start Stop Restart
meta	Started	Good	Synchronized	meta: 6	Start Stop Restart
Presto	Started	Good	Synchronized	Coordinator: 1 Worker: 4	Start Stop Restart
Spark	Started	Good	Synchronized	JobHistory: 2 SparkResource: 2 JDBCServer: 2	Start Stop Restart
Tez	Started	Good	Synchronized	TezUI: 1	Start Stop Restart
Yarn	Started	Good	Synchronized	ResourceManager: 2 NodeManager: 4 TimelineServer: 1 Router: 0 GlobalPolicyGenerator: 0	Start Stop Restart
ZooKeeper	Started	Good	Synchronized	quorumpeer: 3	Start Stop Restart

3. Check whether the client is the latest one in the cluster.

   Check whether the ResourceManager instance has been migrated in the cluster. (Uninstall a ResourceManager instance and add it back to other nodes.)

4. On MRS Manager, click **Audit** to view audit logs and check whether related operations are recorded.

   Run the **ping** command to check whether the IP address can be pinged.

Solution

- If ResourceManager is abnormal, see the Yarn-related sections to rectify the fault.
- If the client is not the latest, download the client again.
- If the IP address cannot be pinged, contact network management personnel to check the network.

15.16.11 DataArts Studio Failed to Schedule Spark Jobs

Issue

DataArts Studio fails to schedule jobs, and a message is displayed indicating that data in the **/thriftserver/active_thriftserver** directory cannot be read.

Symptom

DataArts Studio fails to schedule jobs, and the following error is reported indicating that data in the **/thriftserver/active_thriftserver** directory cannot be read:

Can not get JDBC Connection, due to KeeperErrorCode = NoNode for /thriftserver/active_thriftserver

Cause Analysis

When DataArts Studio submits a Spark job, Spark JDBC is invoked. Spark starts a ThriftServer process for the client to provide JDBC connections. During the startup, JDBCServer creates the **active_thriftserver** subdirectory in the **/thriftserver** directory of ZooKeeper, and registers related connection information. If the connection information cannot be read, the JDBC connection is abnormal.

Procedure

Check whether the ZooKeeper directory contains the target directory and registration information.

Step 1 Log in to any master node as user **root** and initialize environment variables.

source /opt/client/bigdata_env

Step 2 Run the **zkCli.sh -server 'ZookeeperIp:2181'** command to log in to ZooKeeper.

Step 3 Run the **ls /thriftserver** command to check whether the **active_thriftserver** directory exists.

- If the **active_thriftserver** directory exists, run the **get /thriftserver/active_thriftserver** command to check whether it contains the registered configuration information.
  - If yes, contact technical support.
  - If no, go to **Step 4**.
- If the **active_thriftserver** directory does not exist, go to **Step 4**.

Step 4 Log in to Manager and check whether the active/standby status of the Spark JDBCServer instance is unknown.

- If yes, go to **Step 5**.
- If no, contact O&M personnel.

Step 5 Restart the two JDBCServer instances. Check whether the status of the active and standby instances is normal and whether the target directory and data exist in ZooKeeper. If yes, the job is restored. If the instance status is not restored, contact technical support.

----End

15.16.12 Submission Status of the Spark Job API Is Error

Issue

After a Spark job is submitted using an API, the job status is displayed as **error**.

Issue Type

Job management

Symptom

After the log level in **/opt/client/Spark/spark/conf/log4j.properties** is changed and a job is submitted using API V1.1, the job status is displayed as error.

Cause Analysis

The executor monitors the job log output and determines the job execution result. After the execution result is changed to **error**, the output result cannot be detected. Therefore, the executor determines that the job status is abnormal after the job expires.

Procedure

Change the log level in the **/opt/client/Spark/spark/conf/log4j.properties** file to **info**.

Summary and Suggestions

You are advised to use the V2 API to submit jobs.

15.16.13 Alarm 43006 Is Repeatedly Generated in the Cluster

Issue

The alarm "ALM-43006 Heap Memory Usage of the JobHistory Process Exceeds the Threshold" is repeatedly generated in the cluster, and the setting according to the alarm reference is invalid.

Symptom

Alarm **ALM-43006 Heap Memory Usage of the JobHistory Process Exceeds the Threshold** is generated in the cluster. The same alarm is generated again a period of time after handling measures are taken.

Cause Analysis

The JobHistory memory leakage may occur. You need to install the corresponding patch to rectify the fault.

Procedure

- Increase the heap memory of the JobHistory process.
- If the heap memory has been increased, restart the JobHistory instance.

15.16.14 Failed to Create or Delete a Table in Spark Beeline

Issue

When the customer frequently creates or deletes a large number of users in Spark Beeline, some users occasionally fail to create or delete tables.

Symptom

The procedure for creating a table is as follows:

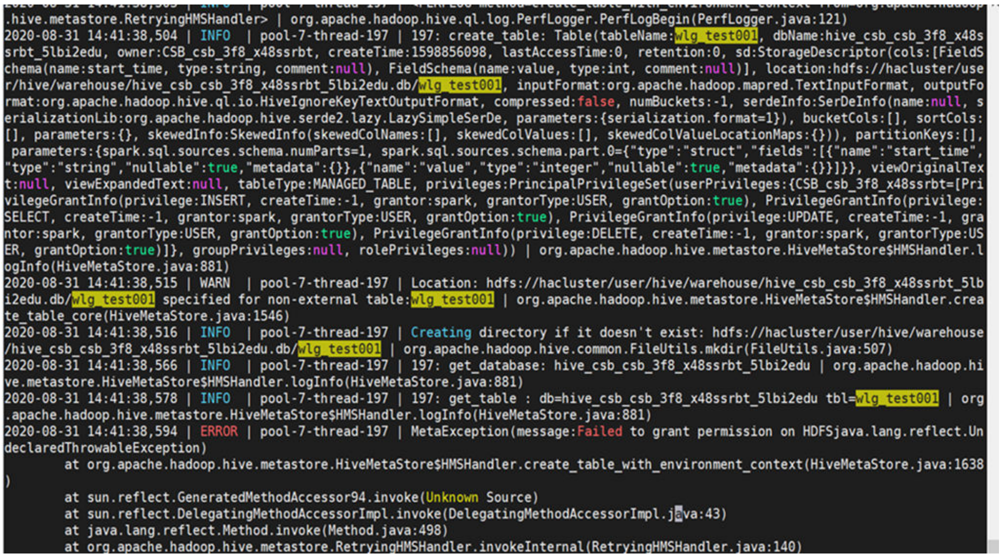
```
CREATE TABLE wlg_test001 (start_time STRING,value INT);
```

The following error message is displayed:

```
Error: org.apache.spark.sql.AnalysisException:
org.apache.hadoop.hive.ql.metadata.HiveException: MetaException(message:Failed to grant permission on
HDFSjava.lang.reflect.UndeclaredThrowableException); (state=,code=0)
```

Cause Analysis

1. View metastore logs.



```
.hive.metastore.RetryingHMSHandler> | org.apache.hadoop.hive.ql.log.PerfLogger.PerfLogBegin(PerfLogger.java:121)
2020-08-31 14:41:38,504 | INFO  | pool-7-thread-197 | 197: create_table: Table(tableName:wlg_test001, dbName:hive_csb_csb_3f8_x48s

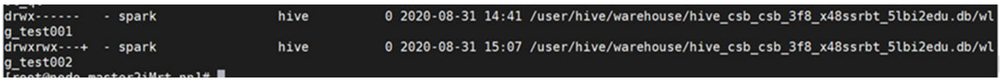
3. Compare permission (**test001** is a table created by a user in abnormal state, and **test002** is a table created by a user in normal state).



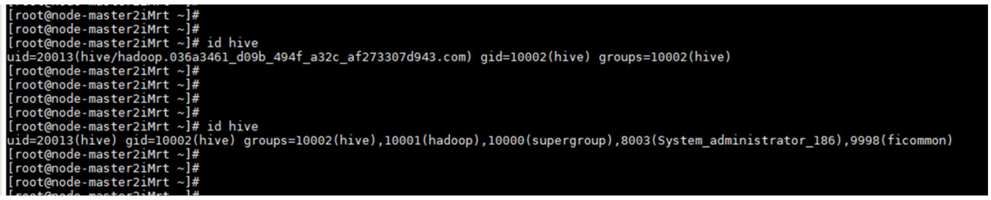
```
drwx------   - spark            hive         0 2020-08-31 14:41 /user/hive/warehouse/hive_csb_csb_3f8_x48ssrbt_5lbi2edu.db/wl
g_test001
drwxrwx---+  - spark            hive         0 2020-08-31 15:07 /user/hive/warehouse/hive_csb_csb_3f8_x48ssrbt_5lbi2edu.db/wl
g_test002
```

4. An error similar to the following is reported when a table is dropped:

```
0: jdbc:hive2://192.168.1.42:10000/> drop table
dataplan_modela_csbch2;
Error: Error while compiling statement: FAILED:
SemanticException Unable to fetch table dataplan_modela_csbch2.
java.security.AccessControlException: Permission denied: user=CSB_csb_3f8_x48ssrbt,
access=READ,
inode="/user/hive/warehouse/hive_csb_csb_3f8_x48ssrbt_5lbi2edu.db/
dataplan_modela_csbch2":spark:hive:drwx------
```

5. Analyze the cause.

   The default user created during cluster creation uses the same UID, causing user disorder. This problem is triggered when a large number of users are created. As a result, the Hive user does not have the permission to create tables occasionally.



```

```

Procedure

Restart the **sssd** process of the cluster.

Run the **service sssd restart** command as the **root** user to restart the **sssd** process and run the **ps -ef | grep sssd** command to check whether the **sssd** process is running properly.

In normal cases, the **/usr/sbin/sssd** process and three sub-processes **/usr/libexec/sssd/sssd_be**, **/usr/libexec/sssd/sssd_nss** and **/usr/libexec/sssd/sssd_pam** exist.

15.16.15 Failed to Connect to the Driver When a Node Outside the Cluster Submits a Spark Job to Yarn

Issue

When a node outside the cluster uses the client mode to submit a Spark task to Yarn, the task fails and an error message is displayed, indicating that the driver cannot be connected.

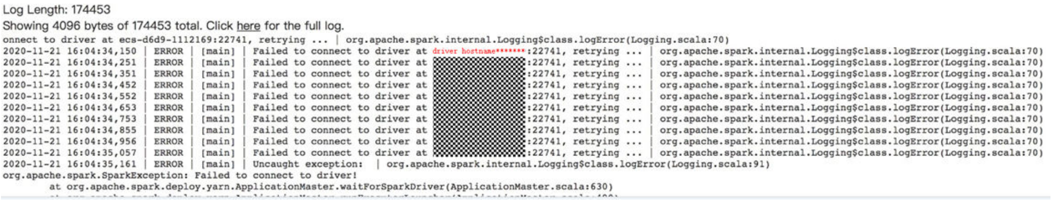
Symptom

Nodes outside the cluster can communicate with each node in the cluster. When a node outside the cluster submits a Spark task to Yarn in client mode, the task fails and an error message is displayed, indicating that the driver cannot be connected.

Cause Analysis

When a Spark task is submitted in the client mode, the driver process of Spark is on the client side, and the executor needs to interact with the driver to run the job.

If the NodeManager fails to connect to the node where the client is located, the following error is reported:



```
Log Length: 174453
Showing 4096 bytes of 174453 total. Click here for the full log.

2020-11-21 16:04:35,161 | ERROR | [main] | Uncaught exception:  | org.apache.spark.internal.Logging$class.logError(Logging.scala:91)
org.apache.spark.SparkException: Failed to connect to driver!
        at org.apache.spark.deploy.yarn.ApplicationMaster.waitForSparkDriver(ApplicationMaster.scala:630)
```

Procedure

Specify the IP address of the driver in the Spark configuration of the client.

Add **spark.driver.host=driverIP** to *<Client installation path>***/Spark/spark/conf/spark-defaults.conf** and run the Spark task again.

Summary and Suggestions

You are advised to submit jobs in cluster mode.

15.16.16 Large Number of Shuffle Results Are Lost During Spark Task Execution

Issue

Spark tasks fail to be executed. The task log shows that a large number of **shuffle** files are lost.

Symptom

Spark tasks fail to be executed. The task log shows that a large number of **shuffle** files are lost.

Cause Analysis

When Spark is running, the **shuffle** file generated temporarily is stored in the temporary directory of the executor for later use.

When an executor exits abnormally, NodeManager deletes the temporary directory of the container where the executor is located. When other executors apply for the shuffle result of the executor, a message is displayed indicating that the file cannot be found.

Therefore, you need to check whether the executor exits abnormally. You can check whether there are executors in the **dead** state on the executors tab page on the Spark task page and view the executor logs of each **dead** state, determine the cause of abnormal exit. Some executors may exit because the **shuffle** file cannot be found. You need to find the earliest executor that exits abnormally.

Common abnormal exit causes:

- OOM occurs on the executor.
- Multiple tasks fail when the executor is running.
- The node where the executor is located is cleared.

Procedure

Adjust or modify the task parameters or code based on the actual cause of the abnormal exit of the executor, and run the Spark task again.

15.16.17 Disk Space Is Insufficient Due to Long-Term Running of JDBCServer

Issue

When the JDBCServer service connected to Spark submits a spark-sql task to the Yarn cluster, the data disk of the Core node is fully occupied after the task runs for a period of time.

Symptom

When the JDBCServer service of a customer connected to Spark submits a spark-sql task to the Yarn cluster, the data disk of the Core node is fully occupied after the task runs for a period of time.

After checking the disk usage in the background, it is found that there are too many APP temporary files (files generated by shuffle) of the JDBCServer service, and the files are not cleared, occupying a large amount of memory.

Cause Analysis

After checking the directories that contain a large number of files on the Core node, it is found that most of the directories are similar to **blockmgr-033707b6-fbbb-45b4-8e3a-128c9bcfa4bf**, which stores temporary shuffle files generated during computing.

The dynamic resource allocation function of Spark is enabled on JDBCServer, and shuffle is hosted by NodeManager. NodeManager only manages these files based on the running period of the application, and does not check whether the container where a single executor is located exists. Therefore, the temporary files are deleted only when the app is stopped. When a task runs for a long time, a large number of temporary files occupy a large amount of disk space.

Procedure

Start a scheduled task to delete shuffle files that have been stored for a specified period of time. For example, delete shuffle files that have been stored for more than 6 hours each hour.

Step 1 Create the **clean_appcache.sh** script. If there are multiple data disks, change the value of **data1** in **BASE_LOC** based on the actual situation.

- Security cluster

```
#!/bin/bash
BASE_LOC=/srv/BigData/hadoop/data1/nm/localdir/usercache/spark/appcache/application_*/
blockmgr*
find $BASE_LOC/ -mmin +360 -exec rmdir {} \;
find $BASE_LOC/ -mmin +360 -exec rm {} \;
```

- Common cluster

```
#!/bin/bash
BASE_LOC=/srv/BigData/hadoop/data1/nm/localdir/usercache/omm/appcache/application_*/
```

```
blockmgr*
find $BASE_LOC/ -mmin +360 -exec rmdir {} \;
find $BASE_LOC/ -mmin +360 -exec rm {} \;
```

Step 2 Run the following commands to change the permission to the script:

chmod 755 clean_appcache.sh

Step 3 Add a scheduled task to start the clearance script. Change the script path to the actual path.

Run the **crontab -l** command to view the scheduled task.

Run the **crontab -e** command to edit the scheduled task.

```
0 * * * * sh /root/clean_appcache.sh > /dev/null 2>&1
```

----End

15.16.18 Failed to Load Data to a Hive Table Across File Systems by Running SQL Statements Using Spark Shell

Issue

When the **spark-shell** command is used to execute SQL statements or the **spark-submit** command is used to submit Spark tasks, the **load** command of SQL statements exists, and the source data and target table are not stored in the same file system. An error is reported when the MapReduce task is started in the preceding two modes.

Cause Analysis

When the **load** command is used to import data to the Hive table across file systems (for example, the original data is stored in the HDFS but the Hive table data is stored in the OBS), and the file length is greater than the threshold (32 MB by default). In this case, the MapReduce job that uses DistCp is triggered to migrate data. The MapReduce task configuration is directly extracted from the Spark task configuration. However, the **net.topology.node.switch.mapping.impl** configuration item of the Spark task does not retain the default value of the Hadoop. Therefore, the JAR package of the Spark needs to be used. As a result, the MapReduce reports an error indicating that the class cannot be found.

Procedure

Solution 1:

If the file size is small, set the default file size to a value greater than the maximum file size. For example, if the maximum file size is 95 MB, run the following command:

```
hive.exec.copyfile.maxsize=104857600
```

Solution 2:

If the file size is large, use DistCp to improve the data migration efficiency. Add the following parameters when starting the Spark task:

```
--conf spark.hadoop.net.topology.node.switch.mapping.impl=org.apache.hadoop.net.ScriptBasedMapping
```

15.16.19 Spark Task Submission Failure

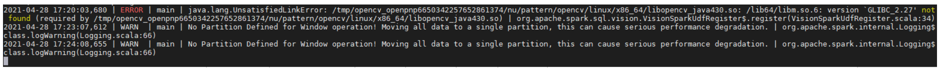
Symptom

- A Spark task fails to be submitted.
- Spark displays a message indicating that the Yarn JAR package cannot be obtained.
- A file is submitted for multiple times.

Cause Analysis

- Symptom 1:

  The most common cause for task submission failure is authentication failure.

