Alarm ID	Alarm Severity	Auto Clear
12081	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The account of user **ommdba** for the host has expired.

Procedure

Check whether user ommdba has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Account expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -E** *'yyyy-MM-dd'* **omm** command to set the validity period of user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.13.55 ALM-12082 User ommdba Is About to Expire

Description

The system starts at 00:00 every day to check whether user **ommdba** is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **ommdba** is reset and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12082	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The account of user **ommdba** for the host is about to expire.

Procedure

Check whether user ommdba is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about user **ommdba**.

Step 2 View the value of **Account expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

Step 3 Run the **chage -E** *'yyyy-MM-dd'* **ommdba** command to set the validity period of user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

10.13.56 ALM-12083 Password of User ommdba Is About to Expire

Description

The system starts at 00:00 every day to check whether the password of user **ommdba** is about to expire every 8 hours. This alarm is generated if the password is about to expire no less than 15 days later.

This alarm is cleared when the expiration time of user **ommdba** password is reset and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12083	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The password of user **ommdba** is about to expire.

Procedure

Check whether the password of user ommdba in the system is about to expire.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Password expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

Step 3 Run the **chage -M** *'days'* **ommdba** command to set the validity period of the password for user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

10.13.57 ALM-12084 Password of User ommdba Expired

Description

The system starts at 00:00 every day to check whether the password of user **ommdba** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **ommdba** password is reset and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12084	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The password of user **ommdba** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

The password of user **ommdba** for the host has expired.

Procedure

Check whether the password of user ommdba in the system has expired.

Step 1 Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -M** *'days'* **ommdba** command to set the validity period of the password for user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

10.13.58 ALM-12085 Service Audit Log Dump Failure

Description

The system dumps service audit logs at 03:00 every day and stores them on the OMS node. This alarm is generated when the dump fails. This alarm is cleared when the next dump succeeds.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12085	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The service audit logs may be lost.

Possible Causes

- The service audit logs are oversized.
- The OMS backup storage space is insufficient.
- The storage space of a host where the service is located is insufficient.

Procedure

Check whether the service audit logs are oversized.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "LOG SIZE is more than 5000MB" can be searched.

- If it can, go to **Step 4**.
- If it cannot, go to **Step 5**.

Step 4 Check whether the oversized service audit logs are caused by exceptions.

The OMS backup storage space is insufficient.

Step 5 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, too many logs on" can be searched.

- If it can, obtain the host IP address following the keyword "Collect log failed, too many logs on", and go to **Step 6**.
- If it cannot, go to **Step 10**.

Step 6 Log in to the host with the IP address obtained in as user **root**.

Step 7 Run the **vi {BIGDATA_LOG_HOME}/nodeagent/scriptlog/collectLog.log** command to check whether the keyword "log size exceeds" can be searched.

- If it can, go to **Step 8**.
- If it cannot, go to **Step 10**.

Step 8 Expand the capacity of the OMS node.

Step 9 In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 10**.

Check whether the space of the host where the service is located is insufficient.

Step 10 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, no enough space on *hostIp*" can be searched.

- If it can, obtain the IP address of the abnormal host and go to **Step 11**.
- If it cannot, go to **Step 14**.

Step 11 Log in to the host with the IP address obtained as user **root**, and run the **df "$BIGDATA_HOME/tmp" -lP | tail -1 | awk '{print ($4/1024)}'** command to obtain the remaining space of the host log directory. Check whether the value is less than 1000 MB.

- If it is, go to **Step 12**.
- If it is not, go to **Step 14**.

Step 12 Expand the capacity of the node

Step 13 In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M**> **Log** > **Download**.

Step 15 Select **Controller** for **Service** and click **OK**.

Step 16 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.13.59 ALM-12087 System Is in the Upgrade Observation Period

Description

The system checks whether it is in the upgrade observation period at 00:00 every day and checks whether the duration that it has been in the upgrade observation state exceeds the preset upgrade observation period, 10 days by default. This alarm is generated when the system is in the upgrade observation period and the duration that the system has been in the upgrade observation state exceeds the preset period (10 days by default). This alarm is automatically cleared if the system exits the upgrade observation period after the user performs a rollback or submission.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12087	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Upgrade Observation Period (Days)	Specifies the days that the system is in the upgrade observation period.

Impact on the System

The next upgrade or patch installation will fail.

Possible Causes

The upgrade task is not submitted a specified period of time (10 days by default) after the system upgrade.

Procedure

Check whether the system is in the upgrade observation period.

Step 1 Log in to the active management node as user **root**.

Step 2 Run the following commands to switch to user **omm** and log in to the **omm** database:

su - omm

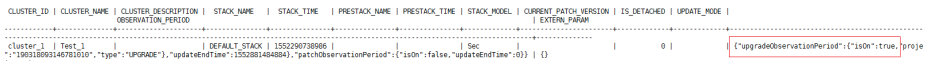
gsql -U omm -W *omm database password* **-p 20015**

Step 3 Run the **select * from OM_CLUSTERS** command to view cluster information.

Step 4 Check whether the value of **upgradObservationPeriod isON** is **true**, as shown in **Figure 10-33**.

- If it is, the system is in the upgrade observation period. Use the UpdateTool to submit the upgrade task. For details, see the upgrade guide of the corresponding version.
- If it is not, go to **Step 6**.

Figure 10-33 Cluster information



Step 5 In the early morning of the next day, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** from the **Service** and click **OK**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

None

10.13.60 ALM-12089 Inter-Node Network Is Abnormal

Description

The alarm module checks the network health status of nodes in the cluster every 10 seconds. This alarm is generated when the network between two nodes is unreachable or the network status is unstable.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12089	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Functions of some components, such as HDFS and ZooKeeper, are affected.

Possible Causes

- The node breaks down.
- The network is faulty.

Procedure

Check the network health status.

Step 1 In the alarm list on FusionInsight Manager, click the drop-down button of the alarm and view **Additional Information**. Record the source IP address and destination IP address of the node for which the alarm is reported.

Step 2 Log in to the node for which the alarm is reported. On the node, ping the target node to check whether the network between the two nodes is normal.

- If yes, go to **6**.

- If no, go to **3**.

Check the node status.

Step 3 On FusionInsight Manager, click **Host** and check whether the host list contains the faulty node to determine whether the faulty node has been removed from the cluster.

- If yes, go to **5**.
- If no, go to **4**.

Step 4 Check whether the faulty node is powered off.

- If yes, start the faulty node and go to **Step 2**.
- If no, contact related personnel to find root cause, if need to remove the faulty nodes from the cluster and go to **5**, otherwise go to **6**.

Step 5 Remove the file **$NODE_AGENT_HOME/etc/agent/hosts.ini** of all nodes in the cluster, and clean up the file **/var/log/Bigdata/unreachable/unreachable_ip_info.log**, and then manually clear the alarm.

Step 6 Wait for 30 seconds and checking if the alarm was been cleared.

- If yes, no further action is required.
- If no, go to **7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **OmmAgent** from the **Service** and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.61 ALM-12101 AZ Unhealthy

Description

After the AZ DR function is enabled, the system checks the AZ health status every 5 minutes. This alarm is generated when the system detects that the AZ is subhealthy or unhealthy. This alarm is cleared when the AZ becomes healthy.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12101	Major	Yes

Parameters

Parameter	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
AZName	Specifies the AZ for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The health status of an AZ is determined by whether the health status of storage resources (HDFS), computing resources (Yarn), and key roles in the AZ exceeds the configured threshold.

An AZ is subhealthy when:

- The computing resources (Yarn) are unhealthy, but the storage resources (HDFS) are healthy. Tasks cannot be submitted to the local AZ, but data can still be read and written in the local AZ.
- The computing resources (Yarn) are healthy, but some storage resources (HDFS) are unhealthy. Tasks can be submitted to the local AZ, and some data can be read and written in the local AZ. This depends on the locality of data detected by Spark/Hive scheduling.

An AZ is unhealthy when:

- The computing resources (Yarn) are healthy, but the storage resources (HDFS) are unhealthy. Although tasks can be submitted to the local AZ, data cannot be read or written in the local AZ. As a result, the tasks submitted to the local AZ are invalid.
- The computing resources (Yarn) and storage resources (HDFS) are unhealthy. Tasks cannot be submitted to the local AZ, and data cannot be read or written in the local AZ.
- The health status of key roles except Yarn and HDFS is lower than the configured threshold.

Possible Causes

- The computing resources (Yarn) are unhealthy.
- The storage resources (HDFS) are unhealthy.
- Some storage resources (HDFS) are unhealthy.
- Key roles except Yarn and HDFS are unhealthy.

Procedure

Disable the DR drill.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Cross-AZ HA**. The Cross-AZ HA page is displayed.

Step 2 In the AZ DR list, check whether **Perform DR Drill** in the **Operation** column of the AZ whose health status is **Unhealthy** is gray.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Click **Restore** in the **Operation** column of the target AZ. Wait 2 minutes and refresh the page to view the health status of the AZ. Check whether the health status is normal.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 Log in to the active management node as user **root**.

Step 5 View logs of unhealthy services.

- HDFS log files are stored in **/var/log/Bigdata/hdfs/nn/hdfs-az-state.log**.
- Yarn log files are stored in **/var/log/Bigdata/yarn/rm/yarn-az-state.log**.
- For other services, view the service health check logs in the corresponding service log directory.

Step 6 Contact O&M personnel and provide detailed log file information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.62 ALM-12102 AZ HA Component Is Not Deployed Based on DR Requirements

Description

The alarm module checks the deployment status of AZ HA components every 5 minutes. This alarm is generated when the components that support DR are not

deployed based on DR requirements after AZ is enabled. This alarm is cleared when the components are deployed based on DR requirements.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12102	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Impact on the System

The cross-AZ HA capability of a single cluster is affected.

Possible Causes

The roles of the components that support DR are not deployed based on DR requirements.

Procedure

Obtain alarm information.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, click ⌄ in the row that contains the alarm and view the roles that are not deployed based on DR requirements in **Additional Information**.

Redeploy the role instance.

Step 3 Choose **Cluster** > **Services** > *Name of the desired service* > **Instance**. On the instance page, redeploy or adjust the role instance.

Step 4 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.63 ALM-12110 Failed to get ECS temporary ak/sk

Description

The meta service periodically obtains the temporary AK/SK of the ECS. This alarm is generated when the meta service fails to obtain the temporary AK/SK.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12110	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

In storage-compute decoupling scenarios, the cluster cannot obtain the latest temporary AK/SK, which may lead to failure access to OBS.

Possible Causes

- The meta role of the MRS cluster is abnormal.
- The cluster has been bound to an agency and accessed OBS but has been unbound from the agency. As a result, the cluster has not been bound to any agency.

Procedure

Check the status of the meta role.

Step 1 On FusionInsight Manager of the cluster, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and determine the IP address of the host for which the alarm is generated.

Step 2 On FusionInsight Manager of the cluster, choose **Cluster** > **Services** > **meta**. On the page that is displayed, click the **Instance** tab, and check whether the meta role corresponding to the host for which the alarm is generated is normal.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Select the abnormal role and choose **More** > **Restart Instance** to restart the abnormal meta role. After the restart is complete, check whether the alarm is cleared several minutes later.

- If yes, no further action is required.
- If no, go to **Step 4**.

Rebind the cluster to an agency.

Step 4 Log in to the MRS management console.

Step 5 In the navigation pane on the left, choose **Clusters** > **Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an agency.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Click **Manage Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 Contact O&M personnel.

----End

10.13.64 ALM-13000 ZooKeeper Service Unavailable

Description

The system checks the ZooKeeper service status every 60 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

ZooKeeper cannot provide coordination services for upper layer components and the components that depend on ZooKeeper may not run properly.

Possible Causes

- The DNS is installed on the ZooKeeper node.
- The network is faulty.
- The KrbServer service is abnormal.
- The ZooKeeper instance is abnormal.
- The disk capacity is insufficient.

Procedure

Check the DNS.

Step 1 Check whether the DNS is installed on the node where the ZooKeeper instance is located. On the Linux node where the ZooKeeper instance is located, run the **cat /etc/resolv.conf** command to check whether the file is empty.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Run the **service named status** command to check whether the DNS is started.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the **service named stop** command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in **/etc/resolv.conf**.

Step 4 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Check the network status.

Step 5 On the Linux node where the ZooKeeper instance is located, run the **ping** command to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Modify the IP addresses in **/etc/hosts** and add the host name and IP address mapping.

Step 7 Run the **ping** command again to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to **Step 8**.
- If no, go to **Step 23**.

Step 8 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the KrbServer service status (Skip this step if the normal mode is used).

Step 9 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services**.

Step 10 Check whether the KrbServer service is normal.

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Perform operations based on "ALM-25500 KrbServer Service Unavailable" and check whether the KrbServer service is recovered.

- If yes, go to **Step 12**.
- If no, go to **Step 23**.

Step 12 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check the ZooKeeper service instance status.

Step 13 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **quorumpeer**.

Step 14 Check whether the ZooKeeper instances are normal.

- If yes, go to **Step 18**.
- If no, go to **Step 15**.

Step 15 Select instances whose status is not good, and choose **More** > **Restart Instance**.

Step 16 Check whether the instance status is good after restart.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check disk status.

Step 18 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Service** > **ZooKeeper** > **quorumpeer**, and check the node host information of the ZooKeeper instance.

Step 19 On FusionInsight Manager, click **Host**.

Step 20 In the **Disk** column, check whether the disk space of each node where ZooKeeper instances are located is insufficient (disk usage exceeds 80%).

- If yes, go to **Step 21**.
- If no, go to **Step 23**.

Step 21 Expand disk capacity. For details, see "ALM-12017 Insufficient Disk Capacity".

Step 22 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Collect fault information.

Step 23 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 24 Select the following nodes in the required cluster from the **Service**: (KrbServer logs do not need to be downloaded in normal mode.)

- ZooKeeper
- KrbServer

Step 25 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.65 ALM-13001 Available ZooKeeper Connections Are Insufficient

Description

The system checks ZooKeeper connections every 60 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold (80% of the maximum connections).

When the **Trigger Count** is 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, external connections cannot be handled.

Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not comply with the actual scenario.

Procedure

Check connection status.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Connections Are Insufficient** and confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 Obtain the PID of the ZooKeeper process. Log in to the node involved in this alarm as user **root** and run the **pgrep -f proc_zookeeper** command.

Step 3 Check whether the PID can be correctly obtained.

- If yes, go to **Step 4**.
- If no, go to **Step 15**.

Step 4 Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the following command based on the obtained PID: **lsof -i|grep** *$pid* **| awk '{print $9}' | cut -d : -f 2 | cut -d \>-f 2 | awk '{a[$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10**. (The PID obtained in the preceding step is used.)

Step 5 Check whether node IP addresses and number of connections are successfully obtained.

- If yes, go to **Step 6**.
- If no, go to **Step 15**.

Step 6 Obtain the ID of the port connected to the process. Run the following command based on the obtained PID and IP address: **lsof -i|grep** *$pid* **| awk '{print $9}'|cut -d \> -f 2 |grep** *$IP*| **cut -d : -f 2**. (The PID and IP address obtained in the preceding step are used.)

Step 7 Check whether the port ID is successfully obtained.

- If yes, go to **Step 8**.
- If no, go to **Step 15**.

Step 8 Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: **lsof -i|grep** *$port*. (The port ID obtained in the preceding step is used.)

Step 9 Check whether the process ID is successfully obtained.

- If yes, go to **Step 10**.
- If no, go to **Step 15**.

Step 10 Check whether connection leakage occurs on the process based on the obtained process ID.

- If yes, go to **Step 11**.

- If no, go to **Step 12**.

Step 11 Close the process where connection leakage occurs and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **Performance** and increase the value of **maxCnxns** as required.

Step 13 Save the configuration and restart the ZooKeeper service.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **ZooKeeper** in the required cluster from the **Service**:

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.66 ALM-13002 ZooKeeper Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the ZooKeeper service every 30 seconds. The alarm is generated when the direct memory usage of a ZooKeeper instance exceeds the threshold (80% of the maximum memory).

When the **Trigger Count** is 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than 80% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the ZooKeeper service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the ZooKeeper instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ZooKeeper Direct Memory Usage Exceeds the Threshold**. Check the IP address of the instance that reports the alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance** > **quorumpeer(the IP address checked)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**.

Step 3 Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, in the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize" and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Save the configuration and restart the ZooKeeper service.

Step 6 Check whether the **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **ZooKeeper** in the required cluster from the **Service**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.67 ALM-13003 GC Duration of the ZooKeeper Process Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the ZooKeeper process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the ZooKeeper process may interrupt the services.

Possible Causes

The heap memory of the ZooKeeper instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **GC Duration of the ZooKeeper Process Exceeds the Threshold**. Check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance** > **quorumpeer(IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **GC**, and select **ZooKeeper GC Duration per Minute**, click **OK** to check the GC duration statistics of the ZooKeeper process collected every minute.

Step 3 Check whether the GC duration of the ZooKeeper process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 Check whether memory leakage occurs in the application program.

Step 5 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

Generally, the value of **-Xmx** is twice of the ZooKeeper data capacity. You are advised to set **MaxDirectMemorySize** to half of the data capacity. If the ZooKeeper capacity reaches 2G, you are advised to set GC_OPTS to:

-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1

Step 6 Save the configuration and restart the ZooKeeper service.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **ZooKeeper** in the required cluster from the **Service**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.68 ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the ZooKeeper service every 60 seconds. The alarm is generated when the heap memory usage of a ZooKeeper instance exceeds the threshold (95% of the maximum memory).

The alarm is cleared when the memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available ZooKeeper heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the ZooKeeper instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, On the displayed interface, click the drop-down button of **ZooKeeper Heap Memory Usage Exceeds the Threshold** and confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance**, click **quorumpeer** in the **Role** column of the corresponding IP address. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**. Check the heap memory usage.

Step 3 Check whether the used heap memory of ZooKeeper reaches 95% of the maximum heap memory specified for ZooKeeper.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** as required. The details are as follows:

1. On the **Instance** tab, click **quorumpeer** in the **Role** column of the corresponding IP address. Choose **Customize** > **CPU and Memory** in the upper right corner, and select **ZooKeeper Heap And Direct Buffer Resource**, click **OK** to check the heap memory used by ZooKeeper.
2. Change the value of **-Xmx** in the **GC_OPTS** parameter based on the actual heap memory usage. Generally, the value is twice the size of the ZooKeeper data volume. For example, if 2 GB ZooKeeper heap memory is used, the following configurations are recommended: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1

Step 5 Save the configuration and restart the ZooKeeper service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.69 ALM-13005 Failed to Set the Quota of Top Directories of ZooKeeper Components

Description

The system sets quotas for each ZooKeeper top-level directory in the **customized.quota** configuration item and components every 5 hours. This alarm is generated when the system fails to set the quota for a directory.

This alarm is cleared when the setting succeeds after a failure.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13005	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

Components can write a large amount of data to the top-level directory of ZooKeeper. As a result, the ZooKeeper service is unavailable.

Possible Causes

The quota for the alarm directory is inappropriate.

Procedure

Check whether the quota for the alarm directory is appropriate.

Step 1 Log in to FusionInsight Manager, and choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper**. On the displayed page, choose **Configurations** > **All Configurations** > **Quota**. Check whether the directory for which the alarm is reported and its quota exist in the **customized.quota** configuration item.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 Check whether the alarm directory for which the alarm is reported is in the following alarm list.

Table 10-87 Component alarm directory

Component	Alarm Directory
Hbase	/hbase
Hive	/beelinesql
Yarn	/rmstore
Storm	/stormroot
Streaming	/storm
Kafka	/kafka

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 View the component of the alarm directory in the table, open the corresponding service page, and choose **Configurations** > **All Configurations**. On the displayed page, search for **zk.quota** in the upper right corner. The search result is the quota of the alarm directory.

Step 4 Check whether the quota of the alarm directory for which the alarm is reported is appropriate. The quota must be greater than or equal to the actual value, which can be obtained in **Trigger Condition**.

Step 5 Modify the **services.quota** value as prompted and save the configuration.

Step 6 After the time specified by **service.quotas.auto.check.cron.expression**, check whether the alarm is cleared.

- If it is, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.70 ALM-13006 Znode Number or Capacity Exceeds the Threshold

Description

The system periodically detects the status of secondary Znode in the ZooKeeper service data directory every four hours. This alarm is generated when the number or capacity of secondary Znodes exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13006	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide normal services.

Possible Causes

A large amount of data is written to the ZooKeeper data directory. The threshold is not appropriate.

Procedure

Check whether a large amount of data is written to the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Znode Number or Capacity Exceeds the Threshold**. Confirm the Znode for which the alarm is generated in Location Information.

Step 2 Log in to FusionInsight Manager, open the ZooKeeper service interface, and select **Resource**. In the table **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written to the top-level Znode for which the alarm is reported.

- If it is, go to **Step 3**.
- If it is not, go to **Step 4**.

Step 3 Log in to the ZooKeeper client and delete the data in the top-level Znode.

Step 4 Log in to FusionInsight Manager and open the ZooKeeper service interface. On the **Resource** page, choose > **By Znode quantity** in **Used Resources (By Second-Level Znode)**. **Threshold Configuration of By Znode quantity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referringto the value of **max.Znode.count** by choosing **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations > Quota**.

Step 5 In the **Used Resources (By Second-Level Znode)**, choose > **By capacity**. The **Threshold Settings** page of **By Capacity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.data.size** by choosing **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations** > **Quota**.

Step 6 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.71 ALM-13007 Available ZooKeeper Client Connections Are Insufficient

Description

The system periodically detects the number of active processes between the ZooKeeper client and the ZooKeeper server every 60 seconds. This alarm is generated when the number of connections exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13007	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
ClientIP	Specifies the client IP address.
ServerIP	Specifies the server IP address.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large number of connections to ZooKeeper caused the ZooKeeper to be fully connected and unable to provide normal services.

Possible Causes

A large number of client processes are connected to ZooKeeper. The thresholds are not appropriate.

Procedure

Check whether there are a large number of client processes connected to ZooKeeper.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Client Connections Are Insufficient**. Confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 Open the ZooKeeper service interface, click **Resource** to enter the **Resource** page, and check whether the number of connections of the client with the IP address specified by **Number of Connections (By Client IP Address)** is large.

- If it is, go to **Step 3**.
- If it is not, go to **Step 4**.

Step 3 Check whether connection leakage occurs on the client process.

Step 4 Click in the **Number of Connections (by Client IP Address)** to enter the **Thresholds** page, and click **Modify** under **Operation**. Increase the threshold by referring to the value of **maxClientCnxns** by choosing **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer**.

Step 5 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **ZooKeeper** in the required cluster from the **Service**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.72 ALM-13008 ZooKeeper Znode Usage Exceeds the Threshold

Description

The system checks the level-2 Znode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper**, and click **Resource**. Click **By Znode quantity** in **Used**

Resources (By Second-Level Znode), and check whether a large amount of data is written to the top Znode.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select **Location** from the drop-down list box next to **ALM-13008 ZooKeeper Znode Quantity Usage Exceeds Threshold**, and obtain the Znode path in **ServiceDirectory**.

Step 3 Log in to the ZooKeeper client as a cluster user and delete unnecessary data from the Znode corresponding to the alarm.

Step 4 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations**, and search for **max.znode.count**, which is the maximum number of ZooKeeper directories. The alarm threshold is 80% of this parameter. Increase the value of this parameter, click **Save**, and restart the service for the configuration to take effect.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select **ZooKeeper** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.73 ALM-13009 ZooKeeper Znode Capacity Usage Exceeds the Threshold

Description

The system checks the level-2 Znode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the capacity usage exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. Confirm the Znode for which the alarm is generated in **Location** of this alarm.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** and click **Resource**. Click **By capacity** in **Used Resources (By Second-Level Znode)** and check whether a large amount of data is written into the top Znode directory.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select **Location** from the drop-down list box next to **ALM-13009 ZooKeeper Znode Capacity Usage Exceeds the Threshold**, and obtain the Znode path in **ServiceDirectory**.

Step 4 Log in to the ZooKeeper client as a cluster user and delete unwanted data in the Znode for which the alarm is generated.

Step 5 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations**, and search for **max.data.size**, which is the maximum capacity quota of the ZooKeeper directory in bytes. Search for the **GC_OPTS** configuration item and check the value of **Xmx**.

Step 6 Compare the values of **max.data.size** and **Xmx** multiplied by 0.65. The threshold is the smaller value multiplied by 80%. You can change the values of **max.data.size** and **Xmx** to increase the threshold.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **ZooKeeper** in the required cluster from the **Service**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.74 ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold

Description

The system checks the Znode usage of all service directories with quota configured every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory. As a result, ZooKeeper cannot provide services properly.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. Confirm the Znode for which the alarm is generated in **Location** of this alarm.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** and click **Resource**. In **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written into the top Znode.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select Location from the drop-down list box next to **ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold**, and obtain the Znode path in ServiceDirectory.

Step 4 Log in to the ZooKeeper client as a cluster user and delete unwanted data in the Znode for which the alarm is generated.

Step 5 Log in to FusionInsight Manager, and choose **Cluster** > *Name of the desired cluster* > **Services** > *Component of the top Znode for which the alarm isgenerated*. Choose **Configurations** > **All Configurations**, search for **zk.quota.number**, increase its value, click **Save**.

NOTICE

If the Component of the top Znode for which the alarm isgenerated is ClickHouse, change the value of **clickhouse.zookeeper.quota.node.count**.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.75 ALM-14000 HDFS Service Unavailable

Description

The system checks the NameService service status every 60 seconds. This alarm is generated when all the NameService services are abnormal and the system considers that the HDFS service is unavailable.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The ZooKeeper service is abnormal.
- All NameService services are abnormal.

Procedure

Check the ZooKeeper service status.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarm page, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 See **ALM-13000 ZooKeeper Service Unavailable** to rectify the health status of ZooKeeper fault and check whether the **Running Status** of the ZooKeeper service restores to **Normal**.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Handle the NameService service exception alarm.

Step 4 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14010 NameService Service Unavailable** is reported.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 See **ALM-14010 NameService Service Unavailable** to handle the abnormal NameService services and check whether each NameService service exception alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.76 ALM-14001 HDFS Disk Usage Exceeds the Threshold

Description

The system checks the HDFS disk usage every 30 seconds and compares the actual HDFS disk usage with the threshold. The HDFS disk usage indicator has a default threshold, this alarm is generated when the value of the disk usage of a Hadoop distributed file system (HDFS) indicator exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Writing Hadoop distributed file system (HDFS) data is affected.

Possible Causes

The disk space configured for the HDFS cluster is insufficient.

Procedure

Check the disk capacity and delete unnecessary files.

Step 1 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**.

Step 2 Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Disk**, and select **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold (80% by default).

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Step 3 In the **Basic Information** area, click the **NameNode(Active)** of the failure NameService and the HDFS WebUI page is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 4 On the HDFS web user interface (WebUI), click **Datanodes** tab. In the **Block pool used** column, view the disk usage of all DataNodes to check whether the disk usage of any DataNode exceeds the threshold.

- If yes, go to **Step 6**.
- If no, go to **Step 11**.

Step 5 Log in to the MRS client node as user **root**.

Step 6 Run **cd /opt/Bigdata/client** to switch to the client installation directory, and run **source bigdata_env**. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Please obtain the password from the administrator.

Step 7 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Expand the system.

Step 9 Expand the disk capacity.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.77 ALM-14002 DataNode Disk Usage Exceeds the Threshold

Description

The system checks the disk usage of the DataNode every 30 seconds and compares the actual disk usage with the threshold. The DataNode Disk Usage indicator has a default threshold. This alarm is generated when the value of the DataNode Disk Usage indicator exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the value of the DataNode Disk Usage indicator is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of the DataNode Disk Usage indicator is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Writing Hadoop distributed file system (HDFS) data is affected.

Possible Causes

- The cluster disk space is full.
- Data among DataNode nodes is skew.

Procedure

Check whether the cluster disk space is full.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, check whether the **ALM-14001 HDFS Disk Usage Exceeds the Threshold** alarm exists.

- If yes, run **Step 2**.
- If no, run **Step 4**.

Step 2 Handle the alarm as instructed in **ALM-14001 HDFS Disk Usage Exceeds the Threshold**. Check whether the alarm is cleared.

- If yes, run **Step 3**.
- If no, run **Step 11**.

Step 3 On the **O&M > Alarm > Alarms** pages, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, run **Step 4**.

Check the balancing status of DataNode nodes.

Step 4 On the FusionInsight Manager portal, click **Host**. Check the number of DataNodes on each rack. If the number differs greatly, adjust the racks to ensure that the number of DataNodes on each rack is almost the same. Restart the HDFS service for the changes to take effect.

Step 5 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 6 In the **Basic Information** area, click **NameNode(Active)** and the HDFS WebUI page is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 7 In the **Summary** area of HDFS WebUI, check whether the value of **Max** is 10% greater than that of **Median** in **DataNodes usages**.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Data in the cluster is skew and must be balanced. Log in to the MRS client as user **root**. If the cluster uses the Normal Mode, run **su - omm** to switch to user **omm**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**. If the cluster uses the security mode, perform security authentication. Run **kinit**

hdfs and enter the password as prompted. Please obtain the password from the administrator.

Step 9 Run the following command to balance the data distribution:

hdfs balancer -threshold 10

Step 10 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select **HDFS** in the required cluster from the **Service**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.78 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold

Description

The system checks the lost blocks every 30 seconds and compares the actual lost blocks with the threshold. The lost blocks indicator has a default threshold. This alarm is generated when the number of lost HDFS blocks exceeds the threshold.

To change the threshold, choose **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the value of lost HDFS blocks is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of lost HDFS blocks is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the safe mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.

Procedure

Check the DataNode instance.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**.

Step 2 Check whether the **Running Status** of all DataNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Step 3 Restart the DataNode instance and check whether the DataNode instance restarts successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Delete the damaged file.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **NameNode(Active)**. On the WebUI page of the HDFS, view the information about lost blocks.

NOTE

- If a block is lost, a line in red is displayed on the WebUI.
- By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 The user checks whether the file containing the lost data block is useful.

NOTE

Files generated in directories **/mr-history**, **/tmp/hadoop-yarn**, and **/tmp/logs** during MapReduce task execution are unnecessary.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 The user checks whether the file containing the lost data block is backed up.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the system administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs

- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 9 On the node client, run **hdfs fsck / -delete** to delete the lost file. If the file where the lost block is located is a useful file, you need to write the file again to restore the data.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 10 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 12 Select **HDFS** in the required cluster from the **Service**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.79 ALM-14006 Number of HDFS Files Exceeds the Threshold

Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the number of HDFS files is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of HDFS files is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14006	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Disk storage space is insufficient, which may result in data import failure. The performance of the HDFS system is affected.

Possible Causes

The number of HDFS files exceeds the threshold.

Procedure

Check the number of files in the system.

Step 1 On FusionInsight Manager, check the number of HDFS files. Specifically, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **File and Block**, and select **HDFS File** and **Total Blocks**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**, and search for the **GC_OPTS** parameter under **NameNode**.

Step 3 Configure the threshold of the number of configuration file objects. Specifically, change the value of **Xmx** (GB) in the **GC_OPTS** parameter. The threshold (specified by y) is calculated as follows: y = 0.2007 x Xmx - 0.6312, where x indicates the memory capacity Xmx (GB) and y indicates the number of files (unit: kW). Adjust the memory size as required.

Step 4 Confirm that the value of **GC_PROFILE** is **custom** so that the **GC_OPTS** configuration takes effect. Click **Save** and choose **More** > **Restart Instance** to restart the service.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether needless files exist in the system.

Step 6 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env** to configure the environment variables.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 7 Run **hdfs dfs -ls** *file or directory* to check whether the files in the directory can be deleted.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Run the **hdfs dfs -rm -r** *file or directory path* command. After deleting unnecessary files, wait until the files are retained in the recycle bin for a period longer than the value of **fs.trash.interval** on the NameNode. Then check whether the alarm is cleared.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

Configuration rules of the NameNode JVM parameter

Default value of the NameNode JVM parameter **GC_OPTS**:

-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -

XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -Djdk.tls.ephemeralDHKeySize=3072 -Djdk.tls.rejectClientInitiatedRenegotiation=true -Djava.io.tmpdir=${Bigdata_tmp_dir}

The number of NameNode files is proportional to the used memory size of the NameNode. When file objects change, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

Table 10-88 NameNode JVM configuration

Number of File Objects	Reference Value
10,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
20,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
50,000,000	-Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
100,000,000	-Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
200,000,000	-Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
300,000,000	-Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

10.13.80 ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold

Description

The system checks the HDFS NameNode Heap Memory usage every 30 seconds and compares the actual Heap memory usage with the threshold. The HDFS NameNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS NameNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to the threshold. When the **Trigger**

Count is greater than 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The HDFS NameNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS NameNode Heap Memory is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the NameNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in the HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of **HDFS->NameNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of files in **Step 6** and the NameNode Heap Memory parameters in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the heap memory parameters of the NameNode based on the mapping between the number of file objects and the memory. Click **Save** and choose **Dashboard** > **More** > **Restart Service**.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.81 ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold

Description

The system checks the HDFS DataNode Heap Memory usage every 30 seconds and compares the actual Heap Memory usage with the threshold. The HDFS DataNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS DataNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The HDFS DataNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS DataNode Heap Memory is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the DataNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **DataNodes** tab, and check the number of blocks of all DataNodes related to the alarm.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the GC_OPTS memory parameter of **HDFS->DataNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of block in **Step 6** and the DataNode Heap Memory parameters in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the heap memory parameters of the DataNode based on the mapping between the number of blocks and the memory. Click **Save** and choose **Dashboard** > **More** > **Restart Service**.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 12 Select **HDFS** in the required cluster from the **Service**.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.82 ALM-14009 Number of Dead DataNodes Exceeds the Threshold

Description

The system periodically detects the number of dead DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The number of DataNodes in the Dead state has a default threshold. This alarm is generated when the number exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

DataNodes that are in the Dead state cannot provide HDFS services.

Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.
- NameNodes are overloaded.
- The NameNodes are not restarted after the DataNode is deleted.

Procedure

Check whether DataNodes are faulty.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. The **HDFS Status** page is displayed.

Step 2 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 3 On the HDFS WebUI, click the **Datanodes** tab. In the **In operation** area, click **Filter** to check whether **down** is in the drop-down list.

- If yes, select **down**, record the information about the filtered DataNodes, and go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** to check whether recorded DataNodes exist in the instance list.

- If all recorded DataNodes exist, go to **Step 5**.
- If none of the recorded DataNodes exists, go to **Step 6**.
- If some of the recorded DataNodes exist, go to **Step 7**.

Step 5 Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 6 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Step 7 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them. Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the status of the network between the NameNode and the DataNode.

Step 8 Log in to the faulty DataNode on the management page as user **root**, and run the **ping** *IP address of the NameNode* command to check whether the network between the DataNode and the NameNode is abnormal.

On the FusionInsight Manager page, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, view the service plane IP address of the faulty DataNode.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Rectify the network fault, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the DataNode is overloaded.

Step 10 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and check whether the alarm **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 See **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check whether the NameNode is overloaded.

Step 13 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and check whether the alarm **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 See **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to **Step 15**.
- If no, go to **Step 16**.

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 17 Select **HDFS** in the required cluster from the **Service**.

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.83 ALM-14010 NameService Service Is Abnormal

Description

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

This alarm is cleared when the NameService service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The KrbServer service is abnormal.
- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.
- The NameNode enters safe mode.

Procedure

Check the KrbServer service status.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Check whether the KrbServer service exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Click **KrbServer**.

Step 4 Click **Instances**. On the KrbServer management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the instance successfully restarts.

- If yes, go to **Step 5**.
- If no, go to **Step 24**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the JournalNode instance status.

Step 6 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 7 Choose **HDFS** > **Instances**.

Step 8 Check whether the **Running Status** of the JournalNode is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Select the faulty JournalNode, and choose **More** > **Restart Instance**. Check whether the JournalNode successfully restarts.

- If yes, go to **Step 10**.
- If no, go to **Step 24**.

Step 10 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the DataNode instance status.

Step 11 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 12 Click **Instances** and check whether **Running Status** of all DataNodes is **Normal**.

- If yes, go to **Step 15**.
- If no, go to **Step 13**.

Step 13 Click **Instances**. On the DataNode management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the DataNode successfully restarts.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check disk status.

Step 15 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Host**.

Step 16 In the **Disk** column, check whether the disk space is insufficient.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 Expand the disk capacity.

Step 18 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check whether NameNode is in the safe mode.

Step 19 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click **NameNode(Active)** of the abnormal NameService. The NameNode web UI is displayed.

NOTE

By default, the admin user does not have the management rights of other components. If the page cannot be opened or the content is not completely displayed due to insufficient permission when you access the native page of a component, you can manually create a user with the management rights of the corresponding component to log in to the component.

Step 20 On the NameNode web UI, check whether "Safe mode is ON." is displayed.

Information behind **Safe mode is ON** is alarm information and is displayed based actual conditions.

- If yes, go to **Step 21**.
- If no, go to **Step 24**.

Step 21 Log in to the client as user **root**. Run the **cd** command to go to the client installation directory and run the **source bigdata_env** command. If the cluster uses the security mode, perform security authentication. Run the **kinit hdfs** command and enter the password as prompted. The password can be obtained from the administrator. If the cluster uses the non-security mode, log in as user **omm** and run the command. Ensure that user **omm** has the client execution permission.

Step 22 Run **hdfs dfsadmin -safemode leave**.

Step 23 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Collect the fault information.

Step 24 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 25 In the **Service** area, select the following nodes of the desired cluster.

- ZooKeeper
- HDFS

Step 26 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 27 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

None

10.13.84 ALM-14011 DataNode Data Directory Is Not Configured Properly

Description

The DataNode parameter **dfs.datanode.data.dir** specifies DataNode data directories. This alarm is generated when a configured data directory cannot be created, a data directory uses the same disk as other critical directories in the system, or multiple directories use the same disk immediately.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode for which the alarm is generated is restarted.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the DataNode data directory is mounted to the root directory or a critical directory, the disk space of the root directory or critical directory will be used up after long time running and the system will be faulty.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk with critical directories, such as **/** or **/boot**.

- Multiple directories in the DataNode data directory use the same disk.

Procedure

Check the alarm cause and information about the DataNode for which the alarm is generated.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 In **HostName** of **Location**, obtain the host name of the DataNode for which the alarm is generated.

Delete directories that do not comply with the disk plan from the DataNode data directory.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, click the DataNode instance on the node for which the alarm is generated.

Step 4 Click **Instance Configurations** and view the value of the DataNode parameter **dfs.datanode.data.dir**.

Step 5 Check whether all DataNode data directories are consistent with the disk plan.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.

Step 7 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** and restart the DataNode instance.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Log in to the DataNode for which the alarm is generated as user **root**.

- If the alarm cause is "The DataNode data directory fails to be created", go to **Step 10**.
- If the alarm cause is "The DataNode data directory uses the same disk with critical directories, such **/** or **/boot**", go to **Step 17**.
- If the alarm cause is "Multiple directories in the DataNode data directory uses the same disk", go to **Step 21**.

Check whether the DataNode data directory fails to be created.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **ls** command to check whether the directories exist in the DataNode data directory.

- If yes, go to **Step 26**.
- If no, go to **Step 12**.

Step 12 Run the **mkdir** *data directory* command to create the directory and check whether the directory can be successfully created.

- If yes, go to **Step 24**.
- If no, go to **Step 13**.

Step 13 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to check whether alarm **ALM-12017 Insufficient Disk Capacity** exists.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Adjust the disk capacity and check whether alarm **ALM-12017 Insufficient Disk Capacity** is cleared. For details, see **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 12**.
- If no, go to **Step 15**.

Step 15 Check whether user **omm** has the **rwx** or **x** permission of all the upper-layer directories of the directory. (For example, for **/tmp/abc/**, user **omm** has the **x** permission for directory **tmp** and the **rwx** permission for directory **abc**.)

- If yes, go to **Step 24**.
- If no, go to **Step 16**.

Step 16 Run the **chmod u+rwx** *path* or **chmod u+x** *path* command as user **root** to assign the **rwx** or **x** permission of these directories to user **omm**. Then go to **Step 12**.

Check whether the DataNode data directory use the same disk as other critical directories in the system.

Step 17 Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory.

Step 18 Check whether the directories mounted to the disk are critical directories, such as **/** or **/boot**.

- If yes, go to **Step 19**.
- If no, go to **Step 24**.

Step 19 Change the value of the DataNode parameter **dfs.datanode.data.dir** and delete the directories that use the same disk as critical directories.

Step 20 Go to **Step 24**.

Check whether multiple directories in the DataNode data directory use the same disk.

Step 21 Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.

Step 22 Modify the DataNode node parameters **dfs.datanode.data.dir** to reserve only one directory among the directories that mounted to the same disk directory.

Step 23 Go to **Step 24**.

Restart the DataNode and check whether the alarm is cleared.

Step 24 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** and restart the DataNode instance

Step 25 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 26**.

Collect fault information.

Step 26 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 27 Select **HDFS** in the required cluster from the **Service**.

Step 28 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 29 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.85 ALM-14012 JournalNode Is Out of Synchronization

Description

On the active NameNode, the system checks the data consistency of all JournalNodes in the cluster every 5 minutes. This alarm is generated when the data on a JournalNode is inconsistent with the data on the other JournalNodes.

This alarm is cleared in 5 minutes after the data on JournalNodes is consistent.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Impact on the System

When a JournalNode is working incorrectly, the data on the node becomes inconsistent with that on the other JournalNodes. If data on more than half of JournalNodes is inconsistent, the NameNode cannot work correctly, making the HDFS service unavailable.

Possible Causes

- The JournalNode instance does not exist (deleted or migrated).
- The JournalNode instance has not been started or has been stopped.
- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

Procedure

Check whether the JournalNode instance has been started up.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, check whether the JournalNode instance exists on the node for which the alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Choose **O&M** > **Alarm** > **Alarms**. In the alarm list, click **Clear** in the **Operation** column of the alarm. In the dialog box that is displayed, click **OK**. No further action is needed.

Step 5 Click the JournalNode instance and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Select the JournalNode instance and choose **Start Instance** to start the instance.

Step 7 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the JournalNode instance is working correctly.

Step 8 Check whether **Running Status** of the JournalNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Select the JournalNode instance and choose **More** > **Restart Instance** to start the instance.

Step 10 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the network of the JournalNode is reachable.

Step 11 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** to check the service IP address of the active NameNode.

Step 12 Log in to the active NameNode as user **root**.

Step 13 Run the **ping** command to check whether a timeout occurs or the network is unreachable between the active NameNode and the JournalNode.

ping *service IP address of the JournalNode*

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Contact the network administrator to rectify the network fault and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **HDFS** in the required cluster from the **Service**.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.86 ALM-14013 Failed to Update the NameNode FsImage File

Description

HDFS metadata is stored in the FsImage file of the NameNode data directory, which is specified by the **dfs.namenode.name.dir** configuration item. The standby NameNode periodically combines existing FsImage files and Editlog files stored in the JournalNode to generate a new FsImage file, and then pushes the new FsImage file to the data directory of the active NameNode. This period is specified by the **dfs.namenode.checkpoint.period** configuration item of HDFS. The default value is 3600s, namely, one hour. If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification.

On the active NameNode, the system checks the FsImage file information every five minutes. This alarm is generated when no FsImage file is generated within three combination periods.

This alarm is cleared when a new FsImage file is generated and pushed to the active NameNode, which indicates that the HDFS metadata combination function can be properly used.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Impact on the System

If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification. If it is not rectified, the Editlog files increase continuously after HDFS runs for a period. In this case, HDFS restart is time-consuming because a large number of Editlog files need to be loaded. In addition, this alarm also indicates that the standby NameNode is abnormal and the NameNode high availability (HA) mechanism becomes invalid. When the active NameNode is faulty, the HDFS service becomes unavailable.

Possible Causes

- The standby NameNode is stopped.
- The standby NameNode instance is working incorrectly.
- The standby NameNode fails to generate a new FsImage file.
- Space of the data directory on the standby NameNode is insufficient.
- The standby NameNode fails to push the FsImage file to the active NameNode.
- Space of the data directory on the active NameNode is insufficient.

Procedure

Check whether the standby NameNode is stopped.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 View **Location** and obtain the host name of the active NameNode for which the alarm is generated and name of the NameService where the active NameNode resides.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**, find the standby NameNode instance of the NameService in the instance list, and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Select the standby NameNode instance, choose **Start Instance**, and wait until the startup is complete.

Step 5 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the NameNode instance is working correctly.

Step 6 Check whether **Running Status** of the standby NameNode instance is **Normal**.

- If yes, go to **Step 9**.
- If no, go to **Step 7**.

Step 7 Select the standby NameNode instance, choose **More** > **Restart Instance**, and wait until the startup is complete.

Step 8 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Check whether the standby NameNode fails to generate a new FsImage file.

Step 9 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**, and search and obtain the value of **dfs.namenode.checkpoint.period**. This value is the period of NameNode metadata combination.

Step 10 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** and obtain the service IP addresses of the active and standby NameNodes of the NameService for which the alarm is generated.

Step 11 Click the **NameNode(***xx***,Standy)** and **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the standby NameNode.

Step 12 Log in to the standby NameNode as user **root** or **omm**.

Step 13 Go to the FsImage storage directory and check the generation time of the newest FsImage file.

cd *Storage directory of the standby NameNode***/current**

stat -c %y $(ls -t | grep "fsimage_[0-9]*$" | head -1)

Step 14 Run the **date** command to obtain the current system time.

Step 15 Calculate the time difference between the generation time of the newest FsImage file and the current system time and check whether the time difference is greater than three times of the metadata combination period.

- If yes, go to **Step 16**.
- If no, go to **Step 20**.

Step 16 The metadata combination function of the standby NameNode is faulty. Run the following command to check whether the fault is caused by insufficient storage space.

Go to the FsImage storage directory and check the size of the newest FsImage file (in MB).

cd *Storage directory of the standby NameNode***/current**

du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'

Step 17 Run the following command to check the available disk space of the standby NameNode (in MB).

df -m ./ | awk 'END{print $4}'

Step 18 Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.

- If yes, go to **Step 7**.
- If no, go to **Step 19**.

Step 19 Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check whether the standby NameNode fails to push the FsImage file to the active NameNode.

Step 20 Log in to the standby NameNode as user **root**.

Step 21 Run the **su - omm** command to switch to user **omm**.

Step 22 Run the following command to check whether the standby NameNode can push the file to the active NameNode.

tmpFile=/tmp/tmp_test_$(date +%s)

echo "test" > $tmpFile

scp $tmpFile *Service IP address of the active NameNode*:**/tmp**

- If yes, go to **Step 24**.
- If no, go to **Step 23**.

Step 23 When the standby NameNode fails to push data to the active NameNode as user **omm**, contact the system administrator to handle the fault. Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Check whether space on the data directory of the active NameNode is insufficient.

Step 24 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**, click the active NameNode of the NameService for which the alarm is generated, and then click **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the active NameNode.

Step 25 Log in to the active NameNode as user **root** or **omm**.

Step 26 Go to the FsImage storage directory and check the size of the newest FsImage file (in MB).

cd *Storage directory of the active NameNode*/**current**

du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'

Step 27 Run the following command to check the available disk space of the active NameNode (in MB).

df -m ./ | awk 'END{print $4}'

Step 28 Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.

- If yes, go to **Step 30**.
- If no, go to **Step 29**.

Step 29 Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Collect fault information.

Step 30 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 31 Select **NameNode** in the required cluster from the **Service**.

Step 32 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 33 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.87 ALM-14014 NameNode GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the NameNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14014	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the NameNode process may interrupt the services.

Possible Causes

The heap memory of the NameNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14014 NameNode GC Time Exceeds the Threshold.** Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection**, and select **NameNode Garbage Collection (GC)** to check the GC duration statistics of the NameNode process collected every minute.

Step 3 Check whether the GC duration of the NameNode process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **NameNode** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 5 Save the configuration and restart the NameNode instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **NameNode** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.88 ALM-14015 DataNode GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the DataNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the DataNode process may interrupt the services.

Possible Causes

The heap memory of the DataNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14015 DataNode GC Time Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **DataNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection**, and select **DataNode Garbage Collection (GC)** to check the GC duration statistics of the DataNode process collected every minute.

Step 3 Check whether the GC duration of the DataNode process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **DataNode** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 5 Save the configuration and restart the DataNode instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **DataNode** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.89 ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the HDFS service every 30 seconds. This alarm is generated when the direct memory usage of a DataNode instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14016	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the HDFS service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the DataNode instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **DataNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource**, and select **DataNode Memory** to check the direct memory usage.

Step 3 Check whether the used direct memory of DataNode reaches 90% of the maximum direct memory specified for DataNode by default.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **DataNode** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize". Save the configuration and restart the DataNode instance.

Step 6 Check whether the **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **DataNode** in the required cluster from the **Service**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.90 ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the HDFS service every 30 seconds. This alarm is generated when the direct memory usage of a NameNode instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the HDFS service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the NameNode instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms.** On the displayed interface, click the drop-down button of **ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** > **NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource**, and select **NameNode Memory** to check the direct memory usage.

Step 3 Check whether the used direct memory of NameNode reaches 90% of the maximum direct memory specified for NameNode by default.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations** > **NameNode** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize". Save the configuration and restart the NameNode instance.

Step 6 Check whether the **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **NameNode** in the required cluster from the **Service**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.91 ALM-14018 NameNode Non-heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the HDFS NameNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS NameNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS NameNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS NameNode is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14018	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

Possible Causes

Non-heap memory of the HDFS NameNode is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the NameNode JVM non-heap memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. The HDFS status page is displayed.

Step 5 In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**,

enter **GC_OPTS** to check the **GC_OPTS** non-heap memory parameter of **HDFS->NameNode**.

Adjust system configurations.

Step 8 Check whether the non-heap memory is properly configured based on the number of file objects in **Step 6** and the non-heap parameters configured for NameNode in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the **GC_OPTS** parameter of the NameNode based on the mapping between the number of file objects and non-heap memory.

Step 10 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 13 Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

Step 14 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.92 ALM-14019 DataNode Non-heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the HDFS DataNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS DataNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS DataNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds>** *Name of the desired cluster* **> HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS DataNode is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14019	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the memory usage of the HDFS DataNode is too high, data read/write performance of HDFS will be affected.

Possible Causes

Non-heap memory of the HDFS DataNode is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the DataNode JVM non-heap memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Datanodes** tab to view the number of blocks of all DataNodes that report alarms.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** non-heap memory parameter of **HDFS->DataNode**.

Adjust system configurations.

Step 8 Check whether the memory is properly configured based on the number of blocks in **Step 6** and the memory parameters configured for DataNode in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the **GC_OPTS** parameter of the DataNode based on the mapping between the number of blocks and memory.

Step 10 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 13 Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

Step 14 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

10.13.93 ALM-14020 Number of Entries in the HDFS Directory Exceeds the Threshold

Description

The system obtains the number of subfiles and subdirectories in a specified directory every hour and checks whether it reaches the percentage of the threshold (the maximum number of subfiles and subdirectories in an HDFS directory, the threshold for triggering an alarm is **90%** by default). If it exceeds the percentage of the threshold, an alarm is triggered.

When the number of subfiles and subdirectories in the directory the alarm is lower than the percentage of the threshold, the alarm is automatically cleared. When the monitoring switch is disabled, alarms corresponding to all directories are cleared. If a directory is removed from the monitoring list, alarms corresponding to the directory are cleared.

NOTE

- The **dfs.namenode.fs-limits.max-directory-items** parameter specifies the maximum number of subfiles and subdirectories in the HDFS directory. Its default value is **1048576**. If the number of subfiles and subdirectories in a directory exceeds the parameter value, subfiles and subdirectories cannot be created in the directory.
- The **dfs.namenode.directory-items.monitor** parameter specifies the list of directories to be monitored. Its default value is **/tmp,/SparkJobHistory,/mr-history**.
- The **dfs.namenode.directory-items.monitor.enabled** parameter is used to enable or disable the monitoring switch. Its default value is **true**, which means the monitoring switch is enabled by default.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14020	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Directory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the number of entries in the monitored directory exceeds 90% of the threshold, an alarm is triggered, but entries can be added to the directory. Once the maximum threshold is exceeded, entries will fail to be added to the directory.

Possible Causes

The number of entries in the monitored directory exceeds 90% of the threshold.

Procedure

Check whether unnecessary files exist in the system.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command to set the environment variables.

If the cluster is in security mode, security authentication is required.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the following command to check whether files and directories in the directory with the alarm can be deleted:

hdfs dfs -ls *Directory with the alarm*

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the following command to delete unnecessary files.

hdfs dfs -rm -r -f *File or directory path*

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 4 Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the threshold is correctly configured.

Step 5 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for the **dfs.namenode.fs-limits.max-directory-items** parameter and check whether the parameter value is appropriate.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Increase the parameter value.

Step 7 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

Step 8 Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.94 ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold

Description

The system checks the average RPC processing time of NameNode every 30 seconds, and compares the actual average RPC processing time with the threshold (default value: 100 ms). This alarm is generated when the system detects that the average RPC processing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14021	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.

Procedure

Obtain alarm information.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check the alarm. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

Check whether the threshold is too small.

Step 3 Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **RPC**, and select **Average Time of Active NameNode RPC Processing** and click **OK**.

Step 5 On the **Average Time of Active NameNode RPC Processing** monitoring page, obtain the value of the NameService node involved in this alarm.

Step 6 On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> HDFS**. Locate **Average Time of Active NameNode RPC Processing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the peak value within one day before and after the alarm is generated. Click **OK** to save the new threshold.

Step 7 Wait for 5 minutes and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the CPU performance of the NameNode node is sufficient.

Step 8 On the FusionInsight Manager portal, click **O&M > Alarm >Alarms** and check whether **ALM-12016 CPU Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 10 Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether the memory of the NameNode node is too small.

Step 11 On the FusionInsight Manager portal, click **O&M > Alarm >Alarms** and check whether **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Handle **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** by taking recommended actions.

Step 13 Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether NameNode parameters are configured properly.

Step 14 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less

than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

Step 15 Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

Step 16 Click **Save** and click **OK**.

Step 17 On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

Step 18 On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

Step 19 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Collect fault information.

Step 20 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 21 Select the following node in the required cluster from the **Service**.

- HDFS

Step 22 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.95 ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold

Description

The system checks the average RPC queuing time of NameNode every 30 seconds, and compares the actual average RPC queuing time with the threshold (default value: 200 ms). This alarm is generated when the system detects that the average RPC queuing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14022	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.
- The volume of services that access HDFS is too large and therefore NameNode is overloaded.

Procedure

Obtain alarm information.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check the alarm. Obtain the alarm generation time from **Generated**. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

Check whether the threshold is too small.

Step 3 Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **RPC**, and select **Average Time of Active NameNode RPC Queuing** and click **OK**.

Step 5 On the **Average Time of Active NameNode RPC Queuing** monitoring page, obtain the value of the NameService node involved in this alarm.

Step 6 On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> HDFS**. Locate **Average Time of Active NameNode RPC Queuing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the monitored value. Click **OK** to save the new threshold.

Step 7 Wait for 1 minute and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the CPU performance of the NameNode node is sufficient.

Step 8 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-12016 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 10 Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether the memory of the NameNode node is too small.

Step 11 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Handle **ALM-14007 CPU Usage Exceeds the Threshold** by taking recommended actions.

Step 13 Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether NameNode parameters are configured properly.

Step 14 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

Step 15 Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

Step 16 Click **Save**, and click **OK**.

Step 17 On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

Step 18 On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

Step 19 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check whether the HDFS workload changes and reduce the workload properly.

Step 20 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, click **Customize**, select **Average Time of Active NameNode RPC Queuing** and click **OK**.

Step 21 Click  . The **Details** page is displayed.

Step 22 Set the monitoring data display period, from 5 days before the alarm generation time to the alarm generation time. Click **OK**.

Step 23 On the **Average RPC Queuing Time** monitoring page, check whether the point in time when the queuing time increases abruptly exists.

- If yes, go to **Step 24**.
- If no, go to **Step 27**.

Step 24 Confirm and check the point in time. Check whether a new task frequently accesses HDFS and whether the access frequency can be reduced.

Step 25 If a Balancer task starts at the point in time, stop the task or specify a node for the task to reduce the HDFS workload.

Step 26 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 27**.

Collect fault information.

Step 27 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 28 Select **HDFS** in the required cluster from the **Service**.

Step 29 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 30 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.96 ALM-14023 Percentage of Total Reserved Disk Space for Replicas Exceeds the Threshold

Description

The system checks the percentage of total reserved disk space for replicas (Total reserved disk space for replicas/(Total reserved disk space for replicas + Total remaining disk space)) every 30 seconds and compares the actual percentage with the threshold (**90%** by default). This alarm is generated when the percentage of total reserved disk space for replicas exceeds the threshold for multiple consecutive times (**Trigger Count**).

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is **1** and the percentage of total reserved disk space for replicas is less than or equal to the threshold; the value of **Trigger Count** is greater than **1** and the percentage of total reserved disk space for replicas is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14023	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The performance of writing data to HDFS is affected. If all remaining DataNode space is reserved for replicas, writing HDFS data fails.

Possible Causes

- The alarm threshold is improperly configured.
- The disk space configured for the HDFS cluster is insufficient.
- The volume of services that access HDFS is too large and therefore DataNode is overloaded.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** > **Disk** > **Percentage of Reserved Space for Replicas of Unused Space** to check whether the alarm threshold is appropriate. (The default threshold is **90%**. Users can change it as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** > **Disk** > **Percentage of Reserved Space for Replicas of Unused Space** and Click **Modify,** change the threshold based on the actual usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether an alarm indicating insufficient disk space is generated.

Step 4 On the FusionInsight Manager portal, check whether **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** exists on the **O&M > Alarm > Alarms** page.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Handle the alarm by referring to instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Expand the DataNode capacity.

Step 7 Expand the DataNode capacity.

Step 8 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.97 ALM-14024 Tenant Space Usage Exceeds the Threshold

Description

The system checks the space usage (used space of each directory/space allocated to each directory) of each directory associated with a tenant every hour and compares the space usage of each directory with the threshold set for the directory. This alarm is generated when the space usage exceeds the threshold.

This alarm is cleared when the space usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14024	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

This alarm is generated if the space usage of the tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the used space exceeds the maximum storage space allocated to the directory, the HDFS fails to write data to the directory.

Possible Causes

- The alarm threshold is improperly configured.
- The space allocated to the tenant is improper.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 On the **Resources** page, click **Modify** to modify or delete the storage space threshold.

Step 4 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the space allocated to the tenant is appropriate.

Step 5 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space quota of the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 On the **Resources** page, click **Modify** to modify the storage space quota.

Step 7 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.98 ALM-14025 Tenant File Object Usage Exceeds the Threshold

Description

The system checks the file object usage (used file objects of each directory/ number of file objects allocated to each directory) of each directory associated with a tenant every hour and compares the file object usage of each directory with the threshold set for the directory. This alarm is generated when the file object usage exceeds the threshold.

This alarm is cleared when the file object usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14025	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

This alarm is generated if the usage of file objects in a tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the number of used file objects exceeds the maximum number of file objects allocated to the directory, the HDFS fails to write data to the directory.

Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of file objects allocated to the tenant directory is inappropriate.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the file object threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 On the **Resources** page, click **Modify** to modify or delete the file object threshold of the tenant directory for which the alarm is generated.

Step 4 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the maximum number of file objects allocated to the tenant is appropriate.

Step 5 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the maximum number of file objects configured for the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 On the **Resources** page, click **Modify** to modify or delete the maximum number of file objects configured for the tenant directory.

Step 7 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.99 ALM-14026 Blocks on DataNode Exceed the Threshold

Description

The system checks the number of blocks on each DataNode every 30 seconds. This alarm is generated when the number of blocks on the DataNode exceeds the threshold.

If the number of smoothing times is 1 and the number of blocks on the DataNode is less than or equal to the threshold, this alarm is cleared. If the number of smoothing times is greater than 1 and the number of blocks on the DataNode is less than or equal to 90% of the threshold, this alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14026	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

If this alarm is reported, there are too many blocks on the DataNode. In this case, data writing into the HDFS may fail due to insufficient disk space.

Possible Causes

- The alarm threshold is improperly configured.
- Data skew occurs among DataNodes.
- The disk space configured for the HDFS cluster is insufficient.

Procedure

Modify the threshold

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > HDFS** > **Configurations** > **All Configurations**. On the displayed page, find the **GC_OPTS** parameter under **HDFS->DataNode**.

Step 2 Set the threshold of the DataNode block number. Specifically, modify the value of **Xmx** of the **GC_OPTS** parameter. **Xmx** specifies the memory, and each GB memory supports a maximum of 500000 DataNode blocks. Set the memory as required. Confirm that **GC_PROFILE** is set to **custom** and save the configuration.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> HDFS > Instance**, select the **DataNode** instance whose **Configuration Status** is **Expired**, and choose **More > Restart Instance** to make the **GC_OPTS** configuration take effect.

Step 4 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether associated alarms are reported.

Step 5 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**, and check whether **ALM-14002 DataNode Disk Usage Exceeds the Threshold** is reported.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by referring to **ALM-14002 DataNode Disk Usage Exceeds the Threshold**. Then, check whether the alarm is cleared.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Expand the DataNode capacity.

Step 8 Expand the DataNode capacity.

Step 9 On the FusionInsight Manager portal, five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 11 Select **HDFS** in the required cluster from the **Service**.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

Configuration rules of the DataNode JVM parameter

Default value of the DataNode JVM parameter **GC_OPTS**:

-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -Djdk.tls.ephemeralDHKeySize=2048

The average number of blocks stored in each DataNode instance in the cluster is: HDFS Block x 3 ÷ Number of DataNodes. If the average number changes, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

Table 10-89 DataNode JVM configuration

Average Number of Blocks in a DataNode Instance	Reference Value
2,000,000	**-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M**
5,000,000	**-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G**

Xmx specifies the memory, and each GB memory supports a maximum of 500000 DataNode blocks. Set the memory as required.

10.13.100 ALM-14027 DataNode Disk Fault

Description

The system checks the disk status on DataNodes every 60 seconds. This alarm is generated when a disk is faulty.

After all faulty disks on the DataNode are recovered, you need to manually clear the alarm and restart the DataNode.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14027	Major	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Failed Volumes	Specifies the list of faulty disks.

Impact on the System

If this alarm is reported, there are abnormal disk partitions on the DataNode. This may cause the loss of written files.

Possible Causes

- The hard disk is faulty.
- The disk permissions are configured improperly.

Procedure

Check whether a disk alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Modify disk permissions.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.

Step 5 Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission of the faulty disk is **711** and whether the user is **omm**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:

chown omm:wheel data1

chmod 711 data1

Step 7 In the alarm list on Manager, click **Clear** in the **Operation** column of the alarm to manually clear the alarm. Choose **Cluster** > **Services** > **HDFS** > **Instance**, select the DataNode, choose **More** > **Restart Instance**, wait for 5 minutes, and check whether a new alarm is reported.

- If no, no further action is required.
- If yes, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **HDFS** and **OMS** for the target cluster.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

Related Information

None

10.13.101 ALM-14028 Number of Blocks to Be Supplemented Exceeds the Threshold

Description

The system checks the number of blocks to be supplemented every 30 seconds and compares the number with the threshold. The number of blocks to be supplemented has a default threshold. This alarm is generated when the number of blocks to be supplemented exceeds the threshold.

You can change the threshold specified by **Blocks Under Replicated (NameNode)** by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HDFS** > **File and Block**.

If **Trigger Count** is set to **1** and the number of blocks to be supplemented is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks to be supplemented is less than or equal to 90% of the threshold, this alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14028	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.
- The number of replicas written into the file is greater than the number of DataNodes.

Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the system administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs
- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 4 Run the **hdfs fsck / >> fsck.log** command to obtain the status of the current cluster.

Step 5 Run the following command to count the number (*M*) of blocks to be replicated:

cat fsck.log | grep "Under-replicated"

Step 6 Run the following command to count the number (*N*) of blocks to be replicated in the **/tmp/hadoop-yarn/staging/** directory:

cat fsck.log | grep "Under replicated" | grep "/tmp/hadoop-yarn/staging/" | wc -l

NOTE

/tmp/hadoop-yarn/staging/ is the default directory. If the directory is modified, obtain it from the configuration item **yarn.app.mapreduce.am.staging-dir** in the **mapred-site.xml** file.

Step 7 Check whether the percentage of *N* is greater than 50% (N/M > 50%).

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Run the following command to reconfigure the number of file replicas in the directory (set the number of file replicas to the number of DataNodes or the default number of file replicas):

hdfs dfs -setrep -w *Number of file replicas*/tmp/hadoop-yarn/staging/

NOTE

To obtain the default number of file replicas:

Log in to FusionInsight Manager, choose **Cluster > Services > HDFS > Configurations > All Configurations**, and search for the **dfs.replication** parameter. The value of this parameter is the default number of file replicas.

Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.102 ALM-14029 Number of Blocks in a Replica Exceeds the Threshold

Description

The system checks the number of blocks in a single replica every four hours and compares the number with the threshold. There is a threshold for the number of blocks in a single replica. This alarm is generated when the actual number of blocks in a single replica exceeds the threshold.

This alarm is cleared when the number of blocks to be supplemented is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14029	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Replica data is prone to be lost when a node is faulty. Too many files of a single replica affect the security of the HDFS file system.

Possible Causes

- The DataNode is faulty.
- The disk is faulty.
- Files are written to a single replica.

Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Check whether files of a single replica have been written into the service.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the system administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs

- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 5 Run the following command on the client node to increase the number of replicas for a single replica file:

hdfs dfs -setrep -w *file replica number file name or file path*

Step 6 In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Select **HDFS** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.103 ALM-16000 Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold

Description

The system detects the percentage of sessions connected to the HiveServer to the maximum number of allowed sessions every 30 seconds. This indicator can be viewed on the **Cluster** > *Name of the desired cluster* > **Services** > **Hive > Instance** > *HiveServer instance***.** This alarm is generated when the percentage exceeds the default value **90%**.

To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive > Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer**.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16000	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If a connection alarm is generated, too many sessions are connected to Hive and new connections are unavailable.

Possible Causes

Too many clients are connected to HiveServer.

Procedure

Increase the maximum number of connections to Hive.

Step 1 On the FusionInsight Manager portal, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations >All Configurations**.

Step 2 Search for **hive.server.session.control.maxconnections** and increase the value of this parameter. If the value of this parameter is **A**, the threshold is **B**, and the number of sessions connected to the HiveServer is **C**, adjust the value of this parameter according to **A x B > C**. To view the number of sessions connected to the HiveServer, check the value of **Statistics for Sessions of the HiveServer** on the Hive monitoring page.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.104 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold

Description

This alarm is generated when the Hive warehouse space usage exceeds the specified threshold (85% by default). The system checks the Hive data warehouse space usage every 30s. The indicator **Percentage of HDFS Space Used by Hive to the Available Space** can be viewed on the Hive service monitoring page.

To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> Hive > Percentage of HDFS Space Used by Hive to the Available Space**.

When the **Trigger Count** is 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to 90% of the threshold.

NOTE

The administrator can reduce the warehouse space usage by expanding the warehouse capacity or releasing the used space.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16001	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The system fails to write data, which causes data loss.

Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The HDFS space is insufficient.
- Some data nodes break down.

Procedure

Expand the system configuration.

Step 1 Analyze the cluster HDFS capacity usage and increase the upper limit of the HDFS capacity available for Hive.

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**, find **hive.metastore.warehouse.size.percent**, and increase its value so that larger HDFS capacity will be available for Hive. Assume that the value of the configuration item is A, the total HDFS storage space is B, the threshold is C, and the HDFS space used by Hive is D. The adjustment policy is A x B x C > D. The total HDFS storage space can be viewed on the HDFS NameNode page. The HDFS space used by Hive can be viewed on the Hive monitoring page.

Step 2 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Expand the system.

Step 3 Expand the system.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the data node is normal.

Step 5 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 6 Check whether "ALM-12006 Node Fault", "ALM-12007 Process Fault", or "ALM-14002 DataNode Disk Usage Exceeds the Threshold" exist.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Clear the alarm by following the steps provided in "ALM-12006 Node Fault", "ALM-12007 Process Fault", and "ALM-14002 DataNode Disk Usage Exceeds the Threshold".

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **Hive** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.105 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold

Description

The system checks the percentage of the HQL statements that are executed successfully in every 30 seconds. The formula is: Percentage of HQL statements that are executed successfully = Number of HQL statements that are executed successfully by Hive in a specified period/Total number of HQL statements that

are executed by Hive. This indicator can be viewed on the **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** > *HiveServer instance* **.** The default threshold of the percentage of HQL statements that are executed successfully is **90%**. An alarm is reported when the percentage is lower than the **90%**. Users can view the name of the host where an alarm is generated in the location information about the alarm. The IP address of the host is the IP address of the HiveServer node.

Users can modify the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** > **Percentage of HQL Statements That Are Executed Successfully by Hive**.

This alarm is cleared when the execution success rate is higher than 110% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The system configuration and performance cannot meet service processing requirements.

Possible Causes

- A syntax error occurs in HQL statements.
- The HBase service is abnormal when a Hive on HBase task is performed.

- The Spark service is abnormal when a Hive on Spark task is performed.
- The dependent basic services, such as HDFS, Yarn, and ZooKeeper, are abnormal.

Procedure

Check whether the HQL statements comply with syntax.

Step 1 On the FusionInsight Manager page, choose **O&M** > **Alarm** to view the alarm details and obtain the node where the alarm is generated.

Step 2 Use the Hive client to log in to the HiveServer node where an alarm is reported. Query the HQL syntax provided by Apache, and check whether the HQL commands are correct. For details, see **https://cwiki.apache.org/confluence/display/hive/languagemanual**.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

NOTE

To view the user who runs an incorrect statement, you can download the hiveserver audit log file of the HiveServer node where this alarm is generated. **Start Data** and **End Data** are 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.

Step 3 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 4**.

Check whether the HBase service is abnormal.

Step 4 Check whether an Hive on HBase task is performed with the user who runs the HQL command.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 On the FusionInsight Manager page, click **Cluster** > *Name of the desired cluster* > **Services**, check whether the HBase service is normal in the service list.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Choose **O&M** > **Alarm**, check the related alarms displayed on the alarm page and clear them according to related alarm help.

Step 7 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

Check whether the HDFS, Yarn, and ZooKeeper are normal.

Step 8 On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services**.

Step 9 In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Check the related alarms displayed on the alarm page and clear them according to related alarm help.

Step 11 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 After 1 minute, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager home page, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service**:

- MapReduce
- Hive

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.106 ALM-16003 Background Thread Usage Exceeds the Threshold

Description

The system checks the background thread usage in every 30 seconds. This alarm is generated when the usage of the background thread pool of Hive exceeds the threshold, 90% by default.

