# 1 Product Consulting

---

## 1.1 What Should I Pay Attention to When Using GaussDB(for MySQL)?

1. Instance operating systems (OSs) are invisible to you. Your applications can access a database only through an IP address and a port.
2. The backup files stored in Object Storage Service (OBS) buckets and the Elastic Cloud Servers (ECSs) used by GaussDB(for MySQL) are invisible to you. They are visible only to the instance management system.
3. When you view your instance in the instance list, select the region where your instance is located.
4. Precautions after GaussDB(for MySQL) instances are created:  
After your instance is created, you do not need to perform basic database O&M operations, such as applying HA and security patches, but you must pay attention to:
  - a. vCPUs and memory of your instance. If they become insufficient, you need to change them in a timely manner.
  - b. Storage space of your instance. If the storage is used up, you will be billed on a pay-per-use basis for any additional storage, but if you scale up storage in advance, you can pay for the additional storage at yearly/monthly rates.
  - c. Performance of your instance. You need to check for slow query SQL statements, SQL statements to be optimized, or redundant or missing indexes regularly.

## 1.2 What Can I Do About Slow Response of Websites When They Use GaussDB(for MySQL)?

To solve this problem:

- Check the performance of GaussDB(for MySQL) instances on the GaussDB(for MySQL) console.

- Compare the database connection status of local databases and GaussDB(for MySQL) instances. This problem depends on web applications.

## 1.3 Does GaussDB(for MySQL) Support Automatic Failover?

Yes. During the creation of a GaussDB(for MySQL) instance, a primary node and a read replica are both created. If the primary node fails, the read replica is automatically promoted to the primary node to provide services, and the original primary node is demoted to be a read replica.

## 1.4 Does GaussDB(for MySQL) Support Decoupling of Compute and Storage?

GaussDB(for MySQL) supports the decoupling of compute and storage, improving high availability and the experience in backup and restoration, upgrade and capacity expansion.

## 1.5 Resource Freezing, Release, Deletion, and Unsubscription

### Why Are My Resources Released?

If your subscriptions have expired but not been renewed, or you are in arrears due to insufficient balance, your resources enter a grace period. If you do not renew the subscriptions or top up your account after the grace period expires, your resources will enter a retention period. During the retention period, the resources are not available. If the renewal is still not completed or the outstanding amount is still not paid off when the retention period ends, the stored data will be deleted and the cloud service resources will be released. For details, see [Service Suspension and Resource Release](#).

### Why Are My Resources Frozen?

Your resources may be frozen for a variety of reasons. The most common reason is that you are in arrears.

### Can I Still Back Up Data If My DB Instance Is Frozen?

No. If your instance is frozen due to arrears, you need to unfreeze the instance first.

### How Do I Unfreeze My Resources?

Frozen due to arrears: You can renew your resources or top up your account. Instances frozen due to arrears can be renewed, released, or deleted. Yearly/Monthly instances that have expired cannot be unsubscribed from, while those that have not expired can be unsubscribed from.

## What Happens When My Resources Are Frozen, Unfrozen, or Released?

- After your resources are frozen:
  - They cannot be accessed, causing downtime. For example, if your instance is frozen, it cannot be connected.
  - If they are yearly/monthly resources, no changes can be made to them.
  - They can be unsubscribed from or deleted manually.
- After your resources are unfrozen, you can connect to them again.
- If your resources are released, your instance will be deleted.

## How Do I Renew My Resources?

After a yearly/monthly instance expires, you can renew it on the [Renewals](#) page. For details, see [Renewal Management](#).

## Can My Resources Be Recovered After Being Released? /Can I Retrieve an Incorrect Unsubscription?

You can restore your deleted instance from a manual backup or rebuild your instance in the recycle bin during the retention period. For details, see [Restoring Data to a DB Instance](#) and [Rebuilding a Deleted Instance from Recycle Bin](#).

Before unsubscribing from a resource, confirm the resource information carefully. If you have unsubscribed from an instance by mistake, purchase a new one.

## How Do I Delete My Instance?

- For pay-per-use instances, see [Deleting a DB Instance Billed on a Pay-per-Use Basis](#).
- For yearly/monthly instances, see [Unsubscribing from a Yearly/Monthly Instance](#).

# 2 Database Connections

---

## 2.1 What Should I Do If I Can't Connect to My GaussDB(for MySQL) Instance?

### Possible Causes

Try the following:

1. **Check whether the DB instance is available.**

for example, the DB instance status is abnormal.

2. **(Common) Check whether the client connection is correct.**

- If you connect to a DB instance over a private network, ensure that the DB instance and ECS are in the same region and VPC.
- If you connect to a DB instance over a public network, bind an EIP to the DB instance and then connect to the DB instance through the EIP.

3. **Check the SSL connection is used.**

Run either of the following example commands to enable or disable SSL:

- SSL enabled: `mysql -h 172.16.0.31 -P 3306 -u root -p --ssl-ca=/tmp/ca.pem`
- SSL disabled: `mysql -h 172.16.0.31 -P 3306 -u root -p`

4. **Check whether the parameters in the connection command are correct.**

For example, check whether the following parameters are configured correctly: connection address, port number, username, password, and connection method.

5. **(Common) Check whether the network connection is normal.**

- For a private network connection:
  - i. Check whether the ECS and DB instance are in the same region and VPC.
  - ii. Check security group rules.
  - iii. On the ECS, check whether the DB instance port can be connected to.

- For a public network connection:
  - i. Check security group rules.
  - ii. Check network ACL rules.
  - iii. Ping the ECSs in the same region to the DB instance.
- 6. **(Common) Check whether there are too many connections to the DB instance.**  
If there is an excessive number of database connections, applications may be unable to connect.
- 7. **View common connection error messages.**  
Find corresponding solutions based on connection error messages.

## Fault Locating

Figure 2-1 What Can I Do If I Can't Connect to My DB Instance?

1. **Check whether the DB instance is available.**  
Check whether the DB instance is in the **Available** state.  
Possible cause: The DB instance is abnormal.  
**Solution:** If the DB instance is abnormal, reboot it.

Figure 2-2 Checking DB instance status

NameID	Description	DB Instan...	DB Engine	Status	Billing Mode	Private IP Ad...	Enterprise Pr...	Created	Database Port	Storage Type	Operation
		Primary/Sta...	GaussDB(for M...	Available	Pay-per-use	192.168.0.100	default	Aug 22, 2023 1...	3306	Shared	Log In View Metric More

2. **Check whether the client connection is correct.**  
Install a **MySQL 8.0 client**.  
For details about how to connect to a DB instance over a private or public network, see **Can an External Server Access the GaussDB(for MySQL) Database?**

**Table 2-1** Connection model

Connecti on method	Scenario	Example
Private network	A private IP address is provided by default.  If your applications are deployed on an ECS that is in the same region and VPC as the DB instance, connect to the ECS and DB instance through a private IP address.	<b>mysql -h <i>private IP address</i> -P 3306 -u root -p --ssl-ca=/tmp/ca.pem</b>  Go to the <b>Basic Information</b> page of the instance and view the private IP address in the <b>Network Information</b> area.
Public network	If you cannot access the DB instance using a private IP address, bind an EIP to the DB instance and then connect to the DB instance through the EIP.  For EIP pricing details, see <a href="#">EIP billing details</a> .	<b>mysql -h <i>EIP</i> -P 3306 -u root -p --ssl-ca=/tmp/ca.pem</b>  Go to the <b>Basic Information</b> page of the instance and view the EIP in the <b>Network Information</b> area.

3. Check whether the SSL connection is used.

- (Recommended) Enable SSL on the **Basic Information** page of the instance, download and decompress the package, and upload the root certificate **ca.pem** to the **/tmp** directory of the ECS.

Example:

```
mysql -h 172.16.0.31 -P 3306 -u root -p --ssl-ca=/tmp/ca.pem
```

**Figure 2-3** Enabling SSL

- Common connection: Disable SSL on the **Basic Information** page.

Example:

```
mysql -h 172.16.0.31 -P 3306 -u root -p
```

4. Check the parameters in the command used to connect.

Ensure that the connection address, port, username and password, and SSL certificate are correct, and try to connect to the DB instance again.

- **Connecting to a DB Instance over a Private Network**

- Connection command  
**mysql -h connection address -P database port -u username -p --ssl-ca= SSL certificate name**

Example:

```
mysql -h 192.168.0.153 -P 3306 -u root -p --ssl-ca=/tmp/ca.pem
```

- *connection address*  
Go to the **Basic Information** page of the instance and view the private IP address in the **Network Information** area.

**Figure 2-4** Private IP address

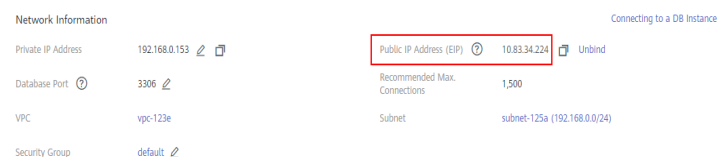

Network Information		Connecting to a DB Instance	
Private IP Address	192.168.0.153	Public IP Address (EIP)	10.83.34.224 Unbind
Database Port	3306	Recommended Max. Connections	1,500
VPC	vpc-123e	Subnet	subnet-125a (192.168.0.0/24)
Security Group	default		

- *database port*  
Go to the **Basic Information** page of the instance and view the database port in the **Network Information** area.
  - *Username*  
Enter **root** and its password.
  - *SSL certificate name*  
Name of the SSL certificate file. The path and file name must be the same as those in the command.
- **Connecting to a DB Instance over a Public Network**
- Connection command  
**mysql -h connection address -P database port -u username -p --ssl-ca= SSL certificate name**  
Example:  

```
mysql -h 10.83.34.224 -P 3306 -u root -p --ssl-ca=/tmp/ca.pem
```
  - EIP  
Go to the **Basic Information** page of the instance and view the EIP in the **Network Information** area.

**Figure 2-5** EIP

Network Information		Connecting to a DB Instance	
Private IP Address	192.168.0.153	Public IP Address (EIP)	10.83.34.224 Unbind
Database Port	3306	Recommended Max. Connections	1,500
VPC	vpc-123e	Subnet	subnet-125a (192.168.0.0/24)
Security Group	default		

- Database port  
Go to the **Basic Information** page of the instance and view the database port in the **Network Information** area.
  - Username and password  
Make sure you have entered the root password correctly.
  - Certificate  
Enter the name of the SSL certificate file. The path and file name must be the same as those in the command.
5. **Check whether the network connection is normal.**
- Private network connection**
- a. Check whether the ECS and DB instance are in the same region and VPC.
    - If the ECS and DB instance are in different regions, they cannot communicate with each other. Select a region near to your service area to reduce network latency and experience faster access. To connect to the DB instance across regions, use Cloud Connect (CC) or Virtual Private Network (VPN).
    - If the ECS and DB instance are in different VPCs of the same region, they cannot communicate with each other through a private network. After a DB instance is created, you cannot change its VPC. In this case, create a VPC peer connection. For details, see [What Should I Do If an ECS and a GaussDB\(for MySQL\) instance Deployed in Different VPCs Cannot Communicate with Each Other?](#).

**Figure 2-6** Checking the VPC of an ECS

#### ECS Information

ID	37144dd6-2d7f-42c4-92bd-e6e1003361e8
Name	ecs-5948 
Description	-- 
Region	
AZ	AZ3
Specifications	General computing   1 vCPU   1 GiB   sn3.small.1
Image	<a href="#">CentOS 8.2 64bit   Public image</a>
VPC	<span style="border: 1px solid red; padding: 2px;">default_vpc</span>

**Figure 2-7** Checking the VPC of a GaussDB(for MySQL) instance

- b. Check security group rules.
  - If **Destination** is not **0.0.0.0/0** and **Protocol & Port** is not **All** on the **Outbound Rules** page of the ECS, add the private IP address and port of the DB instance to the outbound rules.

**Figure 2-8** ECS security group

**Figure 2-9** Fast adding an outbound rule (private IP address of a DB instance)

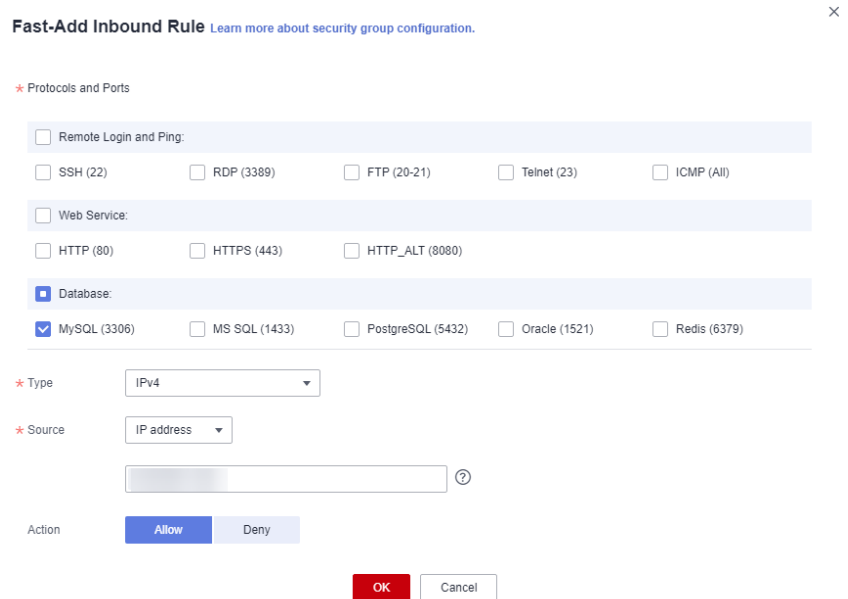

**Figure 2-10** Adding an outbound rule (private IP address of a DB instance)

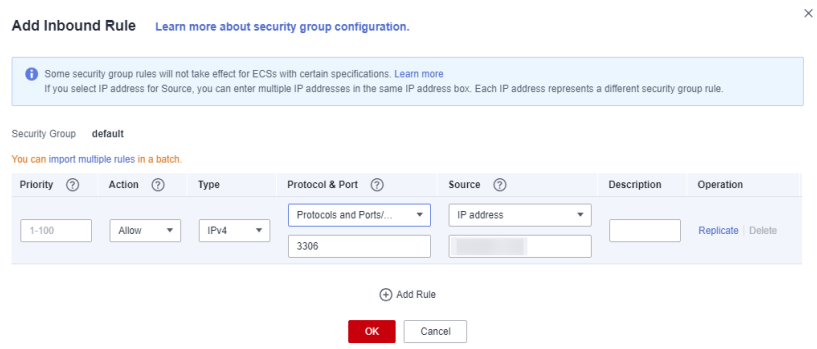

- Add the private IP address and port of the ECS to the **inbound rules**.

