1 Solution Overview

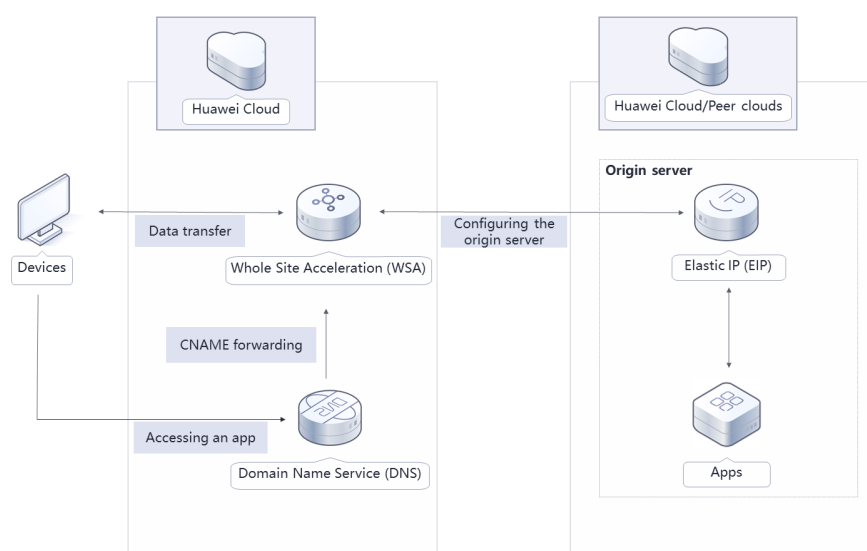

Scenarios

This solution uses the Whole Site Acceleration (WSA) to pull content from the origin server through the possible fastest route, so dynamic pages can load faster. This solution is a good option for websites that have both dynamic and static content and that need to handle a large number of ASP, JSP, or PHP requests.

Architecture

This solution allows you to quickly deploy Whole Site Acceleration (WSA) and **Domain Name Service (DNS)** resources and configure your origin server.

Figure 1-1 Architecture

This solution will:

- Add a WSA domain name and set your application server as the origin server.

- Configure a CNAME record for the domain name for the local DNS server to redirect requests to CDN.

Advantages

- Intelligent routing
WSA intelligently calculates the optimal route to the origin server in real time based on the access location, carrier, network quality, and node load.
- Protocol optimization
WSA uses Huawei-developed protocol optimization algorithms to reduce the packet loss rate and latency for users with weak networks.
- Global presence
Huawei Cloud CDN has over 2,000 points of presence (PoPs) in the Chinese mainland and over 800 PoPs outside the Chinese mainland. The network-wide bandwidth reaches 150 Tbit/s.

Constraints

- Before deploying this solution, ensure that you have an account with access to the target region.
- You must purchase a public domain name from Huawei Cloud DNS and obtain an ICP license from the Ministry of Industry and Information Technology (MIIT).
- Poor network quality may cause the solution deployment to fail. If this happens, uninstall the solution and then re-deploy it.

2 Resource and Cost Planning

Whole site acceleration pricing includes a basic fee for site acceleration and fee for value-added services listed in the [Table 2-1](#). The costs are only estimates and may differ from the final prices. For details, see [pricing details](#).

Table 2-1 Estimated costs (only for reference)

Huawei Cloud Service	Description	Monthly Cost
Whole Site Acceleration (WSA)	<p>WSA fee = Basic traffic/bandwidth fee + Billing on the number of whole site acceleration requests. This solution is billed on a tiered pricing basis by default. You can also buy traffic packages. For details, see pricing details.</p> <p>1. Basic fee: By default, you are billed based on traffic tiers by the traffic used per hour. The billing cycle is one calendar month.</p> <p>Prices outside the Chinese mainland:</p> <ol style="list-style-type: none"> 1. Site traffic ≤ 10 TB: \$0.115 USD/GB 2. 10 TB < site traffic ≤ 50 TB: \$0.11 USD/GB 3. 50 TB < site traffic ≤ 100 TB: \$0.095 USD/GB 4. 100 TB < site traffic ≤ 1 PB: \$0.076 USD/GB 5. Site traffic > 1 PB: \$0.067 USD/GB <p>2. Value-added fee: Number of whole site acceleration requests x Unit price (\$0.023 USD per 10,000 requests). The fee cannot be deducted from traffic packages and will be deducted from your account balance.</p>	\$11.523 USD (10,000 requests +100 GB traffic used)
Total		\$11.523 USD