NOTE

MRS 3.X supports the multi-instance function. If the multi-instance function is enabled in the cluster and multiple Hive services are installed, determine the Hive service for which the alarm is generated based on the value of **ServiceName** in **Location** of the alarm. For example, if Hive1 service is unavailable, **ServiceName** is set to **Hive1** in **Location**, and the operation object in the handling procedure is changed from Hive to Hive1.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

There are too many background threads, so the newly submitted task cannot run in time.

Possible Causes

The usage of the background thread pool of Hive is excessively high when:

- There are many tasks executed in the background thread pool of HiveServer.
- The capacity of the background thread pool of HiveServer is too small.

Procedure

Check the number of tasks executed in the background thread pool of HiveServer.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of **Background Thread Count** and **Background Thread Usage**.

Step 2 Check whether the number of background threads in the latest half an hour is excessively high. (By default, the queue number is 100, and the thread number is considered as high if it is 90 or larger.)

- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Adjust the number of tasks submitted to the background thread pool. (For example, cancel some time-consuming tasks with low performance.)

Step 4 Check whether the values of Background Thread Count and Background Thread Usage decrease.

- If it is, go to **Step 7**.
- If it is not, go to **Step 5**.

Check the capacity of the HiveServer background thread pool.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of Background Thread Count and Background Thread Usage.

Step 6 Increase the value of **hive.server2.async.exec.threads** in the **${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_23_HiveServer/etc/hive-site.xml** file. For example, increase the value by 20%.

Step 7 Save the modification.

Step 8 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **Hive** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.107 ALM-16004 Hive Service Unavailable

Description

This alarm is generated when the HiveServer service is unavailable. The system checks the HiveServer service status every 60 seconds.

This alarm is cleared when the HiveServer service is normal.

NOTE

MRS 3.X supports the multi-instance function. If the multi-instance function is enabled in the cluster and multiple Hive service instances are installed, you need to determine the Hive service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the Hive1 service is unavailable, **ServiceName=Hive1** is displayed in **Location**, and the operation object in the procedure needs to be changed from Hive to Hive1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16004	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- Hive service unavailability may be related to the faults of the Hive process as well as basic services, such as ZooKeeper, Hadoop distributed file system (HDFS), Yarn, and DBService.
  - The ZooKeeper service is abnormal.
  - The HDFS service is abnormal.

  - The Yarn service is abnormal.
  - The DBService service is abnormal.
  - The Hive service process is abnormal. If the alarm is caused by Hive process fault, the alarm report has a delay of about 5 minutes.
- The network communication between the Hive and basic services is interrupted.

Procedure

Check the HiveServer/MetaStore process status.

Step 1 On the FusionInsight Manager portal, click **Cluster >** *Name of the desired cluster* **> Services** > **Hive** > **Instance**. In the Hive instance list, check whether the HiveServer or MetaStore instances are in the Unknown state.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 In the Hive instance list, choose **More** > **Restart Instance** to restart the HiveServer/MetaStore process.

Step 3 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the ZooKeeper service status.

Step 4 On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 In the **Process Fault**, check whether **ServiceName** is **ZooKeeper**.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the steps provided in "ALM-12007 Process Fault".

Step 7 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the HDFS service status.

Step 8 On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the steps provided in "ALM-14000 HDFS Service Unavailable".

Step 10 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the Yarn service status.

Step 11 In FusionInsight Manager alarm list, check whether **Yarn Service Unavailable** is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Rectify the fault. For details, see "ALM-18000 Yarn Service Unavailable".

Step 13 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check the DBService service status.

Step 14 In FusionInsight Manager alarm list, check whether **DBService Service Unavailable** is generated.

- If yes, go to **Step 15**.
- If no, go to **Step 17**.

Step 15 Rectify the fault. For details, see "ALM-27001 DBService Service Unavailable".

Step 16 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Check the network connection between the Hive and ZooKeeper, HDFS, Yarn, and DBService.

Step 17 On the FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services** > **Hive**.

Step 18 Click **Instance**.

The HiveServer instance list is displayed.

Step 19 Click **Host Name** in the row of **HiveServer**.

The active HiveServer host status page is displayed.

Step 20 Record the IP address under **Basic Information**.

Step 21 Use the IP address obtained in **Step 20** to log in to the host where the active HiveServer runs as user **omm**.

Step 22 Run the **ping** command to check whether communication between the host that runs the active HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services is normal. (Obtain the IP addresses of the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services in the same way as that for obtaining the IP address of the active HiveServer.)

- If yes, go to **Step 25**.
- If no, go to **Step 23**.

Step 23 Contact the administrator to restore the network.

Step 24 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 25**.

Collect fault information.

Step 25 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 26 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS
- Yarn
- DBService
- Hive

Step 27 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 28 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.108 ALM-16005 The Heap Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the heap memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

When the heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The heap memory of the Hive instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16005**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum heap memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum heap memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/ METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the heap memory used by the HiveServer process reaches the threshold (default value: 95%) of the maximum heap memory set by the HiveServer process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically. On the FusionInsight Manager home page, choose **O&M**> **Alarm**> **Thresholds** > *Name of the desired cluster* **> Hive** > **CPU and Memory** > **HiveServer Heap Memory Usage Statistics (HiveServer)** to view **Threshold**.

Suggestions for GC parameter settings for the MetaServer:

- When the heap memory used by the MetaStore process reaches the threshold (default value: 95%) of the maximum heap memory set by the MetaStore process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. On the FusionInsight Manager home page, choose **O&M**> **Alarm**> **Thresholds** > *Name of the desired cluster* **> Hive** > **CPU and Memory** > **MetaStore Heap Memory Usage Statistics (MetaStore)** to view **Threshold**.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.109 ALM-16006 The Direct Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the direct memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> Hive** to change the threshold.

The alarm is cleared when the direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the direct memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The direct memory of the Hive instance on the node is overused or the direct memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16006**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used direct memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum direct memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used direct memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum direct memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose

HiveServer/MetaStore > **JVM**. Adjust the value of **-XX:MaxDirectMemorySize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.110 ALM-16007 Hive GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) time of the Hive service every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 12 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive**. This alarm is cleared when the Hive GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the GC time exceeds the threshold, Hive data read and write are affected.

Possible Causes

The memory of Hive instances is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16007**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster*> **Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC)**

Time of HiveServer and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC) Time of MetaStore** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the current JVM configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster* > **Services > Hive > Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/ METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the Hive GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Suggestions for GC parameter settings for the MetaServer:

- When the Meta GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal of active and standby clusters, choose **O&M** > **Log > Download**.

Step 8 In the **Service**, select **Hive** in the required cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.111 ALM-16008 Non-Heap Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the non-heap memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive** to change the threshold.

The alarm is cleared when the non-heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

When the non-heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The non-heap memory of the Hive instance on the node is overused or the non-heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16008**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-XX:MaxMetaspaceSize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:**

  MaxMetaspaceSize is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:**

  MaxMetaspaceSize is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB

Step 5 Click **More > Restart Service** to restart the service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.112 ALM-16009 Map Number Exceeds the Threshold

Description

The system checks the number of HQL maps in every 30 seconds. This alarm is generated if the number exceeds the threshold. By default, **Trigger Count** is set to **3**, and the threshold is 5000.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the number of HQL maps executed on Hive is excessively large, the HQL execution speed is slow, and a large number of resources are occupied.

Possible Causes

The HQL statements are not the optimal.

Procedure

Check the number of HQL maps.

Step 1 On FusionInsight Manager portal, choose **Cluster** >*Name of the desired cluster*> **Services** > **Hive** > **Resource**. Check the HQL statements with the excessively large number (5000 or more) of maps in **HQL Map Count**.

Step 2 Locate the corresponding HQL statements, optimize them and execute them again.

Step 3 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.113 ALM-16045 Hive Data Warehouse Is Deleted

Description

The system checks the Hive data warehouse in every 60 seconds.This alarm is generated when the Hive data warehouse is deleted.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16045	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The default Hive data warehouse is deleted. As a result, creating databases or tables in the default data warehouse fails, and services are affected.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that the default data warehouse is deleted.

Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **warehouse** directory exists in **hdfs://hacluster/user/***<username>***/.Trash/Current/**.

hdfs dfs -ls hdfs://hacluster/user/*<username>*/.Trash/Current/

For example, if **user/hive/warehouse** exists:

```
host01:/opt/Bigdata/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx------   - test hadoop          0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 By default, there is an automatic recovery mechanism for the data warehouse. You can wait for 5 ~10s to check whether the default data warehouse is restored. If the data warehouse is not recovered, manually run the following command to restore the data warehouse.

hdfs dfs -mv hdfs://hacluster/user/*<username>*/.Trash/Current/user/hive/warehouse /user/hive/warehouse

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.114 ALM-16046 Hive Data Warehouse Permission Is Modified

Description

The system checks the Hive data warehouse permission in every 60 seconds. This alarm is generated if the permission is modified.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16046	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the permission on the Hive default data warehouse is modified, the permission for users or user groups to create databases or tables in the default data warehouse is changed.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that default data warehouse permission is changed.

Procedure

Check the Hive default data warehouse permission.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Restore the directory permission based on the current cluster as a user with the **supergroup** permission.

- In security mode, run the following command: **hdfs dfs -chmod 770 hdfs://hacluster/user/hive/warehouse**
- In non-security mode, run the following command: **hdfs dfs -chmod 777 hdfs://hacluster/user/hive/warehouse**

Step 3 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 Collect related information in the **hdfs://hacluster/user/hive/warehouse** directory on the client background.

Step 5 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.115 ALM-16047 HiveServer Has Been Deregistered from ZooKeeper

Description

The system checks the Hive service every 60 seconds. This alarm is generated when Hive registration information on ZooKeeper is lost or Hive cannot connect to ZooKeeper.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16047	Major	Yes

Parameters

Parameter	Meaning
Cluster Name	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the Hive configuration cannot be read from ZooKeeper, HiveServer will be unavailable.

Possible Causes

- The network is disconnected.
- The ZooKeeper instance is abnormal.

Procedure

Restart related instances.

Step 1 Log in to FusionInsight Manager. On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms**, click the drop-down list in the row that contains the alarm. Then check the role name in **Location** and confirm the IP adress of the instance.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance**, select the instance corresponding to the IP address for which the alarm is generated, and choose **More** > **Restart Instance**.

Step 3 Wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If not, go to **Step 4**.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Hive** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.116 ALM-16048 Tez or Spark Library Path Does Not Exist

Description

The system checks the Tez and Spark library paths every 180 seconds. This alarm is generated when the Tez or Spark library path does not exist.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16048	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Hive on Tez and Hive on Spark functions are affected.

Possible Causes

The Tez or Spark library path is deleted from the HDFS.

Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **tezlib** or **sparklib** directory exists in the **hdfs://hacluster/user/{User name}/.Trash/Current/** director:

hdfs dfs -ls hdfs://hacluster/user/*<username>***/.Trash/Current/**

For example, the following information shows that **/user/hive/tezlib/8.1.0.1/** and **/user/hive/sparklib/8.1.0.1/** exist.

```
host01:/opt/Bigdata/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx------   - test hadoop          0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the following command to restore **tezlib** and **sparklib**.

hdfs dfs -mv hdfs://hacluster/user/*<username>***/.Trash/Current/user/hive/tezlib/8.1.0.1/tez.tar.gz /user/hive/tezlib/8.1.0.1/tez.tar.gz**

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.117 ALM-17003 Oozie Service Unavailable

Description

The system checks the Oozie service status in every 5 seconds. This alarm is generated when Oozie or a component on which Oozie depends cannot provide services properly.

This alarm is automatically cleared when the Oozie service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17003	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Oozie cannot be used to submit jobs.

Possible Causes

- The DBService service is abnormal or the data of Oozie stored in DBService is damaged.
- The HDFS service is abnormal or the data of Oozie stored in HDFS is damaged.
- The Yarn service is abnormal.
- The Nodeagent process is abnormal.

Procedure

Query the Oozie service health status code.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* >**Services** > **Oozie**. Click **oozie** (any one is OK) on the **oozie WebUI**. to go to the Oozie WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 2 Add **/servicehealth** to the URL in the address box of the browser and access again. The value of **statusCode** is the current Oozie service health status code.

For example, visit **https://10.10.0.117:20026/Oozie/oozie/130/oozie/servicehealth**. The result is as follows:

```
{"beans":[{"name":"serviceStatus","statusCode":0}]}
```

If the health status code cannot be displayed or the browser does not respond, the service may be unavailable due to Oozie process fault. See **Step 13** to rectify the fault.

Step 3 Perform the operations based on the error code. For details, see **Table 10-90**.

Table 10-90 Oozie service health status code

Status Code	Description	Error Cause	Solution
0	The service is running properly.	None	None
18002	The DBService service is abnormal.	Oozie fails to connect to DBService or the data stored in DBService is damaged.	See **Step 4**.

Status Code	Description	Error Cause	Solution
18003	The HDFS service is abnormal.	Oozie fails to connect to HDFS or the data stored in HDFS is damaged.	See **Step 7**.
18005	The MapReduce service is abnormal.	The Yarn service is abnormal.	See **Step 11**.

Check the DBService service.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the DBService service is running properly.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Resolve the problem of DBService based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 6 Log in to the Oozie database to check whether the data is complete.

1. Log in to the active DBService node as user **root**.

   On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService > Instance** to view the IP address of the active DBservice node.

2. Run the following command to log in to the Oozie database:

   su - omm

   source ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/FusionInsight-dbservice-2.7.0/.dbservice_profile

   gsql -U *Username* **-W** *Oozie database password* **-p 20051 -d** *Database name*

3. After the login is successful, enter **\d** to check whether there are 15 data tables.

   The Oozie service has 15 data tables by default. If these data tables are deleted or the table structure is modified, the Oozie service may be unavailable. Contact the O&M personnel to back up the data and perform restoration.

Check the HDFS service.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the HDFS service is running properly.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Resolve the problem of HDFS based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 9 Log in to HDFS to check whether the Oozie file directory structure is complete.

1. Download and install an HDFS client..
2. Log in to the client node as user **root** and run the following commands to check whether **/user/oozie/share** exists.

   If the cluster uses the security mode, perform security authentication.

   kinit admin

   hdfs dfs -ls /user/oozie/share

- If yes, go to **Step 18**.
- If no, go to **Step 10**.

Step 10 In the Oozie client installation directory, manually upload the share directory to **/user/oozie** in HDFS, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check the Yarn and MapReduce service.

Step 11 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the Yarn and MapReduce services are running properly.

- If yes, go to **Step 18**.
- If no, go to **Step 12**.

Step 12 Resolve the problem of Yarn and MapReduce based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check the Oozie process.

Step 13 Log in to each node of Oozie as user **root**.

Step 14 Run the **ps -ef | grep oozie** command to check whether the Oozie process exists.

- If yes, go to **Step 15**.
- If no, go to **Step 18**.

Step 15 Collect fault information in **prestartDetail.log**, **oozie.log**, and **catalina.out** in the Oozie log directory **/var/log/Bigdata/oozie**. If the alarm is not caused by manual misoperation, go to **Step 16**.

Check the Nodeagent process.

Step 16 Log in to each node of Oozie as user **root**. Run the **ps -ef | grep nodeagent** command to check whether the Nodeagent process exists.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 Run the **kill -9** *The process ID of nodeagent* command, wait 10 minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.118 ALM-17004 Oozie Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the Oozie service every 60 seconds. The alarm is generated when the heap memory usage of a Metadata instance exceeds the threshold (95% of the maximum memory). The alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The heap memory overflow may cause a service breakdown.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **Oozie Heap Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Oozie Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the used heap memory of Oozie reaches the threshold (the default value is 95% of the maximum heap memory) specified for Oozie.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations > All Configurations**. Set Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save** > **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.119 ALM-17005 Oozie Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non heap memory usage of Oozie every 30 seconds. This alarm is reported if the non heap memory usage of Oozie exceeds the threshold (80%). This alarm is cleared if the non heap memory usage is lower than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
17005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the Oozie instance is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **Oozie Non Heap Memory Usage Exceeds the Threshold**. On the displayed page, check the location information of the alarm. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Oozie Non Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the non-heap memory used by Oozie reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Configurations** and then **All Configurations**. On the displayed page, search for the **GC_OPTS** parameter in the search box and check whether it contains **-XX: MaxMetaspaceSize**. If yes, increase the value of **-XX: MaxMetaspaceSize** based on the site requirements. If no, manually add **-XX: MaxMetaspaceSize** and set its value to 1/8 of the value of **-Xmx**. Click **Save**, and then click **OK**

NOTE

JDK1.8 does not support the **MaxPermSize** parameter.

Suggestions on GC parameter settings for Oozie:

Set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Oozie** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.120 ALM-17006 Oozie Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Oozie service every 30 seconds. The alarm is generated when the direct memory usage of an Oozie instance exceeds the threshold (80% of the maximum memory). The alarm is cleared when the direct memory usage of Oozie is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The direct memory overflow may cause a service breakdown.

Possible Causes

The direct memory of the Oozie instance is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Oozie Direct Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Oozie Direct Buffer Resource Percentage**. Click **OK**.

Step 3 Check whether the used direct memory of Oozie reaches the threshold (the default value is 80% of the maximum direct memory) specified for Oozie.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations**. Click **All Configurations**. Search **GC_OPTS** in the search box. Increase the value of **-XX:MaxDirectMemorySize** as required, and click **Save**. Click **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set the value of **-XX:MaxDirectMemorySize** to 1/4 of the value of **-Xmx**. For example, if **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 2 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.121 ALM-17007 Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold

Description

The system checks GC time of the Oozie process every 60 seconds. The alarm is generated when GC time of the Oozie process exceeds the threshold (default value: **12 seconds**). The alarm is cleared when GC time is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Oozie responds slowly when it is used to submit tasks.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Procedure

Check GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of Oozie**. Click **OK**.

Step 3 Check whether GC time of the Oozie process every second exceeds the threshold (default value: **12 seconds**).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Configurations**. Click **All Configurations**. Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save**. Click **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.122 ALM-18000 Yarn Service Unavailable

Description

This alarm is generated when the Yarn service is unavailable. The alarm module checks the Yarn service status every 60 seconds.

The alarm is cleared when the Yarn service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceNam	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide Yarn services. Users cannot run new applications. Submitted applications cannot be run.

Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- There is no active ResourceManager instance in the Yarn cluster.
- All the NodeManagers in the Yarn cluster are abnormal.

Procedure

Check ZooKeeper service status.

Step 1 On the FusionInsight Manager, check whether the alarm list contains **ALM-13000 ZooKeeper Service Unavailable**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check the HDFS service status.

Step 3 On the FusionInsight Manager, check whether the alarm list contains the HDFS alarms.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M > Alarm > Alarms**, handle HDFS alarms based on the alarm help, and check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ResourceManager status in the Yarn cluster.

Step 5 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn**.

Step 6 In **Dashboard**, check whether there is an active ResourceManager instance in the Yarn cluster.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Check the NodeManager node status in the Yarn cluster.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance**.

Step 8 Query NodeManager **Running Status**, and check whether there are unhealthy nodes.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Rectify the fault by following the steps provided in **ALM-18002 NodeManager Heartbeat Lost** or **ALM-18003 NodeManager Unhealthy**. After the fault is rectified, check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager portal of the active cluster, choose **O&M** > **Log > Download**.

Step 11 Select **Yarn** in the required cluster from the **Service**.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.123 ALM-18002 NodeManager Heartbeat Lost

Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number with the threshold. The Number of Lost Nodes indicator has a default threshold. The alarm is generated when the value of Number of Lost Nodes exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.lost.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of lost nodes exceeds the threshold, and is cleared when the number of lost nodes is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Lost Host	Specifies the list of hosts with lost nodes.

Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- NodeManager is forcibly deleted without decommission.
- All the NodeManager instances are stopped or the NodeManager process is faulty.
- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

Procedure

Check the NodeManager status.

Step 1 On the FusionInsight Manager, and choose **O&M** > **Alarm > Alarms**. Click ⌄ before the alarm and obtain lost nodes in **Additional Information**.

Step 2 Check whether the lost nodes are hosts that have been manually deleted without decommission.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 After the setting, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**. Search for **yarn.nodemanager.lost.alarm.threshold** and change its value to the number of hosts that are not out of service and proactively deleted. After the setting, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 Manually clear the alarm. Note that decommission must be performed before deleting hosts.

Step 5 On the FusionInsight Manager portal, choose **Cluster > Hosts**, and check whether the nodes obtained in **Step 1** are healthy.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Rectify the node fault based on **ALM-12006 Node Fault** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the process status.

Step 7 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Instance**, and check whether there are NodeManager instances whose status is not **Good**.

- If yes, go to **Step 10**.
- If no, go to **Step 8**.

Step 8 Check whether the NodeManager instance is deleted.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Restart the active and standby ResourceManager instances, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check the instance status.

Step 10 Select NodeManager instances which running state is not **Normal** and restart them. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the network status.

Step 11 Log in to the management node, **ping** the IP address of the lost NodeManager node to check whether the network is disconnected or busy.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Rectify the network, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log > Download**.

Step 14 Select **Yarn** in the required cluster from the **Service**.

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

10.13.124 ALM-18003 NodeManager Unhealthy

Description

The system checks the number of unhealthy NodeManager nodes every 30 seconds, and compares the number with the threshold. The Unhealthy Nodes indicator has a default threshold. This alarm is generated when the value of the Unhealthy Nodes indicator exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.unhealthy.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of unhealthy nodes exceeds the threshold, and is cleared when the number of unhealthy nodes is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Unhealthy Host	Specifies the list of hosts with unhealthy nodes.

Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- The hard disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Procedure

Check the hard disk space of the host.

Step 1 On the FusionInsight Manager, and choose **O&M** > **Alarm > Alarms**. Click before the alarm and obtain unhealthy nodes in **Additional Information**.

Step 2 Choose **Cluster** > *Name of the desired cluster* **> Services > Yarn** > **Instance**, select the NodeManager instance corresponding to the host, choose **Instance Configurations > All Configurations** and view disks corresponding to **yarn.nodemanager.local-dirs** and **yarn.nodemanager.log-dirs**.

Step 3 Choose **O&M > Alarm > Alarms**. In the alarm list, check whether the related disk has the alarm **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the disk fault based on **ALM-12017 Insufficient Disk Capacit** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 5 Choose **Hosts** > *Name of the desired host* . On the **Dashboard** page, check the disk usage of the corresponding partition. Check whether the percentage of the used space of the mounted disk exceeds the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**

- If yes, go to **Step 6**.

- If no, go to **Step 7**.

Step 6 Reduce the disk usage to less than the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**, wait for 10 to 20 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the access permission of the local directory on each NodeManager node.

Step 7 Obtain the NodeManager directory viewed in **Step 2**, log in to each NodeManager node as user **root**, and go to the obtained directory.

Step 8 Run the **ll** command to check whether the permission of the **localdir** and **containerlogs** folders is **755** and whether **User:Group** is **omm:ficommon**.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Run the following command to set the permission to **755** and **User:Group** to **omm:ficommon**:

chmod 755 *<folder_name>*

chown omm:ficommon *<folder_name>*

Step 10 Wait for 10 to 20 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 12 Select **Yarn** in the required cluster from the **Service**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.125 ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold

Description

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to 95% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager** (Indicates the host name of the instance for which the alarm is generated)**.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **ResourceManager > Percentage of Used Memory of the ResourceManager**. Check the heap memory usage.

Step 3 Check whether the used heap memory of ResourceManager reaches 95% of the maximum heap memory specified for ResourceManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.126 ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Description

The system checks the heap memory usage of Mapreduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Mapreduce JobHistoryServer exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Mapreduce** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to 95% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Mapreduce JobHistoryServer is overhigh, the performance of Mapreduce log archiving is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Mapreduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Mapreduce** > **Instance** > **JobHistoryServer.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **JobHistoryServer heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the heap memory usage.

Step 3 Check whether the used heap memory of JobHistoryServer reaches 95% of the maximum heap memory specified for JobHistoryServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Mapreduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Click **OK** and restart the role instance.

NOTE

The mapping between the number of historical tasks (10000) and the memory of JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Mapreduce

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.127 ALM-18010 ResourceManager GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the ResourceManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the ResourceManager process may interrupt the services.

Possible Causes

The heap memory of the ResourceManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18010 ResourceManager GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of ResourceManager** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the ResourceManager process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Save the configuration and restart the ResourceManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ResourceManager** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.128 ALM-18011 NodeManager GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the NodeManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the NodeManager process may interrupt the services.

Possible Causes

The heap memory of the NodeManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18011 NodeManager GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of NodeManager** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the NodeManager process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the NodeManager instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **NodeManager** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

10.13.129 ALM-18012 JobHistoryServer GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the JobHistoryServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the JobHistoryServer process may interrupt the services.

Possible Causes

The heap memory of the JobHistoryServer instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18012 JobHistoryServer GC Time Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Garbage Collection (GC) Time of the JobHistoryServer** to check the GC duration statistics of the Broker process collected every minute.

Step 3 Check whether the GC duration of the JobHistoryServer process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System** to increase the value of **GC_OPTS** parameter as required.

NOTE

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the JobHistoryServer instance.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.130 ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a ResourceManager instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the ResourceManager instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Memory Usage Status of ResourceManager** to check the direct memory usage.

Step 3 Check whether the used direct memory of ResourceManager reaches 90% of the maximum direct memory specified for ResourceManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System** to increase the value of check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete **-XX:MaxDirectMemorySize**.

Step 6 Save the configuration and restart the ResourceManager instance.

Step 7 Check whether the **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **ResourceManager** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.131 ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a NodeManager instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18014	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the NodeManager instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm > Alarms** > **ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager** to check the direct memory usage.

Step 3 Check whether the used direct memory of NodeManager reaches 90% of the maximum direct memory specified for NodeManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations**> **NodeManager** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the NodeManager instance.

Step 7 Check whether the **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **NodeManager** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.132 ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the MapReduce service every 30 seconds. This alarm is generated when the direct memory usage of a JobHistoryServer instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the MapReduce service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistoryServer instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold** > **Location** to check the IP address of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer (IP address for which the alarm is generated).** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Memory Usage Status of JobHistoryServer** to check the direct memory usage.

Step 3 Check whether the used direct memory of JobHistoryServer reaches 90% of the maximum direct memory specified for JobHistoryServer by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the JobHistoryServer instance.

Step 7 Check whether the **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.133 ALM-18016 Non Heap Memory Usage of ResourceManager Exceeds the Threshold

Description

The system checks the Non Heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn ResourceManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18016	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn ResourceManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18016 Non Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Percentage of Used Memory of the ResourceManager**. ResourceManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of ResourceManager reaches 90% of the maximum Non Heap memory specified for ResourceManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Adjust the **GC_OPTS** memory parameter of ResourceManager. Save the configuration and restart the ResourceManager instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.134 ALM-18017 Non Heap Memory Usage of NodeManager Exceeds the Threshold

Description

The system checks the Non Heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn NodeManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn NodeManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18017 Non Heap Memory Usage of Yarn NodeManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager**. NodeManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of NodeManager reaches 90% of the maximum Non Heap memory specified for NodeManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Adjust the **GC_OPTS** memory parameter of NodeManager, click **Save**, and click **OK,** and restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.135 ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn NodeManager exceeds the threshold (95% of the maximum memory by default).

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18018	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn NodeManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager** to check the heap memory usage.

Step 3 Check whether the used heap memory of NodeManager reaches 95% of the maximum heap memory specified for NodeManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**, and click **OK**, and restart the role instance.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.136 ALM-18019 Non Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Description

The system checks the Non Heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of MapReduce JobHistoryServer exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **MapReduce** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18019	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce task submission and operation is affected. In addition, a memory overflow may occur so that the MapReduce service is unavailable.

Possible Causes

The Non Heap memory of the MapReduce JobHistoryServer instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18019 Non Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **JobHistoryServer Non Heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of JobHistoryServer reaches 90% of the maximum Non Heap memory specified for JobHistoryServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Adjust the **GC_OPTS** memory parameter of the NodeManager, click **Save**, and click **OK,** and restart the role instance.

NOTE

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- MapReduce

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.137 ALM-18020 Yarn Task Execution Timeout

Description

The system checks MapReduce and Spark tasks (except for permanent JDBC tasks) submitted to Yarn every 15 minutes. This alarm is generated when the task execution time exceeds the timeout duration specified by the user. However, the task can be properly executed. The client timeout parameter of MapReduce is mapreduce.application.timeout.alarm and that of Spark is spark.application.timeout.alarm. The unit is ms.

This alarm is cleared when the task is finished or terminated.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18020	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
ApplicationName	Specifies the object (application ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The alarm persists after task execution times out. However, the task can still be properly executed, so this alarm does not exert any impact on the system.

Possible Causes

- The specified timeout duration is shorter than the required execution time.
- The queue resources for task running are insufficient.
- Task data skew occurs. As a result, some tasks process a large amount of data and take a long time to execute.

Procedure

Check whether the timeout interval is correctly set.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. The **Alarms** page is displayed.

Step 2 Select the alarm whose ID is **18020**. In the alarm details, view **Location** to obtain the timeout task name and timeout duration.

Step 3 Based on the task name and timeout interval, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to log in to the native Yarn page. Then find the task on the native page, check its **StartTime** and calculate the task execution time based on the current system time. Check whether the task execution time exceeds the timeout duration.

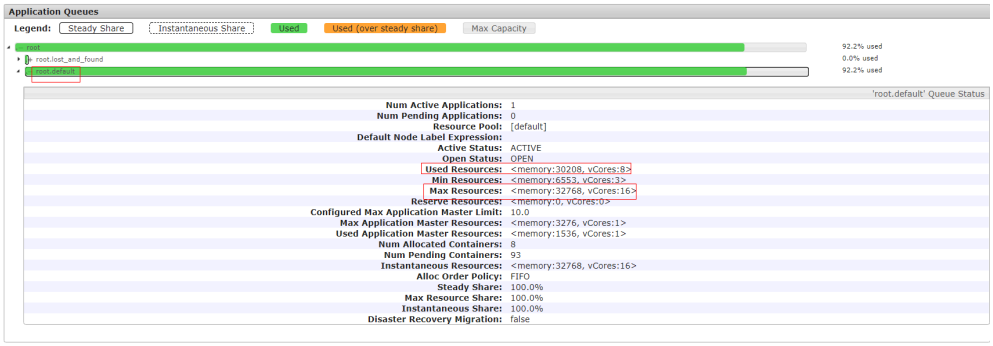
- If yes, go to **Step 5**.
- If no, go to **Step 10**.

Step 4 Evaluate the expected task execution time based on the service and compare it with the task timeout interval. If the timeout interval is too short, set the timeout interval (**mapreduce.application.timeout.alarm** or **spark.application.timeout.alarm**) of the client to the task expected execution time. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the queue resources are sufficient.

Step 5 Find the task on the native page and view the queue name of the task. Click **Scheduler** on the left of the native page. On the **Applications Queues** page, find the corresponding queue name and expand the queue details, as shown in the following figure.

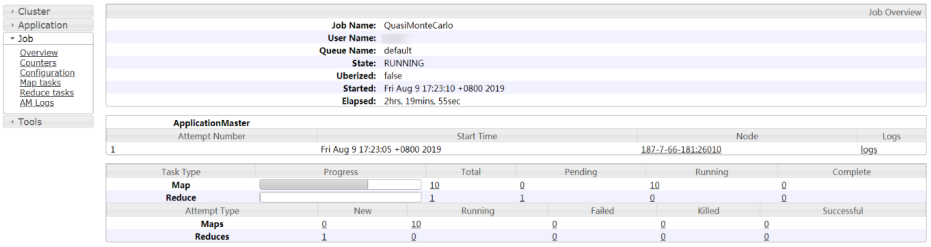


Step 6 Check whether the value of **Used Resources** in the queue details is approximately equal to the value of **Max Resources**, which indicates that the resources in the queue submitted by the task have been used up. If the queue resources are insufficient, choose **Tenant Resources** > **Dynamic Resource Plan** > **Resource Distribution Policy** on FusionInsight Manager and increase the value of **Max Resources** for the queue. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whethercoccurs.

Step 7 On the native Yarn page, click *task ID* (for example, **application_1565337919723_0002**) > **Tracking URL:ApplicationMaster** > **job_1565337919723_0002**. The following page is displayed.



Step 8 Choose **Job** > **Map tasks** or **Job** > **Reduce tasks** on the left and check whether the execution time of each Map or Reduce task differs greatly. If yes, task data skew occurs. In this case, you need to balance the task data.

Step 9 Rectify the fault based on the preceding causes and perform the tasks again. Then, check whether the alarm persists.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.138 ALM-18021 Mapreduce Service Unavailable

Description

The alarm module checks the MapReduce service status every 60 seconds. This alarm is generated when the system detects that the MapReduce service is unavailable.

The alarm is cleared when the MapReduce service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18021	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the MapReduce service. For example, MapReduce cannot be used to view task logs or the log archive function is unavailable.

Possible Causes

- The JobHistoryServer instance is abnormal.
- The KrbServer service is abnormal.
- The ZooKeeper service abnormal.
- The HDFS service abnormal.
- The Yarn service is abnormal.

Procedure

Check MapReduce service JobHistoryServer instance status.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** > **Instance**.

Step 2 Check whether the running status of JobHistoryServer is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Check the KrbServer service status.

Step 3 In the alarm list on FusionInsight Manager, check whether **ALM-25500 KrbServer Service Unavailable** exists.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ZooKeeper service.

Step 5 In the alarm list on FusionInsight Manager, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the HDFS service status.

Step 7 In the alarm list on FusionInsight Manager, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the Yarn service status.

Step 9 In the alarm list on FusionInsight Manager, check whether **ALM-18000 Yarn Service Unavailable** exists.

- If yes, go to **Step 10**
- If no, go to **Step 11**.

Step 10 Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download.**

Step 12 Select **MapReduce** in the required cluster from the **Service.**

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.139 ALM-18022 Insufficient Yarn Queue Resources

Description

The alarm module checks Yarn queue resources every 60 seconds. This alarm is generated when available resources or ApplicationMaster (AM) resources of a queue are insufficient.

This alarm is cleared when available resources are sufficient.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18022	Minor	Yes

Parameters

Parameter Name	Description
Source	Specifies the cluster for which the alarm is generated.
QueueName	Specifies the queue for which the alarm is generated.
QueueMetric	Specifies the metric of the queue for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- An application being executed takes longer time.
- An application fails to be executed for a long time after being submitted.

Possible Causes

- NodeManager node resources are insufficient.
- The configured maximum resource capacity of the queue is excessively small.
- The configured maximum AM resource percentage is excessively small.

Procedure

View alarm details.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm > Alarms**.

Step 2 View location information of this alarm and check whether **QueueName** is **root** and **QueueMetric** is **Memory** or **QueueName** is **root** and **QueueMetric** is **vCores**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 The memory or CPU of the Yarn cluster is insufficient. In this case, log in to the node where NodeManager resides and run the **free -g** and **cat /proc/cpuinfo** commands to query the available memory and available CPU of the node, respectively. On FusionInsight Manager, increase the values of **yarn.nodemanager.resource.memory-mb** and **yarn.nodemanager.resource.cpu-vcores** for the Yarn NodeManager based on the query results. Then, restart the NodeManager instance. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 4 If **QueueName** is **<*Tenant Queue*>** and **QueueMetric** is **Memory**, or **QueueName** is **<*Tenant Queue*>** and **QueueMetric** is **vCores** in **Location**, check whether **available Memory =** or **available vCores =** are included in **Additional Information**.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 The memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources** > **Dynamic Resource Plan > Resource Distribution Policy** and increase the value of **Maximum Capacity**. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available Memory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available Memory =** in **Additional Information**.

If **Additional Information** contains **available vCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available vCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 7 If **available AmMemory =** or **available AmvCores =** is included in **Additional Information**, ApplicationMaster memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources** > **Dynamic Resource Plan** > **Queue Configuration** and increase the value of **Maximum Am Resource Percent**. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available AmMemory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available AmMemory =** in **Additional Information**.

If **Additional Information** contains **available AmvCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available AmvCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 Log in to FusionInsight Manager of the active cluster, and choose **O&M** > **Log** > **Download**.

Step 10 Select **Yarn** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.140 ALM-18023 Number of Pending Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of pending applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 60.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18023	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
QueueName	Identifies the queue for which the alarm is generated.
QueueMetric	Identifies the queue indicator for which the alarm is generated.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Applications** > **Pending Applications**, and increase the thresholds as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.141 ALM-18024 Pending Yarn Memory Usage Exceeds the Threshold

Description

The alarm module checks the pending memory of Yarn every 60 seconds. The alarm is generated when the pending memory exceeds the threshold. Pending memory indicates the total memory that is not allocated to submitted Yarn applications.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18024	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
QueueName	Identifies the queue for which the alarm is generated.
QueueMetric	Identifies the queue indicator for which the alarm is generated.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **CPU and Memory** > **Pending Memory**, and increase the threshold as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

10.13.142 ALM-18025 Number of Terminated Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of terminated applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18025	Major	Yes

Parameters

Name	Meaning
Cluster Name	Specifies the cluster for which the alarm is generated.
Service Name	Specifies the service for which the alarm is generated.
Role Name	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A large number of application tasks are forcibly terminated.

Possible Causes

- The user forcibly terminates a large number of tasks.
- The system terminates tasks due to some error.

Procedure

Check the alarm details.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.

Step 2 View **Additional Information** in the alarm details to check whether the alarm threshold is too small.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Other** > **Terminated Applications of root queue** to modify the threshold. Go to **Step 6**.

Step 4 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager(Active)** to access the ResourceManager web UI.

Step 5 Click **KILLED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task termination details (for example, the task is terminated by a user).

Step 6 Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 8 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.143 ALM-18026 Number of Failed Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of failed applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18026	Major	Yes

Parameters

Name	Meaning
Cluster Name	Specifies the cluster for which the alarm is generated.
Service Name	Specifies the service for which the alarm is generated.
Role Name	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- A large number of application tasks fail to be executed.
- Failed tasks need to be submitted again.

Possible Causes

The task fails to be executed due to some error.

Procedure

Check the alarm details.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.

Step 2 View **Additional Information** in the alarm details to check whether the alarm threshold is too small.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Other** > **Failed Applications of root queue** to modify the threshold. Go to **Step 6**.

Step 4 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager(Active)** to access the ResourceManager web UI.

Step 5 Click **FAILED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task failure causes.

Step 6 Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager, choose O&M > Log > Download.

Step 8 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.144 ALM-19000 HBase Service Unavailable

Description

This alarm is generated when the HBase service is unavailable. The alarm module checks the HBase service status every 120 seconds.

This alarm is cleared when the HBase service recovers.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, ServiceName=HBase1 is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Operations, such as reading or writing data and creating tables, cannot be performed.

Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The HBase service is abnormal.
- The network is abnormal.

Procedure

Check the ZooKeeper service status.

Step 1 On the FusionInsight Manager, check whether the running status of ZooKeeper is **Normal** on service list.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait several minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the HDFS service status.

Step 5 In the alarm list, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**.

Step 7 Wait several minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Check whether **Safe Mode** is **ON**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

Step 9 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication. Obtain the password of user hdfs from the administrator, run the **kinit hdfs** command and enter the password as prompted.

Step 10 Run the following command to manually exit the safe mode:

hdfs dfsadmin -safemode leave

Step 11 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service status.

Step 12 On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services** > **HBase**.

Step 13 Check whether there is one active HMaster and one standby HMaster.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

Step 14 Click **Instances**, select the HMaster whose status is not **Active**, click **More**, and select **Restart Instance** to restart the HMaster. Check whether there is one active HMaster and one standby HMaster again.

- If yes, go to **Step 15**.
- If no, go to **Step 21**.

Step 15 Choose **Cluster** >*Name of the desired cluster* > **Services** > **HBase** > **HMaster(Active)** to go to the HMaster WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

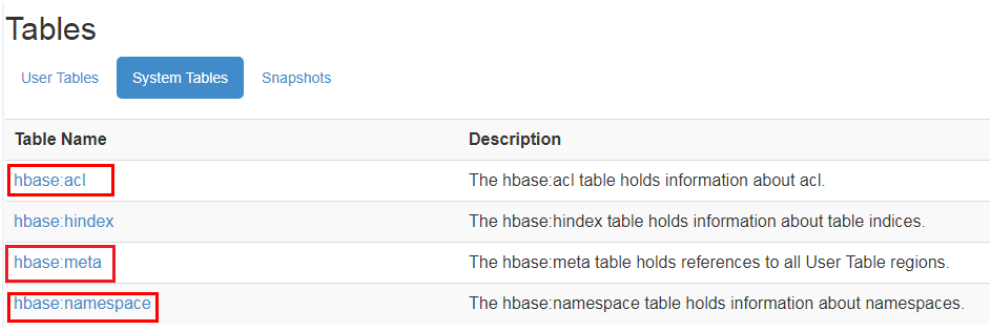
Step 16 Check whether at least one RegionServer exists under **Region Servers**.

- If yes, go to **Step 17**.
- If no, go to **Step 21**.

Step 17 Check **Tables** > **System Tables**, as shown in **Figure 10-34**. Check whether **hbase:meta**, **hbase:namespace**, and **hbase:acl** exist in the **Table Name** column.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Figure 10-34 HBase system table



Step 18 As shown in **Figure 10-34**, click the **hbase:meta**, **hbase:namespace**, and **hbase:acl** hyperlinks and check whether the pages are properly displayed. If the pages are properly displayed, the tables are normal.

If they are, go to **Step 19**.

If they are not, go to **Step 23**.

NOTE

In normal mode, **ACL** is enabled for HBase by default. The **hbase:acl** table is generated only when **ACL** is manually enabled. In this case, check this table. In other scenarios, this table does not need to be checked.

Step 19 View the HMaster startup status.

In **Figure 10-35**, if the **RUNNING** state exists in **Tasks**, HMaster is being started. In the **State** column, you can view the time when HMaster is in the **RUNNING** state. In **Figure 10-36**, if the state is **COMPLETE**, HMaster is started.

Check whether HMaster is in the **RUNNING** state for a long time.

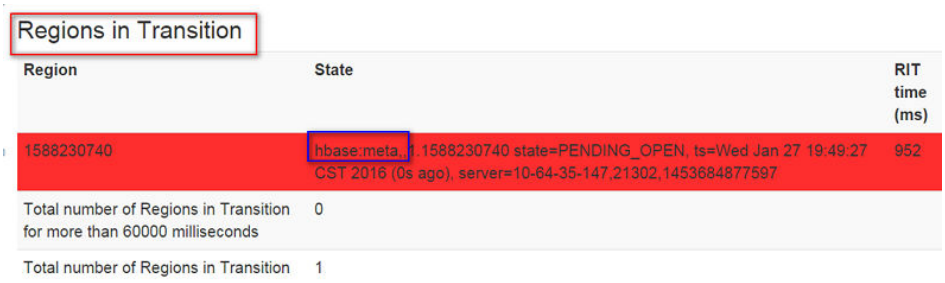
Figure 10-35 HMaster is being started

Figure 10-36 HMaster is started

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 On the HMaster WebUI, check whether any hbase:meta is in the **Region in Transition** state for a long time.

Figure 10-37 Region in Transition



- If yes, go to **Step 21**.
- If no, go to **Step 22**.

Step 21 In the precondition that services are not affected, log in to the FusionInsight Manager portal and choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **More** > **Restart Service**. Enter the administrator password and click **OK**.

- If yes, go to **Step 22**.
- If no, go to **Step 23**.

Step 22 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Check the network connection between HMaster and dependent components.

Step 23 On the FusionInsight Manager, choose **Cluster** >*Name of the desired cluster* > **Services** > **HBase**.

Step 24 Click **Instance** and the HMaster instance list is displayed. Record the **management IP Address** in the row of **HMaster(Active)**.

Step 25 Use the IP address obtained in **Step 24** to log in to the host where the active HMaster runs as user **omm** .

Step 26 Run the **ping** command to check whether communication between the host that runs the active HMaster and the hosts that run the dependent components. (The dependent components include ZooKeeper, HDFS and Yarn. Obtain the IP addresses of the hosts that run these services in the same way as that for obtaining the IP address of the active HMaster.)

- If yes, go to **Step 29**.
- If no, go to **Step 27**.

Step 27 Contact the administrator to restore the network.

Step 28 In the alarm list, check whether **HBase Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 29**.

Collect fault information.

Step 29 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 30 Select the following nodes in the required cluster from the **Service** drop-down list:

- ZooKeeper
- HDFS
- HBase

Step 31 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 32 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.145 ALM-19006 HBase Replication Sync Failed

Description

The alarm module checks the HBase DR data synchronization status every 30 seconds. When disaster recovery (DR) data fails to be synchronized to a standby cluster, the alarm is triggered.

When DR data synchronization succeeds, the alarm is cleared.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19006	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

HBase data in a cluster fails to be synchronized to the standby cluster, causing data inconsistency between active and standby clusters.

Possible Causes

- The HBase service on the standby cluster is abnormal.
- A network exception occurs.

Procedure

Observe whether the system automatically clears the alarm.

Step 1 On the FusionInsight Manager portal of the active cluster, click **O&M** > **Alarm** > **Alarms.**

Step 2 In the alarm list, click the alarm to obtain alarm generation time from **Generated** of the alarm. Check whether the alarm has existed for five minutes.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Wait five minutes and check whether the system automatically clears the alarm.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the HBase service status of the standby cluster.

Step 4 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M** > **Alarm** > **Alarms.**

Step 5 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 6 Access the node where the HBase client of the active cluster resides as user **omm**.

If the cluster uses a security mode, perform security authentication first and then access the **hbase shell** interface as user **hbase**.

cd /opt/Bigdata/client

source ./bigdata_env

kinit *hbaseuser*

Step 7 Run the **status 'replication', 'source'** command to check the DR synchronization status of the faulty node.

The DR synchronization status of a node is as follows.

```

FailedReplicationAttempts=0
SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788,
TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788,
FailedReplicationAttempts=5
```

Step 8 Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

In the preceding step, data on the faulty node 10-10-10-153 fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

Step 9 Run the **list_peers** command to find the cluster and the HBase instance corresponding to the **PeerID** value.

```
PEER_ID CLUSTER_KEY STATE TABLE_CFS
abc1 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase2 ENABLED
abc 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase ENABLED
```

In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

Step 10 In the service list of FusionInsight Manager of the standby cluster, check whether the running status of the HBase instance obtained by using **Step 9** is **Normal**.

- If yes, go to **Step 14**.
- If no, go to **Step 11**.

Step 11 In the alarm list, check whether the **ALM-19000 HBase Service Unavailable** alarm is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Follow troubleshooting procedures in **ALM-19000 HBase Service Unavailable** to rectify the fault.

Step 13 Wait for a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check network connections between RegionServers on active and standby clusters.

Step 14 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M** > **Alarm** > **Alarms.**

Step 15 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 16 Use the IP address obtained in **Step 15** to log in to a faulty RegionServer node as user **omm**.

Step 17 Run the **ping** command to check whether network connections between the faulty RegionServer node and the host where RegionServer of the standby cluster resides are in the normal state.

- If yes, go to **Step 20**.
- If no, go to **Step 18**.

Step 18 Contact the network administrator to restore the network.

Step 19 After the network is running properly, check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 20**.

Collect fault information.

Step 20 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 21 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 22 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.146 ALM-19007 HBase GC Time Exceeds the Threshold

Description

The system checks the old generation garbage collection (GC) time of the HBase service every 60 seconds. This alarm is generated when the detected old generation GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks by default). To change the threshold, on the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase > GC > GC time for old generation**. This alarm is cleared when the old generation GC time of the HBase service is shorter than or equal to the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

If the old generation GC time exceeds the threshold, HBase data read and write are affected.

Possible Causes

The memory of HBase instances is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in HBase. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19007**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of HMaster** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of RegionServer** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Check the current JVM configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. In Search, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of role HMaster(HBase->HMaster), RegionServer(HBase->RegionServer). Adjust the values of **-Xmx** and **-XX:CMSInitiatingOccupancyFraction** of the GC_OPTS parameter by referring to the Note.

NOTE

1. Suggestions on GC parameter configurations for HMaster
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
   - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set -Xmx to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to one eighth of **-Xmx**.
   - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
   - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.
   - **XX:CMSInitiatingOccupancyFraction** to be less than and equal to **85**, and it is calculated as follows: 100 x (hfile.block.cache.size + hbase.regionserver.global.memstore.size)

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 7 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

10.13.147 ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold

Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the heap memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

If the available HBase heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the HBase service is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19008**. Then check the role name in **Location** and confirm the IP adress of the instance.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** by referring to the Note.

NOTE

1. Suggestions on GC parameter configurations for HMaster
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
   - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set -Xmx to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to one eighth of **-Xmx**.
   - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
   - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **HBase** in the required cluster from the **Service** drop-down list.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.148 ALM-19009 Direct Memory Usage of the HBase Process Exceeds the Threshold

Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the direct memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

If the available HBase direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the HBase service is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and check whether **XX:MaxDirectMemorySize** exists in **GC_OPTS**.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Nameof the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and delete **XX:MaxDirectMemorySize** from **GC_OPTS**.

Step 6 Check whether the **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold** alarm is generated.

If yes, handle the alarm by referring to **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold**.

If no, go to **Step 8**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** in the required cluster drop-down list box, select **HBase**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.149 ALM-19011 RegionServer Region Number Exceeds the Threshold

Description

The system checks the number of regions on each RegionServer in each HBase service instance every 30 seconds. The region number is displayed on the HBase service monitoring page and RegionServer role monitoring page. This alarm is generated when the number of regions on a RegionServer exceeds the threshold (default value: 2000) for 20 consecutive times. The threshold can be changed by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase**. This alarm is cleared when the number of regions is less than or equal to the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The data read/write performance of HBase is affected when the number of regions on a RegionServer exceeds the threshold.

Possible Causes

- The RegionServer region distribution is unbalanced.
- The HBase cluster scale is too small.

Procedure

View alarm location information.

Step 1 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms**, select this alarm, and view the service instance and host name in **Location**.

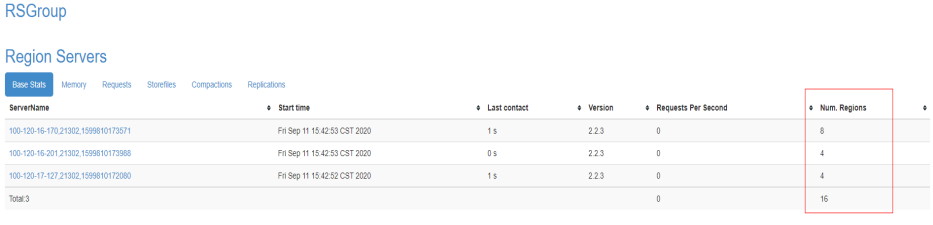
Step 2 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, check whether the region distribution on the RegionServer is balanced.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- If yes, go to **Step 9**.
- If no, go to **Step 3**.

Figure 10-38 WebUI of HBase instance



Enable load balancing.

Step 3 Log in to the node where the HBase client is located as user **root**. Go to the client installation directory, and set environment variables.

cd *client installation directory*

source bigdata_env

If the cluster adopts the security mode, perform security authentication. Specifically, run the **kinit hbase** command and enter the password as prompted (obtain the password from the administrator).

Step 4 Run the following commands to go to the HBase shell command window and check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 On the HBase shell command window, run the following commands to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 6 On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 7 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 8**.
- If no, go to **Step 21**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Delete unwanted HBase tables.

NOTE

Exercise caution when deleting data to ensure data is deleted correctly.

Step 9 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, view tables stored in the HBase service instance and record unwanted tables that can be deleted.

Step 10 On the HBase shell command window, run the **disable** command and **drop** command to delete the table to decrease the number of regions.

disable '*name of the table to be deleted***'**

drop '*name of the table to be deleted***'**

Step 11 On the HBase shell command window, run the following command to check whether the load balancing function is enabled.

balancer_enabled

- If yes, go to **Step 13**.
- If no, go to **Step 12**.

Step 12 On the HBase shell command window, run the following commands to enable the load balancing function and confirm that the function is enabled.

balance_switch true

balancer_enabled

Step 13 On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

Step 14 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 15**.
- If no, go to **Step 21**.

Step 15 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Adjust the threshold.

Step 16 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase** > **Regions(RegionServer)**, select the applied rule, and click **Modify** to check whether the threshold is proper.

- If it is excessively small, increase the threshold as required and go to **Step 17**.
- If it is proper, go to **Step 18**.

Step 17 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Perform system capacity expansion.

Step 18 Add nodes to the HBase cluster and add RegionServer instances to the nodes. Then enable and manually trigger the load balancing function.

Step 19 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 21**.

Collect fault information.

Step 21 On the FusionInsight Manager home page of the active and standby clusters, choose **O&M**> **Log** > **Download**.

Step 22 Select **HBase** in the required cluster from the **Service**.

Step 23 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 24 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.150 ALM-19012 HBase System Table Directory or File Lost

Description

The system checks whether HBase directories and files exist on the HDFS every 120 seconds. This alarm is generated when the system detects that the files or directories do not exist. This alarm is cleared when the files or directories are restored.

The HBase directories and files are as follows:

- Directory of the namespace **hbase** on the HDFS
- **hbase.version** file
- Directory of the table **hbase:meta** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:namespace** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:hindex** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the **hbase:acl** table on the HDFS, .tableinfo, and .regioninfo file (This table does not exist in the common mode cluster by default.)

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19012	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The HBase service fails to restart or start.

Possible Causes

Files or directories on the HDFS are missing.

Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Click this alarm and check whether **Alarm Cause** indicates unknown errors.

- If yes, go to **Step 4**.
- If no, go to **Step 2**

Step 2 On the FusionInsight Manager home page, choose **O&M** > **Backup and Restoration** > **Backup Management**. Check whether there are success records of the backup task named **default** or other HBase metadata backup tasks that have been successfully executed.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Use the latest backup metadata to restore the metadata of the HBase service.

Collect fault information.

Step 4 On the FusionInsight Manager page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 5 In the **Service** area, select faulty HBase services in the required cluster.

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

10.13.151 ALM-19013 Duration of Regions in transaction State Exceeds the Threshold

Description

The system checks the number of regions in transaction state on HBase every 300 seconds. This alarm is generated when the system detects that the duration of regions in transaction state exceeds the threshold for two consecutive times. This alarm is cleared when all timeout regions are restored.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase service instances are installed, you need to determine the HBase service instance where the alarm is generated based on the value of **ServiceName** in **Location**. For example, if the HBase1 service is unavailable, **ServiceName=HBase1** is displayed in **Location**, and the operation object in the procedure needs to be changed from HBase to HBase1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Some data in the table gets lost or becomes unavailable.

Possible Causes

- Compaction is permanently blocked.
- The HDFS files are abnormal.

Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select this alarm, and view the **HostName** and **RoleName** in **Location**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services > HBase**, Click the drop-down menu in the chartarea and choose **Customize > Service** >

Region in transaction count to view **Region in transaction count over threshold**. Check whether the monitoring item detects a value in three consecutive detection periods. (The default threshold is 60 seconds.)

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **HMaster (Active)** > **Tables** to check whether the regions of only one table transaction status time out.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Log in to the client as user **root**. Run the following command:

cd *client installation directory*

source bigdata_env

If the cluster is in security mode, run the **kinit hbase** command

Log in to the HMaster WebUI, choose **Procedure & Locks** in the navigation tree, and check whether any process ID is in the **Waiting** state in **Procedures**. If yes, run the following command to release the procedure lock:

hbase hbck -j *client installation directory*/**HBase/hbase/tools/hbase-hbck2-*.jar bypass -o** *pid*

Check whether the state is in the **Bypass** state. If the procedure on the UI is always in **RUNNABLE(Bypass)** state, perform an active/standby switchover. Run the **assigns** command to bring the region online again.

hbase hbck -j *client installation directory*/**HBase/hbase/tools/hbase-hbck2-*.jar assigns -o** *regionName*

Step 6 Repeat **Step 4**. Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On the FusionInsight Manager page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service** area, select faulty HBase services in the required cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

10.13.152 ALM-19014 Capacity Quota Usage on ZooKeeper Exceeds the Threshold Severely

Description

The system checks the ZNode usage of HBase every 120 seconds. This alarm is generated when the ZNode capacity usage of HBase exceeds the "Critical" alarm threshold (90% by default).

This alarm is cleared when the capacity usage of ZNode is less than the "Critical" alarm threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the HBase service for which the alarm is generated based on the value of **ServiceName** in **Location** of the alarm. For example, if **ServiceName** is **HBase-1** in **Location**, the operation object in the handling procedure should be changed from HBase to HBase-1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19014	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Threshold	Specifies the threshold for which the alarm is generated.

Impact on the System

This alarm indicates that the capacity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Procedure

Check the capacity configuration and usage of ZNode.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Select the alarm whose **Alarm ID** is "19014", and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to access the client installation directory:

cd *client installation directory*

Run the following command to set environment variables:

source bigdata_env

If the cluster uses the security version, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to view the ZNode capacity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the capacity configuration of the root ZNode of the HBase service.

```
[zk: 189-185-229-159:24002,189-185-229-114:24002,189-185-229-251:24002(CONNECTED) 145] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=42,bytes=1601
```

Step 4 Run the **getusage /hbase/splitWAL** command to check the capacity usage of the ZNode. Check whether the ratio of "Data size" in the command output to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose **Alarm ID** is "12007", "19000", or "19013" and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**

Step 6 Run the **getusage /hbase/replication** command to check the capacity usage of the ZNode. Check whether the ratio of "Data size" in the command output to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 7**.

- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose **Alarm ID** is "19006" and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**
- If no, go to **Step 9**.

Step 8 Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager page, choose **O&M** > **Log** > **Download**.

Step 10 In **Service**, select **HBase** of the cluster to be operated.

Step 11 Click  in the upper right corner to set **Start Date** and **End Date** to 10 minutes before and after the time when the alarm is generated, and click **Download**.

Step 12 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.153 ALM-19015 Quantity Quota Usage on ZooKeeper Exceeds the Threshold

Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the quantity of ZNodes used of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the quantity usage of ZNodes is less than the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the HBase service for which the alarm is generated based on the value of **ServiceName** in **Location** of the alarm. For example, if **Service name** is **HBase-1** in **Location**, change the operation object in the handling procedure from HBase to HBase-1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Threshold	Specifies the threshold for which the alarm is generated.

Impact on the System

This alarm indicates that the quantity of ZNodes used in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to "Critical", affecting data writing.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Procedure

Check the quantity quota and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Select the alarm whose ID is "19015", and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to access the client installation directory:

cd *client installation directory*

Run the following command to set environment variables:

source bigdata_env

If the cluster uses the security version, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to view the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity quota of the root ZNode of the HBase service.

```
[zk: 189-185-229-159:24002,189-185-229-114:24002,189-185-229-251:24002(CONNECTED) 7] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=59,bytes=1902
```

Step 4 Run the **getusage /hbase/splitWAL** command to check the quantity usage of the ZNode. Check whether the ratio of "Node count" in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is "12007", "19000", or "19013" and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the usage of the ZNodes. Check whether the ratio of "Node count" in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose Alarm ID is "19006" and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 7**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 In the **Service** area, select **HBase** of the cluster to be operated.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.154 ALM-19016 Quantity Quota Usage on ZooKeeper Exceeds the Threshold Severely

Alarm description

The system checks the ZNode usage of HBase every 120 seconds. This alarm is generated when the ZNode quantity usage of HBase exceeds the "Critical" alarm threshold (90% by default).

This alarm is cleared when the quantity usage of the ZNode is less than the "Critical" alarm threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the HBase service for which the alarm is generated based on the value of **ServiceName** in **Location** of the alarm. For example, if **Service name** is **HBase-1** in **Location**, change the operation object in the handling procedure from HBase to HBase-1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19016	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Threshold	Specifies the threshold for which the alarm is generated.

Impact on the System

This alarm indicates that the quantity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Procedure

Check the quantity quota and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Select the alarm whose ID is "19016", and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to access the client installation directory:

cd *client installation directory*

Run the following command to set environment variables:

source bigdata_env

If the cluster uses the security version, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to view the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity configuration of the root ZNode of the HBase service.

```
[zk: 189-185-229-159:24002,189-185-229-114:24002,189-185-229-251:24002(CONNECTED) 7] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=59,bytes=1902
```

Step 4 Run the **getusage /hbase/splitWAL** command to check the quantity usage of the ZNode. Check whether the ratio of "Node count" in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is "12007", "19000", or "19013" and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the usage of the ZNodes. Check whether the ratio of "Node count" in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose Alarm ID is "19006" and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 In the **Service** area, select **HBase** of the cluster to be operated.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.155 ALM-19017 Capacity Quota Usage on ZooKeeper Exceeds the Threshold

Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the ZNodes capacity usage of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the capacity usage of the ZNode capacity is less than the threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the HBase service for which the alarm is generated based on the value of **ServiceName** in **Location** of the alarm. For example, if **Service name** is **HBase-1** in **Location**, change the operation object in the handling procedure from HBase to HBase-1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Threshold	Specifies the threshold for which the alarm is generated.

Impact on the System

This alarm indicates that the ZNodes capacity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to "Critical", affecting data writing.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Procedure

Check the capacity configuration and usage of ZNode.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Select the alarm whose ID is "19017", and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to access the client installation directory:

cd *client installation directory*

Run the following command to set environment variables:

source bigdata_env

If the cluster uses the security version, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to view the ZNode capacity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the capacity configuration of the root ZNode of the HBase service.

```
[zk: 189-185-229-159:24002,189-185-229-114:24002,189-185-229-251:24002(CONNECTED) 145] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=42,bytes=1601
```

Step 4 Run the **getusage /hbase/splitWAL** command to check the capacity usage of the ZNode. Check whether the ratio of "Data size" to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On the FusionInsight Manager, check whether the alarm whose ID is "12007", "19000", or "19013" and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 7**.

Step 6 Run the **getusage /hbase/replication** command to check the capacity usage of the ZNode. Check whether the ratio of "Data size" to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 7**.

- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose Alarm ID is "19006" and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 In the **Service** area, select **HBase** of the cluster to be operated.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.156 ALM-19018 HBase Compaction Queue Exceeds the Threshold

Description

The system checks the compaction queue length of the HBase service every 300 seconds. This alarm is generated when the system detects that the compaction queue length of the HBase service exceeds the alarm threshold (100 by default). This alarm is cleared when the compaction queue length is less than the alarm threshold.

NOTE

If the multi-instance function is enabled in the cluster and multiple HBase services are installed, determine the HBase service for which the alarm is generated based on the value of **ServiceName** in **Location** of the alarm. For example, if **Service name** is **HBase-1** in **Location**, change the operation object in the handling procedure from HBase to HBase-1.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19018	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The compaction queue length of the HBase service exceeds the threshold. If this alarm is not handled in a timely manner, the cluster performance may deteriorate, affecting data read and write.

Possible Causes

- The number of HBase RegionServers is too small.
- There are too many regions on a single RegionServer of HBase.
- The HBase RegionServer heap size is small.
- Resources are insufficient.
- The related parameters are set improperly.

Procedure

Check whether the related configuration is correct.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether alarms "19011" exist.

- If yes, click **View Help** on the right of the alarm and rectify the fault by referring to the help document. Then, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations** > **All Configurations**. Search for **hbase.hstore.compaction.min**, **hbase.hstore.compaction.max**, **hbase.hstore.compactionThreshold**,

hbase.regionserver.thread.compaction.small, and **hbase.regionserver.thread.compaction.throttle**, and increase their values.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 In the **Service** area, select **HBase** of the cluster to be operated.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

10.13.157 ALM-19019 Number of HBase HFiles to Be Synchronized Exceeds the Threshold

Description

The system checks the number of HFiles to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of HFiles to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **HBase** . This alarm is cleared when the number of HFiles to be synchronized is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19019	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the number of HFiles to be synchronized by a RegionServer exceeds the threshold, the number of ZNodes used by HBase exceeds the threshold, affecting the HBase service status.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19019**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to restore the network.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform **Step 6** to **Step 10** to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to **Step 14**.

- If no, go to **Step 15**.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect the fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.158 ALM-19020 Number of HBase WAL Files to Be Synchronized Exceeds the Threshold

Description

The system checks the number of WAL files to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of WAL files to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **HBase** . This alarm is cleared when the number of WAL files to be synchronized is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19020	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the number of WAL files to be synchronized by a RegionServer exceeds the threshold, the number of ZNodes used by HBase exceeds the threshold, affecting the HBase service status.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19020**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to restore the network.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform **Step 6** to **Step 10** to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to **Step 14**.

- If no, go to **Step 15**.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect the fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.159 ALM-20002 Hue Service Unavailable

Description

This alarm is generated when the Hue service is unavailable. The system checks the Hue service status every 60 seconds.

This alarm is cleared when the Hue service is normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
20002	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- The internal KrbServer service on which the Hue service depends is abnormal.
- The internal DBService service on which the Hue service depends is abnormal.
- The network connection to the DBService is abnormal.

Procedure

Check whether the KrbServer is abnormal.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, check whether the **KrbServer** running status is **Normal**.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Restart the KrbServer service.

Step 3 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the DBService is abnormal.

Step 4 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 5 In the service list, check whether the **DBService** running status is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Restart the DBService.

NOTE

To restart the service, enter the FusionInsight Manager administrator password.

Step 7 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the network connection to the DBService is normal.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hue** > **Instance**, record the IP address of the active Hue.

Step 9 Log in to the active Hue.

Step 10 Run the **ping** command to check whether communication between the host that runs the active Hue and the hosts that run the DBService is normal. (Obtain the IP addresses of the hosts that run the DBService in the same way as that for obtaining the IP address of the active Hue.)

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Contact the administrator to restore the network.

Step 12 Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service** drop-down list:

- Hue
- Controller

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hue**.

Step 17 Choose **More** > **Restart Service**, and click **OK**.

Step 18 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.160 ALM-24000 Flume Service Unavailable

Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is automatically cleared after the Flume service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Flume cannot work and data transmission is interrupted.

Possible Causes

All Flume instances are faulty.

Procedure

Step 1 Log in to a Flume node as user **omm** and run the **ps -ef|grep "flume.role=server"** command to check whether the Flume process exists on the node.

- If yes, go to **Step 3**.

- If no, restart the faulty Flume node or Flume service and go to **Step 2**.

Step 2 In the alarm list, check whether alarm "Flume Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Collect the fault information.

Step 3 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 4 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 5 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

10.13.161 ALM-24001 Flume Agent Exception

Description

The Flume agent instance for which the alarm is generated cannot be started. This alarm is generated when the Flume agent process is faulty (The system checks in every 5 seconds.) or Flume agent fails to start (The system reporting alarms immediately).

This alarm is cleared when the Flume agent process recovers, Flume agent starts successfully and the alarm handling is completed.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
AgentId	Specifies the ID of the agent for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume agent instance for which the alarm is generated cannot provide services properly, and the data transmission tasks of the instance are temporarily interrupted. Real-time data is lost during real-time data transmission.

Possible Causes

- The JAVA_HOME directory does not exist or the Java permission is incorrect.
- The Flume agent directory permission is incorrect.
- Flume agent fails to start.

Procedure

Check whether the JAVA_HOME directory exists or whether the JAVA permission is correct.

Step 1 Log in to the host for which the alarm is generated as user **root**.

Step 2 Run the following command to obtain the installation directory of the Flume client for which the alarm is generated: (The value of **AgentId** can be obtained from **Location** of the alarm.)

ps -ef|grep *AgentId* **| grep -v grep | awk -F 'conf-file ' '{print $2}' | awk -F 'fusioninsight' '{print $1}'**

Step 3 Run the **su -** *Flume installation user* command to switch to the Flume installation user and run the **cd** *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf/** command to go to the Flume configuration directory.

Step 4 Run the **cat ENV_VARS | grep JAVA_HOME** command.

Step 5 Check whether the **JAVA_HOME** directory exists. If the command output in **Step 4** is not empty and **ll $JAVA_HOME/** is not empty, the **JAVA_HOME** directory exists.

- If yes, go to **Step 7**.

- If no, go to **Step 6**.

Step 6 Specify a correct **JAVA_HOME** directory.

Step 7 Run the **$JAVA_HOME/bin/java -version** command to check whether the Flume agent running user has the Java execution permission. If the Java version is displayed in the command output, the Java permission meets the requirement. Otherwise, the Java permission does not meet the requirement.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

NOTE

JAVA_HOME is the environment variable exported during Flume client installation. You can also go to *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf** and run the **cat ENV_VARS | grep JAVA_HOME** command to view the variable value.

Step 8 Run the **chmod 750 $JAVA_HOME/bin/java** command to grant the Java execution permission to the Flume agent running user.

Check the directory permission of the Flume agent.

Step 9 Log in to the host for which the alarm is generated as user **root**.

Step 10 Run the following command to switch to the Flume agent installation directory:

cd *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf/**

Step 11 Run the **ls -al * -R** command to check whether any file owner is the user who running the Flume agent.

- If yes, go to **Step 12**.
- If no, run the **chown** command to change the file owner to the user who runs the Flume agent.

Check the Flume agent configuration.

Step 12 Run the **cat properties.properties | grep spooldir** and **cat properties.properties | grep TAILDIR** commands to check whether the Flume source type is spoolDir or tailDir. If any command output is displayed, the Flume source type is spoolDir or tailDir.

- If yes, go to **Step 13**.
- If no, go to **Step 17**.

Step 13 Check whether the data monitoring directory exists.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

NOTE

Run the **cat properties.properties | grep spoolDir** command to view the spoolDir monitoring directory.

```
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep spoolDir
client.sources.aa1.spoolDir = /opt/liuxingcheng/flumeclient/sourcedata/flumesourcedata1
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]#
```

Run the **cat properties.properties | grep parentDir** command to view the tailDir monitoring directory.

```
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep parentDir
server.sources.AAAA.filegroups.F1.parentDir = /tmp/flumetest/taildir_data
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]#
```

Step 14 Specify a correct data monitoring directory.

Step 15 Check whether the Flume agent user has the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

- If yes, go to **Step 17**.
- If no, go to **Step 16**.

NOTE

Go to the monitoring directory as the Flume running user. If files can be created, the Flume running user has the read, write, and execute permissions on the monitoring directory.

Step 16 Run the **chmod 777** *Flume monitoring directory* command to grant the Flume agent running user the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

Step 17 Check whether the components connected to the Flume sink are in safe mode.

- If yes, go to **Step 18**.
- If no, go to **Step 23**.

NOTE

If the sinks in the **properties.properties** configuration file are the HDFS sink and HBase sink, and the configuration file contains a keytab file, the components connected to the Flume sink are in safe mode.

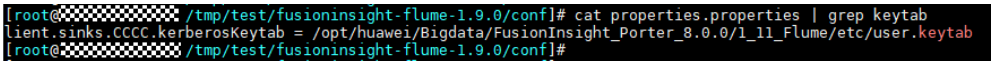
If the sink in the **properties.properties** configuration file is the kafka sink and ***.security.protocol** is set to **SASL_PLAINTEXT** or **SASL_SSL**, Kafka connected to the Flume sink is in safe mode.