**Figure 2-11** Fast adding an inbound rule (private IP address of an ECS)

**Figure 2-12** Adding an inbound rule (private IP address of an ECS)

- c. On the ECS, check whether the private IP address of the DB instance can be connected to.

**telnet private IP address**

Example:

**telnet 192.168.0.153 3306**

- If the connection is normal, the network is normal.
- If the connection fails, **create a service ticket** to contact customer service for assistance.

**Public network connection**

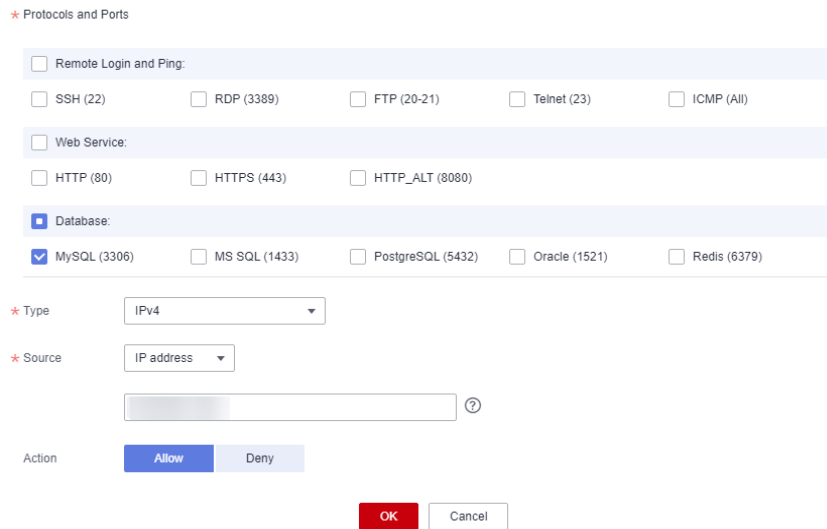

- a. Check security group rules.
  - If **Destination** is not **0.0.0.0/0** and **Protocol & Port** is not **All** on the **Outbound Rules** page of the ECS, add the EIP and port of the DB instance to the outbound rules.

**Figure 2-13** ECS security group

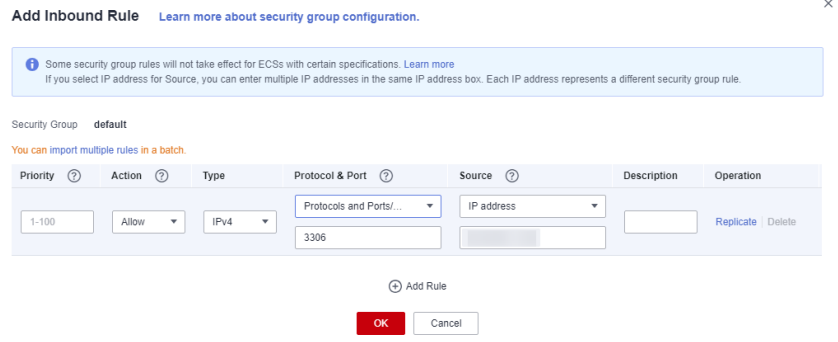

**Figure 2-14** Fast adding an outbound rule (DB instance EIP)

**Fast-Add Inbound Rule** [Learn more about security group configuration.](#)

**Figure 2-15** Adding an outbound rule (DB instance EIP)

- Add the EIP and port of the ECS to the **inbound rules**.

**Figure 2-16** Adding an inbound rule (ECS EIP)

**Fast-Add Inbound Rule** [Learn more about security group configuration.](#)

\* Protocols and Ports

Remote Login and Ping:

SSH (22)     RDP (3389)     FTP (20-21)     Telnet (23)     ICMP (All)

Web Service:

HTTP (80)     HTTPS (443)     HTTP\_ALT (8080)

Database:

MySQL (3306)     MS SQL (1433)     PostgreSQL (5432)     Oracle (1521)     Redis (6379)

\* Type: IPv4

\* Source: IP address

Action:

**Figure 2-17** Adding an inbound rule (ECS EIP)

**Add Inbound Rule** [Learn more about security group configuration.](#)

**Some security group rules will not take effect for ECSs with certain specifications. Learn more**  
If you select IP address for Source, you can enter multiple IP addresses in the same IP address box. Each IP address represents a different security group rule.

Security Group: default

You can import multiple rules in a batch.

Priority	Action	Type	Protocol & Port	Source	Description	Operation
1-100	Allow	IPv4	3306	IP address		<a href="#">Replicate</a> <a href="#">Delete</a>

- b. Check network ACL rules.
  - i. Go to the [Network ACLs](#).
  - ii. Check whether the NIC to which the GaussDB(for MySQL) and EIP bound belongs to the subnet associated with the network ACL.
  - iii. Check whether the network ACL is enabled.  
If yes, [add an ICMP rule to allow traffic](#).

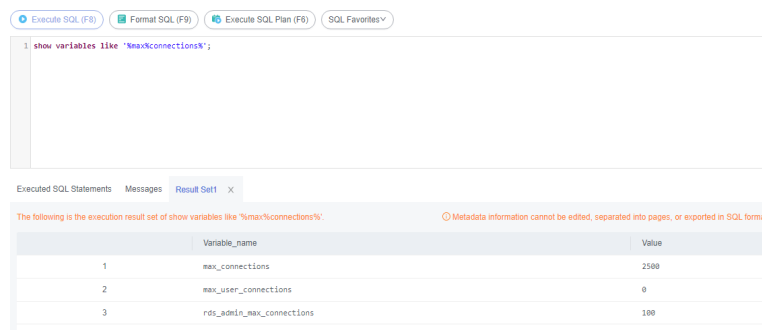

The default network ACL rule denies all inbound and outbound packets. This default rule is still applied even if the network ACL is disabled.

- c. Ping the DB instance from an ECS in the same region as the DB instance.  
If you cannot ping the DB instance's EIP from an ECS, try pinging it from another ECS in the same region. If the EIP can be pinged, the network is normal. In this case, [create a service ticket](#) to contact customer service.

6. **Check whether there are too many connections to the DB instance.**  
**Check method:**

- a. [Log in to the management console.](#)
- b. Click  in the upper left corner and select a region and a project.
- c. Click  in the upper left corner of the page, choose **Databases > GaussDB(for MySQL)**.
- d. On the **Instances** page, locate the DB instance and click **Log In** in the **Operation** column.
- e. Enter the password and click **Test Connection**. After the connection is successful, click **Log In** to access DAS.
- f. Choose **SQL Operations > SQL Query**.
- g. Enter the command and click **Execute SQL** to check the number of instance connections.

**show variables like '%max%connections%';**

- **max\_connections**: the maximum number of clients that can be connected at the same time. If this parameter is set to **default**, the maximum number of clients depends on the amount of memory configured. For details, see [What Is the Maximum Number of Connections to a GaussDB\(for MySQL\) Instance?](#)
  - **max\_user\_connections**: the maximum number of concurrent connections allowed for a specific GaussDB(for MySQL) account.
- h. Check whether the total connections and current active connections have reached the upper limits by referring to [Viewing Instance Monitoring Metrics](#). Determine whether to release the connections.

**Possible cause:** If there are too many database connections, applications may be unable to connect, and full and incremental backups may fail, affecting services.

**Solution:**

- a. Check whether applications are connected, optimize the connections, and release unnecessary connections.
- b. If this parameter is set to **default**, you can scale up the DB instance to set **max\_connections** to a larger value. For details, see [Changing vCPUs and Memory of a DB Instance](#).
- c. Check whether any metrics are abnormal and whether any alarms are generated on the Cloud Eye console. Cloud Eye monitors database metrics, such as the CPU usage, memory usage, storage space usage, and database connections, and allows you to configure alarm policies to

identify risks in advance if any alarms are generated. For details about the supported monitoring metrics, see [Introducing GaussDB\(for MySQL\) Metrics](#).

#### 7. **View common connection error messages.**

When you run commands to connect to a DB instance, understanding the error messages can help:

- ERROR 2013: Lost connection to MySQL server during query  
If the values of **wait\_timeout** and **interactive\_timeout** are too small, GaussDB(for MySQL) client will automatically disconnect the timeout empty connection. For details, see [Client Automatically Disconnected from a DB Instance](#).
- ERROR 1045 : Access denied for user 'root'@'192.168.0.30' (using password: YES)  
Check whether the password is correct and whether the ECS has the permission to connect to the DB instance. For details, see ["Access denied" Displayed During Database Connection](#).
- Error message "SSL routines: tls\_early\_post\_process\_client\_hello:unsupported protocol"  
Check the TLS version of GaussDB(for MySQL) , and upgrade the TLS version of the client. For details, see [SSL Connection Failed Due to Inconsistent TLS Versions](#).
- Error reported when JDBC is used to connect to the database: "unable to find certification path to requested target"  
The JAR package of MariaDB is used to connect to the database, which is slightly different from the official driver package of MySQL. For details, see [Failed to Connect to a Database Using mariadb-connector in SSL Mode](#).

8. If the problem persists, [create a service ticket](#).

## 2.2 Can an External Server Access the GaussDB(for MySQL) Database?

### An Instance Bound with an EIP

For an instance that has been bound with an EIP, you can access it through the EIP.

For details, see:

[Binding an EIP](#)

### An Instance Not Bound with an EIP

- Enable a VPN in a VPC and use the VPN to connect to the GaussDB(for MySQL) instance.
- Create a GaussDB(for MySQL) instance and an ECS in the same VPC and access GaussDB(for MySQL) through the ECS.

For details, see:

## Connecting to a DB Instance over a Private Network

### 2.3 What Do I Do If the Number of GaussDB(for MySQL) Database Connections Reaches the Upper Limit?

The number of database connections indicates the number of applications that can be simultaneously connected to a database, and is irrelevant to the maximum number of users allowed by your applications or websites.

If there is an excessive number of database connections, applications may fail to be connected, and the full and incremental backups may fail, affecting services.

#### Fault Locating

1. Check whether applications are connected, optimize the connections, and release unnecessary connections.
2. Check the specifications and scale them up if needed.
3. Check whether any metrics are abnormal and whether any alarms are generated on the Cloud Eye console. Cloud Eye monitors database metrics, such as the CPU usage, memory usage, storage space usage, and database connections, and allows you to configure alarm policies to identify risks in advance if any alarms are generated. For details, see the *Cloud Eye User Guide*.

#### Solution

1. Connect to an instance through a private network. Using a private network prevents congestion caused by insufficient bandwidth.  
For details, see:  
[Connecting a DB Instance over a Private Network](#)
2. On the console, set the parameter `innodb_adaptive_hash_index` to `off` to reduce lock wait time.  
For details, see [Modifying a Parameter Template](#).
3. Optimize slow queries.

### 2.4 What Is the Maximum Number of Connections to a GaussDB(for MySQL) Instance?

GaussDB(for MySQL) does not have constraints on the number of connections. This number is determined by the default value and value range of the DB engine. For example, you can set `max_connections` and `max_user_connections` in a parameter template to configure the maximum number of connections for a GaussDB(for MySQL) instance.

## Changing the Maximum Number of Connections

The number of connections can be changed online. For details, see [Modifying a Parameter Template](#).

You can run commands to change the maximum number of connections.

1. Check the maximum number of connections:  
**show global variables like 'max\_connections';**
2. Change the value of **max\_connections** under **mysqld** in the **my.cnf** file.  
**[mysqld]**  
**max\_connections = 1000**

## About max\_connections

**max\_connections** indicates the maximum number of clients that can be connected at the same time. If this parameter is set to **default**, it is related to the instance memory (unit: GB). The calculation formula is as follows:

**Estimated value of max\_connections = Available node memory/Estimated memory occupied by a single connection**

- Available node memory = Total memory – Memory occupied by the buffer pool – 1 GB (mysqld process, OS, and monitoring program)
- Estimated memory usage of a single connection (single\_thread\_memory) = thread\_stack (256 KB) + binlog\_cache\_size (32 KB) + join\_buffer\_size (256 KB) + sort\_buffer\_size (256 KB) + read\_buffer\_size (128 KB) + read\_rnd\_buffer\_size (256 KB) ≈ 1 MB

The following table lists the default values of **max\_connections** for different memory specifications.

**Table 2-2** Max\_connections for different memory specifications

Memory (GB)	Connections
512	100,000
384	80,000
256	60,000
128	30,000
64	18,000
32	10,000
16	5,000
8	2,500
4	1,500
2	800

## 2.5 What Should I Do If an ECS Cannot Connect to a GaussDB(for MySQL) Instance?

Perform the following steps to identify the problem:

**Step 1** Check whether the ECS and GaussDB(for MySQL) instance are located in the same VPC.

- If they are in the same VPC, go to [Step 2](#).
- If they are in different VPCs, create an ECS in the VPC where the instance is located.

**Step 2** Check whether a security group has been created for the ECS.

- If a security group has been created, check whether its rules are appropriate. For details, see the security group description in "Creating an Instance" in the *GaussDB(for MySQL) Getting Started*. Then, go to [Step 3](#).
- If no security group has been created, go to the VPC console from the ECS details page and create a security group.