```
2021-04-28 17:20:03,680 | ERROR | main | java.lang.UnsatisfiedLinkError: /tmp/opencv_openpnp6650342257652861374/nu/pattern/opencv/linux/x86_64/libopencv_java430.so: /lib64/libm.so.6: version `GLIBC_2.27' not
 found (required by /tmp/opencv_openpnp6650342257652861374/nu/pattern/opencv/linux/x86_64/libopencv_java430.so) | org.apache.spark.sql.vision.VisionSparkUdfRegister$.register(VisionSparkUdfRegister.scala:34)
2021-04-28 17:23:07,612 | WARN  | main | No Partition Defined for Window operation! Moving all data to a single partition, this can cause serious performance degradation. | org.apache.spark.internal.Logging$
class.logWarning(Logging.scala:66)
2021-04-28 17:24:08,655 | WARN  | main | No Partition Defined for Window operation! Moving all data to a single partition, this can cause serious performance degradation. | org.apache.spark.internal.Logging$
class.logWarning(Logging.scala:66)
```

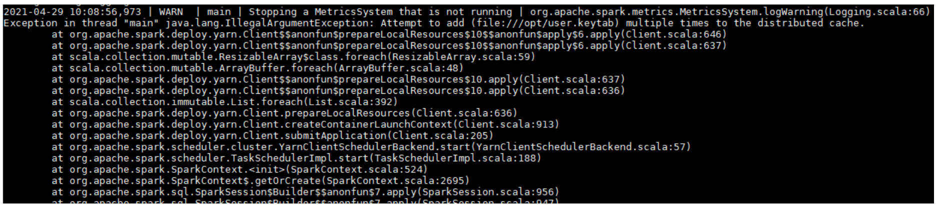
  The parameter settings may be incorrect.

- Symptom 2:

  By default, the cluster adds the Hadoop JAR package of the analysis node to the classpath of the task. If the system displays a message indicating that Yarn packages cannot be found, the Hadoop configuration is not set.

- Symptom 3:

  The common scenario is as follows: The **--files** option is used to upload the **user.keytab** file, and then the **--keytab** option is used to specify the same file. As a result, the same file is uploaded for multiple times.

```
2021-04-29 10:08:56,973 | WARN  | main | Stopping a MetricsSystem that is not running | org.apache.spark.metrics.MetricsSystem.logWarning(Logging.scala:66)

        at org.apache.spark.scheduler.TaskSchedulerImpl.start(TaskSchedulerImpl.scala:188)
        at org.apache.spark.SparkContext.<init>(SparkContext.scala:524)
        at org.apache.spark.SparkContext$.getOrCreate(SparkContext.scala:2695)
        at org.apache.spark.sql.SparkSession$Builder$$anonfun$7.apply(SparkSession.scala:956)
        at org.apache.spark.sql.SparkSession$Builder$$anonfun$7.apply(SparkSession.scala:947)
```

Procedure

- Symptom 1:

  Run **kinit** *[user]* again and modify the corresponding configuration items.

- Symptom 2:

  Check that the Hadoop configuration items are correct and the **core-site.xml**, **hdfs-site.xml**, **yarn-site.xml**, and **mapred-site.xml** configuration files in the **conf** directory of Spark are correct.

- Symptom 3:

  Copy a new **user.keytab** file, for example:

  cp user.keytab user2.keytab

  spark-submit --master yarn --files user.keytab --keytab user2.keytab ......

15.16.20 Spark Task Execution Failure

Symptom

- An executor out of memory (OOM) error occurs.
- The information about the failed task shows that the failure cause is "lost task xxx."

Cause Analysis

- Symptom 1: The data volume is too large or too many tasks are running on the same executor at the same time.
- Symptom 2: Some tasks fail to be executed. When the error is reported, determine the node where the lost task is running. Generally, the error is caused by the abnormal exit of the lost task.

Procedure

- Symptom 1:
  - If the data volume is too large, adjust the memory size of the executor and use **--executor-memory** to specify the memory size.
  - If too many tasks are running at the same time, check the number of vcores specified by **--executor-cores**.
- Symptom 2: Locate the cause in the corresponding task log. If an OOM error occurs, see the solutions to symptom 1.

15.16.21 JDBCServer Connection Failure

Symptom

- The ha-cluster cannot be identified (unknowHost or port required).
- Failed to connect to JDBCServer.

Cause Analysis

- Symptom 1: The **spark-beeline** command is used to connect to JDBCServer. JDBCServer in versions earlier than MRS_3.0 adopts HA mode. Therefore, a specific URL and the JAR package provided by MRS Spark is required to connect to JDBCServer.
- Symptom 2: The JDBCServer service is not running properly or port listening is abnormal.

Procedure

- Symptom 1: Use a specific URL and the JAR package provided by MRS Spark to connect to JDBCServer.
- Symptom 2: Check that the JDBCServer service is running properly and port listening is normal, and try again.

15.16.22 Failed to View Spark Task Logs

Symptom

- A user fails to view logs when a task is running.
- A user fails to view logs when a task is complete.

Cause Analysis

- Symptom 1: The MapReduce component is abnormal.
- Symptom 2:
  - The JobHistory service of Spark is abnormal.
  - The log size is too large, and NodeManager times out during log aggregation.
  - The permission on the HDFS log storage directory (**/tmp/logs/Username/logs** by default) is abnormal.
  - Logs have been deleted. By default, Spark JobHistory stores event logs for seven days (specified by **spark.history.fs.cleaner.maxAge**). MapReduce stores task logs for 15 days (specified by **mapreduce.jobhistory.max-age-ms**).
  - If the task cannot be found on the Yarn page, it may have been cleared by Yarn. By default, Yarn stores 10,000 historical tasks (specified by **yarn.resourcemanager.max-completed-applications**).

Procedure

- Symptom 1: Check whether the MapReduce component is running properly. If it is abnormal, restart it. If the fault persists, check the JobhistoryServer log file in the background.
- Symptom 2: Perform the following checks in sequence:
  a. Check whether JobHistory of Spark is running properly.
  b. On the app details page of Yarn, check whether the log file is too large. If log aggregation fails, the value of **Log Aggregation Status** should be **Failed** or **Timeout**.
  c. Check whether the permission on the corresponding directory is normal.
  d. Check whether the corresponding **appid** file exists in the directory. In MRS 3.x or later, the event log files are stored in the **hdfs://hacluster/spark2xJobHistory2x** directory. In versions earlier than MRS 3.x, the event log files are stored in the **hdfs://hacluster/sparkJobHistory** directory. The task run logs are stored in the **hdfs://hacluster/tmp/logs/*Username*/logs** directory.
  e. Check whether **appid** or the current job ID exceeds the maximum value in the historical records.

15.16.23 Authentication Fails When Spark Connects to Other Services

Symptom

- When Spark connects to HBase, an authentication failure message is displayed or the HBase table cannot be connected.
- When Spark connects to HBase, a message is displayed indicating that the JAR package cannot be found.

Cause Analysis

- Symptom 1: HBase does not obtain the authentication information of the current task. As a result, the authentication fails when HBase is connected, and the corresponding data cannot be read
- Symptom 2: By default, Spark does not load the HBase JAR package. You need to use **--jars** to add the JAR package to the task.

Procedure

- Symptom 1: Enable the HBase authentication function by running the **spark.yarn.security.credentials.hbase.enabled=true** command. However, do not replace **hbase-site.xml** on the Spark client with **hbase-site.xml** on the HBase client because they are not completely consistent.
- Symptom 2: Use **--jars** to upload the HBase JAR package.

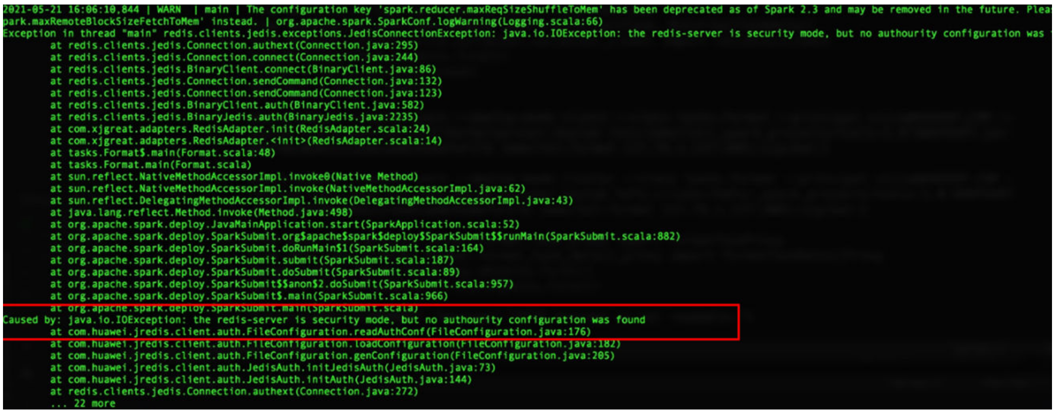
15.16.24 An Error Occurs When Spark Connects to Redis

Issue

An error occurs when the Spark component of the MRS 3.x security cluster is used to access Redis.

Symptom

When Spark of the MRS 3.0 security cluster is used to access Redis, the following error message is displayed.



```
2021-05-21 16:06:10,844 | WARN  | main | The configuration key 'spark.reducer.maxReqSizeShuffleToMem' has been deprecated as of Spark 2.3 and may be removed in the future. Plea
park.maxRemoteBlockSizeFetchToMem' instead. | org.apache.spark.SparkConf.logWarning(Logging.scala:66)

        at redis.clients.jedis.Connection.authext(Connection.java:272)
        ... 22 more
```

Cause Analysis

The **jars** directory of Spark contains a **jredisclient-xxx.jar** package provided by the MRS cluster. This package is loaded when a Spark task connects to Redis, thereby causing this error. You can manually remove this package to rectify the fault.

Procedure

Step 1 Delete JAR packages from the Spark client.

cd $SPARK_HOME/jars

mv jredisclient-*.jar /tmp

Step 2 Delete JAR packages from the Spark server.

Log in to the nodes (generally two) where SparkResource2x is located.

mkdir /tmp/SparkResource2x

cd /opt/Bigdata/FusionInsight_Current/1_*_SparkResource2x/install/spark/jars/

mv jredisclient-*.jar /tmp/SparkResource2x

Step 3 Delete the **jredisclient** file from the HDFS.

1. Check configuration item **spark.yarn.archive** in the **$SPARK_HOME/conf/spark-defaults.conf** file to obtain the address of the **spark-archive-2x.zip** package.

   cat $SPARK_HOME/conf/spark-defaults.conf | grep "spark.yarn.archive"

2. Download the **spark-archive-2x.zip** package. (This section uses MRS 3.0.5 as an example. Modify the command based on the actual cluster version.)

   cd /opt

   mkdir sparkTmp

   cd sparkTmp

   hdfs dfs -get hdfs://hacluster/user/spark2x/jars/8.0.2.1/spark-archive-2x.zip

3. Decompress **spark-archive-2x.zip** and remove the package file.

   unzip spark-archive-2x.zip

   rm -f spark-archive-2x.zip

4. Remove the **jredisclient** package.

   rm -f jredisclient-*.jar

5. Compress the **spark-archive-2x.zip** package again.

   zip spark-archive-2x.zip ./*

6. Back up the original package from the HDFS to **tmp** and upload the newly compressed package to the HDFS.

   hdfs dfs -mv hdfs://hacluster/user/spark2x/jars/8.0.2.1/spark-archive-2x.zip /tmp

   hdfs dfs -put spark-archive-2x.zip hdfs://hacluster/user/spark2x/jars/8.0.2.1/spark-archive-2x.zip

7. Restart the JDBCServer service to prevent JDBCServer exceptions. The **jredisclient** file has been deleted from the **spark-archive-2x.zip** package.
8. Delete temporary files.

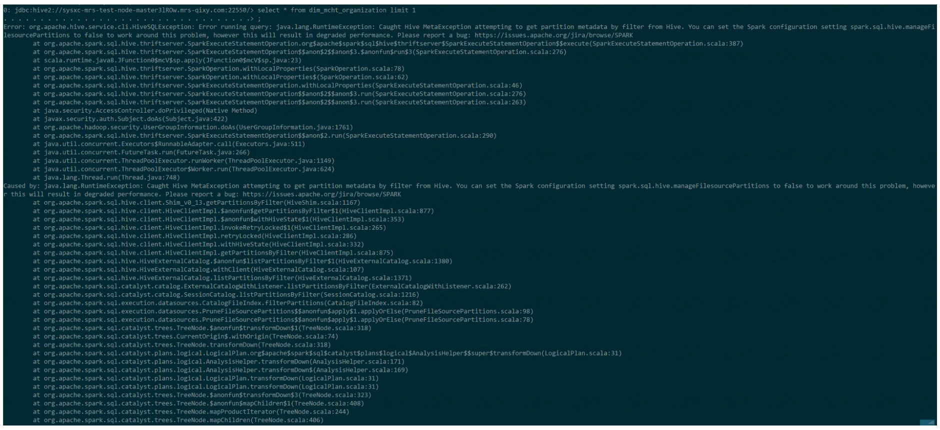
   rm -rf /opt/sparkTmp

----End

15.16.25 An Error Is Reported When spark-beeline Is Used to Query a Hive View

Issue

In MRS 3.1.2, an error is reported when spark-beeline is used to query a Hive view. The error information is as follows.



```

```

Cause Analysis

Failed to convert the format. Spark SQL uses its built-in Metastore instead of Hive Metastore. As a result, metadata fails to be read. Spark SQL reads data in Parquet format, but Hive reads data in ORC format by default.

Procedure

Step 1 Log in to the Spark client node and run the following commands to access Spark SQL:

cd *Client installation directory*

source bigdata_env

source Spark2x/component_env

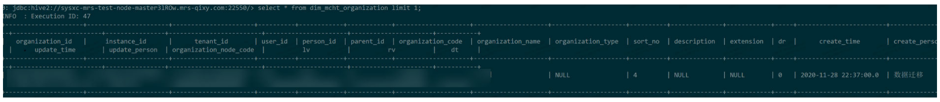
kinit *Component service user* (**kinit** is not required in a normal cluster.)

spark-sql

Step 2 Run the following command to set **spark.sql.hive.convertMetastoreOrc** to **false**:

set spark.sql.hive.convertMetastoreOrc=false;

Step 3 Query the Hive view again.



```
0: jdbc:hive2://sysxc-mrs-test-node-master31ROw.mrs-qixy.com:22550/> select * from dim_mcht_organization limit 1;

commons-compress-1.9.jar           commons-pool-1.5.4.jar               kite-data-mapreduce-1.1.0.jar         snappy-java-1.1.1.6.jar
commons-configuration-1.6.jar      commons-vfs2-2.0.jar                 kite-hadoop-compatibility-1.1.0.jar   xz-1.5.jar
commons-configuration2-2.1.jar     hadoop-huaweicloud-2.8.3-hw-39.jar   mysql-connector-java-5.1.47.jar
commons-dbcp-1.4.jar               hsqldb-1.8.0.10.jar                  opencsv-2.3.jar
[root@node-master1IoKo lib]# pwd
/opt/allClient/Sqoop/sqoop/lib
```

Step 2 Load environment variables in the client directory.

source bigdata_env

Step 3 Perform the Kerberos authentication.

If Kerberos authentication is not enabled for the cluster, skip this step. If it is enabled, run the following command to authenticate the current user:

kinit *MRS cluster user*

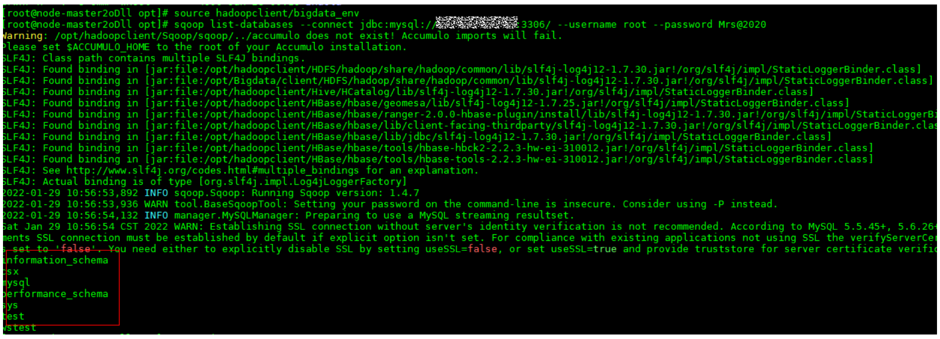
For example:

kinit admin

Step 4 Connect to the database.

sqoop list-databases --connect jdbc:mysql://IP:3306/ --username *Username* --password *Password*

An example is as follows.