Step 18 Run the **ll** *ketab path* command to check whether the keytab authentication path specified by the ***.kerberosKeytab** parameter in the configuration file exists.

- If yes, go to **Step 20**.
- If no, go to **Step 19**.

NOTE

To view the ketab path, run the **cat properties.properties | grep keytab** command.



Step 19 Change the value of **kerberosKeytab** in **Step 18** to the custom keytab path and go to **Step 21**.

Step 20 Perform **Step 18** to check whether the Flume agent running user has the permission to access the keytab authentication file. If the keytab path is returned, the user has the permission. Otherwise, the user does not have the permission.

- If yes, go to **Step 22**.
- If no, go to **Step 21**.

Step 21 Run the **chmod 755** *ketab file* command to grant the read permission on the keytab file specified in **Step 19**, and restart the Flume process.

Step 22 Check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 23**.

Collect the fault information.

Step 23 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 24 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 25 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.162 ALM-24003 Flume Client Connection Interrupted

Description

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in three consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
Client IP Address	Specifies the IP address of the Flume client.

Name	Meaning
Client Name	Specifies the agent name of the Flume client.
Sink Name	Specifies the sink name of Flume Agent.

Impact on the System

The communication between the Flume client and the server fails. The Flume client cannot send data to the Flume server.

Possible Causes

- The network connection between the Flume client and the server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

Procedure

Check the network connection between the Flume client and the server.

Step 1 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 2 Run the **ping** *Flume server IP address* command to check whether the network connection between the Flume client and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Check whether the Flume client's process is normal.

Step 3 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 4 Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.

- If yes, go to **Step 5**.
- If no, go to **Step 11**.

Check the Flume client configuration.

Step 5 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 6 Run the **cd** *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf/** command to go to Flume's configuration directory.

Step 7 Run the **cat properties.properties** command to query the current configuration file of the Flume client.

Step 8 Check whether the **properties.properties** file is correctly configured according to the configuration description of the Flume agent.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Modify the **properties.properties** configuration file.

Check whether the alarm is cleared.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Collect logs in the **/var/log/Bigdata/flume-client** directory on the Flume client using a transmission tool.

Step 15 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.163 ALM-24004 Exception Occurs When Flume Reads Data

Description

The alarm module monitors the status of Flume Source. This alarm is generated immediately when the duration in which Source fails to read the data exceeds the threshold.

The default threshold is **0**, indicating that the threshold is disabled. You can change the threshold by modifying the **properties.properties** file in the **conf** directory. Specifically, modify the **NoDatatime** parameter of required the source.

The alarm is cleared when Source reads the data and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
AgentId	Specifies the ID of the agent for which the alarm is generated.
ComponentType	Specifies the component type for which the alarm is generated.
ComponentName	Specifies the component name for which the alarm is generated.

Impact on the System

If data is found in the data source and Flume Source continuously fails to read data, the data collection is stopped.

Possible Causes

- Flume Source is faulty, so data cannot be sent.
- The network is faulty, so the data cannot be sent.

Procedure

Check whether Flume Source is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for **keyword type = spooldir** in the file, and check whether the Flume source type is spoolDir.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 View the spoolDir directory to check whether all files are already transferred.

- If yes, no further action is required.

- If no, go to **Step 5**.

  NOTE

  The monitoring directory of spooDir is specified by the **.spoolDir** parameter in the **properties.properties** configuration file. If all files in the monitoring directory have been transferred, the file name extension of all files in the monitoring directory is **.COMPLETED**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.source.kafka.KafkaSource** in the file, and check whether the Flume source type is Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Check whether the topic data configured by Kafka Source has been used up.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance**.

Step 6 Go to the Flume instance page of the faulty node to check whether the indicator **Source Speed Metrics** in the alarm is 0.

- If yes, go to **Step 11**.
- If no, go to **Step 7**.

Check the network connection between the faulty node and the node that corresponds to the Flume Source IP address.

Step 7 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume source type is Avro.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume source* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Contact the network administrator to restore the network.

Step 10 In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.164 ALM-24005 Exception Occurs When Flume Transmits Data

Description

The alarm module monitors the capacity status of Flume Channel. The alarm is generated immediately when the duration that Channel is fully occupied exceeds the threshold or the number of times that Source fails to send data to Channel exceeds the threshold.

The default threshold is **10**. You can change the threshold by modifying the **channelfullcount** parameter of the related channel in the **properties.properties** configuration file in the **conf** directory.

The alarm is cleared when the space of Flume Channel is released and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
AgentId	Specifies the ID of the agent for which the alarm is generated.
ComponentType	Specifies the type of the component for which the alarm is generated.
ComponentName	Specifies the component for which the alarm is generated.

Impact on the System

If the disk usage of Flume Channel increases continuously, the time required for importing data to a specified destination prolongs. When the disk usage of Flume Channel reaches 100%, the Flume agent process pauses.

Possible Causes

- Flume Sink is faulty, so the data cannot be sent.
- The network is faulty, so the data cannot be sent.

Procedure

Check whether Flume Sink is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for **type = hdfs** in the file, and check whether the Flume sink type is HDFS.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 On FusionInsight Manager, check whether **HDFS Service Unavailable** alarm is generated in the alarm list and whether the HDFS service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-14000 HDFS Service Unavailable; if the HDFS service is stopped, start it. Then go to **Step 7**.
- If no, go to **Step 7**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **type = hbase** in the file, and check whether the Flume sink type is HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 On FusionInsight Manager, check whether **HBase Service Unavailable** alarm is generated in the alarm list and whether the HBase service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-19000 HBase Service Unavailable; if the HBase service is stopped, start it. Then go to **Step 7**.

- If no, go to **Step 7**.

Step 5 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.sink.kafka.KafkaSink** in the file, and check whether the Flume sink type is Kafka.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 On FusionInsight Manager, check whether **Kafka Service Unavailable** alarm is generated in the alarm list and whether the Kafka service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-38000 Kafka Service Unavailable; if the Kafka service is stopped, start it. Then go to **Step 7**.
- If no, go to **Step 7**.

Step 7 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance**.

Step 8 Go to the Flume instance page of the faulty node to check whether the indicator **Sink Speed Metrics** is 0.

- If yes, go to **Step 13**.
- If no, go to **Step 9**.

Check the network connection between the faulty node and the node that corresponds to the Flume Sink IP address.

Step 9 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume sink type is Avro.

- If yes, go to **Step 10**.
- If no, go to **Step 13**.

Step 10 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume sink* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Contact the network administrator to restore the network.

Step 12 In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect the fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.165 ALM-24006 Heap Memory Usage of Flume Server Exceeds the Threshold

Description

The system checks the heap memory usage of the Flume service every 60 seconds. This alarm is generated when the heap memory usage of the Flume instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory of the Flume instance is overused or the heap memory is inappropriately allocated.

Procedure

Check the heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Heap Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the heap memory used by Flume reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.166 ALM-24007 Flume Server Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Flume service every 60 seconds. This alarm is generated when the direct memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the Flume direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the Flume process is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Direct Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Direct Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the direct memory used by Flume reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

10.13.167 ALM-24008 Flume Server Non-Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the Flume service every 60 seconds. This alarm is generated when the non-heap memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the Flume instance is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Non-Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Non Heap Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the non-heap memory used by Flume reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxPermSize** to twice the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

10.13.168 ALM-24009 Flume Server Garbage Collection (GC) Time Exceeds the Threshold

Description

The system checks the GC duration of the Flume process every 60 seconds. This alarm is generated when the GC duration of the Flume process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Flume data transmission efficiency decreases.

Possible Causes

The heap memory of the Flume process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **GC Duration Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Garbage Collection (GC) Duration of Flume**. Then, click **OK**.

Step 3 Check whether the GC duration of the Flume process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

10.13.169 ALM-24010 Flume Certificate File Is Invalid or Damaged

Description

Flume checks whether the Flume certificate file is valid (whether the certificate exists and whether the certificate format is correct) every hour. This alarm is generated when the certificate file is invalid or damaged. This alarm is automatically cleared when the certificate file becomes valid again.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The Flume certificate file is invalid or damaged.

Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24010 Flume Certificate File Is Invalid or Damaged**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the **ls -l** command to check whether the **flume_sChat.crt** file exists.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Run the **openssl x509 -in flume_sChat.crt -text -noout** command to check whether certificate details are displayed properly.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -f *Custom certificate password of the Flume role on the server* **-g** *Custom certificate password of the Flume role on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

  NOTE

  The custom certificate passwords must meet the following complexity requirements:

  - Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
  - Contain 8 to 64 characters.
  - Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **Flume** in the required cluster for **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

10.13.170 ALM-24011 Flume Certificate File Is About to Expire

Description

Flume checks whether the Flume certificate file is about to expire every hour. This alarm is generated when the remaining validity period is at most 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Currently, there is no impact on the system.

Possible Causes

The Flume certificate file is about to expire.

Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24011 Flume Certificate Is About to Expire**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the Flume user certificate:

openssl x509 -noout -text -in flume_sChat.crt

Step 5 Perform **Step 6** to **Step 7** during off-peak hours to update the certificate file as needed.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -f *Custom certificate password of the Flume role on the server* **-g** *Custom certificate password of the Flume role on the client*

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 6** to **Step 7**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Select **Flume** in the required cluster for **Service**.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

10.13.171 ALM-24012 Flume Certificate File Has Expired

Description

Flume checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the Flume certificate file becomes valid again.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The Flume certificate file has expired.

Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24012 Flume Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the HA user certificate to determine whether the certificate file is still in the validity period:

openssl x509 -noout -text -in flume_sChat.crt

- If yes, go to **Step 9**.
- If no, go to **Step 5**.

Step 5 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 6 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -f *Custom certificate password of the Flume role on the server* **-g** *Custom certificate password of the Flume role on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 7 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 5** to **Step 6**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **Flume** in the required cluster for **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

10.13.172 ALM-24013 Flume MonitorServer Certificate File Is Invalid or Damaged

Description

MonitorServer checks whether its certificate file is valid (whether the certificate exists and whether the certificate format is correct) every hour. This alarm is generated when the certificate file is invalid or damaged. This alarm is automatically cleared when the certificate file becomes valid again.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The MonitorServer certificate file is invalid or damaged.

Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row

containing **ALM-24013 MonitorServer Certificate File Is Invalid or Damaged**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the **ls -l** command to check whether the **ms_sChat.crt** file exists:

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Run the **openssl x509 -in ms_sChat.crt -text -noout** command to check whether certificate details are displayed.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -m *Custom password of the MonitorServer certificate on the server* **-n** *Custom password of the MonitorServer certificate on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

  NOTE

  The custom certificate passwords must meet the following complexity requirements:

  - Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
  - Contain 8 to 64 characters.
  - Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **MonitorServer** in the required cluster for **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

10.13.173 ALM-24014 Flume MonitorServer Certificate Is About to Expire

Description

MonitorServer checks whether its certificate file is about to expire every hour. This alarm is generated when the remaining validity period is at most 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24014	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Currently, there is no impact on the system.

Possible Causes

The MonitorServer certificate file is about to expire.

Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24014 MonitorServer Certificate Is About to Expire**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the MonitorServer user certificate:

openssl x509 -noout -text -in ms_sChat.crt

Step 5 Perform **Step 6** to **Step 7** during off-peak hours to update the certificate file as needed.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -m *Custom password of the MonitorServer certificate on the server* **-n** *Custom password of the MonitorServer certificate on the client*

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

  NOTE

  The custom certificate passwords must meet the following complexity requirements:
  - Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
  - Contain 8 to 64 characters.
  - Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 6** to **Step 7**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Select **MonitorServer** in the required cluster for **Service**.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.174 ALM-24015 Flume MonitorServer Certificate File Has Expired

Description

MonitorServer checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the MonitorServer certificate file becomes valid again.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The MonitorServer certificate file has expired.

Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24015 MonitorServer Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the user certificate to determine whether the certificate file is still in the validity period:

openssl x509 -noout -text -in ms_sChat.crt

- If yes, go to **Step 9**.
- If no, go to **Step 5**.

Step 5 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 6 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -m *Custom password of the MonitorServer certificate on the server* **-n** *Custom password of the MonitorServer certificate on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 7 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 5** to **Step 6**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **MonitorServer** in the required cluster for **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.175 ALM-25000 LdapServer Service Unavailable

Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the system detects that both the active and standby LdapServer services are abnormal.

This alarm is cleared when the system detects that one or two LdapServer services are normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer users and LdapServer users in the cluster. For example, users, user groups, or roles cannot be added, deleted, or modified, and user passwords cannot be changed on the FusionInsight Manager portal. The authentication for existing users in the cluster is not affected.

Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

Procedure

Check whether the nodes where the two SlapdServer instances of the LdapServer service are located are faulty.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Instance** to go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances locates.

Step 2 Choose **O&M** > **Alarm** > **Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 Node Fault".

Step 5 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer process is normal.

Step 6 Choose **O&M** > **Alarm** > **Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Process Fault** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Check whether the service and host name in the alarm are consistent with the LdapServer service and host name.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 11 Select **LdapServer** in the required cluster from the **Service**.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.176 ALM-25004 Abnormal LdapServer Data Synchronization

Description

The system checks the LdapServer data every 30 seconds. This alarm is generated when the data on the active and standby LdapServers of Manager is inconsistent for 12 consecutive times. This alarm is cleared when the data on the active and standby LdapServers is consistent.

The system checks the LdapServer data every 30 seconds. This alarm is generated when the LdapServer data in the cluster is inconsistent with that on Manager for 12 consecutive times. This alarm is cleared when the data is consistent.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25004	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

LdapServer data inconsistency occurs because the LdapServer data in Manager is damaged or the LdapServer data in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

Possible Causes

- The network of the node where the LdapServer process locates is faulty.

- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.

Procedure

Check whether the network where the LdapServer nodes reside is faulty.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Record the IP address of HostName in the alarm locating information as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact O&M personnel and log in to the nodes corresponding to IP 1. Run the ping command to check whether the IP address of the management plane of the active OMS node can be pinged.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to recover the network and check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the LdapServer processes are normal.

Step 4 On the **Alarm** page of FusionInsight Manager, check whether the **OLdap Resource Abnormal** exists.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Clear the alarm by following the steps provided in "ALM-12004 OLdap Resource Abnormal".

Step 6 Check whether **Abnormal LdapServer Data Synchronization** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 On the **Alarm** page of FusionInsight Manager, check whether **Process Faul**t is generated for the LdapServer service.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer processes are normal.

Step 10 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Record the IP address of HostName in the alarm locating information as "IP1" (if multiple alarms exist, record the IP addresses as "IP1", "IP2", and "IP3" respectively). Choose **Cluster** >

Name of the desired cluster > **Services** > **LdapServer** > **Configurations**. Record the port number of LdapServer as "PORT". (If the IP address in the alarm locating information is the IP address of the standby management node, choose **System** > **OMS** > **oldap** > **Modify Configuration** and record the listening port number of LdapServer.)

Step 11 Log in to the nodes corresponding to IP1 as user **omm**.

Step 12 Run the following command to check whether errors are displayed in the queried information.

ldapsearch -H ldaps://*IP1*:*PORT* **-LLL -x -D cn=root,dc=hadoop,dc=com -W -b ou=Peoples,dc=hadoop,dc=com**

After running the command, enter the **LDAP** administrator password. Contact the system administrator to obtain the password.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Recover the LdapServer and OMS nodes using data backed up before the alarm is generated.

NOTE

Use the OMS data and LdapServer data backed up at the same point in time to recover the data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.

Step 14 Check whether alarm **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **LdapServer** in the required cluster and **OmsLdapServer** from the **Service**.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.177 ALM-25005 nscd Service Exception

Description

The system checks the status of the nscd service every 60 seconds. This alarm is generated when the nscd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The **id** command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The nscd service is not started.
- The network is faulty and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Procedure

Check whether the nscd service is started.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Find the IP address of **HostName** in **Location** of the alarm and record it as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact the O&M personnel to access the node using IP1 as user root. Run the **ps -ef | grep nscd** command and check whether the **/usr/sbin/nscd** process is started.

- If the process is started, go to **Step 5**.
- If the process is not started, go to **Step 3**.

Step 3 Run the **service nscd restart** command as user **root** to restart the nscd service. Then run the **ps -ef | grep nscd** command to check whether the nscd service is started.

- If it is started, go to **Step 4**.
- If it is not started, go to **Step 15**.

Step 4 Wait for 5 minutes and run the **ps -ef | grep nscd** command again as user **root**. Check whether the service exists.

- If it exists, go to **Step 11**.
- If it does not exist, go to **Step 15**.

Check whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root**. Run the **ping** command to check the network connectivity between this node and the LdapServer node.

- If the network is normal, go to **Step 6**.
- If the network is faulty, contact network administrators to troubleshoot the fault.

Check whether NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command and check the **passwd**, **group**, **services**, **netgroup**, and **aliases** configurations of NameService.

The correct parameter configurations are as follows: **passwd: compat ldap**, **group: compat ldap**, **services: files ldap**, **netgroup: files ldap**, and **aliases: files ldap**.

- If the configurations are correct, go to **Step 7**.
- If the configurations are incorrect, go to **Step 9**.

Step 7 Log in to the alarmed node as user **root**. Run the **cat /etc/nscd.conf** command and check the **enable-cache passwd**,**positive-time-to-live passwd**,**enable-cache group** and **positive-time-to-live group** configurations of NameService.

The correct parameter configurations are as follows: **enable-cache passwd yes**, **positive-time-to-live passwd 600**, **enable-cache group yes** and **positive-time-to-live group 3600**.

- If the configurations are correct, go to **Step 8**.
- If the configurations are incorrect, go to **Step 10**.

Step 8 Run the **/usr/sbin/nscd -i group** and **/usr/sbin/nscd -i passwd** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 11**.

- If no result is queried, go to **Step 15**.

Step 9 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in **Step 6** and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 11**.
- If no result is queried, go to **Step 15**.

Step 10 Run the **vi /etc/nscd.conf** command as user **root**. Correct the configurations in **Step 7** and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 11**.
- If no result is queried, go to **Step 15**.

Step 11 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **nscd Service Exception** alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm persists, go to **Step 12**.

Check whether frame freezing occurs when running a command in the operating system.

Step 12 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Run the **cat /var/log/messages** command to check whether the nscd frequently restarts or the error information **Can't contact LDAP server** exists.

nscd exception example:

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780: Can't contact LDAP server
```

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Run the **vi $BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/ldap.conf** command to enter the editing mode, press **Insert** to start editing, and then change the first two IP addresses of the URI configuration item.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq** to save the settings and exit.

Run the **service nscd restart** command to restart the nscd service. Wait 5 minutes and run the **id admin** command again. Check whether the command execution is slow.

- If yes, go to **Step 15**.
- If no, log in to other faulty nodes and run **Step 12** to **Step 14** and check whether the first ldapserver node in the URI before modifying **/etc/ldap.conf** is faulty. For example, check whether the service IP address is unreachable, the network delay is too long, or other abnormal software is deployed.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 16 Select **LdapClient** in the required cluster from the **Service**.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.178 ALM-25006 Sssd Service Exception

Description

The system checks the status of the sssd service every 60 seconds. This alarm is generated when the sssd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The id command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The sssd service is not started or is incorrectly started.
- The network is faulty and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Procedure

Check whether the sssd service is correctly started.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Find the IP address of **HostName** in **Location** of the alarm and record it as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact the O&M personnel to access the node using IP1 as user root. Run the **ps -ef | grep sssd** command and check whether the **/usr/sbin/sssd** process is started.

- If the process is started, go to **Step 3**.
- If the process is not started, go to **Step 4**.

Step 3 Check whether the sssd process queried in **Step 2** has three subprocesses.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Run the **service sssd restart** command as user **roo**t to restart the sssd service. Then run the **ps -ef | grep sssd** command to check whether the sssd process is normal.

In the normal state, the **/usr/sbin/sssd** process has three subprocesses: **/usr/libexec/sssd/sssd_be**, **/usr/libexec/sssd/sssd_nss**, and **/usr/libexec/sssd/sssd_pam**.

- If it exists, go to **Step 9**.

- If it does not exist, go to **Step 13**.

Check whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root**. Run the **ping** command to check the network connectivity between this node and the LdapServer node.

- If the network is normal, go to **Step 6**.
- If the network is faulty, contact network administrators to troubleshoot the fault.

Check whether NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command and check the **passwd** and **group** configurations of NameService.

The correct parameter configurations are as follows: **passwd: compat ldap** and **group: compat ldap**.

- If the configurations are correct, go to **Step 7**.
- If the configurations are incorrect, go to **Step 8**.

Step 7 Run the **/usr/sbin/sss_cache -G** and **/usr/sbin/sss_cache -U** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 9**.
- If no result is queried, go to **Step 13**.

Step 8 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in **Step 6** and save the file. Run the **service sssd restart** command to restart the sssd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to **Step 9**.
- If no result is queried, go to **Step 13**.

Step 9 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **sssd Service Exception** alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm persists, go to **Step 10**.

Check whether frame freezing occurs when running a command in the operating system.

Step 10 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Run the **cat /var/log/messages** command to check whether the sssd frequently restarts or the error information **Can't contact LDAP server** exists.

sssd restart example:

```
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
```

```
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Run the **vi $BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/sssd/sssd.conf** command to reverse the first two IP addresses of the **ldap_uri** configuration item, save the settings, and exit.

Run the **ps -ef | grep sssd** command to query the ID of the sssd process, kill it, and run the **/usr/sbin/sssd -D -f** command to restart the sssd service. Wait 5 minutes and run the **id admin** command again.

Check whether the command execution is slow.

- If yes, go to **Step 13**.
- If no, log in to other faulty nodes and run **Step 10** to **Step 12**. Collect logs and check whether the first ldapserver node in the ldap_uri before modifying **/etc/sssd/sssd.conf** is faulty. For example, check whether the service IP address is unreachable, the network latency is too long, or other abnormal software is deployed.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 14 Select **LdapClient** in the required cluster from the **Service**.

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.179 ALM-25500 KrbServer Service Unavailable

Description

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the system detects that the KrbServer service is abnormal.

This alarm is cleared when the system detects that the KrbServer service is normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25500	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer component in the cluster. The authentication of KrbServer in other components will be affected. The running status of components that depend on KrbServer in the cluster is Bad.

Possible Causes

- The node where the KrbServer service locates is faulty.
- The OLdap service is abnormal.

Procedure

Check whether the node where the KrbServer service locates is faulty.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer** > **Instance** to go to the KrbServer instance page to obtain the host name of the node where the KrbServer service locates.

Step 2 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 Node Fault".

Step 5 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the OLdap service is normal.

Step 6 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **OLdap Resource Abnormal** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm according to "ALM-12004 OLdap Resource Abnormal".

Step 8 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Select **KrbServer** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.180 ALM-26051 Storm Service Unavailable

Description

The system checks the Storm service status every 30 seconds. This alarm is generated when all Nimbus nodes in the cluster are abnormal and the Storm service is unavailable.

This alarm is cleared when the Storm service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26051	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Storm service, and users cannot perform new Storm tasks.

Possible Causes

- The Kerberos cluster is faulty.
- The ZooKeeper cluster is faulty or suspended.
- The active and standby Nimbus nodes in the Storm cluster are abnormal

Procedure

Check the status of the Kerberos cluster. (Skip this step if the normal mode is used.)

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Check whether the running status of the Kerberos service is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 See the related maintenance information of **ALM-25500 KrbServer Service Unavailable**.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Check the status of the ZooKeeper cluster.

Step 5 Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 If ZooKeeper service is stopped, start it, else see the related maintenance information of **ALM-13000 ZooKeeper Service Unavailable**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the status of the active and standby Nimbus nodes.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to go to the Nimbus Instances page.

Step 9 Check whether only one Nimbus node that is in the **Active** state in **Roles**.

- If yes, go to **Step 13**.
- If no, go to **Step 10**.

Step 10 Select two Nimbus role instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Log in to the FusionInsight Manager portal again, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to check whether the running status is **Normal**.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collecting Fault Information

Step 13 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service** drop-down list:

- KrbServer

  NOTE

  KrbServer logs do not need to be downloaded in normal mode.

- ZooKeeper
- Storm

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.181 ALM-26052 Number of Available Supervisors of the Storm Service Is Less Than the Threshold

Description

The system periodically checks the number of available Supervisors every 60 seconds and compares the number of available Supervisors with the threshold. This alarm is generated when the number of available Supervisors is less than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster*.

This alarm is cleared when the number of available Supervisors is greater than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26052	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Existing tasks in the cluster cannot be performed. The cluster can receive new Storm tasks, but cannot perform these tasks.

Possible Causes

The status of some Supervisors in the cluster is abnormal.

Procedure

Check the Supervisor status.

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Supervisor** to go to the Storm service management page.

Step 2 In **Roles**, check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for 30 seconds, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

NOTE

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

Collect fault information.

Step 5 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 6 Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.182 ALM-26053 Storm Slot Usage Exceeds the Threshold

Description

The system checks the slot usage every 60 seconds and compares the actual slot usage with the threshold. This alarm is generated when the slot usage is greater than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds**.

This alarm is cleared when the slot usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26053	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

New Storm tasks cannot be performed.

Possible Causes

- The status of some Supervisors in the cluster is abnormal.
- The status of all Supervisors is normal, but the processing capability is insufficient.

Procedure

Check the Supervisor status.

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Instance** to go to the Storm instance management page.

Step 2 Check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 10**.

Step 4 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Increase the number of slots in each Supervisor.

Step 5 Log in to the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Configurations** > **All Configurations**.

Step 6 Increase the number of ports in the **supervisor.slots.ports** parameter of each Supervisor role and restart the instance.

Step 7 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Perform capacity expansion for Supervisor.

Step 9 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

NOTE

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

Collect fault information.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 11 Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.183 ALM-26054 Nimbus Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of Storm Nimbus every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Storm Nimbus exceeds the threshold (80% of the maximum memory by default) for 5 consecutive times.

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Storm** > **Nimbus** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26054	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Storm Nimbus is overhigh, frequent GCs occur. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Storm Nimbus instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Heap Memory Usage of Storm Nimbus Exceeds the Threshold** > **Location**. Check the host name of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Nimbus** > **Heap Memory Usage of Nimbus**. Click **OK**.

Step 3 Check whether the used heap memory of Nimbus reaches the threshold (The default value is 80% of the maximum heap memory) specified for Nimbus.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Configurations** > **All Configurations** > **Nimbus** >

System. Change the value of **-Xmx** in **NIMBUS_GC_OPTS** based on site requirements, and click **Save**. Click **OK**.

NOTE

- You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.
- The number of Workers grows as the Storm cluster scale increases. You can increase the value of **GC_OPTS** for Nimbus. The recommended value is as follows: If the number of Workers is 20, set **-Xmx** to a value greater than or equal to 1 GB. If the number of Workers exceeds 100, set **-Xmx** to a value greater than or equal to 5 GB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service** drop-down list.

- NodeAgent
- Storm

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.184 ALM-27001 DBService Service Unavailable

Description

The alarm module checks the DBService service status every 30 seconds. This alarm is generated when the system detects that DBService service is unavailable.

This alarm is cleared when DBService service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27001	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in some services exceptions.

Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

Procedure

Check whether the floating IP address exists in the cluster environment.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Instance**.

Step 2 Check whether the active instance exists.

- If yes, go to **Step 3**.
- If no, go to **Step 9**.

Step 3 Select the active DBServer instance and record the IP address.

Step 4 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **ifconfig** command to check whether the DBService floating IP address exists on the node.

- If yes, go to **Step 5**.
- If no, go to **Step 9**.

Step 5 Run the **ping** *floatip* command to check whether the DBService floating IP address can be pinged successfully.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Log in to the host that corresponds to the DBService floating IP address as user **root**, and run the command to delete the floating IP address.

ifconfig *interface* **down**

Step 7 On the FusionInsight Manager home page, choose **Cluster >** *Name of the desired cluster* > **Services** > **DBService** > **More** > **Restart Service** to restart DBService, and check whether DBService is restarted successfully.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check the status of the active DBServer instance.

Step 9 Select the DBServer instance whose role status is abnormal and record the IP address.

Step 10 On the **Alarm** page, check whether **Process Fault** occurs in the DBServer instance on the host that corresponds to the IP address.

- If yes, go to **Step 11**.
- If no, go to **Step 14**.

Step 11 Handle the alarm according to "ALM-12007 Process Fault".

Step 12 Wait for about 5 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check the status of the active and standby DBServers.

Step 13 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **su - omm** command to switch to user **omm**.

Step 14 Run the **cd ${DBSERVER_HOME}** command to go to the installation directory of the DBService.

Step 15 Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.

```

```

- If yes, go to **Step 16**.
- If no, go to **Step 19**.

Step 16 Check whether the active and standby HA processes are in the abnormal state.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* > **Services** > **DBService** > **More** > **Restart Service** to restart DBService, and check whether the system displays a message indicating that the restart is successful.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Step 18 Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 19**.

Collect fault information.

Step 19 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 20 Select **DBService** in the required cluster and **NodeAgent** from the **Service**.

Step 21 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 22 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.185 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes

Description

This alarm is generated when the active or standby DBService node does not receive heartbeat messages from the peer node for 7 seconds.

This alarm is cleared when the heartbeat recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27003	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies a local DBService HA.
Peer DBService HA Name	Specifies a peer DBService HA.

Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

Possible Causes

The link between the active and standby DBService nodes is abnormal.

Procedure

Check whether the network between the active DBService server and the standby DBService server is normal.

Step 1 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and view the standby DBService server address.

Step 2 Log in to the active DBService server as user **root**.

Step 3 Run the **ping** *standby DBService heartbeat IP address* command to check whether the standby DBService server is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.

- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following nodes in the required cluster from the **Service**:

- DBService
- Controller
- NodeAgent

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.186 ALM-27004 Data Inconsistency Between Active and Standby DBServices

Description

The system checks the data synchronization status between the active and standby DBService every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27004	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies the HA name of the local DBService.
Peer DBService HA Name	Specifies the HA name of the peer DBService.
SYNC_PERCENT	Specifies the synchronization percentage.

Impact on the System

When data is not synchronized between the active and standby DBServices, data may be lost or abnormal if the active instance becomes abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.
- The standby node disk space is full.

Procedure

Check whether the network between the active and standby nodes is normal.

Step 1 On FusionInsight Manager, choose **Cluster > Services > DBService > Instance**, check the service IP address of the standby DBServer instance.

Step 2 Log in to the active DBService node as user **root**.

Step 3 Run the **ping** *Standby DBService heartbeat IP address* command to check whether the standby DBService node is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the standby DBService is normal.

Step 6 Log in to the standby DBService node as user **root**.

Step 7 Run the **su - omm** command to switch to user **omm**.

Step 8 Go to the **${DBSERVER_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Check whether the standby node disk space is full.

Step 9 Log in to the standby DBService node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Go to the **${DBSERVER_HOME}** directory, and run the following commands to obtain the DBService data directory:

cd ${DBSERVER_HOME}

source .dbservice_profile

echo ${DBSERVICE_DATA_DIR}

Step 12 Run the **df -h** command to view the system disk partition usage information.

Step 13 Check whether the DBService data directory space is full.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 Expand the disk capacity.

Step 15 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 17 Select **DBService** in the required cluster from the **Service**.

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.187 ALM-27005 Database Connections Usage Exceeds the Threshold

Description

The system checks the usage of the number of database connections of the nodes where DBServer instances are located every 30 seconds and compares the usage with the threshold. If the usage exceeds the threshold for five consecutive times (this number is configurable, and 5 is the default value), the system generates this alarm. The default usage threshold is 90%, and you can configure it based on site requirements.

The trigger count is configurable. This alarm is cleared in the following scenarios:

- The trigger count is 1, and the usage of the number of database connections is less than or equal to the threshold.
- The trigger count is greater than 1, and the usage of the number of database connections is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Upper-layer services may fail to connect to the DBService database, affecting services.

Possible Causes

- Too many database connections are used.
- The maximum number of database connections is improperly configured.
- The alarm threshold or alarm trigger count is improperly configured.

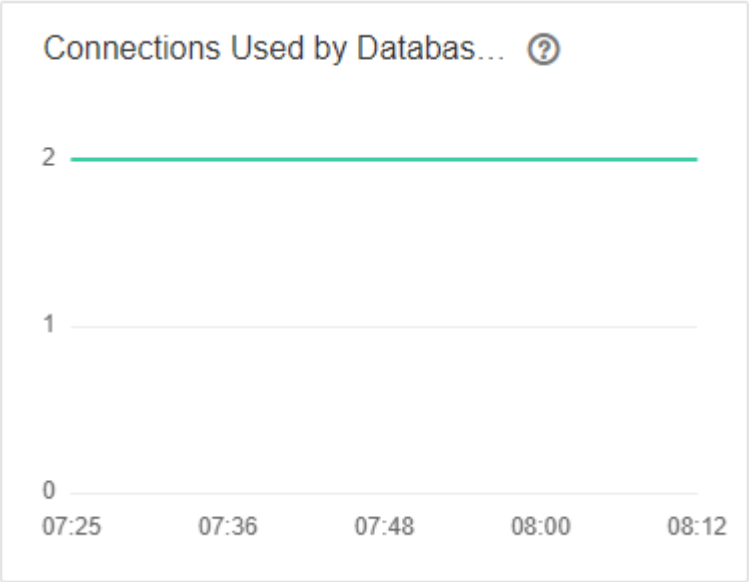
Procedure

Checking whether too many data connections are used

Step 1 On FusionInsight Manager, click DBService in the service list on the left navigation pane. The DBService monitoring page is displayed.

Step 2 Observe the number of connections used by the database user, as shown in **Figure 10-39**. Based on the service scenario, reduce the number of database user connections.

Figure 10-39 Number of connections used by database users



Step 3 Wait for 2 minutes and check whether the alarm is automatically cleared.

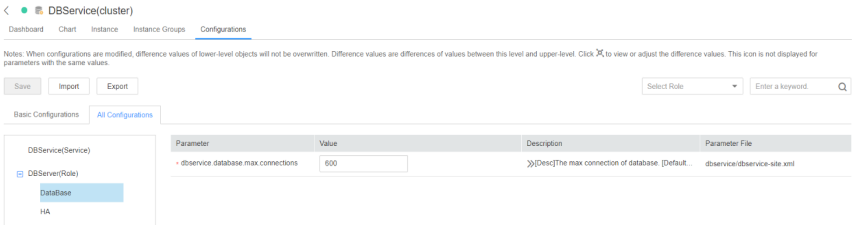
- If it is, no further action is required.

- If it is not, go to **Step 4**.

Checking whether the maximum number of database connections is properly configured

Step 4 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Configurations**. On the displayed page, select the **All Configurations** tab, and increase the maximum number of database connections based on service requirements, as shown in **Figure 10-40**. Click **Save**. In the displayed **Save configuration** dialog box, click **OK**.

Figure 10-40 Setting the maximum number of database connections



Step 5 After the maximum number of database connections is changed, restart DBService (do not restart the upper-layer services).

Procedure: Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the displayed page, choose **More** > **Restart Service**. Enter the password of the current login user and click **OK**. Do not select **Restart upper-layer services.**, click **OK**.

Step 6 After the service is restarted, wait for 2 minutes and check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Checking whether the alarm threshold or trigger count is properly configured

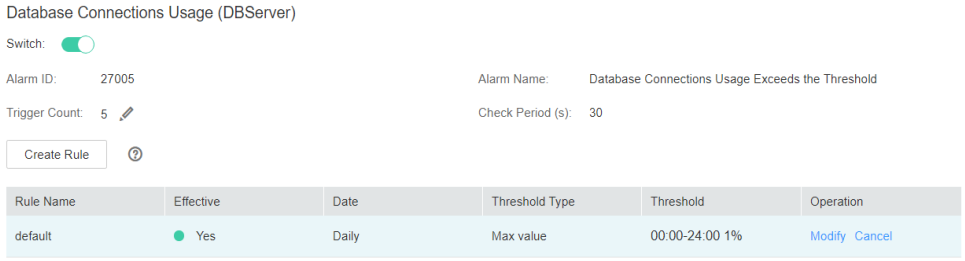
Step 7 Log in to FusionInsight Manager and change the alarm threshold and alarm trigger count based on the actual database connection usage.

Choose **O&M**> **Alarm** > **Thresholds** > *Name of the desired cluster* > **DBService** > **Database** > **Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click the pencil icon next to **Trigger Count**. In the displayed dialog box, change the trigger count, as shown in **Figure 10-41**.

NOTE

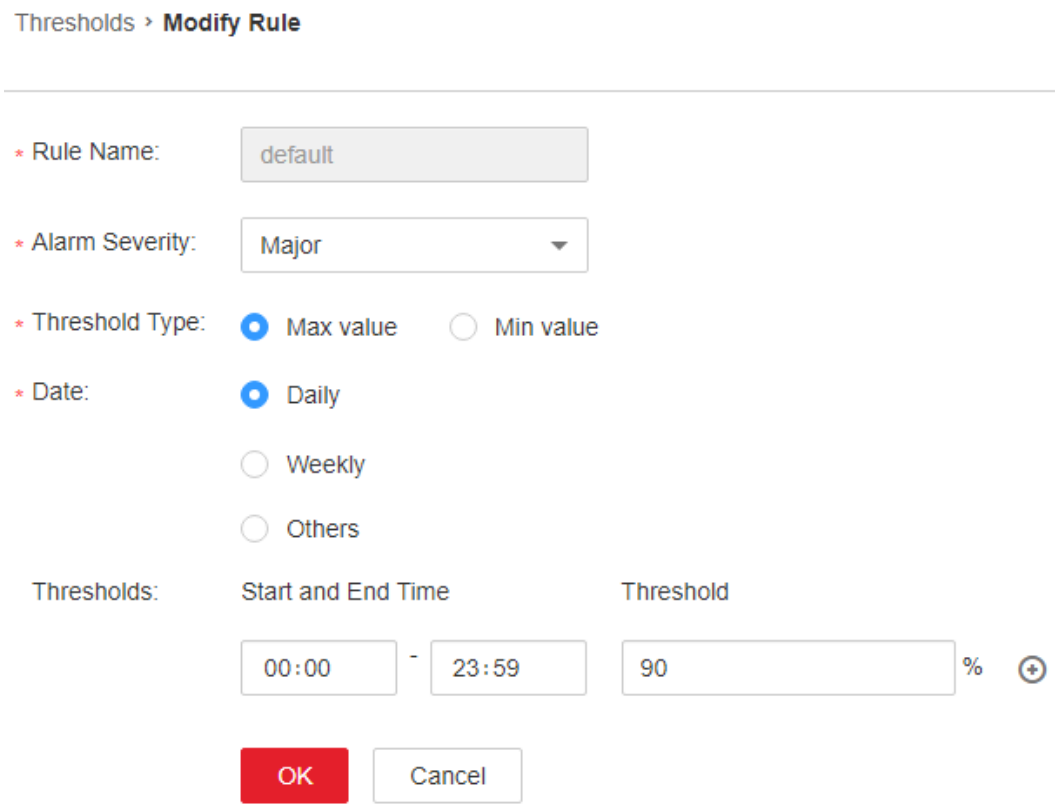
Trigger Count: If the usage of the number of database connections exceeds the threshold consecutively for more than the value of this parameter, an alarm is generated.

Figure 10-41 Setting alarm trigger count



Based on the actual database connection usage, choose **O&M** >**Alarm** > **Thresholds** > *Name of the desired cluster* > **DBService** > **Database** > **Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click **Modify** in the **Operation** column. In the **Modify Rule** dialog box, modify the required parameters and click **OK** as shown in **Figure 10-42**.

Figure 10-42 Set alarm threshold



Step 8 Wait for 2 minutes and check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

Collect fault information

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Select **DBService** in the required cluster from the **Service**.

Step 11 Specify the host for collecting logs by setting the **Host** parameter that is optional. By default, all hosts are selected.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.188 ALM-27006 Disk Space Usage of the Data Directory Exceeds the Threshold

Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds and compares the disk usage with the threshold. The alarm is generated when the disk space usage exceeds the threshold for five consecutive times (the default value). The number of consecutive times is configurable. The disk space usage threshold of the data directory is set to 80% by default, which is configurable as well.

The value of **hit number** is configurable. When the value is set to **1** and the disk space usage is lower than or equal to the threshold, the alarm is cleared. When the value is greater than 1 and the disk space usage is lower than 90% of the threshold, the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27006	Major	Yes

Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- Service processes become unavailable.
- When the disk space usage of the data directory exceeds 90%, the database reports the "Database Enters the Read-Only Mode" alarm and enters the read-only mode, which may cause service data loss.

Possible Causes

- The alarm threshold is improperly configured.
- The data volume of the database is too large or the disk configuration cannot meet service requirements, causing excessive disk usage.

Procedure

Check whether the threshold is set properly.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **DBService** > **Database** > **Disk Space Usage of the Data Directory** to check whether the alarm threshold is proper (the default value 80% is a proper value).

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Change the alarm threshold based on the actual service situation.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory is lower than the threshold.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether large files are incorrectly written into the disk.

Step 5 Log in to the active DBService node as user **omm**.

Step 6 Run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

source $DBSERVER_HOME/.dbservice_profile

find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Handle the large files based on the actual scenario and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 10 Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.189 ALM-27007 Database Enters the Read-Only Mode

Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds. The alarm is generated when the disk space usage exceeds 90%.

The alarm is cleared when the disk space usage is lower than 80%.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27007	Critical	Yes

Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The database enters the read-only mode, causing service data loss.

Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

Procedure

Check whether the disk space usage reaches the upper limit.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**.

Step 2 On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory exceeds 90%.

- If yes, go to **Step 3**.
- If no, go to **Step 13**.

Step 3 Log in to the active management node of the DBServer as user **omm** and run the following commands to check whether the database enters the read-only mode:

source $DBSERVER_HOME/.dbservice_profile

gsql -U omm -W *password* **-d postgres -p 20051**

show default_transaction_read_only;

NOTE

In the preceding commands, *password* indicates the password of user **omm** of the DBService database. You can run the **\q** command to exit the database.

Check whether the value of **default_transaction_read_only** is **on**.

```
POSTGRES=# show default_transaction_read_only;
 default_transaction_read_only
-------------------------------
 on
(1 row)
```

- If yes, go to **Step 4**.
- If no, go to **Step 13**.

Step 4 Run the following commands to open the **dbservice.properties** file:

source $DBSERVER_HOME/.dbservice_profile

vi ${DBSERVICE_SOFTWARE_DIR}/tools/dbservice.properties

Step 5 Change the value of **gaussdb_readonly_auto** to **OFF**.

Step 6 Run the following command to open the **dbservice.properties** file:

vi ${DBSERVICE_DATA_DIR}/postgresql.conf

Step 7 Delete **default_transaction_read_only = on**.

Step 8 Run the following command for the configuration to take effect:

gs_ctl reload -D ${DBSERVICE_DATA_DIR}

Step 9 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the right of the alarm "Database Enters the Read-Only Mode", click **Clear** in the **Operation** column. In the dialog box that is displayed, click **OK** to manually clear the alarm.

Step 10 Log in to the active management node of the DBServer as user **omm** and run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

source $DBSERVER_HOME/.dbservice_profile

find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Handle the files that are incorrectly written into the directory based on the actual scenario.

Step 12 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage is lower than 80%.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 15 Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.

Step 16 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.190 ALM-29000 Impala Service Unavailable

Description

The alarm module checks the Impala service status every 30 seconds. This alarm is generated if the Impala service is abnormal.

This alarm is cleared after the Impala service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
29000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When the Impala service is abnormal, you cannot perform cluster operations on Impala through FusionInsight Manager. The Impala service functions are unavailable.

Possible Causes

- The Hive service is abnormal.
- The KrbServer service is abnormal.
- The Impala process is abnormal.

Procedure

Check whether the services on which Impala depends are normal.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** to check whether Hive and KrbServer are stopped.

- If yes, start the stopped services and go to **Step 2**.
- If no, go to **Step 3**.

Step 2 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether the Impala Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether ALM-16004 Hive Service Unavailable and ALM-25500 KrbServer Service Unavailable exist.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the fault by following the handling procedure of ALM-16004 Hive Service Unavailable or ALM-25500 KrbServer Service Unavailable. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the Impala process is normal.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether ALM-12007 Process Fault exists in the alarm list.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Rectify the fault by referring to the handling method of ALM-12007 Process Fault, and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

10.13.191 ALM-29004 Impalad Process Memory Usage Exceeds the Threshold

Description

The system checks the memory usage of the Impalad process every 30 seconds. This alarm is generated when the system detects that the memory usage exceeds the default threshold (80%).

This alarm is automatically cleared when the system detects that the memory usage of the process falls below the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
29004	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

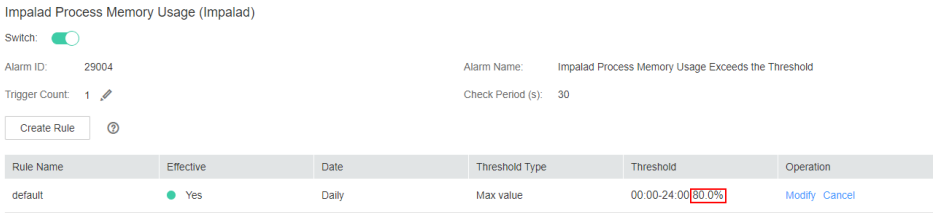
The memory usage is too high. Some query tasks may fail due to insufficient memory.

Possible Causes

The Impalad process is executing a large number of query tasks.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **CPU and Memory** > **Impalad Process Memory Usage (Impalad)** to check the threshold.



Step 2 If the alarm threshold is smaller than 80%, increase the alarm threshold as required and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 If the threshold is greater than 80%, check whether a large number of concurrent query tasks exist when the alarm is generated. A large number of concurrent query tasks will cause the memory usage to increase sharply. After the tasks are complete, the alarm is automatically cleared. During this period, some tasks may fail to be executed or canceled due to insufficient memory. In this case, try again.

NOTE

If the memory usage always exceeds the threshold, the cluster capacity may need to be expanded.

----End

Alarm Clearing

The alarm is automatically cleared after the burst concurrent tasks are complete.

10.13.192 ALM-29005 Number of JDBC Connections to Impalad Exceeds the Threshold

Description

The system checks the number of client connections to the Impalad node every 30 seconds. This alarm is generated when the number of client connections exceeds the customized threshold (60 by default).

This alarm is automatically cleared when the number of client connections is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
29005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

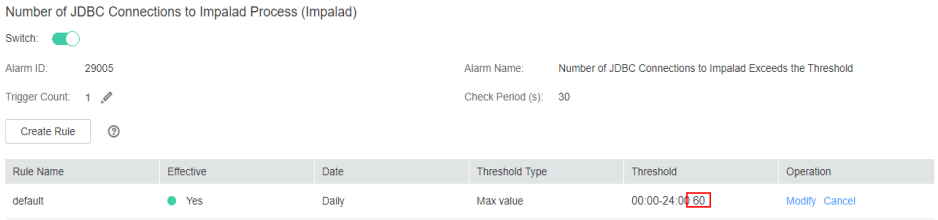
New client connections may be blocked or even fail.

Possible Causes

The number of client connections maintained by the Impalad service is too large or the threshold is too small.

Procedure

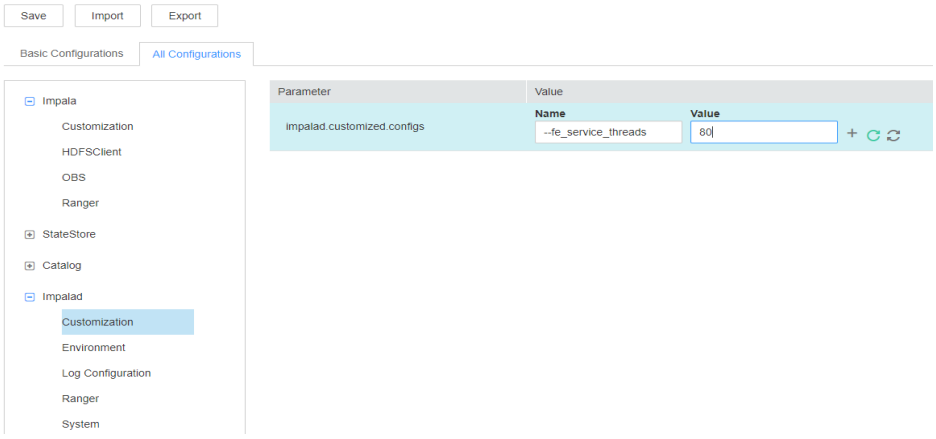
Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **Connections** > **Number of JDBC Connections to Impalad Process** to check the configured threshold.



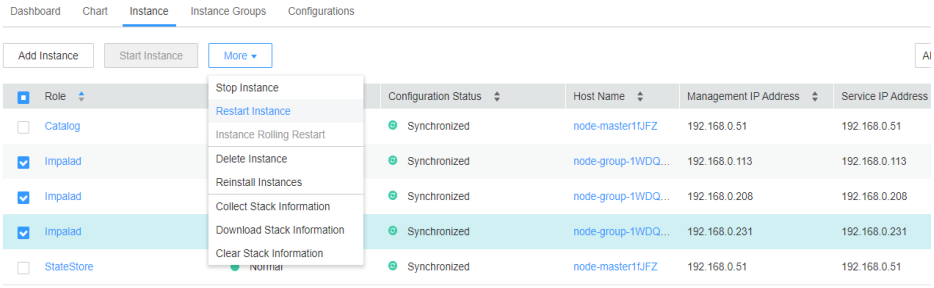
Step 2 Check the number of JDBC applications connected to Impalad and stop idle applications. Check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3** to change the number of concurrent client connections.

Step 3 On FusionInsight Manager, choose **Cluster** > **Impala** > **Configurations** > **All Configurations** > **Impalad** > **Customization**. Add the customized parameter **--fe_service_threads**. The default value of this parameter is **64**. Change the value as required and click **Save**.



Step 4 After the query tasks on all clients are complete, click the **Instance** tab. Select all Impalad instances, and restart them.



Step 5 After the restart is complete, the alarm is cleared. Run the application that uses JDBC to connect to Impalad again.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None

10.13.193 ALM-29006 Number of ODBC Connections to Impalad Exceeds the Threshold

Description

The system checks the number of client connections to the Impalad node every 30 seconds. This alarm is generated when the number of client connections exceeds the customized threshold (60 by default).

This alarm is automatically cleared when the number of client connections is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
29006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

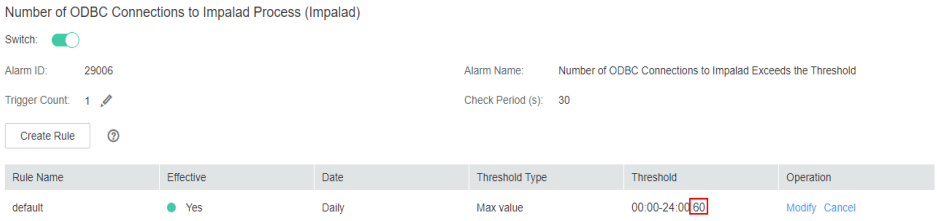
New client connections may be blocked or even fail.

Possible Causes

The number of client connections maintained by the Impalad service is too large or the threshold is too small.

Procedure

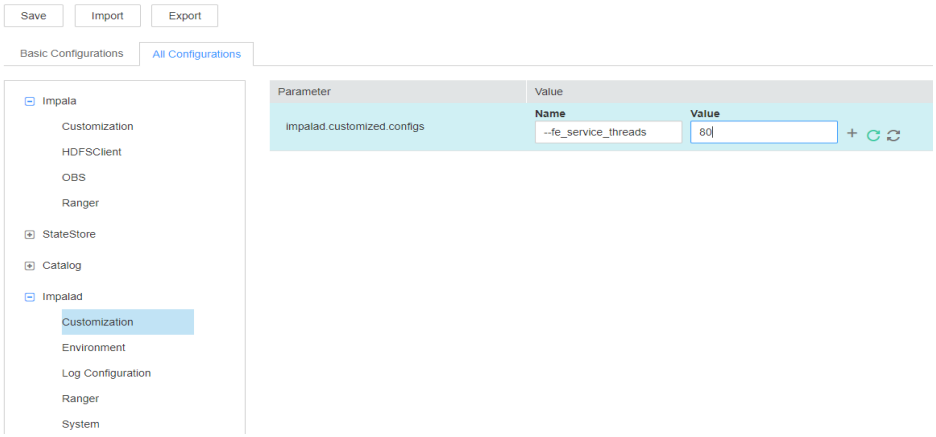
Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **Connections** > **Number of ODBC Connections to Impalad Process (Impalad)** to check the threshold.



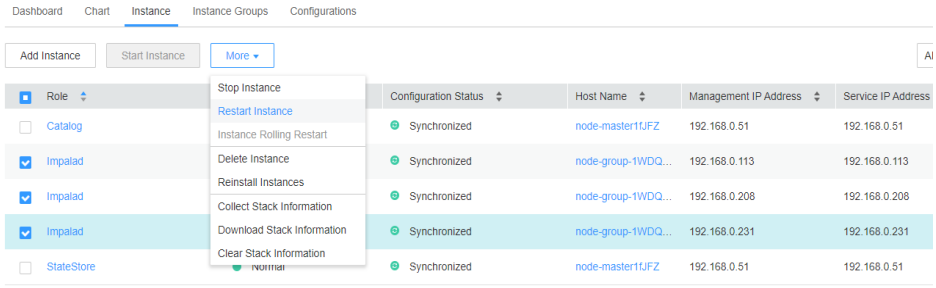
Step 2 Check the number of ODBC applications connected to Impalad and stop idle applications. Check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3** to change the number of concurrent connections supported by Impalad.

Step 3 On FusionInsight Manager, choose **Cluster** > **Impala** > **Configurations** > **All Configurations** > **Impalad** > **Customization**. Add the customized parameter **--fe_service_threads**. The default value of this parameter is **64**. Change the value as required and click **Save**.



Step 4 After the query tasks on all clients are complete, click the **Instance** tab. Select all Impalad instances, and restart them.



Step 5 After the restart is complete, the alarm is cleared. Run the application that uses ODBC to connect to Impalad again.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

10.13.194 ALM-29100 Kudu Service Unavailable

Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the system detects that all Kudu instances are abnormal and considers that the Kudu service is unavailable.

This alarm is cleared when at least one Kudu instance becomes normal and the system considers that the Kudu instance service is restored.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
29100	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Users cannot use the Kudu service.

Possible Causes

Some Kudu instances are abnormal.

Procedure

Handle the Kudu instance exceptions.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, locate the alarm ALM-29100 Kudu Service Unavailable.

Step 2 In the **Location Information** column, record the host name and role name.

Step 3 Choose **Cluster** > **Services** > **Kudu** > **Instance**. Click the role name corresponding to the host name in **Step 2** to restore the instance. Then, check whether the alarm is cleared.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 In the **Service** area, select the following nodes of the desired cluster.

- Kudu

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None

10.13.195 ALM-29104 Tserver Process Memory Usage Exceeds the Threshold

Description

The system checks the memory usage of the Kudu Tserver process every 60 seconds. This alarm is generated when the system detects that the memory usage of the Kudu Tserver process exceeds the threshold.

This alarm is cleared when the memory usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
29104	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Users cannot use the Kudu service.

Possible Causes

The memory usage of a KuduTserver instance is too high.

Procedure

Handle the Kudu instance exceptions.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, locate the alarm ALM-29104 Tserver Process Memory Usage Exceeds the Threshold.

Step 2 Choose **O&M** > **Alarm** > **Threshold Configuration** > **Kudu**. Locate the alarm threshold and compare it with the memory monitoring item of the cluster Kudu instance to check whether the memory usage exceeds the threshold. If the memory usage exceeds the threshold, rectify the fault or change the threshold.

Step 3 Choose **O&M** > **Alarm** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to step 4.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 In the **Service** area, select the following nodes of the desired cluster.

- Kudu

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

10.13.196 ALM-29106 Tserver Process CPU Usage Exceeds the Threshold

Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the system detects that the CPU usage of the Kudu Tserver process is too high.

This alarm is cleared when the CPU usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
29106	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Users cannot use the Kudu service.

Possible Causes

The CPU usage of a KuduTserver instance is too high.

Procedure

Handle the Kudu instance exceptions.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm**. On the displayed page, check whether ALM-29106 Tserver Process CPU Usage Exceeds the Threshold is generated.

- If yes, go to 2.
- If no, go to step 4.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > **Kudu**. Locate the alarm threshold and check whether the CPU usage of the cluster Kudu instance exceeds the threshold. If yes, rectify the fault or change the threshold.

Step 3 Choose **O&M** > **Alarm** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to step 4.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 In the **Service** area, select the following nodes of the desired cluster.

- Kudu

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

10.13.197 ALM-29107 Tserver Process Memory Usage Exceeds the Threshold

Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the memory usage of the Kudu Tserver process exceeds the threshold.

This alarm is cleared when the memory usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
29107	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Users cannot use the Kudu service.

Possible Causes

The memory usage of the KuduTserver instance is too high.

Procedure

Handle the Kudu instance exceptions.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm**. On the displayed page, locate the alarm ALM-29107 Tserver Process Memory Usage Exceeds the Threshold and view the alarm source.

Step 2 Choose **O&M** > **Alarm** > **Threshold Configuration** > **Kudu**, find the threshold of the alarm, compare the memory usage of the KuduTserver instance in the cluster with the threshold, and find the node whose memory usage exceeds the threshold.

Add nodes or reschedule jobs to reduce the memory usage of the Tserver node or change the threshold.

Step 3 Choose **O&M** > **Alarm** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to step 4.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 In the **Service** area, select the following nodes of the desired cluster.

- Kudu

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.198 ALM-38000 Kafka Service Unavailable

Description

The system checks the Kafka service status every 30 seconds. This alarm is generated when the Kafka service is unavailable.

This alarm is cleared when the Kafka service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Kafka service, and users cannot perform new Kafka tasks.

Possible Causes

- The KrbServer service is abnormal.(Skip this step if the normal mode is used.)
- The ZooKeeper service is abnormal or does not respond.
- The Broker instance in the Kafka cluster are abnormal.

Procedure

Check the status of the KrbServer service. (Skip this step if the normal mode is used.)

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > KrbServer**.

Step 2 Check whether the running status of the KrbServer service is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**.

Step 4 Perform **Step 2** again.

Check the status of the ZooKeeper cluster.

Step 5 Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 If ZooKeeper service is stopped, start it, else rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.

Step 7 Perform **Step 5** again.

Check the Broker status.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to go to the Kafka instances page.

Step 9 Check whether all instances in **Roles** are running properly.

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Select all Broker instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** to check whether the running status is **Normal**.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collecting Fault Information

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 14 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.199 ALM-38001 Insufficient Kafka Disk Capacity

Description

The system checks the Kafka disk usage every 60 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated when the disk usage is greater than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds**. Under the service list, choose **Kafka > Disk > Broker Disk Usage (Broker)** and change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the Kafka disk usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Kafka disk usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Kafka data write operations are affected.

Possible Causes

- The configuration (such as number and size) of the disks for storing Kafka data cannot meet the requirement of the current service traffic, due to which the disk usage reaches the upper limit.
- Data retention time is too long, due to which the data disk usage reaches the upper limit.
- The service plan does not distribute data evenly, due to which the usage of some disks reaches the upper limit.

Procedure

Check the disk configuration of Kafka data.

Step 1 On the FusionInsight Manager portal and click **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, locate the alarm and obtain **HostName** from **Location**.

Step 3 Click **Cluster** > *Name of the desired cluster* > **Hosts**.

Step 4 In the host list, click the host name obtained in **Step 2**.

Step 5 Check whether the **Disk** area contains the partition name in the alarm.

- If yes, go to **Step 6**.
- If no, manually clear the alarm and no further operation is required.

Step 6 Check whether the disk partition usage contained in the alarm reaches 100% in the **Disk** area.

- If yes, handle the alarm by following the instructions in **Related Information**.
- If no, go to **Step 7**.

Check the Kafka data storage duration.

Step 7 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations**.

Step 8 Check whether the value of parameter **disk.adapter.enable** is set to **true**.

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Set the value of **disk.adapter.enable** to **true**. Check whether the value of **adapter.topic.min.retention.hours** is properly set.

- If yes, go to **Step 10**.
- If no, adjust the data retention period based on service requirements.

NOTICE

If the disk auto-adaptation function is enabled, some historical data of specified topics is deleted. If the retention period of some topics cannot be adjusted, click **All Configurations** and add the topics to the value of the **disk.adapter.topic.blacklist** parameter.

Step 10 Wait 10 minutes and check whether the usage of faulty disks reduces.

- If yes, wait until the alarm is cleared.
- If no, go to **Step 11**.

Check the Kafka data plan.

Step 11 In the **Instance** area, click **Broker**. In the **Real Time** area of Broker, Click the drop-down menu in the Chart area and choose **Customize** to customize monitoring items.

Step 12 In the dialog box, select **Disk** > **Broker Disk Usage** and click **OK**.

The Kafka disk usage information is displayed.

Step 13 View the information in **Step 12** to check whether there is only the disk parathion for which the alarm is generated in **Step 2**.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Perform disk planning and mount a new disk again. Go to the **Instance Configurations** page of the node for which the alarm is generated, modify **log.dirs**, add other disk directories, and restart the Kafka instance.

Step 15 Determine whether to shorten the data retention time configured on Kafka based on service requirements and service traffic.

- If yes, go to **Step 16**.

- If no, go to **Step 17**.

Step 16 Log in to FusionInsight Manager, select **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations**, and click **All Configurations**. In the search box on the right, enter **log.retention.hours**. The value of the parameter indicates the default data retention time of the topic. You can change the value to a smaller one.

NOTE

- For a topic whose data retention time is configured alone, the modification of the data retention time on the Kafka Service Configuration page does not take effect.
- To modify the data retention time for a topic, use the Kafka client command-line interface (CLI) to configure the topic.

  Example: **kafka-topics.sh --zookeeper "***ZooKeeper IP address***:2181/kafka" --alter --topic "***Topic bane***" --config retention.ms= "***retention time***"**

Step 17 Check whether the usage of some disks reaches the upper limit due to unreasonable configuration of the partitions of some topics. For example, the number of partitions configured for a topic with large data volume is smaller than the number of disks. In this case, the data is not evenly allocated to disks.

NOTE

If you do not know which topic has large data volume, you can log in to an instance node based on the host node information obtained in **Step 2**, and go to the data directory (directory specified by **log.dirs** before the modification in **Step 14**) to check whether there is topic with partition that use large disk space.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Step 18 In the Kafka client CLI, run the following command to perform partition capacity expansion for the topic:

kafka-topics.sh --zookeeper "*ZooKeeper IP address***:2181/kafka" --alter --topic "***Topic name***" --partitions="***New number of partitions***"**

NOTE

- You are advised to set the new number of partitions to a multiple of the number of Kafka data disks.
- The step may not quickly clear the alarm, and you need to modify the data retention time in **Step 11** to gradually balance data allocation.

Step 19 Determine whether to perform capacity expansion.

NOTE

You are advised to perform capacity expansion for Kafka when the current disk usage exceeds 80%.

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 Expand the disk capacity and check whether the alarm is cleared after capacity expansion.

- If yes, no further action is required.
- If no, go to **Step 22**.

Step 21 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 22**.

Collect fault information.

Step 22 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 23 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 24 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 25 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

Step 1 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**, stop the Broker instance whose status is **Restoring**, record the management IP address of the node where the Broker instance is located, and record **broker.id**. The value can be obtained by using the following method: Click the role name. On the **Configurations** page, select **All Configurations**, and search for the **broker.id** parameter.

Step 2 Log in to the recorded management IP address as user **root**, and run the **df -lh** command to view the mounted directory whose disk usage is 100%, for example, **${BIGDATA_DATA_HOME}/kafka/data1**.

Step 3 Go to the directory, run the **du -sh *** command to view the size of each file in the directory,check whether files other than **kafka-logs** exist, and determine whether these files can be deleted or migrated.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 Go to the **kafka-logs** directory, run the **du -sh *** command, select a partition folder to be moved. The naming rule is **Topic name-Partition ID**. Record the topic and partition.

Step 5 Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the **kafka-logs** directory in the same way.

1. Decrease the number in the second line in the file. (To remove multiple directories, the number deducted is equal to the number of files to be removed.)
2. Delete the line of the to-be-removed partition. (The line structure is "Topic name Partition ID Offset". Save the data before deletion. Subsequently, the content must be added to the file of the same name in the destination directory.)

Step 6 Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the destination data directory. For example, **${BIGDATA_DATA_HOME}/kafka/data2/kafka-logs** in the same way.

- Increase the number in the second line in the file. (To move multiple directories, the number added is equal to the number of files to be moved.)
- Add the to-be moved partition to the end of the file. (The line structure is "Topic name Partition ID Offset". You can copy the line data saved in **Step 5**.)

Step 7 Move the partition to the destination directory. After the partition is moved, run the **chown omm:wheel -R** *Partition directory* command to modify the directory owner group for the partition.

Step 8 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to start the Broker instance.

Step 9 Wait for 5 to 10 minutes and check whether the health status of the Broker instance is **Normal**.

- If yes, resolve the disk capacity insufficiency problem according to the handling method of "ALM-38001 Insufficient Kafka Disk Space" after the alarm is cleared.
- If no, contact the O&M personnel.

----End

10.13.200 ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold

Description

The system checks the Kafka service status every 30 seconds. The alarm is generated when the heap memory usage of a Kafka instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available Kafka heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the Kafka instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Kafka Heap Memory Usage Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Process** > **Heap Memory Usage of Kafka**, and click **OK**.

Step 3 Check whether the used heap memory of Kafka reaches 95% of the maximum heap memory specified for Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Check the heap memory size configured for Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations**> **Broker(Role)** > **Environment**. Increase the value of **KAFKA_HEAP_OPTS** by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Heap Memory Usage of Kafka** by referring to **Step 2**, and set the value of **KAFKA_HEAP_OPTS** to twice the value of **Heap Memory Used by Kafka.**

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.201 ALM-38004 Kafka Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Kafka service every 30 seconds. This alarm is generated when the direct memory usage of a Kafka instance exceeds the threshold (80% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the direct memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the direct memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the Kafka instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Kafka Direct Memory Usage Exceeds the Threshold** > **Location** to check the host name of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the Chart area and choose **Customize** > **Process** > **Kafka Direct Memory Usage**, and click **OK**.

Step 3 Check whether the used direct memory of Kafka reaches 80% of the maximum direct memory specified for Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the direct memory size configured for the Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)**

> **Environment** to increase the value of **-Xmx** configured in the **KAFKA_HEAP_OPTS** parameter by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Kafka Direct Memory Usage** by referring to **Step 2**, and set the value of **KAFKA_HEAP_OPTS** to twice the value of **Direct Memory Used by Kafka.**

Step 5 Save the configuration and restart the Kafka service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.202 ALM-38005 GC Duration of the Broker Process Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the Broker process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the GC duration is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the GC duration is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the Broker process may interrupt the services.

Possible Causes

The Kafka GC duration of the node is too long or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **GC Duration of the Broker Process Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Process** > **Broker GC Duration per Minute**, and click **OK**.

Step 3 Check whether the GC duration of the Broker process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the direct memory size configured for the Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Environment** to increase the value of **-Xmx** configured in the **KAFKA_HEAP_OPTS** parameter by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to set the value of **KAFKA_HEAP_OPTS** to twice the value of **Direct Memory Used by Kafka.**

  On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Process** > **Kafka Direct Memory Resource Status** to check the value of **Direct Memory Used by Kafka**.

Step 5 Save the configuration and restart the Kafka service.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.203 ALM-38006 Percentage of Kafka Partitions That Are Not Completely Synchronized Exceeds the Threshold

Description

The system checks the percentage of Kafka partitions that are not completely synchronized to the total number of partitions every 60 seconds. This alarm is

generated when the percentage exceeds the threshold (50% by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Too many Kafka partitions that are not completely synchronized affect service reliability. In addition, data may be lost when leaders are switched.

Possible Causes

Some nodes where the Broker instance resides are abnormal or stop running. As a result, replicas of some partitions in Kafka are out of the in-sync replicas (ISR) set.

Procedure

Check Broker instances.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.

Step 2 Check whether faulty nodes exist among all Broker nodes.

- If yes, record the host name of the node and go to **Step 3**.

- If no, go to **Step 5**.

Step 3 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** to check whether the fault described in **Step 2** exists in the alarm information and handle the alarm based on corresponding methods.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.

Step 5 Check whether stopped nodes exist among all Broker instance.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Select all stopped Broker instances and click **Start Instance**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.204 ALM-38007 Status of Kafka Default User Is Abnormal

Description

The system checks the default user of Kafka every 60 seconds. This alarm is generated when the system detects that the user status is abnormal.

Trigger Count is set to **1**. This alarm is cleared when the user status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38007	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the condition that the Kafka default user status is abnormal.

Impact on the System

If the Kafka default user status is abnormal, metadata synchronization between Brokers and interaction between Kafka and ZooKeeper will be affected, affecting service production, consumption, and topic creation and deletion.

Possible Causes

- The Sssd service is abnormal.
- Some Broker instances stop running.

Procedure

Check whether the Sssd service is abnormal.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Status of Kafka Default User Is Abnormal** > **Location** to check the host name of the instance for which the alarm is generated.

Step 2 Find the host information in the alarm information and log in to the host.

Step 3 Run the **id -Gn kafka** command and check whether "No such user" is displayed in the command output.

- If yes, record the host name of the node and go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms**. Check whether there is **Sssd Service Exception** in the alarm information. If there is, handle the alarm based on alarm information.

Check the running status of the Broker instance.

Step 5 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instance page is displayed.

Step 6 Check whether there are stopped nodes on all Broker instances.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Select all stopped Broker instances and click **Start Instance**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 In the **Service** area, select **Kafka** in the required cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.205 ALM-38008 Abnormal Kafka Data Directory Status

Description

The system checks the Kafka data directory status every 60 seconds. This alarm is generated when the system detects that the status of a data directory is abnormal.

Trigger Count is set to **1**. This alarm is cleared when the data directory status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
DirName	Specifies the directory name for which the alarm is generated.
Trigger Condition	Specifies the condition that the Kafka data directory status is abnormal.

Impact on the System

If the Kafka data directory status is abnormal, the current replicas of all partitions in the data directory are brought offline, and the data directory status of multiple nodes is abnormal at the same time. As a result, some partitions may become unavailable.

Possible Causes

- The data directory permission is tampered with.
- The disk where the data directory is located is faulty.

Procedure

Check the permission on the faulty data directory.

Step 1 Find the host information in the alarm information and log in to the host.

Step 2 In the alarm information, check whether the data directory and its subdirectories belong to the omm:wheel group.

- If yes, record the host name of the node and go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Restore the owner group of the data directory and its subdirectories to omm:wheel.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Check whether the disk where the data directory is located is faulty.