**Step 3** Check whether the ECS can connect to the instance over the instance port.

The default port of a primary/standby instance is **3306**.

```
telnet <IP address> {Port number}
```

- If the ECS can connect to the instance, no further action is required.
- If the ECS still cannot connect to the instance port, contact technical support.

----End

## 2.6 How Can I Connect to a MySQL Database Through JDBC?

Although the SSL certificate is optional if you choose to connect to a database through Java database connectivity (JDBC), you are advised to download the SSL certificate to encrypt the connections for security purposes. By default, SSL data encryption is enabled for newly created GaussDB(for MySQL) instances. Enabling SSL will increase the network connection response time and CPU usage. Before enabling SSL, evaluate the impact on service performance. For details about how to enable or disable SSL, see [Configuring SSL](#).

### Prerequisites

Familiarize yourself with:

- Computer basics
- Java programming language
- JDBC knowledge

## Connection with the SSL Certificate

The SSL certificate needs to be downloaded and verified for connecting to databases.

### NOTE

If the **ssl\_type** value of a database user is **x509**, this method is unavailable.

To check the **ssl\_type** value of the current user, run the following command:

```
select ssl_type from mysql.user where user = 'xxx';
```

**Step 1** Download the CA certificate or certificate bundle.

1. On the **Instances** page, click the instance name to go to the **Basic Information** page.
2. In the **DB Instance Information** area, click  next to **SSL**.

**Step 2** Use keytool to generate a truststore file using the CA certificate.

```
<keytool installation path> ./keytool.exe -importcert -alias <MySQLCACert> -file <ca.pem> -keystore  
<truststore_file> -storepass <password>
```

**Table 2-3** Parameter description

Parameter	Description
<keytool installation path>	Bin directory in the JDK or JRE installation path, for example, <b>C:\Program Files (x86)\Java\jdk11.0.7\bin</b> .
<MySQLCACert>	Name of the truststore file. Set it to a name specific to the service for future identification.
<ca.pem>	Name of the CA certificate downloaded and decompressed in <b>Step 1</b> , for example, <b>ca.pem</b> .
<truststore_file>	Path for storing the truststore file.
<password>	Password of the truststore file.

Code example (using keytool in the JDK installation path to generate the truststore file):

```
Owner: CN=MySQL_Server_8.0.22_Auto_Generated_CA_Certificate  
Issuer: CN=MySQL_Server_8.0.22_Auto_Generated_CA_Certificate  
Serial number: 1  
Valid from: Thu Feb 16 11:42:43 EST 2017 until: Sun Feb 14 11:42:43 EST 2027  
Certificate fingerprints:  
MD5: 18:87:97:37:EA:CB:0B:5A:24:AB:27:76:45:A4:78:C1  
SHA1: 2B:0D:D9:69:2C:99:BF:1E:2A:25:4E:8D:2D:38:B8:70:66:47:FA:ED  
SHA256:C3:29:67:1B:E5:37:06:F7:A9:93:DF:C7:B3:27:5E:09:C7:FD:EE:2D:18:86:F4:9C:40:D8:26:CB:DA:95:  
A0:24  
Signature algorithm name: SHA256withRSA Subject Public Key Algorithm: 2048-bit RSA key  
Version: 1  
Trust this certificate? [no]: y  
Certificate was added to keystore
```

**Step 3** Connect to the GaussDB(for MySQL) instance through JDBC.

```
jdbc:mysql://<instance_ip>:<instance_port>|<database_name>?  
requireSSL=<value1>&useSSL=<value2>&verifyServerCertificate=<value3>&trustCertificateKeyStoreUrl=f
```

```
file:  
<truststore_file>&trustCertificateKeyStorePassword=<password>
```

**Table 2-4** Parameter description

Parameter	Description
<instance_ip>	IP address of the DB instance. <b>NOTE</b> <ul style="list-style-type: none"><li>If you are accessing the instance through ECS, <i>instance_ip</i> is the private IP address of the instance. You can view the private IP address in the <b>Network Information</b> area on the <b>Basic Information</b>.</li><li>If you are accessing the instance through a public network, <i>instance_ip</i> indicates the EIP that has been bound to the instance. You can view the private IP address in the <b>Network Information</b> area on the <b>Basic Information</b>.</li></ul>
<instance_port>	Database port of the instance. The default port is <b>3306</b> . <b>NOTE</b> You can view the private IP address in the <b>Network Information</b> area on the <b>Basic Information</b> .
<database_name >	Database name used for connecting to the instance. The default value is <b>mysql</b> .
<value1>	Value of <b>requireSSL</b> , indicating whether the server supports SSL. It can be either of the following: <ul style="list-style-type: none"><li><b>true</b>: The server supports SSL.</li><li><b>false</b>: The server does not support SSL.</li></ul> <b>NOTE</b> For details about the relationship between <b>requireSSL</b> and <b>sslmode</b> , see <a href="#">Table 2-5</a> .
<value2>	Value of <b>useSSL</b> , indicating whether the client uses SSL to connect to the server. It can be either of the following: <ul style="list-style-type: none"><li><b>true</b>: The client uses SSL to connect to the server.</li><li><b>false</b>: The client does not use SSL to connect to the server.</li></ul> <b>NOTE</b> For details about the relationship between <b>useSSL</b> and <b>sslmode</b> , see <a href="#">Table 2-5</a> .
<value3>	Value of <b>verifyServerCertificate</b> , indicating whether the client verifies the server certificate. It can be either of the following: <ul style="list-style-type: none"><li><b>true</b>: The client verifies the server certificate.</li><li><b>false</b>: The client does not verify the server certificate.</li></ul> <b>NOTE</b> For details about the relationship between <b>verifyServerCertificate</b> and <b>sslmode</b> , see <a href="#">Table 2-5</a> .
<truststore_file>	Path for storing the truststore file configured in <a href="#">Step 2</a> .

Parameter	Description
<code>&lt;password&gt;</code>	Password of the truststore file configured in <a href="#">Step 2</a> .

**Table 2-5** Relationship between connection parameters and sslmode

useSSL	requireSSL	verifyServerCertificate	sslMode
false	N/A	N/A	DISABLED
true	false	false	PREFERRED
true	true	false	REQUIRED
true	N/A	true	VERIFY_CA

Code example (Java code for connecting to a GaussDB(for MySQL) instance):

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;
import java.sql.SQLException;

public class JDBCtest {
    //There will be security risks if the username and password used for authentication are directly written
    //into code. Store the username and password in ciphertext in the configuration file or environment variables.
    //In this example, the username and password are stored in the environment variables. Before running
    //the code, set environment variables EXAMPLE_USERNAME_ENV and EXAMPLE_PASSWORD_ENV as needed.
    static final String USER = System.getenv("EXAMPLE_USERNAME_ENV");
    static final String PASS = System.getenv("EXAMPLE_PASSWORD_ENV");

    public static void main(String[] args) {
        Connection conn = null;
        Statement stmt = null;

        String url = "jdbc:mysql://<instance_ip>:<instance_port>/<database_name>?
requireSSL=true&useSSL=true&verifyServerCertificate=true&trustCertificateKeyStoreUrl=file:
<truststore_file>&trustCertificateKeyStorePassword=<password>";

        try {
            Class.forName("com.mysql.cj.jdbc.Driver");
            conn = DriverManager.getConnection(url, USER, PASS);

            stmt = conn.createStatement();
            String sql = "show status like 'ssl%'";
            ResultSet rs = stmt.executeQuery(sql);

            int columns = rs.getMetaData().getColumnCount();
            for (int i = 1; i <= columns; i++) {
                System.out.print(rs.getMetaData().getColumnName(i));
                System.out.print("\t");
            }

            while (rs.next()) {
                System.out.println();
                for (int i = 1; i <= columns; i++) {
                    System.out.print(rs.getObject(i));
                    System.out.print("\t");
                }
            }
        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```

```
    }  
    }  
    rs.close();  
    stmt.close();  
    conn.close();  
} catch (SQLException se) {  
    se.printStackTrace();  
} catch (Exception e) {  
    e.printStackTrace();  
} finally {  
    // release resource ....  
}  
}
```

----End

## Connection Without the SSL Certificate

### NOTE

You do not need to download the SSL certificate because certificate verification on the server is not required.

**Step 1** Connect to your GaussDB(for MySQL) instance through JDBC.

```
jdbc:mysql://<instance_ip>:<instance_port>|<database_name>?useSSL=false
```

**Table 2-6** Parameter description

Parameter	Description
<i>&lt;instance_ip&gt;</i>	IP address of the instance. <b>NOTE</b> <ul style="list-style-type: none"><li>If you are accessing the instance through ECS, <i>instance_ip</i> is the private IP address of the instance. You can view the private IP address in the <b>Network Information</b> area on the <b>Basic Information</b>.</li><li>If you are accessing the instance through a public network, <i>instance_ip</i> indicates the EIP that has been bound to the instance. You can view the private IP address in the <b>Network Information</b> area on the <b>Basic Information</b>.</li></ul>
<i>&lt;instance_port&gt;</i>	Database port of the instance. The default port is <b>3306</b> . <b>NOTE</b> You can view the private IP address in the <b>Network Information</b> area on the <b>Basic Information</b> .
<i>&lt;database_name&gt;</i> >	Database name used for connecting to the instance. The default value is <b>mysql</b> .

Code example (Java code for connecting to a GaussDB(for MySQL) instance):

```
import java.sql.Connection;  
import java.sql.DriverManager;  
import java.sql.ResultSet;  
import java.sql.Statement;  
  
public class MyConnTest {  
    final public static void main(String[] args) {
```

```
Connection conn = null;
// set sslmode here.
// no ssl certificate, so do not specify path.
String url = "jdbc:mysql://192.168.0.225:3306/my_db_test?useSSL=false";
try {
    Class.forName("com.mysql.jdbc.Driver");
    //There will be security risks if the username and password used for authentication are
    directly written into code. Store the username and password in ciphertext in the configuration file or
    environment variables.
    //In this example, the username and password are stored in the environment variables.
    Before running the code, set environment variables EXAMPLE_USERNAME_ENV and
    EXAMPLE_PASSWORD_ENV as needed.
    conn = DriverManager.getConnection(url, System.getenv("EXAMPLE_USERNAME_ENV"),
    System.getenv("EXAMPLE_PASSWORD_ENV"));
    System.out.println("Database connected");

    Statement stmt = conn.createStatement();
    ResultSet rs = stmt.executeQuery("SELECT * FROM mytable WHERE columnfoo = 500");
    while (rs.next()) {
        System.out.println(rs.getString(1));
    }
    rs.close();
    stmt.close();
    conn.close();
} catch (Exception e) {
    e.printStackTrace();
    System.out.println("Test failed");
} finally {
    // release resource ....
}
}
```

----End

## Related Issues

- Symptom

When you use JDK 8.0 or a later version to connect to your instance with an SSL certificate downloaded, an error similar to the following is reported:

```
javax.net.ssl.SSLHandshakeException: No appropriate protocol (protocol is disabled or
cipher suites are inappropriate)
    at sun.security.ssl.HandshakeContext.<init>(HandshakeContext.java:171) ~[na:1.8.0_292]
    at sun.security.ssl.ClientHandshakeContext.<init>(ClientHandshakeContext.java:98) ~
[na:1.8.0_292]
    at sun.security.ssl.TransportContext.kickstart(TransportContext.java:220) ~

... 68 common frames omitted
```

- Solution

Specify the corresponding parameter values in the code link of [Step 3](#) based on the JAR package used by the client. Example:

- mysql-connector-java-5.1.xx.jar  
`jdbc:mysql://<instance_ip>:<instance_port>/<database_name>?  
requireSSL=true&useSSL=true&verifyServerCertificate=true&trustCertificateKeyStoreUrl=file:  
<truststore_file>&trustCertificateKeyStorePassword=<password>&  
enabledTLSProtocols=TLSv1.2`
- mysql-connector-java-8.0.xx.jar  
`jdbc:mysql://<instance_ip>:<instance_port>/<database_name>?  
requireSSL=true&useSSL=true&verifyServerCertificate=true&trustCertificateKeyStoreUrl=file:  
<truststore_file>&trustCertificateKeyStorePassword=<password>&tlsVersions=TLSv1.2`

## 2.7 How Can I Create and Connect to an ECS?

1. For details about how to create an ECS, see *Elastic Cloud Server User Guide*.
  - The ECS to be created must be in the same VPC with the GaussDB(for MySQL) instance to which it connects.
  - Configure a security group to allow the ECS to access the instance through the IP address.
2. For details on how to connect to the ECS, see section "Logging In to an ECS" in the *Elastic Cloud Server User Guide*.

## 2.8 What Should I Do If a Database Client Problem Causes a Connection Failure?

Check the following items to troubleshoot GaussDB(for MySQL) connection failures caused by a client problem:

1. ECS security policy  
In Windows, check whether the GaussDB(for MySQL) instance port is enabled in the Windows security policy. In Linux, run **iptables** to check whether the GaussDB(for MySQL) instance port is enabled in firewall settings.
2. Application configuration  
Check whether the connection address, port parameter configuration, and JDBC connection parameter configuration are correct.
3. Username or password  
Check whether the username or password is correct if an error similar to the following occurs during the database connection:
  - [Warning] Access denied for user 'username'@'yourIp' (using password: NO)
  - [Warning] Access denied for user 'username'@'yourIp' (using password: YES)

### NOTE

If the problem persists, contact post-sales technical support.

## 2.9 Why Cannot I Ping My EIP After It Is Bound to a DB Instance?

### Fault Locating

1. Check security group rules.
2. Check network ACLs.
3. Ping the ECS to the instance in the same region.

### Solution

1. Check security group rules.
  - a. On the **Instances** page, click the instance name to go to the **Basic Information** page.
  - b. In the **Network Information** area on the **Basic Information** page, click the security group.
  - c. Check whether the ECS NIC security group allows the inbound ICMP traffic.