```
[root@node-master2oDll opt]# source hadoopclient/bigdata_env
[root@node-master2oDll opt]# sqoop list-databases --connect jdbc:mysql://[redacted]:3306/ --username root --password Mrs@2020
Warning: /opt/hadoopclient/Sqoop/sqoop/../accumulo does not exist! Accumulo imports will fail.
Please set $ACCUMULO_HOME to the root of your Accumulo installation.

    at org.apache.sqoop.Sqoop.runTool(Sqoop.java:243)
    at org.apache.sqoop.Sqoop.main(Sqoop.java:252)
```

The following is an example of running the Sqoop command to extract data:

```
sqoop import \
--connect jdbc:mysql://mysqlServer address:Port number/database1 \
--username admin \
--password xxx \
--table table1 \
--hbase-table table2 \
--column-family info \
--hbase-row-key id \
--hbase-create-table --m 1
```

Procedure

After the Sqoop client is installed, the JAR packages on which HBase depends are not imported. You need to manually import the JAR packages on which HBase of an earlier version depends.

Step 1 Check whether the Sqoop and HBase clients are in the same path.

- If yes, go to **Step 2**.
- If no, delete the original Sqoop and HBase client files, download the complete clients from FusionInsight Manager, and install them in the same path. Then go to **Step 2**.

Step 2 Log in to the node where the Sqoop client is installed as user **root**.

Step 3 Download JAR packages of HBase 1.6.0 and upload them to the **lib** directory on the Sqoop client:

Step 4 After the packages are uploaded, run the following command to change the permission on the packages to **755**:

chmod 755 *Package name*

Step 5 Run the following command in the client directory to refresh the Sqoop client:

source bigdata_env

Run the target Sqoop command again.

----End

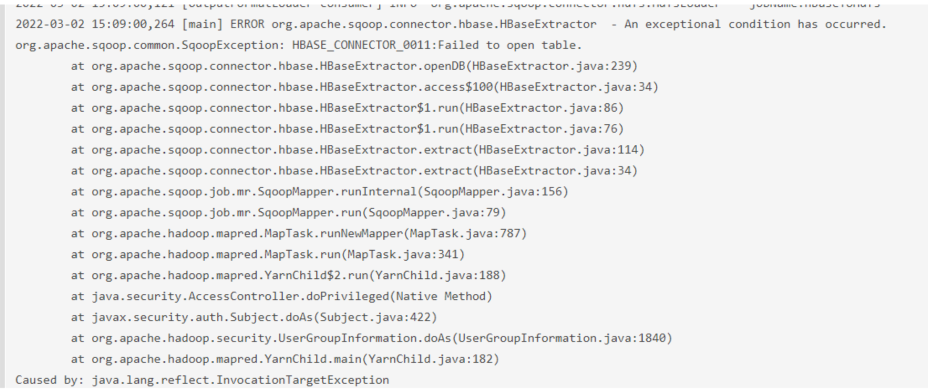
15.17.3 Failed to Export HBase Data to HDFS Through Hue's Sqoop Task

This section applies only to MRS 1.9.2 clusters.

Issue

An error is reported when a Sqoop operation is performed on Hue to export data from HBase to HDFS.

Caused by: java.lang.ClassNotFoundException: org.apache.htrace.Trace



```

```

Symptom

The Sqoop task is executed successfully, but the CSV file in HDFS is empty.

	Name	Description	Creator	Activation	Last Execution	Use Time	Progress	Status	Operate
□	hbaseToHdfs	hbaseTest-->hdfsTest	admin	Enabled	2022/03/02 15:09:04	33s	100%	SUCCEEDED	

Permission	Owner	Group	Size	Last Modified	Replication	Block Size	Name
-rw-r-----	loader	hadoop	0 B	Mar 02 15:09	3	128 MB	hbaseToHdfs-2022-03-02_15.09.00.121.csv

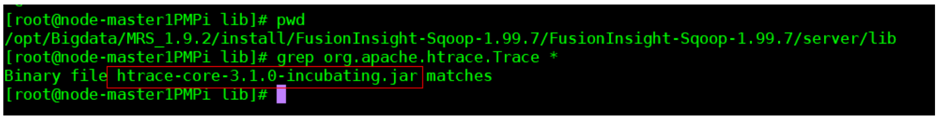
Cause Analysis

The JAR package conflicts or is missing.

Procedure

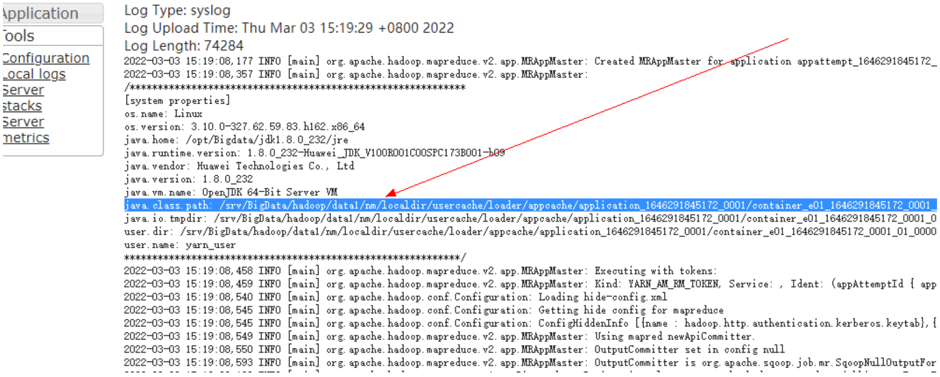
Step 1 Use the **grep** command in the **lib** directory of Sqoop.

1. Go to the **lib** directory of Sqoop and run the **grep** command.



```
[root@node-master1PMPi lib]# pwd
/opt/Bigdata/MRS_1.9.2/install/FusionInsight-Sqoop-1.99.7/FusionInsight-Sqoop-1.99.7/server/lib
[root@node-master1PMPi lib]# grep org.apache.htrace.Trace *
Binary file htrace-core-3.1.0-incubating.jar matches
[root@node-master1PMPi lib]#
```

2. Go to the native Yarn page and view the error information about the running task.



```

Log Type: syslog

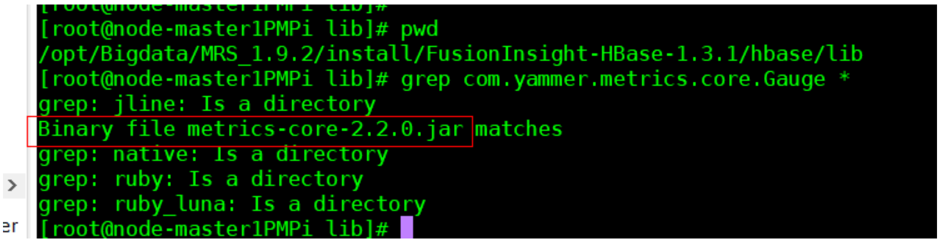
Step 2 Use the **grep** command in the **lib** directory of HBase.

1. Go to the **lib** directory of HBase and run the **grep** command.



```
[root@node-master1PMPi lib]#
[root@node-master1PMPi lib]# pwd
/opt/Bigdata/MRS_1.9.2/install/FusionInsight-HBase-1.3.1/hbase/lib
[root@node-master1PMPi lib]# grep com.yammer.metrics.core.Gauge *
grep: jline: Is a directory
Binary file metrics-core-2.2.0.jar matches
grep: native: Is a directory
grep: ruby: Is a directory
grep: ruby_luna: Is a directory
[root@node-master1PMPi lib]#
```

2. Copy the JAR package.

   cp /opt/Bigdata/MRS_1.9.2/install/FusionInsight-HBase-1.3.1/hbase/lib/metrics-core-2.2.0.jar /opt/Bigdata/MRS_1.9.2/install/FusionInsight-Hadoop-2.8.3/hadoop/share/hadoop/common/lib/

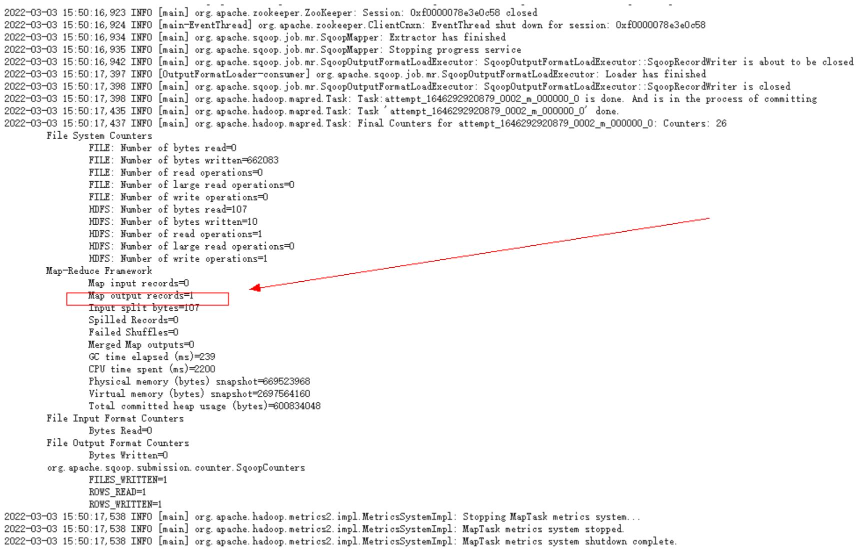
3. Change permissions.

   chmod 777 *metrics-core-2.2.0.jar* (the copied JAR package)

   chown omm:ficommon *metrics-core-2.2.0.jar* (the copied JAR package)

4. View the **hosts** file and perform the same operations to copy the JAR package for all other nodes.

5. Run the Sqoop task.



```

```

----End

Conclusion

1. Copy **htrace-core-3.1.0-incubating.jar** in the **lib** directory of Sqoop and **metrics-core-2.2.0.jar** in the **lib** directory of HBase to **/opt/Bigdata/MRS_1.9.2/install/FusionInsight-Hadoop-2.8.3/hadoop/share/hadoop/common/lib/**.
2. Change the permissions for the JAR packages to **777** and **omm:ficommon**, respectively.
3. Perform the preceding operations on all nodes and run the Sqoop task again.

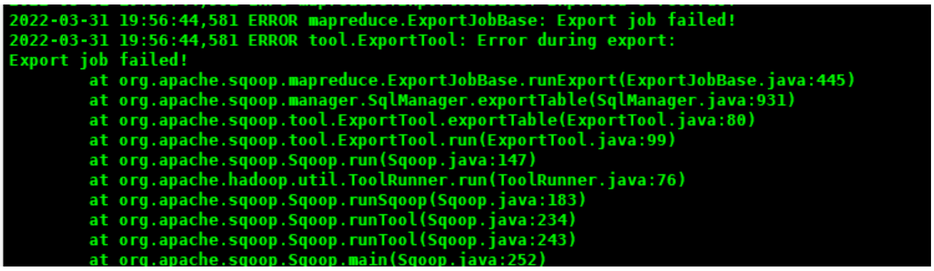
15.17.4 A Format Error Is Reported When Sqoop Is Used to Export Data from Hive to MySQL 8.0

This section applies only to MRS 3.1.0 clusters.

Issue

A format error is reported when a Sqoop task is performed to export data from Hive to MySQL 8.0 in an MRS 3.1.0 cluster.

Symptom



```
2022-03-31 19:56:44,581 ERROR mapreduce.ExportJobBase: Export job failed!
2022-03-31 19:56:44,581 ERROR tool.ExportTool: Error during export:

```

Cause Analysis

The log shows that the format is incorrect.

Procedure

Check that the formats of delimiters and table fields are all correct. Add the **--columns** parameter to the Sqoop statement to make data formats consistent between source and target tables.

sqoop export --connect jdbc:mysql://IP address:Port number/Database name --username *Username* --password *Password* --table *Table name* --columns *Column fields (multiple columns are separated by commas)* -export-dir *Export address* --fields-terminated-by *Delimiter* --input-null-string '\\N' --input-null-non-string '\\N' -m 1

Example:

sqoop export --connect jdbc:mysql://172.16.0.6:3306/lidengpeng --username root --password Mrs@2021 --table hkatg_agr_prod_city_summ --columns year,city_name,city_code,prod_code,prod_name,prod_type,sown_area,area_unit,yield_wegt,yield_unit,total_wegt,total_wegt_unit,data_sorc_code,etl_time -export-dir hdfs://hacluster/user/hive/warehouse/dm_agr_prod_city_summ02 --fields-terminated-by ',' --input-null-string '\\N' --input-null-non-string '\\N' -m 1

15.17.5 An Error Is Reported When sqoop import Is Executed to Import PostgreSQL Data to Hive

Background

The **sqoop import** command is executed to extract data from open-source PostgreSQL to MRS HDFS or Hive.

Issue

The **sqoop** command can be executed to query the PostgreSQL database table, but an error is reported when the **sqoop import** command is executed to import data.

The authentication type 5 is not supported. Check that you have configured the pg_hba.conf file to include the client's IP address or subnet.

Cause Analysis

1. MD5 authentication for connecting to PostgreSQL fails. A whitelist needs to be configured in the **pg_hba.cnf** file.
2. When the **sqoop import** command is executed, a MapReduce job is started. The PostgreSQL driver package **gsjdbc4-*.jar** exists in the MRS Hadoop installation directory **/opt/Bigdata/FusionInsight_HD_*/1_*_DataNode/install/hadoop/share/hadoop/common/lib**, which is incompatible with the open-source PostgreSQL service. As a result, an error is reported.

Procedure

1. Configure a whitelist in the **pg_hba.cnf** file.
2. Delete the **gsjdbc4-*.jar** packages from all core nodes, and add the PostgreSQL JAR package to **sqoop/lib**.

   mv /opt/Bigdata/FusionInsight_HD_*/1_*_DataNode/install/hadoop/share/hadoop/common/lib/gsjdbc4-*.jar /tmp

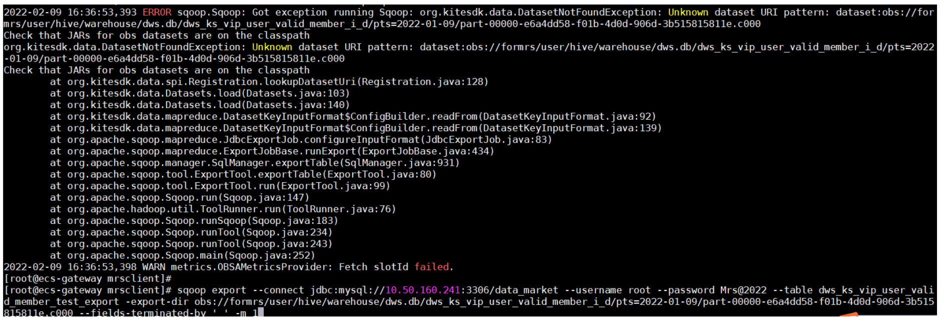
   
```
]$ mv /opt/Bigdata/FusionInsight_HD_8.1.0.1/1_2_NodeManager/install/hadoop/share/hadoop/common/lib/gsjdbc4-V100R003C10SPC125.jar /tmp
]$ exit
```

15.17.6 Sqoop Failed to Read Data from MySQL and Write Parquet Files to OBS

Issue

An error is reported when Sqoop reads MySQL data and writes the data to OBS in Parquet format. However, the data can be successfully written to OBS if the Parquet format is not specified.

Symptom



```
2022-02-09 16:36:53,393 ERROR sqoop.Sqoop: Got exception running Sqoop: org.kitesdk.data.DatasetNotFoundException: Unknown dataset URI pattern: dataset:obs://for

d_member_test_export -export-dir obs://formrs/user/hive/warehouse/dws.db/dws_ks_vip_user_valid_member_i_d/pts=2022-01-09/part-00000-e6a4dd58-f01b-4d0d-906d-3b515
815811e.c000 --fields-terminated-by ' ' -m 1
```

Cause Analysis

Parquet does not support Hive 3. Data can be written using HCatalog.

Procedure

Use HCatalog to write data: Specify the Hive database and table in parameters and modify the SQL statement in the script.

Details are as follows:

Original script:

```
sqoop import --connect 'jdbc:mysql://10.160.5.65/xxx_pos_online_00?zeroDateTimeBehavior=convertToNull' --username root --password Mrs@2022

--split-by id

--num-mappers 2

--query 'select * from pos_remark where 1=1 and $CONDITIONS'

--target-dir obs://za-test/dev/xxx_pos_online_00/pos_remark

--delete-target-dir

--null-string '\\N'

--null-non-string '\\N'

--as-parquetfile
```

Modified script:

```
sqoop import --connect 'jdbc:mysql://10.160.5.65/xxx_pos_online_00?zeroDateTimeBehavior=convertToNull' --username root --password Mrs@2022

--split-by id

--num-mappers 2

--query 'select id,pos_case_id,pos_transaction_id,remark,update_time,update_user,is_deleted,creator,modifier,gmt_created,gmt_modified,update_user_id,tenant_code from pos_remark where 1=1 and $CONDITIONS'

--hcatalog-database xxx_dev

--hcatalog-table ods_pos_remark
```

15.18 Using Storm

15.18.1 Invalid Hyperlink of Events on the Storm UI

Issue

The hyperlink of events on the Storm UI is invalid.

Symptom

After submitting a topology, a user cannot view topology data processing logs and the events hyperlink is invalid.

Cause Analysis

The function of viewing topology data processing logs is disabled by default when a topology is submitted in an MRS cluster.

Procedure

Step 1 Go to the service page.

- For versions earlier than MRS 2.0.1: Log in to MRS Manager and choose **Services**.
- For MRS 2.0.1 or later: Click the cluster name on the MRS console and choose **Components**.

  NOTE

  If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)
- For MRS 3.*x* or later: Log in to FusionInsight Manager and choose **Cluster**. Click the name of the desired cluster and choose **Services**.

Step 2 Log in to the Storm web UI.

- For MRS 2.x and earlier versions: Choose **Storm**. On the **Storm WebUI** page, click any UI link to open the Storm web UI.

  NOTE

  When accessing the Storm web UI for the first time, you must add the address to the trusted site list.
- For MRS 3.x or later: Choose **Storm** > **Overview**. On the **Storm WebUI** in the **Basic Information** area, click any UI link to open the Storm web UI.

Step 3 In the **Topology Summary** area, click the desired topology to view details.

Step 4 In the **Topology actions** area, click **Kill** to delete the submitted Storm topology.