Step 4 In the upper-level directory of the data directory, create and delete files as user **omm**. Check whether data read/write on the disk is normal.

Step 5 Replace or repair the disk where the data directory is located to ensure that data read/write on the disk is normal.

Step 6 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. On the Kafka instance page that is displayed, restart the Broker instance on the host recorded in **Step 2**.

Step 7 After Broker is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** area, select **Kafka** in the required cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.206 ALM-38009 Busy Broker Disk I/Os

Description

The system checks the I/O status of each Kafka disk every 60 seconds. This alarm is generated when the I/O status of a Kafka data directory disk on a broker exceeds the threshold (80% by default).

The alarm smoothing time is 3. This alarm is cleared when the disk I/O is lower than the threshold (80% by default).

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38009	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Data directory name	Name of the data directory of the Kafka disk with busy I/Os

Impact on the System

The I/O usage of the disk partition is high. Data may fail to be written to the Kafka topic for which the alarm is generated.

Possible Causes

- There are many replicas configured for a topic.
- The parameter specifying producer message batch write is inappropriately configured. The service traffic of this topic is too heavy, and the current partition configuration is inappropriate.

Procedure

Check the number of replication.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. On the displayed page, select this alarm, and check the **TopicName** for which this alarm is generated.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **KafkaTopic Monitor**. Search the topic for which this alarm is generated. On the displayed page, view the number of **replication**.

Step 3 If the number of replication is greater than 3, decrease the value to **3**.

Specifically, run the following command to re-plan replicas of the Kafka topic.

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}*/**kafka --reassignment-json-file** *{manual assignment json file path}* **--execute**

For example:

/opt/Bigdata/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 10.149.0.90:2181,10.149.0.91:2181,10.149.0.92:2181/kafka --reassignment-json-file expand-cluster-reassignment.json --execute

NOTE

In the **expand-cluster-reassignment.json** file, describe the Brokers to which the partitions of the topic are migrated in the format of {"partitions":[{"topic": "*topicName*","partition": 1,"replicas": [1,2,3] }],"version":1}.

Step 4 After a period of time, check whether this alarm is cleared. If this alarm persists, go to **Step 5**.

Check the partition planning of the topic.

Step 5 On the **KafkaTopic Monitor** page, click **Topic Traffic** > **Topic Input Traffic** of each topic to obtain the topic with the largest value of **Topic Input Traffic,** and check partitions on this topic and information about hosts of these partitions.

Step 6 Log in to the hosts queried in **Step 5** and run the **iostat -d -x** command to check the value of **%util** for each disk:

```
189-39-172-162:/opt/R3/FusionInsight_Manager/software/packs # iostat -d -x
Linux 3.0.76-0.11-default (189-39-172-162)      06/26/19        _x86_64_

Device:         rrqm/s   wrqm/s     r/s     w/s    rsec/s    wsec/s avgrq-sz avgqu-sz   await  svctm  %util
xvda              0.04    44.44    1.26   21.94     43.62    531.02    24.78     0.03    1.44   0.56   1.30
xvde              0.16   431.84   13.78   82.51    284.32   4115.90    45.70     0.06    1.41   0.64   6.21
```

- If the value is high for each disk, expand the Kafka disks. After the capacity expansion, plan partitions of the topic by following the instruction in **Step 3**.
- If values of **%util** for the disks vary greatly, check the disk partition configuration of Kafka.For example: The configuration item indicates **log.dirs** in the **server.properties** file in the **${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_14_Broker/etc** directory.

  Run the following command to view information about the Filesystem:

  df -h log.dirs *configuration item*.

  The command output is as follows:

  ```
  189-39-172-162:/opt/R3/FusionInsight_Manager/software/packs # df -h /srv/BigData/kafka/data1/kafka-logs/
  Filesystem      Size  Used Avail Use% Mounted on
  /dev/xvda2       36G   21G   14G  62% /
  189-39-172-162:/opt/R3/FusionInsight_Manager/software/packs #
  ```

- If the partition of the Filesystem matches the partition with the high **%util**, plan Kafka partitions on idle disks, and set **log.dirs** to directories of the idle disk. Then, plan partitions of the topic by following the instruction in **Step 3**. to ensure that the partitions of the topic are evenly distributed to disks.

Step 7 After a period of time, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, repeat **Step 5** to **Step 6** for three times. If the number of repeated execution times reaches the upper limit, go to **Step 8**.

Step 8 After a period of time, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 In the **Service** area, select **Kafka** in the required cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.207 ALM-38010 Topics with Single Replica

Description

The system checks the number of replicas of each topic every 60 seconds on the node where the Kafka Controller resides. This alarm is generated when there is one replica for a topic.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38010	Warning	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
TopicName	Specifies the list of topics for which the alarm is generated.

Impact on the System

There is the single point of failure (SPOF) risk for topics with only one replica. When the node where the replica resides becomes abnormal, the partition does not have a leader, and services on the topic are affected.

Possible Causes

- The number of replicas for the topic is incorrectly configured.

Procedure

Check the number of replicas for the topic.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ of this alarm, and view the **TopicName** list in **Location**.

Step 2 Check whether replicas need to be added for the topic for which the alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight client, re-plan topic replicas and describe the partition distribution of the topic in the **add-replicas-reassignment.json** file in the following format: {"partitions":[{"topic": "*topic name*","partition": 1,"replicas": [1,2] }],"version":1}. Then, run the following command to add replicas:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}*/**kafka --reassignment-json-file** *{manual assignment json file path}* **--execute**

For example:

/opt/Bigdata/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --execute

Step 4 Run the following command to check the task execution progress:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}*/**kafka --reassignment-json-file** *{manual assignment json file path}* **--verify**

For example:

/opt/Bigdata/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --verify

Step 5 After completing the handling operations or confirming that the alarm has no impact, manually clear the alarm on FusionInsight Manager.

Step 6 After a period of time, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service** area, select **Kafka** in the required cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

If the alarm has no impact, manually clear the alarm.

Related Information

None

10.13.208 ALM-43001 Spark2x Service Unavailable

Description

The system checks the Spark2x service status every 300 seconds. This alarm is generated when the Spark2x service is unavailable.

This alarm is cleared when the Spark2x service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43001	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The tasks submitted by users fail to be executed.

Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The corresponding Hive service is abnormal.
- Spark2x assembly packet is abnormal.

Procedure

If the alarm is abnormal Spark2x assembly packet, the Spark packet is abnormal. Wait for about 10 minutes. The alarm is automatically cleared.

Check whether service unavailability alarms exist in services depended by **Spark2x.**

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

Step 2 Check whether the following alarms exist in the alarm list:

- ALM-25500 KrbServer Service Unavailable
- ALM-25000 LdapServer Service Unavailable
- ALM-13000 ZooKeeper Service Unavailable
- ALM-14000 HDFS Service Unavailable
- ALM-18000 Yarn Service Unavailable
- ALM-16004 Hive Service Unavailable

NOTE

If the multi-instance function is enabled in the cluster and multiple Spark2x service instances are installed, you need to determine the Spark2x service instance where the alarm is generated based on the value of ServiceName in **Location**. Then you need to check whether the corresponding Hive service is faulty. Spark2x corresponds to Hive, and Spark2x1 corresponds to Hive1. The others follow the same rule.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Handle the service unavailability alarms based on the troubleshooting methods provided in the alarm help.

After all the service unavailability alarms are cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select the following nodes in the required cluster from the **Service** (Hive is the specific Hive service determined based on **ServiceName** in the alarm location information).

- KrbServer
- LdapServer
- ZooKeeper
- HDFS
- Yarn
- Hive

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.209 ALM-43006 Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JobHistory2x Process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the JobHistory2x Process is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43006**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JobHistory2x Process reaches the

threshold(default value is 95%) of the maximum heap memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **SPARK_DAEMON_MEMORY** is 4GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.210 ALM-43007 Non-Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JobHistory2x Process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the JobHistory2x Process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43007**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**, Check whether the used non-heap memory of the JobHistory2x Process reaches the threshold(default value is 95%) of the maximum non-heap memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the non-heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. You can change the value of **-XX:MaxMetaspaceSize** in **SPARK_DAEMON_JAVA_OPTS** according to the following rules: Ratio of the JobHistory2x non-heap memory usage to the **Threshold** of **JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** in the alarm period.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

10.13.211 ALM-43008 The Direct Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the direct memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JobHistory2x Process direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistory2x Process is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43008**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct memory of the JobHistory2x Process reaches the threshold(default value is 95%) of the maximum direct memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Direct Memory of JobHistory2x**, and click **OK**. Based on the alarm generation time, check the values of the used direc memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** ***N****ame of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **-XX:MaxDirectMemorySize** in **SPARK_DAEMON_JAVA_OPTS** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. It is recommended that the value be less than or equal to the value of **SPARK_DAEMON_MEMORY**.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.212 ALM-43009 JobHistory2x Process GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) time of the JobHistory2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks.) To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Time** > **Total GC time in milliseconds (JobHistory2x)**. This alarm is cleared when the JobHistory2x GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the GC time exceeds the threshold, JobHistory2x maybe run in low performance.

Possible Causes

The memory of JobHistory2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of JobHistory2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold(default value: 12 seconds).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **SPARK_DAEMON_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.

Step 4 Restart all JobHistory2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log > Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.213 ALM-43010 Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JDBCServer2x Process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the JDBCServer2x Process is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43010**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JDBCServer2x Process reaches the threshold(default value is 95%) of the maximum heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. The default value of **SPARK_DRIVER_MEMORY** is 4 GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JobHistory2x to the **Threshold** of the

JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x) in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.214 ALM-43011 Non-Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of an JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JDBCServer2x Process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the JDBCServer2x Process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43011**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**, Check whether the used non-heap memory of the JDBCServer2x Process reaches the threshold(default value is 95%) of the maximum non-heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper

right corner of the chart area, choose **Customize** > **Memory > Statistics for the non-heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. You can change the value of **-XX: MaxMetaspaceSize** in **spark.driver.extraJavaOptions** according to the following rules: Ratio of the JDBCServer2x non-heap memory usage to the **Threshold** of **JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** in the alarm period.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** > **JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log >Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.215 ALM-43012 Direct Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the direct heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Auto Clear
43012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available JDBCServer2x Process direct heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct heap memory of the JDBCServer2x Process is overused or the direct heap memory is inappropriately allocated.

Procedure

Check direct heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43012**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > Memory > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct heap memory of the JDBCServer2x Process reaches

the threshold(default value is 95%) of the maximum direct heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Direct Memory of JDBCServer2x**, and click **OK**. Based on the alarm generation time, check the values of the used direct memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. The default value of **-XX:MaxDirectMemorySize** in **spark.driver.extraJavaOptions** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JDBCServer2x to the **Threshold** of the **JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high service concurrency, you are advised to add instances.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* **> Spark2x** > **Memory** >**JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.216 ALM-43013 JDBCServer2x Process GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) time of the JDBCServer2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks.) To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Time** > **Total GC time in milliseconds (JDBCServer2x)**. This alarm is cleared when the JDBCServer2x GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

If the GC time exceeds the threshold, JDBCServer2x maybe run in low performance.

Possible Causes

The memory of JDBCServer2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43013**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of JDBCServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold(default value: 12 seconds).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Default**. The default value of **SPARK_DRIVER_MEMORY** is 4 GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Restart all JDBCServer2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log > Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

10.13.217 ALM-43017 JDBCServer2x Process Full GC Number Exceeds the Threshold

Description

The system checks the number of Full garbage collection (GC) times of the JDBCServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive checks.) You can change the threshold by choosing **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC number** > **Full GC Number of JDBCServer2x**. This alarm is cleared when the Full GC number of the JDBCServer2x process is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43017	Major	Yes

Parameters

Name	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The performance of the JDBCServer2x process is affected, or even the JDBCServer2x process is unavailable.

Possible Causes

The heap memory usage of the JDBCServer2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

Procedure

Check the number of Full GCs.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. On the displayed page, click the JDBCServer2x for which the alarm is reported. On the **Dashboard** page that is displayed, click the drop-down menu in the Chart area and choose **Customize** > **GC Number** > **Full GC Number of JDBCServer2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JDBCServer2x process is greater than the threshold(default value: 12).

- If it is, go to **Step 3**.
- If it is not, go to **Step 6**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations**. On the displayed page, choose **JDBCServer2x** > **Tuning**. The default value of **SPARK_DRIVER_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

Step 4 Restart all JDBCServer2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 Log in to FusionInsight Manager, and choose **O&M** > **Log** > **Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

10.13.218 ALM-43018 JobHistory2x Process Full GC Number Exceeds the Threshold

Description

The system checks the number of Full garbage collection (GC) times of the JobHistory2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive checks.) You can change the threshold by choosing **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC number** > **Full GC Number of JobHistory2x**. This alarm is cleared when the Full GC number of the JobHistory2x process is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43018	Major	Yes

Parameters

Name	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The performance of the JobHistory2x process is affected, or even the JobHistory2x process is unavailable.

Possible Causes

The heap memory usage of the JobHistory2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

Procedure

Check the number of Full GCs.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. On the displayed page, click the JobHistory2x for which the alarm is reported. On the **Dashboard** page that is displayed, click the drop-down menu in the Chart area and choose **Customize** > **GC Number** > **Full GC Number of JobHistory2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JobHistory2x process is greater than the threshold(default value: 12).

- If it is, go to **Step 3**.
- If it is not, go to **Step 6**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations**. On the displayed page, choose **JobHistory2x** > **Default.** The default value of **SPARK_DAEMON_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.

Step 4 Restart all JobHistory2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 Log in to FusionInsight Manager, and choose **O&M** > **Log** > **Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

10.13.219 ALM-43019 Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Severity	Auto Clear
43019	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available IndexServer2x process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated.

Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43019**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **IndexServer2x Memory Usage Statistics** > **OK**. Check whether the heap memory used by the IndexServer2x process reaches the maximum heap memory threshold (95% by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Statistics for the heap memory of the IndexServer2x Process** > **OK**. Based on the alarm generation time, check the values of the used heap memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configuration** > **IndexServer2x**> **Tuning**. The default value of the **SPARK_DRIVER_MEMORY** parameter is 4 GB. You can change the value based on the ratio of the maximum heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, double the rate.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

10.13.220 ALM-43020 Non-Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the non-heap memory usage of the IndexServer2x process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Severity	Auto Clear
43020	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available IndexServer2x process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the IndexServer2x process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43020**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory > IndexServer2x Memory Usage Statistics** > **OK**. Check whether the non-heap memory used by the IndexServer2x process reaches the maximum non-heap memory threshold (95% by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Statistics for the non-heap memory of the IndexServer2x Process** > **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x**> **Tuning**. You can change the value of **XX:MaxMetaspaceSize** in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum non-heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** in the alarm period.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

10.13.221 ALM-43021 Direct Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the direct heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

Attribute

Alarm ID	Severity	Auto Clear
43021	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available IndexServer2x process direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct heap memory of the IndexServer2x process is overused or the direct heap memory is inappropriately allocated.

Procedure

Check direct heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43021**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **IndexServer2x Memory Usage Statistics** > **OK**. Check whether the direct memory used by the IndexServer2x process reaches the maximum direct memory threshold.

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Direct Memory of IndexServer2x** > **OK**. Based on the alarm generation time, check the values of the used direct memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x**> **Tuning**. You can change the value of **XX:MaxDirectMemorySize** (the default value is 512 MB) in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum direct memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, double the rate.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.

- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

None

10.13.222 ALM-43022 IndexServer2x Process GC Time Exceeds the Threshold

Description

The system checks the GC time of the IndexServer2x process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Time** > **Total GC time in milliseconds (IndexServer2x)**. This alarm is cleared when the IndexServer2x GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Severity	Auto Clear
43022	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the GC time exceeds the threshold, IndexServer2x may run in low performance or even unavailable.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, GC occurs frequently.

Procedure

Check the GC time.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm with ID **43022**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance** and click the IndexServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold (default value: 12 seconds).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Default**. The default value of the **SPARK_DRIVER_MEMORY** is 4 GB. You can change the value according to the following rules: Increase the value of the **SPARK_DRIVER_MEMORY** parameter 1.5 times to its default value. If this alarm is still generated occasionally after the adjustment, increase the value by 0.5 times. Double the value if the alarm is reported frequently.

Step 4 Restart all IndexServer2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

None

10.13.223 ALM-43023 IndexServer2x Process Full GC Number Exceeds the Threshold

Description

The system checks the Full GC number of the IndexServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (12) for three consecutive times. You can change the threshold by choosing **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Number** > **Full GC Number of IndexServer2x**. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold.

Attribute

Alarm ID	Severity	Auto Clear
43023	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the GC number exceeds the threshold, IndexServer2x maybe run in low performance or even unavailable.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

Procedure

Check the number of Full GCs.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. In the displayed alarm list, choose the alarm with the ID **43023**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance** and click the IndexServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the chart area and choose **Customize** > **GC Number > Full GC Number of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC number is larger than the threshold (default value: 12).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Tuning**. The default value of the **SPARK_DRIVER_MEMORY** is 4 GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. Double the value if the alarm is reported frequently. In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Restart all IndexServer2x instances.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

10.13.224 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold

Description

This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold. The system queries the number of queuing tasks in a resource group through the JMX interface. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to configure a resource group. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to configure the threshold of each resource group.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44004	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the number of queuing tasks in a resource group exceeds the threshold, a large number of tasks may be in the queuing state. The Presto task time exceeds the expected value. When the number of queuing tasks in a resource group exceeds the maximum number (**maxQueued**) of queuing tasks in the resource group, new tasks cannot be executed.

Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

Procedure

Step 1 Choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to adjust the resource group configuration.

Step 2 You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to modify the threshold of each resource group.

Step 3 Collect fault information.

1. Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks based on **Resource Group** in the additional information on the Presto client.
2. Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and search for resource group information to view the monitoring collection information of the resource group.
3. Contact the O&M personnel and send the collected logs.

10.13.225 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold

Description

The system collects GC time of the Presto Coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Presto** > **Coordinator** > **Presto Process Garbage Collection Time** > **Garbage Collection Time of the Coordinator Process** on MRS Manager. This alarm is cleared when the Coordinator process GC time is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44005	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the GC time of the Coordinator process is too long, the Coordinator process running performance will be affected and the Coordinator process will even be unavailable.

Possible Causes

The heap memory of the Coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.

   NOTE

   For MRS 1.8.10 or earlier, log in to MRS Manager and choose **Alarms**.

2. Select the alarm whose **Alarm ID** is **44005** and then check the role name in **Location** and confirm the IP adress of the instance.
3. Choose **Components** > **Presto** > **Instances** > **Coordinator** (business IP address of the instance for which the alarm is generated) > **Customize** > **Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Coordinator process is longer than 5 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Presto** > **Service Configuration**, and switch **Basic** to **All**. Choose **Presto** > **Coordinator**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.

6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

Reference

None

10.13.226 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold

Description

The system collects GC time of the Presto Worker process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Presto** > **Worker** > **Presto Garbage Collection Time** > **Garbage Collection Time of the Worker Process** on MRS Manager. This alarm is cleared when the Worker process GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44006	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the GC time of the Worker process is too long, the Worker process running performance will be affected and the Worker process will even be unavailable.

Possible Causes

The heap memory of the Worker process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.

   NOTE

   For MRS 1.8.10 or earlier, log in to MRS Manager and choose **Alarms**.

2. Select the alarm whose **Alarm ID** is **44006**. Then check the role name in **Location** and confirm the IP adress of the instance.
3. Choose **Components** > **Presto** > **Instances** > **Worker** (business IP address of the instance for which the alarm is generated) > **Customize** > **Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Worker process is longer than 5 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Presto** > **Service Configuration**, and switch **Basic** to **All**, and choose **Presto** > **Worker** Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

10.13.227 ALM-45175 Average Time for Calling OBS Metadata APIs Is Greater than the Threshold

Description

The system checks whether the average duration for calling OBS metadata APIs is greater than the threshold every 30 seconds. This alarm is generated when the number of consecutive times that the average time exceeds the specified threshold is greater than the number of smoothing times.

This alarm is automatically cleared when the average duration for calling the OBS metadata APIs is lower than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45175	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the average time for calling the OBS metadata APIs exceeds the threshold, the upper-layer big data computing services may be affected. To be more specific, the execution time of some computing tasks will exceed the threshold.

Possible Causes

Frame freezing occurs on the OBS server, or the network between the OBS client and the OBS server is unstable.

Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Average Time for Calling the OBS Metadata API Exceeds the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Average time of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.

- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Average Time for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.228 ALM-45176 Success Rate of Calling OBS Metadata APIs Is Lower than the Threshold

Description

The system checks whether the success rate of calling OBS metadata APIs is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for writing OBS data is greater than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45176	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the success rate of calling the OBS metadata APIs is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

Possible Causes

An execution exception or severe timeout occurs on the OBS server.

Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Success Rate for Calling the OBS Metadata API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Success Rate for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.229 ALM-45177 Success Rate of Calling OBS Data Read APIs Is Lower than the Threshold

Description

The system checks whether the success rate of calling APIs for reading OBS data is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for reading OBS data is greater than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45177	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the success rate of calling the OBS APIs for reading data is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

Possible Causes

An execution exception or severe timeout occurs on the OBS server.

Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Success Rate for Calling the OBS Data Read API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS data read operation interface calls** from **OBS data read operation**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Success Rate for Calling the OBS Data Read API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

10.13.230 ALM-45178 Success Rate of Calling OBS Data Write APIs Is Lower Than the Threshold

Description

The system checks whether the success rate of calling APIs for writing OBS data is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for writing OBS data is greater than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45178	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the success rate of calling the OBS APIs for writing data is lower than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

Possible Causes

An execution exception or severe timeout occurs on the OBS server.

Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Success Rate for Calling the OBS Data Write API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS data write operation interface calls** from **OBS data write operation**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Success Rate for Calling the OBS Data Write API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.231 ALM-45275 Ranger Service Unavailable

Description

The alarm module checks the Ranger service status every 180 seconds. This alarm is generated if the Ranger service is abnormal.

This alarm is cleared after the Ranger service recovers.

Attributes

Alarm ID	Alarm Severity	Automatically Cleared
45275	Critical	Yes

Parameters

Name	Meaning
Source	Cluster for which the alarm is generated.
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

When the Ranger service is unavailable, Ranger cannot work properly and the native Ranger UI cannot be accessed.

Possible Causes

- The DBService service on which Ranger depends is abnormal.
- The RangerAdmin role instance is abnormal.

Procedure

Check the DBService process status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, check whether the ALM-27001 DBService Service Unavailable alarm is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the DBService service fault by following the handling procedure of ALM-27001 DBService Service Unavailable. After the DBService alarm is cleared, check whether Ranger Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check all RangerAdmin instances.

Step 3 Log in to the node where the RangerAdmin instance is located as user **omm** and run the **ps -ef|grep "proc_rangeradmin"** command to check whether the RangerAdmin process exists on the current node.

- If yes, go to **Step 5**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 4**.

Step 4 In the alarm list, check whether the alarm "Ranger Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None

10.13.232 ALM-45276 Abnormal RangerAdmin status

Description

The alarm module checks the RangerAdmin status every 60 seconds. This alarm is generated when the RangerAdmin status is abnormal.

This alarm is cleared after the RangerAdmin status recovers.

Attributes

Alarm ID	Alarm Severity	Automatically Cleared
45276	Major	Yes

Parameters

Name	Meaning
Source	Cluster for which the alarm is generated.
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the status of a single RangerAdmin is abnormal, the access to the Ranger native UI is not affected. When the status of two RangerAdmins is abnormal, the native UI of Ranger cannot be accessed, and policies cannot be created, modified, or deleted.

Possible Causes

The RangerAdmin port is not started.

Procedure

Check the port process.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to query the host name.

Step 2 Log in to the node where the abnormal RangerAdmin instance resides as user **omm**. Run the **ps -ef|grep "proc_rangeradmin" | grep -v grep | awk -F ' ' '{print $2}'** command to obtain ***pid*** of the RangerAdmin process, and run the **netstat -anp|grep *pid* | grep LISTEN** command to check whether the RangerAdmin process listens to port 21401 for a cluster in security mode and port 21400 for a cluster in normal mode.

- If yes, go to **Step 4**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 3**.

Step 3 In the alarm list, check whether the **Abnormal RangerAdmin status** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None

10.13.233 ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the RangerAdmin instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45277	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory usage of the RangerAdmin instance is high or the heap memory is improperly allocated.

Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by RangerAdmin reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.234 ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the direct memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the direct memory usage of RangerAdmin is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45278	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the RangerAdmin instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by RangerAdmin reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for RangerAdmin cannot meet the direct memory required by the RangerAdmin process. You are advised to check the direct memory usage of RangerAdmin and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by RangerAdmin. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.235 ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the non-heap memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45279	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory usage of the RangerAdmin instance is high or the non-heap memory is improperly allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by RangerAdmin reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the RangerAdmin instance cannot meet the non-heap memory required by the RangerAdmin process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to the twice of the current non-heap memory usage or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.236 ALM-45280 RangerAdmin GC Duration Exceeds the Threshold

Description

The system checks the GC duration of the RangerAdmin process every 60 seconds. This alarm is generated when the GC duration of the RangerAdmin process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45280	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The RangerAdmin responds slowly.

Possible Causes

The heap memory of the RangerAdmin instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45280 RangerAdmin GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **RangerAdmin GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the RangerAdmin process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.

- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

10.13.237 ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the UserSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45281	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory usage of the UserSync instance is high or the heap memory is improperly allocated.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by UserSync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.

- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

10.13.238 ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the UserSync service every 60 seconds. This alarm is generated when the direct memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the UserSync direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45282	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the UserSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the UserSync reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for UserSync cannot meet the direct memory required by the UserSync process. You are advised to check the direct memory usage of UserSync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by UserSync. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

10.13.239 ALM-45283 UserSync Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45283	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the UserSync process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45283 UserSync Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by UserSync reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and click **Save** to save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the UserSync instance cannot meet the non-heap memory required by the UserSync process. You are advised to change the **-XX:MaxPermSize** value of **GC_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

10.13.240 ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold

Description

The system checks the GC duration of the UserSync process every 60 seconds. This alarm is generated when the GC duration of the UserSync process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Attributes

Alarm ID	Alarm Severity	Automatically Cleared
45284	Major	Yes

Parameters

Name	Meaning
Source	Cluster for which the alarm is generated.
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.
Trigger Condition	Threshold for triggering the alarm.

Impact on the System

UserSync responds slowly.

Possible Causes

The heap memory of the UserSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **UserSync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the UserSync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose

UserSync > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to the twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

10.13.241 ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the heap memory usage of the TagSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45285	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory usage of the TagSync instance is high or the heap memory is improperly allocated.

Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by TagSync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.242 ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the TagSync service every 60 seconds. This alarm is generated when the direct memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the TagSync direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45286	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the TagSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the TagSync reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for TagSync cannot meet the direct memory required by the TagSync process. You are advised to check the direct memory usage of TagSync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by TagSync. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.243 ALM-45287 TagSync Non Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45287	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the TagSync process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45287 TagSync Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by TagSync reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the TagSync instance cannot meet the non-heap memory required by the TagSync process. You are advised to change the **-XX:MaxPermSize** value of **GC_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

10.13.244 ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold

Description

The system checks the GC duration of the TagSync process every 60 seconds. This alarm is generated when the GC duration of the TagSync process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Attributes

Alarm ID	Alarm Severity	Auto Clear
45288	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

TagSync responds slowly.

Possible Causes

The heap memory of the TagSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **TagSync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the TagSync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

10.13.245 ALM-45425 ClickHouse Service Unavailable

Description

The alarm module checks the ClickHouse instance status every 60 seconds. This alarm is generated when the alarm module detects that all ClickHouse instances are abnormal.

This alarm is cleared when the system detects that any ClickHouse instance is restored and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45425	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The ClickHouse service is abnormal. You cannot use FusionInsight Manager to perform cluster operations on the ClickHouse service. The ClickHouse service function is unavailable.

Possible Causes

The configuration information in the **metrika.xml** file in the component configuration directory of the faulty ClickHouse instance node is inconsistent with that of the corresponding ClickHouse instance in the ZooKeeper.

Procedure

Check whether the configuration in metrika.xml of the ClickHouse instance is correct.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**, and locate the abnormal ClickHouse instance based on the alarm information.

- If yes, go to **Step 2**.
- If no, go to **Step 9**.

Step 2 Log in to the host where the ClickHouse service is abnormal and ping the IP address of another normal ClickHouse instance node to check whether the network connection is normal.

- If yes, go to **Step 3**.
- If no, contact the network administrator to repair the network.

Step 3 Choose **Cluster** > **Services** > **ClickHouse** > **Instance**, click the abnormal instance name in the **Role** column, click **Configurations**, search for **macros.id** in the search box, and find the value of **macros.id** of the current instance.

Step 4 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 5 Run the following command to check whether the ClickHouse cluster topology information can be obtained.

get /clickhouse/config/*value of* ***macros.id*** *in* **Step 3**/**metrika.xml**

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Log in to the host where the ClickHouse instance is abnormal and go to the configuration directory of the ClickHouse instance.

cd ${BIGDATA_HOME}/**FusionInsight_ClickHouse_***Version*/x_x_**ClickHouseServer/etc**

cat metrika.xml

Step 7 Check whether the cluster topology information on ZooKeeper obtained in **Step 5** is the same as that in the **metrika.xml** file in the component configuration directory in **Step 6**.

- If yes, check whether the alarm is cleared. If the alarm persists, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. Then, check whether the service status is normal and whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

10.13.246 ALM-45426 ClickHouse Service Quantity Quota Usage in ZooKeeper Exceeds the Threshold

Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45426	Major (default)	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

Possible Causes

When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the number of znodes may exceed the configured threshold.

Procedure

Check the number of znodes created by ClickHouse on ZooKeeper.

Step 1 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 2 Run the following command to check the quota used by ClickHouse on ZooKeeper and check whether the ratio of the **count** value of **Output stat** to the **count** value of **Output quota** in the command output is greater than **0.9**.

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **count** value of **Output stat** is **2667**, and the **count** value of **Output quota** is **200000**.

- If yes, go to **Step 4**.
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 5**.

Step 3 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Configurations** > **All Configurations**, search for the **clickhouse.zookeeper.quota.node.count** parameter, and change the value of this parameter to twice the **count** value of **Output stat** in **Step 2**.

Step 4 Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform **Step 4** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

10.13.247 ALM-45427 ClickHouse Service Capacity Quota Usage in ZooKeeper Exceeds the Threshold

Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45427	Major (default)	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

Possible Causes

When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the capacity of znodes may exceed the configured threshold.

Procedure

Check the znode capacity of the ClickHouse in the ZooKeeper.

Step 1 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 2 Run the following command to check the quota used by ClickHouse on ZooKeeper and check whether the ratio of the **bytes** value of **Output stat** to the **bytes** value of **Output quota** in the command output is greater than **0.9**.

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **bytes** value of **Output stat** is **60063**, and the **bytes** value of **Output quota** is **1000000000**.

- If yes, go to **Step 4**.
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 5**.

Step 3 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Configurations** > **All Configurations**, search for the **clickhouse.zookeeper.quota.size** parameter, and change the value of this parameter to twice the **bytes** value of **Output stat** in **Step 2**.

Step 4 Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform **Step 4** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

None

10.13.248 ALM-45736 Guardian Service Unavailable

Description

The alarm module checks the Guardian service status every 60 seconds. This alarm is generated if Guardian is unavailable.

This alarm is cleared after Guardian recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45275	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Guardian cannot work properly.

Possible Causes

- The Ranger or HDFS service on which Guardian depends is abnormal.
- The TokenServer role instance is abnormal.

Procedure

Check the Ranger and HDFS service status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, check whether ALM-45275 Ranger Service Unavailable or ALM-14000 HDFS Service Unavailable is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Handle the alarm by referring to section "ALM-45275 Ranger Service Unavailable" or "ALM-14000 HDFS Service Unavailable".

After the alarm is cleared, wait a few minutes and check whether the alarm GuardianService Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check all TokenServer instances.

Step 3 Log in to the node where the TokenServer instance is located as user **omm** and run the **ps -ef|grep "ranger-obs-service"** command to check whether the TokenServer process exists on the node.

- If yes, go to **Step 5**.
- If no, restart the faulty TokenServer instance and go to **Step 4**.

Step 4 In the alarm list, check whether the alarm "Guardian Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Guardian** for the target cluster.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

11 MRS Manager Operation Guide (Applicable to 2.x and Earlier Versions)

11.1 Introduction to MRS Manager

Overview

MRS manages and analyzes massive data and helps you rapidly obtain desired data from structured and unstructured data. The structure of open-source components is complex. The installation, configuration, and management processes are time- and labor-consuming. MRS Manager is a unified enterprise-level cluster management platform and provides the following functions:

- Cluster monitoring enables you to quickly view the health status of hosts and services.
- Graphical metric monitoring and customization enable you to quickly obtain key information about the system.
- Service property configurations can meet service performance requirements.
- With cluster, service, and role instance functions, you can start or stop services and clusters in one click.

Introduction to the MRS Manager GUI

MRS Manager provides a unified cluster management platform, facilitating rapid and easy O&M for clusters. For details about how to access MRS Manager, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Table 11-1 describes the functions of each operation entry.

Table 11-1 Functions of each entry on the operation bar

Parameter	Function
Dashboard	Displays the status of all services, main monitoring indicators of each service, and host status in charts, such as bar charts, line charts, and tables. You can customize a dashboard for the key monitoring indicators and drag it to any position on the interface. The system dashboard page supports automatic data update.
Services	Provides the service monitoring, operation, and configuration guidance, which helps you manage services in a unified manner.
Hosts	Provides guidance on how to monitor, operate, and configure hosts, helping you manage hosts in a unified manner.
Alarms	Supports alarm query and provides guidance on alarm handling, helping you identify and rectify product faults and potential risks in a timely manner to ensure normal system operation.
Audit	Allows authorized users to query and export audit logs, helping you to view all user activities and operations.
Tenant	Provides a unified tenant management platform.
System	Provides monitoring, alarm configuration management, and backup management.

Go to the **System** tab page, and switch to another function pages through shortcuts. See **Table 11-2**.

The following is an example of quick redirection through shortcuts:

Step 1 On MRS Manager, click **System**.

Step 2 On the **System** tab page, click a function link. The function page is displayed.

For example, in the **Backup and Restoration** area, click **Back Up Data**. The page for backing up data is displayed.

Step 3 Move the cursor to the left border of the browser window. The **System** black shortcut menu is displayed. After you move the cursor out of the menu, the menu is collapsed.

Step 4 In the shortcut menu that is displayed, you can click a function link to go to the corresponding function page.

For example, choose **Maintenance > Export Log**. The page for exporting logs is displayed.

----End

Table 11-2 Shortcut menus on the **System** tab page

Menu	Function Link
Backup and Restoration	Back Up Data
	Restore Data
Maintenance	Export Log
	Export Audit Log
	Check Health Status
Monitoring and Alarm	Configure Syslog
	Configure Alarm Threshold
	Configure SNMP
	Configure Monitoring Metric Dump
	Configure Resource Contribution Ranking
Permission	Manage User
	Manage User Group
	Manage Role
	Configure Password Policy
	Change OMS Database Password
Patch	Manage Patch

Reference

MapReduce Service (MRS) is a data analysis service. It is used to manage and analyze massive sets of data.

MRS uses MRS Manager to manage big data components, such as components in the Hadoop ecosystem. Therefore, some concepts on the MRS Console must be different from those on MRS Manager. For details, see **Table 11-3**.

Table 11-3 Difference Comparison

Concept	MRS	MRS Manager
MapReduce Service	Indicates the data analysis cloud service, called MRS. This service includes components such as Hive, Spark, Yarn, HDFS, and ZooKeeper.	Provides a unified management platform for big data components in tenant clusters.

11.2 Checking Running Tasks

Scenario

When you perform operations on MRS Manager to trigger a task, the task execution process and progress are displayed. After the task window is closed, you need to open the task window by using the task management function.

MRS Manager reserves 10 latest tasks by default, for example, restarting services, synchronizing service configurations, and performing health check.

Procedure

Step 1 On MRS Manager, click  to open the task list.

You can view the following information in the task list: **Name**, **Status**, **Progress**, **Start Time** and **End Time**.

Step 2 Click the target task name to view the detailed information about the running task.

----End

11.3 Monitoring Management

11.3.1 Dashboard

On MRS Manager, nodes in a cluster can be classified into management nodes, control nodes, and data nodes. The change trends of key host monitoring metrics on each type of node can be calculated and displayed as curve charts in reports based on the customized periods. If a host belongs to multiple node types, the metric statistics will be repeatedly collected.

This section provides overview of MRS clusters and describes how to view, customize, and export node monitoring metrics on MRS Manager.

Procedure

Step 1 Log in to MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 Choose **Dashboard** on MRS Manager.

Step 3 In **Period**, you can specify a period to view monitoring data. The options are as follows:

- Real time
- Last 3 hours
- Last 6 hours
- Last 24 hours

- Last week
- Last month
- Last 3 months
- Last 6 months
- Customize. If you select this option, you can customize the period for viewing monitoring data.

Step 4 Click **View** to view monitoring data in a period.

- You can view **Health Status** and **Roles** of each service on the **Service Summary** page of MRS Manager.
- Click  above the curve chart to view details about a metric.

Step 5 Customize a monitoring report.

1. Click **Customize** and select monitoring metrics to be displayed on MRS Manager.

   MRS Manager supports a maximum of 14 monitoring metrics, but at most 12 customized monitoring metrics can be displayed on the page.

   - Cluster Host Health Status
   - Cluster Network Read Speed Statistics
   - Host Network Read Speed Distribution
   - Host Network Write Speed Distribution
   - Cluster Disk Write Speed Statistics
   - Cluster Disk Usage Statistics
   - Cluster Disk Information
   - Host Disk Usage Statistics
   - Cluster Disk Read Speed Statistics
   - Cluster Memory Usage Statistics
   - Host Memory Usage Distribution
   - Cluster Network Write Speed Statistics
   - Host CPU Usage Distribution
   - Cluster CPU Usage Statistics
2. Click **OK** to save the selected monitoring metrics for display.

   NOTE

   Click **Clear** to cancel all the selected monitoring metrics in a batch.

Step 6 Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

NOTE

If you select **Full Screen**, the **Dashboard** window will be maximized.

Step 7 Export a monitoring report.

1. Select a period. The options are as follows:
   - Real time
   - Last 3 hours
   - Last 6 hours
   - Last 24 hours
   - Last week
   - Last month
   - Last 3 months
   - Last 6 months
   - Customize. If you select this option, you can customize a time of period to export a report.
2. Click **Export**. MRS Manager will generate a report about the selected monitoring metrics in a specified time of period. Save the report.

   NOTE

   To view the curve charts of monitoring metrics in a specified period, click **View**.

----End

11.3.2 Managing Services and Monitoring Hosts

You can manage the following status and indicators of all services (including role instances) and hosts on the MRS Manager:

- Status information: includes operation, health, configuration, and role instance status.
- Metric information: includes key monitoring metrics for services.
- Metric export: allows you to export monitoring reports.

NOTE

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

Managing Service Monitoring

Step 1 On MRS Manager, click **Services**.

The service list includes **Service**, **Operating Status**, **Health Status**, **Configuration Status**, **Roles**, and **Operation** are displayed in the component list.

- **Table 11-4** describes the service operating status.

Table 11-4 Service operating status

Status	Description
Started	The service is started.
Stopped	The service is stopped.
Failed to start	Failed to start the role instance.
Failed to stop	Failed to stop the role instance.
Unknown	Indicates initial service status after the background system restarts.

- Table 11-5 describes the service health status.

Table 11-5 Service health status

Status	Description
Good	Indicates that all role instances in the service are running properly.
Bad	Indicates that the running status of at least one role instance is **Faulty** or the status of the service on which the current service depends is abnormal.
Unknown	Indicates that all role instances in the service are in the **Unknown** state.
Concerning	Indicates that the background system is restarting the service.
Partially Healthy	Indicates that the status of the service on which the service depends is abnormal, and APIs related to the abnormal service cannot be invoked by external systems.

- Table 11-6 describes the service health status.

Table 11-6 Service configuration status

Status	Description
Synchronized	The latest configuration takes effect.
Expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use **Synchronize Configuration** to rectify the fault.

Status	Description
Configuring	Parameters are being configured.
Unknown	Current configuration status cannot be obtained.

By default, the **Service** column is sorted in ascending order. You can click the icon next to **Service**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

Step 2 Click a specified service in the list to view its status and metric information.

Step 3 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

Managing Role Instances

Step 1 On MRS Manager, click **Services** and click the target service name in the service list.

Step 2 Click **Instance** to view the role status.

The role instance list contains the **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Operation Status**, **Health Status,** and **Configuration Status** of an instance.

- Table 11-7 shows the configuration status of a role instance.

Table 11-7 Role instance status

Status	Description
Started	The role instance has been started.
Stopped	The role instance has been stopped.
Failed to start	Failed to start the role instance.
Failed to stop	Failed to stop the role instance.
Decommissioning	The role instance is being decommissioned.
Decommissioned	The role instance has been decommissioned.
Recommissioning	The role instance is being recommissioned.
Unknown	Indicates initial role instance status after the background system restarts.

- Table 11-8 shows the health status of a role instance.

  Table 11-8 Role instance health status

Status	Description
Good	The role instance is running properly.
Bad	The role instance is abnormal. For example, the port cannot be accessed if PID does not exist.
Unknown	The host where a role instance resides does not connect to the background system.
Concerning	The background system is restarting a role instance.

- Table 11-9 shows the configuration status of a role instance.

  Table 11-9 Role instance configuration status

Status	Description
Synchronized	The latest configuration takes effect.
Expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use **Synchronize Configuration** to rectify the fault.
Configuring	Parameters are being configured.
Unknown	Current configuration status cannot be obtained.

By default, the **Role** column is sorted in ascending order. You can click the sorting icon next to **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

You can filter out all instances of the same role in the **Role** column.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. Click **Reset** to clear the search criteria. Fuzzy search is supported.

Step 3 Click the target role instance to view its status and metric information.

Step 4 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

Managing Hosts

Step 1 On MRS Manager, click **Hosts** to view the status of all hosts.

The host list contains the host name, management IP address, service IP address, rack, network speed, operating status, health status, disk usage, memory usage, and CPU usage.

- **Table 11-10** shows the host operating status.

  Table 11-10 Host operating status

Status	Description
Normal	The host and service roles on the host are running properly.
Isolated	The host is isolated, and the service roles on the host stop running.

- **Table 11-11** describes the host health status.

  Table 11-11 Host health status

Status	Description
Good	The host can properly send heartbeats.
Bad	The host fails to send heartbeats due to timeout.
Unknown	The host initial status is unknown during the operation of adding or deleting a host.

By default, the **Host Name** column is sorted by host name in ascending order. You can click the sorting icon next to **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Network Speed**, **Operating Status**, **Health Status**, **Disk Usage**, **Memory Usage**, or **CPU Usage** to change the sorting mode.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. Click **Reset** to clear the search criteria. Fuzzy search is supported.

Step 2 Click the target host in the host list to view its status and metric information.

Step 3 Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

11.3.3 Managing Resource Distribution

On MRS Manager, you can query the top value curves, bottom value curves, or average data curves of key service and host monitoring metrics, that is, the resource distribution information. MRS Manager allows you to view the monitoring data of the last hour.

You can also modify the resource distribution on MRS Manager to display both the top and bottom value curves in service and host resource distribution figures.

Resource distribution of some monitoring metrics is not recorded.

Procedure

- View the resource distribution of service monitoring metrics.
  a. On MRS Manager, click **Services**.
  b. Select the target service from the service list.
  c. Click **Resource Distribution**.
     Select key metrics of the service from **Metric**. MRS Manager displays the resource distribution of the metrics in the last hour.
- View the resource distribution of host monitoring metrics.
  a. Click **Hosts**.
  b. Click the name of the specified host in the host list.
  c. Click **Resource Distribution**.
     Select key metrics of the host from **Metrics**. MRS Manager displays the resource distribution of the metrics in the last hour.
- Configure resource distribution.
  a. On MRS Manager, click **System**.
  b. In **Configuration**, click **Configure Resource Contribution Ranking** under **Monitoring and Alarm**.
  c. Change the number of resources to be displayed.
     - Set **Number of Top Resources** to the number of top values.
     - Set **Number of Bottom Resources** to the number of bottom values.

     NOTE

     The sum of the maximum value and minimum value of resource distribution cannot be greater than 5.
  d. Click **OK** to save the configurations.
     The message "Number of top and bottom resources saved successfully" is displayed in the upper right corner of the page.

11.3.4 Configuring Monitoring Metric Dumping

You can configure interconnection parameters on MRS Manager to save monitoring metric data to a specified FTP server using the FTP or SFTP protocol. In this way, MRS clusters can interconnect with third-party systems. The FTP protocol does not encrypt data, which brings potential security risks. Therefore, the SFTP protocol is recommended.

MRS Manager supports the collection of all the monitoring metric data in the managed clusters. The collection period is 30 seconds, 60 seconds, or 300 seconds. The monitoring metric data is stored to different monitoring files on the FTP server by collection period. The monitoring file naming rule is in the "*Cluster name*_**metric**_*Monitoring metric data collection period*_*File saving time*.**log**" format.

Prerequisites

The ECS corresponding to the dump server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the dump server. The FTP service on the dump server is running properly.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure Monitoring Metric Dump** under **Monitoring and Alarm**.

Step 3 Table 11-12 describes dump parameters.

Table 11-12 Dump parameters

Parameter	Description
FTP IP Address	Mandatory. This parameter specifies the FTP server for storing monitoring files after the monitoring indicator data is interconnected.
FTP Port	Mandatory. This parameter specifies the port connected to the FTP server.
FTP Username	Mandatory. This parameter specifies the username for logging in to the FTP server.
FTP Password	Mandatory. This parameter specifies the password for logging in to the FTP server.
Save Path	Mandatory. This parameter specifies the path for storing monitoring files on the FTP server.
Dump Interval (s)	Mandatory. This parameter specifies the interval at which monitoring files are periodically stored on the FTP server, in seconds.
Dump Mode	Mandatory. This parameter specifies the protocol used for sending monitoring files. This parameter is mandatory. The options are **FTP** and **SFTP**.
SFTP Public Key	Optional. This parameter specifies the public key of the FTP server and is valid only when **Dump Mode** is set to **SFTP**. You are advised to configure a public key. Otherwise, security risks may arise.

Step 4 Click **OK** to complete the settings.

----End

11.4 Alarm Management

11.4.1 Viewing and Manually Clearing an Alarm

Scenario

You can view and clear alarms on MRS Manager.

Generally, the system automatically clears an alarm when the fault is rectified. If the fault has been rectified and the alarm cannot be automatically cleared, you can manually clear the alarm.

You can view the latest 100,000 alarms (including uncleared, manually cleared, and automatically cleared alarms) on MRS Manager. If the number of cleared alarms exceeds 100,000 and is about to reach 110,000, the system automatically dumps the earliest 10,000 cleared alarms to **${BIGDATA_HOME}/OMSV100R001C00x8664/workspace/data** on the active management node. A directory is automatically generated when alarms are dumped for the first time.

NOTE

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

Procedure

Step 1 On MRS Manager, click **Alarms** to view the alarm information in the alarm list.

- By default, the alarm list page displays the latest 10 alarms.
- By default, alarms are displayed in descending order by **Generated**. You can click **Alarm ID**, **Alarm Name**, **Severity**, **Generated**, **Location**, **Operation** to change the display mode.
- You can filter all alarms of the same severity in **Severity**, including cleared and uncleared alarms.
- You can click  ,  , , or  to filter out **Critical**, **Major**, **Minor**, or **Warning** alarms.

Step 2 Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view the information about specified alarms. Click **Reset** to clear the search criteria.

NOTE

You can set the **Start Time** and **End Time** to specify the time range. You can search for alarms generated within the time range.

Handle the alarm by referring to **Alarm Reference**. If the alarms in some scenarios are generated due to other cloud services that MRS depends on, you need to contact maintenance personnel of the corresponding cloud services.

Step 3 If the alarm needs to be manually cleared after errors are rectified, click **Clear Alarm**.

NOTE

If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.

----End

11.4.2 Configuring an Alarm Threshold

Scenario

You can configure an alarm threshold to learn the metric health status. After **Send Alarm** is selected, the system sends an alarm message when the monitored data reaches the alarm threshold. You can view the alarm information in **Alarms**.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure Alarm Threshold** under **Monitoring and Alarm**, select monitoring metrics as planned, and set their baselines.

Step 3 Click a metric, for example, **CPU Usage**, and click **Create Rule**.

Step 4 Set the monitoring metric rule parameters on the displayed configuration page.

Table 11-13 Monitoring metric rule parameters

Parameter	Value	Description
Rule Name	CPU_MAX (example value)	Specifies the rule name.
Reference Date	2014/11/06 (example)	Specifies the date on which the reference indicator history is generated.

Parameter	Value	Description
Threshold Type	• Max. value • Min. value	Specifies the maximum or minimum value of a metric. If this parameter is set to **Max. Value**, the system generates an alarm when the actual value of the metric is greater than the threshold. If this parameter is set to **Min. Value**, the system generates an alarm when the actual value of the metric is smaller than the threshold.
Alarm Severity	• Critical • Major • Minor • Suggestion	Alarm Severity
Time Range	From 00:00 to 23:59 (example)	Specifies the period in which the rule takes effect.
Threshold	80 (example)	Specifies the threshold of the rule monitoring metrics.
Date	• Workday • Weekend • Other	Specifies the type of date when the rule takes effect.
Add Date	11/06 (example)	This parameter is valid only when **Date** is set to **Other**. You can select multiple dates.

Step 5 Click **OK**. A message is displayed in the upper right corner of the page, indicating that the template is saved successfully.

Send alarm is selected by default. MRS Manager checks whether the value of each monitored metric reaches the threshold. If the number of consecutive check times is equal to the value of **Trigger Count**, and the threshold is not reached in these checks, the system sends an alarm. The value can be customized. **Check Period (s)** indicates the interval at which MRS Manager checks monitoring metrics.

Step 6 Locate the row that contains the newly added rule, and click **Apply** in the **Operation** column. A message is displayed in the upper right corner, indicating that the rule *xx* is successfully added. Click **Cancel** in the **Operation** column. A

message is displayed in the upper right corner, indicating that the rule *xx* is successfully canceled.

----End

11.4.3 Configuring Syslog Northbound Interface Parameters

Scenario

You can configure the northbound interface so that alarms generated on MRS Manager can be reported to your monitoring O&M system using Syslog.

NOTICE

If the Syslog protocol is not encrypted, data may be stolen.

Prerequisites

The ECS corresponding to the server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the server.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure Syslog** under **Monitoring and Alarm**.

The **Syslog Service** is disabled by default. Click the switch to enable the Syslog service.

Step 3 Set the interconnection parameters listed in **Table 11-14**.

Table 11-14 Syslog parameters

Area	Parameter	Description
Syslog Protocol	Service IP Address	Specifies the IP address of the interconnection server.
	Server Port	Specifies the port number for interconnection.
	Protocol	Specifies the protocol type. The options are as follows: • **TCP** • **UDP**

Area	Parameter	Description
	Severity	Specifies the severity of the reported message. The options are as follows: • **Informational** • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice** • **Debug**
	Facility	Specifies the module where the log is generated.
	Identifier	Specifies the product ID. The default value is **MRS Manager**.
Report Message	Report Format	Specifies the message format of the alarm report. For details, see help information on the web page.
	Alarm Status	Specifies the type of the alarm to be reported. • **Fault**: indicates that the Syslog alarm message is reported when MRS Manager generates an alarm. • **Clear**: indicates that a Syslog alarm message is reported when an alarm on MRS Manager is cleared. • **Event**: indicates that the Syslog alarm message is reported when MRS Manager generates an event.

Area	Parameter	Description
	Report Alarm Severity	Specifies the level of the alarm to be reported. The value can be **Suggestion**, **Minor**, **Major**, and **Critical**.
Uncleared Alarm Reporting	Periodic Uncleared Alarm Report	Specifies whether uncleared alarms are reported periodically. By default, the switch of **Periodic Uncleared Alarm Reporting** is disabled. You can click the switch to enable it.
	Report Interval (min)	Specifies the interval for periodically reporting uncleared alarms to the remote Syslog service. This parameter is valid only when **Periodic Uncleared Alarm Reporting** switch is enabled. The unit is minute. The default value is **15**. The value ranges from 5 minutes to one day (1,440 minutes).
Heartbeat Settings	Heartbeat Report	Specifies whether to periodically report Syslog heartbeat messages. By default, the switch of **Periodic Uncleared Alarm Reporting** is disabled. You can click the switch to enable it.
	Heartbeat Period (min)	Specifies the interval for periodically reporting heartbeat messages. This parameter is valid only when **Heartbeat Report** switch is enabled. The unit is minute. The default value is **15**. The value ranges from 1 to 60.

Area	Parameter	Description
	Heartbeat Packet	Specifies the content of the reported heartbeat message. This parameter is enabled when **Heartbeat Report** is enabled. The value can contain a maximum of 256 characters, including digits, letters, underscores (_), vertical bars (|), colons (:), spaces, commas (,), and periods (.).

NOTE

After the periodic heartbeat packet function is enabled, packets may be interrupted during automatic recovery of some cluster error tolerance (for example, active/standby management node switchover). In this case, wait for automatic recovery.

Step 4 Click **OK** to complete the settings.

----End

11.4.4 Configuring SNMP Northbound Interface Parameters

Scenario

You can configure the northbound interface so that alarms and monitoring metrics on MRS Manager can be integrated to the network management platform using SNMP.

Prerequisites

The ECS corresponding to the server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the server.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In **Configuration**, click **Configure SNMP** under **Monitoring and Alarm**.

The **SNMP Service** is disabled by default. Click the switch to enable the SNMP service.

Step 3 Set the interconnection parameters listed in **Table 11-15**.

Table 11-15 Syslog parameters

Parameter	Description
Version	Specifies the version of the SNMP, which can be: • v2c: an earlier version with low security • v3: the latest version of SNMP with higher security than SNMPv2c The SNMP v3 version is recommended.
Local Port	Specifies the local port. The default value is **20000**. The value ranges from **1025** to **65535**.
Read Community Name	Specifies the read-only community name. This parameter is valid only when **Version** is set to **v2c**.
Write Community Name	Specifies the write community name. This parameter is valid only when **Version** is set to **v2c**.
Security Username	Specifies the SNMP security username. This parameter is valid only when **Version** is set to **v3**.
Authentication Protocol	Specifies the authentication protocol. You are advised to set this parameter to set this parameter to **SHA**. This parameter is valid only when **Version** is set to **v3**.
Authentication Password	Specifies the authentication key. This parameter is valid only when **Version** is set to **v3**.
Confirm Password	Used to confirm the authentication key. This parameter is valid only when **Version** is set to **v3**.
Encryption Protocol	Specifies the encryption protocol. You are advised to set this parameter to **AES256**. This parameter is valid only when **Version** is set to **v3**.
Encryption Password	Specifies the encryption key. This parameter is valid only when **Version** is set to **v3**.
Confirm Password	Used to confirm the encryption key. This parameter is valid only when **Version** is set to **v3**.

NOTE

- The **Authentication Password** and **Encryption Password** must contain 8 to 16 characters, including at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. The two passwords must be different. The two passwords cannot be the same as the security username or the reverse of the security username.
- For security purposes, periodically change the authentication password and encryption password when the SNMP protocol is used.
- If SNMPv3 is used, a security user will be locked after five consecutive authentication failures within 5 minutes. The user will be automatically unlocked 5 minutes later.

Step 4 Click **Create Trap Target** in the **Trap Target** area. In the displayed dialog box, set the following parameters:

- **Target Symbol** specifies the trap target ID, which is the ID of the NMS or host that receives traps. The value consists of 1 to 255 characters, including letters or digits.
- **Target IP Address** specifies the IP address of the target trap. IP addresses of class A, B, and C can be used to communicate with the IP address of the management plane of the management node.
- **Target Port** specifies the port receiving traps. The port number must be consistent with the peer end and ranges from 0 to 65535.
- **Trap Community Name** is valid only when **Version** is set to **v2c**.

Click **OK**. The **Create Trap Target** dialog box is closed.

Step 5 Click **OK** to complete the settings.

----End

11.5 Object Management

11.5.1 Managing Objects

MRS contains different types of basic objects as described in **Table 11-16**.

Table 11-16 MRS basic object overview

Object	Description	Example
Service	Function set that can complete specific business.	KrbServer service and LdapServer service
Service instance	Specific instance of a service, usually called service.	KrbServer service
Service role	Function entity that forms a complete service, usually called role.	KrbServer is composed of the KerberosAdmin role and KerberosServer role.
Role instance	Specific instance of a service role running on a host.	KerberosAdmin that is running on Host2 and KerberosServer that is running on Host3
Host	An ECS running Linux OS.	Host1 to Host5
Rack	Physical entity that contains multiple hosts connecting to the same switch.	Rack1 contains Host1 to Host5.
Cluster	Logical entity that consists of multiple hosts and provides various services.	Cluster names **Cluster1** consists of five hosts (Host1 to Host5) and provides services such as KrbServer and LdapServer.

11.5.2 Viewing Configurations

On MRS Manager, users can view the configurations of services (including roles) and role instances.

Procedure

- Query service configurations.
  a. On MRS Manager page, click **Services**.
  b. Select the target service from the service list.
  c. Click **Service Configuration**.
  d. Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.
  e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

     The parameters under the service nodes and role nodes are service configuration parameters and role configuration parameters respectively.
  f. In the **Non-default** parameter, select **Non-default**. The parameters whose values are not default values will be displayed.
- Query role instance configurations.
  a. On MRS Manager page, click **Services**.
  b. Select the target service from the service list.
  c. Click the **Instances** tab.
  d. Click the target role instance from the role instance list.
  e. Click **Instance Configuration**.
  f. Set **Type** to **All**. The navigation tree of all configuration parameters of the role instance is displayed.
  g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.
  h. In the **Non-default** parameter, select **Non-default**. The parameters whose values are not default values will be displayed.

11.5.3 Managing Services

You can perform the following operations on MRS Manager:

- Start the service in the **Stopped**, **Stop Failed**, or **Start Failed** state to use the service.
- Stop the services or stop abnormal services.
- Restart abnormal services or configure expired services to restore or enable the services.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Locate the row that contains the target service, **Start**, **Stop**, or **Restart** to start, stop, or restart the service.

Services are interrelated. If a service is started, stopped, and restarted, services dependent on it will be affected.

The services will be affected in the following ways:

- If a service is to be started, the lower-layer services dependent on it must be started first.
- If a service is stopped, the upper-layer services dependent on it are unavailable.
- If a service is restarted, the running upper-layer services dependent on it must be restarted.

----End

11.5.4 Configuring Service Parameters

On MRS Manager, you can view and modify the default service configurations based on site requirements and export or import the configurations.

Impact on the System

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.
- The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

Procedure

- Modify a service.
  a. Click **Services**.
  b. Select the target service from the service list.
  c. Click **Service Configuration**.
  d. Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.
  e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

     If you want to cancel the modification of a parameter value, click  to restore it.

NOTE

You can also use host groups to change role instance configurations in batches. Select a role name from the **Role** drop-down list and choose **< Select Host >** in the **Host** drop-down list. Enter a name in the **Host Group Name** text box, select the hosts to be modified from the **Host** list, add them to the **Selected hosts** area, and click **OK**. The added host group can be selected from **Host** and is only valid on the current page. The page cannot be saved after being refreshed.

f. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

NOTE

To update the queue configuration of the Yarn service without restarting service, choose **More** > **Refresh Queue** to update the queue for the configuration to take effect.

- Export service configuration parameters.
  a. Click **Services**.
  b. Select a service.
  c. Click **Service Configuration**.
  d. Click **Export Service Configuration**. Select a path for saving the configuration files.
- Import service configuration parameters.
  a. Click **Services**.
  b. Select a service.
  c. Click **Service Configuration**.
  d. Click **Import Service Configuration**.
  e. Select the target configuration file.
  f. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

11.5.5 Configuring Customized Service Parameters

Each component of MRS supports all open-source parameters. You can modify some parameters for key application scenarios on MRS Manager. Some component clients may not include all parameters with open-source features. For component parameters that cannot be directly modified on Manager, users can add new parameters for components by using the configuration customization function on Manager. Newly added parameters are saved in component configuration files and take effect after restart.

Impact on the System

- After the service attributes are configured, the service needs to be restarted and cannot be accessed.

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

Prerequisites

You have understood the meanings of parameters to be added, configuration files that have taken effect, and the impact on components.

Procedure

Step 1 On MRS Manager, click **Services**.

Step 2 Select the target service from the service list.

Step 3 Click **Service Configuration**.

Step 4 Set **Type** to **All**.

Step 5 In the navigation tree, select **Customization**. The customized parameters of the current component are displayed on Manager.

The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Different configuration files may have same open source parameters. After the parameters in different files are set to different values, whether the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

Step 6 Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.

- You can click  or  to add or delete a user-defined parameter. You can delete a customized parameter only after you click  for the first time.
- If you want to cancel the modification of a parameter value, click  to restore it.

Step 7 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

Task Example

Configuring Customized Hive Parameters

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters to take effect are controlled by HDFS in a unified manner. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout period for all clients to connect to the HDFS server. If you need to modify

the timeout period for Hive to connect to HDFS, you can use the configuration customization function. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

Step 1 On MRS Manager, choose **Services** > **Hive** > **Service Configuration**.

Step 2 Set **Type** to **All**.

Step 3 In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

Step 4 In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Name** column, and enter a new value in the **Value** column, for example, **150000**. The unit is millisecond.

Step 5 Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the service.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

11.5.6 Synchronizing Service Configurations

Scenario

If **Configuration Status** of a service is **Expired** or **Failed**, synchronize configurations for the cluster or service to restore its configuration status. If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.

Impact on the System

After synchronizing service configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Select the target service from the service list.

Step 3 In the upper part of the service status and metric information, choose **More** > **Synchronize Configuration**.

Step 4 In the displayed dialog box, select **Restart services and instances whose configuration have expired.** and click **OK** to restart the service whose configuration has expired.

When **Operation successful** is displayed, click **Finish**. The service is started successfully.

----End

11.5.7 Managing Role Instances

Scenario

You can start a role instance that is in the **Stopped**, **Failed to stop** or **Failed to start** status, stop an unused or abnormal role instance or restart an abnormal role instance to recover its functions.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Select the target service from the service list.

Step 3 Click the **Instances** tab.

Step 4 Select the check box on the left of the target role instance.

Step 5 Choose **More** > **Start Instance**, **Stop Instance**, or **Restart Instance** accordingly.

----End

11.5.8 Configuring Role Instance Parameters

Scenario

You can view and modify default role instance configurations on MRS Manager based on site requirements. The configurations can be imported and exported.

Impact on the System

You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

Procedure

- Modifying role instance configurations
  a. Click **Services**.
  b. Select the target service from the service list.
  c. Click the **Instances** tab.
  d. Click the target role instance from the role instance list.
  e. Click **Instance Configuration**.
  f. Set **Type** to **All**. The navigation tree of all configuration parameters of the role instance is displayed.
  g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

     If you want to cancel the modification of a parameter value, click  to restore it.
  h. Click **Save Configuration**, select **Restart the role instance**, and click **OK** to restart the role instance.

After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.

- Exporting Configuration Parameters of a Role Instance
  a. Click **Services**.
  b. Select a service.
  c. Select a role instance or click the **Instances** tab.
  d. Select a role instance on a specified host.
  e. Click **Instance Configuration**.
  f. Click **Export Instance Configuration** to export the configuration data of a specified role instance, and choose a path for saving the configuration file.
- Import configuration data of a role instance.
  a. Click **Services**.
  b. Select a service.
  c. Select a role instance or click the **Instances** tab.
  d. Select a role instance on a specified host.
  e. Click **Instance Configuration**.
  f. Click **Import Instance Configuration** to import the configuration data of the specified role instance.
  g. Click **Save Configuration** and select **Restart the role instance**. Click **OK**.
  After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.

11.5.9 Synchronizing Role Instance Configuration

Scenario

When **Configuration Status** of a role instance is **Expired** or **Failed**, you can synchronize the configuration data of the role instance with the background configuration.

Impact on the System

After synchronizing a role instance configuration, you need to restart the role instance whose configuration has expired. The role instance is unavailable during restart.

Procedure

Step 1 On MRS Manager, click **Services** and select a service name.

Step 2 Click the **Instances** tab.

Step 3 Click the target role instance from the role instance list.

Step 4 Choose **More** > **Synchronize Configuration** above the role instance status and indicator information.

Step 5 In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the role instance.

After **Operation successful** is displayed, click **Finish**. The role instance is started successfully.

----End

11.5.10 Decommissioning and Recommissioning a Role Instance

Scenario

If a Core or Task node is faulty, the cluster status may be displayed as **Abnormal**. In an MRS cluster, data can be stored on different Core nodes. Users can decommission the specified role instance on MRS Manager to stop the role instance from providing services. After fault rectification, you can recommission the role instance.

The following role instances can be decommissioned and recommissioned.

- DataNode role instance on HDFS
- NodeManager role instance on Yarn
- RegionServer role instance on HBase
- Broker role instance on Kafka

Restrictions:

- If the number of the DataNodes is less than or equal to that of HDFS copies, decommissioning cannot be performed. If the number of HDFS copies is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and the decommissioning will be stopped 30 minutes after the decommissioning attempt is performed on Manager.
- If the number of Kafka Broker instances is less than or equal to that of copies, decommissioning cannot be performed. For example, if the number of Kafka copies is two and the number of nodes is less than three in the system, decommissioning cannot be performed. Instance decommissioning will fail on Manager and exit.
- If a role instance is out of service, you must recommission the instance to start it before using it again.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Click a service in the service list.

Step 3 Click the **Instances** tab.

Step 4 Select an instance.

Step 5 Choose **More** > **Decommission** or **Recommission** to perform the corresponding operation.

NOTE

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS Manager displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

11.5.11 Managing a Host

Scenario

When a host is abnormal or faulty, you need to stop all roles of the host on MRS Manager to check the host. After the host fault is rectified, start all roles running on the host to recover host services.

Procedure

Step 1 Click **Hosts**.

Step 2 Select the check box of the target host.

Step 3 Choose **More** > **Start All Roles** or **Stop All Roles** accordingly.

----End

11.5.12 Isolating a Host

Scenario

If a host is found to be abnormal or faulty, affecting cluster performance or preventing services from being provided, you can temporarily exclude that host from the available nodes in the cluster. In this way, the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation.

Users can isolate a host manually on MRS Manager based on the actual service requirements or O&M plan. Only non-management nodes can be isolated.

Impact on the System

- After a host is isolated, all role instances on the host will be stopped. You cannot start, stop, or configure the host and any instances on the host.
- After a host is isolated, statistics about the monitoring status and indicator data of the host hardware and instances on the host cannot be collected or displayed.

Procedure

Step 1 On MRS Manager, click **Hosts**.

Step 2 Select the check box of the host to be isolated.

Step 3 Choose **More** > **Isolate Host**,

Step 4 and click **OK** in the displayed dialog box.

After **Operation successful.** is displayed, click **Finish**. The host is isolated successfully, and the value of **Operating Status** becomes **Isolated**.

NOTE

For isolated hosts, you can cancel the isolation and add them to the cluster again. For details, see **Canceling Host Isolation**.

----End

11.5.13 Canceling Host Isolation

Scenario

After the exception or fault of a host is handled, you must cancel the isolation of the host for proper usage.

Users can cancel the isolation of a host on MRS Manager.

Prerequisites

- The host is in the **Isolated** state.
- The exception or fault of the host has been rectified.

Procedure

Step 1 On MRS Manager, click **Hosts**.

Step 2 Select the check box of the host to be de-isolated.

Step 3 Choose **More** > **Cancel Host Isolation**,

Step 4 and click **OK** in the displayed dialog box.

After **Operation successful.** is displayed, click **Finish**. The host is de-isolated successfully, and the value of **Operating Status** becomes **Normal**.

Step 5 Click the name of the de-isolated host to show its status, and click **Start All Roles**.

----End

11.5.14 Starting or Stopping a Cluster

Scenario

A cluster is a collection of service components. You can start or stop all services in a cluster.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 In the upper part of the service list, choose **More** > **Start Cluster** or **Stop Cluster** accordingly.

----End

11.5.15 Synchronizing Cluster Configurations

Scenario

If **Configuration Status** of all services or some services is **Expired** or **Failed**, synchronize configuration for the cluster or service to restore its configuration status.

- If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.
- If all services in the cluster are in the **Failed** state, synchronize the service configuration with the background configuration.

Impact on the System

After synchronizing cluster configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 In the upper part of the service list, choose **More** > **Synchronize Configuration**.

Step 3 In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

11.5.16 Exporting Configuration Data of a Cluster

Scenario

You can export all configuration data of a cluster on MRS Manager to meet site requirements. The exported configuration data is used to rapidly update service configuration.

Procedure

Step 1 On MRS Manager page, click **Services**.

Step 2 Choose **More** > **Export Cluster Configuration**.

The exported file is used to update service configurations. For details, see **Import service configuration parameters** in **Configuring Service Parameters**.

----End

11.6 Log Management

11.6.1 About Logs

Log Description

MRS cluster logs are stored in the **/var/log/Bigdata** directory. The following table lists the log types.

Table 11-17 Log types

Type	Description
Installation log	Installation logs record information about FusionInsight Manager, cluster, and service installation to help users locate installation errors.
Run logs	Run logs record the running track information, debugging information, status changes, potential problems, and error information generated during the running of services.
Audit logs	Audit logs record information about users' activities and operation instructions, which can be used to locate fault causes in security events and determine who are responsible for these faults.

The following table lists the MRS log directories.

Table 11-18 Log directories

File Directory	Log Content
/var/log/Bigdata/audit	Component audit log.
/var/log/Bigdata/controller	Log collecting script log. Controller process log. Controller monitoring log.
/var/log/Bigdata/dbservice	DBService log.
/var/log/Bigdata/flume	Flume log.
/var/log/Bigdata/hbase	HBase log.
/var/log/Bigdata/hdfs	HDFS log.
/var/log/Bigdata/hive	Hive log.