**Table 2-7** Security group rules

Direction	Type	Protocol/Port Range	Source IP Address
Inbound	IPv4	Any: Any	0.0.0.0/0 (all IP addresses)
Inbound	IPv4	ICMP: Any	0.0.0.0/0 (all IP addresses)

2. Check network ACLs.
  - a. Check the network ACL status.
  - b. Check whether the NIC to which the EIP bound belongs to the subnet associated with the network ACL.
  - c. If the network ACL is enabled, add an ICMP rule to allow traffic.

#### NOTE

The default network ACL rule denies all incoming and outgoing packets. After the network ACL is disabled, the default rule still takes effect.

3. Ping the affected EIP from another ECS in the same region.

If the affected EIP can be pinged from another ECS in the same region, the virtual network is functional. In such a case, contact customer service for technical support.

## 2.10 What Can I Do If the Connection Test Failed?

### Fault Locating

1. Check security group rules.
2. Check network ACLs.
3. Check the NIC information of ECSs.
4. Check the disconnected ports.

### Solution

**Step 1** On the **Instances** page, click the instance name to go to the **Basic Information** page. In the **Network Information** area of the page, view the VPC where the instance is located.

**Step 2** Check whether the instance to which distributed transactions are added is in the same VPC as an ECS.

- If they are in the same VPC, see [Why Does Communication Fail Between Two ECSs in the Same VPC or Packet Loss Occur When They Communicate?](#)
- If they are in different VPCs:
  - Public access: Bind an EIP to the instance. For details, see [Binding an EIP](#).
  - Private access: Create a VPC peering connection. For details, see [VPC Peering Connection Overview](#).
  - Change the VPC hosting the ECS to the same as that hosting the GaussDB(for MySQL). For details, see [Changing a VPC](#).

----End

## 2.11 Can I Access a GaussDB(for MySQL) Instance over an Intranet Connection Across Regions?

By default, instances cannot be accessed over an intranet across regions. Cloud services in different regions cannot communicate with each other over an intranet. You can use Cloud Connect (CC) or Virtual Private Network (VPN) to connect to instances across regions.

- CC allows you to connect two VPCs of the same account or different accounts even if they are in different regions. For details, see [Communication Among VPCs of the Same Account](#).
- VPN uses an encrypted tunnel to connect VPCs in different regions and sends traffic over the Internet. It is inexpensive, easy to configure, and easy to use. However, the quality of VPN connections depends on the quality of Internet connections. For details, see [Connecting an On-Premises Data Center to a VPC Through a VPN](#).

## 2.12 Are There Any Potential Risks If There Are Too Many Connections to a GaussDB(for MySQL) Instance?

If there is an excessive number of GaussDB(for MySQL) connections, applications may fail to be connected, and the full and incremental backups may fail, affecting services.

### Solution

1. Check whether applications are connected, optimize the connections, and release unnecessary connections.
2. Cloud Eye monitors database metrics, such as the CPU usage, memory usage, storage space usage, and database connections, and allows you to set alarm policies to identify potential risks if any alarms are generated.

## 2.13 What Should I Do If an ECS and a GaussDB(for MySQL) instance Deployed in Different VPCs Cannot Communicate with Each Other?

When a GaussDB(for MySQL) instance and an ECS are deployed in different VPCs of the same region, they cannot communicate with each other through a private network. After a GaussDB(for MySQL) instance is created, you cannot change its VPC.

### Solution

1. Create a VPC peer connection. For details, see [VPC Peering Connection Overview](#).
2. Change the VPC hosting the ECS to the same as that hosting the GaussDB(for MySQL). For details, see [Changing a VPC](#).

## 2.14 How Do I View All IP Addresses Connected to a Database?

You can run the following SQL statement on the database to query the number of connected IP addresses:

```
SELECT substring_index(host, ':',1) AS host_name,state,count(*) FROM  
information_schema.processlist GROUP BY state,host_name;
```

# 3 Client Installation

---

## 3.1 How Can I Install the MySQL Client?

MySQL provides client installation packages for different OSs on its official website. Download the [MySQL 8.0 client installation package](#) or [packages of other versions](#). The following uses Red Hat Linux as an example to show how to obtain the required installation package and install it.

### Procedure

**Step 1** Obtain the installation package.

Find the [link](#) to the required version on the download page. The `mysql-community-client-8.0.21-1.el6.x86_64` is used as an example.

Figure 3-1 Download

## MySQL Community Downloads

Login Now or Sign Up for a free account.

An Oracle Web Account provides you with the following advantages:

- Fast access to MySQL software downloads
- Download technical White Papers and Presentations
- Post messages in the MySQL Discussion Forums
- Report and track bugs in the MySQL bug system

[No thanks, just start my download.](#)

### NOTE

Click [No thanks, just start my download.](#) to download the installation package.

**Step 2** Upload the installation package to the ECS.

### NOTE

When you create an ECS, select an OS, such as Red Hat 6.6, and bind an EIP to it. Then, upload the installation package to the ECS using a remote connection tool, and use PuTTY to connect to the ECS.

**Step 3** Run the following command to install the MySQL client:

```
sudo rpm -ivh mysql-community-client-8.0.21-1.el6.x86_64.rpm
```

### NOTE

- If any conflicts occur during the installation, add the **replacefiles** parameter to the command and try to install the client again. Example:  

```
rpm -ivh --replacefiles mysql-community-client-8.0.21-1.el6.x86_64.rpm
```
- If a message is displayed prompting you to install a dependency package, you can add the **nodeps** parameter to the command and install the client again. Example:  

```
rpm -ivh --nodeps mysql-community-client-8.0.21-1.el6.x86_64.rpm
```

**Step 4** Use the MySQL client to connect to the database and check whether the client can run properly.

```
mysql -h <hostIP> -P <port> -u <userName> -p --ssl-ca=<cafile>
```

**Table 3-1** Parameter description

Parameter	Description
<i>&lt;hostIP&gt;</i>	Private IP address. To obtain this parameter, go to the <b>Basic Information</b> page of the instance and view the private IP address in the <b>Network Information</b> area.
<i>&lt;port&gt;</i>	Database port. By default, the value is <b>3306</b> . To obtain this parameter, go to the <b>Basic Information</b> page of the instance and view the database port in the <b>Network Information</b> area.
<i>&lt;userName&gt;</i>	Username of the GaussDB(for MySQL) database administrator account. The default username is <b>root</b> .
<i>&lt;cafile&gt;</i>	SSL certificate file, which should be stored in the same directory where the command is executed.

Example:

To connect to a DB instance through an SSL connection as user **root**, run the following command:

```
mysql -h 172.xx.xx.xx -P 3306 -u root -p --ssl-ca=ca.pem
```

Enter the password of the database account as prompted.

Enter password:

#### NOTE

If error information similar to "mysql: error while loading shared libraries: libxxx: cannot open shared object file: No such file or directory" is displayed, perform the following steps:  
For example, if the error "mysql: error while loading shared libraries: libtinfo.so.5: cannot open shared object file: No such file or directory" is displayed,

1. Query the current version file of the dynamic library that reports the error on the local host.

```
find / -name libtinfo.so*
```

Assume that the query result is as follows:

```
/usr/lib64/libtinfo.so.6.2
```

```
/usr/lib64/libtinfo.so.6
```

2. Set up the soft link of the required version.

```
ln -s /usr/lib64/libtinfo.so.6 /usr/lib64/libtinfo.so.5
```

3. Connect to the database again.

```
mysql -h <hostIP> -P <port> -u <userName> -p --ssl-ca=<cafile>
```

----End

# 4 Database Migration

---

## 4.1 What Types of DB Engines Does GaussDB(for MySQL) Support for Importing Data?

- Exporting or importing data between DB engines of the same type is called homogeneous database export or import.
- Exporting or importing data between DB engines of different types is called heterogeneous database export or import. For example, import data from Oracle to the DB engines supported by GaussDB(for MySQL).

Generally, data cannot be exported or imported between heterogeneous databases due to the different data formats involved. However, if the data formats are compatible, table data can, in theory, be migrated between them.

Third-party software is usually required for data replication to export and import between heterogeneous databases. For example, you can use a third-party tool to export table records from Oracle in .txt format. Then, you can use Load statements to import the exported table records to the DB engines supported by GaussDB(for MySQL).

# 5 Database Permissions

---

## 5.1 Does GaussDB(for MySQL) Provide the Root Account or Super Permission?

GaussDB(for MySQL) provides the administrator user **root** which has the permissions except super, file, shutdown, and create tablespace.

Most cloud database service platforms do not provide the super permission for the **root** user. The super permissions allow users to execute many management commands, such as reset master, set global, kill, and reset slave. These operations may cause unpredictable exceptions and faults for GaussDB(for MySQL). This is a major difference between cloud databases and on-premises MySQL databases. To ensure stable running of instances, GaussDB(for MySQL) does not provide the super permission for the **root** user.

If you need to perform actions that normally require super permissions, GaussDB(for MySQL) provides alternative methods.

For example:

You can modify parameter values only on the GaussDB(for MySQL) console. You cannot run the following command on a database to modify parameter values.

**set global parameter name=*Parameter value*;**

If the script contains the **set global** command, delete the **set global** command and modify parameter values on the console.

An error is reported after you run the following command because the **root** user does not have super permissions. You can delete **definer='root'** from the command.

**create definer='root'@'%' trigger(procedure)...**

You can import and export data using mysqldump. For details, see [Migrating Data to GaussDB\(for MySQL\) Using mysqldump](#).

# 6 Database Performance

---

## 6.1 What Should I Do If the CPU Usage of My Instance Is High?

If the CPU usage is high or close to 100% when you use GaussDB(for MySQL), data read/write processing slows down, connections cannot be established, and errors are reported, interrupting services.

### Solution

1. Check slow SQL logs for slow queries and examine their performance characteristics (if any) to locate the cause.  
For details on viewing MySQL logs, see [Viewing Slow Query Logs](#).
2. View the CPU usage of your GaussDB(for MySQL) instance to facilitate problem locating.  
For details, see [Configuring Displayed Metrics](#).
3. Create read replicas to offload read pressure from the primary node.
4. Add indexes for associated fields in multi-table association queries.
5. Do not use the SELECT statement to scan all tables. You can specify fields or add the WHERE condition.

## 6.2 How Do I Handle Slow SQL Statements Caused by Inappropriate Composite Index Settings?

### Scenario

On your instance, an SQL query that ran at 11:00 and was expected to take 8 seconds took more than 30 seconds.

## Possible Causes

1. Check the CPU usage. In this example, during that time period, the CPU usage of the instance did not increase sharply and remained low, so we know that the slow query was not caused by high CPU usage.

**Figure 6-1** CPU usage

2. Analyze slow query logs generated during that period. In this example, shown below, there were several SQL statements that involved millions of rows being scanned. These were the slow statements. But no large amount of data was inserted into the table during that time, so we know that the slow execution was caused by missing or incorrect index settings. By running **EXPLAIN**, you can find that the execution plan of the SQL statement was full table scanning.

**Figure 6-2** Slow query logs

select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	6.027128 s	0.000105	125	2119000
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	5.479857 s	0.000104	123	2085096
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	5.288658 s	0.000106	123	2085096
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	33.601792 s	0.000064	140	16961077
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	34.342761 s	0.000171	140	16961077
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	44.536072 s	0.000167	140	16961077
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	46.501796 s	0.000095	140	16961077
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	33.050387 s	0.000099	139	16944097
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	38.523306 s	0.000101	139	16944097
select query_date, sum(queue) queue, sum(server_user_num) serverUserNum, su...	SELECT	1	40.108127 s	0.000090	139	16944097

3. Perform **SHOW INDEX FROM** on the table on the instance to check the cardinality of the three columns.

Figure 6-3 Index cardinality

```
***** 3. row *****
Table: [REDACTED]
Non_unique: 1
Key_name: idx_query_date_channel_group_id
Seq_in_index: 1
Column_name: query_date
Collation: A
Cardinality: 133994
Sub_part: NULL
Packed: NULL
Null: YES
Index_type: BTREE
Comment:
Index_comment:
***** 4. row *****
Table: [REDACTED]
Non_unique: 1
Key_name: idx_query_date_channel_group_id
Seq_in_index: 2
Column_name: channel
Collation: A
Cardinality: 405333
Sub_part: NULL
Packed: NULL
Null: YES
Index_type: BTREE
Comment:
Index_comment:
***** 5. row *****
Table: [REDACTED]
Non_unique: 1
Key_name: idx_query_date_channel_group_id
Seq_in_index: 3
Column_name: group_id
Collation: A
Cardinality: 16213328
Sub_part: NULL
Packed: NULL
Null: YES
Index_type: BTREE
```

The **query\_date** field with the smallest cardinality was in the first place of the composite index, and the **group\_id** field with the largest cardinality was in the last place of the composite index. In addition, the SQL statement contained the range query of the **query\_date** field. As a result, only the **query\_date** field was indexed.

The SQL statement could only use the index of the **query\_date** column. Additionally, the optimizer may have selected full table scanning during cost estimation because the cardinality was too small.

A new composite index was created with the **group\_id** field in the first place and the **query\_date** field in the last place. The query time met the expectation.

## Solution

1. Check whether the slow query was caused by insufficient CPU resources.
2. Check whether the table structure is properly designed and whether index settings are correct.

- Execute the **ANALYZE TABLE** statement periodically to prevent incorrect execution plans because performing a large number of INSERT or DELETE operations for table data may result in outdated statistics.

## 6.3 How Do I Handle a Large Number of Temporary Tables Being Generated for Long Transactions and High Memory Usage?

### Scenario

The memory usage of a GaussDB(for MySQL) instance kept increasing from 11:30 to 12:27 and reached the memory limit.