Step 5 Submit the Storm topology again and enable the function of viewing topology data processing logs. Add the **topology.eventlogger.executors** parameter and set it to a positive integer when submitting the Storm topology. Example:

storm jar *Path of the topology package Class name of the topology Main method Topology name* -c topology.eventlogger.executors=X

Step 6 In the **Topology Summary** area on the Storm UI, click the desired topology to view details.

Step 7 In the **Topology actions** area, click **Debug**, specify the data sampling percentage, and click **OK**.

Step 8 Click the **Spouts** or **Bolts** task name of the topology. In **Component summary**, click **events** to view data processing logs.

NOTE

To enable the function of viewing topology data processing logs of the specified **Spouts** or **Bolts** task, click the **Spouts** or **Bolts** task name of the topology, click **Debug** in the **Topology actions** area, and enter the data sampling percentage.

----End

15.18.2 Failed to Submit a Topology

Symptom

An MRS streaming cluster is installed, and ZooKeeper, Storm, as well as Kafka are installed in the cluster.

A topology fails to be submitted by running commands on the client.

Possible Causes

- The Storm service is abnormal.
- The client user is not authenticated or the authentication has expired.
- The **storm.yaml** file in the submitted topology conflicts with that on the server.

Cause Analysis

A user fails to submit the topology. The possible cause is that the client or Storm is faulty.

1. Check the Storm status.

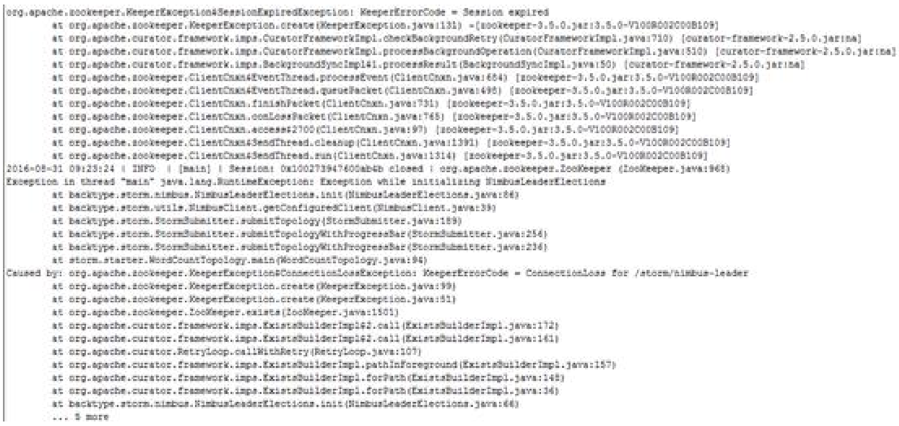
   MRS Manager:

   Log in to MRS Manager. On the MRS Manager page, choose **Services** > **Storm** to check the status of Storm. The status is **Good**, and the monitoring metrics are correctly displayed.

   FusionInsight Manager:

   For MRS 3.*x* or later: Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Storm** to check the status of Storm. It is found that the status is **Good** and the monitoring metrics are correctly displayed.

2. Check the submission logs of the client. The logs contain "KeeperExceptionSessionExpireException".



```

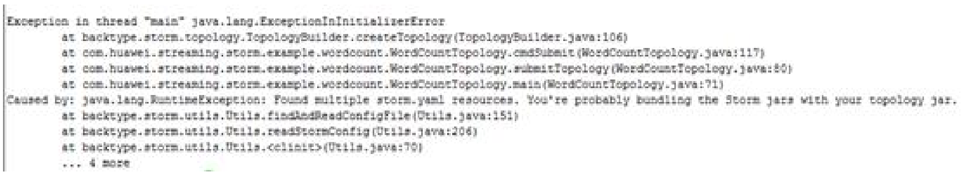
        at org.apache.curator.framework.imps.ExistsBuilderImpl.pathInForeground(ExistsBuilderImpl.java:157)
        at org.apache.curator.framework.imps.ExistsBuilderImpl.forPath(ExistsBuilderImpl.java:148)
        at org.apache.curator.framework.imps.ExistsBuilderImpl.forPath(ExistsBuilderImpl.java:36)
        at backtype.storm.nimbus.NimbusLeaderElections.init(NimbusLeaderElections.java:66)
        ... 5 more
```

The preceding error occurs because security authentication is not performed before the topology is submitted or the TGT expires after authentication.

For details about the solution, see **Step 1**.

3. Check the client submission log. It is found that the "ExceptionInIntializerError" exception information is printed, and the message "Found multiple storm.yaml resources" is displayed. The following is an example:



```
Exception in thread "main" java.lang.ExceptionInInitializerError
        at backtype.storm.topology.TopologyBuilder.createTopology(TopologyBuilder.java:106)
        at com.huawei.streaming.storm.example.wordcount.WordCountTopology.cmdSubmit(WordCountTopology.java:117)
        at com.huawei.streaming.storm.example.wordcount.WordCountTopology.submitTopology(WordCountTopology.java:80)
        at com.huawei.streaming.storm.example.wordcount.WordCountTopology.main(WordCountTopology.java:71)
Caused by: java.lang.RuntimeException: Found multiple storm.yaml resources. You're probably bundling the Storm jars with your topology jar.
        at backtype.storm.utils.Utils.findAndReadConfigFile(Utils.java:151)
        at backtype.storm.utils.Utils.readStormConfig(Utils.java:206)
        at backtype.storm.utils.Utils.<clinit>(Utils.java:70)
        ... 4 more
```

This error occurs because the **storm.yaml** file in the service JAR package conflicts with that on the server.

For details about the solution, see **Step 2**.

4. If the fault is not caused by the preceding reasons, see **Topology Submission Fails and the Message "Failed to check principle for keytab" Is Displayed**.

Solution

Step 1 An authentication error occurs.

1. Log in to the node where the client resides and switch to the client directory.
2. Run the following command to submit the task again: (Replace the service JAR package and topology based on the site requirements.)

   source bigdata_env

   kinit *Username*

   storm jar storm-starter-topologies-0.10.0.jar storm.starter.WordCountTopology test

Step 2 The topology package is abnormal.

Check the service JAR package, delete the **storm.yaml** file from the service JAR package, and submit the task again.

----End

15.18.3 Topology Submission Fails and the Message "Failed to check principle for keytab" Is Displayed

Symptom

An MRS streaming cluster in security mode is installed, and ZooKeeper, Storm, and Kafka are installed in the cluster.

When a topology is defined to access components such as HDFS and HBase and the topology fails to be submitted using client commands.

Possible Causes

- The submitted topology does not contain the keytab file of the user.

- The keytab file contained in the submitted topology is inconsistent with the user who submits the topology.
- The **user.keytab** file exists in the **/tmp** directory on the client, and the owner is not the running user.

Cause Analysis

1. Check the logs. Error information "Can not found user.keytab in storm.jar" is found. Details are as follows:

```
[main] INFO  b.s.StormSubmitter - Get principle for stream@HADOOP.COM success
[main] ERROR b.s.StormSubmitter - Can not found user.keytab in storm.jar.
Exception in thread "main" java.lang.RuntimeException: Failed to check principle for keytab
at backtype.storm.StormSubmitter.submitTopologyAs(StormSubmitter.java:219)
at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:292)
at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:176)
at com.xxx.streaming.storm.example.hbase.SimpleHBaseTopology.main(SimpleHBaseTopology.java:77)
```

   Check the JAR file of the submitted topology. It is found that the keytab file is not contained.

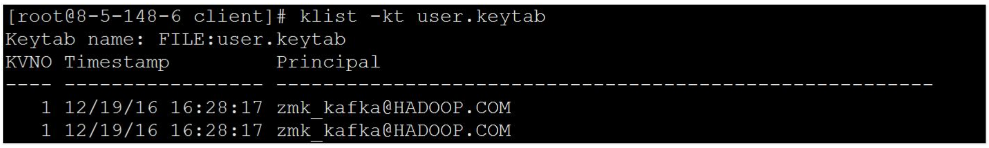
2. Check the logs. Error information "The submit user is invalid,the principle is" is found. Details are as follows:

```
[main] INFO  b.s.StormSubmitter - Get principle for stream@HADOOP.COM success
[main] WARN  b.s.s.a.k.ClientCallbackHandler - Could not login: the client is being asked for a password, but the  client code does not currently support obtaining a password from the user. Make sure that the client is configured to use a ticket cache (using the JAAS configuration setting 'useTicketCache=true)' and restart the client. If you still get this message after that, the TGT in the ticket cache has expired and must be manually refreshed. To do so, first determine if you are using a password or a keytab. If the former, run kinit in a Unix shell in the environment of the user who is running this client using the command 'kinit <princ>' (where <princ> is the name of the client's Kerberos principal). If the latter, do 'kinit -k -t <keytab> <princ>' (where <princ> is the name of the Kerberos principal, and <keytab> is the location of the keytab file). After manually refreshing your cache, restart this client. If you continue to see this message after manually refreshing your cache, ensure that your KDC host's clock is in sync with this host's clock.
[main] ERROR b.s.StormSubmitter - The submit user is invalid,the principle is : stream@HADOOP.COM
Exception in thread "main" java.lang.RuntimeException: Failed to check principle for keytab
at backtype.storm.StormSubmitter.submitTopologyAs(StormSubmitter.java:219)
at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:292)
at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:176)
at com.xxx.streaming.storm.example.hbase.SimpleHBaseTopology.main(SimpleHBaseTopology.java:77)
```

   The authenticated user used to submit the topology is **stream**. However, the system displays a message indicating that the submit user is invalid during topology submission, indicating that the internal verification fails.

3. Check the JAR file of the submitted topology. It is found that the keytab file is contained.

   The principal parameter is set to **zmk_kafka** in the **user.keytab** file.



```
[root@8-5-148-6 client]# klist -kt user.keytab
Keytab name: FILE:user.keytab
KVNO Timestamp         Principal
---- ----------------- --------------------------------------------------------
   1 12/19/16 16:28:17 zmk_kafka@HADOOP.COM
   1 12/19/16 16:28:17 zmk_kafka@HADOOP.COM
```

   It is found that the authenticated user does not match the principal in the **user.keytab** file.

4. Check the logs and find the error information "Delete the tmp keytab file failed, the keytab file is:/tmp/user.keytab". The detailed information is as follows:

```
[main] WARN b.s.StormSubmitter - Delete the tmp keytab file failed, the keytab file is : /tmp/user.keytab
[main] ERROR b.s.StormSubmitter - The submit user is invalid,the principle is : hbase1@HADOOP.COM
Exception in thread "main" java.lang.RuntimeException: Failed to check principle for keytab
```

```
at backtype.storm.StormSubmitter.submitTopologyAs(StormSubmitter.java:213)
at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:286)
at backtype.storm.StormSubmitter.submitTopology(StormSubmitter.java:170)
at com.touchstone.storm.cmcc.CmccDataHbaseTopology.main(CmccDataHbaseTopology.java:183)
```

Check the **/tmp** directory. It is found that the **user.keytab** file exists and the file owner is not the running user.

Solution

- Ensure that the **user.keytab** file is carried when the topology is submitted.
- Ensure that the user for submitting the topology is the same as that of the **user.keytab** file.
- Delete the **user.keytab** file from the **/tmp** directory.

15.18.4 The Worker Log Is Empty After a Topology Is Submitted

Symptom

After a topology is remotely submitted in Eclipse, the detailed information about the topology cannot be viewed on the Storm web UI, and the Worker node where Bolt and Spout of each topology are located keeps changing. The Worker log is empty.

Possible Causes

The Worker process fails to be started, triggering Nimbus to re-allocate tasks and start the Worker process on other Supervisors. The Worker process continues to restart. As a result, the Worker node keeps changing, and the Worker log is empty. The possible causes of the Worker process startup failure are as follows:

- The submitted JAR package contains the **storm.yaml** file.

  Storm specifies that each classpath can contain only one **storm.yaml** file. If there is more than one **storm.yaml** file, an exception occurs. Use the Storm client to submit the topology. The classpath configuration of the client is different from the classpath configuration of Eclipse. The client automatically loads the JAR package of the user to classpath. As a result, two **storm.yaml** files exist in classpath.
- The initialization of the Worker process takes a long time, which exceeds the Worker startup timeout period set in the Storm cluster. As a result, the Worker process is killed and reallocated.

Troubleshooting Process

1. Use the Storm client to submit the topology and check whether the **storm.yaml** file is duplicate.
2. Repack the JAR file and submit the topology again.
3. Modify the Worker startup timeout parameter in the Storm cluster.

Procedure

Step 1 If the Worker log is empty after the topology is remotely submitted using Eclipse, use the Storm client to submit the JAR package corresponding to the topology and view the prompt message.

For example, if the JAR package contains two **storm.yaml** files in different paths, the following information is displayed:

```
Exception in thread "main" java.lang.ExceptionInInitializerError
  at com.xxx.streaming.storm.example.WordCountTopology.createConf(WordCountTopology.java:132)
  at com.xxx.streaming.storm.example.WordCountTopology.remoteSubmit(WordCountTopology.java:120)
  at com.xxx.streaming.storm.example.WordCountTopology.main(WordCountTopology.java:101)
 Caused by: java.lang.RuntimeException: Found multiple storm.yaml resources. You're probably bundling the
Storm jars with your topology jar. [jar:file:/opt/xxx/fi_client/Streaming/streaming-0.9.2/bin/stormDemo.jar!/
storm.yaml, file:/opt/xxx/fi_client/Streaming/streaming-0.9.2/conf/storm.yaml]
  at backtype.storm.utils.Utils.findAndReadConfigFile(Utils.java:151)
  at backtype.storm.utils.Utils.readStormConfig(Utils.java:206)
  at backtype.storm.utils.Utils.<(Utils.java:70)>
```

Step 2 Compress the JAR package again. Ensure that the package does not contain the **storm.yaml** file and JAR packages related to **log4j** and **slf4j-log4j**.

Step 3 Use IntelliJ IDEA to remotely submit the new JAR package.

Step 4 Check whether the topology details and Worker logs can be viewed on the web UI.

Step 5 On MRS Manager, modify the Worker startup timeout parameter of the Storm cluster (for details about the parameter description, see **Related Information**). Save the modification, and restart the Storm service.

- MRS Manager: Log in to MRS Manager and choose **Services** > **Storm** > **Configuration**.
- FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Storm** > **Configuration**.

Step 6 Submit the JAR package to be run again.

----End

Related Information

1. The **nimbus.task.launch.secs** and **supervisor.worker.start.timeout.secs** parameters indicate the topology startup timeout tolerance of the Nimbus and supervisor, respectively. Generally, the value of **nimbus.task.launch.secs** must be greater than or equal to that of **supervisor.worker.start.timeout.secs**. It is recommended that the value of **nimbus.task.launch.secs** be slightly greater or equal to that of **supervisor.worker.start.timeout.secs**. Otherwise, the task reallocation efficiency will be affected.
   – **nimbus.task.launch.secs**: If the Nimbus does not receive the heartbeat message sent by the topology task within the period specified by this parameter, the Nimbus re-allocates the topology to another supervisor and updates the task information in ZooKeeper. The supervisor reads the task information in ZooKeeper and compares it with the topology started. If the topology does not belong to the supervisor, the supervisor deletes the metadata of the topology, that is, the **/srv/Bigdata/streaming_data/stormdir/supervisor/stormdist/{worker-id}** directory.

- **supervisor.worker.start.timeout.secs**: After the supervisor starts a worker, if no heartbeat message is received from the worker within the period specified by this parameter, the supervisor stops the worker and waits for worker rescheduling. Generally, the value of this parameter is increased when the service startup takes a long time to ensure that the worker can be started successfully.

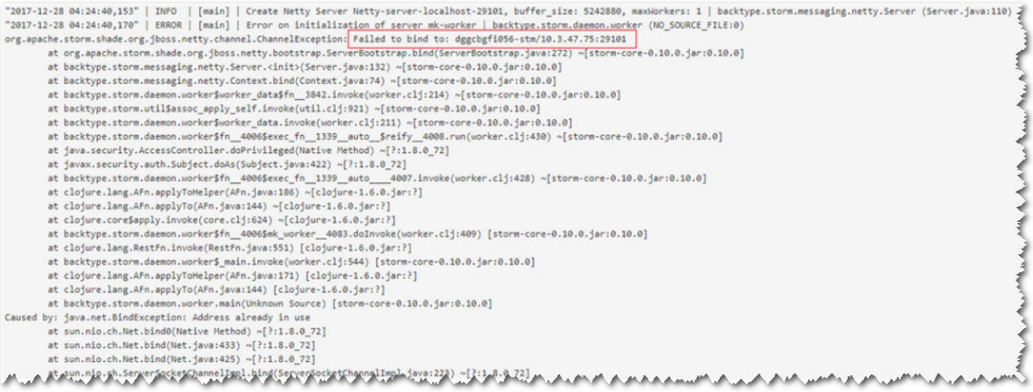
  If the value of **supervisor.worker.start.timeout.secs** is greater than that of **nimbus.task.launch.secs**, the worker is still started before the tolerance time of supervisor ends. However, the Nimbus considers that the service startup times out and allocates the service to another host. The background thread of the supervisor finds that the tasks are inconsistent and deletes the metadata of the topology. As a result, when the worker attempts to read **stormconf.ser** during startup, the file does not exist, and "FileNotFoundException" is thrown.