3 Procedure

[3.1 Preparations](#)

[3.2 Quick Deployment](#)

[3.3 Quick Uninstallation](#)

3.1 Preparations

Creating the rf_admin_trust Agency

Step 1 Log in to the Huawei Cloud official website, open the [console](#), hover over the account name, and choose **Identity and Access Management**.

Figure 3-1 Console page

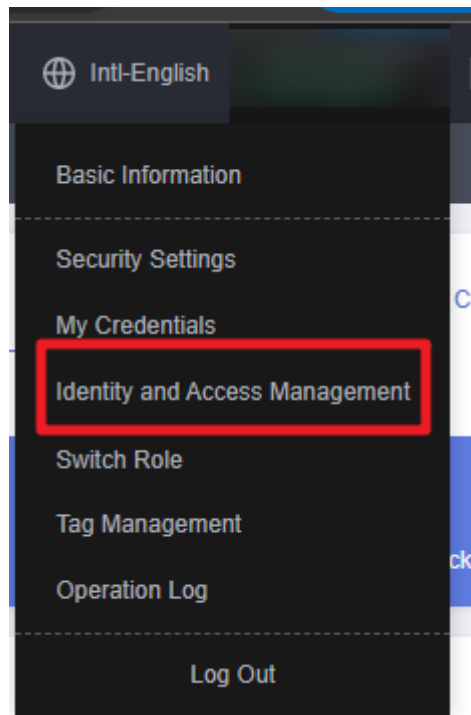

Figure 3-2 Identity and access management page

Step 2 Choose **Agencies** in the left navigation pane and search for the **rf_admin_trust** agency.

Figure 3-3 Agencies

- If the agency is found, skip the following steps.
- If the agency is not found, perform the following steps to create it.

Step 3 Click **Create Agency** in the upper right corner of the page. On the displayed page, enter **rf_admin_trust** for **Agency Name**, select **Cloud service** for **Agency Type** and **RFS** for **Cloud Service**, and click **Next**.

Figure 3-4 Creating the **rf_admin_trust** agency

The screenshot shows the 'Create Agency' interface. The 'Agency Name' field contains 'rf_admin_trust'. The 'Agency Type' section has 'Cloud service' selected with a radio button. The 'Cloud Service' dropdown is set to 'RFS'. The 'Validity Period' dropdown is set to 'Unlimited'. The 'Description' field is empty with a placeholder 'Enter a brief description.' and a character count of '0/255'. At the bottom, there are 'Next' and 'Cancel' buttons.

Step 4 Search for **Tenant Administrator** and select it in the search result.

Figure 3-5 Selecting a policy/role

The screenshot shows the 'Authorize Agency' page. It has a progress bar with three steps: '1 Select Policy/Role', '2 Select Scope', and '3 Finish'. Below the progress bar, there is a search bar and a table of policies/roles. The table has columns for 'Policy/Role Name' and 'Type'. The 'Tenant Administrator' role is selected, indicated by a red box around its checkbox. The table lists the following roles:

Policy/Role Name	Type
<input type="checkbox"/> DME AdministratorAccess Data Model Engine tenant administrator with full permissions.	System-defined policy
<input checked="" type="checkbox"/> Tenant Administrator Tenant Administrator (Exclude IAM)	System-defined role
<input type="checkbox"/> CS Tenant Admin Cloud Stream Service Tenant Administrator, can manage multiple CS users.	System-defined role

Step 5 Select **All resources** and click **OK**.

Figure 3-6 Setting the authorization scope

The screenshot shows the 'Authorize Agency' page at the 'Select Scope' step. A message box says: 'The following are recommended scopes for the permissions you selected. Select the desired scope requiring minimum authorization.' Below this, there is a 'Scope' section with the 'All resources' option selected. A note below the scope selection states: 'IAM users will be able to use all resources, including those in enterprise projects, region-specific projects, and global services under your account based on assigned permissions.' There is a 'Show More' link below the note.