Figure 6-4 Memory usage

### Possible Causes

- Check the **processlist.log** file. In this example, shown below, there were two slow SQL statements in that time period.

Figure 6-5 Slow SQL statements

```

2022-03-29 12:27:45
188547 dbankpt dbankptdb Query 3011 executing select app_ver,pro_name,login_status,sum(case login_status
when 'true' then 1 else 0 end)as success,sum(case login_status when 'false' then 1 else 0 end)as failed
,count(login_status),sum(case login_status when 'true' then 1 else 0 end) / count(login_status)
from
where login_status is not null
and (date_format(pt_6,'%Y-%m-%d') BETWEEN '2022-03-21' AND '2022-03-28')
group by app_ver
188575 dbankpt dbankptdb Query 2679 executing select app_ver,pro_name,login_status,sum(case login_status
when 'true' then 1 else 0 end)as success,sum(case login_status when 'false' then 1 else 0 end)as failed
,count(login_status),sum(case login_status when 'true' then 1 else 0 end) / count(login_status)
from
where login_status is not null
and (date_format(pt_6,'%Y-%m-%d') BETWEEN '2022-03-21' AND '2022-03-28')
group by app_ver
    
```

- Analyze slow query logs generated in that time period. There was about 90 GB of data and about 1 billion of data rows in the logs, and there were two SQL statements that took 40 to 50 minutes to execute. The execution time basically overlapped when the memory usage went up in the monitoring results, so we know that the high memory usage was caused by temporary tables.

```

mysql> select table_name, table_size, data_length, data_length / 1024 as data_size, table_size / 1024 as table_size
+-----+-----+-----+-----+-----+
| table_name | table_size | data_length | data_size | table_size |
+-----+-----+-----+-----+-----+
| app_info | 1024 | 1024 | 1 | 1024 |
+-----+-----+-----+-----+-----+
mysql> select table_name, table_size, data_length, data_length / 1024 as data_size, table_size / 1024 as table_size
+-----+-----+-----+-----+-----+
| table_name | table_size | data_length | data_size | table_size |
+-----+-----+-----+-----+-----+
| dbankptdb | 1024 | 1024 | 1 | 1024 |
+-----+-----+-----+-----+-----+
    
```

### Solution

- Upgrade the instance specifications to maintain the memory usage within a proper range, preventing a sudden increase in traffic from causing an OOM crash. For details, see [Changing vCPUs and Memory of a DB Instance](#).

2. Optimize slow SQL statements as needed.

## 6.4 What Should I Do If Locks on Long Transactions Block the Execution of Subsequent Transactions?

### Scenario

Error code 1205 was reported:

"MySQL error code MY-001205 (ER\_LOCK\_WAIT\_TIMEOUT): **Lock wait timeout exceeded**; try restarting transaction"

### Possible Causes

1. Check the value of the monitoring metric **Row Lock Time**. In this example, the value of this metric was high, so we know there were lock conflicts in the system.

For details about monitoring metrics, see [Viewing Instance Monitoring Metrics](#).

2. Log in to the DB instance and run the following SQL statement to check the long transactions in the system and the row locks held by the transactions:

```
select trx_mysql_thread_id, trx_id, trx_state, trx_started, trx_tables_locked, trx_rows_locked,
trx_isolation_level, trx_query, trx_operation_state from information_schema.innodb_trx order by
trx_started;
```

```
mysql> select trx_mysql_thread_id, trx_id, trx_state, trx_started, trx_tables_locked, trx_rows_locked, trx_isolation_level, trx_query, trx_operation_state from information_schema.innodb_trx order by trx_started;
```

trx_mysql_thread_id	trx_id	trx_state	trx_started	trx_tables_locked	trx_rows_locked	trx_isolation_level	trx_query	trx_operation_state
416	51965	RUNNING	2022-07-28 19:27:55	1	1	READ COMMITTED	NULL	NULL
415	51967	LOCK WAIT	2022-07-28 00:11:03	1	2	READ COMMITTED		fetching rows

- **information\_schema.innodb\_trx**: information about transactions that are being executed in the InnoDB.
- **trx\_started**: start time of a transaction, which is used to determine whether the current transaction is a long transaction. The execution time of a transaction is the current time minus the start time.
- **trx\_state**: Status of the current transaction. The values are as follows:
  - **RUNNING**

- **LOCK WAIT**

- 📖 **NOTE**

- If the status of a transaction is **LOCK WAIT**, the transaction holds a row lock.

- **ROLLING BACK**

- **COMMITTING**

## Solution

Kill the long transactions.

## 6.5 How Can I Use Temporary Disk of GaussDB(for MySQL)?

Temporary disks of GaussDB(for MySQL) instances are used to temporarily store temporary tables, temporary files, and binlog caches generated during database operation. On the management console, you can monitor used temporary disk space and temporary disk usage of your instance in different time periods and granularities in real time, as shown in the following figure.

**Figure 6-6** Temporary disk usage

As services fluctuate, you may find that the usage of temporary disks suddenly or continuously increases. To improve database availability and stability, GaussDB(for MySQL) provides up to 500 GB of temporary disk space for a DB instance for free.

To prevent the temporary disk usage from continuously increasing and ultimately getting filled up, you are advised to check services as soon as possible based on the queried disk usage. This section describes the risks, scenarios, and troubleshooting you can perform when temporary disks are full.

## Risks

- SQL statements fail to be executed and no results are returned.
- SQL statements occupy lock resources for a long time and block other SQL statements. As a result, the number of connections increases or even reaches the upper limit, affecting other services.

- There are too many temporary files in the binlog cache, which can cause the database to break down. This takes a long time to restore, so services are interrupted for a long time.

## Scenarios and Troubleshooting

### 1. Explicitly creating temporary disk tables

#### - Scenario

You can run the **create temporary table** statement to explicitly create temporary disk tables. The temporary tables whose storage engine is InnoDB are cached in the buffer pool and flushed to disks by dirty threads.

In GaussDB(for MySQL), data in disk temporary tables is stored in session temporary tablespace (the path is specified by the **innodb\_temp\_tablespaces\_dir** parameter), and undo logs are stored in the global temporary tablespace (the path is specified by the **innodb\_temp\_data\_file\_path** parameter).

To prevent temporary disk tables from occupying too much disk space, you are advised to delete unnecessary temporary disk tables or disconnect unnecessary database connections.

#### NOTICE

- Session temporary tablespace: It is reclaimed when the current database connection is released.
- Global temporary tablespace: It is reclaimed only after the database is restarted.

#### - Troubleshooting

##### i. View information about the temporary tables you created in InnoDB.

```
mysql> select * from information_schema.innodb_temp_table_info;
+-----+-----+-----+-----+
| TABLE_ID | NAME | N_COLS | SPACE |
+-----+-----+-----+-----+
| 18446744069414584311 | #sql055_24_0 | 5 | 4294502266 |
+-----+-----+-----+-----+
```

##### ii. Check the usage of InnoDB temporary table files.

In a table, the **ID** column indicates the ID of the session that is using the temporary table file. If the value is **0**, the ibt file is not used. The **SIZE** column indicates the size of the ibt file, which automatically increases based on the usage and is reclaimed when the session ends. If the value of the **PURPOSE** column is **INTRINSIC**, the table is an implicit temporary table. If the value of the **PURPOSE** column is **USER**, the table is an explicit temporary table.

```
mysql> select * from information_schema.innodb_session_temp_tablespaces;
+----+-----+-----+-----+-----+-----+
| ID | SPACE | PATH | SIZE | STATE | PURPOSE |
+----+-----+-----+-----+-----+-----+
| 31 | 4294502265 | ./#innodb_temp/temp_9.ibt | 81920 | ACTIVE | INTRINSIC |
| 36 | 4294502266 | ./#innodb_temp/temp_10.ibt | 98304 | ACTIVE | USER |
| 34 | 4294502264 | ./#innodb_temp/temp_8.ibt | 81920 | ACTIVE | INTRINSIC |
| 0 | 4294502257 | ./#innodb_temp/temp_1.ibt | 81920 | INACTIVE | NONE |
| 0 | 4294502258 | ./#innodb_temp/temp_2.ibt | 81920 | INACTIVE | NONE |
```

0	4294502259	./#innodb_temp/temp_3.ibt	81920	INACTIVE	NONE	
0	4294502260	./#innodb_temp/temp_4.ibt	81920	INACTIVE	NONE	
0	4294502261	./#innodb_temp/temp_5.ibt	81920	INACTIVE	NONE	
0	4294502262	./#innodb_temp/temp_6.ibt	81920	INACTIVE	NONE	
0	4294502263	./#innodb_temp/temp_7.ibt	81920	INACTIVE	NONE	

## 2. Querying disk temporary tables or temporary files implicitly created

### - Scenario

When selecting an execution plan for a query, the query optimizer may use temporary tables. Temporary memory tables are preferentially used. When the size of temporary memory tables exceeds a certain threshold (either **tmp\_table\_size** or **max\_heap\_table\_size**, whichever is smaller), temporary disk tables are used.

Disk temporary tables are implicitly created by queries. The data between tables that are implicitly and explicitly created are the same and stored in the session temporary tablespace. If there are complex queries, including but not limited to keywords such as UNION, GROUP BY, and ORDER BY, in larger tables, temporary disk tables may be generated. In addition, when queries involve sorting operations, if the sort buffer cannot store all of the data (the buffer size is specified by **sort\_buffer\_size**), temporary disk files can be used for auxiliary sorting. In most scenarios, temporary disk tables implicitly created are the main reason disks fill up. If your disk is filling up, you can locate complex queries or long transactions, optimize query statements, add proper indexes, and split long transactions to address the issue.

### - Troubleshooting

- i. Check whether there are SQL statements using temporary tables or file sorting.

If **Using temporary** is displayed in the **Extra** column, temporary tables are used. If **Using filesort** is displayed, file sorting is used.

```
mysql> explain {SQL};
```

id	select_type	table	type	possible_keys	...	Extra
1	SIMPLE	p	index	PRIMARY,org_contact_fk	...	Using index; Using temporary; Using filesort
1	SIMPLE	c1	eq_ref	PRIMARY	...	
1	SIMPLE	t2p	ref	idx_publisher_id	...	Using where
1	SIMPLE	t	eq_ref	PRIMARY,active_index	...	Using where
.....						

- ii. Query the usage of implicit temporary tables. The method is the same as that the explicit disk temporary tables.

## 3. Querying binlogs generated for long transactions

### - Scenario

A binlog is a binary that records database changes, such as DDL, DCL, and DML (excluding SELECT). InnoDB caches binlogs in the memory before transactions are committed and writes binlogs to disks only after the transactions are committed. The size of the binlog file for each connection in the memory is specified by the **binlog\_cache\_size** parameter. When the size of the binlog file recorded by a transaction exceeds the value of this parameter, the binlog file is written to a temporary disk file. Long transactions may cause large binlogs. As a result, the size of temporary binlogs on the disk is large and the disk may be full. You are advised to control the transaction size, split long transactions, or change **binlog\_cache\_size** to a more appropriate value.

- Troubleshooting

- i. Check whether binlog is enabled.

```
mysql> show variables like 'log_bin';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| log_bin      | ON   |
+-----+-----+
```

- ii. View the binlog cache usage.

**Binlog\_cache\_disk\_use** indicates the number of times that temporary disk files are used for caching binlogs due to insufficient memory (specified by **binlog\_cache\_size**). If the value of **binlog\_cache\_size** is large, temporary disk files are invoked for caching binlogs multiple times.

```
mysql> show global status like '%binlog_cache%';
+-----+-----+
| Variable_name      | Value |
+-----+-----+
| Binlog_cache_disk_use | 1335006 |
| Binlog_cache_use    | 264240359 |
+-----+-----+
```

- 4. Checking temporary files generated by DDLs

- Scenario

During DDL operations on tables, temporary disk files are generated in some phases.

- Sometimes, you need to re-create the tablespace of the original table, which involves the re-creation of the B+ tree index on the table. If a table contains a large amount of data, the sort buffer cannot store all of the data. You need to create a temporary file to assist with the sorting.
    - Although some online DDL statements support DML operations on the original table, the original table cannot be directly modified. The modification must be recorded in online logs and applied to the new table after the DDL operations are complete. Online logs are preferentially stored in the memory. The size of online logs is specified by the **innodb\_sort\_buffer\_size** parameter. If the size of online logs exceeds the parameter value, online logs are temporarily stored in a temporary file.
    - When the **OPTIMIZE TABLE** statement is executed on a table, the data stored in the clustered index needs to be reorganized, which may generate temporary files.

- Troubleshooting

- Run the **SHOW PROCESSLIST** command to check whether there are DDL statements that have been taking a long time to execute.
    - Ensure that there is enough space before performing DDLs for large tables.

# 7 Database Usage

---

## 7.1 Why Are the Results Inconsistent After the MATCH AGAINST Statement Is Executed, Respectively, on Primary Nods and Read Replicas?

MATCH AGAINST is used to search for MySQL full-text indexes. For rows in the table, MATCH returns relevance values, that is, a similarity measure between the search string (given as the argument to AGAINST() function and the text in that row in the columns named in the MATCH() list). This statement uses the **stat\_n\_rows** value to calculate the relevance value. Primary nodes and read replicas use different methods to obtain the **stat\_n\_rows** value. The primary nodes use the persistent method and the read replicas use the transient method. Therefore, the obtained values are slightly different from each other. The execution result of MATCH AGAINST on primary nodes and read replicas are different.

## 7.2 How Do I Add Columns Using INSTANT?

GaussDB(for MySQL) is compatible with open-source MySQL 8.0.22, so you can use **ALGORITHM=INSTANT** to quickly add columns, preventing lock waiting from affecting services or SQL statement execution timeout.

### Constraints

- Columns can be added only in one statement. If there are other non-INSTANT operations in the same statement, columns cannot be added immediately.
- Columns can be added only at the end of existing columns.
- COMPRESSED row format is not supported.
- Tables that already have full-text indexes are not supported.