File Directory	Log Content
/var/log/Bigdata/httpd	HTTPD log.
/var/log/Bigdata/hue	Hue log.
/var/log/Bigdata/kerberos	Kerberos log.
/var/log/Bigdata/ldapclient	LDAP client log.
/var/log/Bigdata/ldapserver	LDAP server log.
/var/log/Bigdata/loader	Loader log.
/var/log/Bigdata/logman	logman script log management log.
/var/log/Bigdata/mapreduce	MapReduce log.
/var/log/Bigdata/nodeagent	NodeAgent log.
/var/log/Bigdata/okerberos	OMS Kerberos log.
/var/log/Bigdata/oldapserver	OMS LDAP log.
/var/log/Bigdata/omm	**oms**: complex event processing log, alarm service log, HA log, authentication and authorization management log, and monitoring service run log of the omm server. **oma**: installation log and run log of the omm agent. **core**: dump log generated when the omm agent and the HA process are suspended.
/var/log/Bigdata/spark	Spark log.
/var/log/Bigdata/sudo	Log generated when the **sudo** command is executed by user **omm**.
/var/log/Bigdata/timestamp	Time synchronization management log.
/var/log/Bigdata/tomcat	Tomcat log.
/var/log/Bigdata/yarn	Yarn log.
/var/log/Bigdata/zookeeper	ZooKeeper log.
/var/log/Bigdata/kafka	Kafka log.
/var/log/Bigdata/storm	Storm log.
/var/log/Bigdata/patch	Patch log.

Run logs

Table 11-19 describes the running information recorded in run logs.

Table 11-19 Running information

Run Log	Description
Installation preparation log	Records information about preparations for the installation, such as the detection, configuration, and feedback operation information.
Process startup log	Records information about the commands executed during the process startup.
Process startup exception log	Records information about exceptions during process startup, such as dependent service errors and insufficient resources.
Process run log	Records information about the process running track information and debugging information, such as function entries and exits as well as cross-module interface messages.
Process running exception log	Records errors that cause process running errors, for example, the empty input objects or encoding or decoding failure.
Process running environment log	Records information about the process running environment, such as resource status and environment variables.
Script logs	Records information about the script execution process.
Resource reclamation log	Records information about the resource reclaiming process.
Uninstallation clearing logs	Records information about operations performed during service uninstallation, such as directory deletion and execution time

Audit logs

Audit information recorded in audit logs includes FusionInsight Manager audit information and component audit information.

Table 11-20 Audit information of FusionInsight Manager

Audit Log	Operation Type	Operation
Manager audit log	User management	Creating a user Modifying a user Deleting a user Creating a user group Modifying a user group Deleting a user group Adding a role Modifying a role Deleting a role Changing a password policy Changing a password Resetting a password User login User logout Unlocking the screen Downloading the authentication credential Unauthorized operation Unlocking a user account Locking a user account Locking the screen Exporting user information Exporting a user group Exporting a role

Audit Log	Operation Type	Operation
	Tenant management	Saving the static configuration Adding a tenant Deleting a tenant Associating a service with a tenant Deleting a service from a tenant Configuring resources Creating resources Deleting resources Adding a resource pool Modifying a resource pool Deleting a resource pool Restoring tenant data

Audit Log	Operation Type	Operation
	Cluster management	Starting a cluster Stopping a cluster Saving configurations Synchronizing cluster configurations Customizing cluster monitoring indicators Saving monitoring thresholds Downloading a client configuration file Configuring the northbound API Configuring the northbound SNMP API Creating a threshold template Deleting a threshold template Applying a threshold template Saving cluster monitoring configuration data Exporting configuration data Importing cluster configuration data Exporting an installation template Modifying a threshold template Canceling the application of a threshold template Masking alarms Sending an alarm Changing the OMS database password Changing the component database password Starting the health check of a cluster

Audit Log	Operation Type	Operation
		Updating the health check configuration Exporting cluster health check results Importing a certificate file Deleting historical health check reports Exporting historical health check reports Customizing report monitoring indicators Exporting report monitoring data Customizing monitoring indicators for static resource pools Exporting monitoring data of a static resource pool
	Service management	Starting a service Stopping a service Synchronizing service configurations Refreshing a service queue Customizing service monitoring indicators Restarting a service Exporting service monitoring data Importing service configuration data Starting the health check of a service Exporting service health check results Configuring the service Uploading a configuration file Downloading a configuration file

Audit Log	Operation Type	Operation
	Instance management	Synchronizing instance configurations Commissioning an instance Decommissioning an instance Starting an instance Stopping an instance Customizing instance monitoring indicators Restarting an instance Exporting instance monitoring data Importing instance configuration data
	Host management	Setting a node rack Starting all roles Stopping all roles Isolating a host Canceling host isolation Customizing host monitoring indicators Exporting host monitoring data Starting the health check of a host Exporting the health check result of a host

Audit Log	Operation Type	Operation
	Maintenance management	Exporting alarms Clearing alarms Exporting events Clearing alarms in batches Clearing alarm through SNMP Adding a trap target through SNMP Deleting a trap target through SNMP Checking alarms through SNMP Synchronizing alarms through SNMP Modifying audit dump configurations Exporting audit logs Collecting log files Downloading log files Uploading a file Deleting an uploaded file Creating a backup task Executing a backup task Stopping a backup task Deleting a backup task Modifying a backup task Locking a backup task Unlocking a backup task Creating a restoration task Executing a backup restoration task Stopping a restoration task Retrying a restoration task Deleting a restoration task

Table 11-21 Component audit information

Audit Log	Operation Type	Operation
DBService audit log	Maintenance management	Performing backup restoration operations
HBase audit log	Data definition language (DDL) statement	Creating a table Deleting a table Modifying a table Adding a column family Modifying a column family Deleting a column family Enabling a table Disabling a table Modify the user information Changing a password User login
	Data manipulation language (DML) statement	Putting data (to the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables) Deleting data (from the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables) Checking and putting data (to the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables) Checking and deleting data (from the **hbase:meta**, **_ctmeta_**, and **hbase:acl** tables)
	Permission control	Assigning permissions to a user Canceling permission assigning

Audit Log	Operation Type	Operation
Hive audit logs	Metadata operation	Defining metadata, such as creating databases and tables Deleting metadata, such as deleting databases and tables Modifying metadata, such as adding columns and renaming tables Importing and exporting metadata
	Data maintenance	Loading data to a table Inserting data into a table
	Permissions management	Creating or deleting roles Granting/Reclaiming roles Granting/Reclaiming permissions
HDFS audit log	Permissions management	Managing permissions on files or folders Managing permissions on owner information files or folders
	File operation	Creating a folder Creating a file Opening a file Appending file content Changing a file name Deleting a file or folder Setting time property of a file Setting the number of file copies Merging files Checking the file system File links

Audit Log	Operation Type	Operation
MapReduce audit log	Application running	Starting a Container request Stopping a Container request After Container request is completed, the status of the request is displayed as succeeded. After Container request is completed, the status of the request is displayed as failed. After Container request is completed, the status of the request is displayed as suspended. Submitting a task Ending a task
LdapServer audit log	Maintenance management	Adding an operating system user Adding a user group Adding a user to user group Deleting a user Deleting a group
KrbServer audit log	Maintenance management	Changing the password of a Kerberos account Adding a Kerberos account Deleting a Kerberos account Authenticating a user
Loader audit log	Security management	User login
	Metadata management	Querying connector information Querying a framework Querying step information

Audit Log	Operation Type	Operation
	Managing data source connections	Querying a data source connection Adding a data source connection Updating a data source connection Deleting a data source connection Activating a data source connection Disabling a data source connection
	Job management	Querying a job Creating a Job Updating a Job Deleting a job Activating a job Disabling a job Querying all execution records of a job Querying the latest execution record of a job Submitting a job Stopping a job
Hue audit log	Service startup	Starting Hue
	User operation	User login User logout
	Task operation	Creating a job Modifying a job Deleting a job Submitting a task Saving a task Updating the status of a task
ZooKeeper audit log	Permissions management	Setting the access permission to Znode
	Znode operation	Creating a Znode Deleting a Znode Configuring Znode data

Audit Log	Operation Type	Operation
Storm audit log	Nimbus	Submitting a topology Stopping a topology Reallocating a topology Deactivating a topology Activating a topology
	UI	Stopping a topology Reallocating a topology Deactivating a topology Activating a topology

MRS audit logs are stored in the database. You can view and export audit logs on the **Audit** page.

The following table lists the directories to store component audit logs. Audit log files of some components are stored in **/var/log/Bigdata/audit**, such as HDFS, HBase, MapReduce, Hive, Hue, Yarn, Storm, and ZooKeeper. The component audit logs are automatically compressed and backed up to **/var/log/Bigdata/audit/bk** at 03: 00 every day. A maximum of latest 90 compressed backup files are retained, and the backup time cannot be changed.

Audit log files of other components are stored in the component log directory.

Table 11-22 Directory for storing component audit logs

Component	Audit Log Directory
DBService	/var/log/Bigdata/audit/dbservice/dbservice_audit.log
HDFS	/var/log/Bigdata/audit/hdfs/nn/hdfs-audit-namenode.log /var/log/Bigdata/audit/hdfs/dn/hdfs-audit-datanode.log /var/log/Bigdata/audit/hdfs/jn/hdfs-audit-journalnode.log /var/log/Bigdata/audit/hdfs/zkfc/hdfs-audit-zkfc.log /var/log/Bigdata/audit/hdfs/httpfs/hdfs-audit-httpfs.log /var/log/Bigdata/audit/hdfs/router/hdfs-audit-router.log
MapReduce	/var/log/Bigdata/audit/mapreduce/jobhistory/mapred-audit-jobhistory.log

Component	Audit Log Directory
Hive	/var/log/Bigdata/audit/hive/hiveserver/hive-audit.log /var/log/Bigdata/audit/hive/metastore/metastore-audit.log /var/log/Bigdata/audit/hive/webhcat/webhcat-audit.log
Loader	/var/log/Bigdata/loader/audit/default.audit
Hue	/var/log/Bigdata/audit/hue/hue-audits.log
ZooKeeper	/var/log/Bigdata/audit/zookeeper/quorumpeer/zk-audit-quorumpeer.log
Spark	/var/log/Bigdata/audit/spark/jdbcserver/jdbcserver-audit.log /var/log/Bigdata/audit/spark/jobhistory/jobhistory-audit.log
Yarn	/var/log/Bigdata/audit/yarn/rm/yarn-audit-resourcemanager.log /var/log/Bigdata/audit/yarn/nm/yarn-audit-nodemanager.log
Storm	/var/log/Bigdata/audit/storm/nimbus/audit.log /var/log/Bigdata/audit/storm/ui/audit.log

11.6.2 Manager Log List

Log Description

Log path: The default storage path of Manager log files is **/var/log/Bigdata/***Manager component*.

- ControllerService: **/var/log/Bigdata/controller/** (operation & maintenance system (OMS) installation and run logs)
- Httpd: **/var/log/Bigdata/httpd** (httpd installation and run logs)
- logman: **/var/log/Bigdata/logman** (log packaging tool logs)
- NodeAgent: **/var/log/Bigdata/nodeagent** (NodeAgent installation and run logs)
- okerberos: **/var/log/Bigdata/okerberos** (okerberos installation and run logs)
- oldapserver: **/var/log/Bigdata/oldapserver** (oldapserver installation and run logs)
- MetricAgent: **/var/log/Bigdata/metric_agent** (MetricAgent run log)
- omm: **/var/log/Bigdata/omm** (omm installation and run logs)
- timestamp: **/var/log/Bigdata/timestamp** (NodeAgent startup time logs)
- tomcat: **/var/log/Bigdata/tomcat** (Web process logs)

- Patch: **/var/log/Bigdata/patch** (patch installation log)
- Sudo: **/var/log/Bigdata/sudo** (sudo script execution log)
- OS: **/var/log/**_message file_ (OS system log)
- OS Performance: **/var/log/osperf** (OS performance statistics log)
- OS Statistics: **/var/log/osinfo/statistics** (OS parameter configuration log)

Log archiving rule:

The automatic compression and archiving function is enabled for Manager logs. By default, when the size of a log file exceeds 10 MB, the log file is automatically compressed. The naming rule of a compressed log file is as follows: <*Original log name*>-<*yyyy-mm-dd_hh-mm-ss*>.[*ID*].**log.zip** A maximum of 20 latest compressed files are reserved.

Table 11-23 Manager logs

Type	Log File Name	Description
Controller run log	controller.log	Log that records component installation, upgrade, patch installation, configuration, monitoring, alarms, and routine O&M operations
	controller_client.log	Run log of the Representational State Transfer (REST) API
	acs.log	ACS run log file
	acs_spnego.log	spnego user log in ACS
	aos.log	AOS run log
	plugin.log	AOS plug-in log
	backupplugin.log	Log that records the backup and restoration operations
	controller_config.log	Configuration run log
	controller_nodesetup.log	Controller loading task log
	controller_root.log	System log of the Controller process
	controller_trace.log	Log that records the remote procedure call (RPC) communication between Controller and NodeAgent

Type	Log File Name	Description
	controller_monitor.log	Monitoring log
	controller_fsm.log	State machine log
	controller_alarm.log	Controller alarm log
	controller_backup.log	Controller backup and recovery log
	install.log, distributeAdapterFiles.log, install_os_optimization.log	OMS installation log
	oms_ctl.log	OMS startup and stop log
	installntp.log	NTP installation log
	modify_manager_param.log	Manager parameter modification log
	backup.log	OMS backup script run log
	supressionAlarm.log	Alarm script run log
	om.log	OM certificate generation log
	backupplugin_ctl.log	Startup log of the backup and restoration plug-in process
	getLogs.log	Run log of the collection log script
	backupAuditLogs.log	Run log of the audit log backup script
	certStatus.log	Log that records regular certificate checks
	distribute.log	Certificate distribution log
	ficertgenetrate.log	Certificate replacement logs, including logs of level-2 certificates, CAS certificates, and httpd certificates
	genPwFile.log	Log that records the generation of certificate password files

Type	Log File Name	Description
	modifyproxyconf.log	Log that records the modification of the HTTPD proxy configuration
	importTar.log	Log that records the process of importing certificates into the trust library
Httpd	install.log	Httpd installation log
	access_log, error_log	Httpd run log
logman	logman.log	Log packaging tool log
NodeAgent	install.log, install_os_optimization.log	NodeAgent installation log
	installntp.log	NTP installation log
	start_ntp.log	NTP startup log
	ntpChecker.log	NTP check log
	ntpMonitor.log	NTP monitoring log
	heartbeat_trace.log	Log that records heartbeats between NodeAgent and Controller
	alarm.log	Alarm log
	monitor.log	Monitoring log
	nodeagent_ctl.log, start-agent.log	NodeAgent startup log
	agent.log	NodeAgent run log
	cert.log	Certificate log
	agentplugin.log	Agent plug-in running status monitoring log
	omaplugin.log	OMA plug-in run log
	diskhealth.log	Disk health check log
	supressionAlarm.log	Alarm script run log
	updateHostFile.log	Host list update log
	collectLog.log	Run log of the node log collection script

Type	Log File Name	Description
	host_metric_collect.log	Host index collection run log
	checkfileconfig.log	Run log file of file permission check
	entropycheck.log	Entropy check run log
	timer.log	Log of periodic node scheduling
	pluginmonitor.log	Component monitoring plug-in log
	agent_alarm_py.log	Log that records alarms upon insufficient NodeAgent file permission
okerberos	addRealm.log, modifyKerberosRealm.log	Domain handover log
	checkservice_detail.log	Okerberos health check log
	genKeytab.log	keytab generation log
	KerberosAdmin_genConfigDetail.log	Run log that records the generation of kadmin.conf when starting the kadmin process
	KerberosServer_genConfigDetail.log	Run log that records the generation of krb5kdc.conf when starting the krb5kdc process
	oms-kadmind.log	Run log of the kadmin process
	oms_kerberos_install.log, postinstall_detail.log	Okerberos installation log
	oms-krb5kdc.log	Run log of the krbkdc process
	start_detail.log	Okerberos startup log
	realmDataConfigPro-cess.log	Log rollback for domain handover failure
	stop_detail.log	Okerberos stop log
oldapserver	ldapserver_backup.log	Oldapserver backup log

Type	Log File Name	Description
	ldapserver_chk_service.log	Oldapserver health check log
	ldapserver_install.log	Oldapserver installation log
	ldapserver_start.log	Oldapserver startup log
	ldapserver_status.log	Log that records the status of the Oldapserver process
	ldapserver_stop.log	Oldapserver stop log
	ldapserver_wrap.log	Oldapserver service management log
	ldapserver_uninstall.log	Oldapserver uninstallation log
	restart_service.log	Oldapserver restart log
	ldapserver_unlockUser.log	Log that records information about unlocking LDAP users and managing accounts
omm	omsconfig.log	OMS configuration log
	check_oms_heartbeat.log	OMS heartbeat log
	monitor.log	OMS monitoring log
	ha_monitor.log	HA_Monitor operation log
	ha.log	HA operation log
	fms.log	Alarm log
	fms_ha.log	HA alarm monitoring log
	fms_script.log	Alarm control log
	config.log	Alarm configuration log
	iam.log	IAM log
	iam_script.log	IAM control log
	iam_ha.log	IAM HA monitoring log
	config.log	IAM configuration log
	operatelog.log	IAM operation log

Type	Log File Name	Description
	heartbeatcheck_ha.log	OMS heartbeat HA monitoring log
	install_oms.log	OMS installation log
	pms_ha.log	HA monitoring log
	pms_script.log	Monitoring control log
	config.log	Monitoring configuration log
	plugin.log	Monitoring plug-in run log
	pms.log	Monitoring log
	ha.log	HA run log
	cep_ha.log	CEP HA monitoring log
	cep_script.log	CEP control log
	cep.log	CEP log
	config.log	CEP configuration log
	omm_gaussdba.log	GaussDB HA monitoring log
	gaussdb-<SERIAL>.log	GaussDB run log
	gs_ctl-<DATE>.log	GaussDB control log archive log
	gs_ctl-current.log	GaussDB control log
	gs_guc-current.log	GaussDB operation log
	encrypt.log	Omm encryption log
	omm_agent_ctl.log	OMA control log
	oma_monitor.log	OMA monitoring log
	install_oma.log	OMA installation log
	config_oma.log	OMA configuration log
	omm_agent.log	OMA run log
	acs.log	ACS resource log
	aos.log	AOS resource log
	controller.log	Controller resource log

Type	Log File Name	Description
	feed_watchdog.log	feed_watchdog resource log
	floatip.log	Floating IP address resource log
	ha_ntp.log	NTP resource log
	httpd.log	Httpd resource log
	okerberos.log	Okerberos resource log
	oldap.log	OLdap resource log
	tomcat.log	Tomcat resource log
	send_alarm.log	Run log of the HA alarm sending script of the management node
timestamp	restart_stamp	NodeAgent start time log
tomcat	cas.log, localhost_access_cas_log.log	CAS run log
	catalina.log, catalina.out, host-manager.log, localhost.log, manager.log	Tomcat run log
	localhost_access_web_log.log	Log that records the access to REST APIs of FusionInsight Manager
	web.log	Run log of the web process
	northbound_ftp_sftp.log, snmp.log	Northbound log
watchdog	watchdog.log, feed_watchdog.log	watchdog run log
patch	oms_installPatch.log	OMS patch installation log
	agent_installPatch.log	Agent patch installation log
	agent_uninstallPatch.log	Agent patch uninstallation log
	NODE_AGENT_restoreFile.log	Agent patch restoration log

Type	Log File Name	Description
	NODE_AGENT_updateFile.log	Agent patch update log
	OMA_restoreFile.log	OMA patch restoration file log
	OMA_updateFile.log	OMA patch update file log
	CONTROLLER_restoreFile.log	CONTROLLER patch restoration file log
	CONTROLLER_updateFile.log	CONTROLLER patch update file log
	OMS_restoreFile.log	OMS patch restoration file log
	oms_uninstallPatch.log	OMS patch uninstallation log
	OMS_updateFile.log	OMS patch update file log
	createStackConf.log, decompress.log, decompress_OMS.log, distrExtractPatchO-nOMS.log, slimReduction.log, switch_adapter.log	Patch installation log
sudo	sudo.log	Sudo script execution log

Log Levels

Table 11-24 describes the log levels provided by Manager. The priorities of log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the specified level are printed. The number of printed logs decreases as the specified log level increases.

Table 11-24 Log levels

Level	Description
FATAL	Logs of this level record fatal error information about the current event processing that may result in a system crash.
ERROR	Logs of this level record error information about the current event processing, which indicates that system running is abnormal.

Level	Description
WARN	Abnormal information about the current event processing. These abnormalities will not result in system faults.
INFO	Normal running status information about the system and events.
DEBUG	Logs of this level record the system information and system debugging information.

Log Formats

The following table lists the Manager log formats.

Table 11-25 Log formats

Type	Component	Format	Example
Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	<*yyyy-MM-dd HH:mm:ss,SSS*>|<*Log level*>|<*Name of the thread that generates the log*>|<*Message in the log*>|<*Location where the log event occurs*>	2015-06-30 00:37:09,067 INFO [pool-1-thread-1] Completed Discovering Node. com.xxx.hadoop.om.controller.tasks.nodesetup.DiscoverNodeTask.execute(DiscoverNodeTask.java:299)

11.6.3 Viewing and Exporting Audit Logs

Scenario

This section describes how to view and export audit logs on MRS Manager. The audit logs can be used to trace security events, locate fault causes, and determine responsibilities.

The system record the following log information:

- User activity information, such as user login and logout, system user information modification, and system user group information modification
- User operation instruction information, such as cluster startup, stop, and software upgrade.

Procedure

- Viewing audit logs

a. On MRS Manager, click **Audit** to view the default audit logs.

   If the audit content of an audit log contains more than 256 characters, click the expand button of the audit log to expand the audit details. Click **Log File** to download the complete file and view the information.

   - By default, records are sorted in descending order by the **Occurred** column. You can click **Operation Type**, **Severity**, **Occurred**, **User**, **Host**, **Service**, **Instance**, or **Operation Result** to change the sorting mode.
   - All alarms of the same severity can be filtered by **Severity**. The results include cleared and uncleared alarms.

   Exported audit logs contain the following information:

   - **Sno**: indicates the number of audit logs generated by MRS Manager. The number is incremented by 1 when a new audit log is generated.
   - **Operation Type**: indicates the operation type of a user operation. There are nine scenarios: **Alarm**, **Auditlog**, **Backup And Restoration**, **Cluster**, **Collect Log**, **Host**, **Service**, **Tenant** and **User_Manager**. **User_Manager** is supported only in clusters with Kerberos authentication enabled. Each scenario contains different operation types. For example, **Alarm** includes **Export alarms**; **Cluster** includes **Start cluster**, and **Tenant** include **Add tenant**.
   - **Severity**: indicates the security level of each audit log, including **Critical**, **Major**, **Minor** and **Informational**.
   - **Start Time**: indicates the time when the operation starts. The time is UTC/GMT+08:00.
   - **End Time**: indicates the time when the operation ends. The time is UTC/GMT+08:00.
   - **User IP Address**: indicates the IP address used by a user to perform operations.
   - **User**: indicates the name of the user who performs the operation.
   - **Host**: indicates the node where the user operation is performed. The information is not saved if the operation does not involve a node.
   - **Service**: indicates the service in the cluster where the user operation is performed. The information is not saved if the operation does not involve a service.
   - **Instance**: indicates the role instance in the cluster where the user operation is performed. The information is not saved if the operation does not involve a role instance.
   - **Operation Result**: indicates the operation result, including **Successful**, **Failed** and **Unknown**.
   - **Content**: indicates execution information of the user operation.

b. Click **Advanced Search**. In the search area, set search criteria and click **Search** to view audit logs of the specified type. Click **Reset** to clear the search criteria.

NOTE

Start Time and **End Time** specify the start time and end time of the time range. You can search for alarms generated within the time range.

- Exporting audit logs
  a. In the audit log list, click **Export All** to export all logs.
  b. In the audit log list, select the check box of a log and click **Export** to export the log.

11.6.4 Exporting Service Logs

Scenario

This section describes how to export logs generated by each service role from MRS Manager.

Prerequisites

- You have obtained the access key ID (AK) and secret access key (SK) of the account.
- A parallel file system has been created in OBS.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Click **Export Log** under **Maintenance**.

Step 3 Set a service for **Service**. Set **Host** to the IP address of the host where the service is deployed. Select the corresponding time for **Start Time** and **End Time**.

Step 4 In **Export To**, select a path for saving logs. This parameter is available only for clusters with Kerberos authentication enabled.

- **Local PC**: indicates that logs are saved to the local environment. Then go to **Step 8**.
- **OBS**: indicates that logs are saved to OBS. This is the default option. Then go to **Step 5**.

Step 5 Set **OBS Path** to the path for storing service logs on OBS.

The value must be a complete path and cannot start with a slash (/). The path can be nonexistent and will be automatically created by the system. The full path of OBS can contain a maximum of 900 bytes.

Step 6 In **Bucket**, enter the name of the created OBS file system.

Step 7 Set **AK** and **SK** to the access key ID and secret access key of the user.

Step 8 Click **OK**.

----End

11.6.5 Configuring Audit Log Exporting Parameters

Scenario

If MRS audit logs are stored in the system for a long time, the disk space of the data directory may be insufficient. Therefore, you can set export parameters to automatically export audit logs to a specified directory on the OBS server timely, facilitating audit log management.

NOTE

Audit logs exported to the OBS server include service audit logs and management audit logs.

- Service audit logs are automatically compressed and stored in the **/var/log/Bigdata/audit/bk/** directory on the active management node at 03:00 every day. The file name format is <*yyyy-MM-dd_HH-mm-ss*>**.tar.gz**. By default, a maximum of seven log files can be stored. If more than seven log files are stored, the system automatically deletes the log files generated seven days ago.
- The data range of management audit logs exported to OBS each time is from the last date when the logs are successfully exported to OBS to the date when the task is executed. When the number of management audit logs reaches 100,000, the system automatically dumps the first 90,000 audit logs to a local file and retains 10,000 audit logs in the database. The dumped log files are saved in the **${BIGDATA_DATA_HOME}/dbdata_om/dumpData/iam/operatelog** directory on the active management node. The file name format is **OperateLog_store_***YY_MM_DD_HH_MM_SS***.csv**. A maximum of 50 historical audit log files can be saved.

Prerequisites

- You have obtained the access key ID (AK) and secret access key (SK) of the account.
- A parallel file system has been created in OBS.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Choose **Export Audit Log** under **Maintenance**.

Table 11-26 Parameters for exporting audit logs

Parameter	Value	Description
Start Time	7/24/2017 09:00:00 (example value)	(Mandatory) Specifies the start time for exporting audit logs.
Period (days)	1 day (example value)	(Mandatory) Specifies the interval for exporting audit logs. The interval ranges from 1 to 5 days.
Bucket	mrs-bucket (example value)	(Mandatory) Specifies the name of the OBS file system to which audit logs are exported.

Parameter	Value	Description
OBS path	**/opt/omm/oms/auditLog** (example value)	(Mandatory) Specifies the OBS path to which audit logs are exported.
AK	*XXX* (example value)	(Mandatory) Specifies the user's access key ID.
SK	*XXX* (example value)	(Mandatory) Specifies the user's secret access key.

NOTE

Audit logs are stored in **service_auditlog** and **manager_auditlog** on OBS, which are used to store service audit logs and management audit logs, respectively.

----End

11.7 Health Check Management

11.7.1 Performing a Health Check

Scenario

To ensure that cluster parameters, configurations, and monitoring are correct and that the cluster can run stably for a long time, you can perform a health check during routine maintenance.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Procedure

- Manually perform the health check for all services.
  a. Click **Services** and select the target service.
  b. Choose **More** > **Start Service Health Check** to start the health check for the service.

NOTE

- The cluster health check includes Manager, service, and host status checks.
- To perform cluster health checks, you can also choose **System** > **Check Health Check** > **Start Cluster Health Check** on MRS Manager.
- To export the health check result, click **Export Report** in the upper left corner.

- Manually perform the health check for a service.
  a. Click **Services**. In the services list, click the desired service name.
  b. Choose **More** > **Start Service Health Check** to start the health check for the service.
- Manually perform the health check for a host.
  a. Click **Hosts**.
  b. Select the check box of the host for which you want to check the health status.
  c. Choose **More** > **Start Host Health Check** to start the health check for the host.
- Automatically performing a health check
  a. Click **System**.
  b. Click **Check Health Status** under **Maintenance**.
  c. Click **Configure Health Check** to configure automatic health check items.

     Periodic Health Check: specifies whether to enable automatic health check. The **Periodic Health Check** function is disabled by default. You can click to enable the function and select **Daily**, **Weekly**, or **Monthly** based on management requirements.
  d. Click **OK** to save the settings. The **Health check configuration saved successfully** is displayed in the upper right corner.

11.7.2 Viewing and Exporting a Health Check Report

Scenario

You can view the health check result in MRS Manager and export the health check results for further analysis.

NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

Prerequisites

You have performed a health check.

Procedure

Step 1 Click **Services**.

Step 2 Choose **More > View Cluster Health Check Report** to view the health check report of a cluster.

Step 3 Click **Export Report** on the health check report pane to export the report and view detailed information about check items.

NOTE

For details about how to rectify the faults of the check items, see **DBService Health Check Indicators** to **ZooKeeper Health Check Indicators**.

----End

11.7.3 Configuring the Number of Health Check Reports to Be Reserved

Scenario

Health check reports of MRS clusters, services, and hosts may vary with the time and scenario. You can modify the number of health check reports to be reserved on MRS Manager for later comparison.

This setting is valid for health check reports of clusters, services, and hosts. Report files are saved in **$BIGDATA_DATA_HOME/Manager/healthcheck** on the active management node by default and are automatically synchronized to the standby management node.

Prerequisites

Users have specified service requirements and planned the save time and health check frequency, and the disk space of the active and standby management nodes is sufficient.

Procedure

Step 1 Choose **System** > **Check Health Status** > **Configure Health Check**.

Step 2 Set **Max. Number of Health Check Reports** to the number of health check reports to be reserved. The value ranges from 1 to 100. The default value is 50.

Step 3 Click **OK** to save the settings. The **Health check configuration saved successfully** is displayed in the upper right corner.

----End

11.7.4 Managing Health Check Reports

Scenario

On MRS Manager, users can manage historical health check reports, for example, viewing, downloading, and deleting historical health check reports.

Procedure

- Download a specified health check report.
  a. Choose **System** > **Check Health Status**.
  b. Locate the row that contains the target health check report and click **Download** to download the report file.
- Download specified health check reports in batches.
  a. Choose **System** > **Check Health Status**.
  b. Select multiple health check reports and click **Download File** to download them.
- Delete a specified health check report.
  a. Choose **System** > **Check Health Status**.
  b. Locate the row that contains the target health check report and click **Delete** to delete the report file.
- Delete specified health check reports in batches.
  a. Choose **System** > **Check Health Status**.
  b. Select multiple health check reports and click **Delete File** to delete them.

11.7.5 DBService Health Check Indicators

Service Health Check

Indicator: Service Status

Description: This indicator is used to check whether the DBService service status is normal. If the status is abnormal, the service is unhealthy.

Handling method: If the indicator is abnormal, rectify the fault by referring to ALM-27001.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.6 Flume Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Flume service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-24000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.7 HBase Health Check Indicators

Normal RegionServer Count

Indicator: Normal RegionServer Count

Description: This indicator is used to check the number of RegionServers that are running properly in an HBase cluster.

Recovery Guide: If the indicator is abnormal, check whether the status of RegionServer is normal. If the status is abnormal, resolve the problem and check that the network is normal.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the HBase service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the status of HMaster and RegionServer is normal. If the status is abnormal, resolve the problem. Then, check whether the status of the ZooKeeper service is faulty. On the HBase client, check whether the data in the HBase table can be correctly read and locate the data reading failure cause. Handle the alarm following instructions in the alarm processing document.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.8 Host Health Check Indicators

Swap Usage

Indicator: Swap Usage

Description: Swap usage of the system. The value is calculated using the following formula: Swap usage = Used swap size/Total swap size. Assume that the

current threshold is set to 75.0%. If the usage of the file handles in the system exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the swap usage of the node.

   Log in to the unhealthy node and run the **free -m** command to check the total swap space and used swap space. If the swap space usage exceeds the threshold, go to **2**.
2. If the swap usage exceeds the threshold, you are advised to expand the system capacity, for example, add nodes.

Host File Handle Usage

Indicator: Host File Handle Usage

Description: This indicator indicates the file handle usage in the system. Host file handle usage = Number of used handles/Total number of handles. If the usage exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the file handle usage of the host.

   Log in to the unhealthy node and run the **cat /proc/sys/fs/file-nr** command. In the command output, the first and third columns indicate the number of used handles and the total number of handles, respectively. If the usage exceeds the threshold, go to **2**.
2. If the file handle usage of the host exceeds the threshold, you are advised to check the system and analyze the file handle usage.

NTP Offset

Indicator: NTP Offset

Description: This indicator indicates the NTP time offset. If the time deviation exceeds the threshold, the system is unhealthy.

Recovery Guide:

1. Check the NTP time offset.

   Log in to the unhealthy node and run the **/usr/sbin/ntpq -np** command to view the information. In the command output, the **Offset** column indicates the time offset. If the time offset is greater than the threshold, go to **2**.
2. If the indicator is abnormal, check whether the clock source configuration is correct. Contact O&M personnel.

Average Load

Indicator: Average Load

Description: Average system load, indicating the average number of processes in the running queue in a specified period. The system average load is calculated using the load value obtained by the uptime command. Calculation method: (Load of 1 minute + Load of 5 minutes + Load of 15 minutes)/(3 x Number of CPUs).

Assume that the current threshold is set to 2. If the average load exceeds 2, the system is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the **uptime** command. The last three columns in the command output indicate the load in 1 minute, 5 minutes, and 15 minutes, respectively. If the average system load exceeds the threshold, go to **2**.
2. If the system average load exceeds the threshold, you are advised to perform system capacity expansion, such as adding nodes.

D State Process

Indicator: D State Process

Description: This indicator indicates the unstoppable sleep process, that is, the process in the D state. A process that is in the D state is waiting for I/O, such as disk I/O and network I/O, and experiences an I/O exception. If any process in the D state exists in the system, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12028.

Hardware Status

Indicator: Hardware Status

Description: This indicator is used to check the system hardware status, including the CPU, memory, disk, power supply, and fan. This indicator obtains related hardware information using **ipmitool sdr elist**. If the hardware status is abnormal, the hardware is unhealthy.

Recovery Guide:

1. Log in to the node where the check result is unhealthy. Run the **ipmitool sdr elist** command to check system hardware status. The last column in the command output indicates the hardware status. If the status is included in the following fault description table, the check result is unhealthy.

Module	Symptom
Processor	IERR Thermal Trip FRB1/BIST failure FRB2/Hang in POST failure FRB3/Processor startup/init failure Configuration Error SM BIOS Uncorrectable CPU-complex Error Disabled Throttled Uncorrectable machine check exception
Power Supply	Failure detected Predictive failure Power Supply AC lost AC lost or out-of-range AC out-of-range, but present Config Error: Vendor Mismatch Config Error: Revision Mismatch Config Error: Processor Missing Config Error: Power Supply Rating Mismatch Config Error: Voltage Rating Mismatch Config Error
Power Unit	240VA power down Interlock power down AC lost Soft-power control failure Failure detected Predictive failure
Memory	Uncorrectable ECC Parity Memory Scrub Failed Memory Device Disabled Correctable ECC logging limit reached Configuration Error Throttled Critical Overtemperature

Module	Symptom
Drive Slot	Drive Fault Predictive Failure Parity Check In Progress In Critical Array In Failed Array Rebuild In Progress Rebuild Aborted
Battery	Low Failed

2. If the indicator is abnormal, contact O&M personnel.

Host Name

Indicator: Host Name

Description: This indicator is used to check whether the host name is set. If the host name is not set, the system is unhealthy. If the indicator is abnormal, you are advised to set the host name properly.

Recovery Guide:

1. Log in to the node where the check result is unhealthy.
2. Run the hostname host name command to change the host name to ensure that the host name is consistent with the planned host name.

   hostname*host name* For example, to change the host name to **Bigdata-OM-01**, run the **hostname Bigdata-OM-01** command.
3. Modify the host name configuration file.

   Run the **vi /etc/HOSTNAME** command to edit the file. Change the file content to **Bigdata-OM-01**. Save the file, and exit.

Umask

Indicator: Umask

Description: This indicator is used to check whether the umask setting of user **omm** is correct. If Umask is not 0077, the system is unhealthy.

Recovery Guide:

1. If the indicator is abnormal, you are advised to set umask of user **omm** to 0077. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the **vi ${BIGDATA_HOME}/.om_profile** command and change the value of **umask** to **0077**. Save and exit.

OMS HA Status

Indicator: OMS HA Status

Description: This indicator is used to check whether the OMS two-node cluster resources are normal. You can run the **${CONTROLLER_HOME}/sbin/status-oms.sh** command to view the detailed information about the status of the OMS two-node cluster resources. If any module is abnormal, the OMS is unhealthy.

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **${CONTROLLER_HOME}/sbin/status-oms.sh** command to check the OMS status.
2. If floatip, okerberos, and oldap are abnormal, handle the problems by referring to ALM-12002, ALM-12004, and ALM-12005 respectively.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

   If controller resources are abnormal, view **/var/log/Bigdata/controller/controller.log** of the faulty node.

   If CEP resources are abnormal, view **/var/log/Bigdata/omm/oms/cep/cep.log** of the faulty node.

   If AOS resources are abnormal, view **/var/log/Bigdata/controller/aos/aos.log** of the faulty node.

   If feed_watchdog resources are abnormal, view **/var/log/Bigdata/watchdog/watchdog.log** of the abnormal node.

   If HTTPD resources are abnormal, view **/var/log/Bigdata/httpd/error_log** of the abnormal node.

   If FMS resources are abnormal, view **/var/log/Bigdata/omm/oms/fms/fms.log** of the abnormal node.

   If PMS resources are abnormal, view **/var/log/Bigdata/omm/oms/pms/pms.log** of the abnormal node.

   If IAM resources are abnormal, view **/var/log/Bigdata/omm/oms/iam/iam.log** of the abnormal node.

   If the GaussDB resource is abnormal, check the **/var/log/Bigdata/omm/oms/db/omm_gaussdba.log** of the abnormal node.

   If NTP resources are abnormal, view **/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log** of the abnormal node.

   If Tomcat resources are abnormal, view **/var/log/Bigdata/tomcat/catalina.log** of the abnormal node.
4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

Checking the Installation Directory and Data Directory

Indicator: Installation Directory and Data Directory Check

Description: This indicator checks the **lost+found** directory in the root directory of the disk partition where the installation directory (**/opt/Bigdata** by default) is located. If the directory contains the files of user **omm**, there are exceptions.

When a node is abnormal, related files are stored in the **lost+found** directory. This indicator is used to check whether files are lost in such scenarios. Check the installation directory (for example, **/opt/Bigdata**) and data directory (for example, **/srv/BigData**). If any files of non-omm users exist in the two directories, the system is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**. Check whether files or folders of user omm exist in the **lost+found** directory.

   If the **omm** user file exists, you are advised to restore it and check again. If the **omm** user file does not exist, go to **2**.
2. Check the installation directory and data directory. Check whether the files or folders of other users exist in the installation directory and data directory. If the files and folders are manually generated temporary files, you are advised to delete them and check again.

CPU Usage

Indicator: CPU Usage

Description: This indicator is used to check whether the CPU usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12016.

Memory Usage

Indicator: Memory Usage

Description: This indicator is used to check whether the memory usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12018.

Host Disk Usage

Indicator: Host Disk Usage

Description: This indicator is used to check whether the host disk usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12017.

Host Disk Write Rate

Indicator: Host Disk Write Rate

Description: This indicator is used to check the disk write rate of a host. The write rate of the host disk may vary according to the service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

Recovery Guide: Determine whether the current disk write rate is normal based on the service scenario.

Host Disk Read Rate

Indicator: Host Disk Read Rate

Description: This indicator is used to check the disk read rate of a host. The read rate of the host disk may vary by service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

Recovery Guide: Determine whether the current disk read rate is normal based on the service scenario.

Host Service Plane Network Status

Indicator: Host Service Plane Network Status

Description: This indicator is used to check the connectivity of the service plane network of the cluster host. If the hosts are disconnected, the cluster is unhealthy.

Recovery Guide: If the single-plane networking is used, check the IP address of the single plane. For a dual-plane network, the operation procedure is as follows:

1. Check the network connectivity between the service plane IP addresses of the active and standby management nodes.

   If the network is abnormal, go to **3**.

   If the network is normal, go to **2**.
2. Check the network connectivity between the IP address of the active management node and the IP address of the abnormal node in the cluster.
3. If the network is disconnected, contact O&M personnel to rectify the network fault to ensure that the network meets service requirements.

Host Status

Indicator: Host Status

Description: This indicator is used to check whether the host status is normal. If a node is faulty, the host is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-12006.

Alarm Check

Indicator: Alarm Check

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.9 HDFS Health Check Indicators

Average Packet Sending Time

Indicator: Average Packet Sending Time

Description: This indicator is used to collect statistics on the average time for the DataNode in the HDFS to execute SendPacket each time. If the average time is greater than 2,000,000 ns, the DataNode is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high. Check whether the HDFS load in the cluster is high.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the HDFS service status is normal. If a node is faulty, the host is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the health status of the KrbServer, LdapServer and ZooKeeper services are faulty. If yes, rectify the fault. Then, check whether the file writing failure is caused by HDFS SafeMode ON. Use the client to check whether data cannot be written into HDFS and locate the cause of the HDFS data writing failure. Handle the alarm following instructions in the alarm processing document.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.10 Hive Health Check Indicators

Maximum Number of Sessions Allowed by HiveServer

Indicator: Maximum Number of Sessions Allowed by HiveServer

Description: This indicator is used to check the maximum number of sessions that can be connected to Hive.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Number of Sessions Connected to HiveServer

Indicator: Number of Sessions Connected to HiveServer

Description: This indicator is used to check the number of Hive connections.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Hive service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.11 Kafka Health Check Indicators

Number of Available Broker Nodes

Indicator: Number of Brokers

Description: This indicator is used to check the number of available Broker nodes in a cluster. If the number of available Broker nodes in a cluster is less than 2, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Kafka service instance page and click the host name of the unavailable Broker instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to the alarm handling suggestions in **Process Fault**. If the status is not **Good**, rectify the fault by referring to the handling procedure of the **Node Fault** alarm.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Kafka service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to the alarm "Kafka Service Unavailable".

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.12 KrbServer Health Check Indicators

KerberosAdmin Service Availability

Indicator: KerberosAdmin Service Availability

Description: The system checks the KerberosAdmin service status. If the check result is abnormal, the KerberosAdmin service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KerberosAdmin service is located is faulty or the SlapdServer service is unavailable. During the KerberosAdmin service recovery, try the following operations:

1. Check whether the node where the KerberosAdmin service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

KerberosServer Service Availability

Indicator: KerberosServer Service Availability

Description: The system checks the KerberosServer service status. If the check result is abnormal, the KerberosServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KerberosServer service is located is faulty or the SlapdServer service is unavailable. During the KerberosServer service recovery, try the following operations:

1. Check whether the node where the KerberosServer service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

Service Health Status

Indicator: Service Status

Description: The system checks the KrbServer service status. If the check result is abnormal, the KrbServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the KrbServer service resides is faulty or the LdapServer service is unavailable. For details, see the handling procedure of ALM-25500.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check the alarm information about the KrbServer service. If any alarms exist, the KrbServer service may be abnormal.

Recovery Guide: If this indicator check result is abnormal, see the related alarm document to handle the alarms.

11.7.13 LdapServer Health Check Indicators

SlapdServer Service Availability

Indicator: SlapdServer Service Availability

Description: The system checks the SlapdServer service status. If the status is abnormal, the SlapdServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the SlapdServer service is located is faulty or the SlapdServer process is faulty. During the SlapdServer service recovery, try the following operations:

1. Check whether the node where the SlapdServer service locates is faulty. For details, see ALM-12006.
2. Check whether the SlapdServer process is normal. For details, see ALM-12007.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check the alarm information about the LdapServer service. If the status is abnormal, the LdapServer service is unavailable.

Recovery Guide: If the indicator check result is abnormal, the possible cause is that the node where the active LdapServer service resides is faulty or the active LdapServer process is faulty. For details, see ALM-25000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check the alarm information about the LdapServer service. If any alarms exist, the LdapServer service may be abnormal.

Recovery Guide: If this indicator check result is abnormal, see the related alarm document to handle the alarms.

11.7.14 Loader Health Check Indicators

ZooKeeper Health Status

Indicator: ZooKeeper health status

Description: This indicator is used to check whether the ZooKeeper health status is normal. If the status is abnormal, the ZooKeeper service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

HDFS Health Status

Indicator: HDFS health status

Description: This indicator is used to check whether the HDFS health status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

DBService Health Status

Indicator: DBService Health Status

Description: This indicator is used to check whether the DBService health status is normal. If the status is abnormal, the DBService service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Yarn Health Status

Indicator: Yarn health status

Description: This indicator is used to check whether the Yarn health status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

MapReduce Health Status

Indicator: MapReduce Health Status

Description: This indicator is used to check whether the MapReduce health status is normal. If the status is abnormal, the MapReduce service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Loader Process Status

Indicator: Loader Process Status

Description: This indicator is used to check whether the Loader process is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Loader service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist for loader. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.15 MapReduce Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the MapReduce service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.16 OMS Health Check Indicators

OMS Status Check

Indicator: OMS Status Check

Description: The OMS status check includes the HA status check and resource status check. The HA status includes **active**, **standby**, and **NULL**, indicating the active node, standby node, and unknown, respectively. The resource status includes normal, abnormal, and NULL. If the HA status is NULL, the HA status is unhealthy. If the resource status is NULL or abnormal, the resource status is unhealthy.

Table 11-27 OMS status description

Name	Description
HA state	**active**: indicates the active node. **standby**: indicates the standby node. **NULL**: unknown

Name	Description
Resource status	**normal**: All resources are normal. **abnormal**: indicates that abnormal resources exist. **NULL**: unknown

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **${CONTROLLER_HOME}/sbin/status-oms.sh** command to check the status of OMS.
2. If the HA status is NULL, the system may be restarting. NULL is an intermediate state, and the HA status will automatically change to a normal state.
3. If the resource status is abnormal, certain component resources of FusionInsight Manager are abnormal. Check whether the status of components such as acs, aos cep, controller, feed_watchdog, fms, gaussDB, httpd, iam, ntp, okerberos, oldap, pms, and tomcat component is normal.
4. If any Manager component resource is abnormal, see Manager component status check to rectify the fault.

Manager Component Status Check

Indicator: Manager Component Status Check

Description: This indicator is used to check the running status and HA status of Manager components. The resource running status includes **Normal** and **Abnormal**, and the resource HA status includes **Normal** and **Exception**. Manager components include Acs, Aos, Cep, Controller, feed_watchdog, Floatip, Fms, GaussDB, HeartBeatCheck, httpd, IAM, NTP, Okerberos, OLDAP, PMS, and Tomcat. If the running status and HA status is not Normal, the check result is unhealthy.

Table 11-28 Manager status description

Name	Description
Resource running status:	**Normal**: The system is running properly. **Abnormal**: The running is abnormal. **Stopped**: The task is stopped. **Unknown**: The status is unknown. **Starting**: The process is being started. **Stopping**: The task is being stopped. **Active_normal**: The active node is running properly. **Standby_normal**: The standby node is running properly. **Raising_active**: The node is being promoted to be the active node. **Lowing_standby**: The node is being set to be the standby node. **No_action**: the action does not exist. **Repairing**: The disk is being repaired. **NULL**: unknown
Resource HA status	**Normal**: the status is normal. **Exception**: indicates a fault. **Non_steady**: indicates the non-steady state. **Unknown**: unknown **NULL**: unknown

Recovery Guide:

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **${CONTROLLER_HOME}/sbin/status-oms.sh** command to check the status of OMS.
2. If floatip, okerberos, and oldap are abnormal, handle the problems by referring to ALM-12002, ALM-12004, and ALM-12005 respectively.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

   If controller resources are abnormal, view **/var/log/Bigdata/controller/controller.log** of the faulty node.

   If CEP resources are abnormal, view **/var/log/Bigdata/omm/oms/cep/cep.log** of the faulty node.

   If AOS resources are abnormal, view **/var/log/Bigdata/controller/aos/aos.log** of the faulty node.

   If feed_watchdog resources are abnormal, view **/var/log/Bigdata/watchdog/watchdog.log** of the abnormal node.

If HTTPD resources are abnormal, view **/var/log/Bigdata/httpd/error_log** of the abnormal node.

If FMS resources are abnormal, view **/var/log/Bigdata/omm/oms/fms/fms.log** of the abnormal node.

If PMS resources are abnormal, view **/var/log/Bigdata/omm/oms/pms/pms.log** of the abnormal node.

If IAM resources are abnormal, view **/var/log/Bigdata/omm/oms/iam/iam.log** of the abnormal node.

If the GaussDB resource is abnormal, check the **/var/log/Bigdata/omm/oms/db/omm_gaussdba.log** of the abnormal node.

If NTP resources are abnormal, view **/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log** of the abnormal node.

If Tomcat resources are abnormal, view **/var/log/Bigdata/tomcat/catalina.log** of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

OMA Running Status

Indicator: OMA Running Status

Description: This indicator is used to check the running status of the OMA. The status can be **Running** or **Stopped**. If the OMA is **Stopped**, the OMA is unhealthy.

Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run **${OMA_PATH}/restart_oma_app** to manually start the OMA and check again. If the check result is still unhealthy, go to **3**.
3. If manually starting the OMA cannot resolve the problem, you are advised to check the OMA logs in **/var/log/Bigdata/omm/oma/omm_agent.log**.
4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

SSH Trust Between Each Node and the Active Management Node

Indicator: SSH Trust Between Each Node and the Active Management Node

Description: This indicator is used to check whether the SSH mutual trust is normal. If you can switch to another node through SSH from the active OMS node as user omm without the need of entering the password, SSH communication is normal. Otherwise, SSH communication is abnormal. In addition, if you can switch to another node through SSH from the active OMS node but fail to switch to the active OMS node from the other nodes, SSH communication is abnormal.

Recovery Guide:

1. If the indicator check result is abnormal, the SSH trust relationships between the nodes and the active management node are abnormal. In this case, check whether the permission of the **/home/omm** directory is **omm**. If non-omm users have the directory permission, the SSH trust relationship may be

abnormal. You are advised to run **chown omm:wheel** to modify the permission and check again. If the permission on the **/home/omm** directory is normal, go to **2**.

2. The SSH trust relationship exception may cause heartbeat exceptions between Controller and NodeAgent, resulting in node fault alarms. In this case, rectify the fault by referring to the handling procedure of ALM-12006.

Process Running Time

Indicator: Running Time of NodeAgent, Controller, and Tomcat

Description: This indicator is used to check the running time of the NodeAgent, Controller, and Tomcat processes. If the time is less than half an hour (1,800s), the process may have been restarted. You are advised to check the process after half an hour. If multiple check results indicate that the process runs for less than half an hour, the process is abnormal.

Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the following command to check the PID based on the process name:

   ps -ef | grep NodeAgent
3. Run the following command to check the process startup time based on the PID:

   ps -p pid -o lstart
4. Check whether the process start time is normal. If the process restarts repeatedly, go to **5**.
5. View the related logs and analyze restart causes.

   If the runtime of NodeAgent is abnormal, check **/var/log/Bigdata/nodeagent/agentlog/agent.log**.

   If the Controller running time is abnormal, check the **/var/log/Bigdata/controller/controller.log** file.

   If the Tomcat running time is abnormal, check the **/var/log/Bigdata/tomcat/web.log** file.
6. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

Account and Password Expiration Check

Indicator: Account and Password Expiration Check

Description: This indicator checks the two operating system users **omm** and **ommdba** of MRS. For OS users, both the account and password expiration time must be checked. If the validity period of the account or password is not greater than 15 days, the account is abnormal.

Recovery Guide: If the validity period of the account or password is less than or equal to 15 days, contact O&M personnel.

11.7.17 Spark Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Spark service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to ALM-28001.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.18 Storm Health Check Indicators

Number of Working Nodes

Indicator: Number of Supervisors

Description: This indicator is used to check the number of available Supervisors in a cluster. If the number of available Supervisors in a cluster is less than 1, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Streaming service instance page and click the host name of the unavailable Supervisor instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to ALM-12007 Process Faults. If the status is not **Good**, rectify the fault by referring to the handling procedure of the ALM-12006 Node Faults.

Number of Idle Slots

Indicator: Number of Idle Slots

Description: This indicator is used to check the number of idle slots in a cluster. If the number of idle slots in a cluster is less than 1, the cluster is unhealthy.

Recovery Guide: If the indicator is abnormal, go to the Storm service instance page and check the health status of the Supervisor instance. If the health status of all Supervisor instances is **Good**, you need to expand the capacity of the Core node in the cluster. If not, rectify the fault by referring to ALM-12007 Process Faults.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Storm service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, rectify the fault by referring to the alarm "ALM-26051 Storm Service Unavailable".

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.19 Yarn Health Check Indicators

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether the Yarn service status is normal. If the number of NodeManager nodes cannot be obtained, the system is unhealthy.

Recovery Guide: If this indicator is abnormal, you can handle the alarm by referring to the alarm handling guide and make sure that the network is normal.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.7.20 ZooKeeper Health Check Indicators

Average ZooKeeper Request Processing Latency

Indicator: Average ZooKeeper Service Request Processing Latency

Description: This indicator is used to check the average delay for the ZooKeeper service to process requests. If the average delay is greater than 300 ms, the ZooKeeper service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high.

ZooKeeper Connections Usage

Indicator: ZooKeeper Connections Usage

Description: This indicator is used to check whether the ZooKeeper memory usage exceeds 80%. If the disk usage exceeds the threshold, the system is unhealthy.

Recovery Guide: If the indicator is abnormal, you are advised to increase the memory available for the ZooKeeper service. The method of increasing the memory is as follows: Increase the value of **-Xmx** in the **GC_OPTS** configuration item in the ZooKeeper service. After the modification, restart the ZooKeeper service for the configuration to take effect.

Service Health Status

Indicator: Service Status

Description: This indicator is used to check whether ZooKeeper service status is normal. If the status is abnormal, the service is unhealthy.

Recovery Guide: If the indicator is abnormal, check whether the health status of the KrbServer and LdapServer services is faulty. If yes, rectify the fault. Log in to the ZooKeeper client, check whether the ZooKeeper data writing fails. If yes, find the failure cause based on the error message and handle the fault according to error message. Rectify the fault by following the procedure for handling ALM-13000.

Alarm Check

Indicator: Alarm Information

Description: This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

Recovery Guide: If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

11.8 Static Service Pool Management

11.8.1 Viewing the Status of a Static Service Pool

Scenario

MRS Manager manages and isolates service resources that are not running on YARN through the static service resource pool. It dynamically manages the total CPU, I/O, and memory resources that can be used by HDFS and YARN on the deployment node. The system supports time-based automatic adjustment of static service resource pools. This enables the cluster to automatically adjust the parameter values at different periods to ensure more efficient resource utilization.

On MRS Manager, you can view the monitoring metrics of the resources used by each service in the static service pool. The monitoring metrics are as follows:

- Service Total CPU Usage
- Service Total Disk I/O Read Speed
- Service Total Disk I/O Write Speed

- Service Total Memory Usage

Procedure

Step 1 On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.

Step 2 Click **Status**.

Step 3 Check the system resource adjustment base values.

- **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
- **CPU(%)** indicates the maximum number of CPUs that can be used by services on a node.
- **Memory(%)** indicates the maximum memory that can be used by services on a node.

Step 4 Check the cluster service resource usage.

In the chart area, select **All services** from the service drop-down list box. The resource usage status of all services in the service pool is displayed.

NOTE

Effective Configuration Group indicates the resource control configuration group used by the cluster service. By default, the **default** configuration group is used at all time every day, indicating that the cluster service can use all CPUs and 70% memory of the node.

Step 5 View the resource usage of a single service.

In the chart area, select a service from the service drop-down list box. The resource usage status of the service is displayed.

Step 6 You can set the interval for automatically refreshing the page.

The following refresh interval options are supported:

- **Refresh every 30 seconds**
- **Refresh every 60 seconds**
- **Stop refreshing**

Step 7 In the **Period** area, select a time range for viewing service resources. The options are as follows:

- Real time
- Last 3 hours
- Last 6 hours
- Last 24 hours
- Last week
- Last month
- Last 3 months

- Last 6 months
- Customize: If you select this option, you can customize the period for viewing monitoring data.

Step 8 Click **View** to view the service resource data in the corresponding time range.

Step 9 Customize a service resource report.

1. Click **Customize** and select the service source indicators to be displayed.
   - Service Total Disk I/O Read Speed
   - Service Total Memory Usage
   - Service Total Disk I/O Write Speed
   - Service Total CPU Usage
2. Click **OK** to save the selected monitoring metrics for display.

   NOTE

   Click **Clear** to cancel all the selected monitoring metrics in a batch.

Step 10 Export a monitoring report.

Click **Export**. MRS Manager will generate a report about the selected service resources in a specified time of period. Save the report.

NOTE

To view the curve charts of monitoring metrics in a specified period, click **View**.

----End

11.8.2 Configuring a Static Service Pool

Scenario

If you need to control the node resources that can be used by the cluster service or the CPU usage of the node used by the cluster in different time periods, you can adjust the resource base on MRS Manager and customize the resource configuration groups.

Prerequisites

- After the static service pool is configured, the HDFS and YARN services need to be restarted. During the restart, the services are unavailable.
- After a static service pool is configured, the maximum number of resources used by each service and role instance cannot exceed the upper limit.

Procedure

Step 1 Modify the system resource adjustment base.

1. On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.
2. Click **Configuration**. The service pool configuration group management page is displayed.

3. In the **System Resource Adjustment Base** area, change the values of **CPU(%)** and **Memory(%)** .

   Modifying **System Resource Adjustment Base** limits the maximum physical CPU and memory resource percentage of nodes that can be used by the Flume, HBase, HDFS, Impala and YARN services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

4. Click **Next**.

   If you need to modify the parameters again, click **Previous** in the lower part of the page.

Step 2 Modify the **default** configuration group of the service pool.

1. Click **default**. In the **Service Pool Configuration** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for the Flume, HBase, HDFS, Impala and YARN services.

   NOTE

   - The sum of **CPU LIMIT(%)** used by all services can exceed 100%.
   - The sum of **CPU SHARE(%)** and **I/O(%)** used by all services must be 100%. For example, if CPU resources are allocated to the HDFS and Yarn services, the total CPU resources allocated to the two services are 100%.
   - The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
   - **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.

2. Click in the blank area of the page to complete the editing. MRS Manager generates the correct values of service pool parameters in the **Detailed Configuration** area based on the cluster hardware resources and allocation information.

3. You can click  on the right of **Detailed Configuration** to modify the parameter values of the service pool based on service requirements.

   In the **Service Pool Configuration** area, click the specified service name. The **Detailed Configuration** area displays only the parameters of the service. Manual changing of parameter values does not refresh the service resource usage. In added configuration groups, the configuration group numbers of the parameters that take effect dynamically will be displayed. For example, **HBase: RegionServer: dynamic-config1.RES_CPUSET_PERCENTAGE**. The parameter functions do not change.

   Table 11-29 Parameters of the static service pool

Parameter	Description
– RES_CPUSET_PERCENTAGE – dynamic-configX.RES_CPUSET_PERCENTAGE	Configures the service CPU percentage.

Parameter	Description
– RES_CPU_SHARE – dynamic-configX.RES_CPU_SHARE	Configures the service CPU share.
– RES_BLKIO_WEIGHT – dynamic-configX.RES_BLKIO_WEIGHT	Configures service I/O usage.
HBASE_HEAPSIZE	Configures the maximum JVM memory for RegionServer.
HADOOP_HEAPSIZE	Configures the maximum JVM memory of a DataNode.
yarn.nodemanager.resource.memory-mb	Configures the memory that can be used by NodeManager on the current node.
dfs.datanode.max.locked.memory	Configures the maximum memory that can be used by a DataNode as the HDFS cache.
FLUME_HEAPSIZE	Configures the maximum JVM memory that can be used by each Flume instance.
IMPALAD_MEM_LIMIT	Configures the maximum memory that can be used by an Impalad instance.

Step 3 Add a customized resource configuration group.

1. Determine whether to automatically adjust resource configurations based on the time.

   If yes, go to **Step 3.2**.

   If no, go to **Step 4**.

2. Click  to add a resource configuration group. In the **Scheduling Time** area, click  . The time policy configuration page is displayed.

   Modify the following parameters based on service requirements and click **OK**.

   – **Repeat**: If selected, the resource configuration group runs repeatedly based on the scheduling period. If not selected, set the date and time when the configuration of the group of resources can be applied.

   – **Repeat Policy**: can be set to **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.

   – **Between**: indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved. This parameter is valid only when **Repeat** is selected.

NOTE

- The **default** group of resource configuration takes effect in all undefined time segments.
- The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
- The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
- Select a repetition policy. If the end time is earlier than the start time, the next day is labeled by default. For example, if a validity period ranges from 22:00 to 06:00, the customized resource configuration takes effect from 22:00 on the current day to 06:00 on the next day.
- If the repeat policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: [04:00 to 07:00] and [06:00 to 08:00]. In this case, the configuration of the group that uses the monthly policy prevails.
- If the repeat policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04:00 to 07:00, on Monday and Wednesday, respectively.

3. On the **Service Pool Configuration** page, modify the resource configuration of each service. Click the blank area on the page to complete the editing, and go to **Step 4**.

   You can click on the right of **Service Pool Configuration** to modify the parameters. Click in the **Detailed Configuration** area to manually update the parameter values generated by the system based on service requirements.

Step 4 Saves the settings.

Click **Save**. In the **Save Configuration** dialog box, select **Restart the affected services or instances**. Click **OK** to save the settings and restart related services.

Operation succeeded is displayed. click **Finish**. The service is started successfully.

----End

11.9 Tenant Management

11.9.1 Overview

Definition

An MRS cluster provides various resources and services for multiple organizations, departments, or applications to share. The cluster provides tenants as a logical entity to use these resources and services. A mode involving different tenants is called multi-tenant mode. Currently, only the analysis cluster supports tenant management.

Principles

The MRS cluster provides the multi-tenant function. It supports a layered tenant model and allows dynamic adding or deleting of tenants to isolate resources. It dynamically manages and configures tenants' computing and storage resources.

The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.

The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

As the unified tenant management platform of MRS clusters, MRS Manager provides enterprises with time-tested multi-tenant management models, enabling centralized tenant and service management. Tenants can create and manage tenants in a cluster based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- Permissions to view the current tenant's resources, add a subtenant, and manage the subtenant's resources are granted to the tenant's roles by default.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

MRS Manager supports a maximum of 512 tenants. The tenants that are created by default in the system contain **default**. Tenants that are in the topmost layer with the default tenant are called level-1 tenants.

Resource Pools

Yarn task queues support only the label-based scheduling policy. This policy enables Yarn task queues to associate NodeManagers that have specific node labels. In this way, Yarn tasks run on specified nodes so that tasks are scheduled and certain hardware resources are utilized. For example, Yarn tasks requiring a large memory capacity can run on nodes with a large memory capacity by means of label association, preventing poor service performance.

In an MRS cluster, the tenant logically divides Yarn cluster nodes to combine multiple NodeManagers into a resource pool. Yarn task queues can be associated with specified resource pools by configuring queue capacity policies, ensuring efficient and independent resource utilization in the resource pools.

MRS Manager supports a maximum of 50 resource pools. The system has a **Default** resource pool.

11.9.2 Creating a Tenant

Scenario

You can create a tenant on MRS Manager to specify the resource usage.

Prerequisites

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the HDFS directory.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click **Create Tenant**. On the page that is displayed, configure tenant properties.

Table 11-30 Tenant parameters

Parameter	Description
Name	Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).
Tenant Type	The options include **Leaf** and **Non-leaf**. If **Leaf** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If **Non-leaf** is selected, sub-tenants can be added to the current tenant.
Dynamic Resources	Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the tenant name in Yarn. When dynamic resources are not **Yarn**, the system does not automatically create a task queue.
Default Resource Pool Capacity (%)	Specifies the percentage of the computing resources used by the current tenant in the **default** resource pool.
Default Resource Pool Max. Capacity (%)	Specifies the maximum percentage of the computing resources used by the current tenant in the **default** resource pool.
Storage Resource	Specifies storage resources for the current tenant. The system automatically creates a file folder named after the tenant name in the **/tenant** directory. When a tenant is created for the first time, the system automatically creates the **/tenant** directory in the HDFS root directory. If storage resources are not **HDFS**, the system does not create a storage directory under the root directory of HDFS.

Parameter	Description
Space Quota (MB)	Specifies the quota for HDFS storage space used by the current tenant. The value ranges from **1** to **8796093022208**. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the oHDFS physical disk. **NOTE** To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).
Storage Path	Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the tenant name in the **/tenant** directory by default. For example, the default HDFS storage directory for tenant **ta1** is **tenant/ta1**. When a tenant is created for the first time, the system automatically creates the **/tenant** directory in the HDFS root directory. The storage path is customizable.
Service	Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click **Associate Services**. In the dialog box that is displayed, set **Service** to **HBase**. If **Association Mode** is set to **Exclusive**, service resources are occupied exclusively. If **share** is selected, service resources are shared.
Description	Specifies the description of the current tenant.

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully.

NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the Manager_tenant role and the role corresponding to the tenant to the user. For details, see **Creating a User**.

----End

Related Tasks

Viewing an added tenant

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, click the name of the added tenant.

The **Summary** tab is displayed on the right by default.

Step 3 View **Basic Information**, **Resource Quota**, and **Statistics** of the tenant.

If HDFS is in the **Stopped** state, **Available** and **Used** of **Space** in **Resource Quota** are **unknown.**

----End

11.9.3 Creating a Sub-tenant

Scenario

You can create a sub-tenant on MRS Manager if the resources of the current tenant need to be further allocated.

Prerequisites

- A parent tenant has been added.
- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a sub-tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the storage directory of the parent tenant.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table:

Table 11-31 Sub-tenant parameters

Parameter	Description
Parent tenant	Specifies the name of the parent tenant.
Name	Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).

Parameter	Description
Tenant Type	The options include **Leaf** and **Non-leaf**. If **Leaf** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If **Non-leaf** is selected, sub-tenants can be added to the current tenant.
Dynamic Resources	Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the sub-tenant name in the Yarn parent queue. When dynamic resources are not **Yarn**, the system does not automatically create a task queue. If the parent tenant does not have dynamic resources, the sub-tenant cannot use dynamic resources.
Default Resource Pool Capacity (%)	Specifies the percentage of the resources used by the current tenant. The base value is the total resources of the parent tenant.
Default Resource Pool Max. Capacity (%)	Specifies the maximum percentage of the computing resources used by the current tenant. The base value is the total resources of the parent tenant.
Storage Resource	Specifies storage resources for the current tenant. The system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. If storage resources are not **HDFS**, the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources.
Space Quota (MB)	Specifies the quota for HDFS storage space used by the current tenant. The minimum value is 1, and the maximum value is the total storage quota of the parent tenant. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the oHDFS physical disk. If the quota is greater than the quota of the parent tenant, the actual storage capacity is subject to the quota of the parent tenant. **NOTE** To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).

Parameter	Description
Storage Path	Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is **ta1s** and the parent directory is **tenant/ta1**, the system sets this parameter for the sub-tenant to **tenant/ta1/ta1s**. The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.
Service	Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click **Associate Services**. In the dialog box that is displayed, set **Service** to **HBase**. If **Association Mode** is set to **Exclusive**, service resources are occupied exclusively. If **share** is selected, service resources are shared.
Description	Specifies the description of the current tenant.

Step 3 Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- When using this tenant, create a system user and assign the user a related tenant role. For details, see **Creating a User**.

----End

11.9.4 Deleting a tenant

Scenario

You can delete a tenant that is not required on MRS Manager.

Prerequisites

- A tenant has been added.
- You have checked whether the tenant to be deleted has sub-tenants. If the tenant has sub-tenants, delete them; otherwise, you cannot delete the tenant.

- The role of the tenant to be deleted cannot be associated with any user or user group. For details about how to cancel the binding between a role and a user, see **Modifying User Information**.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

Step 3 Click OK to save the settings.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

NOTE

- After the tenant is deleted, the task queue of the tenant still exists in Yarn.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

11.9.5 Managing a Tenant Directory

Scenario

You can manage the HDFS storage directory used by a specific tenant on MRS Manager. The management operations include adding a tenant directory, modifying the directory file quota, modifying the storage space, and deleting a directory.

Prerequisites

A tenant associated with HDFS storage resources has been added.

Procedure

- Viewing a tenant directory
  a. On MRS Manager, click **Tenant**.
  b. In the tenant list on the left, click the target tenant.
  c. Click the **Resource** tab.
  d. View the **HDFS Storage** table.
     - The Quota column indicates the quantity quotas of files and directories.
     - The **Storage Space Quota** column indicates the storage space size of the tenant directory.

- Adding a tenant directory
  a. On MRS Manager, click **Tenant**.
  b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be added.
  c. Click the **Resource** tab.
  d. In the **HDFS Storage** table, click **Create Directory**.
     - In **Parent Directory**, select a storage directory of a parent tenant.
       This parameter applies only to sub-tenants. If the parent tenant has multiple directories, select any of them.
     - Set **Path** to a tenant directory path.
       NOTE
       - If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.
       - If the current tenant is a sub-tenant, the new path is created in the specified directory.

       A complete HDFS storage directory can contain a maximum of 1,023 characters. An HDFS directory name contains digits, letters, spaces, and underscores (_). The name cannot start or end with a space.
     - Set **Quota** to the quotas of file and directory quantity.
       Maximum Number of Files/Directories is optional. Its value ranges from **1** to **9223372036854775806**.
     - Set **Storage Space Quota** to the storage space size of the tenant directory.
       The value of **Storage Space Quota** ranges from **1** to **8796093022208**.
       NOTE
       To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).
  e. Click **OK**. The system creates tenant directories in the HDFS root directory.
- Modify a tenant directory.
  a. On MRS Manager, click **Tenant**.
  b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be modified.
  c. Click the **Resource** tab.
  d. In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.
     - Set **Quota** to the quotas of file and directory quantity.
       Maximum Number of Files/Directories is optional. Its value ranges from **1** to **9223372036854775806**.

- Set **Storage Space Quota** to the storage space size of the tenant directory.

  The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

  NOTE

  To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB (500/2 = 250).

e. Click **OK**.

- Delete a tenant directory.

  a. On MRS Manager, click **Tenant**.

  b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be deleted.

  c. Click the **Resource** tab.

  d. In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

  The default HDFS storage directory set during tenant creation cannot be deleted. Only the newly added HDFS storage directory can be deleted.

  e. Click **OK**.

11.9.6 Restoring Tenant Data

Scenario

Tenant data is stored on Manager and in cluster components by default. When components are restored from faults or reinstalled, some tenant configuration data may be abnormal. In this case, you can manually restore the tenant data.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 In the tenant list on the left, click a tenant node.

Step 3 Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the left of **Basic Information**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resources** and check the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Good** indicates that the component can provide services for the associated tenant. **Bad** indicates that the component cannot provide services for the tenant.