Step 6 Check that the **rf_admin_trust** agency is created and displayed in the agency list.

Figure 3-7 Agencies

----End

3.2 Quick Deployment

This section helps you quickly deploy the global data transfer acceleration solution.

Table 3-1 Parameters for deploying the global data transfer acceleration solution

Parameter	Type	Mandatory	Description	Default Value
accelerate_domain	string	Yes	Specifies the domain name used to access the application to accelerated. The domain name must have been licensed by the Ministry of Industry and Information Technology (MIIT). You are advised to use a level-2 domain name of the public domain specified by public_zone_domain . A domain name must consist of one or more labels, representing domains at different levels. These labels are concatenated and delimited by dots (.). A label consists of letters A to Z, or a to z, not case sensitive, digits 0 to 9, and hyphens (-). The length of a domain name is within 75 characters. Do not start or end a domain name with hyphens (-). Example: download.game-apk1.com.	Left blank

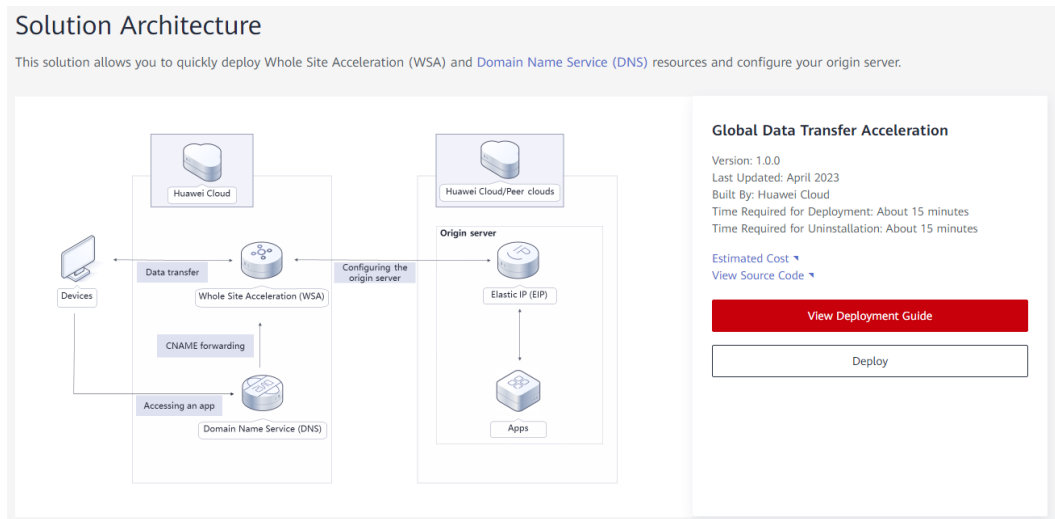

Parameter	Type	Mandatory	Description	Default Value
public_zone_domain	string	Yes	Specifies the public domain used by the user service system to provide services that can be accessed from the Internet. A domain name must consist of one or more labels, representing domains at different levels. These labels are concatenated and delimited by dots (.). A label consists of letters A to Z, or a to z, not case sensitive, digits 0 to 9, and hyphens (-). The length of a domain name is within 75 characters. Do not start or end a domain name with hyphens (-). Example: game-apk1.com.	Left blank

Parameter	Type	Mandatory	Description	Default Value
service_area	string	Yes	<p>Specifies the service area. The default value is outside_mainland_china. You can select one of the following as required by your services:</p> <ol style="list-style-type: none"> 1. mainland_china: areas in the Chinese mainland 2. outside_mainland_china: areas outside the Chinese mainland 3. global: global areas 	outside_mainland_china