#### NOTE

If a table has a full-text index, you must run the OPTIMIZE TABLE statement on the table after deleting the full-text index.

- Temporary tables are not supported.
- A new field cannot have a default value.

## Procedure

**Step 1** [Log in to the management console.](#)

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases** > **GaussDB(for MySQL)**.

**Step 4** On the **Instances** page, locate the instance and click **Log In** in the **Operation** column.

Alternatively, on the **Instances** page, click the instance name to go to the **Basic Information** page. Click **Log In** in the upper right corner of the page.

**Step 5** On the displayed login page, enter the correct username and password and click **Log In**.

**Step 6** On the top menu bar, choose **SQL Operations** > **SQL Query**.

**Step 7** Run the following SQL statement to quickly add a column:

```
ALTER TABLE table_name ADD COLUMN column_name column_definition,  
ALGORITHM=INSTANT;
```

- *table\_name*: table name
- *column\_name*: column name
- *column\_definition*: column remarks

----End

## 7.3 How Do I Use LOAD DATA to Import Local Data?

You can use LOAD DATA to import local data to GaussDB(for MySQL).

### Syntax

```
LOAD DATA LOCAL  
  INFILE 'file_name'  
  [REPLACE | IGNORE]  
  INTO TABLE tbl_name  
  [CHARACTER SET charset_name]  
  [{FIELDS | COLUMNS}  
   [TERMINATED BY 'string']  
   [[OPTIONALLY] ENCLOSED BY 'char']  
  ]  
  [LINES  
   [TERMINATED BY 'string']  
  ]  
  [IGNORE number {LINES | ROWS}]  
  [(col_name_or_user_var  
   [, col_name_or_user_var] ...)]
```

## Parameters

- **file\_name**: path of the local file to be imported.
- **REPLACE | IGNORE**: whether to replace or ignore duplicate records.
- **tbl\_name**: name of the table to be imported.
- **CHARACTER SET charset\_name**: file encoding format. You are advised to use the encoding format of the GaussDB(for MySQL) instances to avoid garbled characters.
- **FIELDS TERMINATED BY 'string'**: separator between columns. The default value is `\t`.
- **[OPTIONALLY] ENCLOSED BY 'char'**: used to ignore symbols in data source fields.
- **LINES TERMINATED BY 'string'?**: newline character between lines. The default value is `\n`.

### NOTE

On some hosts running the Windows servers, the newline characters of text files may be `\r\n`, which is invisible.

- **IGNORE number LINES**: used to ignore lines at the start of the file.
- **(column\_name\_or\_user\_var, ...)**: columns to be imported. If this parameter is not configured, data is imported based on the column sequence by default.
- For other parameters, see the [load data infile](#) on the MySQL official website. The sequence of other parameters must be correct. For sequence details, visit [the MySQL official website](#).

## Standard Example

### Prerequisites

- The **local\_infile** parameter must be enabled on the server. Click the instance name to go to the **Basic Information** page. On the **Parameters** page, change the value of this parameter to **ON**.
- The **local-infile** parameter must be enabled on the client. Configure **local-infile** in the **my.cnf** file or use the **--local-infile=1** option to connect to the database.

```
[mysql]
local-infile
```

1. Import the data in the local file **qq.txt** to the **test** table. The **qq.txt** file contains five rows of data. The column separator is `,` and the row separator is `\n`.

```
1,a
2,b
3,c
4,d
5,"e"
```

2. Create the **test** table.

```
CREATE TABLE test (
  `id` int NOT NULL,
  `a` varchar(4) NOT NULL,
  PRIMARY KEY (`id`)
);
```

3. On the client, run the LOAD DATA statement to import data in the **qq.txt** file to the **test** table, set the character set to **utf8**, and ignore the double quotation marks in the data source field.

```
mysql> LOAD DATA LOCAL INFILE '/data/qq.txt' IGNORE INTO TABLE test CHARACTER SET 'utf8'  
FIELDS TERMINATED BY ',' OPTIONALLY ENCLOSED BY '"' LINES TERMINATED BY '\n';  
Query OK, 5 rows affected, 1 warning (0.00 sec)  
Records: 5 Deleted: 0 Skipped: 0 Warnings: 1
```

```
mysql> select * from test;
```

```
+----+----+
```

```
| id | a |
```

```
+----+----+
```

```
| 1 | a |
```

```
| 2 | b |
```

```
| 3 | c |
```

```
| 4 | d |
```

```
| 5 | e |
```

```
+----+----+
```

```
5 rows in set (0.00 sec)
```

---

#### NOTICE

1. Importing data affects performance of GaussDB(for MySQL) instances. Import data during off-peak hours.
  2. Do not to initiate multiple LOAD DATA requests at the same time. When multiple LOAD DATA requests are initiated, SQL transactions may time out due to highly concurrent data write operations, table locking, and system I/O occupation, resulting in failure of all LOAD DATA requests.
-

# 8 Backups

---

## 8.1 How Long Does GaussDB(for MySQL) Store Backup Data?

Automated backup data is kept based on the backup retention period you specified. For details, see [Configuring an Automated Backup Policy](#).

There is no limit for the manual backup retention period. For details, see [Deleting a Manual Backup](#).

The backup data is stored in OBS and does not occupy the database storage space.

## 8.2 How Do I Clear GaussDB(for MySQL) Backup Space?

The GaussDB(for MySQL) backup space stores automated backups and manual backups.

- **Automated full and incremental backups**

Automated backup files cannot be manually deleted. You need to change the backup cycle by referring to [Configuring an Automated Backup Policy](#). The backup files that have expired will be deleted.

- **Manual full backups**

You can manually delete manual backups. For details, see [Deleting a Manual Backup](#).

## 8.3 How Can I Back Up a GaussDB(for MySQL) Database to an ECS?

You can back up data to an ECS in the same way you export SQL statements. The ECS service does not have restrictions on the types of data to be backed up as

long as the data complies with local laws and regulations. You can store backup data on an ECS.

However, you are advised to use GaussDB(for MySQL) [automated backups](#) and [manual backups](#) to back up data to OBS for higher data reliability and service assurance.

## 8.4 How Do I View My Backup Storage Usage?

In the **Storage/Backup Space** area of the **Basic Information** page on the console, you can view the backup space usage.

### Procedure

- Step 1** [Log in to the management console](#).
- Step 2** Click  in the upper left corner and select a region and a project.
- Step 3** Click  in the upper left corner of the page, choose **Databases** > **GaussDB(for MySQL)**.
- Step 4** On the **Instances** page, click the instance name to go to the **Basic Information** page.
- Step 5** On the **Basic Information** page, view the backup space usage in the **Backup Space** area.

**Figure 8-1** Viewing backup space

### NOTE

There are data and binlog backups of an instance in the backup space.  
Free backup storage space of the same size as your purchased storage space are provided.

----End

## 8.5 Why Has My Automated Backup Failed?

Automated backups may fail for the following reasons:

1. The network environment is unstable due to issues such as network delay or interruption. GaussDB(for MySQL) will detect these problems and trigger another automated backup half an hour later. You can also perform a manual backup before then.
2. Multi-task executions are complicated, resulting in problems such as task waiting or interruptions. GaussDB(for MySQL) will detect these problems and trigger another automated backup half an hour later. You can also perform a manual backup.
3. An instance is unavailable, possibly because the instance is faulty or being modified. GaussDB(for MySQL) will trigger an automated backup when the instance status becomes available. You can also perform a manual backup before then.
4. A parameter is changed incorrectly. For example, an instance may become faulty after a parameter template containing incorrect parameters was applied to it. You can check whether original and current values are correct, check whether any related parameters also need to be changed, reset the parameter template, or reboot the instance.
5. An error occurred during data import.  
If system catalog records get lost due to improper data import, you can import data again by referring to [Migrating Data to GaussDB\(for MySQL\) Using DRS](#).
6. If the issue persists, contact technical support.

## 8.6 How Is GaussDB(for MySQL) Backup Data Billed?

All the GaussDB(for MySQL) backups are stored on OBS without occupying the storage of your DB instances. GaussDB(for MySQL) provides free backup space of the same size as your purchased storage.

The lifecycle of automated backups is the same as that of the DB instance. If you delete a DB instance, its automated backups are also deleted, but manual backups will not be automatically deleted. For details, see [Deleting a Manual Backup](#).

For example, if you purchase a DB instance with 200 GB of storage, you can get an additional 200 GB of backup space and are only charged for backups in excess of 200 GB. The first 200 GB of backup data is free. When the 200 GB storage is used up, the backups will be billed on a pay-per-use basis. For pricing details, see [Product Pricing Details](#).

---

**NOTICE**

If your storage is frozen, it is no longer charged and the free backup space is also unavailable.

If your DB instance is frozen, no free backup space is available. As a result, the original automated backups of the DB instance will be charged.

- If you unfreeze the DB instance, the free backup space will be restored.
  - If you directly delete the frozen DB instance, its automated backups will also be deleted and the backup space will not be charged any longer.
-

# 9 Database Parameter Modification

---

## 9.1 How Can I Change the Time Zone?

GaussDB(for MySQL) allows you to select a time zone when you create an instance and change the time zone after the instance is created.

### Procedure

**Step 1** [Log in to the management console.](#)

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases > GaussDB(for MySQL)**.

**Step 4** On the **Instances** page, click the instance name.

**Step 5** In the navigation pane on the left, choose **Parameters**.

**Step 6** Search for a time zone parameter in the search box, for example, **time\_zone**.

**Step 7** Select a time zone, and click **Save**.

**Step 8** In the displayed dialog box, click **OK**.

For example, to change the time zone to UTC+08:00, select **Asia/Shanghai** from the drop-down list.

----End

### Time Zone Parameters

- **system\_time\_zone**: operating system (OS) time zone. Changing the value of this parameter does not affect the database time zone.
- **time\_zone**: database time zone. You can modify this parameter to change the time zone for your instance.

## 9.2 How Do I Configure a Password Expiration Policy for GaussDB(for MySQL) Instances?

In GaussDB(for MySQL) 8.0, you can configure the global variable **default\_password\_lifetime** to control the default validity period of a user password.

The value of **default\_password\_lifetime** indicates how many days until a password expires. The default value is **0**, indicating that the created user password will never expire.

```
mysql> show variables like 'default_password_lifetime';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| default_password_lifetime | 0 |
+-----+-----+
1 row in set (0.00 sec)
```

### Changing the Global Automatic Password Expiration Policy

- Change the value of the **default\_password\_lifetime** parameter on the GaussDB(for MySQL) console.  
For details, see [Modifying a Parameter Template](#).
- Run the following command to change the value of **default\_password\_lifetime**:  
`mysql> set global default_password_lifetime=0;`

### Checking the Password Expiration Date of All Users

Run the following command:

```
mysql> select
user,host,password_expired,password_last_changed,password_lifetime from
user;
```

```
mysql> select user,host,password_expired,password_last_changed,password_lifetime from user;
+-----+-----+-----+-----+-----+
| user          | host      | password_expired | password_last_changed | password_lifetime |
+-----+-----+-----+-----+-----+
| mysql.session | localhost | N                | 2020-01-17 15:02:23   | NULL              |
| mysql.sys     | localhost | N                | 2020-01-17 15:02:23   | NULL              |
| rdsAdmin      | localhost | N                | 2020-01-17 15:02:30   | 0                 |
| root         | %        | N                | 2020-03-05 14:23:54   | NULL              |
| rdsRepl      | 192.168.% | N                | 2020-01-17 15:02:45   | 0                 |
| rdsMetric     | 192.168.% | N                | 2020-01-17 15:02:30   | 0                 |
| rdsBackup     | localhost | N                | 2020-01-17 15:02:30   | 0                 |
| u_test01     | %        | N                | 2020-03-05 14:28:10   | 30                |
| u_test02     | %        | N                | 2020-03-05 14:28:38   | NULL              |
| jeffrey      | localhost | N                | 2020-03-05 15:23:17   | NULL              |
+-----+-----+-----+-----+-----+
10 rows in set (0.00 sec)
```

### Checking the Password Expiration Policy of a Specified User

Run the following command:

```
mysql> show create user jeffrey@'localhost';
```

```
mysql> show create user jeffrey@'localhost';
+-----+
| CREATE USER for jeffrey@localhost |
+-----+
| CREATE USER 'jeffrey'@'localhost' IDENTIFIED WITH 'mysql_native_password' AS '*1369F151658FC90255853119A9C8B05540B0D7F' REQUIRE NONE PASSWORD EXPIRE DEFAULT ACCOUNT UNLOCK |
+-----+
1 row in set (0.00 sec)
```

**EXPIRE DEFAULT** indicates that the password follows the global expiration policy.

## Configuring the Password Expiration Policy for a Specified User

- Configuring the password expiration policy during user creation  
**create user 'script'@'localhost' identified by '\*\*\*\*\*' password expire interval 90 day;**
- Configuring the password expiration policy after user creation  
**ALTER USER 'script'@'localhost' PASSWORD EXPIRE INTERVAL 90 DAY;**
- Setting the password to be permanently valid  
**mysql> CREATE USER 'mike'@'%' PASSWORD EXPIRE NEVER;**  
**mysql> ALTER USER 'mike'@'%' PASSWORD EXPIRE NEVER;**
- Setting the password to follow the global expiration policy  
**mysql> CREATE USER 'mike'@'%' PASSWORD EXPIRE DEFAULT;**  
**mysql> ALTER USER 'mike'@'%' PASSWORD EXPIRE DEFAULT;**

## 9.3 How Do I Ensure that the Database Character Set of a GaussDB(for MySQL) Instance Is Correct?

UTF-8 supports 4 byte characters, but GaussDB(for MySQL) utf8 supports only 3 byte characters. Emojis and newly added Unicode characters cannot be stored using MySQL utf8 character set. MySQL released the utf8mb4 character set in 2010 and added the utf8mb4 code after 5.5.3 to be compatible with the 4-byte unicode. You only need to change utf8 to utf8mb4. No other conversion is required.