2. The **nimbus.task.timeout.secs** and **supervisor.worker.timeout.secs** parameters indicate the timeout tolerance time for the Nimbus and supervisor to report heartbeat messages during topology running. Generally, the value of **nimbus.task.timeout.secs** must be slightly greater than or equal to that of **supervisor.worker.timeout.secs**.

15.18.5 Worker Runs Abnormally After a Topology Is Submitted and Error "Failed to bind to:host:ip" Is Displayed

Symptom

After the service topology is submitted, the Worker cannot be started normally. Check the Worker log. The log records "Failed to bind to: host:ip."



```
"2017-12-28 04:24:40,153" | INFO  | [main] | Create Netty Server Netty-server-localhost-29101, buffer_size: 5242880, maxWorkers: 1 | backtype.storm.messaging.netty.Server (Server.java:110)

```

Possible Causes

The random port range is incorrectly configured.

Troubleshooting Process

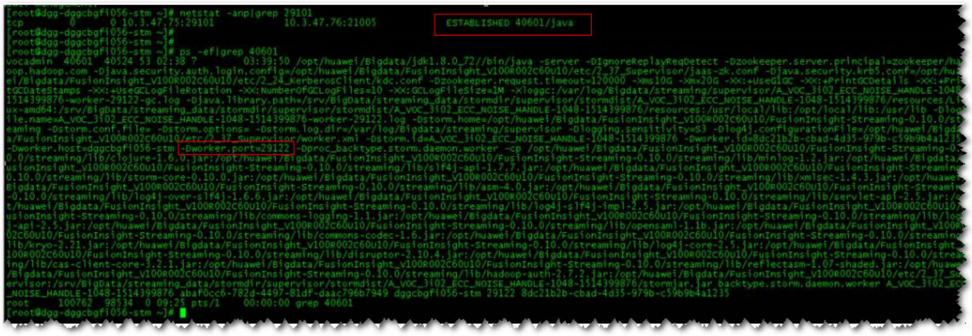
1. Check related information in the Worker log.

2. Check the process information about the bond port.

3. Check the random port range.

Cause Analysis

1. Use SSH to log in to the host where the Worker fails to be started and run the **netstat -anp | grep** <*port*> command to check the ID of the process that occupies the port. In the preceding command, change *port* to the actual port number.
2. Run the **ps -ef | grep** <*pid*> command to view process details. In the command, *pid* indicates the actual process ID.



```
[root@dgg-dggcbgfi056-stm ~]# netstat -anp|grep 29101
tcp        0      0 10.3.47.75:29101            10.3.47.76:21005            ESTABLISHED 40601/java
[root@dgg-dggcbgfi056-stm ~]#
[root@dgg-dggcbgfi056-stm ~]#
[root@dgg-dggcbgfi056-stm ~]# ps -ef|grep 40601

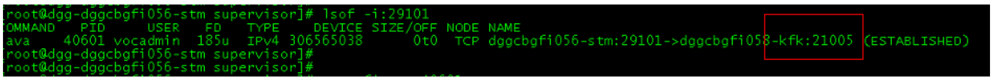
ervisor:/srv/BigData/streaming_data/stormdir/supervisor/stormdist/A_VOC_3i02_ECC_NOISE_HANDLE-1048-1514399876/stormjar.jar backtype.storm.daemon.worker A_VOC_3i02_EC
_NOISE_HANDLE-1048-1514399876 abaf0cc6-782d-4497-81df-daac796b7949 dggcbgfi056-stm 29122 8dc21b2b-cbad-4d35-979b-c59b9b4a1235
root     100762  98534  0 09:25 pts/1    00:00:00 grep 40601
[root@dgg-dggcbgfi056-stm ~]#
```

It is found that the worker process occupies the port. This process is another topology service process. According to the process details, port 29122 is allocated to the process.

3. Run the **lsof -i:**<*port*> command to view connection details. In the preceding command, change *port* to the actual port number.

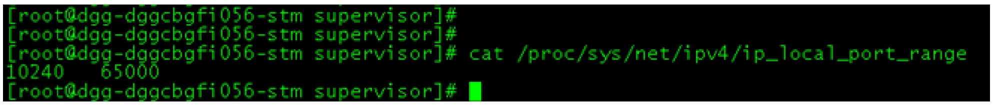


```
root@dgg-dggcbgfi056-stm supervisor]# lsof -i:29101
OMMAND    PID     USER   FD   TYPE    DEVICE SIZE/OFF NODE NAME
ava     40601 vocadmin  185u  IPv4 306565038      0t0  TCP dggcbgfi056-stm:29101->dggcbgfi058-kfk:21005 (ESTABLISHED)
root@dgg-dggcbgfi056-stm supervisor]#
root@dgg-dggcbgfi056-stm supervisor]#
```

It is found that port 29101 connects to port 21005 of the peer end, and port 21005 is the Kafka server port.

It indicates that the service layer connects to Kafka to obtain messages as a client. Service ports are allocated based on the random port range of the OS.

4. Run the **cat /proc/sys/net/ipv4/ip_local_port_range** command to check the random port range.



```
[root@dgg-dggcbgfi056-stm supervisor]#
[root@dgg-dggcbgfi056-stm supervisor]#
[root@dgg-dggcbgfi056-stm supervisor]# cat /proc/sys/net/ipv4/ip_local_port_range
10240   65000
[root@dgg-dggcbgfi056-stm supervisor]#
```

5. It is found that the random port range is too large and conflicts with the service port range of MRS.

NOTE

The MRS service port number ranges from 20000 to 30000.

Procedure

Step 1 Modify the random port range.

```
vi /proc/sys/net/ipv4/ip_local_port_range
32768 61000
```

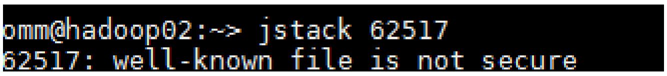
Step 2 Stop the service process that occupies the service port to release the port. (Stop the service topology.)

----End

15.18.6 "well-known file is not secure" Is Displayed When the jstack Command Is Used to Check the Process Stack

Symptom

Run the **jstack** command to check the process stack information. The error message "well-known file is not secure" is displayed.



```
omm@hadoop02:~> jstack 62517
62517: well-known file is not secure
```

Cause Analysis

1. The user running the **jstack** command is inconsistent with the user submitting the process for viewing the pid information.
2. Storm uses the feature of differentiating users for implementing tasks. When the worker process is started, the process UID and GID are changed to the user submitting the task and ficommon. This way, logviewer can access logs of the worker process and only log file permission 640 is open. After the user is changed, the **jstack** and **jmap** commands fail to be executed for the worker process, because the default GID of the user is not ficommon. You need to run the ldap command to change the user GID to 9998 (ficommon).

Solution

You can use either of the following two methods to resolve the problem:

Method 1: View the process stack on the native Storm page.

Step 1 Log in to the native Storm page.

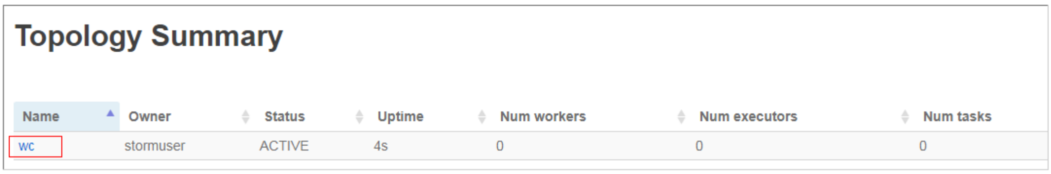
MRS Manager:

1. Access MRS Manager.
2. Choose **Services** > **Storm**. In **Storm WebUI** of **Storm Summary**, click any UI link to access the Storm WebUI.

FusionInsight Manager:

1. Log in to FusionInsight Manager.
2. On Manager, choose **Cluster > Service** > **Storm**. On the **Storm WebUI** page of **Overview**, click any UI link to open the Storm WebUI.

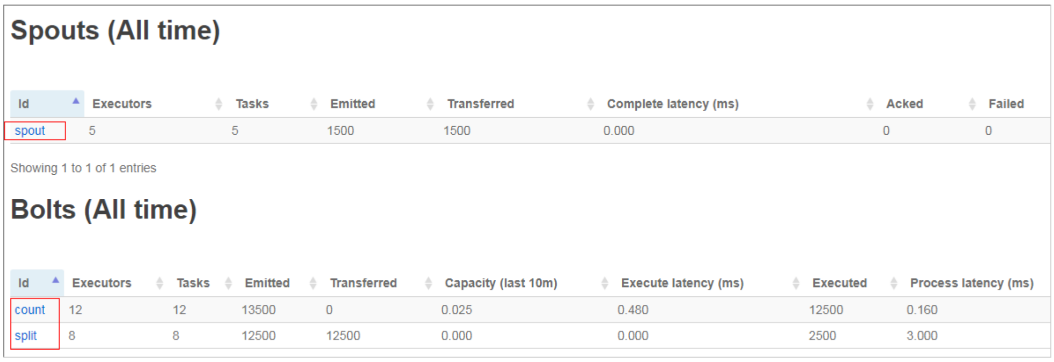
Step 2 Select the topology to be viewed.



Topology Summary

Name	Owner	Status	Uptime	Num workers	Num executors	Num tasks
wc	stormuser	ACTIVE	4s	0	0	0

Step 3 Select the spout or bolt to be viewed.



Spouts (All time)

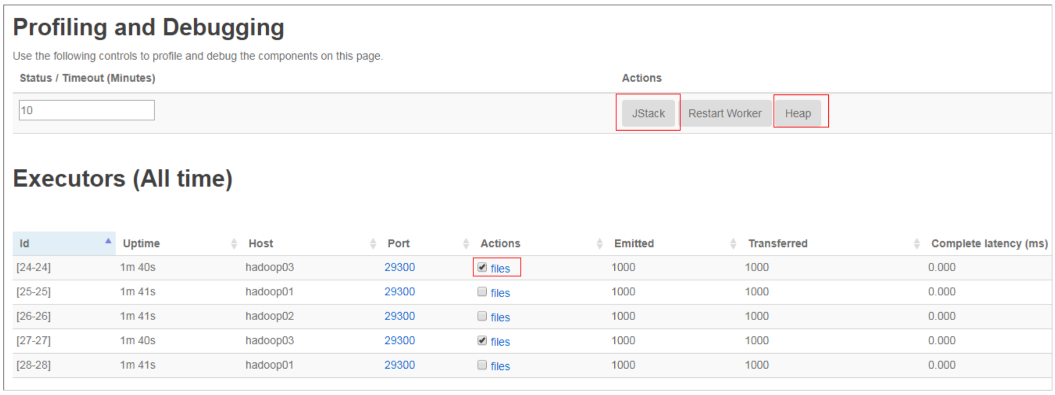
Id	Executors	Tasks	Emitted	Transferred	Complete latency (ms)	Acked	Failed
spout	5	5	1500	1500	0.000	0	0

Showing 1 to 1 of 1 entries

Bolts (All time)

Id	Executors	Tasks	Emitted	Transferred	Capacity (last 10m)	Execute latency (ms)	Executed	Process latency (ms)
count	12	12	13500	0	0.025	0.480	12500	0.160
split	8	8	12500	12500	0.000	0.000	2500	3.000

Step 4 Select the log file of the node to be viewed, and then click **JStack** or **Heap**. **JStack** corresponds to the stack information, and **Heap** corresponds to the heap information.



Profiling and Debugging

Use the following controls to profile and debug the components on this page.

Status / Timeout (Minutes)	Actions
10	JStack Restart Worker Heap

Executors (All time)

Id	Uptime	Host	Port	Actions	Emitted	Transferred	Complete latency (ms)
[24-24]	1m 40s	hadoop03	29300	☑ files	1000	1000	0.000
[25-25]	1m 41s	hadoop01	29300	□ files	1000	1000	0.000
[26-26]	1m 41s	hadoop02	29300	□ files	1000	1000	0.000
[27-27]	1m 40s	hadoop03	29300	☑ files	1000	1000	0.000
[28-28]	1m 41s	hadoop01	29300	□ files	1000	1000	0.000

----End

Method 2: View the process stack by modifying user-defined parameters.

Step 1 Access the Storm parameter configuration page.

MRS Manager: Log in to MRS Manager, choose **Services** > **Storm** > **Service Configuration**, and select **All** from the **Type** drop-down list.

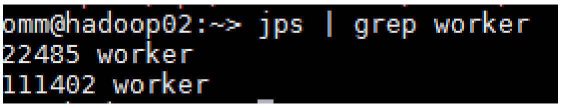
Operation on FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Yarn** > **Configurations** > **All Configurations**.

Step 2 In the navigation tree on the left, choose **supervisor** > **Customize** and add the variable **supervisor.run.worker.as.user=false**.

Step 3 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

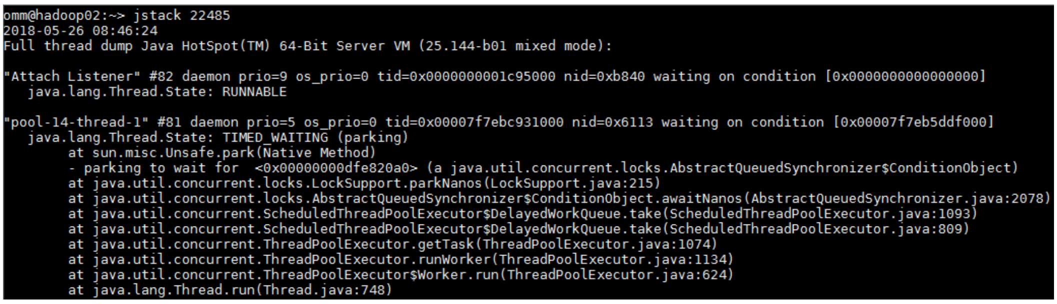
Step 4 Submit the topology again.

Step 5 Switch to the **omm** user on the background node and run the **jps** command to view the PID of the worker process.



```
omm@hadoop02:~> jps | grep worker
22485 worker
111402 worker
```

Step 6 Run the **jstack pid** command to view the jstack information.



```
omm@hadoop02:~> jstack 22485
2018-05-26 08:46:24

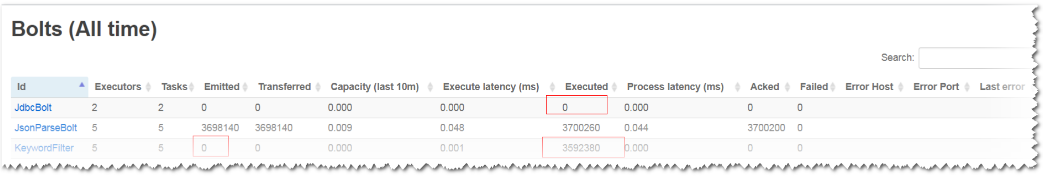
----End

15.18.7 When the Storm-JDBC plug-in is used to develop Oracle write Bolts, data cannot be written into the Bolts.

Symptom

When the Storm-JDBC plug-in is used to develop Oracle write Bolts, the Oracle database can be connected, but data cannot be written to the Oracle database.



Bolts (All time)

Search:

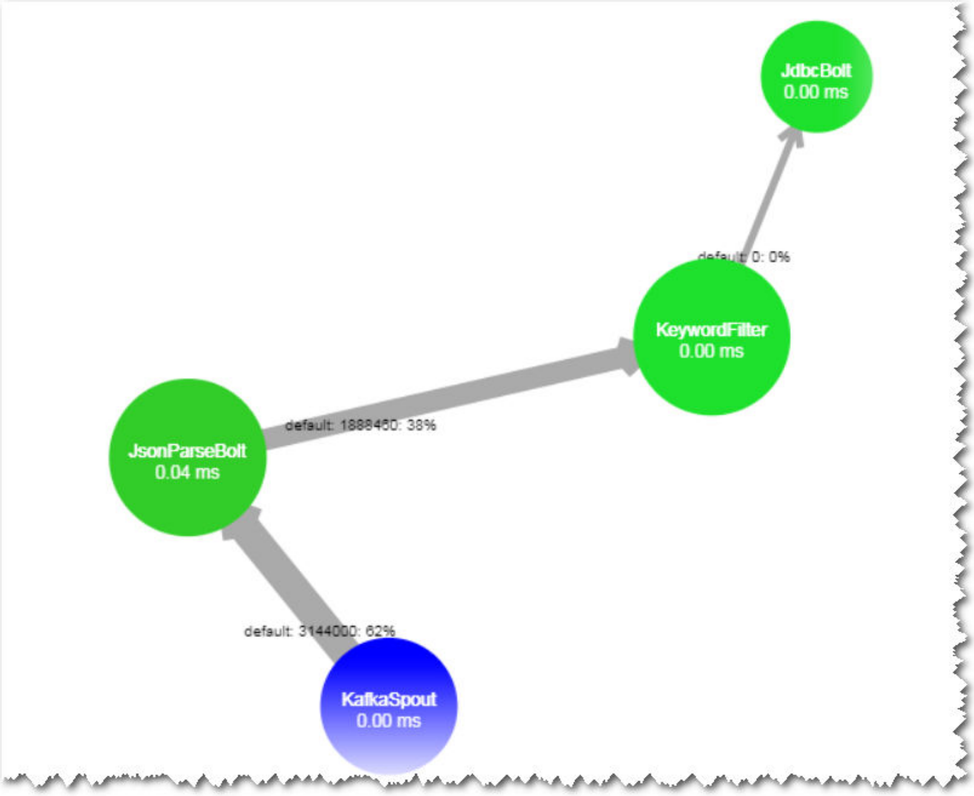
Id	Executors	Tasks	Emitted	Transferred	Capacity (last 10m)	Execute latency (ms)	Executed	Process latency (ms)	Acked	Failed	Error Host	Error Port	Last error
JdbcBolt	2	2	0	0	0.000	0.000	0	0.000	0	0			
JsonParseBolt	5	5	3698140	3698140	0.009	0.048	3700260	0.044	3700200	0			
KeywordFilter	5	5	0	0	0.000	0.001	3592380	0.000	0	0			

Possible Causes

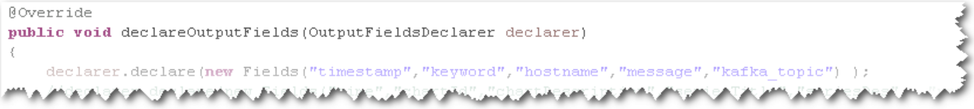
- The topology definition is incorrect.
- The definition of the database table result is incorrect.

Cause Analysis

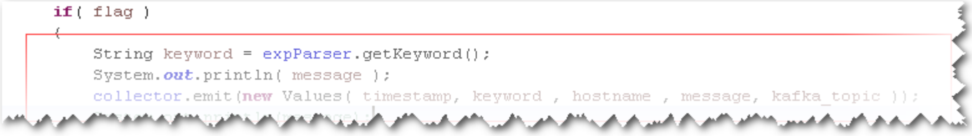
1. On the Storm web UI, check the DAG of the topology. The DAG is consistent with the topology definition.



2. The definition of the KeyWordFilter Bolt is consistent with the **expParser** field.

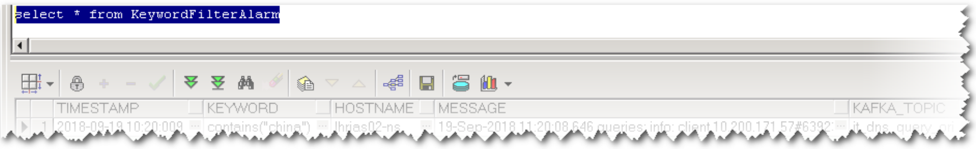