Parameter	Type	Mandatory	Description	Default Value
origin_server_addresses	string	Yes	Specifies the origin server address. The address type can be IP address or domain name. If the origin server address type is IP address, only IPv4 addresses are supported. If there are multiple IP addresses, multiple objects must be specified to pass these addresses respectively, and the values of the parameters except the IP address in these objects must be the same. Up to 15 IP addresses can be specified for the primary or standby origin server. If the origin server address type is domain name, only one domain name is supported. The address type can be either IP address or domain name.	Left blank
origin_server_type	string	Yes	Specifies the address type of the origin server. The default value is ipaddr . You can select either of the following as required by your services: <ol style="list-style-type: none"> ipaddr: IP address Domain: domain name 	ipaddr

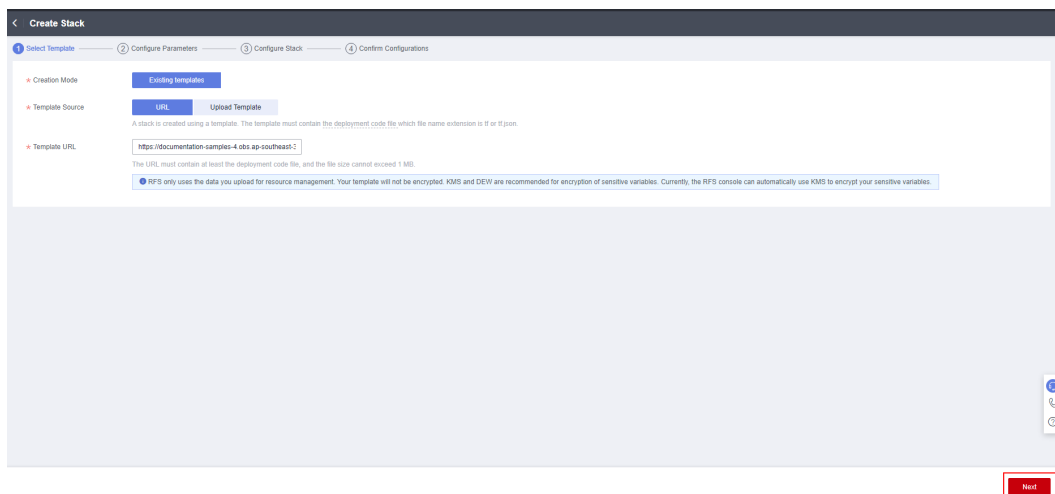

Step 1 Log in to Huawei Cloud Solution Best Practices, choose **Global Data Transfer Acceleration**, and click **Deploy**.

Figure 3-8 Selecting a solution

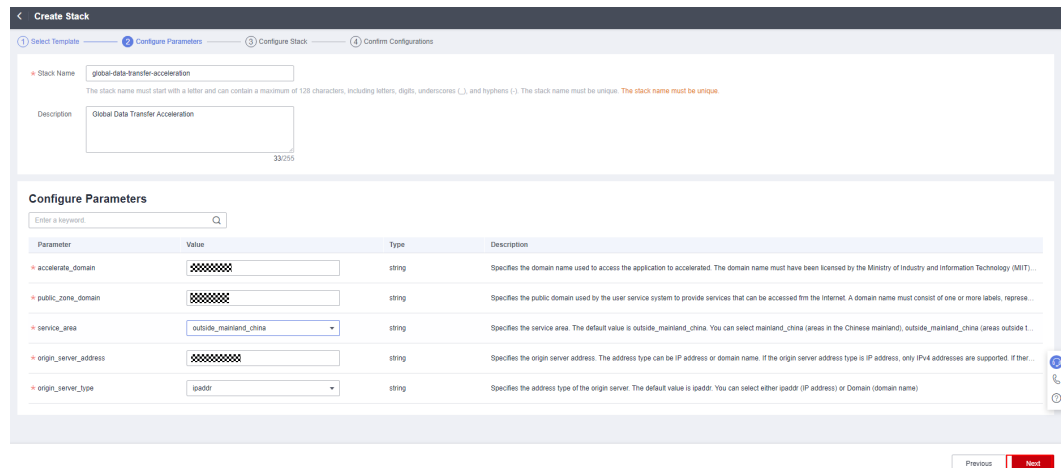

Step 2 On the **Select Template** page, click **Next**.