4. If any check result is abnormal, go to **Step 4** to restore tenant data.

Step 4 Click **Restore Tenant Data**.

Step 5 In the **Restore Tenant Data** window, select one or more components whose data needs to be restored. Click **OK**. The system automatically restores the tenant data.

----End

11.9.7 Creating a Resource Pool

Scenario

In an MRS cluster, users can logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The system contains a **Default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

You can create a customized resource pool on MRS Manager and add hosts that have not been added to other customized resource pools to it.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Click **Add Resource Pool**.

Step 4 In **Create Resource Pool**, set the properties of the resource pool.

- **Name**: Enter a name for the resource pool. The name of the newly created resource pool cannot be **Default**.

  The name consists of 1 to 20 characters and can contain digits, letters, and underscores (_) but cannot start with an underscore (_).

- **Hosts**: In the host list on the left, select the name of a specified host and click 

to add the selected host to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

Step 5 Click **OK**.

Step 6 After a resource pool is created, users can view the **Name**, **Members**, **Type**, **vCore** and **Memory** in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **Default** resource pool.

----End

11.9.8 Modifying a Resource Pool

Scenario

You can modify members of an existing resource pool on MRS Manager.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Locate the row that contains the specified resource pool, and click **Modify** in the **Operation** column.

Step 4 In **Modify Resource Pool**, modify **Added Hosts**.

- Adding a host: Select the name of a specified host in host list on the left and click 
to add the selected host to the resource pool.
- Deleting a host: In the host list on the right, select the name of a specified host and click 

to add the selected host to the resource pool. The host list of a resource pool can be left blank.

Step 5 Click **OK**.

----End

11.9.9 Deleting a Resource Pool

Scenario

You can delete an existing resource pool on MRS Manager.

Prerequisites

- Any queue in a cluster cannot use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see **Configuring a Queue**.
- Resource distribution policies of all queues have been cleared from the resource pool being deleted. For details, see **Clearing Configuration of a Queue**.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Resource Pools** tab.

Step 3 Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

In the displayed dialog box, click **OK**.

----End

11.9.10 Configuring a Queue

Scenario

This section describes how to modify the queue configuration for a specified tenant on MRS Manager.

Prerequisites

A tenant associated with Yarn and allocated dynamic resources has been added.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 Click the **Queue Configuration** tab.

Step 4 In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

NOTE

In the tenant list on the left of the **Tenant Management** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click to open the queue modification page.

Table 11-32 Queue configuration parameters

Parameter	Description
Maximum Application	Specifies the maximum number of applications. The value ranges from 1 to 2147483647.
Maximum AM Resource Percent	Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster. The value ranges from 0 to 1.
Minimum User Limit Percent (%)	Specifies the minimum percentage of resources consumed by a user. The value ranges from 0 to 100.
User Limit Factor	Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster. The minimum value is **0**.
Status	Specifies the current status of a resource plan. The values are **Running** and **Stopped**.

Parameter	Description
Default Resource Pool	Specifies the resource pool used by a queue. The default value is **Default**. If you want to change the resource pool, configure the queue capacity first. For details, see **Configuring the Queue Capacity Policy of a Resource Pool**.

----End

11.9.11 Configuring the Queue Capacity Policy of a Resource Pool

Scenario

After a resource pool is added, the capacity policies of available resources need to be configured for Yarn task queues. This ensures that tasks in the resource pool are running properly. Each queue can be configured with the queue capacity policy of only one resource pool. Users can view the queues in any resource pool and configure queue capacity policies. After the queue policies are configured, Yarn task queues and resource pools are associated.

You can configure queue policies on MRS Manager.

Prerequisites

- A resource pool has been added.
- The task queues are not associated with other resource pools. By default, all queues are associated with the **Default** resource pool.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 In **Resource Pools**, select a specified resource pool.

Available Resource Quota: indicates that all resources in each resource pool are available for queues by default.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

Step 5 In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

Step 6 Click **OK** to save the settings.

----End

11.9.12 Clearing Configuration of a Queue

Scenario

Users can clear the configuration of a queue on MRS Manager when the queue does not need resources from a resource pool or if a resource pool needs to be disassociated from the queue. Clearing queue configurations means that the resource capacity policy of the queue is canceled.

Prerequisites

If a queue is to be unbound from a resource pool, this resource pool cannot serve as the default resource pool of the queue. Therefore, you must first change the default resource pool of the queue to another one. For details, see **Configuring a Queue**.

Procedure

Step 1 On MRS Manager, click **Tenant**.

Step 2 Click the **Dynamic Resource Plan** tab.

Step 3 In **Resource Pools**, select a specified resource pool.

Step 4 Locate the specified queue in the **Resource Allocation** table, and click **Clear** in the **Operation** column.

In the **Clear Queue Configuration** dialog box, click **OK** to clear the queue configuration in the current resource pool.

NOTE

If no resource capacity policy is configured for a queue, the clearing function is unavailable for the queue by default.

----End

11.10 Backup and Restoration

11.10.1 Introduction

Purpose

MRS Manager provides backup and restoration for user data and system data. The backup function is provided based on components to back up Manager data (including OMS data and LdapServer data), Hive user data, component metadata saved in DBService, and HDFS metadata.

Backup and restoration tasks are performed in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- If the system is faulty, the data backup can be used to recover the system.
- If the active cluster is completely faulty, a mirror cluster identical to the active cluster needs to be created. You can use the backup data to restore the active cluster.

Table 11-33 Backing up metadata

Backup Type	Backup Content
OMS	Database data (excluding alarm data) and configuration data in the cluster management system to be backed up by default
LdapServer	User information, including the username, password, key, password policy, and group information
DBService	Metadata of the components (Hive) managed by DBService
NameNode	HDFS metadata.

Principles

Task

Before backup or restoration, you need to create a backup or restoration task and set task parameters, such as the task name, backup data source, and type of backup file save path. Data backup and restoration can be performed by executing backup and restoration tasks. When the Manager is used to recover the data of HDFS, HBase, Hive, and NameNode, no cluster can be accessed.

Each backup task can back up data of different data sources and generates an independent backup file for each data source. All the backup files generated in each backup task form a backup file set, which can be used in restoration tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS. The backup task provides the full backup or incremental backup policies. HDFS and Hive backup tasks support the incremental backup policy, while OMS, LdapServer, DBService, and NameNode backup tasks support only the full backup policy.

NOTE

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started at the same time.
- The interval at which a periodical task is automatically executed must be greater than 120s; otherwise, the task is postponed and will be executed in the next period. Manual tasks can be executed at any interval.
- When a periodic task is to be automatically executed, the current time cannot be 120s later than the task start time; otherwise, the task is postponed and executed in the next period.
- When a periodic task is locked, it cannot be automatically executed and needs to be manually unlocked.
- Before an OMS, LdapServer, DBService, or NameNode backup task starts, ensure that the LocalBackup partition on the active management node has more than 20 GB available space. Otherwise, the backup task cannot be started.
- When you are planning backup and restoration tasks, select the data to be backed up or restored strictly based on the service logic, data store structure, and database or table association. The system creates a default periodic backup task **default** whose execution interval is 24 hours to perform full backup of OMS, LdapServer, DBService, and NameNode data to the Linux local disk.

Specifications

Table 11-34 Backup and restoration feature specifications

Item	Specifications
Maximum number of backup or restoration tasks	100
Number of concurrent running tasks	1
Maximum number of waiting tasks	199
Maximum size of backup files on a Linux local disk (GB)	600

Table 11-35 Specifications of the **default** task

Item	OMS	LdapServer	DBService	NameNode
Backup period	1 hour			
Maximum number of copies	2			
Maximum size of a backup file	10 MB	20 MB	100 MB	1.5 GB

Item	OMS	LdapServer	DBService	NameNode
Maximum size of disk space used	20 MB	40 MB	200 MB	3 GB
Save path of backup data	*Data save path*/**LocalBackup/** of the active and standby management nodes			

NOTE

The backup data of the **default** task must be periodically transferred and saved outside the cluster based on the enterprise O&M requirements.

11.10.2 Backing Up Metadata

Scenario

To ensure the security of metadata either on a routine basis or before and after performing critical metadata operations (such as scale-out, scale-in, patch installation, upgrades, and migration), metadata must be backed up. The backup data can be used to recover the system if an exception occurs or if the operation has not achieved the expected result. This minimizes the adverse impact on services. Metadata includes data of OMS, LdapServer, DBService, and NameNode. MRS Manager data to be backed up includes OMS data and LdapServer data.

By default, metadata backup is supported by the **default** task. This section describes how to create a backup task and back up metadata on MRS Manager. Both automatic backup tasks and manual backup tasks are supported.

Prerequisites

- A standby cluster for backing up data has been created, and the network is connected. The inbound rules of the two security groups on the peer cluster have been added to the two security groups in each cluster to allow all access requests of all protocols and ports of all ECSs in the security groups.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path*/**LocalBackup/** has sufficient space on the active and standby management nodes.

Procedure

Step 1 Create a backup task.

1. On MRS Manager, choose **System** > **Back Up Data**.
2. Click **Create Backup Task**.

Step 2 Configure a backup policy.

1. Set **Task Name** to the name of the backup task.

2. Set **Backup Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

   To create a periodic backup task, set the following parameters:

   - **Started**: indicates the time when the task is started for the first time.
   - **Period**: indicates the task execution interval. The options include **By hour** and **By day**.
   - **Backup Policy**: indicates the volume of data to be backed up in each task execution. The options include **Full backup at the first time and incremental backup later**, **Full backup every time**, and **Full backup once every n times**. If you select **Full backup once every n times**, you need to specify the value of **n**.

Step 3 Select backup sources.

In the **Configuration** area, select **OMS** and **LdapServer** under **Metadata**.

Step 4 Set backup parameters.

1. Set **Path Type** of **OMS** and **LdapServer** to a backup directory type.

   The following backup directory types are supported:

   - **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path***/LocalBackup/**. If you select **LocalDir**, you need to set the maximum number of copies to specify the number of backup files that can be retained in the backup directory.
   - **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:

     - **Target Path**: indicates the HDFS directory for storing the backup files. The save path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory.
     - **Max Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
     - **Target Instance Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

2. Click **OK**.

Step 5 Execute the backup task.

In the **Operation** column of the created task in the backup task list, click **Back Up Now** if **Backup Mode** is set to **Periodic** or click **Start** If **Backup Mode** is set to **Manual** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version_Data source_Task execution time*.**tar.gz**.

----End

11.10.3 Restoring Metadata

Scenario

You need to restore metadata in the following scenarios: A user modifies or deletes data unexpectedly, data needs to be retrieved, system data becomes abnormal or does not achieve the expected result, all modules are faulty, and data is migrated to a new cluster.

This section describes how to restore metadata on MRS Manager. Only manual restoration tasks are supported.

NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the data that is generated after the data backup and before the data restoration will be lost.
- Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail.
- By default, MRS clusters use DBService to store Hive metadata.

Impact on the System

- After the data is restored, the data generated between the backup time and restoration time is lost.
- After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.

Prerequisites

- The data in the OMS and LdapServer backup files has been backed up at the same time.
- The status of the OMS resources and the LdapServer instances is normal. If the status is abnormal, data restoration cannot be performed.
- The status of the cluster hosts and services is normal. If the status is abnormal, data restoration cannot be performed.
- The cluster host topologies during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
- The services added to the cluster during data restoration and data backup are the same. If the services are different, data restoration cannot be performed and you need to back up data again.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.
- The upper-layer applications depending on the MRS cluster have been stopped.

- On MRS Manager, you have stopped all the NameNode role instances whose data is to be recovered. Other HDFS role instances are running properly. After data is recovered, the NameNode role instances need to be restarted and cannot be accessed before the restart.
- You have checked whether NameNode backup files have been stored in the *Data save path*/**LocalBackup/** directory on the active management node.

Procedure

Step 1 Check the location of backup data.

1. On MRS Manager, choose **System** > **Back Up Data**.
2. In the row where the specified backup task resides, choose **More** > **View History** in the **Operation** column to display the historical execution records of the backup task. In the window that is displayed, select a success record and click **View Backup Path** in the corresponding column to view its backup path information. Find the following information:
   - **Backup Object**: indicates the backup data source.
   - **Backup Path**: indicates the full path where backup files are stored.
3. Select the correct path, and manually copy the full path of backup files in **Backup Path**.

Step 2 Create a restoration task.

1. On MRS Manager, choose System > Recovery Management.
2. On the page that is displayed, click **Create Restoration Task**.
3. Set **Task Name** to the name of the restoration task.

Step 3 Select restoration sources.

In **Configuration**, select the metadata component whose data is to be restored.

Step 4 Set the restoration parameters.

1. Set **Path Type** to a backup directory type.
2. The settings vary according to backup directory types:
   - **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select **LocalDir**, you need to set **Source Path** to specify the full path of the backup file. For example, *Data storage path*/**LocalBackup/***Backup task name_Task creation time*/*Data source_Task execution time*/*Version number_Data source_Task execution time*.**tar.gz**.
   - **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:
     - **Source Path**: indicates the full HDFS path of a backup file. for example, *Backup path/Backup task name_Task creation time/Version_Data source_Task execution time*.**tar.gz**.
     - **Source Instance Name**: indicates the name of NameService corresponding to the backup directory when a restoration task is being executed. The default value is **hacluster**.

3. Click **OK**.

Step 5 Execute the restoration task.

In the restoration task list, locate the row where the created task resides, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and try to execute the task again by clicking **Start**.

Step 6 Determine what metadata has been restored.

- If the OMS and LdapServer metadata is restored, go to **Step 7**.
- If DBService data is restored, no further action is required.
- Restore NameNode data. On MRS Manager, choose **Services > HDFS > More > Restart Service**. The task is complete.

Step 7 Restarting Manager for the recovered data to take effect

1. In MRS Manager, Choose **LdapServer** > **More** > **Restart Service** and click **OK**. Wait until the LdapServer service is restarted successfully.
2. Log in to the active management node. For details, see **Determining Active and Standby Management Nodes of Manager**.
3. Run the following command to restart OMS:

   sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh

   The command has been executed successfully if the following information is displayed:

   ```
   start HA successfully.
   ```

4. On MRS Manager, choose **KrbServer > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the KrbServer service configuration is synchronized and restarted successfully.
5. Choose **Services > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the cluster is configured and synchronized successfully.
6. Choose **Services > More > Stop Cluster**. After the cluster is stopped, choose **Services > More> Start Cluster**.

----End

11.10.4 Modifying a Backup Task

Scenario

This section describes how to modify the parameters of a created backup task on MRS Manager to meet changing service requirements. The parameters of restoration tasks can be viewed but not modified.

Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.

Procedure

Step 1 On MRS Manager, choose **System** > **Back Up Data**.

Step 2 In the task list, locate a specified task, click **Modify** in the **Operation** column to go to the configuration modification page.

Step 3 Modify the following parameters on the displayed page:

- Manual backup:
  - Target Path
  - Max Number of Backup Copies
- Periodic backup:
  - Started
  - Period
  - Target Path
  - Max Number of Backup Copies

  NOTE

  - When **Path Type** is set to **LocalHDFS**, **Target Path** is valid for modifying a backup task.
  - After you change the value of **Target Path** for a backup task, full backup is performed by default when the task is executed for the first time.

Step 4 Click **OK**.

----End

11.10.5 Viewing Backup and Restoration Tasks

Scenario

This section describes how to view created backup and restoration tasks and check their running status on MRS Manager.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Click **Back Up Data** or **Restore Data**.

Step 3 In the task list, obtain the previous execution result in the **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

Step 4 In the **Operation** column of a specified task in the task list, choose **More** > **View History** to view the historical record of backup and restoration execution.

In the displayed window, click **View** in the **Details** column. The task execution logs and paths are displayed.

----End

Related Tasks

- Modifying a backup task

  For details, see **Modifying a Backup Task**.
- Viewing a restoration task

  In the **Operation** column of the specified task in the task list, click **View Details** to view the restoration task. You can only view but cannot modify the parameters of a restoration task.
- Executing a backup or restoration task

  In the task list, locate a specified task and click **Start** in the **Operation** column to start a backup or restoration task that is ready or fails to be executed. Executed restoration tasks cannot be repeatedly executed.
- Stopping backup tasks

  In the task list, locate a specified task and click **More** > **Stop** in the **Operation** column to stop a backup task that is running.
- Deleting a backup or restoration task

  In the **Operation** column of the specified task in the task list, choose **More** > **Delete** to delete the backup or restoration task. After a task is deleted, the backup data is retained by default.
- Suspending a backup task

  In the **Operation** column of the specified task in the task list, choose **More** > **Suspend** to suspend the backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To cancel the suspension status of a task, click **More** > **Resume**.

11.11 Security Management

11.11.1 Default Users of Clusters with Kerberos Authentication Disabled

User Classification

The MRS cluster provides the following two types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System users	User who runs OMS processes
Database users	• User who manages OMS database and accesses data • User who runs the database of service components (Hive, Loader, and DBService)

System users

NOTE

- User **Idap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

Operation	Username	Initial Password	Description
System administrator of the MRS cluster	admin	Specified by the user during the cluster creation	MRS Manager administrator. This user also has the following permissions: • Common HDFS and ZooKeeper user permissions. • Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI. • Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service. • Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service.

Operation	Username	Initial Password	Description
MRS cluster node OS user	omm	Randomly generated by the system	Internal running user of the MRS cluster system. This user is an OS user generated on all node and does not require a unified password.
MRS cluster node OS user	root	Set by the user	User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.

User Group Information

Default User Group	Description
supergroup	Primary group of user **admin**, which has no additional permissions in the cluster with Kerberos authentication disabled.
check_sec_ldap	Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. which is an internal system user group used only between components.
Manager_tenant	Tenant system user group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
System_administrator	MRS cluster system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_viewer	MRS Manager system viewer group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_operator	MRS Manager system operator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_auditor	MRS Manager system auditor group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.

Default User Group	Description
Manager_administrator	MRS Manager system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
compcommon	MRS cluster internal group, used to access public resources in the cluster. All system users and system running users are added to this user group by default.
default_1000	User group created for tenants, which is an internal system user group used only between components.
launcher-job	MRS internal group, which is used to submit jobs using V2 APIs.

OS User Group	Description
wheel	Primary group of MRS internal running user **omm**.
ficommon	MRS cluster common group that corresponds to **compcommon** for accessing public resource files stored in the OS of the cluster.

Database users

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

Operation	Default User	Initial Password	Description
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping.
	omm	ChangeMe@123456	User for accessing OMS database data
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component

Operation	Default User	Initial Password	Description
	hive	HiveUser@	User for Hive to connect to the DBService database
	hue	HueUser@123	User for Hue to connect to the DBService database
	sqoop	SqoopUser@	User for Loader to connect to the DBService database.

11.11.2 Default Users of Clusters with Kerberos Authentication Enabled

User Classification

The MRS cluster provides the following three types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System user	• User created on Manager for MRS cluster O&M and service scenarios. There are two types of users: – **Human-machine** user: used for Manager O&M scenarios and component client operation scenarios. – **Machine-machine** user: used for MRS cluster application development scenarios. • User who runs OMS processes.
Internal system user	Internal user who performs process communications, saves user group information, and associates user permissions.
Database user	• User who manages OMS database and accesses data. • User who runs the database of service components (Hive, Hue, Loader, and DBService)

System User

NOTE

- User **Idap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

Type	Username	Initial Password	Description
System administrator of the MRS cluster	admin	Specified by the user during the cluster creation.	Manager administrator with the following permissions: • Common HDFS and ZooKeeper user permissions. • Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI. • Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service. • Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service.
MRS cluster node OS user	omm	Randomly generated by the system.	Internal running user of the MRS cluster system. This user is an OS user generated on all nodes and does not require a unified password.
MRS cluster node OS user	root	Set by the user.	User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.

Internal System Users

NOTE

Do not delete the following internal system users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
Component running user	hdfs	Hdfs@123	This user is the HDFS system administrator and has the following permissions: 1. File system operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. ● Views and sets disk quotas for users. 2. HDFS management operation permissions: ● Views the web UI status. ● Views and sets the active and standby HDFS status. ● Enters and exits the HDFS in security mode. ● Checks the HDFS file system.

Type	Default User	Initial Password	Description
	hbase	Hbase@123	This user is the HBase system administrator and has the following permissions: ● Cluster management permission: **Enable** and **Disable** operations on tables to trigger MajorCompact and ACL operations. ● Grants and revokes permissions, and shuts down the cluster. ● Table management permission: Creates, modifies, and deletes tables. ● Data management permission: Reads and writes data in tables, column families, and columns. ● Accesses the HBase web UI.
	mapred	Mapred@123	This user is the MapReduce system administrator and has the following permissions: ● Submits, stops, and views the MapReduce tasks. ● Modifies the Yarn configuration parameters. ● Accesses the Yarn and MapReduce web UI.
	spark	Spark@123	This user is the Spark system administrator and has the following permissions: ● Accesses the Spark web UI. ● Submits Spark tasks.

User Group Information

Default User Group	Description
hadoop	Users added to this user group have the permission to submit tasks to all Yarn queues.
hbase	Common user group. Users added to this user group will not have any additional permission.
hive	Users added to this user group can use Hive.
spark	Common user group. Users added to this user group will not have any additional permission.
supergroup	Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.
check_sec_ldap	Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components.
Manager_tenant	Tenant system user group, which is an internal system user group used only between components.
System_administrator	MRS cluster system administrator group, which is an internal system user group used only between components.
Manager_viewer	MRS Manager system viewer group, which is an internal system user group used only between components.
Manager_operator	MRS Manager system operator group, which is an internal system user group used only between components.
Manager_auditor	MRS Manager system auditor group, which is an internal system user group used only between components.
Manager_administrator	MRS Manager system administrator group, which is an internal system user group used only between components.
compcommon	Internal system group for accessing public resources in a cluster. All system users and system running users are added to this user group by default.
default_1000	User group created for tenants, which is an internal system user group used only between components.

Default User Group	Description
kafka	Kafka common user group. Users added to this group need to be granted with read and write permission by users in the **kafkaadmin** group before accessing the desired topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
storm	Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
stormadmin	Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
opentsdb	Common user group. Users added to this user group will not have any additional permission.
presto	Common user group. Users added to this user group will not have any additional permission.
flume	Common user group. Users added to this user group will not have any additional permission.
launcher-job	MRS internal group, which is used to submit jobs using V2 APIs.

OS User Group	Description
wheel	Primary group of MRS internal running user **omm**.
ficommon	MRS cluster common group that corresponds to **compcommon** for accessing public resource files stored in the OS of the cluster.

Database User

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping applications.
	omm	ChangeMe@123456	User for accessing OMS database data.
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component.
	hive	HiveUser@	User for Hive to connect to the DBService database.
	hue	HueUser@123	User for Hue to connect to the DBService database.
	sqoop	SqoopUser@	User for Loader to connect to the DBService database.
	ranger	RangerUser@	User for Ranger to connect to the DBService database.

11.11.3 Changing the Password of an OS User

Scenario

This section describes how to periodically change the login passwords of the OS users **omm**, **ommdba**, and **root** on MRS cluster nodes to improve the system O&M security.

Passwords of users **omm**, **ommdba**, and **root** on each node can be different.

Procedure

Step 1 Log in to the **Master1** node and then log in to other nodes whose OS user passwords need to be changed.

Step 2 Run the following command to switch to user **root**:

sudo su - root

Step 3 Run the following command to change the passwords of users **omm**, **ommdba**, or **root**:

passwd omm

passwd ommdba

passwd root

For example, if you run the **omm:passwd** command, the system displays the following information:

```
Changing password for user omm.
New password:
```

Enter a new password. The password change policies for an OS vary according to the OS that is used.

```
Retype new password:
passwd: all authentication tokens updated successfully.
```

NOTE

The default password complexity requirements of the MRS cluster are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The new password cannot be the same as last five historical passwords.

----End

11.11.4 Changing the password of user admin

This section describes how to periodically change the password of cluster user **admin** to improve the system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Changing the Password of User admin on the Cluster Node

Step 1 Update the client of the active management node. For details, see **Updating a Client (Versions Earlier Than 3.x)**.

Step 2 Log in to the active management node.

Step 3 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 4 Run the following command to switch to the client directory, for example, **/opt/client**.

cd /opt/client

Step 5 Run the following command to configure environment variables:

source bigdata_env

Step 6 Run the following command to change the password of user **admin**: This operation takes effect in the whole cluster.

kpasswd admin

Enter the old password and then enter a new password twice.

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

Changing the Password of User admin on MRS Manager

You can change the password of user **admin** on MRS Manager only for clusters with Kerberos authentication enabled and clusters with Kerberos authentication disabled but the EIP function enabled.

Step 1 Log in to MRS Manager as user **admin**.

Step 2 Click the username in the upper right corner of the page and choose **Change Password**.

Step 3 On the **Change Password** page, set **Old Password**, **New Password**, and **Confirm Password**.

NOTE

The default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

Step 4 Click **OK**. Log in to MRS Manager with the new password.

----End

Resetting the Password for User admin

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

cpw *Component running user name*

For example, to reset the password of user admin, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

11.11.5 Changing the Password of the Kerberos Administrator

Scenario

This section describes how to periodically change the password of the Kerberos administrator **kadmin** of the MRS cluster to improve the system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Prerequisites

A client has been prepared on the **Master1** node.

Procedure

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**.

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to change the password of **kadmin/admin**. This operation takes effect for all servers.

kpasswd kadmin/admin

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

11.11.6 Changing the Passwords of the LDAP Administrator and the LDAP User

Scenario

This section describes how to periodically change the passwords of the LDAP administrator **rootdn:cn=root,dc=hadoop,dc=com** and the LDAP user **pg_search_dn:cn=pg_search_dn,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

Impact on the System

All services need to be restarted for the new password to take effect. The services are unavailable during the restart.

Procedure

Step 1 On MRS Manager, choose **Services** > **LdapServer** > **More**.

Step 2 Click **Change Password**.

Step 3 In the **Change Password** dialog box, select the user whose password needs to be modified in the **User Information** drop-down box.

Step 4 Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The default password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters (`~!@#$%^&*()-_=+\|[{}];:",<.>/?).
- The password cannot be the username or the reverse username.
- The new password cannot be the same as the current password.

NOTE

The default password of the LDAP administrator **rootdn:cn=root,dc=hadoop,dc=com** is **LdapChangeMe@123**, and that of the LDAP user **pg_search_dn:cn=pg_search_dn,ou=Users,dc=hadoop,dc=com** is **pg_search_dn@123**. Periodically change the passwords and keep them secure.

Step 5 Select **I have read the information and understand the impact**, and click **OK** to confirm the modification and restart the service.

----End

11.11.7 Changing the Password of a Component Running User

Scenario

This section describes how to periodically change the password of the component running user of the MRS cluster to improve the system O&M security.

If the initial password is randomly generated by the system, reset the password.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Prerequisites

A client has been prepared on the **Master1** node.

Procedure

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

cpw *Component running user name*

For example, to reset the password of user admin, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.

- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

11.11.8 Changing the Password of the OMS Database Administrator

Scenario

This section describes how to periodically change the password of the OMS database administrator to improve the system O&M security.

Procedure

Step 1 Log in to the active management node.

NOTE

The password of user **ommdba** cannot be changed on the standby management node. Otherwise, the cluster may not work properly. Change the password on the active management node only.

Step 2 Run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch the directory:

cd $OMS_RUN_PATH/tools

Step 4 Run the following command to change the password of user **ommdba**:

mod_db_passwd ommdba

Step 5 Enter the old password of user **ommdba** and enter a new password twice.

The password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully.

```
Congratulations, update [ommdba] password successfully.
```

----End

11.11.9 Changing the Password of the Data Access User of the OMS Database

Scenario

This section describes how to periodically change the password of the data access user of the OMS database to improve the system O&M security.

Impact on the System

The OMS service needs to be restarted for the new password to take effect. The service is unavailable during the restart.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Change OMS Database Password**.

Step 3 Locate the row that contains user **omm**, and click **Change password** in the **Operation** column.

The password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

Step 4 Click **OK**. When **Operation successful** is displayed, click **Finish**.

Step 5 Locate the row that contains user **omm**, and click **Restart the OMS service** in the **Operation** column to restart the OMS database.

NOTE

If the password is changed but the OMS database is not restarted, the status of user **omm** changes to **Waiting to restart** and the password cannot be changed until the OMS database is restarted.

Step 6 In the displayed dialog box, select **I have read the information and understand the impact**. Click **OK**, and restart the OMS service.

----End

11.11.10 Changing the Password of a Component Database User

Scenario

This section describes how to periodically change the password of the component database user to improve the system O&M security.

Impact on the System

The services need to be restarted for the new password to take effect. The services are unavailable during the restart.

Procedure

Step 1 On MRS Manager, click **Services** and click the name of the database user service to be modified.

Step 2 Determine the component database user whose password is to be changed.

- To change the password of the DBService database user, go to **Step 3**.
- To change the password of the Loader, Hive, or Hue database user, stop the service first and then execute **Step 3**.

Click **Stop Service**.

Step 3 Choose **More** > **Change Password**.

Step 4 Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The password of the DBService database user contains 16 to 32 characters. The password of the Loader, Hive, or Hue database user contains 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

Step 5 Click **OK**. The system automatically restarts the corresponding service. When **Operation successful** is displayed, click **Finish**.

----End

11.11.11 Updating Cluster Keys

Scenario

When a cluster is installed, an encryption key is generated automatically to store the security information in the cluster (such as all database user passwords and key file access passwords) in encryption mode. After the cluster is successfully installed, you are advised to periodically update the encryption key based on the following procedure.

Impact on the System

- After a cluster key is updated, a new key is generated randomly in the cluster. This key is used to encrypt and decrypt the newly stored data. The old key is not deleted, and it is used to decrypt data encrypted using the old key. After security information is modified, for example, a database user password is changed, the new password is encrypted using the new key.

- When the key is updated, the cluster is stopped and cannot be accessed.

Prerequisites

The upper-layer applications depending on the cluster are stopped.

Procedure

Step 1 Log in to MRS Manager and choose **Services** > **More** > **Stop Cluster**.

In the displayed dialog box, select **I have read the information and understand the impact.** Click **OK**. Wait until the system displays a message indicating that the operation is successful. Click **Finish**. The cluster is stopped successfully.

Step 2 Log in to the active management node.

Step 3 Run the following commands to switch the user:

sudo su - omm

Step 4 Run the following command to disable logout upon timeout:

TMOUT=0

Step 5 Run the following command to switch the directory:

cd ${BIGDATA_HOME}/om-0.0.1/tools

Step 6 Run the following command to update the cluster key:

sh updateRootKey.sh

Enter **y** as prompted.

```
The root key update is a critical operation.
Do you want to continue?(y/n):
```

The key is updated successfully if the following information is displayed:

```
...
Step 4-1: The key save path is obtained successfully.
...
Step 4-4: The root key is sent successfully.
```

Step 7 On MRS Manager, choose **Services > More > Start Cluster**.

In the displayed dialog box, click **OK**. After **Operation successful** is displayed, click **Finish**. The cluster is started.

----End

11.12 Permissions Management

11.12.1 Creating a Role

Scenario

This section describes how to create a role on MRS Manager and authorize and manage Manager and components.

Up to 1,000 roles can be created on MRS Manager.

Prerequisites

You have learned service requirements.

Procedure

Step 1 On MRS Manager, choose **System** > **Manage Role**.

Step 2 Click **Create Role** and fill in **Role Name** and **Description**.

Role Name is mandatory and contains 3 to 30 digits, letters, and underscores (_). **Description** is optional.

Step 3 In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

NOTE

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click . The search result is displayed.
- The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive. Results of the next page can be searched.

Table 11-36 Manager permission description

Resource Supporting Permission Management	Permission Setting
Alarm	Authorizes the Manager alarm function. You can select **View** to view alarms and **Management** to manage alarms.
Audit	Authorizes the Manager audit log function. You can select **View** to view audit logs and **Management** to manage audit logs.
Dashboard	Authorizes the Manager overview function. You can select **View** to view the cluster overview.
Hosts	Authorizes the node management function. You can select **View** to view node information and **Management** to manage nodes.
Services	Authorizes the service management function. You can select **View** to view service information and **Management** to manage services.
System_cluster_management	Authorizes the MRS cluster management function. You can select **Management** to use the MRS patch management function.

Resource Supporting Permission Management	Permission Setting
System_configuration	Authorizes the MRS cluster configuration function. You can select **Management** to configure MRS clusters on Manager.
System_task	Authorizes the MRS cluster task function. You can select **Management** to manage periodic tasks of MRS clusters on Manager.
Tenant	Authorizes the Manager multi-tenant management function. You can select **Management** to manage multi-tenants.

Table 11-37 HBase permission description

Resource Supporting Permission Management	Permission Setting
SUPER_USER_GROUP	Grants you HBase administrator rights.
Global	HBase resource type, indicating the whole HBase.
Namespace	HBase resource type, indicating namespace, which is used to store HBase tables. It has the following permissions: • **Admin** permission to manage the namespace • **Create**: permission to create HBase tables in the namespace • **Read**: permission to access the namespace • **Write**: permission to write data to the namespace • **Execute**: permission to execute the coprocessor (Endpoint)
Table	HBase resource type, indicating a data table, which is used to store data. It has the following permissions: • **Admin**: permission to manage a data table • **Create**: permission to create column families and columns in a data table • **Read**: permission to read a data table • **Write**: permission to write data to a data table • **Execute**: permission to execute the coprocessor (Endpoint)

Resource Supporting Permission Management	Permission Setting
ColumnFamily	HBase resource type, indicating a column family, which is used to store data. It has the following permissions: ● **Create**: permission to create columns in a column family ● **Read**: permission to read a column family ● **Write**: permission to write data to a column family
Qualifier	HBase resource type, indicating a column, which is used to store data. It has the following permissions: ● **Read**: permission to read a column ● **Write**: permission to write data to a column

By default, permissions of an HBase resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Read** and **Write** permissions are added to the **default** namespace, they are automatically added to the tables, column families, and columns in the namespace. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 11-38 HDFS permission description

Resource Supporting Permission Management	Permission Setting
Folder	HDFS resource type, indicating an HDFS directory, which is used to store files or subdirectories. It has the following permissions: ● **Read**: permission to access the HDFS directory ● **Write**: permission to write data to the HDFS directory ● **Execute**: permission to perform an operation. It must be selected when you add access or write permission.
Files	HDFS resource type, indicating a file in HDFS. It has the following permissions: ● **Read**: permission to access the file ● **Write**: permission to write data to the file ● **Execute**: permission to perform an operation. It must be selected when you add access or write permission.

Permissions of an HDFS directory of each level are not shared by directory types of sub-levels by default. For example, if **Read** and **Execute** permissions are added to the **tmp** directory, you must select **Recursive** at the same time to add permissions to subdirectories.

Table 11-39 Hive permission description

Resource Supporting Permission Management	Permission Setting
Hive Admin Privilege	Grants you Hive administrator rights.
Database	Hive resource type, indicating a Hive database, which is used to store Hive tables. It has the following permissions: • **Select**: permission to query the Hive database • **Delete**: permission to perform the deletion operation in the Hive database • **Insert**: permission to perform the insertion operation in the Hive database • **Create**: permission to perform the creation operation in the Hive database
Table	Hive resource type, indicating a Hive table, which is used to store data. It has the following permissions: • **Select**: permission to query the Hive table • **Delete**: permission to perform the deletion operation in the Hive table • **Update**: grants users the **Update** permission of the Hive table • **Insert**: permission to perform the insertion operation in the Hive table • **Grant of Select**: permission to grant the **Select** permission to other users using Hive statements • **Grant of Delete**: permission to grant the **Delete** permission to other users using Hive statements • **Grant of Update**: permission to grant the **Update** permission to other users using Hive statements • **Grant of Insert**: permission to grant the **Insert** permission to other users using Hive statements

By default, permissions of a Hive resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Select** and **Insert** permissions are added to the **default** database, they are automatically added to the tables and columns in the database. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 11-40 Yarn permission description

Resource Supporting Permission Management	Permission Setting
Cluster Admin Operations	Grants you Yarn administrator rights.
root	Root queue of Yarn. It has the following permissions: • **Submit**: permission to submit jobs in the queue • **Admin**: permission to manage permissions of the current queue
Parent Queue	Yarn resource type, indicating a parent queue containing sub-queues. A root queue is a type of a parent queue. It has the following permissions: • **Submit**: permission to submit jobs in the queue • **Admin**: permission to manage permissions of the current queue
Leaf Queue	Yarn resource type, indicating a leaf queue. It has the following permissions: • **Submit**: permission to submit jobs in the queue • **Admin**: permission to manage permissions of the current queue

By default, permissions of a Yarn resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if the **Submit** permission is added to the **root** queue, it is automatically added to the sub-queue. Permissions inherited by sub-queues will not be displayed as selected in the **Permission** table. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 11-41 Hue permission description

Resource Supporting Permission Management	Permission Setting
Storage Policy Admin	Grants you storage policy administrator rights.

Step 4 Click **OK**. Return to **Manage Role**.

----End

Related Tasks

Modifying a role

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage Role**.

Step 3 In the row of the role to be modified, click **Modify** to modify role information.

NOTE

If you change permissions assigned by the role, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a role

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage Role**.

Step 3 In the row of the role to be deleted, click **Delete**.

Step 4 Click **OK**. The role is deleted.

----End

11.12.2 Creating a User Group

Scenario

This section describes how to create user groups and specify their operation permissions on MRS Manager. Management of single or multiple users can be unified in the user groups. After being added to a user group, users can obtain operation permissions owned by the user group.

Up to 100 user groups can be created on MRS Manager.

Prerequisites

Administrators have learned service requirements and created roles required by service scenarios.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 Above the user group list, click **Create User Group**.

Step 4 Input **Group Name** and **Description**.

Group Name is mandatory and contains 3 to 20 digits, letters, and underscores (_). **Description** is optional.

Step 5 In **Role**, click **Select and Add Role** to select and add specified roles.

If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

Step 6 Click **OK**. The user group is created.

----End

Related Tasks

Modifying a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be modified, click **Modify**.

NOTE

If you change role permissions assigned to the user group, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be deleted, click **Delete**.

Step 4 Click **OK**. The user group is deleted.

----End

11.12.3 Creating a User

Scenario

This section describes how to create users on MRS Manager based on site requirements and specify their operation permissions to meet service requirements.

Up to 1,000 users can be created on MRS Manager.

If a new password policy needs to be used for a new user's password, follow instructions in **Modifying a Password Policy** to modify the password policy and then perform the following operations to create a user.

Prerequisites

Administrators have learned service requirements and created roles and role groups required by service scenarios.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 Above the user list, click **Create User**.

Step 4 Configure parameters as prompted and enter a username in **User Name**.

NOTE

- If a username exists, you cannot create another username that only differs from the existing username in case. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the correct username, which is case-sensitive.
- **User Name** is mandatory and contains 3 to 20 digits, letters, and underscores (_).
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

Step 5 Set **User Type** to either **Human-Machine** or **Machine-Machine**.

- **Human-Machine** users: used for O&M on MRS Manager and operations on component clients. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-Machine** users: used for MRS application development. If you select this user type, you do not need to enter a password, because the password is randomly generated.

Step 6 In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

NOTE

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager_tenant** role and the role corresponding to the tenant.

Step 7 In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

Step 8 In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on service requirements.

NOTE

- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user rights.
- A new user can access WebUIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

Step 9 In **Description**, provide description based on onsite service requirements.

Description is optional.

Step 10 Click **OK**. The user is created.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed. For details, see section **Changing the Password of an Operation User**.

----End

11.12.4 Modifying User Information

Scenario

This section describes how to modify user information on MRS Manager, including information about the user group, primary group, role, and description.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user to be modified, click **Modify**.

NOTE

If you change user groups for or assign role permissions to the user, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

11.12.5 Locking a User

This section describes how to lock users in MRS clusters. A locked user cannot log in to MRS Manager or perform security authentication in the cluster.

A locked user can be unlocked by an administrator manually or until the lock duration expires. You can lock a user by using either of the following methods:

- Automatic lock: Set **Number of Password Retries** in **Configure Password Policy**. If user login attempts exceed the parameter value, the user is automatically locked. For details, see **Modifying a Password Policy** .
- Manual lock: The administrator manually locks a user.

The following describes how to manually lock a user. **Machine-Machine** users cannot be locked.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user to be locked, click **Lock User**.

Step 4 In the window that is displayed, click **Yes** to lock the user.

----End

11.12.6 Unlocking a User

If a user is locked because the number of login attempts exceeds the value of **Number of Password Retries**, or the user is manually locked by the administrator, the administrator can unlock the user on MRS Manager.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user to be unlocked, click **Unlock User**.

Step 4 In the window that is displayed, click **Yes** to unlock the user.

----End

11.12.7 Deleting a User

Scenario

If an MRS cluster user is not required, the administrator can delete the user on MRS Manager.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user to be deleted, choose **More** > **Delete**.

Step 4 Click **OK**.

----End

11.12.8 Changing the Password of an Operation User

Scenario

Passwords of **Human-Machine** system users must be regularly changed to ensure MRS cluster security. This section describes how to change your passwords on MRS Manager.

If a new password policy needs to be used for the password modified by the user, follow instructions in **Modifying a Password Policy** to modify the password policy and then perform the following operations to modify the password.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after changing the password of the MRS cluster user.

Prerequisites

- You have obtained the current password policies from the administrator.
- You have obtained the MRS Manager access address from the administrator.

Procedure

Step 1 On MRS Manager, move the mouse cursor to  in the upper right corner.

On the menu that is displayed, select **Change Password**.

Step 2 Fill in the **Old Password**, **New Password**, and **Confirm Password**. Click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

11.12.9 Initializing the Password of a System User

Scenario

This section describes how to initialize a password on MRS Manager if a user forgets the password or the password of a public account needs to be changed regularly. After password initialization, the user must change the password upon the first login.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

Initializing the Password of a Human-Machine User

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 Locate the row that contains the user whose password is to be initialized, choose **More** > **Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password of the current administrator account and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).

- The password cannot be the username or the reverse username.

----End

Initializing the Password of a Machine-Machine User

Step 1 Prepare a client based on service conditions and log in to the node where the client is installed.

Step 2 Run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

cpw *Component running user name*

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

11.12.10 Downloading a User Authentication File

Scenario

When a user develops big data applications and runs them in an MRS cluster that supports Kerberos authentication, the user needs to prepare a user authentication file for accessing the MRS cluster. The keytab file in the authentication file can be used for user authentication.

This section describes how to download a user authentication file and export the keytab file on MRS Manager.

NOTE

- Before downloading a **Human-machine** user authentication file, change the password for the user on MRS Manager to make the initial password set by the administrator invalid. Otherwise, the exported keytab file cannot be used. For details, see **Changing the Password of an Operation User**.
- After a user password is changed, the exported keytab file becomes invalid, and you need to export a keytab file again.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User**.

Step 3 In the row of the user for whom you want to export the keytab file, choose **More** > **Download authentication credential** to download the authentication file. After the file is automatically generated, save it to a specified path and keep it properly.

Step 4 Open the authentication file with a decompression program.

- **user.keytab** indicates a user keytab file used for user authentication.
- **krb5.conf** indicates the configuration file of the authentication server. The application connects to the authentication server according to the configuration file information when authenticating users.

----End

11.12.11 Modifying a Password Policy

Scenario

This section describes how to set password and user login security rules as well as user lock rules. Password policies set on MRS Manager take effect for **Human-machine** users only, because the passwords of **Machine-machine** users are randomly generated.

If a new password policy needs to be used for a new user's password or the password modified by the user, perform the following operations to modify the password policy first, and then create a user or change the password by following instructions in **Creating a User** or **Changing the Password of an Operation User**.

NOTICE

Modify password policies based on service security requirements, because they involve user management security. Otherwise, security risks may be caused.

Procedure

Step 1 On MRS Manager, click **System**.

Step 2 Click **Configure Password Policy**.

Step 3 Modify password policies as prompted. For parameter details, see the following table:

Table 11-42 Password policy parameter description

Parameter	Description
Minimum Password Length	Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is **8**.
Number of Character Types	Indicates the minimum number of character types a password contains. The character types are uppercase letters, lowercase letters, digits, spaces, and special characters (~`!?,.:;-_'(){}[]/<>@#$ %^&*+|\\=). The value can be **3** or **4**. The default value **3** indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces.
Password Validity Period (days)	Indicates the validity period (days) of a password. The value ranges from 0 to 90. 0 means that the password is permanently valid. The default value is **90**.
Password Expiration Notification Days	Indicates the number of days in advance users are notified that their passwords are about to expire. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to MRS Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from **0** to *X* (*X* must be set to the half of the password validity period and rounded down). Value **0** indicates that no notification is sent. The default value is **5**.
Interval of Resetting Authentication Failure Count (min)	Indicates the interval of retaining incorrect password attempts, in minutes. The value ranges from 0 to 1440. 0 indicates that incorrect password attempts are permanently retained and 1440 indicates that incorrect password attempts are retained for one day. The default value is **5**.
Number of Password Retries	Indicates the number of consecutive wrong passwords allowed before the system locks the user. The value ranges from 3 to 30. The default value is **5**.

Parameter	Description
Account Lock Duration (min)	Indicates the time period for which a user is locked when the user lockout conditions are met. The value ranges from 5 to 120. The default value is **5**.

----End

11.13 MRS Multi-User Permission Management

11.13.1 Users and Permissions of MRS Clusters

Overview

- **MRS Cluster Users**

  Indicate the security accounts of Manager, including usernames and passwords. These accounts are used to access resources in MRS clusters. Each MRS cluster in which Kerberos authentication is enabled can have multiple users.

- **MRS Cluster Roles**

  Before using resources in an MRS cluster, users must obtain the access permission which is defined by MRS cluster objects. A cluster role is a set of one or more permissions. For example, the permission to access a directory in HDFS needs to be configured in the specified directory and saved in a role.

Manager provides the user permission management function for MRS clusters, facilitating permission and user management.

- Permission management: adopts the role-based access control (RBAC) mode. In this mode, permissions are granted by role to form a permission set. After one or more roles are allocated to a user, the user can obtain the permissions of the roles.
- User management: uses MRS Manager to uniformly manage users, adopts the Kerberos protocol for user identity verification, and employs Lightweight Directory Access Protocol (LDAP) to store user information.

Permission Management

Permissions provided by MRS clusters include the O&M permissions of Manager and components (such as HDFS, HBase, Hive, and Yarn). In actual application, permissions must be assigned to each user based on service scenarios. To facilitate permission management, Manager introduces the role function to allow administrators to select and assign specified permissions. Permissions are centrally viewed and managed in permission sets, enhancing user experience.

A role is a logical entity that contains one or more permissions. Permissions are assigned to roles, and users can be granted the permissions by obtaining the roles.

A role can have multiple permissions, and a user can be bound to multiple roles.

- Role 1: is assigned operation permissions A and B. After role 1 is allocated to users a and b, users a and b can obtain operation permissions A and B.
- Role 2: is assigned operation permission C. After role 2 is allocated to users c and d, users c and d can obtain operation permission C.
- Role 3: is assigned operation permissions D and F. After role 3 is allocated to user a, user a can obtain operation permissions D and F.

For example, if an MRS user is bound to the administrator role, the user becomes an administrator of the MRS cluster.

Table 11-43 lists the roles that are created by default on Manager.

Table 11-43 Default roles and description

Default Role	Description
default	Tenant role
Manager_administrator	Manager administrator: This role has the permission to manage MRS Manager.
Manager_auditor	Manager auditor: This role has the permission to view and manage auditing information.
Manager_operator	Manager operator: This role has all permissions except tenant, configuration, and cluster management permissions.
Manager_viewer	Manager viewer: This role has the permission to view the information about systems, services, hosts, alarms, and auditing logs.
System_administrator	System administrator: This role has the permissions of Manager administrators and all service administrators.
Manager_tenant	Manager tenant viewer: This role has the permission to view information on the **Tenant** page on MRS Manager.

When creating a role on Manager, you can perform rights management for Manager and components, as shown in **Table 11-44**.

Table 11-44 Manager and component permission management

Permission	Description
Manager	Manager access and login permission.
HBase	HBase administrator permission and permission for accessing HBase tables and column families.
HDFS	HDFS directory and file permission.

Permission	Description
Hive	• Hive Admin Privilege Hive administrator permission. • Hive Read Write Privileges Hive data table management permission to set and manage the data of created tables.
Hue	Storage policy administrator permissions.
Yarn	• Cluster Admin Operations Yarn administrator permission. • Scheduler Queue Queue resource management permission.

User Management

MRS clusters that support Kerberos authentication use the Kerberos protocol and LDAP for user management.

- Kerberos verifies the identity of the user when a user logs in to Manager or uses a component client. Identity verification is not required for clusters with Kerberos authentication disabled.
- LDAP is used to store user information, including user records, user group information, and permission information.

MRS clusters can automatically update Kerberos and LDAP user data when users are created or modified on Manager. They can also automatically perform user identity verification and authentication and obtain user information when a user logs in to Manager or uses a component client. This ensures the security of user management and simplifies the user management tasks. Manager also provides the user group function for managing one or multiple users by type:

- A user group is a set of users, which can be used to manage users by type. Users in the system can exist independently or in a user group.
- After a user is added to a user group to which roles are allocated, the role permission of the user group is assigned to the user.

Table 11-45 lists the user groups that are created by default on MRS Manager in MRS 3.x or earlier.

For details about the default user groups displayed on FusionInsight Manager of MRS 3.*x* or later, see **User group**.

Table 11-45 Default user groups and description

User Group	Description
hadoop	Users added to this user group have the permission to submit tasks to all Yarn queues.

User Group	Description
hbase	Common user group. Users added to this user group will not have any additional permission.
hive	Users added to this user group can use Hive.
spark	Common user group. Users added to this user group will not have any additional permission.
supergroup	Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.
flume	Common user group. Users added to this user group will not have any additional permission.
kafka	Kafka common user group. Users added to this group need to be granted with read and write permission by users in the **kafkaadmin** group before accessing the desired topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
storm	Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
stormadmin	Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.

User **admin** is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.

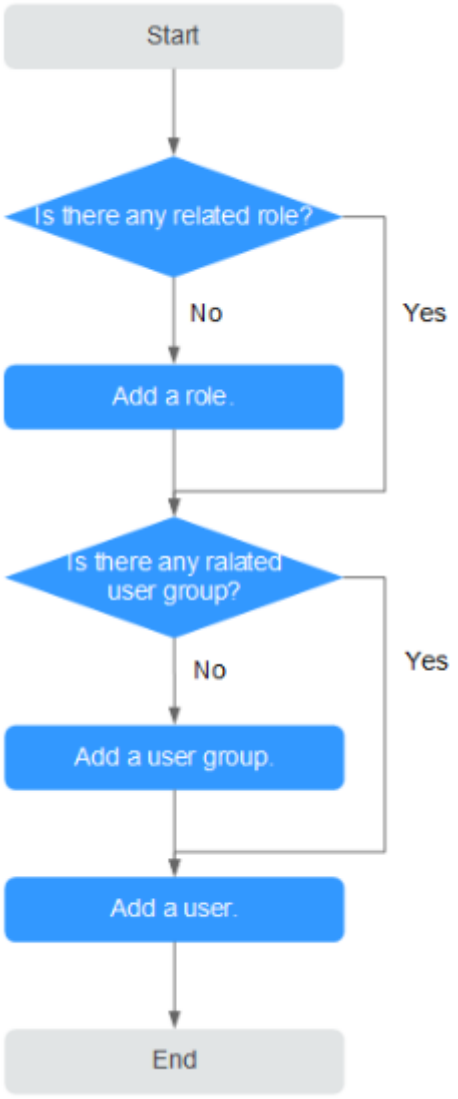
Process Overview

In practice, MRS cluster users must understand the service scenarios of big data and plan user permissions. Then, create roles and assign permissions to the roles on MRS Manager to meet service requirements. Manager provides the user group function for administrators to create user groups for managing users of one or multiple service scenarios of the same type.

NOTE

If a role has the permission of HDFS, HBase, Hive, or Yarn respectively, the role can only use the corresponding functions of the component. To use Manager, the corresponding Manager permission must be added to the role.

Figure 11-1 Process of creating a user



11.13.2 Default Users of Clusters with Kerberos Authentication Enabled

User Classification

The MRS cluster provides the following three types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System user	• User created on Manager for MRS cluster O&M and service scenarios. There are two types of users: – **Human-machine** user: used for Manager O&M scenarios and component client operation scenarios. – **Machine-machine** user: used for MRS cluster application development scenarios. • User who runs OMS processes.
Internal system user	Internal user who performs process communications, saves user group information, and associates user permissions.
Database user	• User who manages OMS database and accesses data. • User who runs the database of service components (Hive, Hue, Loader, and DBService)

System User

NOTE

- User **Idap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

Type	Username	Initial Password	Description
System administrator of the MRS cluster	admin	Specified by the user during the cluster creation.	Manager administrator with the following permissions: • Common HDFS and ZooKeeper user permissions. • Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI. • Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service. • Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service.
MRS cluster node OS user	omm	Randomly generated by the system.	Internal running user of the MRS cluster system. This user is an OS user generated on all nodes and does not require a unified password.
MRS cluster node OS user	root	Set by the user.	User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.

Internal System Users

NOTE

Do not delete the following internal system users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
Component running user	hdfs	Hdfs@123	This user is the HDFS system administrator and has the following permissions: 1. File system operation permissions: ● Views, modifies, and creates files. ● Views and creates directories. ● Views and modifies the groups where files belong. ● Views and sets disk quotas for users. 2. HDFS management operation permissions: ● Views the web UI status. ● Views and sets the active and standby HDFS status. ● Enters and exits the HDFS in security mode. ● Checks the HDFS file system.

Type	Default User	Initial Password	Description
	hbase	Hbase@123	This user is the HBase system administrator and has the following permissions: ● Cluster management permission: **Enable** and **Disable** operations on tables to trigger MajorCompact and ACL operations. ● Grants and revokes permissions, and shuts down the cluster. ● Table management permission: Creates, modifies, and deletes tables. ● Data management permission: Reads and writes data in tables, column families, and columns. ● Accesses the HBase web UI.
	mapred	Mapred@123	This user is the MapReduce system administrator and has the following permissions: ● Submits, stops, and views the MapReduce tasks. ● Modifies the Yarn configuration parameters. ● Accesses the Yarn and MapReduce web UI.
	spark	Spark@123	This user is the Spark system administrator and has the following permissions: ● Accesses the Spark web UI. ● Submits Spark tasks.

User Group Information

Default User Group	Description
hadoop	Users added to this user group have the permission to submit tasks to all Yarn queues.
hbase	Common user group. Users added to this user group will not have any additional permission.
hive	Users added to this user group can use Hive.
spark	Common user group. Users added to this user group will not have any additional permission.
supergroup	Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.
check_sec_ldap	Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components.
Manager_tenant	Tenant system user group, which is an internal system user group used only between components.
System_administrator	MRS cluster system administrator group, which is an internal system user group used only between components.
Manager_viewer	MRS Manager system viewer group, which is an internal system user group used only between components.
Manager_operator	MRS Manager system operator group, which is an internal system user group used only between components.
Manager_auditor	MRS Manager system auditor group, which is an internal system user group used only between components.
Manager_administrator	MRS Manager system administrator group, which is an internal system user group used only between components.
compcommon	Internal system group for accessing public resources in a cluster. All system users and system running users are added to this user group by default.
default_1000	User group created for tenants, which is an internal system user group used only between components.

Default User Group	Description
kafka	Kafka common user group. Users added to this group need to be granted with read and write permission by users in the **kafkaadmin** group before accessing the desired topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
storm	Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
stormadmin	Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
opentsdb	Common user group. Users added to this user group will not have any additional permission.
presto	Common user group. Users added to this user group will not have any additional permission.
flume	Common user group. Users added to this user group will not have any additional permission.
launcher-job	MRS internal group, which is used to submit jobs using V2 APIs.

OS User Group	Description
wheel	Primary group of MRS internal running user **omm**.
ficommon	MRS cluster common group that corresponds to **compcommon** for accessing public resource files stored in the OS of the cluster.

Database User

MRS cluster system database users include OMS database users and DBService database users.

NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping applications.
	omm	ChangeMe@123456	User for accessing OMS database data.
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component.
	hive	HiveUser@	User for Hive to connect to the DBService database.
	hue	HueUser@123	User for Hue to connect to the DBService database.
	sqoop	SqoopUser@	User for Loader to connect to the DBService database.
	ranger	RangerUser@	User for Ranger to connect to the DBService database.

11.13.3 Creating a Role

Scenario

This section describes how to create a role on Manager and authorize and manage Manager and components.

Up to 1000 roles can be created on Manager.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Managing Roles**.

Prerequisites

- You have learned service requirements.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, choose **System** > **Manage Role**.

Step 3 Click **Create Role** and fill in **Role Name** and **Description**.

Role Name is mandatory and contains 3 to 30 characters. Only digits, letters, and underscores (_) are allowed. **Description** is optional.

Step 4 In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

NOTE

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click  . The search result is displayed.
- The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive. Results of the next page can be searched.

Table 11-46 Manager permission description

Resource Supporting Permission Management	Permission Setting
Alarm	Authorizes the Manager alarm function. You can select **View** to view alarms and **Management** to manage alarms.
Audit	Authorizes the Manager audit log function. You can select **View** to view audit logs and **Management** to manage audit logs.
Dashboard	Authorizes the Manager overview function. You can select **View** to view the cluster overview.
Hosts	Authorizes the node management function. You can select **View** to view node information and **Management** to manage nodes.
Services	Authorizes the service management function. You can select **View** to view service information and **Management** to manage services.
System_cluster_management	Authorizes the MRS cluster management function. You can select **Management** to use the MRS patch management function.
System_configuration	Authorizes the MRS cluster configuration function. You can select **Management** to configure MRS clusters on Manager.
System_task	Authorizes the MRS cluster task function. You can select **Management** to manage periodic tasks of MRS clusters on Manager.

Resource Supporting Permission Management	Permission Setting
Tenant	Authorizes the Manager multi-tenant management function. You can select **Management** to manage multi-tenants.

Table 11-47 HBase permission description

Resource Supporting Permission Management	Permission Setting
SUPER_USER_GROUP	Grants you HBase administrator permissions.
Global	HBase resource type, indicating the whole HBase.
Namespace	HBase resource type, indicating namespace, which is used to store HBase tables. It has the following permissions: ● **Admin** permission to manage the namespace ● **Create**: permission to create HBase tables in the namespace ● **Read**: permission to access the namespace ● **Write**: permission to write data to the namespace ● **Execute**: permission to execute the coprocessor (Endpoint)
Table	HBase resource type, indicating a data table, which is used to store data. It has the following permissions: ● **Admin**: permission to manage a data table ● **Create**: permission to create column families and columns in a data table ● **Read**: permission to read a data table ● **Write**: permission to write data to a data table ● **Execute**: permission to execute the coprocessor (Endpoint)
ColumnFamily	HBase resource type, indicating a column family, which is used to store data. It has the following permissions: ● **Create**: permission to create columns in a column family ● **Read**: permission to read a column family ● **Write**: permission to write data to a column family

Resource Supporting Permission Management	Permission Setting
Qualifier	HBase resource type, indicating a column, which is used to store data. It has the following permissions: ● **Read**: permission to read a column ● **Write**: permission to write data to a column

By default, permissions of an HBase resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Read** and **Write** permissions are added to the **default** namespace, they are automatically added to the tables, column families, and columns in the namespace. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 11-48 HDFS permission description

Resource Supporting Permission Management	Permission Setting
Folder	HDFS resource type, indicating an HDFS directory, which is used to store files or subdirectories. It has the following permissions: ● **Read**: permission to access the HDFS directory ● **Write**: permission to write data to the HDFS directory ● **Execute**: permission to perform an operation. It must be selected when you add access or write permission.
Files	HDFS resource type, indicating a file in HDFS. It has the following permissions: ● **Read**: permission to access the file ● **Write**: permission to write data to the file ● **Execute**: permission to perform an operation. It must be selected when you add access or write permission.

Permissions of an HDFS directory of each level are not shared by directory types of sub-levels by default. For example, if **Read** and **Execute** permissions are added to the **tmp** directory, you must select **Recursive** for permissions to be added to subdirectories.

Table 11-49 Hive permission description

Resource Supporting Permission Management	Permission Setting
Hive Admin Privilege	Grants you Hive administrator permissions.
Database	Hive resource type, indicating a Hive database, which is used to store Hive tables. It has the following permissions: • **Select**: permission to query the Hive database • **Delete**: permission to perform the deletion operation in the Hive database • **Insert**: permission to perform the insertion operation in the Hive database • **Create**: permission to perform the creation operation in the Hive database
Table	Hive resource type, indicating a Hive table, which is used to store data. It has the following permissions: • **Select**: permission to query the Hive table • **Delete**: permission to perform the deletion operation in the Hive table • **Update**: permission to perform the update operation in the Hive table • **Insert**: permission to perform the insertion operation in the Hive table • **Grant of Select**: permission to grant the **Select** permission to other users using Hive statements • **Grant of Delete**: permission to grant the **Delete** permission to other users using Hive statements • **Grant of Update**: permission to grant the **Update** permission to other users using Hive statements • **Grant of Insert**: permission to grant the **Insert** permission to other users using Hive statements

By default, permissions of a Hive resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Select** and **Insert** permissions are added to the **default** database, they are automatically added to the tables and columns in the database. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 11-50 Yarn permission description

Resource Supporting Permission Management	Permission Setting
Cluster Admin Operations	Grants you Yarn administrator permissions.
root	Root queue of Yarn. It has the following permissions: • **Submit**: permission to submit jobs in the queue • **Admin**: permission to manage permissions of the current queue
Parent Queue	Yarn resource type, indicating a parent queue containing sub-queues. A root queue is a type of a parent queue. It has the following permissions: • **Submit**: permission to submit jobs in the queue • **Admin**: permission to manage permissions of the current queue
Leaf Queue	Yarn resource type, indicating a leaf queue. It has the following permissions: • **Submit**: permission to submit jobs in the queue • **Admin**: permission to manage permissions of the current queue

By default, permissions of a Yarn resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if the **Submit** permission is added to the **root** queue, it is automatically added to the sub-queue. Permissions inherited by sub-queues will not be displayed as selected in the **Permission** table. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

Table 11-51 Hue permission description

Resource Supporting Permission Management	Permission Setting
Storage Policy Admin	Grants you storage policy administrator permissions.

Step 5 Click **OK**. Return to **Manage Role**.

----End

Related Tasks

Modifying a role

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage Role**.

Step 3 In the row of the role to be modified, click **Modify** to modify role information.

NOTE

If you modify permissions assigned by the role, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a role

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage Role**.

Step 3 In the row of the role to be deleted, click **Delete**.

Step 4 Click **OK**. The role is deleted.

----End

11.13.4 Creating a User Group

Scenario

This section describes how to create user groups and specify their operation permissions on Manager. Management of single or multiple users can be unified in the user groups. After being added to a user group, users can obtain operation permissions owned by the user group.

Manager supports a maximum of 100 user groups.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Managing User Groups**.

Prerequisites

- Administrators have learned service requirements and created roles required by service scenarios.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User Group**.

Step 4 Above the user group list, click **Create User Group**.

Step 5 Input **Group Name** and **Description**.

Group Name is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (_) are allowed. **Description** is optional.

Step 6 In **Role**, click **Select and Add Role** to select and add specified roles.

If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

Step 7 Click **OK**.

----End

Related Tasks

Modifying a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of a user group to be modified, click **Modify**.

NOTE

If you change role permissions assigned to the user group, it takes 3 minutes to make new configurations take effect.

Step 4 Click **OK**. The modification is complete.

----End

Deleting a user group

Step 1 On MRS Manager, click **System**.

Step 2 In the **Permission** area, click **Manage User Group**.

Step 3 In the row of the user group to be deleted, click **Delete**.

Step 4 Click **OK**. The user group is deleted.

----End

11.13.5 Creating a User

Scenario

This section describes how to create users on Manager based on site requirements and specify their operation permissions to meet service requirements.

Up to 1000 users can be created on Manager.

If a new password policy needs to be used for a new user's password, follow instructions in **Modifying a Password Policy** to modify the password policy and then perform the following operations to create a user.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Creating a User**.

Prerequisites

- Administrators have learned service requirements and created roles and role groups required by service scenarios.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 Above the user list, click **Create User**.

Step 5 Configure parameters as prompted and enter a username in **Username**.

NOTE

- A username that differs only in alphabetic case from an existing username is not allowed. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the exactly correct username, which is case-sensitive.
- **Username** is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (_) are allowed.
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

Step 6 Set **User Type** to either **Human-machine** or **Machine-machine**.

- **Human-machine** user: used for MRS Manager O&M scenarios and component client operation scenarios. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-machine** users: used for MRS application development scenarios. If you select this user type, you do not need to enter a password, because the password is randomly generated.

Step 7 In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

NOTE

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager_tenant** role and the role corresponding to the tenant.
- Users created on Manager cannot be added to the user group synchronized using the IAM user synchronization function.

Step 8 In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

Step 9 In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on onsite service requirements.

NOTE

- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user rights.
- A new user can access web UIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

Step 10 In **Description**, provide description based on onsite service requirements.

Description is optional.

Step 11 Click **OK**.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed. For details, see **Changing the Password of an Operation User**.

----End

11.13.6 Modifying User Information

Scenario

This section describes how to modify user information on Manager, including information about the user group, primary group, role, and description.

This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Modifying User Information**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row of a user to be modified, click **Modify**.

NOTE

If you change user groups for a user or assign role permissions to a user, it takes 3 minutes to make new configurations take effect.

Step 5 Click **OK**. The modification is complete.

----End

11.13.7 Locking a User

This section describes how to lock users in MRS clusters. A locked user cannot log in to Manager or perform security authentication in the cluster. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

A locked user can be unlocked by an administrator manually or until the lock duration expires. You can lock a user by using either of the following methods:

- Automatic lock: Set **Number of Password Retries** in **Configure Password Policy**. If user login attempts exceed the parameter value, the user is automatically locked. For details, see **Modifying a Password Policy**.
- Manual lock: The administrator manually locks a user.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Locking a User**.

The following describes how to manually lock a user. **Machine-machine** users cannot be locked.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row of a user you want to lock, click **Lock User**.

Step 5 In the window that is displayed, click **OK** to lock the user.

----End

11.13.8 Unlocking a User

If a user is locked because the number of login attempts exceeds the value of **Number of Password Retries**, or the user is manually locked by the administrator, the administrator can unlock the user on Manager. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Unlocking a User**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row of a user to be unlocked, click **Unlock User**.

Step 5 In the window that is displayed, click **OK** to unlock the user.

----End

11.13.9 Deleting a User

The administrator can delete an MRS cluster user that is not required on MRS Manager. Deleting a user is allowed only in clusters with Kerberos authentication enabled or normal clusters with the EIP function enabled.

NOTE

If you want to create a new user with the same name as user A after deleting user A who has submitted a job on the client or MRS console, you need to delete user A's residual folders when deleting user A. Otherwise, the newly created user A may fail to submit a job.

To delete residual folders, log in to each Core node in the MRS cluster and run the following commands. In the following commands, **$user** indicates the folder named after the username.

cd /srv/BigData/hadoop/data1/nm/localdir/usercache/

rm -rf $user

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Deleting a User**.

Procedure

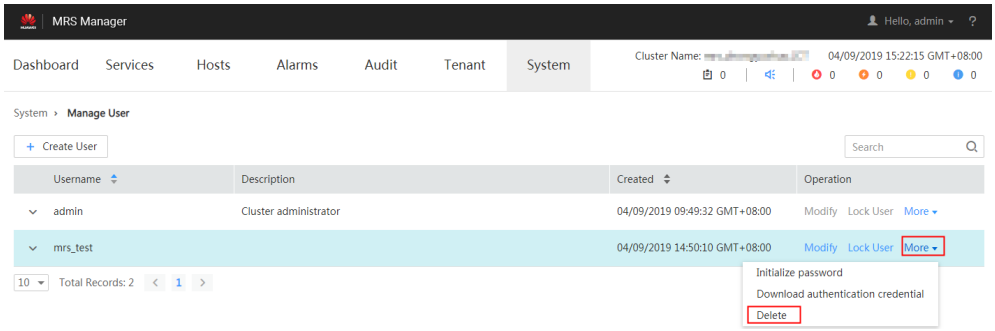
Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row that contains the user to be deleted, choose **More** > **Delete**.

Figure 11-2 Deleting a user



Step 5 Click **OK**.

----End

11.13.10 Changing the Password of an Operation User

Scenario

Passwords of **Human-machine** system users must be regularly changed to ensure MRS cluster security. This section describes how to change passwords on MRS Manager.

If a new password policy needs to be used for the password modified by the user, follow instructions in **Modifying a Password Policy** to modify the password policy and then perform the following operations to modify the password.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Changing a User Password**.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after modifying the password of the MRS cluster user.

Prerequisites

- You have obtained the current password policies from the administrator.
- You have obtained the MRS Manager access address from the administrator.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, move the mouse cursor to in the upper right corner.

On the menu that is displayed, select **Change Password**.

Step 3 Fill in the **Old Password**, **New Password**, and **Confirm Password**. Click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

11.13.11 Initializing the Password of a System User

Scenario

This section describes how to initialize a password on Manager if a user forgets the password or the password of a public account needs to be changed regularly. After password initialization, the user must change the password upon the first login. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Initializing a Password**.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

Initializing the Password of a Human-Machine User

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 Locate the row that contains the user whose password is to be initialized, choose **More** > **Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password of the current administrator account and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.

- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

Initializing the Password of a Machine-Machine User

Step 1 Prepare a client based on service conditions and log in to the node with the client installed.

Step 2 Run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

kadmin -p kadmin/admin

Step 6 Run the following command to reset the password of a component running user. This operation takes effect on all servers:

cpw *Component running user name*

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#$ %^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

11.13.12 Downloading a User Authentication File

Scenario

When a user develops big data applications and runs them in an MRS cluster that supports Kerberos authentication, the user needs to prepare a **Machine-machine** user authentication file for accessing the MRS cluster. The keytab file in the authentication file can be used for user authentication.

This section describes how to download a **Machine-machine** user authentication file and export the keytab file on Manager. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

NOTE

Before downloading a **Human-machine** user authentication file, change the password for the user on MRS Manager to make the initial password set by the administrator invalid. Otherwise, the exported keytab file cannot be used. For details, see **Changing the Password of an Operation User**.

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Exporting an Authentication Credential File**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 In the **Permission** area, click **Manage User**.

Step 4 In the row of a user for whom you want to export the keytab file, choose **More** > **Download authentication credential** to download the authentication file. After the file is automatically generated, save it to a specified path and keep it secure.

Step 5 Open the authentication file with a decompression program.

- **user.keytab** indicates a user keytab file used for user authentication.
- **krb5.conf** indicates the configuration file of the authentication server. The application connects to the authentication server according to this configuration file information when authenticating users.