```
@Override
public void declareOutputFields(OutputFieldsDeclarer declarer)
{
    declarer.declare(new Fields("timestamp","keyword","hostname","message","kafka_topic") );
```



```
    if( flag )
    {
        String keyword = expParser.getKeyword();
        System.out.println( message );
        collector.emit(new Values( timestamp, keyword , hostname , message, kafka_topic ));
```

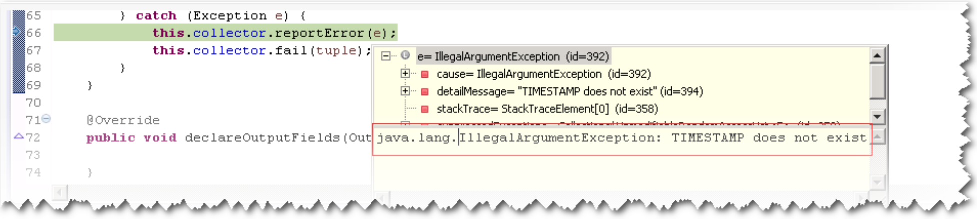
3. View the table definition in the Oracle database. The field name is in uppercase, which is inconsistent with flow definition field name.



```
select * from KeywordFilterAlarm
```

	TIMESTAMP	KEYWORD	HOSTNAME	MESSAGE	KAFKA_TOPIC
1	2018-09-19 10:20:009	contains("china")	lhrias02-ns	19-Sep-2018 11:20:08.646 queries: info: client 10.200.171.57#6392:	it_dns_query_ori

4. When the execute method is debugged independently, it is found that the thrown field does not exist.



```
        } catch (Exception e) {
            this.collector.reportError(e);
            this.collector.fail(tuple);
        }
    }

    @Override
    public void declareOutputFields(Out

    }
```

```
e= IllegalArgumentException  (id=392)
    cause= IllegalArgumentException  (id=392)
    detailMessage= "TIMESTAMP does not exist" (id=394)
    stackTrace= StackTraceElement[0]  (id=358)
java.lang.IllegalArgumentException: TIMESTAMP does not exist
```

Procedure

The field name of the stream definition is changed to uppercase letters, which is the same as that defined in the database table.

15.18.8 The GC Parameter Configured for the Service Topology Does Not Take Effect

Symptom

The **topology.worker.childopts** parameter in the service topology code does not take effect. The key log is as follows:

```
[main] INFO b.s.StormSubmitter - Uploading topology jar /opt/jar/example.jar to assigned location: /srv/

jar:/o
```

Cause Analysis

1. **topology.worker.gc.childopts**, **topology.worker.childopts**, and **worker.gc.childopts** (server parameters) have priorities: **topology.worker.gc.childopts** > **worker.gc.childopts** > **topology.worker.childopts**.
2. If the client parameter **topology.worker.childopts** is set, this parameter and the server parameter **worker.gc.childopts** are configured together. However, for two same parameters, one of them will be overwritten by the other parameter after it. Take parameter **-Xmx**, as shown in the red box of the preceding figure, as an example, parameter **-Xmx1G** overwrites **-Xmx4096m**.
3. If parameter **topology.worker.gc.childopts** is configured on the client, the parameter **worker.gc.childopts** on the server will be replaced.

Solution

Step 1 If you want to modify the JVM parameter of the topology, you can directly modify the **topology.worker.gc.childopts** parameter in the command or modify the parameter on the server. When **topology.worker.gc.childopts** is set to **-Xms4096m -Xmx4096m -XX:+UseG1GC -XX:+PrintGCDetails -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M**:

```

15.18.9 Internal Server Error Is Displayed When the User Queries Information on the UI

Symptom

An MRS cluster is installed, and ZooKeeper and Storm are installed in the cluster.

"Internal Server Error" is displayed when a user accesses information from the **Storm Status** page of MRS Manager.

The detailed information is as follows:

```
Internal Server Error
org.apache.thrift7.transport.TTransportException: Frame size (306030) larger than max length (1048576)!
```

Possible Causes

- Nimbus of Storm is abnormal.
- Storm cluster information exceeds the default Thrift transmission size.

Cause Analysis

1. Check the Storm service status and monitoring metrics:
   - MRS Manager: Log in to MRS Manager and choose **Services** > **Storm**. Check the Storm status. The status is **Good**, and the monitoring metrics are correctly displayed.
   - FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > *Name of the target cluster* > **Service** > **Storm**.

     Check the Storm status. It is found that the status is good and the monitoring metrics are correctly displayed.
2. Click the **Instance** tab and check the status of the Nimbus instance. The status is normal.
3. Check the Thrift configuration of the Storm cluster. It is found that **nimbus.thrift.max_buffer_size** is set to **1048576** (1 MB).
4. The preceding configuration is the same as that in the exception information, indicating that the buffer size of Thrift is less than that required by the cluster information.

Procedure

Adjust the Thrift buffer size of the Storm cluster.

Step 1 Access the Storm parameter configuration page.

- MRS Manager: Log in to MRS Manager, choose **Services** > **Storm** > **Service Configuration**, and select **All** from the **Type** drop-down list.
- Operation on FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Yarn** > **Configurations** > **All Configurations**.

Step 2 Change the value of **nimbus.thrift.max_buffer_size** to **10485760** (10 MB).

Step 3 Click Save Configuration and select **Restart the affected services or instances**. Click **OK** to restart the services.

----End

15.19 Using Ranger

15.19.1 After Ranger Authentication Is Enabled for Hive, Unauthorized Tables and Databases Can Be Viewed on the Hue Page

Issue

Although Ranger authentication is enabled for Hive, unauthorized tables and databases can be still viewed on the Hue page.

Symptom

In a normal cluster with Kerberos authentication disabled, after Ranger authentication is enabled for Hive, unauthorized tables and databases can be viewed on the Hue page.

Cause Analysis

After Ranger authentication is enabled for Hive, the default Hive policies contain two public group policies about databases. All users belong to the public group. By default, the public group is granted the permission to create tables in the default database and create other databases. Therefore, all users have the **show databases** and **show tables** permissions by default. If some users do not need to have these two permissions, you can delete the default public group policies on the Ranger web UI and grant the required user permissions.

Procedure

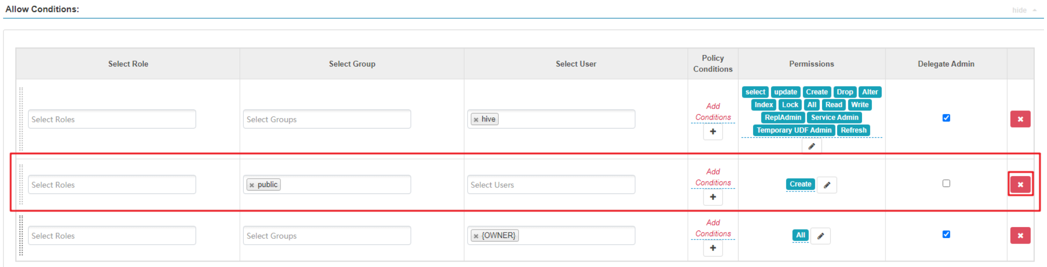
Step 1 Log in to the Ranger web UI.

Step 2 In the **Service Manager** area, click the Hive component name to access the Hive security access policy page.

Step 3 Click 📝 in the rows containing the **all - database** and **default database tables columns** policies.

Step 4 Delete the public group policies.

Figure 15-59 all - database policy



Allow Conditions:

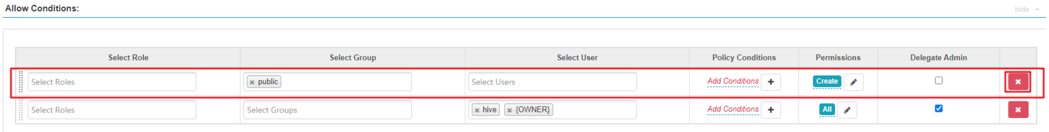
Select Roles	Select Groups	× {OWNER}	Add Conditions +	All	☑	✖

Figure 15-60 default database tables columns policy



Allow Conditions:

Select Role	Select Group	Select User	Policy Conditions	Permissions	Delegate Admin	
Select Roles	× public	Select Users	Add Conditions +	Create	□	✖
Select Roles	Select Groups	× hive × {OWNER}	Add Conditions +	All	☑	✖

Step 5 On the Hive security access policy page, click **Add New Policy** to add resource access policies for related users or user groups.

----End

15.20 Using Yarn

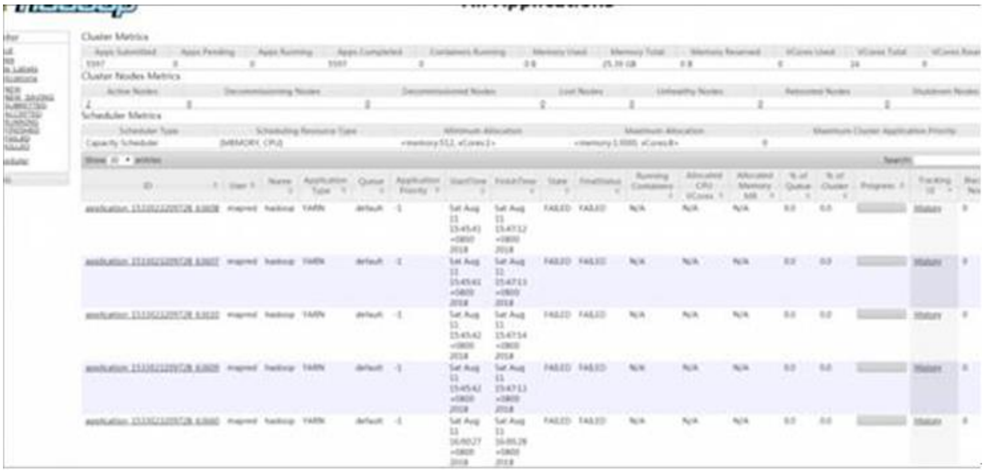
15.20.1 Plenty of Jobs Are Found After Yarn Is Started

Issue

After Yarn starts in an MRS cluster (MRS 2.x or earlier), plenty of jobs occupying resources are found.

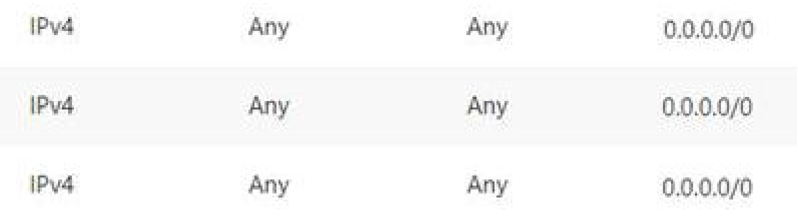
Symptom

After the customer creates an MRS cluster and starts Yarn, plenty of jobs occupying resources are found.



Cause Analysis

- It is suspected that there are hacker attacks.
- Set the Any protocol in the inbound direction of the SG to the 0.0.0.0/0.



IPv4	Any	Any	0.0.0.0/0
IPv4	Any	Any	0.0.0.0/0
IPv4	Any	Any	0.0.0.0/0

Procedure

Step 1 Log in to the MRS management console. On the **Active Clusters** page, click the cluster name. The cluster details page is displayed.

Step 2 Click **Manage** next to **Cluster Manager**. The **Access MRS Manager** page is displayed.

Step 3 Click **Manage Security Group Rule** to check the security group rule configuration.

Step 4 Check whether the source address of the Any protocol in the inbound direction is 0.0.0.0/0.

Step 5 If it is 0.0.0.0/0, change the remote end of the Any protocol in the inbound direction to a specified IP address. If it is not 0.0.0.0/0, there is no need to change the value.

Step 6 After the value is changed successfully, restart the cluster VM.

----End

Summary and Suggestions

Disable the Any protocol in the inbound direction, or specify the remote end of the Any protocol in the inbound direction as the specified IP address.

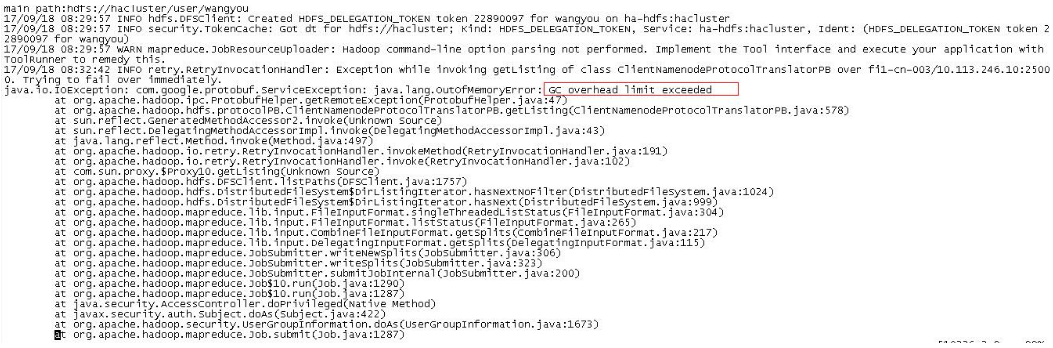
Related Information

For details, see **MapReduce Service User Guide** > **Security > Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled**.

15.20.2 "GC overhead" Is Displayed on the Client When Tasks Are Submitted Using the Hadoop Jar Command

Symptom

When a user submits a task on the client, the client returns a memory overflow error.



```

        at org.apache.hadoop.mapreduce.Job.submit(Job.java:1287)
```

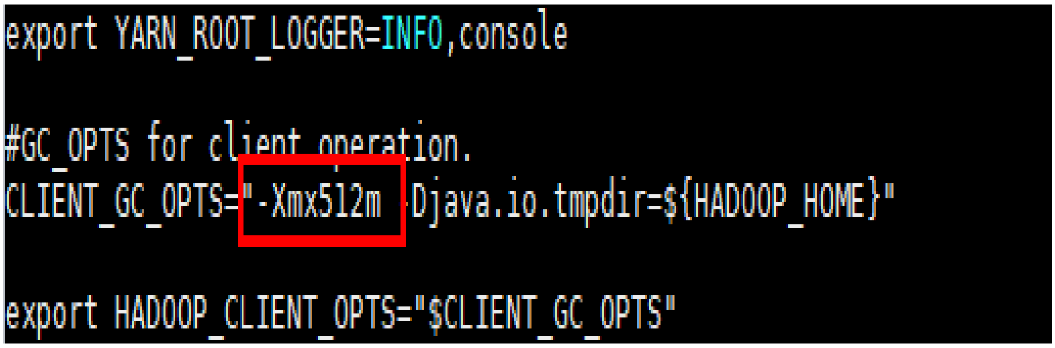
Cause Analysis

According to the error stack, the memory overflows when the HDFS files are read during task submission. Generally, the memory is insufficient because the task needs to read a large number of small files.

Solution

Step 1 Check whether multiple HDFS files need to be read for the started MapReduce tasks. If yes, reduce the file quantity by combining the small-sized files in advance or using **combineInputFormat**.