Figure 3-9 Selecting a template

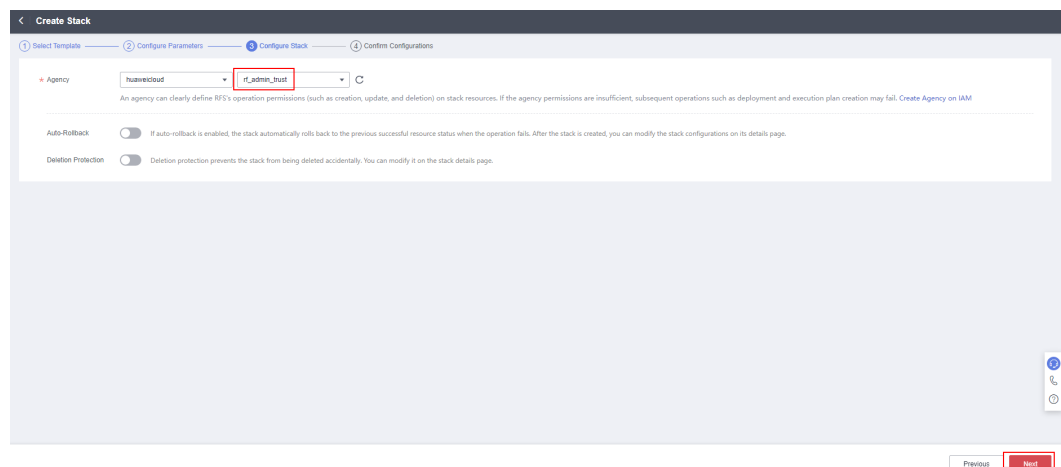

Step 3 On the **Configure Parameters** page, enter a stack name, configure parameters based on **Table 3-1**, and click **Next**.

Figure 3-10 Configuring parameters

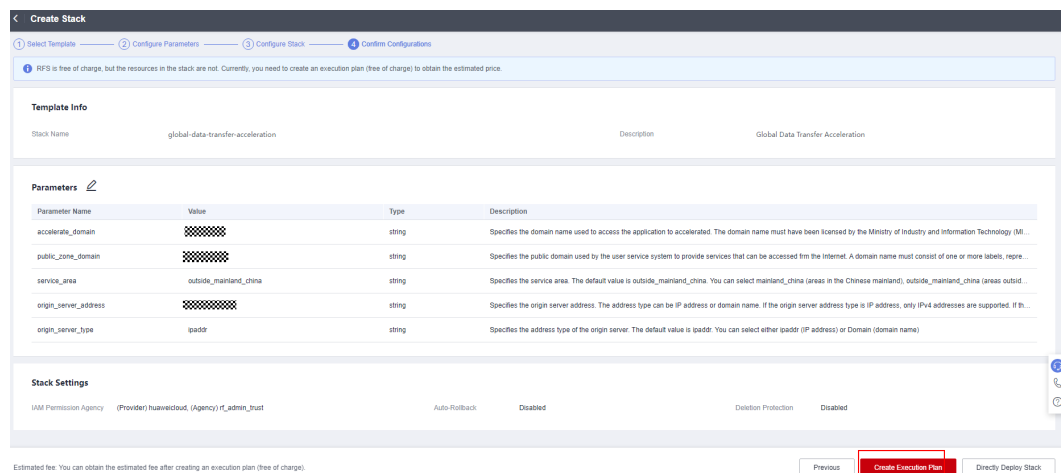

Step 4 On the **Configure Stack** page, select the **rf_admin_trust** agency and click **Next**.