Huawei Cloud Data Admin Service (DAS) is a professional database management tool. You can view the database and system character sets through the DAS console.

### Procedure

**Step 1** [Log in to the management console.](#)

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases > GaussDB(for MySQL)**.

**Step 4** On the **Instances** page, locate the instance and click **Log In** in the **Operation** column.

Alternatively, on the **Instances** page, click the instance name to go to the **Basic Information** page. Click **Log In** in the upper right corner of the page.

**Step 5** On the displayed login page, enter the correct username and password and click **Log In**.

**Step 6** On the top menu bar, choose **SQL Operations > SQL Window**.

**Step 7** Run the following SQL statement in the SQL window to view the database character set:

```
show variables like '%character%';
```

**Figure 9-1** SQL execution result

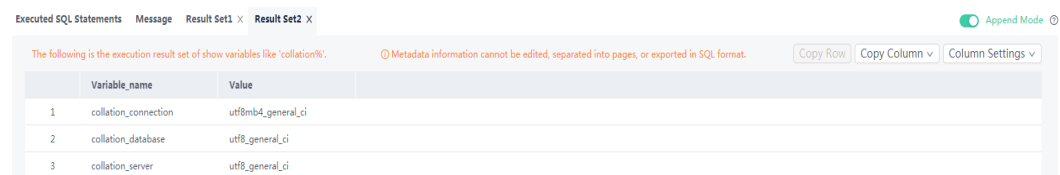

The screenshot shows the execution result of the SQL statement 'show variables like '%character%';'. The result is displayed in a table with two columns: 'Variable\_name' and 'Value'. The table contains 8 rows of data. The interface includes a header with 'Executed SQL Statements', 'Message', 'Result Set1 X', and 'Append Mode'. Below the table, there are buttons for 'Copy Row', 'Copy Column', and 'Column Settings'.

	Variable_name	Value
1	character_set_client	utf8mb4
2	character_set_connection	utf8mb4
3	character_set_database	utf8
4	character_set_filesystem	binary
5	character_set_results	
6	character_set_server	utf8
7	character_set_system	utf8
8	character_sets_dir	/usr/local/mysql-5.7.27...

**Step 8** Run the following SQL statement in the SQL window to view the database coding:

```
show variables like 'collation%';
```

**Figure 9-2** SQL execution result

The screenshot shows the execution result of the SQL statement 'show variables like 'collation%';'. The result is displayed in a table with two columns: 'Variable\_name' and 'Value'. The table contains 3 rows of data. The interface includes a header with 'Executed SQL Statements', 'Message', 'Result Set1 X', 'Result Set2 X', and 'Append Mode'. Below the table, there are buttons for 'Copy Row', 'Copy Column', and 'Column Settings'.

	Variable_name	Value
1	collation_connection	utf8mb4_general_ci
2	collation_database	utf8_general_ci
3	collation_server	utf8_general_ci

**Step 9** Change the character set to utf8mb4.

1. Run the following SQL statement to change the database character sets.  
**ALTER DATABASE *DATABASE\_NAME* DEFAULT CHARACTER SET utf8mb4 COLLATE utf8mb4\_general\_ci;**
2. Run the following SQL statement to change the table character sets.  
**ALTER TABLE *TABLE\_NAME* DEFAULT CHARACTER SET utf8mb4 COLLATE utf8mb4\_general\_ci;**

**NOTE**

The SQL statement just changes the character sets of tables. The character sets of fields in the tables are not changed.

3. Run the following SQL statement to change all the field character sets in tables:  
**ALTER TABLE *TABLE\_NAME* CONVERT TO CHARACTER SET utf8mb4 COLLATE utf8mb4\_general\_ci;**

 NOTE

- **character\_set\_client**, **character\_set\_connection**, and **character\_set\_results** are the settings of the client.
- **character\_set\_system**, **character\_set\_server**, and **character\_set\_database** are the settings of the server.
- The priorities of the parameters on the server are as follows: **character\_set\_database** > **character\_set\_server** > **character\_set\_system**.

----End

## 9.4 How Do I Use the utf8mb4 Character Set to Store Emojis in a GaussDB(for MySQL) Instance?

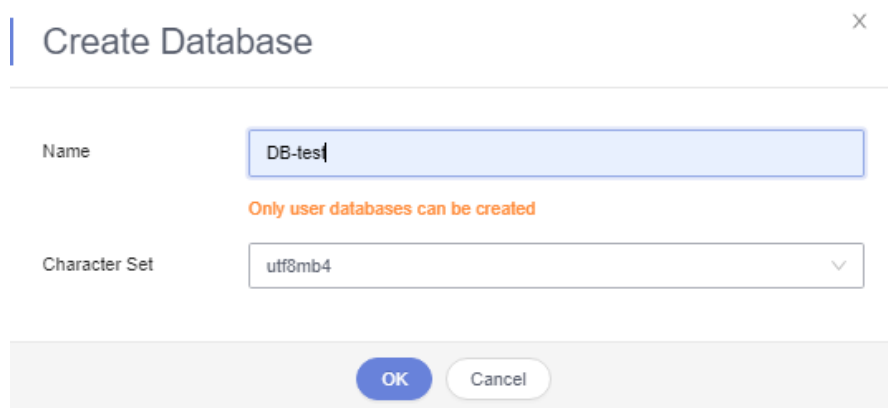

To store emoji in a GaussDB(for MySQL) instance, ensure that:

- The client outputs the utf8mb4 character set.
- The connection supports the utf8mb4 character set. If you want to use a JDBC connection, download MySQL Connector/J 5.1.13 or a later version and leave **characterEncoding** undefined for the JDBC connection string.
- Configure the instance as follows:
  - Setting **character\_set\_server** to **utf8mb4**

Parameter Name	Effective upon Reboot	Value	Allowed Values	Description
character_set_server	Yes	utf8mb4	utf8, latin1, gbk, utf8mb4	The server's default character set.

- [Log in to the management console.](#)
  - Click  in the upper left corner and select a region and a project.
  - Click  in the upper left corner of the page, choose **Databases** > **GaussDB(for MySQL)**.
  - On the **Instances** page, click the instance name.
  - In the navigation pane on the left, choose **Parameters**. On the **Parameters** tab page, locate **character\_set\_server** and change its value to **utf8mb4**.
  - Click **Save**. In the displayed dialog box, click **Yes**.
- Selecting **utf8mb4** for database character set
    - On the **Instances** page, locate the instance and click **Log In** in the **Operation** column.

Alternatively, on the **Instances** page, click the instance name to go to the **Basic Information** page. Click **Log In** in the upper right corner of the page.
    - On the displayed login page, enter the correct username and password and click **Log In**.
    - On the **Databases** page, click **Create Database**. In the displayed dialog box, enter a database name, select the character set **utf8mb4**, and authorize database permissions for users. Then, click **OK**.

**Figure 9-3** Creating a database

The screenshot shows a 'Create Database' dialog box. The 'Name' field is filled with 'DB-test'. Below it, a red warning message states 'Only user databases can be created'. The 'Character Set' dropdown menu is set to 'utf8mb4'. At the bottom of the dialog, there are two buttons: 'OK' and 'Cancel'.

- Setting the character set of the table to **utf8mb4**

```
([...]) [ ... ]> create table emoji_01 (id int auto_increment primary key, content varchar(255)) default charset utf8mb4;
Query OK, 0 rows affected (0.01 sec)

([...]) [ ... ]> show create table emoji_01 \G
***** 1. row *****
Table: emoji_01
Create Table: CREATE TABLE `emoji_01` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `content` varchar(255) DEFAULT NULL,
  PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4
1 row in set (0.00 sec)
```

## FAQs

If you have set **characterEncoding** to **utf8** for the JDBC connection string, or the emoji data cannot be inserted properly after you have performed the above operations, you are advised to set the connection character set to **utf8mb4** as follows:

```
String query = "set names utf8mb4";
stat.execute(query);
```

## 9.5 How Do I Set Case Sensitivity for GaussDB(for MySQL) Table Names?

You can specify case sensitivity for table names when creating an instance on the console or using APIs. It cannot be changed after the instance is created.

- Set **Table Name Case Sensitivity** on the console. For details, see [Buying a DB Instance](#).

**Figure 9-4** Configuring case sensitivity for table names

The screenshot shows a configuration interface for GaussDB. At the top, there are fields for 'Administrator' (value: root), 'Administrator Password', and 'Confirm Password'. Below these is a 'Parameter Template' dropdown set to 'Default-GaussDB-for-MySQL 8.0'. The 'Table Name' section has two radio buttons: 'Case sensitive' and 'Case Insensitive', with 'Case Insensitive' selected. A note next to it says 'This option cannot be changed later.' At the bottom, there is an 'Enterprise Project' dropdown set to '--Select--'.

- Set **lower\_case\_table\_names** by invoking an API. For details, see [Creating a DB Instance](#).

Value range:

- **0**: Table names are case sensitive.
- **1** (default value): Table names are stored in lowercase and are case insensitive.

## 9.6 Can I Use SQL Commands to Modify Global Parameters?

Sorry, you cannot use SQL commands to modify global parameters, but you can modify specific parameters on the console.

### Procedure

**Step 1** [Log in to the management console](#).

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases > GaussDB(for MySQL)**.

**Step 4** On the **Instances** page, click the target DB instance.

**Step 5** In the navigation pane on the left, choose **Parameters**.

**Step 6** Change the value of the target parameter and click **Save**.

**Step 7** In the displayed dialog box, click **OK**.

----End

# 10 Network Security

---

## 10.1 What Security Assurance Measures Does GaussDB(for MySQL) Have?

### Network

- GaussDB(for MySQL) allows you to configure your instances in a VPC, ensuring that the instances are isolated from other services.
- GaussDB(for MySQL) uses security groups to ensure that only trusted sources can access your instances.
- GaussDB(for MySQL) supports SSL connections to encrypt data during transmission.

### Management

You can use the [Identity and Access Management \(IAM\)](#) to manage GaussDB(for MySQL) permissions.

## 10.2 How Can I Prevent Untrusted Source IP Addresses from Accessing GaussDB(for MySQL)?

- If you enable public accessibility, your EIP DNS and database port may be vulnerable to hacking. To protect information such as your EIP, DNS, database port, database account, and password, you are advised to specify the range of source IP addresses in the GaussDB(for MySQL) security group to ensure that only trusted source IP addresses can access your instances.
- To prevent your database password from being cracked, specify a strong password and periodically change it.

## 10.3 How Do I Configure a Security Group to Enable Access to a GaussDB(for MySQL) Instance?

- When you attempt to connect to a GaussDB(for MySQL) instance through a private network, check whether the ECS and GaussDB(for MySQL) instance are in the same security group.
  - If the ECS and GaussDB(for MySQL) instance are in the same security group, they can communicate with each other by default. No security group rules need to be configured.
  - If the ECS and GaussDB(for MySQL) instance are in different security groups, configure security group rules for the ECS and instance, respectively.
    - Instance: Configure an **inbound rule** for the security group to which the instance is associated.
    - ECS: The default security group rule allows all outbound data packets. In this case, you do not need to configure a security group rule for the ECS. If not all outbound traffic is allowed in the security group, you may need to configure an outbound rule for the ECS to allow all outbound packets.
- When you attempt to access an instance through an EIP, you need to configure an **inbound rule** for the security group associated with the instance.

## 10.4 How Can I Import the Root Certificate to a Windows or Linux Server?

### Importing the Root Certificate to a Windows Server

1. Click **Start** and choose **Run**. In the displayed **Run** dialog box, enter **MMC** and press **Enter**.
2. On the displayed console, choose **File > Add/Remove Snap-in**.
3. In the left **Available snap-ins** pane of the displayed dialog box, select **Certificates**. Click **Add** to add the certificate.
4. In the displayed **Certificates snap-in** dialog box, select **Computer account** and click **Next**.
5. In the displayed **Select Computer** dialog box, click **Finish**.
6. In the **Add or Remove Snap-ins** dialog box, click **OK**.
7. On the console, double-click **Certificates**.
8. Right-click **Trusted Root Certification Authorities** and choose **All Tasks > Import**.
9. Click **Next**.
10. Click **Browse** to change the file type to **All Files (\*.\*)**.
11. Locate the downloaded root certificate (a **ca.pem** file) and click **Open**. Then, click **Next**.

---

**NOTICE**

You must change the file type to **All Files (\*.\*)** because **.pem** is not a standard certificate extension name.

---

12. Click **Next**.
13. Click **Finish**.
14. Click **OK** to complete the import of the root certificate.

## Importing the Root Certificate to a Linux Server

You can use a connection tool (such as WinSCP or PuTTY) to upload the certificate to any directory on a Linux Server.

## 10.5 How Do I Manage and Ensure GaussDB(for MySQL) Security?

For security reasons, do not use the username and password of your Huawei Cloud account. We recommend that you create IAM users and other users (if necessary) for your database users.

An error may occur if you do not have sufficient permissions or your account configuration is incorrect. For example, you fail to create instances if you do not have the permissions to do so. If required, contact your IAM administrator to assign the permissions

# 11 Log Management

---

## 11.1 Can I Enable `general_log` for GaussDB(for MySQL)?

No.

If you need to enable `general_log` for full SQL audit and troubleshooting, you can use [TOP SQL](#) and [SQL Insights](#).

## 11.2 How Do I View All SQL Logs Executed by GaussDB(for MySQL)?

You can use the visualized database management service Data Admin Service (DAS) to quickly search for target SQL execution records.

### Querying SQL Logs Through DAS

**Step 1** [Log in to the management console](#).

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases** > **GaussDB(for MySQL)**.