Step 2 Increase the memory when the **hadoop** command is run. The memory is set on the client. Change the value of **-Xmx** in **CLIENT_GC_OPTS** in the *Client installation directory***/HDFS/component_env** file to a larger value, for example, 512 MB. Run the **source component_env** command for the modification to take effect.



```
export YARN_ROOT_LOGGER=INFO,console

#GC_OPTS for client operation.
CLIENT_GC_OPTS="-Xmx512m -Djava.io.tmpdir=${HADOOP_HOME}"

export HADOOP_CLIENT_OPTS="$CLIENT_GC_OPTS"
```

----End

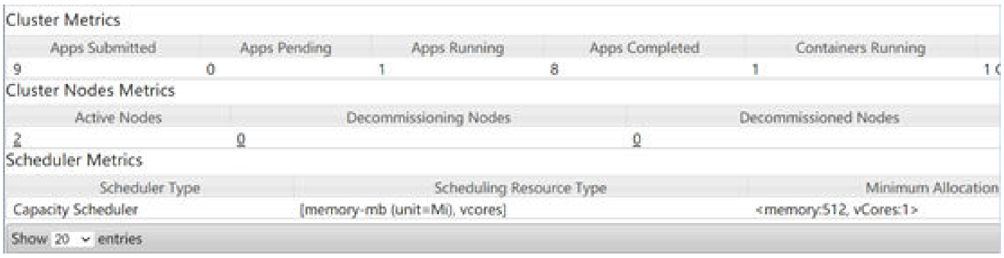
15.20.3 Disk Space Is Used Up Due to Oversized Aggregated Logs of Yarn

Issue

The disk usage of the cluster is high.

Symptom

- On the host management page of Manager, the disk usage is too high.
- Only a few tasks are running on the Yarn web UI.



Cluster Metrics

Apps Submitted	Apps Pending	Apps Running	Apps Completed	Containers Running	
9	0	1	8	1	1 (

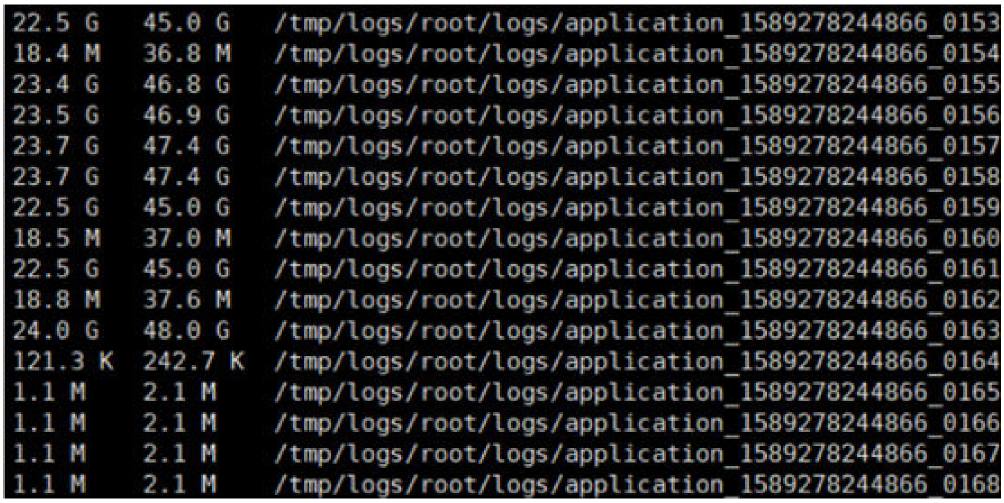
Cluster Nodes Metrics

Active Nodes	Decommissioning Nodes	Decommissioned Nodes
2	0	0

Scheduler Metrics

Scheduler Type	Scheduling Resource Type	Minimum Allocation
Capacity Scheduler	[memory-mb (unit=Mi), vcores]	<memory:512, vCores:1>

- After the **hdfs dfs -du -h /** command is executed on the master node of the cluster, the command output shows that the following files consume a large amount of disk space.



```
22.5 G   45.0 G   /tmp/logs/root/logs/application_1589278244866_0153
18.4 M   36.8 M   /tmp/logs/root/logs/application_1589278244866_0154
23.4 G   46.8 G   /tmp/logs/root/logs/application_1589278244866_0155
23.5 G   46.9 G   /tmp/logs/root/logs/application_1589278244866_0156
23.7 G   47.4 G   /tmp/logs/root/logs/application_1589278244866_0157
23.7 G   47.4 G   /tmp/logs/root/logs/application_1589278244866_0158
22.5 G   45.0 G   /tmp/logs/root/logs/application_1589278244866_0159

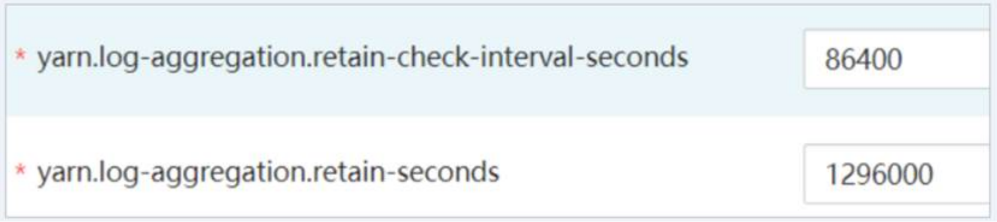
22.5 G   45.0 G   /tmp/logs/root/logs/application_1589278244866_0161
18.8 M   37.6 M   /tmp/logs/root/logs/application_1589278244866_0162
24.0 G   48.0 G   /tmp/logs/root/logs/application_1589278244866_0163
121.3 K  242.7 K  /tmp/logs/root/logs/application_1589278244866_0164
1.1 M    2.1 M    /tmp/logs/root/logs/application_1589278244866_0165
1.1 M    2.1 M    /tmp/logs/root/logs/application_1589278244866_0166
1.1 M    2.1 M    /tmp/logs/root/logs/application_1589278244866_0167
1.1 M    2.1 M    /tmp/logs/root/logs/application_1589278244866_0168
```

- The log aggregation configuration of the Yarn service is as follows.



* yarn.log-aggregation.retain-check-interval-seconds 86400

* yarn.log-aggregation.retain-seconds 1296000

Cause Analysis

Jobs are submitted too frequently, and the time for deleting aggregated log files is set to 1296000, that is, aggregated logs are retained for 15 days. As a result, aggregated logs cannot be released within a short period of time, exhausting the disk space.

Procedure

Step 1 Log in to Manager and navigate to the all configurations page of the MapReduce service.

- MRS Manager: Log in to MRS Manager, choose **Services** > **MapReduce** > **Service Configuration**, and select **All** from the **Type** drop-down list.
- FusionInsight Manager: Log in to FusionInsight Manager and choose **Cluster** > **Services** > **MapReduce**. On the MapReduce page, choose **Configurations** > **All Configurations**.

Step 2 Search for the **yarn.log-aggregation.retain-seconds** parameter and decrease its value based on site requirements, for example, to **259200**. In this case, the aggregated logs of Yarn are retained for three days, and the disk space is automatically released after the retention period expires.

Step 3 Click **Save Configuration** and deselect **Restart the affected services or instances**.

Step 4 Restart the MapReduce service during off-peak hours. The restart will interrupt upper-layer services and affect cluster management, maintenance, and services.

1. Log in to Manager.
2. Restart the MapReduce service.

----End

15.20.4 Temporary Files Are Not Deleted When an MR Job Is Abnormal

Issue

Temporary files are not deleted when an MR job is abnormal.

Symptom

There are too many files in the HDFS temporary directory, occupying too much memory.

Cause Analysis

When an MR job is submitted, related configuration files, JAR files, and files added by running the **-files** command are stored in the temporary directory on HDFS so that the started container can obtain the files. The configuration item **yarn.app.mapreduce.am.staging-dir** specifies the storage path. The default value is **/tmp/hadoop-yarn/staging**.

After a properly running MR job is complete, temporary files are deleted. However, when a Yarn task corresponding to the job exits abnormally, temporary files are not deleted. As a result, the number of files in the temporary directory increases over time, occupying more and more storage space.

Procedure

Step 1 Log in to a cluster.

1. Log in to any master node as user **root**. The user password is the one defined during cluster creation.
2. If Kerberos authentication is enabled for the cluster, run the following commands to go to the client installation directory and configure environment variables. Then, authenticate the user and enter the password as prompted. Obtain the password from an administrator.

   cd *Client installation directory*

   source bigdata_env

   kinit hdfs
3. If Kerberos authentication is not enabled for the cluster, run the following commands to switch to user **omm** and go to the client installation directory to configure environment variables:

   su - omm

   cd *Client installation directory*

   source bigdata_env

Step 2 Obtain the file list.

hdfs dfs -ls /tmp/hadoop-yarn/staging/*/.staging/ | grep "^drwx" | awk '{print $8}' > job_file_list

The **job_file_list** file contains the folder list of all jobs. The following shows an example of the file content:

```
/tmp/hadoop-yarn/staging/omm/.staging/job__<Timestamp>_<ID>
```

Step 3 Collect statistics on running jobs.

mapred job -list 2>/dev/null | grep job_ | awk '{print $1}' > run_job_list

The **run_job_list** file contains the IDs of running jobs. The content format is as follows:

```
job_<Timestamp>_<ID>
```

Step 4 Delete running jobs from the **job_file_list** file. Ensure that data of running jobs is not deleted by mistake when deleting expired data.

cat run_job_list | while read line; do sed -i "/$line/d" job_file_list; done

Step 5 Delete expired data.

cat job_file_list | while read line; do hdfs dfs -rm -r $line; done

Step 6 Delete temporary files.

rm -rf run_job_list job_file_list

----End

15.20.5 ResourceManager of Yarn (Port 8032) Throws Error "connection refused"

Issue

The ResourceManager of Yarn that requests to submit jobs throws error "connection refused", and the port number configured for Yarn is 8032.

Symptom

One of Yarn's ResourceManager nodes in the MRS cluster cannot be connected, and the port number configured for Yarn is 8032.

Cause Analysis

The service application runs outside the cluster, and the in-use client does not match the latest client configuration provided by the MRS cluster. The Yarn port is 8032, which is different from the actual port of Yarn's ResourceManager of MRS. As a result, the ResourceManager of Yarn that requests to submit jobs reports error "connection refused".

Procedure

Step 1 Update the MRS client.

Step 2 Submit the job again.

----End

15.20.6 Failed to View Job Logs on the Yarn Web UI

Symptom

When a user logs in to the Yarn web UI to view job logs and clicks **Local logs**, error message "Could not access logs page!" is displayed.

Cause Analysis

Local logs is used to access service logs. However, for security purposes, this function is inaccessible from the Yarn web UI. You can log in to the active ResourceManager node to view ResourceManager logs.

Procedure

Step 1 Log in to Manager and choose **Cluster** > **Services** > **Yarn**. On the **Yarn** page, click the **Instance** tab and take note of the service IP address of the active ResourceManager instance.

Step 2 Log in to the active ResourceManager node as user **root**.

Step 3 Go to the **/var/log/Bigdata/yarn/rm** directory and view the ResourceManager logs.

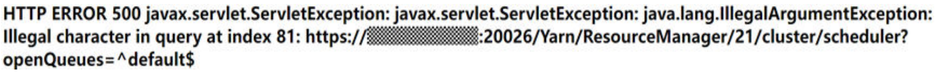
cd /var/log/Bigdata/yarn/rm

----End

15.20.7 An Error Is Reported When a Queue Name Is Clicked on the Yarn Page

Symptom

When Yarn uses the Capacity scheduler, error 500 is reported after a user clicks a queue name on the native Yarn web UI.



```
HTTP ERROR 500 javax.servlet.ServletException: javax.servlet.ServletException: java.lang.IllegalArgumentException:
Illegal character in query at index 81: https://[redacted]:20026/Yarn/ResourceManager/21/cluster/scheduler?
openQueues=^default$
```

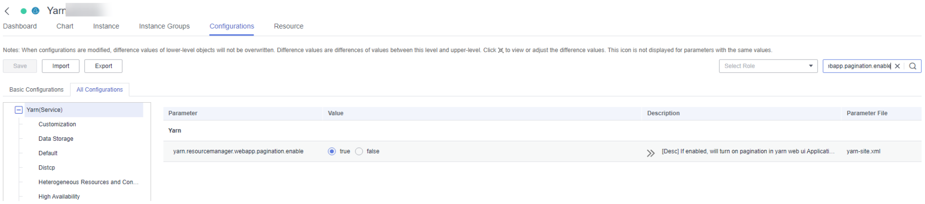
Cause Analysis

Symbol **^** in the URL cannot be identified. As a result, the page access fails.

Procedure

Step 1 Log in to Manager and choose **Cluster** > **Services** > **Yarn** > **Configurations** > **All Configurations**.

Step 2 Search for **yarn.resourcemanager.webapp.pagination.enable** in the search box.



Notes: When configurations are modified, difference values of lower-level objects will not be overwritten. Difference values are differences of values between this level and upper-level. Click ⌘ to view or adjust the difference values. This icon is not displayed for parameters with the same values.

ebapp.pagination.enable

Parameter	Value	Description	Parameter File
Yarn			
yarn.resourcemanager.webapp.pagination.enable	● true ○ false	[Desc] If enabled, will turn on pagination in yarn web ui Applicati...	yarn-site.xml

Step 3 If the value is **true** (default), change it to **false** and save the configuration.

Step 4 On the Yarn page, click **Instance**, select all ResourceManager instances, click **More**, and select **Instance Rolling Restart**. Wait until the instances are started.

----End

15.21 Using ZooKeeper

15.21.1 Accessing ZooKeeper from an MRS Cluster

Issue

An error is reported when a user attempts to access ZooKeeper from an MRS cluster.

Symptom

The customer uses **zkcli.sh** to access ZooKeeper on the MRS Master node, but an error is reported.

Cause Analysis

The command used by the customer is incorrect. As a result, an error is reported.

Procedure

Step 1 Obtain the ZooKeeper IP address.

Step 2 Log in to the Master node as user **root**.

Step 3 Run the following command to initialize environment variables:

source /opt/client/bigdata_env

Step 4 Run the **zkCli.sh -server** *IP address of the node where ZooKeeper is located*:**2181** command to connect to ZooKeeper of the MRS cluster.

The IP address of the node where ZooKeeper is located is the one queried in **Step 1**. Use commas (,) to separate multiple IP addresses.

Step 5 Run common commands such as **ls /** to view ZooKeeper information.

----End

15.22 Accessing OBS

15.22.1 When Using the MRS Multi-user Access to OBS Function, a User Does Not Have the Permission to Access the /tmp Directory

Issue

When the MRS multi-user access to OBS function is used to execute jobs such as Spark, Hive, and Presto jobs, an error message is displayed, indicating that the user does not have the permission to access the **/tmp** directory.

Symptom

When the MRS multi-user access to OBS function is used to execute jobs such as Spark, Hive, and Presto jobs, an error message is displayed, indicating that the user does not have the permission to access the **/tmp** directory.

Cause Analysis

A temporary directory exists during job execution. The user who submits the job does not have permission on the temporary directory.

Procedure

Step 1 On the **Dashboard** tab page of the cluster, query and record the name of the agency bound to the cluster.

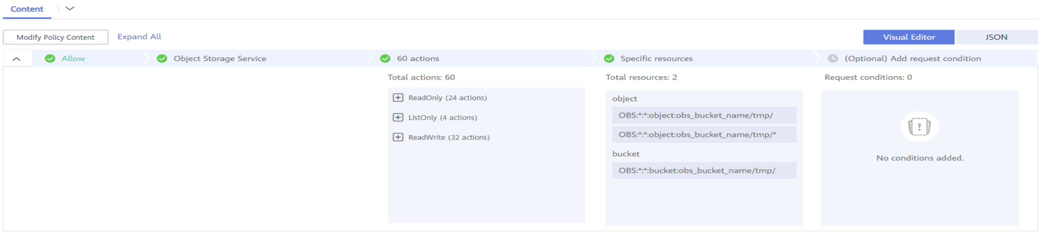
Step 2 Log in to the IAM console.

Step 3 Choose **Permissions**. On the displayed page, click **Create Custom Policy**.

- **Policy Name**: Enter a policy name.
- **Scope**: Select **Global services**.
- **Policy View**: Select **Visual editor**.
- **Policy Content**:
  a. **Allow**: Select **Allow**.
  b. **Select service**: Select **Object Storage Service (OBS)**.
  c. **Select action**: Select **WriteOnly**, **ReadOnly**, and **ListOnly**.
  d. **Specific resources**:
     i. Set **object** to **Specify resource path**, click **Add resource path**, and enter *obs_bucket_name*/**tmp/** and *obs_bucket_name*/**tmp/*** in **Path**. The **/tmp** directory is used as an example. If you need to add permissions for other directories, perform the following steps to add the directories and resource paths of all objects in the directories.
     ii. Set **bucket** to **Specify resource path**, click **Add resource path**, and enter *obs_bucket_name* in **Path**.

     Replace *obs_bucket-name* with the actual OBS bucket name. If the bucket type is Parallel File System, you need to add the *obs_bucket_name*/**tmp/** path. If the bucket type is Object Storage, you do not need to add the path.
  e. (Optional) Request condition, which does not need to be added currently.

Figure 15-61 Custom policy



Allow
Object Storage Service
60 actions
Specific resources
(Optional) Add request condition

Total actions: 60
ReadOnly (24 actions)
ListOnly (4 actions)
ReadWrite (32 actions)

Total resources: 2
object
OBS:*:*:object:obs_bucket_name/tmp/
OBS:*:*:object:obs_bucket_name/tmp/*
bucket
OBS:*:*:bucket:obs_bucket_name/tmp/

Request conditions: 0
No conditions added.

Step 4 Click **OK**.

Step 5 Select **Agency** and click **Assign Permissions** in the **Operation** column of the agency queried in **Step 1**.

Step 6 Query and select the created policy in **Step 3**.

Step 7 Click **OK**.