Figure 3-11 Configuring a stack

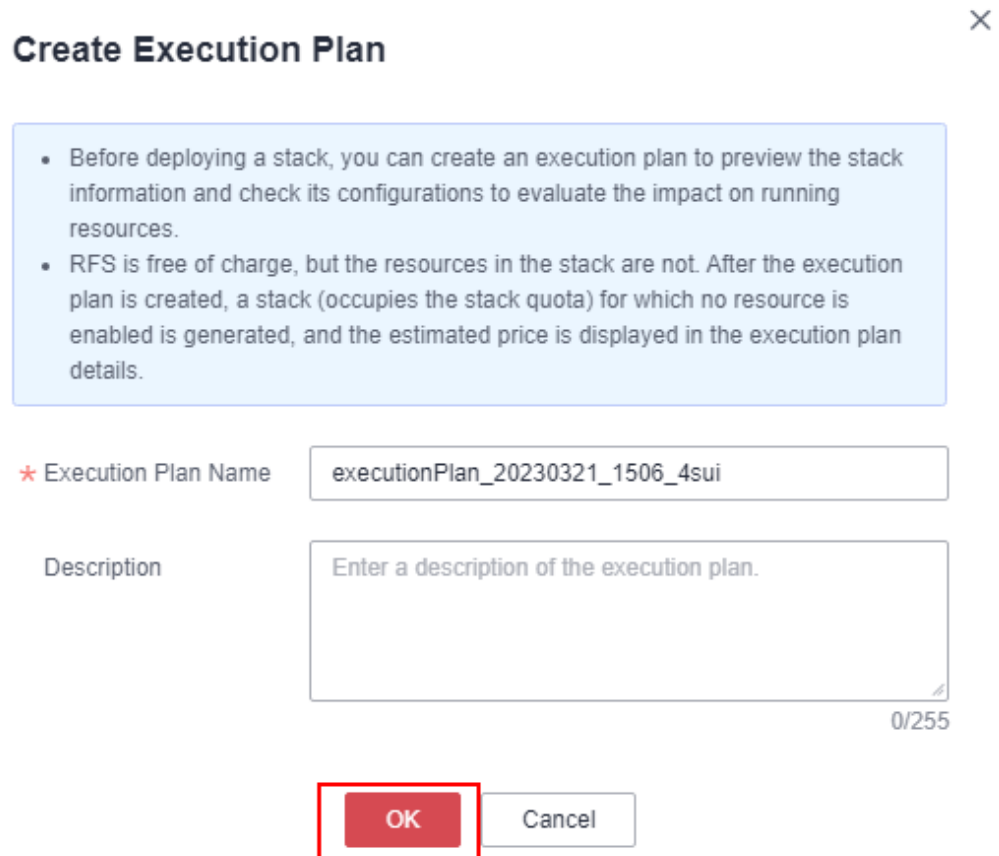

Step 5 On the **Confirm Configurations** page, click **Create Execution Plan**.

Figure 3-12 Confirming the configurations

Step 6 In the displayed **Create Execution Plan** dialog box, enter an execution plan name and click **OK**.

Figure 3-13 Creating an execution plan

Step 7 Wait until the status of the execution plan changes to **Available** and click **Deploy** in the **Operation** column. In the displayed dialog box, click **Execute**.