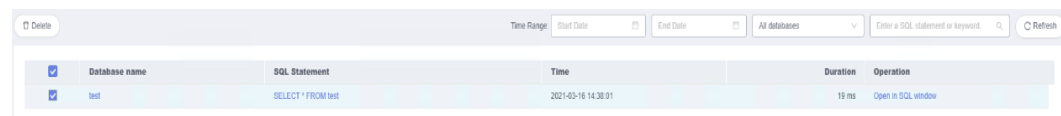

**Step 4** On the **Instances** page, locate the instance you want to log in and click **Log In** in the **Operation** column.

**Step 5** On the displayed login page, enter the correct username and password and click **Log In**.

**Step 6** On the top menu bar, choose **SQL Operations** > **SQL History**.

**Step 7** On the displayed page, search for execution information about the target SQL statement by time range, database name, or keyword.

Figure 11-1 SQL history

Database name	SQL Statement	Time	Duration	Operation
test	SELECT * FROM test	2021-03-16 14:38:01	19 ms	Open in SQL window

- To access the **Database Management** page, click a database name.
- To copy and use a SQL statement, click it in the **SQL Statement** column.
- To execute a SQL statement, locate the statement and click **Open in SQL Window** in the **Operation** column.

----End

## 11.3 How Do I View Slow Query Logs of GaussDB(for MySQL)?

### Viewing Log Details

**Step 1** [Log in to the management console.](#)

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases > GaussDB(for MySQL)**.

**Step 4** On the **Instances** page, click the instance name to go to the **Basic Information** page.

**Step 5** In the navigation pane on the left, choose **Logs**.

**Step 6** On the **Slow Query Logs** page, view the slow query log details.

You can view the slow query log records of a specified execution statement type or a specific time period.

----End

## 11.4 How Do I Enable and View Binlog of My GaussDB(for MySQL) Instance?

### Enabling Binlog

GaussDB(for MySQL) does not support enabling binlog for read replicas. For details about enabling binlog for the primary node, perform the following steps:

**Step 1** [Log in to the management console.](#)

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases > GaussDB(for MySQL)**.

**Step 4** Click the instance name to go to the **Basic Information** page.

**Step 5** In the navigation pane on the left, choose **Parameters**.

**Step 6** Configure parameters as follows:

- If the kernel version is earlier than 2.0.45.230900, search for the **log-bin** parameter, select **ON** from the drop-down list box in the **Value** column, and click **Save**. The modified parameter value is applied only after the DB instance is rebooted.

#### NOTE

To view the kernel version, click the instance name to go to the **Basic Information** page. In the **DB Instance Information** area, view the **DB Engine Version** field.

**Figure 11-2** Viewing the kernel version

- If the kernel version is 2.0.45.230900 or later, search for the **rds\_global\_sql\_log\_bin** parameter, select **ON** from the drop-down list box in the **Value** column, and click **Save**. The modified parameter value is applied immediately. You do not need to reboot the DB instance.

After this parameter is changed, connect to the database and run the following command to check whether the binlog is enabled for all threads:

```
select @@session.rds_sql_log_bin_inconsistent_count;
```

- If the command output is 0, binlog is successfully enabled for all threads, and all statements can be recorded in binlog.
- If the command output is not 0, run the following command to check the IDs of the threads that binlog is not enabled for:

```
show warnings;
```

**Figure 11-3** Querying the IDs of the threads that binlog is not enabled for

The statements executed in the queried thread IDs may not be recorded in binlog temporarily.

Check your services based on the obtained thread IDs (for example, **53** in [Figure 11-3](#)), submit or roll back transactions and execute new

transactions (for example, **SELECT 1;**) in a timely manner based on service requirements, or disconnect idle connections and reconnect them.

----End

## Viewing Binlog Files

**Step 1** Connect to an instance. For details, see [Connect to a DB Instance](#).

**Step 2** Run the following command to view binlog files:

```
SHOW BINLOG EVENTS [IN 'log_name'] [FROM pos] [LIMIT [offset,] row_count];
```

### NOTE

If a message indicating that the account permissions are insufficient, use the **root** account.

----End

## Impact of Enabling Binlog on GaussDB(for MySQL) Performance

Enabling binlog does not affect SELECT operations, but affects INSERT, UPDATE, DELETE and other write operations.

### NOTE

There are no significant differences between GaussDB(for MySQL) binlog and open-source MySQL binlog. The binlog syntax of GaussDB(for MySQL) is fully compatible with that of the open-source MySQL.

# 11.5 How Do I Change the Binlog Retention Period?

GaussDB(for MySQL) is compatible with the **binlog\_expire\_logs\_seconds** parameter of community version 8.0. You can change binlog retention period using this parameter.

## Procedure

**Step 1** [Log in to the management console](#).

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases > GaussDB(for MySQL)**.

**Step 4** On the **Instances** page, click the instance name to go to the **Basic Information** page.

**Step 5** In the navigation pane, choose **Parameters**. On the **Parameters** tab, view the following parameters.

- If the kernel version is earlier than 2.0.45.230900, search for the **log-bin** parameter. If the parameter value is **ON**, binlog is enabled.
- If the kernel version is 2.0.45.230900 or later, search for the **rds\_global\_sql\_log\_bin** parameter. If the parameter value is **ON**, binlog is enabled.

**NOTE**

To view the kernel version, click the instance name to go to the **Basic Information** page. In the **DB Instance Information** area, view the **DB Engine Version** field.

**Figure 11-4** Viewing the kernel version

**Step 6** On the **Parameters** tab, configure **binlog\_expire\_logs\_seconds**.

**NOTE**

- When a new binlog file is generated, any existing binlog files that have expired will be deleted.
- If no new binlog file is generated, historical binlog files will not be deleted even if they have expired. To delete binlog files manually, connect to the database and run **flush logs**; to forcibly generate a new binlog file.

----End

## 11.6 How Do I View Deadlock Logs of GaussDB(for MySQL)?

Database deadlock logs are not recorded in error logs. To view deadlock logs, use Data Admin Service (DAS), a visualized and professional database management tool, to quickly execute SQL statements.

### Procedure

**Step 1** [Log in to the management console.](#)

**Step 2** Click  in the upper left corner and select a region and a project.

**Step 3** Click  in the upper left corner of the page, choose **Databases > GaussDB(for MySQL)**.

**Step 4** On the **Instances** page, locate the instance you want to log in and click **Log In** in the **Operation** column.

**Step 5** On the displayed login page, enter the correct username and password and click **Log In**.

**Figure 11-5** Logging in to an instance

**Step 6** Select the target database and click **SQL Operations > SQL Window**.

**Step 7** In the displayed SQL window, run **show engine innodb status** to view the latest deadlock logs of the selected database. Use the keyword **LATEST DETECTED DEADLOCK** to locate the latest deadlock logs. The latest deadlock logs will overwrite the historical deadlock logs.

----End

# 12 Version Upgrade

## 12.1 How Can I Check a GaussDB(for MySQL) Instance Version?

- On the **Basic Information** page of the target instance, view the instance version.

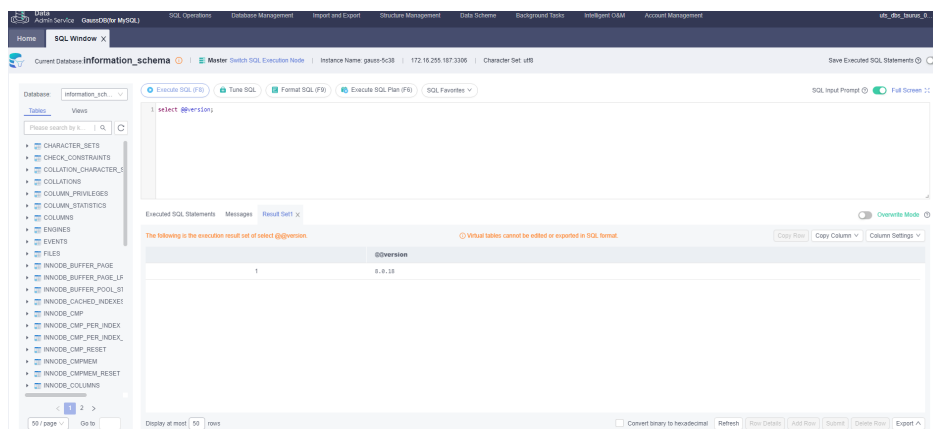

**Figure 12-1** Viewing instance basic information

DB Instance Information			
DB Instance Name	gauss <a href="#">✎</a> <a href="#">🔗</a>	DB Instance ID	bf10ede6894043d9a029136cc3db31e4in07 <a href="#">🔗</a>
Status	<span style="color: green;">●</span> Available	Nodes	2
DB Engine Version	MySQL 8.0 <span style="border: 1px solid red; padding: 2px;">Upgrade</span>	Time Zone	UTC+08:00
Instance Class	gaussdb.mysql.2xlarge.x86_4   8 vCPUs   32 GB <a href="#">Change</a>	Region	Beijing4
AZ Type	Single-AZ	Primary AZ	cn-north-4b
Administrator	root <a href="#">Reset Password</a>	SSL	<a href="#">Certificate</a> <a href="#">↓</a>
Maintenance Window	<a href="#">🔔</a> 02:00 – 06:00 <a href="#">Change</a>	Enterprise Project	default

- On the DAS console, perform the following steps to view the version of the target instance:
  - a. Log in to the target instance.
  - b. On the top menu bar, choose **SQL Operations > SQL Query**.
  - c. Run **select @@version;** to view the version of the instance.

## 12.2 Can I Upgrade GaussDB(for MySQL) Versions of Instances?

You can manually upgrade minor versions of your instances to improve performance, add new functions, and fix bugs.

Read replicas are upgraded prior to the primary node.

For more information upgrade operations, see [Upgrading a Minor Version](#).

# A Change History

Released On	Description
2023-12-18	This issue is the seventeenth official release. Added <a href="#">Can I Enable general_log for GaussDB(for MySQL)?</a> .
2023-11-08	This issue is the sixteenth official release, which incorporates the following change: Modified the method of enabling binlog in <a href="#">How Do I Enable and View Binlog of My GaussDB(for MySQL) Instance?</a>
2023-10-12	This issue is the fifteenth official release, which incorporates the following change: Added <a href="#">How Can I Use Temporary Disk of GaussDB(for MySQL)?</a>
2023-08-31	This issue is the fourteenth official release, which incorporates the following change: Added <a href="#">What Should I Do If I Can't Connect to My GaussDB(for MySQL) Instance?</a>
2023-07-24	This issue is the thirteenth official release, which incorporates the following change: Added <a href="#">How Do I Add Columns Using INSTANT?</a>
2023-05-16	This issue is the twelfth official release, which incorporates the following change: Added <a href="#">How Do I View Deadlock Logs of GaussDB(for MySQL)?</a>

Released On	Description
2023-03-30	This issue is the eleventh official release, which incorporates the following changes: <ul style="list-style-type: none"><li>• Added <a href="#">How Do I Handle Slow SQL Statements Caused by Inappropriate Composite Index Settings?</a></li><li>• Added <a href="#">How Do I Handle Slow SQL Statements Caused by Inappropriate Composite Index Settings?</a></li><li>• Added <a href="#">What Should I Do If Locks on Long Transactions Block the Execution of Subsequent Transactions?</a></li></ul>
2023-02-22	This issue is the tenth official release, which incorporates the following changes: <ul style="list-style-type: none"><li>• Added <a href="#">How Do I Change the Binlog Retention Period?</a></li><li>• Optimized the content in <a href="#">How Do I Enable and View Binlog of My GaussDB(for MySQL) Instance?</a></li></ul>
2022-11-22	This issue is the ninth official release, which incorporates the following change: Optimized the content in <a href="#">How Do I Set Case Sensitivity for GaussDB(for MySQL) Table Names?</a>
2022-11-03	This issue is the eighth official release, which incorporates the following change: Optimized the content in <a href="#">How Can I Connect to a MySQL Database Through JDBC?</a>
2022-08-30	This issue is the seventh official release, which incorporates the following change: Added <a href="#">Resource Freezing, Release, Deletion, and Unsubscription</a>
2022-07-30	This issue is the sixth official release, which incorporates the following changes: <ul style="list-style-type: none"><li>• Added <a href="#">How Do I Ensure that the Database Character Set of a GaussDB(for MySQL) Instance Is Correct?</a></li><li>• Added <a href="#">Can I Use SQL Commands to Modify Global Parameters?</a></li><li>• Added <a href="#">How Do I Set Case Sensitivity for GaussDB(for MySQL) Table Names?</a></li><li>• Added <a href="#">How Do I Use the utf8mb4 Character Set to Store Emojis in a GaussDB(for MySQL) Instance?</a></li><li>• Added <a href="#">Can I Upgrade GaussDB(for MySQL) Versions of Instances?</a></li><li>• Added <a href="#">How Do I View My Backup Storage Usage?</a></li><li>• Added <a href="#">How Is GaussDB(for MySQL) Backup Data Billed?</a></li></ul>

Released On	Description
2022-06-30	This issue is the fifth official release, which incorporates the following change: Added <a href="#">How Can I Install the MySQL Client?</a>
2022-02-18	This issue is the fourth official release, which incorporates the following changes: <ul style="list-style-type: none"><li>• Added <a href="#">Does GaussDB(for MySQL) Provide the Root Account or Super Permission?</a></li><li>• Adjusted the classification of FAQs.</li></ul>
2021-04-30	This issue is the third official release, which incorporates the following change: Added <a href="#">What Should I Do If an ECS and a GaussDB(for MySQL) instance Deployed in Different VPCs Cannot Communicate with Each Other?</a>
2020-12-30	This issue is the second official release, which incorporates the following changes: <ul style="list-style-type: none"><li>• Added <a href="#">How Can I Connect to a MySQL Database Through JDBC?</a></li><li>• Added <a href="#">Why Are the Results Inconsistent After the MATCH AGAINST Statement Is Executed, Respectively, on Primary Nods and Read Replicas?</a></li></ul>
2019-09-03	This issue is the first official release.