----End

15.22.2 When the Hadoop Client Is Used to Delete Data from OBS, It Does Not Have the Permission for the .Trash Directory

Issue

When a user uses the Hadoop client to delete data from OBS, an error message is displayed indicating that the user does not have the permission on the **.Trash** directory.

Symptom

After the **hadoop fs -rm obs://<***obs_path***>** command is executed, the following error information is displayed:

```
exception [java.nio.file.AccessDeniedException: user/root/.Trash/Current/: getFileStatus on user/root/.Trash/
Current/: status [403]
```

Cause Analysis

When deleting a file, Hadoop moves the file to the **.Trash** directory. If the user does not have the permission on the directory, error 403 is reported.

Procedure

Solution 1:

Run the **hadoop fs -rm -skipTrash** command to delete the file.

Solution 2:

Add the permission to access the **.Trash** directory to the agency corresponding to the cluster.

Step 1 On the **Dashboard** tab page of the cluster, query and record the name of the agency bound to the cluster.

Step 2 Log in to the IAM console.

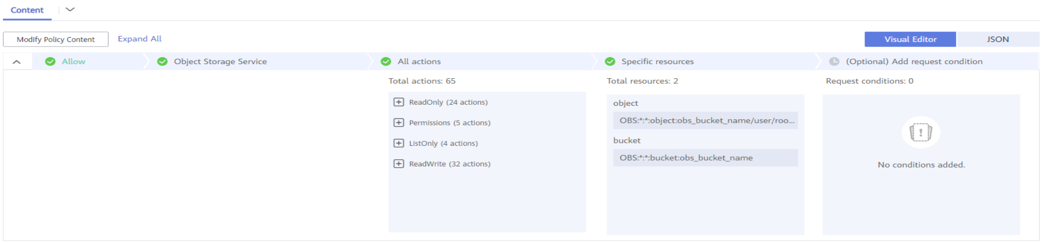
Step 3 Choose **Permissions**. On the displayed page, click **Create Custom Policy**.

- **Policy Name**: Enter a policy name.
- **Scope**: Select **Global services**.
- **Policy View**: Select **Visual editor**.
- **Policy Content**:
  a. **Allow**: Select **Allow**.
  b. **Select service**: Select **Object Storage Service (OBS)**.
  c. Select all operation permissions.
  d. **Specific resources**:
     i. Set **object** to **Specify resource path**, click **Add resource path**, and enter the **.Trash** directory, for example, **obs_bucket_name/user/root/.Trash/*** in **Path**.
     ii. Set **bucket** to **Specify resource path**, click **Add resource path**, and enter *obs_bucket_name* in **Path**.

Replace *obs_bucket-name* with the actual OBS bucket name.

e. (Optional) Request condition, which does not need to be added currently.

Figure 15-62 Custom policy



Allow | Object Storage Service | All actions | Specific resources | (Optional) Add request condition

Total actions: 65
- ReadOnly (24 actions)
- Permissions (5 actions)
- ListOnly (4 actions)
- ReadWrite (32 actions)

Total resources: 2

object
OBS:*:*:object:obs_bucket_name/user/roo...

bucket
OBS:*:*:bucket:obs_bucket_name

Request conditions: 0

No conditions added.

Step 4 Click **OK**.

Step 5 Select **Agency** and click **Assign Permissions** in the **Operation** column of the agency queried in **Step 1**.

Step 6 Query and select the created policy in **Step 3**.

Step 7 Click **OK**.

Step 8 Run the **hadoop fs -rm obs://<*obs_path*>** command again.

----End

16 Appendix

16.1 Precautions for MRS 3.x

Purpose

Custers of versions earlier than MRS 3.x use MRS Manager to manage and monitor MRS clusters. On the Cluster Management page of the MRS management console, you can view cluster details, manage nodes, components, alarms, patches, files, jobs, tenants, and backup and restoration. In addition, you can configure Bootstrap actions and manage tags.

MRS 3.x uses FusionInsight Manager to manage and monitor clusters. On the Cluster Management page of the MRS management console, you can view cluster details, manage nodes, components, alarms, files, jobs, Bootstrap actions, and tags.

Some maintenance operations of the MRS 3.x cluster are different from those of earlier versions. For details, see **MRS Manager Operation Guide (Applicable to 2.x and Earlier Versions)** and **FusionInsight Manager Operation Guide (Applicable to 3.x)**.

Accessing MRS Manager

- For details about how to access MRS Manager of versions earlier than MRS 3.x, see **Accessing MRS Manager MRS 2.x or Earlier)**.
- For details about how to access FusionInsight Manager of MRS 3.x, see **Accessing FusionInsight Manager (MRS 3.x or Later)**.

Modifying MRS Cluster Service Configuration Parameters

- For versions earlier than MRS 3.x, you can modify service configuration parameters on the cluster management page of the MRS management console.
  a. Log in to the MRS console. In the left navigation pane, choose **Clusters** > **Active Clusters**, and click a cluster name.
  b. Choose **Components** > *Name of the desired service* > **Service Configuration**.

The **Basic Configurations** tab page is displayed by default. To modify more parameters, click the **All Configurations** tab. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.

c. In the navigation tree, select the specified parameter category and change the parameter values on the right.

   If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The system searches for the parameter in real time and displays the result.

d. Click **Save Configuration**. In the displayed dialog box, click **OK**.

e. Wait until the message "Operation succeeded" is displayed. Click **Finish**. The configuration is modified.

   Check whether there is any service whose configuration has expired in the cluster. If yes, restart the corresponding service or role instance for the configuration to take effect. You can also select **Restart the affected services or instances** when saving the configuration.

- In MRS 3.x, you need to log in to FusionInsight Manager to modify service configuration parameters.

  a. Log in to FusionInsight Manager.

  b. Choose **Cluster** > **Services**.

  c. Click the specified service name on the service management page.

  d. Click **Configurations**.

     The **Basic Configurations** tab page is displayed by default. To modify more parameters, click the **All Configurations** tab. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.

  e. In the navigation tree, select the specified parameter category and change the parameter values on the right.

     If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The Manager searches for the parameter in real time and displays the result.

  f. Click **Save**. In the confirmation dialog box, click **OK**.

  g. Wait until the message "Operation succeeded" is displayed. Click **Finish**. The configuration is modified.

     Check whether there is any service whose configuration has expired in the cluster. If yes, restart the corresponding service or role instance for the configuration to take effect.

16.2 Installing the Flume Client

16.2.1 Installing the Flume Client on Clusters of Versions Earlier Than MRS 3.x

Scenario

To use Flume to collect logs, you must install the Flume client on a log host. You can create an ECS and install the Flume client on it.

This section applies to MRS 3.*x* or earlier clusters.

Prerequisites

- A streaming cluster with the Flume component has been created.
- The log host is in the same VPC and subnet with the MRS cluster.
- You have obtained the username and password for logging in to the log host.

Procedure

Step 1 Create an ECS that meets the requirements.

Step 2 Go to the cluster details page.

- For versions earlier than MRS 2.0.1, log in to MRS Manager and choose **Services**.
- For MRS 2.0.1 or later, click the cluster name on the MRS console and choose **Components**.

Step 3 Click **Download Client**.

1. In **Client Type**, select **All client files**.
2. In **Download to**, select **Remote host**.
3. Set **Host IP Address** to the IP address of the ECS, **Host Port** to **22**, and **Save Path** to .
   - If the default port **22** for logging in to an ECS through SSH has been changed, set **Host Port** to a new port.
   - The value of **Save Path** contains a maximum of 256 characters.
4. Set **Login User** to **root**.

   If another user is used, ensure that the user has permissions to read, write, and execute the save path.
5. Click **OK** to generate a client file.

   If the following information is displayed, the client package is saved.

   ```
   Client files downloaded to the remote host successfully.
   ```

   If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to **Step 3** to download the client again.

   ```
   Failed to connect to the server. Please check the network connection or parameter settings.
   ```

Step 4 Choose **Flume** > **Instance**. Query the **Business IP Address** of any Flume instance and any two MonitorServer instances.

Step 5 Log in to the ECS using VNC. See .

Log in to the ECS using an SSH key by referring to **Login Using an SSH Key** and set the password. Then log in to the ECS using VNC.

Step 6 On the ECS, switch to user **root** and copy the installation package to the **/opt** directory.

sudo su - root

cp /MRS_Flume_Client.tar /opt

Step 7 Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

tar -xvf MRS_Flume_Client.tar

Step 8 Run the following command to verify the configuration package of the client:

sha256sum -c MRS_Flume_ClientConfig.tar.sha256

If the following information is displayed, the file package is successfully verified:

```
MRS_Flume_ClientConfig.tar: OK
```

Step 9 Run the following command to decompress **MRS_Flume_ClientConfig.tar**:

tar -xvf MRS_Flume_ClientConfig.tar

Step 10 Run the following command to install the client running environment to a new directory, for example, **/opt/Flumeenv**. A directory is automatically generated during the client installation.

sh /opt/MRS_Flume_ClientConfig/install.sh /opt/Flumeenv

If the following information is displayed, the client running environment is successfully installed:

```
Components client installation is complete.
```

Step 11 Run the following command to configure environment variables:

source /opt/Flumeenv/bigdata_env

Step 12 Run the following commands to decompress the Flume client package:

cd /opt/MRS_Flume_ClientConfig/Flume

tar -xvf FusionInsight-Flume-1.6.0.tar.gz

Step 13 Run the following command to check whether the password of the current user has expired:

chage -l root

If the value of **Password expires** is earlier than the current time, the password has expired. Run the **chage -M -1 root** command to validate the password.

Step 14 Run the following command to install the Flume client to a new directory, for example, **/opt/FlumeClient**. A directory is automatically generated during the client installation.

sh /opt/MRS_Flume_ClientConfig/Flume/install.sh -d /opt/FlumeClient -f *service IP address of the MonitorServer instance* **-c** *path of the Flume configuration file* **-l /var/log/ -e** *service IP address of Flume* **-n** *name of the Flume client*

The parameters are described as follows:

- **-d**: indicates the installation path of the Flume client.
- (Optional) **-f**: indicates the service IP addresses of the two MonitorServer instances, separated by a comma (,). If the IP addresses are not configured, the Flume client will not send alarm information to MonitorServer, and the client information will not be displayed on MRS Manager.
- (Optional) **-c**: indicates the **properties.properties** configuration file that the Flume client loads after installation. If this parameter is not specified, the **fusioninsight-flume-1.6.0/conf/properties.properties** file in the client installation directory is used by default. The configuration file of the client is empty. You can modify the configuration file as required and the Flume client will load it automatically.
- (Optional) **-l**: indicates the log directory. The default value is **/var/log/Bigdata**.
- (Optional) **-e**: indicates the service IP address of the Flume instance. It is used to receive the monitoring indicators reported by the client.
- (Optional) **-n**: indicates the name of the Flume client.
- IBM JDK does not support **-Xloggc**. You must change **-Xloggc** to **-Xverbosegclog** in **flume/conf/flume-env.sh**. For 32-bit JDK, the value of **-Xmx** must not exceed 3.25 GB.
- In **flume/conf/flume-env.sh**, the default value of **-Xmx** is 4 GB. If the client memory is too small, you can change it to 512 MB or even 1 GB.

For example, run **sh install.sh -d /opt/FlumeClient**.

If the following information is displayed, the client is successfully installed:

```
install flume client successfully.
```

----End

16.2.2 Installing the Flume Client on MRS 3.*x* or Later Clusters

Scenario

To use Flume to collect logs, you must install the Flume client on a log host. You can create an ECS and install the Flume client on it.

This section applies to MRS 3.*x* or later clusters.

Prerequisites

- A cluster with the Flume component has been created.
- The log host is in the same VPC and subnet with the MRS cluster.
- You have obtained the username and password for logging in to the log host.

- The installation directory is automatically created if it does not exist. If it exists, the directory must be left blank. The directory path cannot contain any space.

Procedure

Step 1 Obtain the software package.

Log in to the FusionInsight Manager. Choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the Flume service page that is displayed, choose **More** > **Download Client** in the upper right corner and set **Select Client Type** to **Complete Client** to download the Flume service client file.

The file name of the client is **FusionInsight_Cluster_**<*Cluster ID*>**_Flume_Client.tar**. This section takes the client file **FusionInsight_Cluster_1_Flume_Client.tar** as an example.

Step 2 Upload the software package.

Upload the software package to a directory, for example, **/opt/client** on the node where the Flume service client will be installed as user **user**.

NOTE

user is the user who installs and runs the Flume client.

Step 3 Decompress the software package.

Log in to the node where the Flume service client is to be installed as user **user**. Go to the directory where the installation package is installed, for example, **/opt/client**, and run the following command to decompress the installation package to the current directory:

```
cd /opt/client
```

```
tar -xvf FusionInsight_Cluster_1_Flume_Client.tar
```

Step 4 Verify the software package.

Run the **sha256sum -c** command to verify the decompressed file. If **OK** is returned, the verification is successful. Example:

```
sha256sum -c FusionInsight_Cluster_1_Flume_ClientConfig.tar.sha256
```

```
FusionInsight_Cluster_1_Flume_ClientConfig.tar: OK
```

Step 5 Decompress the package.

```
tar -xvf FusionInsight_Cluster_1_Flume_ClientConfig.tar
```

Step 6 Run the following command in the Flume client installation directory to install the client to a specified directory (for example, **opt/FlumeClient**): After the client is installed successfully, the installation is complete.

```
cd /opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/Flume/FlumeClient
```

./install.sh -d */opt/FlumeClient* **-f** *MonitorServerService IP address or host name of the role* **-c** *User service configuration filePath for storing properties.properties* **-s** *CPU threshold* **-l /var/log/Bigdata -e** *FlumeServer service IP address or host name* **-n** *Flume*

NOTE

- **-d**: Flume client installation path
- (Optional) **-f**: IP addresses or host names of two MonitorServer roles. The IP addresses or host names are separated by commas (,). If this parameter is not configured, the Flume client does not send alarm information to MonitorServer and information about the client cannot be viewed on the FusionInsight Manager GUI.
- (Optional) **-c**: Service configuration file, which needs to be generated on the configuration tool page of the Flume server based on your service requirements. Upload the file to any directory on the node where the client is to be installed. If this parameter is not specified during the installation, you can upload the generated service configuration file **properties.properties** to the **/opt/FlumeClient/fusioninsight-flume-1.9.0/conf** directory after the installation.
- (Optional) **-s**: cgroup threshold. The value is an integer ranging from 1 to 100 x *N*. *N* indicates the number of CPU cores. The default threshold is **-1**, indicating that the processes added to the cgroup are not restricted by the CPU usage.
- (Optional) **-l**: Log path. The default value is **/var/log/Bigdata**. The user **user** must have the write permission on the directory. When the client is installed for the first time, a subdirectory named **flume-client** is generated. After the installation, subdirectories named **flume-client-***n* will be generated in sequence. The letter *n* indicates a sequence number, which starts from 1 in ascending order. In the **/conf/** directory of the Flume client installation directory, modify the **ENV_VARS** file and search for the **FLUME_LOG_DIR** attribute to view the client log path.
- (Optional) **-e**: Service IP address or host name of FlumeServer, which is used to receive statistics for the monitoring indicator reported by the client.
- (Optional) **-n**: Name of the Flume client. You can choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Flume Management** on FusionInsight Manager to view the client name on the corresponding node.
- If the following error message is displayed, run the **export JAVA_HOME=*JDK path*** command.

  ```
  JAVA_HOME is null in current user,please install the JDK and set the JAVA_HOME
  ```
- IBM JDK does not support **-Xloggc**. You must change **-Xloggc** to **-Xverbosegclog** in **flume/conf/flume-env.sh**. For 32-bit JDK, the value of **-Xmx** must not exceed 3.25 GB.
- When installing a cross-platform client in a cluster, go to the **/opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/Flume/FusionInsight-Flume-1.9.0.tar.gz** directory to install the Flume client.

----End

17 Change History

Released On	What's New
2022-11-30	This issue is the seventh official release. ● The user account list adapts to 3.1.2-LTS.3. For details, see **User Account List**. ● Added section **Changing the Password for User compdbuser of the DBService Database**.
2022-07-30	This issue is the sixth official release. Released MRS 3.1.2-LTS.3. For details, see **Creating a Custom Cluster**.
2021-06-30	This issue is the fifth official release. Released MRS 3.1.0-LTS.1. For details, see **Creating a Custom Cluster**.
2020-10-24	This issue is the fourth official release. Added the following sections: ● **Methods of Creating MRS Clusters** ● **Quick Creation of a Hadoop Analysis Cluster** ● **Quick Creation of an HBase Analysis Cluster** **Quick Creation of a Kafka Streaming Cluster** Modified the following sections: ● **Creating a Custom Cluster** ● **Viewing Basic Cluster Information** ● **Viewing Information of a Historical Cluster**
2020-01-17	This issue is the third official release. Modified the following sections: ● **Creating a Custom Cluster** ● **Viewing Basic Cluster Information** ● **Viewing Information of a Historical Cluster**

Released On	What's New
2019-03-20	This issue is the second official issue. Added the following sections: - **Security Configuration Suggestions for Clusters with Kerberos Authentication Disabled** - **Authorizing O&M** - **Authorizing O&M** - **Adding a Tag to a Cluster** - **Installing Third-Party Software Using Bootstrap Actions** - **Restoring Patches for the Isolated Hosts** - **Rolling Restart** Modified the following sections: - **Creating a Custom Cluster** - **Viewing Basic Cluster Information** - **Configuring an Auto Scaling Rule** - **Viewing Information of a Historical Cluster**
2018-10-12	This issue is the first official release.