Figure 3-14 Execution plan page

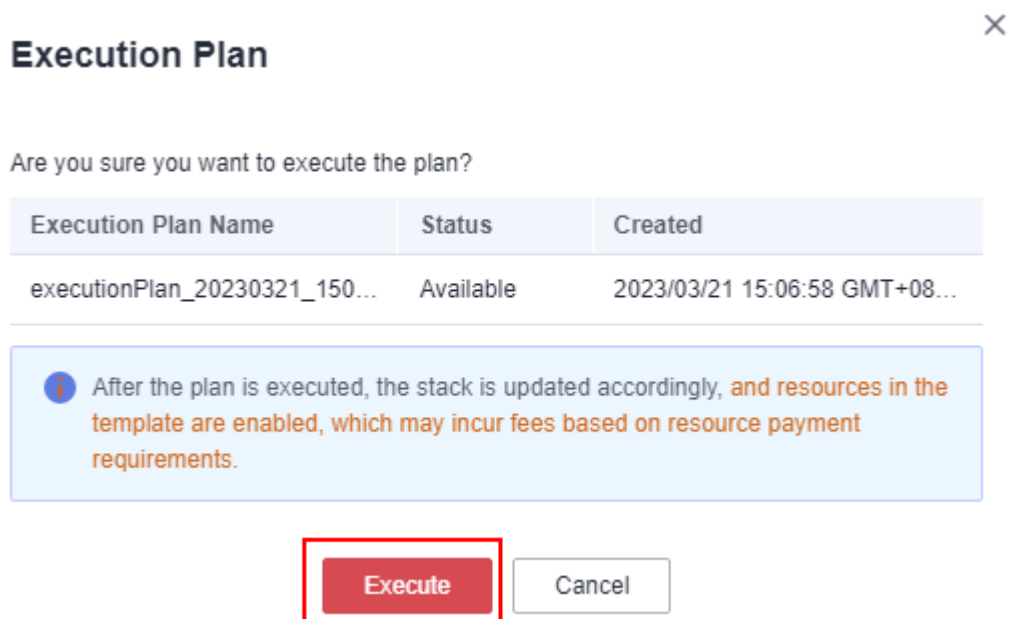

Figure 3-15 Confirming the execution plan

Step 8 Wait until the automatic deployment is complete, and click the **Events** tab to view details.

Figure 3-16 Resources created

----End

3.3 Quick Uninstallation

Step 1 Click **Delete** in the row where the solution stack is.

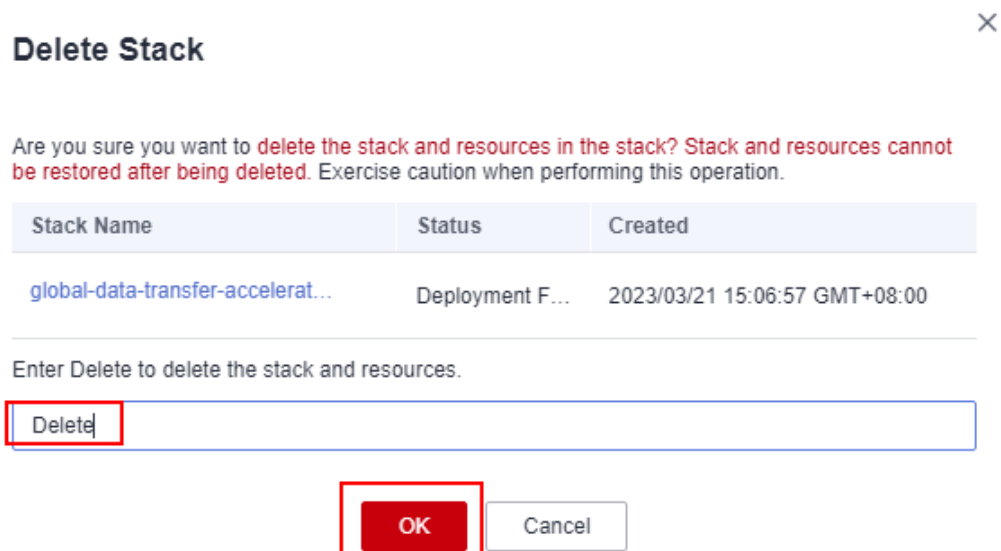

Figure 3-18 Uninstalling the solution

Stacks [?] [Search by stack name by default]

Stack Name	Status	Description	Created	Updated	Operation
global-data-transfer-acceleration 953d9e06-2117-4d37-9e75-48e8911fa806	Creation Complete	--	2023/03/21 15:06:57 GMT+08:00	2023/03/21 15:08:23 GMT+08:00	Delete Update

Step 2 Enter **Delete** and click **OK**.

4 Appendix

Terms

- **Content Delivery Network (CDN):** CDN massively speeds up website load-times, high-quality video streams, and file download times. Built upon a global network of 2,800+ edge nodes, huge bandwidth, and smart cache technology, CDN makes your apps faster and more reliable for users in every part of the world.
- **Domains:** A service that helps you register, authenticate, and manage domain names. All domain names are registered with Xinnnet and hosted on Huawei Cloud DNS. You need to pay for the use of a domain name for a period of time.
- **Whole Site Acceleration (WSA):** WSA is a website acceleration solution that integrates dynamic and static content acceleration. CDN's whole site acceleration accelerates both dynamic and static content. Static content can be served from nearby nodes, whereas dynamic content is pulled from the origin server through the fastest possible route, so that CDN can load dynamic pages more quickly by bypassing congested routes.