----End

11.13.13 Modifying a Password Policy

Scenario

NOTICE

Because password policies are critical to the user management security, modify them based on service security requirements. Otherwise, security risks may be incurred.

This section describes how to set password and user login security rules as well as user lock rules. Password policies set on MRS Manager take effect for **Human-machine** users only, because the passwords of **Machine-machine** users are randomly generated. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

If a new password policy needs to be used for a new user's password or the password modified by the user, perform the following operations to modify the

password policy first, and then follow instructions in **Creating a User** or **Changing the Password of an Operation User**.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Configuring Password Policies**.

Procedure

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 On MRS Manager, click **System**.

Step 3 Click **Configure Password Policy**.

Step 4 Modify password policies as prompted. For parameter details, see **Table 11-52**.

Table 11-52 Password policy parameter description

Parameter	Description
Minimum Password Length	Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is **8**.
Number of Character Types	Indicates the minimum number of character types a password contains. The character types include uppercase letters, lowercase letters, digits, spaces, and special characters (~`!?,.:;-_'(){}[]/<>@#$ %^&*+|\=). The value can be **3** or **4**. The default value **3** indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces.
Password Validity Period (days)	Indicates the validity period (days) of a password. The value ranges from 0 to 90. Value **0** means that the password is permanently valid. The default value is **90**.

Parameter	Description
Password Expiration Notification Days	Indicates the number of days to notify password expiration in advance. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to MRS Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from **0** to *X* (*X* must be set to the half of the password validity period and rounded down). Value **0** indicates that no notification is sent. The default value is **5**.
Interval of Resetting Authentication Failure Count (min)	Indicates the interval (minutes) of retaining incorrect password attempts. The value ranges from 0 to 1440. Value **0** indicates that the number of incorrect password attempts are permanently retained and value **1440** indicates that the number of incorrect password attempts are retained for one day. The default value is **5**.
Number of Password Retries	Indicates the number of consecutive wrong passwords allowed before the system locks the user. The value ranges from 3 to 30. The default value is **5**.
Account Lock Duration (min)	Indicates the time period for which a user is locked when the user lockout conditions are met. The value ranges from 5 to 120. The default value is **5**.

----End

11.13.14 Configuring Cross-Cluster Mutual Trust Relationships

Scenario

If cluster A needs to access the resources of cluster B, the mutual trust relationship must be configured between these two clusters.

If no trust relationship is configured, resources of a cluster are available only for users in this cluster. MRS automatically assigns a unique **domain name** for each cluster to define the scope of resources for users.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**.

Impact on the System

- After cross-cluster mutual trust is configured, resources of a cluster become available for users in other cluster. User permission in the clusters must be regularly checked based on service and security requirements.
- After cross-cluster mutual trust is configured, the KrbServer service needs to be restarted and the cluster becomes unavailable during the restart.
- After cross-cluster mutual trust is configured, internal users **krbtgt/***Local cluster domain name*@*External cluster domain name* and **krbtgt/***External cluster domain name*@*Local cluster domain name* are added to the two clusters. The internal users cannot be deleted.

Procedure

Step 1 On the MRS management console, query all security groups of the two clusters.

- If the security groups of the two clusters are the same, go to **Step 3**.
- If the security groups of the two clusters are different, go to **Step 2**.

Step 2 On the VPC management console, add rules for each security group.

Set **Protocol** to **ANY**, **Transfer Direction** to **Inbound**,

and **Source** to **Security Group**. The source is the security group of the peer cluster.

- For cluster A, add inbound rules to the security group, set **Source** to the security groups of cluster B (the peer cluster of cluster A).
- For cluster B, add inbound rules to the security group, set **Source** to the security groups of cluster A (the peer cluster of cluster B).

NOTE

For a common cluster with Kerberos authentication disabled, perform step **Step 1** to **Step 2** to configure cross-cluster mutual trust. For a security cluster with Kerberos authentication enabled, after completing the preceding steps, proceed to the following steps for configuration.

Step 3 Log in to MRS Manager of the two clusters separately. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**. Click **Service** and check whether the **Health Status** of all components is **Good**.

- If yes, go to **Step 4**.
- If no, contact technical support personnel for troubleshooting.

Step 4 Query configuration information.

1. On MRS Manager of the two clusters, choose **Services** > **KrbServer** > **Instance**. Query the **OM IP Address** of the two KerberosServer hosts.
2. Click **Service Configuration**. Set **Type** to **All**. Choose **KerberosServer** > **Port** in the navigation tree on the left. Query the value of **kdc_ports**. The default value is **21732**.

3. Click **Realm** and query the value of **default_realm**.

Step 5 On MRS Manager of either cluster, modify the **peer_realms** parameter.

Table 11-53 Parameter description

Parameter	Description
realm_name	Domain name of the mutual-trust cluster, that is, the value of **default_realm** obtained in step 4.
ip_port	KDC address of the peer cluster. Format: *IP address of a KerberosServer node in the peer cluster:kdc_port* The addresses of the two KerberosServer nodes are separated by a comma. For example, if the IP addresses of the KerberosServer nodes are 10.0.0.1 and 10.0.0.2 respectively, the value of this parameter is **10.0.0.1:21732,10.0.0.2:21732**.

NOTE

- To deploy trust relationships with multiple clusters, click  to add items and specify relevant parameters. To delete an item, click  .
- A cluster can have trust relationships with a maximum of 16 clusters. By default, no trust relationship exists between different clusters that are trusted by a local cluster.

Step 6 Click **Save Configuration**. In the dialog box that is displayed, select **Restart the affected services or instances** and click **OK**. If you do not select **Restart the affected services or instances**, manually restart the affected services or instances.

After **Operation successful** is displayed, click **Finish**.

Step 7 Exit MRS Manager and log in to it again. If the login is successful, the configurations are valid.

Step 8 Log in to MRS Manager of the other cluster and repeat step **Step 5** to **Step 7**.

----End

Follow-up Operations

After cross-cluster mutual trust is configured, the service configuration parameters are modified on MRS Manager and the service is restarted. Therefore, you need to prepare the client configuration file again and update the client.

Scenario 1:

Cluster A and cluster B (peer cluster and mutually trusted cluster) are the same type, for example, analysis cluster or streaming cluster. Follow instructions in **Updating a Client (Versions Earlier Than 3.x)** to update the client configuration files of cluster A and B respectively.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Scenario 2:

Cluster A and cluster B (peer cluster and mutually trusted cluster) are the different type. Perform the following steps to update the configuration files.

- Update the client configuration file of cluster A to cluster B.
- Update the client configuration file of cluster B to cluster A.
- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Step 1 Log in to MRS Manager of cluster A.

Step 2 Click **Services**, and then **Download Client**.

Step 3 Set **Client Type** to **Only configuration files**.

Step 4 Set **Download to** to **Remote host**.

Step 5 Set **Host IP Address** to the IP address of the active Master node of cluster B, **Host Port** to 22, and **Save Path** to **/tmp**.

- If the default port **22** for logging in to cluster B using SSH is changed, set **Host Port** to a new port.
- The value of **Save Path** contains a maximum of 256 characters.

Step 6 Set **Login User** to **root**.

If another user is used, ensure that the user has permissions to read, write, and execute the save path.

Step 7 Select **Password** or **SSH Private Key** for **Login Mode**.

- **Password**: Enter the password of user **root** set during cluster creation.
- **SSH Private Key**: Select and upload the key file used for creating the cluster.

Step 8 Click **OK** to generate a client file.

If the following information is displayed, the client file is saved. Click **Close**.

```
Client files downloaded to the remote host successfully.
```

If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to **Step 2** to download the client again.

```
Failed to connect to the server. Please check the network connection or parameter settings.
```

Step 9 Log in to the ECS of cluster B using VNC. For details, see

Step 10 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 11 Run the following command to update the client configuration of cluster A to cluster B:

sh refreshConfig.sh *Client installation directory Full path of the client configuration file package*

For example, run the following command:

sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS_Services_Client.tar

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.
Succeed to refresh components client config.
```

NOTE

You can also refer to method 2 in **Updating a Client (Versions Earlier Than 3.x)** to perform operations in **Step 1** to **Step 11**.

Step 12 Repeat step **Step 1** to **Step 11** to update the client configuration file of cluster B to cluster A.

Step 13 Follow instructions in **Updating a Client (Versions Earlier Than 3.x)** to update the client configuration file of the local cluster.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

----End

11.13.15 Configuring Users to Access Resources of a Trusted Cluster

Scenario

After cross-cluster mutual trust is configured, permission must be configured for users in the local cluster, so that the users can access the same resources in the peer cluster as the users in the peer cluster.

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.*x*** or later, see **Configuring Cross-Manager Cluster Mutual Trust Relationships**.

Prerequisites

The mutual trust relationship has been configured between two clusters (clusters A and B). The clients of the clusters have been updated.

Procedure

Step 1 Log in to MRS Manager of cluster A and choose **System** > **Manage User**. Check whether cluster A has accounts that are the same as those of cluster B.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Click on the left side of the username to unfold the detailed user information. Check whether the user group and role to which the user belongs meet the service requirements.

For example, user **admin** of cluster A has the permission to access and create files in the **/tmp** directory of cluster A. Then go to **Step 4**.

Step 3 Create the accounts in cluster A and bind the accounts to the user group and roles required by the services. Then go to **Step 4**.

Step 4 Choose **Service** > **HDFS** > **Instance**. Query the **OM IP Address** of **NameNode (Active)**.

Step 5 Log in to the client of cluster B.

For example, if you have updated the client on the Master2 node, log in to the Master2 node to use the client. For details, see **Using an MRS Client**.

Step 6 Run the following command to access the **/tmp** directory of cluster A.

hdfs dfs -ls hdfs://192.168.6.159:9820/tmp

In the preceding command, **192.168.6.159** is the IP address of the active NameNode of cluster A; **9820** is the default port for communication between the client and the NameNode.

Step 7 Run the following command to create a file in the **/tmp** directory of cluster A:

hdfs dfs -touchz hdfs://192.168.6.159:9820/tmp/mrstest.txt

If you can query the **mrstest.txt** file in the **/tmp** directory of cluster A, the cross-cluster mutual trust is configured successfully.

----End

11.13.16 Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS

When fine-grained permission control is enabled, you can configure OBS access permissions to implement access control on directories in OBS file systems.

This function enables you to control MRS users' access to OBS resources. For example, if you allow user group A to only access log files in a specified OBS file system, perform the following operations:

1. Configure an agency with OBS access permissions for an MRS cluster so that OBS can be accessed using the temporary AK/SK automatically obtained by the ECS. This prevents the AK/SK from being exposed in the configuration file.
2. Create a policy on the IAM console to allow access to log files in a specified OBS file system, and create an agency bound to the policy permission.
3. In the MRS cluster, bind the new agency to user group A so that user group A only has the permission to access log files in the specified OBS file system.

In the following scenarios, the username used for submitting jobs is an internal username so that MRS multi-user access to OBS is not supported.

- For spark-beeline, the internal username used for submitting jobs is **spark** in a security cluster and **omm** in a normal cluster.

- For the HBase shell, the internal username used for submitting jobs is **hbase** in a security cluster and **omm** in a normal cluster.
- For Presto, the internal username used for submitting jobs in the security cluster is **omm** or **hive**, and that in the normal cluster is **omm**. (Choose **Components** > **Presto** > **Service Configuration**. Change **Basic** to **All** in the parameter type drop-down box.) Then, search for and change the value of **hive.hdfs.impersonation.enabled** to **true** to enable MRS multi-user to access OBS with fine-grained permissions.

Prerequisites

- Fine-grained permission control has been enabled. For details about permissions management, see **Creating an MRS User**.
- You have a basic knowledge of and OBS fine-grained policies.

Step 1: Configuring an Agency with OBS Access Permission for a Cluster

Step 1 Follow instructions in **Configuring a Storage-Compute Decoupled Cluster (Agency)** to configure an agency with OBS access permissions.

The agency takes effect for all users (including internal users) and user groups in the cluster. To control the permissions of users and user groups in the cluster to access OBS, perform the following operations.

----End

Step 2: Creating a Policy and an Agency on IAM

Create policies with different access permissions and bind the policies to the agency. For details, see **Creating a Policy and an Agency on IAM**.

Step 3: Configuring OBS Permission Control Mappings on the MRS Cluster Details Page

Step 1 On the MRS management console, choose **Clusters** > **Active Clusters** and click the cluster name.

Step 2 In the **Basic Information** area on the **Dashboard** tab page, click **Manage** next to **OBS Permission Control**.

Step 3 Click **Add Mapping** and set parameters according to **Table 11-54**.

Table 11-54 OBS permission control parameters

Parameter	Description
IAM Agency	Select the agency created in **Step 2**.

Parameter	Description
Type	• **User**: User-level mapping • **Group**: User group-level mapping **NOTE** • User-level mapping takes priority over user group-level mapping. If you select **Group**, you are advised to enter the primary group name in **MRS User (User Group)**. • Do not use the same username (user group) for multiple mapping records.
MRS User (User Group)	Use commas (,) to separate multiple names of users or user groups. **NOTE** • If OBS permission control is not configured for a user and no AK and SK are configured, the permission in **MRS_ECS_DEFAULT_AGENCY** will be used for accessing OBS. You are advised not to bind the internal user of a component to an agency. • If you need to configure an agency for the internal user of a component when submitting a job in the following scenarios, the requirements are as follows: – To control permissions on spark-beeline operations, set the username to **spark** for a security cluster and **omm** for a normal cluster. – To control permissions on HBase shell operations, set the username to **hbase** for a security cluster and **omm** for a normal cluster. – To control permissions on Presto, set the username to **omm**, **hive**, and the username used for logging in to the client for a security cluster and **omm** and the username used for logging in to the client for a normal cluster. – If you want to use Hive to create tables in beeline mode, set the username to the internal user **hive**.

Step 4 Click **OK**.

Step 5 Select **I agree to authorize the trust relationships between MRS Users (Groups) and IAM agencies**, and click **OK**. The mapping between the MRS user and OBS permission is added.

If appears next to **OBS Permission Control** on the **Dashboard** tab page or the mapping table has been updated for OBS permission control, the mapping takes effect. It takes about 1 minute to for the mapping to take effect.

In the **Operation** column of the mapping list, you can edit or delete the added mapping.

NOTE

- If OBS permission control is not configured for a user and no AK and SK are configured, the permissions owned by the agency configured for the cluster in the **Object Storage Service (OBS)** project will be used to access OBS.
- Regardless of whether OBS permission control is configured, AK/SK permission is used for accessing OBS once it is configured.
- Security Administrator permission is required to modify, create, or delete a mapping.
- To enable mapping changes to take effect in spark-line, hive beeline and Presto respectively, you need to restart Spark, exit beeline and enter again, and restart Presto respectively.

----End

Component Access to OBS When OBS Permission Control Is Enabled

Step 1 Log in to any node in a cluster as user **root** using the password set during cluster creation.

Step 2 Set environment variables (In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.).

source /opt/Bigdata/client/bigdata_env

Step 3 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

Example: **kinit admin**

Step 4 If the Kerberos authentication is disabled for the current cluster, run the following commands to log in. Note that you should create a user that belongs to the **supergroup** group by referring to **Creating a User** and replace *XXXX* with the username:

mkdir /home/XXXX

chown XXXX /home/XXXX

su - XXXX

Step 5 Access OBS. You do not need to configure the AK, SK, and endpoint. The OBS path format is **obs://buck_name/*XXX***.

Example: **hadoop fs -ls "obs://obs-example/job/hadoop-mapreduce-examples-3.1.2.jar"**

NOTE

- If you want to use **hadoop fs** to delete files on OBS, use **hadoop fs -rm -skipTrash** to delete the files.
- If data import is not involved when a table is created using spark-sql and spark-beeline, OBS will not be accessed. That is, if you create a table in an OBS directory on which you do not have permission, the **CREATE TABLE** operation will still be successful, but the error message "**403 AccessDeniedException**" is displayed when you insert data.

----End

Creating a Policy and an Agency on IAM

Step 1 Create a policy on IAM.

1. Log in to the IAM console.
2. Choose **Permissions**. On the displayed page, click **Create Custom Policy**.
3. Set parameters according to **Table 11-55**. Obtain the customized OBS policy samples that are frequently used by referring to .

Table 11-55 Policy parameters

Parameter	Description
Policy Name	Only letters, digits, spaces, and special characters (-_.,) are allowed.
Scope	Select **Global services**, because OBS is a global service.
Policy View	Select **Visual editor**.

Parameter	Description
Policy Content	1. **Allow**: Select **Allow**. 2. **Select service**: Select **Object Storage Service (OBS)**. 3. **Select action**: Select **WriteOnly**, **ReadOnly**, and **ListOnly**. 4. **Specific resources**: a. Set **object** to **Specify resource path**, click **Add Resource Path**, and enter *obs_bucket_name*/**tmp/** and *obs_bucket_name*/**tmp/***. The **/tmp** directory is used as an example. If you need to add permissions for other directories, perform the following steps to add the directories and resource paths of all objects in the directories. b. Set **bucket** to **Specify resource path**, click **Add Resource Path**, and enter *obs_bucket_name*. 5. (Optional) Add request condition, which does not need to be added currently.
Description	(Optional) Brief description about the policy.

NOTE

If the data write operation of each component is implemented in **rename** mode, the permission to delete objects must be configured when data is written.

4. Click **OK** to save the policy.

Step 2 Create an agency on IAM.

1. Log in to the IAM console.
2. Choose **Agencies**. On the displayed page, click **Create Agency**.
3. Set parameters according to **Table 11-56**.

Table 11-56 Agency parameters

Parameter	Description
Agency Name	Only letters, digits, spaces, and special characters (-_.,) are allowed.

Parameter	Description
Agency Type	Select **Common account**.
Delegated Account	Enter your cloud account, that is, the account you register using your mobile phone number. It cannot be a federated user or an IAM user created using your cloud account.
Validity Period	Set this parameter as required.
Description	(Optional) Brief description about the agency.
Permissions	1. In the **Project [Region]** column, locate the row where **OBS** is, click **Attach Policy**. 2. Select the policy created in **Step 1** to display it in **Selected Policies**. 3. Click **OK**.

4. Click **OK** to save the agency.

   NOTE

   If you modify an agency and policies bound to it after using the agency to access OBS, the modification will take effect within 15 minutes.

----End

11.14 Patch Operation Guide

11.14.1 Patch Operation Guide for Versions

If you obtain patch information from the following sources, upgrade the patch according to actual requirements.

- You obtain information about the patch released by MRS from a message pushed by the message center service.
- You obtain information about the patch by accessing the cluster and viewing patch information.

Preparing for Patch Installation

- Follow instructions in **Performing a Health Check** to check cluster status. If the cluster health status is normal, install a patch.
- You need to confirm the target patch to be installed according to the patch information in the patch content.

Installing a Patch

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patch Information** page, click **Install** in the **Operation** column to install the target patch.

NOTE

- For details about rolling patch operations, see **Supporting Rolling Patches**.
- For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

Uninstalling a Patch

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patch Information** page, click **Uninstall** in the **Operation** column to uninstall the target patch.

NOTE

- For details about rolling patch operations, see **Supporting Rolling Patches**.
- For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

11.14.2 Supporting Rolling Patches

The rolling patch function indicates that patches are installed or uninstalled for one or more services in a cluster by performing a rolling service restart (restarting services or instances in batches), without interrupting the services or within a minimized service interruption interval. Services in a cluster are divided into the following three types based on whether they support rolling patch:

- Services supporting rolling patch installation or uninstallation: All businesses or part of them (varying depending on different services) of the services are not interrupted during patch installation or uninstallation.
- Services not supporting rolling patch installation or uninstallation: Businesses of the services are interrupted during patch installation or uninstallation.
- Services with some roles supporting rolling patch installation or uninstallation: Some businesses of the services are not interrupted during patch installation or uninstallation.

Table 11-57 provides services and instances that support or do not support rolling restart in the MRS cluster.

Table 11-57 Services and instances that support or do not support rolling restart

Service	Instance	Whether to Support Rolling Restart
HDFS	NameNode	Yes
	ZKFC	
	JournalNode	
	HttpFS	
	DataNode	
Yarn	ResourceManager	Yes
	NodeManager	
Hive	MetaStore	Yes
	WebHCat	
	HiveServer	
MapReduce	JobHistoryServer	Yes
HBase	HMaster	Yes
	RegionServer	
	ThriftServer	
	RESTServer	
Spark	JobHistory	Yes
	JDBCServer	
	SparkResource	No
Hue	Hue	No
Tez	TezUI	No
Loader	Sqoop	No
ZooKeeper	QuorumPeer	Yes
Kafka	Broker	Yes
	MirrorMaker	No
Flume	Flume	Yes
	MonitorServer	
Storm	Nimbus	Yes
	UI	
	Supervisor	

Service	Instance	Whether to Support Rolling Restart
	LogViewer	

Installing a Patch

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patch Information** page, click **Install** in the **Operation** column.

Step 4 On the **Warning** page, enable or disable **Rolling Patch**.

NOTE

- Enabling the rolling patch installation function: Services are not stopped before patch installation, and rolling service restart is performed after the patch installation. This minimizes the impact on cluster services but takes more time than common patch installation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch installation function is not available in clusters with less than two Master nodes and three Core nodes.

Step 5 Click **OK** to install the target patch.

Step 6 View the patch installation progress.

1. Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.
2. Choose **System** > **Manage Patch**. On the **Manage Patch** page, you can view the patch installation progress.

NOTE

For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

Uninstalling a Patch

Step 1 Log in to the MRS management console.

Step 2 Choose **Clusters** > **Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

Step 3 On the **Patch Information** page, click **Uninstall** in the **Operation** column.

Step 4 On the **Warning** page, enable or disable **Rolling Patch**.

NOTE

- Enabling the rolling patch uninstallation function: Services are not stopped before patch uninstallation, and rolling service restart is performed after the patch uninstallation. This minimizes the impact on cluster services but takes more time than common patch uninstallation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch uninstallation function is not available in clusters with less than two Master nodes and three Core nodes.

Step 5 Click **OK** to uninstall the target patch.

Step 6 View the patch uninstallation progress.

1. Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.
2. Choose **System** > **Manage Patch**. On the **Manage Patch** page, you can view the patch uninstallation progress.

NOTE

For the isolated host nodes in the cluster, follow instructions in **Restoring Patches for the Isolated Hosts** to restore the patch.

----End

11.15 Restoring Patches for the Isolated Hosts

If some hosts are isolated in a cluster, perform the following operations to restore patches for these isolated hosts after patch installation on other hosts in the cluster. After patch restoration, versions of the isolated host nodes are consistent with those are not isolated.

Step 1 Access MRS Manager. For details, see **Accessing MRS Manager MRS 2.1.0 or Earlier)**.

Step 2 Choose **System** > **Manage Patch**. The **Manage Patch** page is displayed.

Step 3 In the **Operation** column, click **View Details**.

Step 4 On the patch details page, select host nodes whose **Status** is **Isolated**.

Step 5 Click **Select and Restore** to restore the isolated host nodes.

----End

11.16 Rolling Restart

After modifying the configuration items of a big data component, you need to restart the corresponding service to make new configurations take effect. If you use a normal restart mode, all services or instances are restarted concurrently, which may cause service interruption. To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling

restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted. Rolling restart takes longer than normal restart.

Table 11-58 provides services and instances that support or do not support rolling restart in the MRS cluster.

Table 11-58 Services and instances that support or do not support rolling restart

Service	Instance	Whether to Support Rolling Restart
HDFS	NameNode	Yes
	ZKFC	
	JournalNode	
	HttpFS	
	DataNode	
Yarn	ResourceManager	Yes
	NodeManager	
Hive	MetaStore	Yes
	WebHCat	
	HiveServer	
MapReduce	JobHistoryServer	Yes
HBase	HMaster	Yes
	RegionServer	
	ThriftServer	
	RESTServer	
Spark	JobHistory	Yes
	JDBCServer	
	SparkResource	No
Hue	Hue	No
Tez	TezUI	No
Loader	Sqoop	No
ZooKeeper	Quorumpeer	Yes
Kafka	Broker	Yes
	MirrorMaker	No
Flume	Flume	Yes

Service	Instance	Whether to Support Rolling Restart
	MonitorServer	
Storm	Nimbus	Yes
	UI	
	Supervisor	
	Logviewer	

Restrictions

- Perform a rolling restart during off-peak hours.
  - Otherwise, a rolling restart failure may occur. For example, if the throughput of Kafka is high (over 100 MB/s) during the Kafka rolling restart, the Kafka rolling restart may fail.
  - For example, if the requests per second of each RegionServer on the native interface exceed 10,000 during the HBase rolling restart, you need to increase the number of handles to prevent a RegionServer restart failure caused by heavy loads during the restart.
- Before the restart, check the number of current requests of HBase. If requests of each RegionServer on the native interface exceed 10,000, increase the number of handles to prevent a failure.
- If the number of Core nodes in a cluster is less than six, services may be affected for a short period of time.
- Preferentially perform a rolling instance or service restart and select **Only restart instances whose configurations have expired**.

Performing a Rolling Service Restart

Step 1 On MRS Manager, click **Services** and select a service for which you want to perform a rolling restart.

Step 2 On the **Service Status** tab page, click **More** and select **Perform Rolling Service Restart**.

Step 3 After you enter the administrator password, the **Perform Rolling Service Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.

Step 4 After the rolling restart task is complete, click **Finish**.

----End

Performing a Rolling Instance Restart

Step 1 On MRS Manager, click **Services** and select a service for which you want to perform a rolling restart.

Step 2 On the **Instance** tab page, select the instance to be restarted. Click **More** and select **Perform Rolling Instance Restart**.

Step 3 After you enter the administrator password, the **Perform Rolling Instance Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the instance.

Step 4 After the rolling restart task is complete, click **Finish**.

----End

Perform a Rolling Cluster Restart

Step 1 On MRS Manager, click **Services**. The **Services** page is displayed.

Step 2 Click **More** and select **Perform Rolling Cluster Restart**.

Step 3 After you enter the administrator password, the **Perform Rolling Cluster Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the cluster.

Step 4 After the rolling restart task is complete, click **Finish**.

----End

Rolling Restart Parameter Description

Table 11-59 describes rolling restart parameters.

Table 11-59 Rolling restart parameter description

Parameter	Description
Only restart instances whose configurations have expired	Specifies whether to restart only the modified instances in a cluster.
Data Node Instances to Be Batch Restarted	Specifies the number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is **1**. The value ranges from 1 to 20. This parameter is valid only for data nodes.
Batch Interval	Specifies the interval between two batches of instances for rolling restart. The default value is **0**. The value ranges from 0 to 2147483647. The unit is second. Note: Setting the batch interval parameter can increase the stability of the big data component process during the rolling restart. You are advised to set this parameter to a non-default value, for example, 10.
Batch Fault Tolerance Threshold	Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is **0**, which indicates that the rolling restart task ends after any batch of instances fails to be restarted. The value ranges from 0 to 214748364.

Procedure in a Typical Scenario

Step 1 On MRS Manager, click **Services** and select HBase. The HBase service page is displayed.

Step 2 Click the **Service Configuration** tab, and modify an HBase parameter. After the following dialog box is displayed, click **OK** to save the configurations.

NOTE

Do not select **Restart the affected services or instances**. This option indicates a normal restart. If you select this option, all services or instances will be restarted, which may cause service interruption.

Step 3 After saving the configurations, click **Finish**.

Step 4 Click the **Service Status** tab.

Step 5 On the **Service Status** tab page, click **More** and select **Perform Rolling Service Restart**.

Step 6 After you enter the administrator password, the **Perform Rolling Service Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.

Step 7 After the rolling restart task is complete, click **Finish**.

----End

12 MRS Cluster Component Operation Guide

12.1 Using Alluxio

12.1.1 Configuring an Underlying Storage System

If you want to use a unified client API and a global namespace to access persistent storage systems including HDFS and OBS to separate computing from storage, you can configure the underlying storage system of Alluxio on MRS Manager. After a cluster is created, the default underlying storage address is **hdfs://hacluster/**, that is, the HDFS root directory is mapped to Alluxio.

Prerequisites

- Alluxio has been installed in a cluster.
- The password of user **admin** has been obtained. The password of user **admin** is specified by the user during MRS cluster creation.

Configuring HDFS as the Underlying File System of Alluxio

NOTE

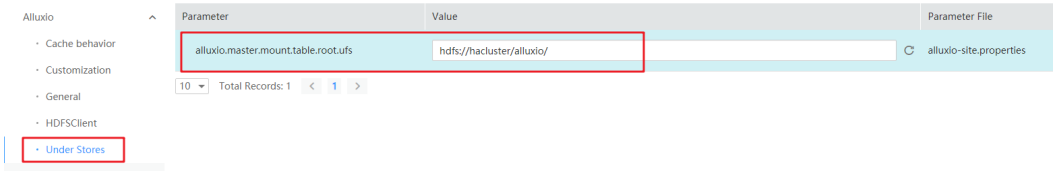
Security clusters with Kerberos authentication enabled do not support this function.

Step 1 Go to the **All Configurations** page of Alluxio. See **Modifying Cluster Service Configuration Parameters**.

Step 2 In the left pane, choose **Alluxio** > **Under Stores**, and modify the value of **alluxio.master.mount.table.root.ufs** to **hdfs://hacluster***/XXX/*.

For example, if you want to use *HDFS root directory*/**alluxio/** as the root directory of Alluxio, modify the value of **alluxio.master.mount.table.root.ufs** to **hdfs://hacluster/alluxio/**.

Figure 12-1 Configuring HDFS as the underlying file system of Alluxio



Step 3 Click **Save Configuration**. In the displayed dialog box, select **Restart the affected services or instances**.

Step 4 Click **OK** to restart Alluxio.

----End

12.1.2 Accessing Alluxio Using a Data Application

The port number used for accessing the Alluxio file system is 19998, and the access address is **alluxio://***<Master node IP address of Alluxio>***:19998/***<PATH>*. This section uses examples to describe how to access the Alluxio file system using data applications (Spark, Hive, Hadoop MapReduce, and Presto).

Using Alluxio as the Input and Output of a Spark Application

Step 1 Log in to the Master node in a cluster as user **root** using the password set during cluster creation.

Step 2 Run the following command to configure environment variables:

source /opt/client/bigdata_env

Step 3 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

Example: **kinit admin**

Step 4 Prepare an input file and copy local data to the Alluxio file system.

For example, prepare the input file **test_input.txt** in the local **/home** directory, and run the following command to save the **test_input.txt** file to Alluxio:

alluxio fs copyFromLocal /home/test_input.txt /input

Step 5 Run the following commands to start **spark-shell**:

spark-shell

Step 6 Run the following commands in spark-shell:

val s = sc.textFile("alluxio://<*Name of the Alluxio node*>:19998/input")

val double = s.map(line => line + line)

double.saveAsTextFile("alluxio://<*Name of the Alluxio node*>:19998/output")

NOTE

Replace ***Name of the Alluxio node*****:19998** with the actual node name and port numbers of all nodes where the AlluxioMaster instance is deployed. Use commas (,) to separate the node name and port number, for example, **node-ana-coremspb.mrs-m0va.com:19998,node-master2kiww.mrs-m0va.com:19998,node-master1cqwv.mrs-m0va.com:19998**.

Step 7 Press **Ctrl+C** to exit spark-shell.

Step 8 Run the **alluxio fs ls /** command to check whether the output directory **/output** containing double content of the input file exists in the root directory of Alluxio.

----End

Creating a Hive Table on Alluxio

Step 1 Log in to the Master node in a cluster as user **root** using the password set during cluster creation.

Step 2 Run the following command to configure environment variables:

source /opt/client/bigdata_env

Step 3 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

Example: **kinit admin**

Step 4 Prepare an input file. For example, prepare the **hive_load.txt** input file in the local **/home** directory. The file content is as follows:

```
1, Alice, company A
2, Bob, company B
```

Step 5 Run the following command to import the **hive_load.txt** file to Alluxio:

alluxio fs copyFromLocal /home/hive_load.txt /hive_input

Step 6 Run the following command to start the Hive beeline:

beeline

Step 7 Run the following commands in beeline to create a table based on the input file in Alluxio:

CREATE TABLE u_user(id INT, name STRING, company STRING) ROW FORMAT DELIMITED FIELDS TERMINATED BY ',' STORED AS TEXTFILE;

LOAD DATA INPATH 'alluxio://<*Name of the Alluxio node*>:19998/hive_input' INTO TABLE u_user;

NOTE

Replace ***Name of the Alluxio node*****:19998** with the actual node name and port numbers of all nodes where the AlluxioMaster instance is deployed. Use commas (,) to separate the node name and port number, for example, **node-ana-coremspb.mrs-m0va.com:19998,node-master2kiww.mrs-m0va.com:19998,node-master1cqwv.mrs-m0va.com:19998**.

Step 8 Run the following command to view the created table:

select * from u_user;

----End

Running Hadoop Wordcount in Alluxio

Step 1 Log in to the Master node in a cluster as user **root** using the password set during cluster creation.

Step 2 Run the following command to configure environment variables:

source /opt/client/bigdata_env

Step 3 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

Example: **kinit admin**

Step 4 Prepare an input file and copy local data to the Alluxio file system.

For example, prepare the input file **test_input.txt** in the local **/home** directory, and run the following command to save the **test_input.txt** file to Alluxio:

alluxio fs copyFromLocal /home/test_input.txt /input

Step 5 Run the following command to execute the wordcount job:

yarn jar /opt/share/hadoop-mapreduce-examples-<*Hadoop version*>-mrs-<*MRS cluster version*>/hadoop-mapreduce-examples-<*Hadoop version*>-mrs-<*MRS cluster version*>.jar wordcount alluxio://<*Name of the Alluxio node*>:19998/input alluxio://<*Name of the Alluxio node*>:19998/output

NOTE

- Replace **<*Hadoop version*>** with the actual one.
- Replace **<*MRS cluster version*>** with the major version of MRS. For example, for a cluster of MRS 1.9.2, mrs-1.9.0 is used.
- Replace ***Name of the Alluxio node*>:19998** with the actual node name and port numbers of all nodes where the AlluxioMaster instance is deployed. Use commas (,) to separate the node name and port number, for example, **node-ana-coremspb.mrs-m0va.com:19998,node-master2kiww.mrs-m0va.com:19998,node-master1cqwv.mrs-m0va.com:19998**.

Step 6 Run the **alluxio fs ls /** command to check whether the output directory **/output** containing the wordcount result exists in the root directory of Alluxio.

----End

Using Presto to Query Tables in Alluxio

Step 1 Log in to the Master node in a cluster as user **root** using the password set during cluster creation.

Step 2 Run the following command to configure environment variables:

source /opt/client/bigdata_env

Step 3 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

Example: **kinit admin**

Step 4 Run the following commands to start Hive Beeline to create a table on Alluxio.

beeline

CREATE TABLE u_user (id int, name string, company string) ROW FORMAT DELIMITED FIELDS TERMINATED BY ',' LOCATION 'alluxio://<*Name of the Alluxio node*>:19998/u_user';

insert into u_user values(1,'Alice','Company A'),(2, 'Bob', 'Company B');

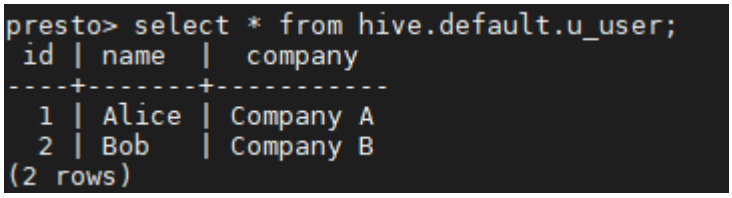
NOTE

Replace ***Name of the Alluxio node*>:19998** with the actual node name and port numbers of all nodes where the AlluxioMaster instance is deployed. Use commas (,) to separate the node name and port number, for example, **node-ana-coremspb.mrs-m0va.com:19998,node-master2kiww.mrs-m0va.com:19998,node-master1cqwv.mrs-m0va.com:19998**.

Step 5 Start the Presto client. For details, see **Step 2** to **Step 8** in **Using a Client to Execute Query Statements**.

Step 6 On the Presto client, run the **select * from hive.default.u_user;** statement to query the table created in Alluxio:

Figure 12-2 Using Presto to query the table created in Alluxio



----End

12.1.3 Common Operations of Alluxio

Preparations

1. Create a cluster with Alluxio installed.
2. Log in to the active Master node in a cluster as user **root** using the password set during cluster creation.
3. Run the following command to configure environment variables:

   source /opt/client/bigdata_env

Using the Alluxio Shell

The **Alluxio shell** contains multiple command line operations that interact with Alluxio.

- View a file system operation command list:

  alluxio fs

- Run the **ls** command to list the files in Alluxio. For example, list all files in the root directory:

  alluxio fs ls /

- Run the **copyFromLocal** command to copy local files to Alluxio:

  alluxio fs copyFromLocal /home/test_input.txt /test_input.txt

  Command output:

  ```
  Copied file:///home/test_input.txt to /test_input.txt
  ```

- Run the **ls** command again to list the files in Alluxio. The copied **test_input.txt** file is listed:

  alluxio fs ls /

  Command output:

  ```
  12      PERSISTED 11-28-2019 17:10:17:449 100% /test_input.txt
  ```

  The **test_input.txt** file is displayed in Alluxio. The parameters in the file indicate the file size, whether the file is persistent, creation date, cache ratio of the file in Alluxio, and file name.

- Run the **cat** command to print file content:

  alluxio fs cat /test_input.txt

  Command output:

  ```
  Test Alluxio
  ```

Mounting Function of Alluxio

Alluxio uses a unified namespace feature to unify the access to storage systems. For details, see **https://docs.alluxio.io/os/user/2.0/en/advanced/Namespace-Management.html**.

This feature allows users to mount different storage systems to an Alluxio namespace and seamlessly access files across storage systems through the Alluxio namespace.

1. Create a directory as a mount point in Alluxio.

   alluxio fs mkdir /mnt

   ```
   Successfully created directory /mnt
   ```

2. Mount an existing OBS file system to Alluxio. (Prerequisite: An agency with the **OBS OperateAccess** permission has been configured for the cluster. The **obs-mrstest** file system is used as an example. Replace the file system name with the actual one.

   alluxio fs mount /mnt/obs obs://obs-mrstest/data

   ```
   Mounted obs://obs-mrstest/data at /mnt/obs
   ```

3. List files in the OBS file system using the Alluxio namespace. Run the **ls** command to list the files in the OBS mount directory.

   alluxio fs ls /mnt/obs

   ```
   38      PERSISTED 11-28-2019 17:42:54:554   0% /mnt/obs/hive_load.txt
   12      PERSISTED 11-28-2019 17:43:07:743   0% /mnt/obs/test_input.txt
   ```

You can also view the newly mounted files and directories on the Alluxio web UI.

4. After the mounting is complete, you can seamlessly exchange data between different storage systems through the unified namespace of Alluxio. For example, run the **ls -R** command to list all files in a directory recursively:

   alluxio fs ls -R /

   ```
         0       PERSISTED 11-28-2019 11:15:19:719  DIR /app-logs
         1       PERSISTED 11-28-2019 11:18:36:885  DIR /apps
         1       PERSISTED 11-28-2019 11:18:40:209  DIR /apps/templeton
   239440292       PERSISTED 11-28-2019 11:18:40:209   0% /apps/templeton/hive.tar.gz
   .....
         1       PERSISTED 11-28-2019 19:00:23:879  DIR /mnt
         2       PERSISTED 11-28-2019 19:00:23:879  DIR /mnt/obs
        38       PERSISTED 11-28-2019 17:42:54:554   0% /mnt/obs/hive_load.txt
        12       PERSISTED 11-28-2019 17:43:07:743   0% /mnt/obs/test_input.txt
   .....
   ```

   The command output shows all files that are from the mounted storage system in the root directory of the Alluxio file system (the default directory is the HDFS root directory, that is, **hdfs://hacluster/**). The **/app-logs** and **/apps** directories are in HDFS, and the **/mnt/obs/** directory is in OBS.

Using Alluxio to Accelerate Data Access

Alluxio can accelerate data access, because it uses memory to store data. Example commands are provided as follows:

1. Upload the **test_data.csv** file (a sample that records recipes) to the **/data** directory of the **obs-mrstest** file system. Run the **ls** command to display the file status.

   alluxio fs ls /mnt/obs/test_data.csv

   ```
   294520189       PERSISTED 11-28-2019 19:38:55:000   0% /mnt/obs/test_data.csv
   ```

   The output indicates that the cache percentage of the file in Alluxio is 0%, that is, the file is not in Alluxio memory.

2. Count the occurrence times of the word "milk" in the file, and calculate the time consumed.

   time alluxio fs cat /mnt/obs/test_data.csv | grep -c milk

   ```
   52180

   real    0m10.765s
   user    0m5.540s
   sys     0m0.696s
   ```

3. Data is stored in memory after being read for the first time. When Alluxio reads data again, the data access speed is increased. For example, after running the **cat** command to obtain a file, run the **ls** command to check the file status.

   alluxio fs ls /mnt/obs/test_data.csv

   ```
   294520189       PERSISTED 11-28-2019 19:38:55:000 100% /mnt/obs/test_data.csv
   ```

   The output shows that the file has been fully loaded to Alluxio.

4. Access the file again, count the occurrence times of the word "eggs", and calculate the time consumed.

   time alluxio fs cat /mnt/obs/test_data.csv | grep -c eggs

   ```
   59510

   real    0m5.777s
   ```

```
user    0m5.992s
sys     0m0.592s
```

According to the comparison of the two time consumption records, the time consumed for accessing data stored in Alluxio memory is significantly reduced.

12.2 Using CarbonData (for Versions Earlier Than MRS 3.x)

12.2.1 Using CarbonData from Scratch

This section is for MRS 3.x or earlier. For MRS 3.x or later, see **Using CarbonData (for MRS 3.x or Later)**.

This section describes the procedure of using Spark CarbonData. All tasks are based on the Spark-beeline environment. The tasks include:

1. Connecting to Spark

   Before performing any operation on CarbonData, users must connect CarbonData to Spark.
2. Creating a CarbonData table

   After connecting to Spark, users must create a CarbonData table to load and query data.
3. Loading data to the CarbonData table

   Users load data from CSV files in HDFS to the CarbonData table.
4. Querying data from the CarbonData table

   After data is loaded to the CarbonData table, users can run query commands such as **groupby** and **where**.

Prerequisites

A client has been installed. For details, see **Using an MRS Client**.

Procedure

Step 1 Connect CarbonData to Spark.

1. Prepare a client based on service requirements and use user **root** to log in to the node where the client is installed.

   For example, if you have updated the client on the Master2 node, log in to the Master2 node to use the client. For details, see **Using an MRS Client**.
2. Run the following commands to switch the user and configure environment variables:

   sudo su - omm

   source /opt/client/bigdata_env
3. For clusters with Kerberos authentication enabled, run the following command to authenticate the user. For clusters with Kerberos authentication disabled, skip this step.

kinit *Spark username*

NOTE

The user needs to be added to user groups **hadoop** (primary group) and **hive**.

4. Run the following command to connect to the Spark environment.

   spark-beeline

Step 2 Create a CarbonData table.

Run the following command to create a CarbonData table, which is used to load and query data.

CREATE TABLE x1 (imei string, deviceInformationId int, mac string, productdate timestamp, updatetime timestamp, gamePointId double, contractNumber double)

STORED BY 'org.apache.carbondata.format'

TBLPROPERTIES ('DICTIONARY_EXCLUDE'='mac','DICTIONARY_INCLUDE'='deviceInformationId');

The command output is as follows:

```
+---------+--+
| result  |
+---------+--+
+---------+--+
No rows selected (1.551 seconds)
```

Step 3 Load data from CSV files to the CarbonData table.

Run the command to load data from CSV files based on the required parameters. Only CSV files are supported. The CSV column name and sequence configured in the **LOAD** command must be consistent with those in the CarbonData table. The data formats and number of data columns in the CSV files must also be the same as those in the CarbonData table.

The CSV files must be stored on HDFS. You can upload the files to OBS and import them from OBS to HDFS on the **Files** page of the MRS console.

If Kerberos authentication is enabled, prepare the CSV files in the work environment and import them to HDFS using open-source HDFS commands. In addition, assign the Spark user with the read and execute permissions of the files on HDFS by referring to **5**.

For example, the **data.csv** file is saved in the **tmp** directory of HDFS with the following contents:

```
x123,111,dd,2017-04-20 08:51:27,2017-04-20 07:56:51,2222,33333
```

The command for loading data from that file is as follows:

LOAD DATA inpath 'hdfs://hacluster/tmp/data.csv' into table x1 options('DELIMITER'=',','QUOTECHAR'='"','FILEHEADER'='imei,deviceinformationid,mac,productdate,updatetime,gamepointid,contractnumber');

The command output is as follows:

```
+---------+--+
| Result  |
+---------+--+
+---------+--+
No rows selected (3.039 seconds)
```

Step 4 Query data from the CarbonData.

- **Obtaining the number of records**

  Run the following command to obtain the number of records in the CarbonData table:

  select count(*) from x1;

- **Querying with the groupby condition**

  Run the following command to obtain the **deviceinformationid** records without repetition in the CarbonData table:

  select deviceinformationid,count (distinct deviceinformationid) from x1 group by deviceinformationid;

- **Querying with the where condition**

  Run the following command to obtain specific **deviceinformationid** records:

  select * from x1 where deviceinformationid='111';

Step 5 Run the following command to exit the Spark environment.

!quit

----End

12.2.2 About CarbonData Table

Description

CarbonData tables are similar to tables in the relational database management system (RDBMS). RDBMS tables consist of rows and columns to store data. CarbonData tables have fixed columns and also store structured data. In CarbonData, data is saved in entity files.

Supported Data Types

CarbonData tables support the following data types:

- Int
- String
- BigInt
- Decimal
- Double
- TimeStamp

Table 12-1 describes the details about each data type.

Table 12-1 CarbonData data types

Data Type	Description
Int	4-byte signed integer ranging from -2,147,483,648 to 2,147,483,647 **NOTE** If a non-dictionary column is of the **int** data type, it is internally stored as the **BigInt** type.
String	The maximum character string length is 100000.
BigInt	Data is saved using the 64-bit technology. The value ranges from -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
Decimal	The default value is (10,0) and maximum value is (38,38). **NOTE** When query with filters, append **BD** to the number to achieve accurate results. For example, **select * from carbon_table where num = 1234567890123456.22BD**.
Double	Data is saved using the 64-bit technology. The value ranges from 4.9E-324 to 1.7976931348623157E308.
TimeStamp	**yyyy-MM-dd HH:mm:ss** format is used by default.

NOTE

Measurement of all Integer data is processed and displayed using the **BigInt** data type.

12.2.3 Creating a CarbonData Table

Scenario

A CarbonData table must be created to load and query data.

Creating a Table with Self-Defined Columns

Users can create a table by specifying its columns and data types. For analysis clusters with Kerberos authentication enabled, if a user wants to create a CarbonData table in a database other than the **default** database, the **Create** permission of the database must be added to the role to which the user is bound in Hive role management.

Sample command:

CREATE TABLE IF NOT EXISTS productdb.productSalesTable (

productNumber Int,

productName String,

storeCity String,

storeProvince String,

revenue Int)

STORED BY 'org.apache.carbondata.format'

TBLPROPERTIES (

'table_blocksize'='128',

'DICTIONARY_EXCLUDE'='productName',

'DICTIONARY_INCLUDE'='productNumber');

The following table describes parameters of preceding commands.

Table 12-2 Parameter description

Parameter	Description
productSalesTable	Table name. The table is used to load data for analysis. The table name consists of letters, digits, and underscores (_).
productdb	Database name. The database maintains logical connections with tables stored in it to identify and manage the tables. The database name consists of letters, digits, and underscores (_).
productNumber productName storeCity storeProvince revenue	Columns in the table. The columns are service entities for data analysis. The column name (field name) consists of letters, digits, and underscores (_). **NOTE** In CarbonData, you cannot configure a column's NOT NULL or default value, or the primary key of the table.
table_blocksize	Block size of data files used by the CarbonData table. The value ranges from 1 MB to 2048 MB. The default is 1024 MB. ● If the value of **table_blocksize** is too small, a large number of small files will be generated when data is loaded. This may affect the performance in using HDFS. ● If the value of **table_blocksize** is too large, a large volume of data must be read from a block and the read concurrency is low when data is queried. As a result, the query performance deteriorates. You are advised to set the block size based on the data volume. For example, set the block size to 256 MB for GB-level data, 512 MB for TB-level data, and 1024 MB for PB-level data.

Parameter	Description
DICTIONARY_EXCLUDE	Specifies the columns that do not generate dictionaries. This function is optional and applicable to columns of high complexity. By default, the system generates dictionaries for columns of the String type. However, as the number of values in the dictionaries increases, conversion operations by the dictionaries increase and the system performance deteriorates. Generally, if a column has over 50,000 unique data records, it is considered as a highly complex column and dictionary generation must be disabled. **NOTE** Non-dictionary columns support only the String and Timestamp data types.
DICTIONARY_INCLUDE	Specifies the columns that generate dictionaries. This function is optional and applicable to columns of low complexity. It improves the performance of queries with the **groupby** condition. Generally, the complexity of a dictionary column cannot exceed 50,000.

12.2.4 Deleting a CarbonData Table

Scenario

Unused CarbonData tables can be deleted. After a CarbonData table is deleted, its metadata and loaded data are deleted together.

Procedure

Step 1 Run the following command to delete a CarbonData table:

DROP TABLE *[IF EXISTS] [db_name.]table_name*;

db_name is optional. If **db_name** is not specified, the table named **table_name** in the current database is deleted.

For example, run the following command to delete the **productSalesTable** table in the **productdb** database:

DROP TABLE productdb.productSalesTable;

Step 2 Run the following command to confirm that the table is deleted:

SHOW TABLES;

----End

12.3 Using CarbonData (for MRS 3.x or Later)

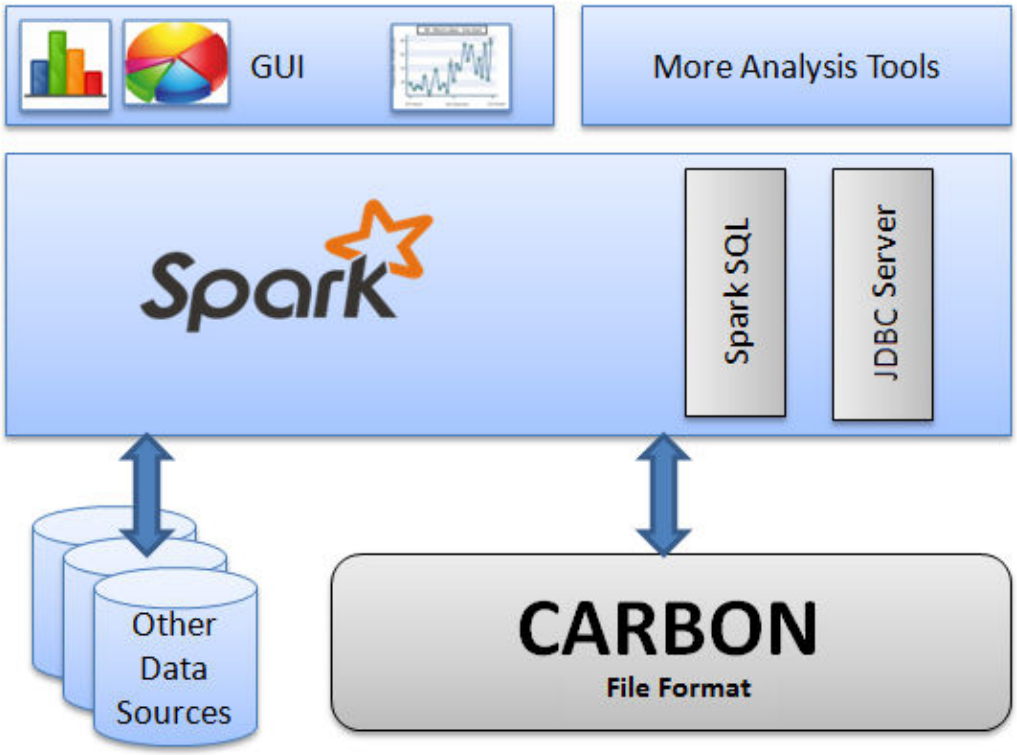
12.3.1 Overview

This section is for MRS 3.x or later. For MRS 3.x or earlier, see **Using CarbonData (for Versions Earlier Than MRS 3.x)**.

12.3.1.1 CarbonData Overview

CarbonData is a new Apache Hadoop native data-store format. CarbonData allows faster interactive queries over PetaBytes of data using advanced columnar storage, index, compression, and encoding techniques to improve computing efficiency. In addition, CarbonData is also a high-performance analysis engine that integrates data sources with Spark.

Figure 12-3 Basic architecture of CarbonData



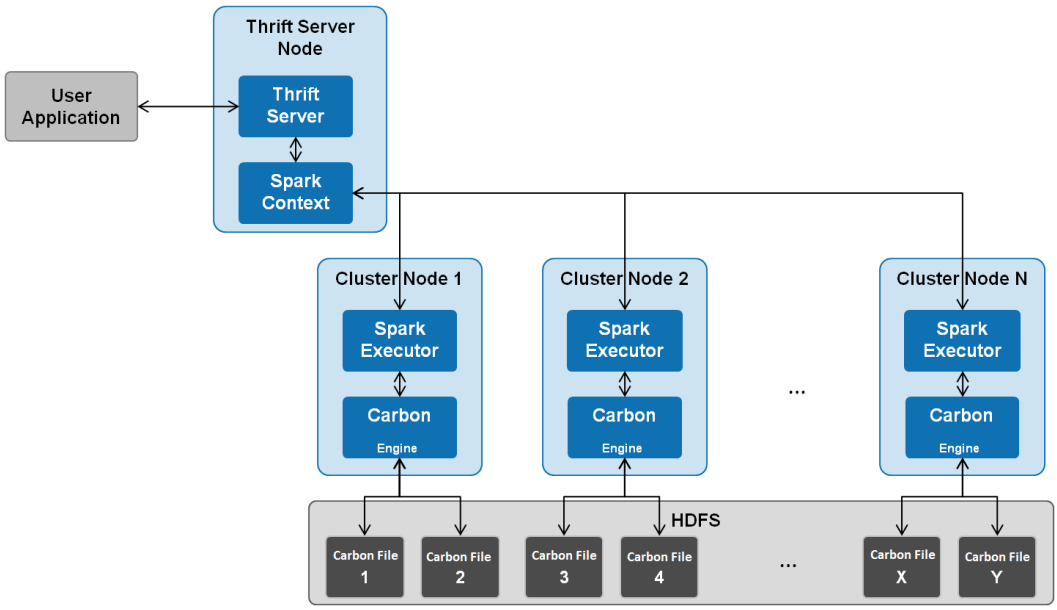
The purpose of using CarbonData is to provide quick response to ad hoc queries of big data. Essentially, CarbonData is an Online Analytical Processing (OLAP) engine, which stores data by using tables similar to those in Relational Database Management System (RDBMS). You can import more than 10 TB data to tables created in CarbonData format, and CarbonData automatically organizes and stores data using the compressed multi-dimensional indexes. After data is loaded to CarbonData, CarbonData responds to ad hoc queries in seconds.

CarbonData integrates data sources into the Spark ecosystem and you can query and analyze the data using Spark SQL. You can also use the third-party tool JDBCServer provided by Spark to connect to SparkSQL.

Topology of CarbonData

CarbonData runs as a data source inside Spark. Therefore, CarbonData does not start any additional processes on nodes in clusters. CarbonData engine runs inside the Spark executor.

Figure 12-4 Topology of CarbonData



Data stored in CarbonData Table is divided into several CarbonData data files. Each time when data is queried, CarbonData Engine reads and filters data sets. CarbonData Engine runs as a part of the Spark Executor process and is responsible for handling a subset of data file blocks.

Table data is stored in HDFS. Nodes in the same Spark cluster can be used as HDFS data nodes.

CarbonData Features

- SQL: CarbonData is compatible with Spark SQL and supports SQL query operations performed on Spark SQL.
- Simple Table dataset definition: CarbonData allows you to define and create datasets by using user-friendly Data Definition Language (DDL) statements. CarbonData DDL is flexible and easy to use, and can define complex tables.
- Easy data management: CarbonData provides various data management functions for data loading and maintenance. CarbonData supports bulk loading of historical data and incremental loading of new data. Loaded data can be deleted based on load time and a specific loading operation can be undone.
- CarbonData file format is a columnar store in HDFS. This format has many new column-based file storage features, such as table splitting and data compression. CarbonData has the following characteristics:
  - Stores data along with index: Significantly accelerates query performance and reduces the I/O scans and CPU resources, when there are filters in the query. CarbonData index consists of multiple levels of indices. A

processing framework can leverage this index to reduce the task that needs to be schedules and processed, and it can also perform skip scan in more finer grain unit (called blocklet) in task side scanning instead of scanning the whole file.

- Operable encoded data: Through supporting efficient compression, CarbonData can query on compressed/encoded data. The data can be converted just before returning the results to the users, which is called late materialized.
- Support for various use cases with one single data format: like interactive OLAP-style query, sequential access (big scan), and random access (narrow scan).

Key Technologies and Advantages of CarbonData

- Quick query response: CarbonData features high-performance query. The query speed of CarbonData is 10 times of that of Spark SQL. It uses dedicated data formats and applies multiple index technologies and multiple push-down optimizations, providing quick response to TB-level data queries.
- Efficient data compression: CarbonData compresses data by combining the lightweight and heavyweight compression algorithms. This significantly saves 60% to 80% data storage space and the hardware storage cost.

12.3.1.2 Main Specifications of CarbonData

Main Specifications of CarbonData

Table 12-3 Main Specifications of CarbonData

Entity	Tested Value	Test Environment
Number of tables	10000	3 nodes. 4 vCPUs and 20 GB memory for each executor. Driver memory: 5 GB, 3 executors. Total columns: 107 String: 75 Int: 13 BigInt: 7 Timestamp: 6 Double: 6
Number of table columns	2000	3 nodes. 4 vCPUs and 20 GB memory for each executor. Driver memory: 5 GB, 3 executors.
Maximum size of a raw CSV file	200 GB	17 cluster nodes. 150 GB memory and 25 vCPUs for each executor. Driver memory: 10 GB, 17 executors.

Entity	Tested Value	Test Environment
Number of CSV files in each folder	100 folders. Each folder has 10 files. The size of each file is 50 MB.	3 nodes. 4 vCPUs and 20 GB memory for each executor. Driver memory: 5 GB, 3 executors.
Number of load folders	10000	3 nodes. 4 vCPUs and 20 GB memory for each executor. Driver memory: 5 GB, 3 executors.

The memory required for data loading depends on the following factors:

- Number of columns
- Column values
- Concurrency (configured using **carbon.number.of.cores.while.loading**)
- Sort size in memory (configured using **carbon.sort.size**)
- Intermediate cache (configured using **carbon.graph.rowset.size**)

Data loading of an 8 GB CSV file that contains 10 million records and 300 columns with each row size being about 0.8 KB requires about 10 GB executor memory. That is, set **carbon.sort.size** to **100000** and retain the default values for other parameters.

Table Specifications

Table 12-4 Table specifications

Entity	Tested Value
Number of secondary index tables	10
Number of composite columns in a secondary index table	5
Length of column name in a secondary index table (unit: character)	120
Length of a secondary index table name (unit: character)	120
Cumulative length of all secondary index table names + column names in an index table* (unit: character)	3800**

NOTE

- * Characters of column names in an index table refer to the upper limit allowed by Hive or the upper limit of available resources.
- ** Secondary index tables are registered using Hive and stored in HiveSERDEPROPERTIES in JSON format. The value of **SERDEPROPERTIES** supported by Hive can contain a maximum of 4,000 characters and cannot be changed.

12.3.2 Configuration Reference

This section provides the details of all the configurations required for the CarbonData System.

Table 12-5 System configurations in **carbon.properties**

Parameter	Default Value	Description
carbon.ddl.base.hdfs.url	hdfs://hacluster/opt/data	HDFS relative path from the HDFS base path, which is configured in **fs.defaultFS**. The path configured in **carbon.ddl.base.hdfs.url** will be appended to the HDFS path configured in **fs.defaultFS**. If this path is configured, you do not need to pass the complete path while dataload. For example, if the absolute path of the CSV file is **hdfs://10.18.101.155:54310/data/cnbc/2016/xyz.csv**, the path **hdfs://10.18.101.155:54310** will come from property **fs.defaultFS** and you can configure **/data/cnbc/** as **carbon.ddl.base.hdfs.url**. During data loading, you can specify the CSV path as **/2016/xyz.csv**.
carbon.badRecords.location	-	Storage path of bad records. This path is an HDFS path. The default value is **Null**. If bad records logging or bad records operation redirection is enabled, the path must be configured by the user.
carbon.bad.records.action	fail	The following are four types of actions for bad records: **FORCE**: Data is automatically corrected by storing the bad records as NULL. **REDIRECT**: Bad records are written to the raw CSV instead of being loaded. **IGNORE**: Bad records are neither loaded nor written to the raw CSV. **FAIL**: Data loading fails if any bad records are found.

Parameter	Default Value	Description
carbon.update.sync.folder	/tmp/carbondata	Specifies the **modifiedTime.mdt** file path. You can set it to an existing path or a new path. **NOTE** If you set this parameter to an existing path, ensure that all users can access the path and the path has the 777 permission.

Table 12-6 Performance configurations in **carbon.properties**

Parameter	Default Value	Description
Data Loading Configuration		
carbon.sort.file.write.buffer.size	16384	CarbonData sorts data and writes it to a temporary file to limit memory usage. This parameter controls the size of the buffer used for reading and writing temporary files. The unit is bytes. The value ranges from 10240 to 10485760.
carbon.graph.rowset.size	100,000	Rowset size exchanged in data loading graph steps. The value ranges from 500 to 1,000,000.
carbon.number.of.cores.while.loading	6	Number of cores used during data loading. The greater the number of cores, the better the compaction performance. If the CPU resources are sufficient, you can increase the value of this parameter.
carbon.sort.size	500000	Number of records to be sorted
carbon.enableXXHash	true	Hashmap algorithm used for hashkey calculation
carbon.number.of.cores.block.sort	7	Number of cores used for sorting blocks during data loading
carbon.max.driver.lru.cache.size	-1	Maximum size of LRU caching for data loading at the driver side. The unit is MB. The default value is **-1**, indicating that there is no memory limit for the caching. Only integer values greater than 0 are accepted.
carbon.max.executor.lru.cache.size	-1	Maximum size of LRU caching for data loading at the executor side. The unit is MB. The default value is **-1**, indicating that there is no memory limit for the caching. Only integer values greater than 0 are accepted. If this parameter is not configured, the value of **carbon.max.driver.lru.cache.size** is used.

Parameter	Default Value	Description
carbon.merge.sort.prefetch	true	Whether to enable prefetch of data during merge sort while reading data from sorted temp files in the process of data loading
carbon.update.persist.enable	true	Configuration to enable the dataset of RDD/dataframe to persist data. Enabling this will reduce the execution time of UPDATE operation.
enable.unsafe.sort	true	Whether to use unsafe sort during data loading. Unsafe sort reduces the garbage collection during data load operation, resulting in better performance. The default value is **true**, indicating that unsafe sort is enabled.
enable.offheap.sort	true	Whether to use off-heap memory for sorting of data during data loading
offheap.sort.chunk.size.inmb	64	Size of data chunks to be sorted, in MB. The value ranges from 1 to 1024.
carbon.unsafe.working.memory.in.mb	512	Size of the unsafe working memory. This will be used for sorting data and storing column pages. The unit is MB. Memory required for data loading: carbon.number.of.cores.while.loading [default value is 6] x Number of tables to load in parallel x offheap.sort.chunk.size.inmb [default value is 64 MB] + carbon.blockletgroup.size.in.mb [default value is 64 MB] + Current compaction ratio [64 MB/3.5]) = Around 900 MB per table Memory required for data query: (SPARK_EXECUTOR_INSTANCES. [default value is 2] x (carbon.blockletgroup.size.in.mb [default value: 64 MB] + carbon.blockletgroup.size.in.mb [default value = 64 MB x 3.5) x Number of cores per executor [default value: 1]) = ~ 600 MB
carbon.sort.inmemory.storage.size.in.mb	512	Size of the intermediate sort data to be kept in the memory. Once the specified value is reached, the system writes data to the disk. The unit is MB.

Parameter	Default Value	Description
sort.inmemory.size.inmb	1024	Size of the intermediate sort data to be kept in the memory. Once the specified value is reached, the system writes data to the disk. The unit is MB. If **carbon.unsafe.working.memory.in.mb** and **carbon.sort.inmemory.storage.size.in.mb** are configured, you do not need to set this parameter. If this parameter has been configured, 20% of the memory is used for working memory **carbon.unsafe.working.memory.in.mb**, and 80% is used for sort storage memory **carbon.sort.inmemory.storage.size.in.mb**. **NOTE** The value of **spark.yarn.executor.memoryOverhead** configured for Spark must be greater than the value of **sort.inmemory.size.inmb** configured for CarbonData. Otherwise, Yarn might stop the executor if off-heap access exceeds the configured executor memory.
carbon.blockletgroup.size.in.mb	64	The data is read as a group of blocklets which are called blocklet groups. This parameter specifies the size of each blocklet group. Higher value results in better sequential I/O access. The minimum value is 16 MB. Any value less than 16 MB will be reset to the default value (64 MB). The unit is MB.
enable.inmemory.merge.sort	false	Whether to enable **inmemorymerge sort**.
use.offheap.in.query.processing	true	Whether to enable **offheap** in query processing.
carbon.load.sort.scope	local_sort	Sort scope for the load operation. There are two types of sort: **batch_sort** and **local_sort**. If **batch_sort** is selected, the loading performance is improved but the query performance is reduced.
carbon.batch.sort.size.inmb	-	Size of data to be considered for batch sorting during data loading. The recommended value is less than 45% of the total sort data. The unit is MB. **NOTE** If this parameter is not set, its value is about 45% of the value of **sort.inmemory.size.inmb** by default.
enable.unsafe.columnpage	true	Whether to keep page data in heap memory during data loading or query to prevent garbage collection bottleneck.

Parameter	Default Value	Description
carbon.use.local.dir	false	Whether to use Yarn local directories for multi-disk data loading. If this parameter is set to **true**, Yarn local directories are used to load multi-disk data to improve data loading performance.
carbon.use.multiple.temp.dir	false	Whether to use multiple temporary directories for storing temporary files to improve data loading performance.
carbon.load.datamaps.parallel.db_name.table_name	N/A	The value can be **true** or **false**. You can set the database name and table name to improve the first query performance of the table.
Compaction Configuration		
carbon.number.of.cores.while.compacting	2	Number of cores to be used while compacting data. The greater the number of cores, the better the compaction performance. If the CPU resources are sufficient, you can increase the value of this parameter.
carbon.compaction.level.threshold	4,3	This configuration is for minor compaction which decides how many segments to be merged. For example, if this parameter is set to **2,3**, minor compaction is triggered every two segments. **3** is the number of level 1 compacted segments which is further compacted to new segment. The value ranges from 0 to 100.
carbon.major.compaction.size	1024	Major compaction size. Sum of the segments which is below this threshold will be merged. The unit is MB.
carbon.horizontal.compaction.enable	true	Whether to enable/disable horizontal compaction. After every DELETE and UPDATE statement, horizontal compaction may occur in case the incremental (DELETE/ UPDATE) files becomes more than specified threshold. By default, this parameter is set to **true**. You can set this parameter to **false** to disable horizontal compaction.
carbon.horizontal.update.compaction.threshold	1	Threshold limit on number of UPDATE delta files within a segment. In case the number of delta files goes beyond the threshold, the UPDATE delta files within the segment becomes eligible for horizontal compaction and are compacted into single UPDATE delta file. By default, this parameter is set to **1**. The value ranges from **1** to **10000**.

Parameter	Default Value	Description
carbon.horizontal.delete.compaction.threshold	1	Threshold limit on number of DELETE incremental files within a block of a segment. In case the number of incremental files goes beyond the threshold, the DELETE incremental files for the particular block of the segment becomes eligible for horizontal compaction and are compacted into single DELETE incremental file. By default, this parameter is set to **1**. The value ranges from **1** to **10000**.
Query Configuration		
carbon.number.of.cores	4	Number of cores to be used during query
carbon.limit.block.distribution.enable	false	Whether to enable the CarbonData distribution for limit query. The default value is **false**, indicating that block distribution is disabled for query statements that contain the keyword limit. For details about how to optimize this parameter, see **Configurations for Performance Tuning**.
carbon.custom.block.distribution	false	Whether to enable Spark or CarbonData block distribution. By default, the value is **false**, indicating that Spark block distribution is enabled. To enable CarbonData block distribution, change the value to **true**.
carbon.infilter.subquery.pushdown.enable	false	If this is set to **true** and a Select query is triggered in the filter with subquery, the subquery is executed and the output is broadcast as IN filter to the left table. Otherwise, SortMergeSemiJoin is executed. You are advised to set this to **true** when IN filter subquery does not return too many records. For example, when the IN sub-sentence query returns 10,000 or fewer records, enabling this parameter will give the query results faster. Example: ***select * from flow_carbon_256b where cus_no in (select cus_no from flow_carbon_256b where dt>='20260101' and dt<='20260701' and txn_bk='tk_1' and txn_br='tr_1') limit 1000;***
carbon.scheduler.minRegisteredResourcesRatio	0.8	Minimum resource (executor) ratio needed for starting the block distribution. The default value is **0.8**, indicating that 80% of the requested resources are allocated for starting block distribution.
carbon.dynamicAllocation.schedulerTimeout	5	Maximum time that the scheduler waits for executors to be active. The default value is **5** seconds, and the maximum value is **15** seconds.

Parameter	Default Value	Description
enable.unsafe.in.query.processing	true	Whether to use unsafe sort during query. Unsafe sort reduces the garbage collection during query, resulting in better performance. The default value is **true**, indicating that unsafe sort is enabled.
carbon.enable.vector.reader	true	Whether to enable vector processing for result collection to improve query performance
carbon.query.show.datamaps	true	**SHOW TABLES** lists all tables including the primary table and datamaps. To filter out the datamaps, set this parameter to **false**.
Secondary Index Configuration		
carbon.secondary.index.creation.threads	1	Number of threads to concurrently process segments during secondary index creation. This property helps fine-tuning the system when there are a lot of segments in a table. The value ranges from 1 to 50.
carbon.si.lookup.partialstring	true	• When the parameter value is **true**, it includes indexes started with, ended with, and contained. • When the parameter value is **false**, it includes only secondary indexes started with.
carbon.si.segment.merge	true	Enabling this property merges **.carbondata** files inside the secondary index segment. The merging will happen after the load operation. That is, at the end of the secondary index table load, small files are checked and merged. **NOTE** Table Block Size is used as the size threshold for merging small files.

Table 12-7 Other configurations in **carbon.properties**

Parameter	Default Value	Description
Data Loading Configuration		

Parameter	Default Value	Description
carbon.lock.type	HDFSLOCK	Type of lock to be acquired during concurrent operations on a table. There are following types of lock implementation: • **LOCALLOCK**: Lock is created on local file system as a file. This lock is useful when only one Spark driver (or JDBCServer) runs on a machine. • **HDFSLOCK**: Lock is created on HDFS file system as a file. This lock is useful when multiple Spark applications are running and no ZooKeeper is running on a cluster.
carbon.sort.intermediate.files.limit	20	Minimum number of intermediate files. After intermediate files are generated, sort and merge the files. For details about how to optimize this parameter, see **Configurations for Performance Tuning**.
carbon.csv.read.buffersize.byte	1048576	Size of CSV reading buffer
carbon.merge.sort.reader.thread	3	Maximum number of threads used for reading intermediate files for final merging.
carbon.concurrent.lock.retries	100	Maximum number of retries used to obtain the concurrent operation lock. This parameter is used for concurrent loading.
carbon.concurrent.lock.retry.timeout.sec	1	Interval between the retries to obtain the lock for concurrent operations.
carbon.lock.retries	3	Maximum number of retries to obtain the lock for any operations other than import.
carbon.lock.retry.timeout.sec	5	Interval between the retries to obtain the lock for any operation other than import.
carbon.tempstore.location	/opt/Carbon/TempStoreLoc	Temporary storage location. By default, the **System.getProperty("java.io.tmpdir")** method is used to obtain the value. For details about how to optimize this parameter, see the description of **carbon.use.local.dir** in **Configurations for Performance Tuning**.
carbon.load.log.counter	500000	Data loading records count in logs

Parameter	Default Value	Description
SERIALIZATION_NULL_FORMAT	\N	Value to be replaced with NULL
carbon.skip.empty.line	false	Setting this property will ignore the empty lines in the CSV file during data loading.
carbon.load.datamaps.parallel	false	Whether to enable parallel datamap loading for all tables in all sessions. This property will improve the time to load datamaps into memory by distributing the job among executors, thus improving query performance.
Merging Configuration		
carbon.numberof.preserve.segments	0	If you want to preserve some number of segments from being compacted, then you can set this configuration. For example, if **carbon.numberof.preserve.segments** is set to **2**, the latest two segments will always be excluded from the compaction. No segments will be preserved by default.
carbon.allowed.compaction.days	0	This configuration is used to control on the number of recent segments that needs to be merged. For example, if this parameter is set to **2**, the segments which are loaded in the time frame of past 2 days only will get merged. Segments which are loaded earlier than 2 days will not be merged. This configuration is disabled by default.
carbon.enable.auto.load.merge	false	Whether to enable compaction along with data loading.
carbon.merge.index.in.segment	true	This configuration enables to merge all the CarbonIndex files (**.carbonindex**) into a single MergeIndex file (**.carbonindexmerge**) upon data loading completion. This significantly reduces the delay in serving the first query.
Query Configuration		
max.query.execution.time	60	Maximum time allowed for one query to be executed. The unit is minute.

Parameter	Default Value	Description
carbon.enableMinMax	true	MinMax is used to improve query performance. You can set this to **false** to disable this function.
carbon.lease.recovery.retry.count	5	Maximum number of attempts that need to be made for recovering a lease on a file. Minimum value: **1** Maximum value: **50**
carbon.lease.recovery.retry.interval	1000 (ms)	Interval or pause time after a lease recovery attempt is made on a file. Minimum value: **1000** (ms) Maximum value: **10000** (ms)

Table 12-8 Spark configuration reference in **spark-defaults.conf**

Parameter	Default Value	Description
spark.driver.memory	4G	Memory to be used for the driver process. SparkContext has been initialized. **NOTE** In client mode, do not use SparkConf to set this parameter in the application because the driver JVM has been started. To configure this parameter, configure it in the **--driver-memory** command-line option or in the default property file.
spark.executor.memory	4 GB	Memory to be used for each executor process.
spark.sql.crossJoin.enabled	true	If the query contains a cross join, enable this property so that no error is thrown. In this case, you can use a cross join instead of a join for better performance.

Configure the following parameters in the **spark-defaults.conf** file on the Spark driver.

- In spark-sql mode:

Table 12-9 Parameter description

Parameter	Value	Description
spark.driver.extraJavaOptions	-Dlog4j.configuration=file:/opt/client/Spark2x/spark/conf/log4j.properties -Djetty.version=x.y.z -Dzookeeper.server.principal=zookeeper/hadoop.*<System domain name>* -Djava.security.krb5.conf=/opt/client/KrbClient/kerberos/var/krb5kdc/krb5.conf -Djava.security.auth.login.config=/opt/client/Spark2x/spark/conf/jaas.conf -Dorg.xerial.snappy.tempdir=/opt/client/Spark2x/tmp -Dcarbon.properties.filepath=/opt/client/Spark2x/spark/conf/carbon.properties -Djava.io.tmpdir=/opt/client/Spark2x/tmp	The default value **/opt/client/Spark2x/spark** indicates **CLIENT_HOME** of the client and is added to the end of the value of **spark.driver.extraJavaOptions**. This parameter is used to specify the path of the **carbon.properties**file in Driver. **NOTE** Spaces next to equal marks (=) are not allowed.
spark.sql.session.state.builder	org.apache.spark.sql.hive.FIHiveACLSessionStateBuilder	Session state constructor.
spark.carbon.sqlastbuilder.classname	org.apache.spark.sql.hive.CarbonInternalSqlAstBuilder	AST constructor.
spark.sql.catalog.class	org.apache.spark.sql.hive.HiveACLExternalCatalog	Hive External catalog to be used. This parameter is mandatory if Spark ACL is enabled.
spark.sql.hive.implementation	org.apache.spark.sql.hive.HiveACLClientImpl	How to call the Hive client. This parameter is mandatory if Spark ACL is enabled.
spark.sql.hiveClient.isolation.enabled	false	This parameter is mandatory if Spark ACL is enabled.

- In JDBCServer mode:

Table 12-10 Parameter description

Parameter	Value	Description
spark.driver.extraJavaOptions	-Xloggc:${SPARK_LOG_DIR}/indexserver-omm-%p-gc.log -XX:+PrintGCDetails -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps -XX:+PrintGCDateStamps -XX:MaxDirectMemorySize=512M -XX:MaxMetaspaceSize=512M -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=20 -XX:GCLogFileSize=10M -XX:OnOutOfMemoryError='kill -9 %p' -Djetty.version=x.y.z -Dorg.xerial.snappy.tempdir=${BIGDATA_HOME}/tmp/spark2x/JDBCServer/snappy_tmp -Djava.io.tmpdir=${BIGDATA_HOME}/tmp/spark2x/JDBCServer/io_tmp -Dcarbon.properties.filepath=${SPARK_CONF_DIR}/carbon.properties -Djdk.tls.ephemeralDHKeySize=20	The default value **${SPARK_CONF_DIR}** depends on a specific cluster and is added to the end of the value of the **spark.driver.extraJavaOptions** parameter. This parameter is used to specify the path of the **carbon.properties** file in Driver. **NOTE** Spaces next to equal marks (=) are not allowed.

Parameter	Value	Description
	48 -Dspark.ssl.keyStore=${SPARK_CONF_DIR}/child.keystore #{java_stack_prefer}	
spark.sql.session.state.builder	org.apache.spark.sql.hive.FIHiveACLSessionStateBuilder	Session state constructor.
spark.carbon.sqlastbuilder.classname	org.apache.spark.sql.hive.CarbonInternalSqlAstBuilder	AST constructor.
spark.sql.catalog.class	org.apache.spark.sql.hive.HiveACLExternalCatalog	Hive External catalog to be used. This parameter is mandatory if Spark ACL is enabled.
spark.sql.hive.implementation	org.apache.spark.sql.hive.HiveACLClientImpl	How to call the Hive client. This parameter is mandatory if Spark ACL is enabled.
spark.sql.hiveClient.isolation.enabled	false	This parameter is mandatory if Spark ACL is enabled.

12.3.3 CarbonData Operation Guide

12.3.3.1 CarbonData Quick Start

This section describes how to create CarbonData tables, load data, and query data. This quick start provides operations based on the Spark Beeline client. If you want to use Spark shell, wrap the queries with **spark.sql()**.

The following describes how to load data from a CSV file to a CarbonData table.

Table 12-11 CarbonData Quick Start

Operation	Description
Preparing a CSV File	Prepare the CSV file to be loaded to the CarbonData Table.

Operation	Description
Connecting to CarbonData	Connect to CarbonData before performing any operations on CarbonData.
Creating a CarbonData Table	Create a CarbonData table to load data and perform query operations.
Loading Data to a CarbonData Table	Load data from CSV to the created table.
Querying Data from a CarbonData Table	Perform query operations such as filters and groupby.

Preparing a CSV File

1. Prepare a CSV file named **test.csv** on the local PC. An example is as follows:

   ```
   13418592122,1001, MAC address, 2017-10-23 15:32:30,2017-10-24 15:32:30,62.50,74.56
   13418592123 1002,  MAC address, 2017-10-23 16:32:30,2017-10-24 16:32:30,17.80,76.28
   13418592124,1003, MAC address, 2017-10-23 17:32:30,2017-10-24 17:32:30,20.40,92.94
   13418592125 1004,  MAC address, 2017-10-23 18:32:30,2017-10-24 18:32:30,73.84,8.58
   13418592126,1005, MAC address, 2017-10-23 19:32:30,2017-10-24 19:32:30,80.50,88.02
   13418592127 1006,  MAC address, 2017-10-23 20:32:30,2017-10-24 20:32:30,65.77,71.24
   13418592128,1007, MAC address, 2017-10-23 21:32:30,2017-10-24 21:32:30,75.21,76.04
   13418592129,1008, MAC address, 2017-10-23 22:32:30,2017-10-24 22:32:30,63.30,94.40
   13418592130, 1009, MAC address, 2017-10-23 23:32:30,2017-10-24 23:32:30,95.51,50.17
   13418592131,1010, MAC address, 2017-10-24 00:32:30,2017-10-25 00:32:30,39.62,99.13
   ```

2. Use WinSCP to import the CSV file to the directory of the node where the client is installed, for example, **/opt**.
3. Log in to FusionInsight Manager and choose **System**. In the navigation pane on the left, choose **Permission** > **User**, click **Create** to create human-machine user **sparkuser**, and add the user to user groups hadoop (primary group) and hive.
4. Run the following commands to go to the client installation directory, load environment variables, and authenticate the user.

   cd /*Client installation directory*

   source ./bigdata_env

   source ./Spark2x/component_env

   kinit sparkuser
5. Run the following command to upload the CSV file to the **/data** directory of the HDFS.

   hdfs dfs -put /opt/test.csv /data/

Connecting to CarbonData

- Use Spark SQL or Spark shell to connect to Spark and run Spark SQL commands.
- Run the following commands to start the JDBCServer and use a JDBC client (for example, Spark Beeline) to connect to the JDBCServer.

  cd ./Spark2x/spark/bin

  ./spark-beeline

Creating a CarbonData Table

After connecting Spark Beeline with the JDBCServer, create a CarbonData table to load data and perform query operations. Run the following commands to create a simple table:

create table x1 (imei string, deviceInformationId int, mac string, productdate timestamp, updatetime timestamp, gamePointId double, contractNumber double) STORED AS carbondata TBLPROPERTIES ('SORT_COLUMNS'='imei,mac');

The command output is as follows:

```
+---------+
| Result  |
+---------+
+---------+
No rows selected (1.093 seconds)
```

Loading Data to a CarbonData Table

After you have created a CarbonData table, you can load the data from CSV to the created table.

Run the following command with required parameters to load data from CSV. The column names of the CarbonData table must match the column names of the CSV file.

LOAD DATA inpath 'hdfs://hacluster/data/*test.csv***' into table** ***x1*** **options('DELIMITER'=',', 'QUOTECHAR'='"','FILEHEADER'='imei, deviceinformationid,mac, productdate,updatetime, gamepointid,contractnumber');**

test.csv is the CSV file prepared in **Preparing a CSV File** and **x1** is the table name.

The CSV example file is as follows:

```
13418592122,1001, MAC address, 2017-10-23 15:32:30,2017-10-24 15:32:30,62.50,74.56
13418592123 1002,  MAC address, 2017-10-23 16:32:30,2017-10-24 16:32:30,17.80,76.28
13418592124,1003, MAC address, 2017-10-23 17:32:30,2017-10-24 17:32:30,20.40,92.94
13418592125 1004,  MAC address, 2017-10-23 18:32:30,2017-10-24 18:32:30,73.84,8.58
13418592126,1005, MAC address, 2017-10-23 19:32:30,2017-10-24 19:32:30,80.50,88.02
13418592127 1006,  MAC address, 2017-10-23 20:32:30,2017-10-24 20:32:30,65.77,71.24
13418592128,1007, MAC address, 2017-10-23 21:32:30,2017-10-24 21:32:30,75.21,76.04
13418592129,1008, MAC address, 2017-10-23 22:32:30,2017-10-24 22:32:30,63.30,94.40
13418592130, 1009, MAC address, 2017-10-23 23:32:30,2017-10-24 23:32:30,95.51,50.17
13418592131,1010, MAC address, 2017-10-24 00:32:30,2017-10-25 00:32:30,39.62,99.13
```

The command output is as follows:

```
+-------------+
|Segment ID  |
+-------------+
|0           |
+-------------+
No rows selected (3.039 seconds)
```

Querying Data from a CarbonData Table

After a CarbonData table is created and the data is loaded, you can perform query operations as required. Some query operations are provided as examples.

- **Obtaining the number of records**

  Run the following command to obtain the number of records in the CarbonData table:

  select count(*) from x1;

- **Querying with the groupby condition**

  Run the following command to obtain the **deviceinformationid** records without repetition in the CarbonData table:

  select deviceinformationid,count (distinct deviceinformationid) from x1 group by deviceinformationid;

- **Querying with Filter**

  Run the following command to obtain specific **deviceinformationid** records:

  select * from x1 where deviceinformationid='1010';

Using CarbonData on Spark-shell

If you need to use CarbonData on a Spark-shell, you need to create a CarbonData table, load data to the CarbonData table, and query data in CarbonData as follows:

```
spark.sql("CREATE TABLE x2(imei string, deviceInformationId int, mac string, productdate timestamp, updatetime timestamp, gamePointId double, contractNumber double) STORED AS carbondata")
spark.sql("LOAD DATA inpath 'hdfs://hacluster/data/x1_without_header.csv' into table x2 options('DELIMITER'=',', 'QUOTECHAR'='\"','FILEHEADER'='imei, deviceinformationid,mac, productdate,updatetime, gamepointid,contractnumber')")
spark.sql("SELECT * FROM x2").show()
```

12.3.3.2 CarbonData Table Management

12.3.3.2.1 About CarbonData Table

Overview

In CarbonData, data is stored in entities called tables. CarbonData tables are similar to RDBMS tables. RDBMS data is stored in a table consisting of rows and columns. CarbonData tables store structured data, and have fixed columns and data types.

Supported Data Types

CarbonData tables support the following data types:

- Int
- String
- BigInt
- Smallint
- Char
- Varchar
- Boolean
- Decimal

- Double
- TimeStamp
- Date
- Array
- Struct
- Map

The following table describes supported data types and their respective values range.

Table 12-12 CarbonData data types

Data Type	Value Range
Int	4-byte signed integer ranging from -2,147,483,648 to 2,147,483,647. **NOTE** If a non-dictionary column is of the **int** data type, it is internally stored as the **BigInt** type.
String	100,000 characters **NOTE** If the **CHAR** or **VARCHAR** data type is used in **CREATE TABLE**, the two data types are automatically converted to the String data type. If a column contains more than 32,000 characters, add the column to the **LONG_STRING_COLUMNS** attribute of the **tblproperties** table during table creation.
BigInt	64-bit value ranging from -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807
SmallInt	–32,768 to 32,767
Char	A to Z and a to z
Varchar	A to Z, a to z, and 0 to 9
Boolean	**true** or **false**
Decimal	The default value is (10,0) and maximum value is (38,38). **NOTE** When query with filters, append **BD** to the number to achieve accurate results. For example, **select * from carbon_table where num = 1234567890123456.22BD**.
Double	64-bit value ranging from 4.9E-324 to 1.7976931348623157E308
TimeStamp	The default format is **yyyy-MM-dd HH:mm:ss**.
Date	The **DATE** data type is used to store calendar dates. The default format is **yyyy-MM-DD**.

Data Type	Value Range
Array<data_type>	N/A **NOTE** Currently, only two layers of complex types can be nested.
Struct<col_name: data_type COMMENT col_comment, ...>	
Map<primitive_type, data_type>	

12.3.3.2.2 Creating a CarbonData Table

Scenario

A CarbonData table must be created to load and query data. You can run the **Create Table** command to create a table. This command is used to create a table using custom columns.

Creating a Table with Self-Defined Columns

Users can create a table by specifying its columns and data types.

Sample command:

CREATE TABLE *IF NOT EXISTS productdb.productSalesTable (*

productNumber Int,

productName String,

storeCity String,

storeProvince String,

productCategory String,

productBatch String,

saleQuantity Int,

revenue Int)

STORED AS *carbondata*

TBLPROPERTIES (

'table_blocksize'='128');

The following table describes parameters of preceding commands.

Table 12-13 Parameter description

Parameter	Description
productSalesTable	Table name. The table is used to load data for analysis. The table name consists of letters, digits, and underscores (_).
productdb	Database name. The database maintains logical connections with tables stored in it to identify and manage the tables. The database name consists of letters, digits, and underscores (_).
productName storeCity storeProvince procuctCategory productBatch saleQuantity revenue	Columns in the table. The columns are service entities for data analysis. The column name (field name) consists of letters, digits, and underscores (_).
table_blocksize	Indicates the block size of data files used by the CarbonData table, in MB. The value ranges from **1** to **2048**. The default value is **1024**. If **table_blocksize** is too small, a large number of small files will be generated when data is loaded. This may affect the performance of HDFS. If **table_blocksize** is too large, during data query, the amount of block data that matches the index is large, and some blocks contain a large number of blocklets, affecting read concurrency and lowering query performance. You are advised to set the block size based on the data volume. For example, set the block size to 256 MB for GB-level data, 512 MB for TB-level data, and 1024 MB for PB-level data.

NOTE

- Measurement of all Integer data is processed and displayed using the **BigInt** data type.
- CarbonData parses data strictly. Any data that cannot be parsed is saved as **null** in the table. For example, if the user loads the **double** value (3.14) to the BigInt column, the data is saved as **null**.
- The Short and Long data types used in the **Create Table** command are shown as Smallint and BigInt in the **DESCRIBE** command, respectively.
- You can run the **DESCRIBE** command to view the table data size and table index size.

Operation Result

Run the command to create a table.

12.3.3.2.3 Deleting a CarbonData Table

Scenario

You can run the **DROP TABLE** command to delete a table. After a CarbonData table is deleted, its metadata and loaded data are deleted together.

Procedure

Run the following command to delete a CarbonData table:

Run the following command:

DROP TABLE *[IF EXISTS] [db_name.]table_name;*

Once this command is executed, the table is deleted from the system. In the command, **db_name** is an optional parameter. If **db_name** is not specified, the table named **table_name** in the current database is deleted.

Example:

DROP TABLE *productdb.productSalesTable;*

Run the preceding command to delete the **productSalesTable** table from the **productdb** database.

Operation Result

Deletes the table specified in the command from the system. After the table is deleted, you can run the **SHOW TABLES** command to check whether the table is successfully deleted. For details, see **SHOW TABLES**.

12.3.3.2.4 Modify the CarbonData Table

SET and UNSET

When the **SET** command is executed, the new properties overwrite the existing ones.

- SORT SCOPE

  The following is an example of the **SET SORT SCOPE** command:

  ALTER TABLE *tablename* **SET TBLPROPERTIES('SORT_SCOPE'**=*'no_sort'*)

  After running the **UNSET SORT SCOPE** command, the default value **NO_SORT** is adopted.

  The following is an example of the **UNSET SORT SCOPE** command:

  ALTER TABLE *tablename* **UNSET TBLPROPERTIES('SORT_SCOPE'**)
- SORT COLUMNS

  The following is an example of the **SET SORT COLUMNS** command:

  ALTER TABLE *tablename* **SET TBLPROPERTIES('SORT_COLUMNS'**=*'column1'*)

After this command is executed, the new value of **SORT_COLUMNS** is used. Users can adjust the **SORT_COLUMNS** based on the query results, but the original data is not affected. The operation does not affect the query performance of the original data segments which are not sorted by new **SORT_COLUMNS**.

The **UNSET** command is not supported, but the **SORT_COLUMNS** can be set to empty string instead of using the **UNSET** command.

ALTER TABLE *tablename* **SET TBLPROPERTIES('SORT_COLUMNS'**= '')

NOTE

- The later version will enhance custom compaction to resort the old segments.
- The value of **SORT_COLUMNS** cannot be modified in the streaming table.
- If the **inverted index** column is removed from **SORT_COLUMNS**, **inverted index** will not be created in this column. However, the old configuration of **INVERTED_INDEX** will be kept.

12.3.3.3 CarbonData Table Data Management

12.3.3.3.1 Loading Data

Scenario

After a CarbonData table is created, you can run the **LOAD DATA** command to load data to the table for query. Once data loading is triggered, data is encoded in CarbonData format and files in multi-dimensional and column-based format are compressed and copied to the HDFS path of CarbonData files for quick analysis and queries. The HDFS path can be configured in the **carbon.properties** file. For details, see **Configuration Reference**.

12.3.3.3.2 Deleting Segments

Scenario

If you want to modify and reload the data because you have loaded wrong data into a table, or there are too many bad records, you can delete specific segments by segment ID or data loading time.

NOTE

The segment deletion operation only deletes segments that are not compacted. You can run the **CLEAN FILES** command to clear compacted segments.

Deleting a Segment by Segment ID

Each segment has a unique ID. This segment ID can be used to delete the segment.

Step 1 Obtain the segment ID.

Command:

SHOW SEGMENTS FOR Table *dbname.tablename LIMIT number_of_loads;*

Example:

SHOW SEGMENTS FOR TABLE *carbonTable;*

Run the preceding command to show all the segments of the table named **carbonTable**.

SHOW SEGMENTS FOR TABLE *carbonTable LIMIT 2;*

Run the preceding command to show segments specified by *number_of_loads*.

The command output is as follows:

```
+-----+----------+--------------------------+------------------+------------+------------+-------------+--------------+--
+
| ID  |  Status  |     Load Start Time      | Load Time Taken  | Partition  | Data Size  | Index Size  | File Format  |
+-----+----------+--------------------------+------------------+------------+------------+-------------+--------------+--
+
| 3   | Success  | 2020-09-28 22:53:26.336  | 3.726S           | {}         | 6.47KB     | 3.30KB      | columnar_v3  |
| 2   | Success  | 2020-09-28 22:53:01.702  | 6.688S           | {}         | 6.47KB     | 3.30KB      | columnar_v3  |
+-----+----------+--------------------------+------------------+------------+------------+-------------+--------------+--
+
```

NOTE

The output of the **SHOW SEGMENTS** command includes ID, Status, Load Start Time, Load Time Taken, Partition, Data Size, Index Size, and File Format. The latest loading information is displayed in the first line of the command output.

Step 2 Run the following command to delete the segment after you have found the Segment ID:

Command:

DELETE FROM TABLE tableName WHERE SEGMENT.ID IN (load_sequence_id1, load_sequence_id2, ...);

Example:

DELETE FROM TABLE carbonTable WHERE SEGMENT.ID IN (1,2,3);

For details, see **DELETE SEGMENT by ID**.

----End

Deleting a Segment by Data Loading Time

You can delete a segment based on the loading time.

Command:

DELETE FROM TABLE db_name.table_name WHERE SEGMENT.STARTTIME BEFORE date_value;

Example:

DELETE FROM TABLE carbonTable WHERE SEGMENT.STARTTIME BEFORE '2017-07-01 12:07:20';

The preceding command can be used to delete all segments before 2017-07-01 12:07:20.

For details, see **DELETE SEGMENT by DATE**.

Result

Data of corresponding segments is deleted and is unavailable for query. You can run the **SHOW SEGMENTS** command to display the segment status and check whether the segment has been deleted.

NOTE

- Segments are not physically deleted after the execution of the **DELETE SEGMENT** command. Therefore, if you run the **SHOW SEGMENTS** command to check the status of a deleted segment, it will be marked as **Marked for Delete**. If you run the **SELECT * FROM tablename** command, the deleted segment will be excluded.
- The deleted segment will be deleted physically only when the next data loading reaches the maximum query execution duration, which is configured by the **max.query.execution.time** parameter. The default value of the parameter is 60 minutes.
- If you want to forcibly delete a physical segment file, run the **CLEAN FILES** command.

  Example:

  CLEAN FILES FOR TABLE table1;

  This command will physically delete the segment file in the **Marked for delete** state.

  If this command is executed before the time specified by **max.query.execution.time** arrives, the query may fail. **max.query.execution.time** indicates the maximum time allowed for a query, which is set in the **carbon.properties** file.

12.3.3.3.3 Combining Segments

Scenario

Frequent data access results in a large number of fragmented CarbonData files in the storage directory. In each data loading, data is sorted and indexing is performed. This means that an index is generated for each load. With the increase of data loading times, the number of indexes also increases. As each index works only on one loading, the performance of index is reduced. CarbonData provides loading and compression functions. In a compression process, data in each segment is combined and sorted, and multiple segments are combined into one large segment.

Prerequisites

Multiple data loadings have been performed.

Operation Description

There are three types of compaction: Minor, Major, and Custom.

- Minor compaction:

  In minor compaction, you can specify the number of loads to be merged. If **carbon.enable.auto.load.merge** is set, minor compaction is triggered for every data load. If any segments are available to be merged, then compaction will run parallel with data load.

  There are two levels in minor compaction:

  – Level 1: Merging of the segments which are not yet compacted

  - Level 2: Merging of the compacted segments again to form a larger segment

- Major compaction:

  Multiple segments can be merged into one large segment. You can specify the compaction size so that all segments below the size will be merged. Major compaction is usually done during the off-peak time.

- Custom compaction:

  In Custom compaction, you can specify the IDs of multiple segments to merge them into a large segment. The IDs of all the specified segments must exist and be valid. Otherwise, the compaction fails. Custom compaction is usually done during the off-peak time.

For details, see **ALTER TABLE COMPACTION**.

Table 12-14 Compaction parameters

Parameter	Default Value	Application Type	Description
carbon.enable.auto.load.merge	false	Minor	Whether to enable compaction along with data loading. **true**: Compaction is automatically triggered when data is loaded. **false**: Compaction is not triggered when data is loaded.
carbon.compaction.level.threshold	4,3	Minor	This configuration is for minor compaction which decides how many segments to be merged. For example, if this parameter is set to **2,3**, minor compaction is triggered every two segments and segments form a single level 1 compacted segment. When the number of compacted level 1 segments reach 3, compaction is triggered again to merge them to form a single level 2 segment. The compaction policy depends on the actual data size and available resources. The value ranges from 0 to 100.

Parameter	Default Value	Application Type	Description
carbon.major.compaction.size	1024 MB	Major	The major compaction size can be configured using this parameter. Sum of the segments which is below this threshold will be merged. For example, if this parameter is set to 1024 MB, and there are five segments whose sizes are 300 MB, 400 MB, 500 MB, 200 MB, and 100 MB used for major compaction, only segments whose total size is less than this threshold are compacted. In this example, only the segments whose sizes are 300 MB, 400 MB, 200 MB, and 100 MB are compacted.
carbon.numberof.preserve.segments	0	Minor/ Major	If you want to preserve some number of segments from being compacted, then you can set this configuration. For example, if **carbon.numberof.preserve.segments** is set to **2**, the latest two segments will always be excluded from the compaction. By default, no segments are reserved.
carbon.allowed.compaction.days	0	Minor/ Major	This configuration is used to control on the number of recent segments that needs to be compacted. For example, if this parameter is set to **2**, the segments which are loaded in the time frame of past 2 days only will get merged. Segments which are loaded earlier than 2 days will not be merged. This configuration is disabled by default.
carbon.number.of.cores.while.compacting	2	Minor/ Major	Number of cores to be used while compacting data. The greater the number of cores, the better the compaction performance. If the CPU resources are sufficient, you can increase the value of this parameter.

Parameter	Default Value	Application Type	Description
carbon.merge.index.in.segment	true	SEGMENT_INDEX	If this parameter is set to **true**, all the Carbon index (.carbonindex) files in a segment will be merged into a single Index (.carbonindexmerge) file. This enhances the first query performance.

Reference

You are advised not to perform minor compaction on historical data. For details, see **How to Avoid Minor Compaction for Historical Data?**.

12.3.3.4 CarbonData Data Migration

Scenario

If you want to rapidly migrate CarbonData data from a cluster to another one, you can use the CarbonData backup and restoration commands. This method does not require data import in the target cluster, reducing required migration time.

Prerequisites

The Spark2x client has been installed in a directory, for example, **/opt/client**, in two clusters. The source cluster is cluster A, and the target cluster is cluster B.

Procedure

Step 1 Log in to the node where the client is installed in cluster A as a client installation user.

Step 2 Run the following commands to configure environment variables:

source /opt/client/bigdata_env

source /opt/client/Spark2x/component_env

Step 3 If the cluster is in security mode, run the following command to authenticate the user. In normal mode, skip user authentication.

kinit *carbondatauser*

carbondatauser indicates the user of the original data. That is, the user has the read and write permissions for the tables.

NOTE

You must add the user to the **hadoop** (primary group) and **hive** groups, and associate it with the **System_administrator** role.

Step 4 Run the following command to connect to the database and check the location for storing table data on HDFS:

spark-beeline

desc formatted *Name of the table containing the original data*;

Location in the displayed information indicates the directory where the data file resides.

Step 5 Log in to the node where the client is installed in cluster B as a client installation user and configure the environment variables:

source /opt/client/bigdata_env

source /opt/client/Spark2x/component_env

Step 6 If the cluster is in security mode, run the following command to authenticate the user. In normal mode, skip user authentication.

kinit *carbondatauser2*

carbondatauser2 indicates the user that uploads data.

NOTE

You must add the user to the **hadoop** (primary group) and **hive** groups, and associate it with the **System_administrator** role.

Step 7 Run the **spark-beeline** command to connect to the database.

Step 8 Does the database that maps to the original data exist?

- If yes, go to **Step 9**.
- If no, run the **create database** *Database name* command to create a database with the same name as that maps to the original data and go to **Step 9**.

Step 9 Copy the original data from the HDFS directory in cluster A to that in cluster B.

When uploading data in cluster B, ensure that the upload directory has the directories with the same names as the database and table in the original directory and the upload user has the permission to write data to the upload directory. After the data is uploaded, the user has the permission to read and write the data.

For example, if the original data is stored in **/user/carboncadauser/warehouse/db1/tb1**, the data can be stored in **/user/carbondatauser2/warehouse/db1/tb1** in the new cluster.

1. Run the following command to download the original data to the **/opt/backup** directory of cluster A:

   hdfs dfs -get /user/carboncadauser/warehouse/db1/tb1 /opt/backup

2. Run the following command to copy the original data of cluster A to the **/opt/backup** directory on the client node of cluster B.

   scp /opt/backup root@*IP address of the client node of cluster B*:**/opt/backup**

3. Run the following command to upload the data copied to cluster B to HDFS:

   hdfs dfs -put /opt/backup /user/carbondatauser2/warehouse/db1/tb1

Step 10 In the client environment of cluster B, run the following command to generate the metadata associated with the table corresponding to the original data in Hive:

REFRESH TABLE *$dbName.$tbName;*

$dbName indicates the database name, and *$tbName* indicates the table name.

Step 11 If the original table contains an index table, perform **Step 9** and **Step 10** to migrate the index table directory from cluster A to cluster B.

Step 12 Run the following command to register an index table for the CarbonData table (skip this step if no index table is created for the original table):

REGISTER INDEX TABLE *$tableName* ON *$maintable*;

$tableName indicates the index table name, and *$maintable* indicates the table name.

----End

12.3.3.5 Migrating Data on CarbonData from Spark 1.5 to Spark2x

Migration Solution Overview

This migration guides you to migrate the CarbonData table data of Spark 1.5 to that of Spark2x.

NOTE

Before performing this operation, you need to stop the data import service of the CarbonData table in Spark 1.5 and migrate data to the CarbonData table of Spark2x at a time. After the migration is complete, use Spark2x to perform service operations.

Migration roadmap:

1. Use Spark 1.5 to migrate historical data to the intermediate table.
2. Use Spark2x to migrate data from the intermediate table to the target table and change the target table name to the original table name.
3. After the migration is complete, use Spark2x to operate data in the CarbonData table.

Migration Solution and Commands

Migrating Historical Data

Step 1 Stop the CarbonData data import service, use spark-beeline of Spark 1.5 to view the ID and time of the latest segment in the CarbonData table, and record the segment ID.

show segments for table dbname.tablename;

Step 2 Run spark-beeline of Spark 1.5 as the user who has created the original CarbonData table to create an intermediate table in ORC or Parquet format. Then import the data in the original CarbonData table to the intermediate table. After the import is complete, the services of the CarbonData table can be restored.

Create an ORC table.

CREATE TABLE dbname.mid_tablename_orc STORED AS ORC as select * from dbname.tablename;

Create a Parquet table.

CREATE TABLE dbname.mid_tablename_parq STORED AS PARQUET as select * from dbname.tablename;

In the preceding command, **dbname** indicates the database name and **tablename** indicates the name of the original CarbonData table.

Step 3 Run spark-beeline of Spark2x as the user who has created the original CarbonData table. Run the table creation statement of the old table to create a CarbonData table.

NOTE

In the statement for creating a new table, the field sequence and type must be the same as those of the old table. In this way, the index column structure of the old table can be retained, which helps avoid errors caused by the use of **select *** statement during data insertion.

Run the spark-beeline command of Spark 1.5 to view the table creation statement of the old table: **SHOW CREATE TABLE dbname.tablename;**

Create a CarbonData table named **dbname.new_tablename**.

Step 4 Run spark-beeline of Spark2x as the user who has created the original CarbonData table to load the intermediate table data in ORC (or PARQUET) format created in **Step 2** to the new table created in **Step 3**. This step may take a long time (about 2 hours for 200 GB data). The following uses the ORC intermediate table as an example to describe the command for loading data:

insert into dbname.new_tablename select *

from dbname. mid_tablename_orc;

Step 5 Run spark-beeline of Spark2x as the user who has created the original CarbonData table to query and verify the data in the new table. If the data is correct, change the name of the original CarbonData table and then change the name of the new CarbonData table to the name of the original one.

ALTER TABLE dbname.tablename RENAME TO dbname.old_tablename;

ALTER TABLE dbname.new_tablename RENAME TO dbname.tablename;

Step 6 Complete the migration. In this case, you can use Spark2x to query the new table and rebuild the secondary index.

----End

12.3.4 CarbonData Performance Tuning

12.3.4.1 Tuning Guidelines

Query Performance Tuning

There are various parameters that can be tuned to improve the query performance in CarbonData. Most of the parameters focus on increasing the parallelism in processing and optimizing system resource usage.

- Spark executor count: Executors are basic entities of parallelism in Spark. Raising the number of executors can increase the amount of parallelism in the cluster. For details about how to configure the number of executors, see the Spark documentation.
- Executor core: The number of concurrent tasks that an executor can run are controlled in each executor. Increasing the number of executor cores will add more concurrent processing tasks to improve performance.
- HDFS block size: CarbonData assigns query tasks by allocating different blocks to different executors for processing. HDFS block is the partition unit. CarbonData maintains a global block level index in Spark driver, which helps to reduce the quantity of blocks that need to be scanned for a query. Higher block size means higher I/O efficiency and lower global index efficiency. Reversely, lower block size means lower I/O efficiency, higher global index efficiency, and greater memory consumption.
- Number of scanner threads: Scanner threads control the number of parallel data blocks that are processed by each task. By increasing the number of scanner threads, you can increase the number of data blocks that are processed in parallel to improve performance. The **carbon.number.of.cores** parameter in the **carbon.properties** file is used to configure the number of scanner threads. For example, **carbon.number.of.cores = 4**.
- B-Tree caching: The cache memory can be optimized using the B-Tree least recently used (LRU) caching. In the driver, the B-Tree LRU caching configuration helps free up the cache by releasing table segments which are not accessed or not used. Similarly, in the executor, the B-Tree LRU caching configuration will help release table blocks that are not accessed or used. For details, see the description of **carbon.max.driver.lru.cache.size** and **carbon.max.executor.lru.cache.size** in **Table 12-6**.

CarbonData Query Process

When CarbonData receives a table query task, for example query for table A, the index data of table A will be loaded to the memory for the query process. When CarbonData receives a query task for table A again, the system does not need to load the index data of table A.

When a query is performed in CarbonData, the query task is divided into several scan tasks, namely, task splitting based on HDFS blocks. Scan tasks are executed by executors on the cluster. Tasks can run in parallel, partially parallel, or in sequence, depending on the number of executors and configured number of executor cores.

Some parts of a query task can be processed at the individual task level, such as **select** and **filter.** Some parts of a query task can be processed at the individual task level, such as **group-by**, **count**, and **distinct count**.

Some operations cannot be performed at the task level, such as **Having Clause** (filter after grouping) and **sort**. Operations which cannot be performed at the task level or can be only performed partially at the task level require data (partial results) transmission across executors on the cluster. The transmission operation is called shuffle.

The more the tasks are, the more data needs to be shuffled. This affects query performance.

The number of tasks is depending on the number of HDFS blocks and the number of blocks is depending on the size of each block. You are advised to configure proper HDFS block size to achieve a balance among increased parallelism, the amount of data to be shuffled, and the size of aggregate tables.

Relationship Between Splits and Executors

If the number of splits is less than or equal to the executor count multiplied by the executor core count, the tasks are run in parallel. Otherwise, some tasks can start only after other tasks are complete. Therefore, ensure that the executor count multiplied by executor cores is greater than or equal to the number of splits. In addition, make sure that there are sufficient splits so that a query task can be divided into sufficient subtasks to ensure concurrency.

Configuring Scanner Threads

The scanner threads property decides the number of data blocks to be processed. If there are too many data blocks, a large number of small data blocks will be generated, affecting performance. If there are few data blocks, the parallelism is poor and the performance is affected. Therefore, when determining the number of scanner threads, you are advised to consider the average data size within a partition and select a value that makes the data block not small. Based on experience, you are advised to divide a single block size (unit: MB) by 250 and use the result as the number of scanner threads.

The number of actual available vCPUs is an important factor to consider when you want to increase the parallelism. The number of vCPUs that conduct parallel computation must not exceed 75% to 80% of actual vCPUs.

The number of vCPUs is approximately equal to:

Number of parallel tasks x Number of scanner threads. Number of parallel tasks is the smaller value of number of splits or executor count x executor cores.

Data Loading Performance Tuning

Tuning of data loading performance is different from that of query performance. Similar to query performance, data loading performance depends on the amount of parallelism that can be achieved. In case of data loading, the number of worker threads decides the unit of parallelism. Therefore, more executors mean more executor cores and better data loading performance.

To achieve better performance, you can configure the following parameters in HDFS.

Table 12-15 HDFS configuration

Parameter	Recommended Value
dfs.datanode.drop.cache.behind.reads	false
dfs.datanode.drop.cache.behind.writes	false
dfs.datanode.sync.behind.writes	true

Compression Tuning

CarbonData uses a few lightweight compression and heavyweight compression algorithms to compress data. Although these algorithms can process any type of data, the compression performance is better if the data is ordered with similar values being together.

During data loading, data is sorted based on the order of columns in the table to achieve good compression performance.

Since CarbonData sorts data in the order of columns defined in the table, the order of columns plays an important role in the effectiveness of compression. If the low cardinality dimension is on the left, the range of data partitions after sorting is small and the compression efficiency is high. If a high cardinality dimension is on the left, a range of data partitions obtained after sorting is relatively large, and compression efficiency is relatively low.

Memory Tuning

CarbonData provides a mechanism for memory tuning where data loading depends on the columns needed in the query. Whenever a query command is received, columns required by the query are fetched and data is loaded for those columns in memory. During this operation, if the memory threshold is reached, the least used loaded files are deleted to release memory space for columns required by the query.

12.3.4.2 Suggestions for Creating CarbonData Tables

Scenario

This section provides suggestions based on more than 50 test cases to help you create CarbonData tables with higher query performance.

Table 12-16 Columns in the CarbonData table

Column name	Data type	Cardinality	Attribution
msisdn	String	30 million	dimension
BEGIN_TIME	bigint	10,000	dimension
host	String	1 million	dimension

Column name	Data type	Cardinality	Attribution
dime_1	String	1,000	dimension
dime_2	String	500	dimension
dime_3	String	800	dimension
counter_1	numeric(20,0)	NA	measure
...	...	NA	measure
counter_100	numeric(20,0)	NA	measure

Procedure

- If the to-be-created table contains a column that is frequently used for filtering, for example, this column is used in more than 80% of filtering scenarios,

  implement optimization as follows:

  Place this column in the first column of **sort_columns**.

  For example, if **msisdn** is the most frequently used filter criterion in a query, it is placed in the first column. Run the following command to create a table. The query performance is good if **msisdn** is used as the filter condition.

  ```
  create table carbondata_table(
     msisdn String,
     ...
     )STORED AS carbondata TBLPROPERTIES ('SORT_COLUMS'='msisdn');
  ```

- If the to-be-created table has multiple columns which are frequently used to filter the results,

  implement optimization as follows:

  Create an index for the columns.

  For example, if **msisdn**, **host**, and **dime_1** are frequently used columns, the **sort_columns** column sequence is "dime_1-> host-> msisdn..." based on cardinality. Run the following command to create a table. The following command can improve the filtering performance of **dime_1**, **host**, and **msisdn**.

  ```
  create table carbondata_table(
     dime_1 String,
     host String,
     msisdn String,
     dime_2 String,
     dime_3 String,
     ...
     )STORED AS carbondata
  TBLPROPERTIES ('SORT_COLUMS'='dime_1,host,msisdn');
  ```

- If the frequency of each column used for filtering is similar,

  implement optimization as follows:

  sort_columns is sorted in ascending order of cardinality.

  Run the following command to create a table:

  ```
  create table carbondata_table(
     Dime_1 String,
  ```

```
    BEGIN_TIME bigint,
    HOST String,
    MSISDN String,
    ...
    )STORED AS carbondata
TBLPROPERTIES ('SORT_COLUMS'='dime_2,dime_3,dime_1, BEGIN_TIME,host,msisdn');
```

- Create tables in ascending order of cardinalities. Then create secondary indexes for columns with more cardinalities. The statement for creating an index is as follows:

```
create index carbondata_table_index_msidn on tablecarbondata_table (
MSISDN String) as 'carbondata' PROPERTIES ('table_blocksize'='128');
create index carbondata_table_index_host on tablecarbondata_table (
host String) as 'carbondata' PROPERTIES ('table_blocksize'='128');
```

- For columns of measure type, not requiring high accuracy, the numeric (20,0) data type is not required. You are advised to use the double data type to replace the numeric (20,0) data type to enhance query performance.

  The result of performance analysis of test-case shows reduction in query execution time from 15 to 3 seconds, thereby improving performance by nearly 5 times. The command for creating a table is as follows:

```
create table carbondata_table(
    Dime_1 String,
    BEGIN_TIME bigint,
    HOST String,
    MSISDN String,
    counter_1 double,
    counter_2 double,
    ...
    counter_100 double,
    )STORED AS carbondata
;
```

- If values (**start_time** for example) of a column are incremental:

  For example, if data is loaded to CarbonData every day, **start_time** is incremental for each load. In this case, it is recommended that the **start_time** column be put at the end of **sort_columns**, because incremental values are efficient in using min/max index. The command for creating a table is as follows:

```
create table carbondata_table(
    Dime_1 String,
    HOST String,
    MSISDN String,
    counter_1 double,
    counter_2 double,
    BEGIN_TIME bigint,
    ...
    counter_100 double,
    )STORED AS carbondata
    TBLPROPERTIES ( 'SORT_COLUMS'='dime_2,dime_3,dime_1..BEGIN_TIME');
```

12.3.4.3 Configurations for Performance Tuning

Scenario

This section describes the configurations that can improve CarbonData performance.

Procedure

Table 12-17 and **Table 12-18** describe the configurations about query of CarbonData.

Table 12-17 Number of tasks started for the shuffle process

Parameter	spark.sql.shuffle.partitions
Configuration File	spark-defaults.conf
Function	Data query
Scenario Description	Number of tasks started for the shuffle process in Spark
Tuning	You are advised to set this parameter to one to two times as much as the executor cores. In an aggregation scenario, reducing the number from 200 to 32 can reduce the query time by two folds.

Table 12-18 Number of executors and vCPUs, and memory size used for CarbonData data query

Parameter	spark.executor.cores spark.executor.instances spark.executor.memory
Configuration File	spark-defaults.conf
Function	Data query
Scenario Description	Number of executors and vCPUs, and memory size used for CarbonData data query
Tuning	In the bank scenario, configuring 4 vCPUs and 15 GB memory for each executor will achieve good performance. The two values do not mean the more the better. Configure the two values properly in case of limited resources. If each node has 32 vCPUs and 64 GB memory in the bank scenario, the memory is not sufficient. If each executor has 4 vCPUs and 12 GB memory, Garbage Collection may occur during query, time spent on query from increases from 3s to more than 15s. In this case, you need to increase the memory or reduce the number of vCPUs.

Table 12-19, **Table 12-20**, and **Table 12-21** describe the configurations for CarbonData data loading.

Table 12-19 Number of vCPUs used for data loading

Parameter	carbon.number.of.cores.while.loading

Configuration File	carbon.properties
Function	Data loading
Scenario Description	Number of vCPUs used for data processing during data loading in CarbonData
Tuning	If there are sufficient CPUs, you can increase the number of vCPUs to improve performance. For example, if the value of this parameter is changed from 2 to 4, the CSV reading performance can be doubled.

Table 12-20 Whether to use Yarn local directories for multi-disk data loading

Parameter	carbon.use.local.dir
Configuration File	carbon.properties
Function	Data loading
Scenario Description	Whether to use Yarn local directories for multi-disk data loading
Tuning	If this parameter is set to **true**, CarbonData uses local Yarn directories for multi-table load disk load balance, improving data loading performance.

Table 12-21 Whether to use multiple directories during loading

Parameter	carbon.use.multiple.temp.dir
Configuration File	carbon.properties
Function	Data loading
Scenario Description	Whether to use multiple temporary directories to store temporary sort files
Tuning	If this parameter is set to **true**, multiple temporary directories are used to store temporary sort files during data loading. This configuration improves data loading performance and prevents single points of failure (SPOFs) on disks.

Table 12-22 describes the configurations for CarbonData data loading and query.

Table 12-22 Number of vCPUs used for data loading and query

Parameter	carbon.compaction.level.threshold
Configuration File	carbon.properties
Function	Data loading and query
Scenario Description	For minor compaction, specifies the number of segments to be merged in stage 1 and number of compacted segments to be merged in stage 2.
Tuning	Each CarbonData load will create one segment, if every load is small in size, it will generate many small files over a period of time impacting the query performance. Configuring this parameter will merge the small segments to one big segment which will sort the data and improve the performance. The compaction policy depends on the actual data size and available resources. For example, a bank loads data once a day and at night when no query is performed. If resources are sufficient, the compaction policy can be 6 or 5.

Table 12-23 Whether to enable data pre-loading when the index cache server is used

Parameter	carbon.indexserver.enable.prepriming
Configuration File	carbon.properties
Function	Data loading
Scenario Description	Enabling data pre-loading during the use of the index cache server can improve the performance of the first query.
Tuning	You can set this parameter to **true** to enable the pre-loading function. The default value is **false**.

12.3.5 CarbonData Access Control

The following table provides details about Hive ACL permissions required for performing operations on CarbonData tables.

Prerequisites

Parameters listed in **Table 12-9** or **Table 12-10** have been configured.

Hive ACL permissions

Table 12-24 Hive ACL permissions required for CarbonData table-level operations

Scenario	Required Permission
DESCRIBE TABLE	SELECT (of table)
SELECT	SELECT (of table)
EXPLAIN	SELECT (of table)
CREATE TABLE	CREATE (of database)
CREATE TABLE As SELECT	CREATE (on database), INSERT (on table), RW on data file, and SELECT (on table)
LOAD	INSERT (of table) RW on data file
DROP TABLE	OWNER (of table)
DELETE SEGMENTS	DELETE (of table)
SHOW SEGMENTS	SELECT (of table)
CLEAN FILES	DELETE (of table)
INSERT OVERWRITE / INSERT INTO	INSERT (of table) RW on data file and SELECT (of table)
CREATE INDEX	OWNER (of table)
DROP INDEX	OWNER (of table)
SHOW INDEXES	SELECT (of table)
ALTER TABLE ADD COLUMN	OWNER (of table)
ALTER TABLE DROP COLUMN	OWNER (of table)
ALTER TABLE CHANGE DATATYPE	OWNER (of table)
ALTER TABLE RENAME	OWNER (of table)
ALTER TABLE COMPACTION	INSERT (on table)
FINISH STREAMING	OWNER (of table)
ALTER TABLE SET STREAMING PROPERTIES	OWNER (of table)
ALTER TABLE SET TABLE PROPERTIES	OWNER (of table)
UPDATE CARBON TABLE	UPDATE (of table)
DELETE RECORDS	DELETE (of table)
REFRESH TABLE	OWNER (of main table)

Scenario	Required Permission
REGISTER INDEX TABLE	OWNER (of table)
SHOW PARTITIONS	SELECT (on table)
ALTER TABLE ADD PARTITION	OWNER (of table)
ALTER TABLE DROP PARTITION	OWNER (of table)

NOTE

- If tables in the database are created by multiple users, the **Drop database** command fails to be executed even if the user who runs the command is the owner of the database.
- In a secondary index, when the parent table is triggered, **insert** and **compaction** are triggered on the index table. If you select a query that has a filter condition that matches index table columns, you should provide selection permissions for the parent table and index table.
- The LockFiles folder and lock files created in the LockFiles folder will have full permissions, as the LockFiles folder does not contain any sensitive data.
- If you are using ACL, ensure you do not configure any path for DDL or DML which is being used by other process. You are advised to create new paths.

  Configure the path for the following configuration items:

  1) carbon.badRecords.location

  2) Db_Path and other items during database creation
- For Carbon ACL in a non-security cluster, **hive.server2.enable.doAs** in the **hive-site.xml** file must be set to **false**. Then the query will run as the user who runs the hiveserver2 process.

12.3.6 CarbonData Syntax Reference

12.3.6.1 DDL

12.3.6.1.1 CREATE TABLE

Function

This command is used to create a CarbonData table by specifying the list of fields along with the table properties.

Syntax

CREATE TABLE *[IF NOT EXISTS] [db_name.]table_name*

[(col_name data_type, ...)]

STORED AS *carbondata*

[TBLPROPERTIES (property_name=property_value, ...)];

Additional attributes of all tables are defined in **TBLPROPERTIES**.

Parameter Description

Table 12-25 CREATE TABLE parameters

Parameter	Description
db_name	Database name that contains letters, digits, and underscores (_).
col_name data_type	List with data types separated by commas (,). The column name contains letters, digits, and underscores (_). **NOTE** When creating a CarbonData table, do not use tupleId, PositionId, and PositionReference as column names because columns with these names are internally used by secondary index commands.
table_name	Table name of a database that contains letters, digits, and underscores (_).
STORED AS	The **carbondata** parameter defines and creates a CarbonData table.
TBLPROPERTIES	List of CarbonData table properties.

Precautions

Table attributes are used as follows:

- Block size

  The block size of a data file can be defined for a single table using **TBLPROPERTIES**. The larger one between the actual size of the data file and the defined block size is selected as the actual block size of the data file in HDFS. The unit is MB. The default value is 1024 MB. The value ranges from 1 MB to 2048 MB. If the value is beyond the range, the system reports an error.

  Once the block size reaches the configured value, the write program starts a new block of CarbonData data. Data is written in multiples of the page size (32,000 records). Therefore, the boundary is not strict at the byte level. If the new page crosses the boundary of the configured block, the page is written to the new block instead of the current block.

  TBLPROPERTIES('table_blocksize'='128')

  NOTE

  - If a small block size is configured in the CarbonData table while the size of the data file generated by the loaded data is large, the block size displayed in HDFS is different from the configured value. This is because when data is written to a local block file for the first time, even though the size of the to-be-written data is larger than the configured value of the block size, data will still be written into the block. Therefore, the actual value of block size in HDFS is the larger value between the size of the data to be written and the configured block size.
  - If **block.num** is less than the parallelism, the blocks are split into new blocks so that new blocks.num is greater than parallelism and all cores can be used. This optimization is called block distribution.

- **SORT_SCOPE** specifies the sort scope during table creation. There are four types of sort scopes:
  - **GLOBAL_SORT**: It improves query performance, especially for point queries. *TBLPROPERTIES('SORT_SCOPE'='GLOBAL_SORT'*)
  - **LOCAL_SORT**: Data is sorted locally (task-level sorting).
  - **NO_SORT**: The default sorting mode is used. Data is loaded in unsorted manner, which greatly improves loading performance.
- SORT_COLUMNS

  This table property specifies the order of sort columns.

  TBLPROPERTIES('SORT_COLUMNS'='column1, column3')

  NOTE

  - If this attribute is not specified, no columns are sorted by default.
  - If this property is specified but with empty argument, then the table will be loaded without sort. For example, *('SORT_COLUMNS'='')*.
  - **SORT_COLUMNS** supports the string, date, timestamp, short, int, long, byte, and boolean data types.
- RANGE_COLUMN

  This property is used to specify a column to partition the input data by range. Only one column can be configured. During data import, you can use **global_sort_partitions** or **scale_factor** to avoid generating small files.

  TBLPROPERTIES('RANGE_COLUMN'='column1')
- LONG_STRING_COLUMNS

  The length of a common string cannot exceed 32,000 characters. To store a string of more than 32,000 characters, set **LONG_STRING_COLUMNS** to the target column.

  TBLPROPERTIES('LONG_STRING_COLUMNS'='column1, column3')

  NOTE

  LONG_STRING_COLUMNS can be set only for columns of the STRING, CHAR, or VARCHAR type.

Scenarios

Creating a Table by Specifying Columns

The **CREATE TABLE** command is the same as that of Hive DDL. The additional configurations of CarbonData are provided as table properties.

CREATE TABLE *[IF NOT EXISTS] [db_name.]table_name*

[(col_name data_type , ...)]

STORED AS *carbondata*

[TBLPROPERTIES (property_name=property_value, ...)];

Examples

CREATE TABLE *IF NOT EXISTS productdb.productSalesTable (*

productNumber Int,

productName String,

storeCity String,

storeProvince String,

productCategory String,

productBatch String,

saleQuantity Int,

revenue Int)

STORED AS carbondata

TBLPROPERTIES (

'table_blocksize'='128',

'SORT_COLUMNS'='productBatch, productName')

System Response

A table will be created and the success message will be logged in system logs.

12.3.6.1.2 CREATE TABLE As SELECT

Function

This command is used to create a CarbonData table by specifying the list of fields along with the table properties.

Syntax

CREATE TABLE *[IF NOT EXISTS] [db_name.]table_name* ***STORED AS carbondata*** *[TBLPROPERTIES (key1=val1, key2=val2, ...)] AS select_statement;*

Parameter Description

Table 12-26 CREATE TABLE parameters

Parameter	Description
db_name	Database name that contains letters, digits, and underscores (_).
table_name	Table name of a database that contains letters, digits, and underscores (_).
STORED AS	Used to store data in CarbonData format.
TBLPROPERTIES	List of CarbonData table properties. For details, see **Precautions**.

Precautions

N/A

Examples

CREATE TABLE ctas_select_parquet ***STORED AS*** carbondata as select * from parquet_ctas_test;

System Response

This example will create a Carbon table from any Parquet table and load all the records from the Parquet table.

12.3.6.1.3 DROP TABLE

Function

This command is used to delete an existing table.

Syntax

DROP TABLE *[IF EXISTS] [db_name.]table_name;*

Parameter Description

Table 12-27 DROP TABLE parameters

Parameter	Description
db_name	Database name. If this parameter is not specified, the current database is selected.
table_name	Name of the table to be deleted

Precautions

In this command, **IF EXISTS** and **db_name** are optional.

Example

DROP TABLE IF EXISTS productDatabase.productSalesTable;

System Response

The table will be deleted.

12.3.6.1.4 SHOW TABLES

Function

SHOW TABLES command is used to list all tables in the current or a specific database.

Syntax

SHOW TABLES *[IN db_name];*

Parameter Description

Table 12-28 SHOW TABLE parameters

Parameter	Description
IN db_name	Name of the database. This parameter is required only when tables of this specific database are to be listed.

Usage Guidelines

IN db_Name is optional.

Examples

SHOW TABLES IN ProductDatabase;

System Response

All tables are listed.

12.3.6.1.5 ALTER TABLE COMPACTION

Function

The **ALTER TABLE COMPACTION** command is used to merge a specified number of segments into a single segment. This improves the query performance of a table.

Syntax

ALTER TABLE*[db_name.]table_name COMPACT 'MINOR/MAJOR/ SEGMENT_INDEX';*

ALTER TABLE*[db_name.]table_name COMPACT 'CUSTOM' WHERE SEGMENT.ID IN (id1, id2, ...);*

Parameter Description

Table 12-29 ALTER TABLE COMPACTION parameters

Parameter	Description
db_name	Database name. If this parameter is not specified, the current database is selected.
table_name	Table name.
MINOR	Minor compaction. For details, see **Combining Segments**.
MAJOR	Major compaction. For details, see **Combining Segments**.
SEGMENT_INDEX	This configuration enables you to merge all the CarbonData index files (**.carbonindex**) inside a segment to a single CarbonData index merge file (**.carbonindexmerge**). This enhances the first query performance. For more information, see **Table 12-14**.
CUSTOM	Custom compaction. For details, see **Combining Segments**.

Precautions

N/A

Examples

ALTER TABLE ProductDatabase COMPACT 'MINOR';

ALTER TABLE ProductDatabase COMPACT 'MAJOR';

ALTER TABLE ProductDatabase COMPACT 'SEGMENT_INDEX';

ALTER TABLE ProductDatabase COMPACT 'CUSTOM' WHERE SEGMENT.ID IN (0, 1);

System Response

ALTER TABLE COMPACTION does not show the response of the compaction because it is run in the background.

If you want to view the response of minor and major compactions, you can check the logs or run the ***SHOW SEGMENTS*** command.

Example:

```
+------+------------+--------------------------+------------------+------------+------------+-------------+--------------
+--+
|  ID  |   Status   |     Load Start Time      | Load Time Taken  | Partition  | Data Size  | Index Size  | File
Format  |
+------+------------+--------------------------+------------------+------------+------------+-------------+--------------
+--+
| 3    | Success    | 2020-09-28 22:53:26.336  | 3.726S           | {}         | 6.47KB     | 3.30KB      | columnar_v3  |
| 2    | Success    | 2020-09-28 22:53:01.702  | 6.688S           | {}         | 6.47KB     | 3.30KB      | columnar_v3  |
| 1    | Compacted  | 2020-09-28 22:51:15.242  | 5.82S            | {}         | 6.50KB     | 3.43KB      |
```

```
columnar_v3  |
| 0.1  | Success    | 2020-10-30 20:49:24.561  | 16.66S          | {}        | 12.87KB    | 6.91KB      | columnar_v3
|
| 0    | Compacted  | 2020-09-28 22:51:02.6    | 6.819S          | {}        | 6.50KB     | 3.43KB      | columnar_v3
|
+------+------------+--------------------------+-----------------+-----------+------------+-------------+-------------
+--+
```

In the preceding information:

- **Compacted** indicates that data has been compacted.
- **0.1** indicates the compacting result of segment 0 and segment 1.

The compact operation does not incur any change to other operations.

Compacted segments, such as segment 0 and segment 1, become useless. To save space, before you perform other operations, run the ***CLEAN FILES*** command to delete compacted segments. For more information about the **CLEAN FILES** command, see **CLEAN FILES**.

12.3.6.1.6 TABLE RENAME

Function

This command is used to rename an existing table.

Syntax

ALTER TABLE *[db_name.]table_name* **RENAME TO** *new_table_name*;

Parameter Description

Table 12-30 RENAME parameters

Parameter	Description
db_name	Database name. If this parameter is not specified, the current database is selected.
table_name	Current name of the existing table
new_table_name	New name of the existing table

Precautions

- Parallel queries (using table names to obtain paths for reading CarbonData storage files) may fail during this operation.
- The secondary index table cannot be renamed.

Example

ALTER TABLE *carbon* **RENAME TO** *carbondata*;

ALTER TABLE *test_db.carbon* **RENAME TO** *test_db.carbondata*;

System Response

The new table name will be displayed in the CarbonData folder. You can run **SHOW TABLES** to view the new table name.

12.3.6.1.7 ADD COLUMNS

Function

This command is used to add a column to an existing table.

Syntax

ALTER TABLE *[db_name.]table_name* **ADD COLUMNS** *(col_name data_type,...)* **TBLPROPERTIES***(''COLUMNPROPERTIES.columnName.shared_column'='sharedFolder.sharedColumnName,...', 'DEFAULT.VALUE.COLUMN_NAME'='default_value')*;

Parameter Description

Table 12-31 ADD COLUMNS parameters

Parameter	Description
db_name	Database name. If this parameter is not specified, the current database is selected.
table_name	Table name.
col_name data_type	Name of a comma-separated column with a data type. It consists of letters, digits, and underscores (_). **NOTE** When creating a CarbonData table, do not name columns as tupleId, PositionId, and PositionReference because they will be used in UPDATE, DELETE, and secondary index commands.

Precautions

- Only **shared_column** and **default_value** are read. If any other property name is specified, no error will be thrown and the property will be ignored.
- If no default value is specified, the default value of the new column is considered null.
- If filter is applied to the column, new columns will not be added during sort. New columns may affect query performance.

Examples

- **ALTER TABLE** *carbon* **ADD COLUMNS** *(a1 INT, b1 STRING)*;
- **ALTER TABLE** *carbon* **ADD COLUMNS** *(a1 INT, b1 STRING)* **TBLPROPERTIES***('COLUMNPROPERTIES.b1.shared_column'='sharedFolder.b1')*;
- ALTER TABLE *carbon* **ADD COLUMNS** *(a1 INT, b1 STRING)* **TBLPROPERTIES***('DEFAULT.VALUE.a1'='10')*;

System Response

The newly added column can be displayed by running the **DESCRIBE** command.

12.3.6.1.8 DROP COLUMNS

Function

This command is used to delete one or more columns from a table.

Syntax

ALTER TABLE *[db_name.]table_name* **DROP COLUMNS** *(col_name, ...)*;

Parameter Description

Table 12-32 DROP COLUMNS parameters

Parameter	Description
db_name	Database name. If this parameter is not specified, the current database is selected.
table_name	Table name.
col_name	Name of a column in a table. Multiple columns are supported. It consists of letters, digits, and underscores (_).

Precautions

After a column is deleted, at least one key column must exist in the schema. Otherwise, an error message is displayed, and the column fails to be deleted.

Examples

Assume that the table contains four columns named a1, b1, c1, and d1.

- Delete a column:
  ALTER TABLE *carbon* **DROP COLUMNS** *(b1)*;
  ALTER TABLE *test_db.carbon* **DROP COLUMNS** *(b1)*;
- Delete multiple columns:
  ALTER TABLE *carbon* **DROP COLUMNS** *(b1,c1)*;
  ALTER TABLE *test_db.carbon* **DROP COLUMNS** *(b1,c1)*;

System Response

If you run the **DESCRIBE** command, the deleted columns will not be displayed.

12.3.6.1.9 CHANGE DATA TYPE

Function

This command is used to change the data type from INT to BIGINT or decimal precision from lower to higher.

Syntax

ALTER TABLE *[db_name.]table_name* **CHANGE** *col_name col_name changed_column_type*;

Parameter Description

Table 12-33 CHANGE DATA TYPE parameters

Parameter	Description
db_name	Name of the database. If this parameter is left unspecified, the current database is selected.
table_name	Name of the table.
col_name	Name of columns in a table. Column names contain letters, digits, and underscores (_).
changed_column_type	The change in the data type.

Usage Guidelines

- Change of decimal data type from lower precision to higher precision will only be supported for cases where there is no data loss.

  Example:

  - **Invalid scenario** - Change of decimal precision from (10,2) to (10,5) is not valid as in this case only scale is increased but total number of digits remain the same.
  - **Valid scenario** - Change of decimal precision from (10,2) to (12,3) is valid as the total number of digits are increased by 2 but scale is increased only by 1 which will not lead to any data loss.
- The allowed range is 38,38 (precision, scale) and is a valid upper case scenario which is not resulting in data loss.

Examples

- Changing data type of column a1 from INT to BIGINT.

  ALTER TABLE *test_db.carbon* **CHANGE** *a1 a1 BIGINT*;
- Changing decimal precision of column a1 from 10 to 18.

  ALTER TABLE *test_db.carbon* **CHANGE** *a1 a1 DECIMAL(18,2)*;

System Response

By running DESCRIBE command, the changed data type for the modified column is displayed.

12.3.6.1.10 REFRESH TABLE

Function

This command is used to register Carbon table to Hive meta store catalogue from exisiting Carbon table data.

Syntax

REFRESH TABLE *db_name.table_name*;

Parameter Description

Table 12-34 REFRESH TABLE parameters

Parameter	Description
db_name	Name of the database. If this parameter is left unspecified, the current database is selected.
table_name	Name of the table.

Usage Guidelines

- The new database name and the old database name should be same.
- Before executing this command the old table schema and data should be copied into the new database location.
- If the table is aggregate table, then all the aggregate tables should be copied to the new database location.
- For old store, the time zone of the source and destination cluster should be same.
- If old cluster used HIVE meta store to store schema, refresh will not work as schema file does not exist in file system.

Examples

REFRESH TABLE *dbcarbon.productSalesTable*;

System Response

By running this command, the Carbon table will be registered to Hive meta store catalogue from exisiting Carbon table data.

12.3.6.1.11 REGISTER INDEX TABLE

Function

This command is used to register an index table with the primary table.

Syntax

REGISTER INDEX TABLE *indextable_name* ON *db_name.maintable_name*;

Parameter Description

Table 12-35 REFRESH INDEX TABLE parameters

Parameter	Description
db_name	Database name. If this parameter is not specified, the current database is selected.
indextable_name	Index table name.
maintable_name	Primary table name.

Precautions

Before running this command, run **REFRESH TABLE** to register the primary table and secondary index table with the Hive metastore.

Examples

create database productdb;

use productdb;

CREATE TABLE productSalesTable(a int,b string,c string) stored as carbondata;

create index productNameIndexTable on table productSalesTable(c) as 'carbondata';

insert into table productSalesTable select 1,'a','aaa';

create database productdb2;

Run the **hdfs** command to copy **productSalesTable** and **productNameIndexTable** in the **productdb** database to the **productdb2** database.

refresh table productdb2.productSalesTable ;

refresh table productdb2.productNameIndexTable ;

explain select * from productdb2.productSalesTable where c = 'aaa'; / The query command does not use an index table.

REGISTER INDEX TABLE productNameIndexTable ON productdb2.productSalesTable;

explain select * from productdb2.productSalesTable where c = 'aaa'; // The query command uses an index table.

System Response

By running this command, the index table will be registered to the primary table.

12.3.6.2 DML

12.3.6.2.1 LOAD DATA

Function

This command is used to load user data of a particular type, so that CarbonData can provide good query performance.

NOTE

Only the raw data on HDFS can be loaded.

Syntax

LOAD DATA *INPATH 'folder_path' INTO TABLE [db_name.]table_name OPTIONS(property_name=property_value, ...);*

Parameter Description

Table 12-36 LOAD DATA parameters

Parameter	Description
folder_path	Path of the file or folder used for storing the raw CSV data.
db_name	Database name. If this parameter is not specified, the current database is used.
table_name	Name of a table in a database.

Precautions

The following configuration items are involved during data loading:

- **DELIMITER**: Delimiters and quote characters provided in the load command. The default value is a comma (**,**).

  OPTIONS('DELIMITER'=',' , 'QUOTECHAR'='"')

  You can use **'DELIMITER'='\t'** to separate CSV data using tabs.

  OPTIONS('DELIMITER'='\t')

  CarbonData also supports **\001** and **\017** as delimiters.

> NOTE
>
> When the delimiter of CSV data is a single quotation mark ('), the single quotation mark must be enclosed in double quotation marks (" "). For example, 'DELIMITER'= "'".

- **QUOTECHAR**: Delimiters and quote characters provided in the load command. The default value is double quotation marks (**"**).

  OPTIONS('DELIMITER'=',' , 'QUOTECHAR'='"')

- **COMMENTCHAR**: Comment characters provided in the load command. During data loading, if there is a comment character at the beginning of a line, the line is regarded as a comment line and data in the line will not be loaded. The default value is a pound key (#).

  OPTIONS('COMMENTCHAR'='#')

- **FILEHEADER**: If the source file does not contain any header, add a header to the **LOAD DATA** command.

  OPTIONS('FILEHEADER'='column1,column2')

- **ESCAPECHAR**: Is used to perform strict verification of the escape character on CSV files. The default value is backslash (****).

  OPTIONS('ESCAPECHAR'='\')

  > NOTE
  >
  > Enter **ESCAPECHAR** in the CSV data. **ESCAPECHAR** must be enclosed in double quotation marks (" "). For example, "a\b".

- Bad records handling:

  In order for the data processing application to provide benefits, certain data integration is required. In most cases, data quality problems are caused by data sources.

  Methods of handling bad records are as follows:

  – Load all of the data before dealing with the errors.

  – Clean or delete bad records before loading data or stop the loading when bad records are found.

  There are many options for clearing source data during CarbonData data loading, as listed in **Table 12-37**.

Table 12-37 Bad Records Logger

Configuration Item	Default Value	Description
BAD_RECORDS_LOGGER_ENABLE	false	Whether to create logs with details about bad records

Configuration Item	Default Value	Description
BAD_RECORDS_ACTION	FAIL	The four types of actions for bad records are as follows: • **FORCE**: Auto-corrects the data by storing the bad records as NULL. • **REDIRECT**: Bad records are written to the raw CSV instead of being loaded. • **IGNORE**: Bad records are neither loaded nor written to the raw CSV. • **FAIL**: Data loading fails if any bad records are found. **NOTE** In loaded data, if all records are bad records, **BAD_RECORDS_ACTION** is invalid and the load operation fails.
IS_EMPTY_DATA_BAD_RECORD	false	Whether empty data of a column to be considered as bad record or not. If this parameter is set to **false**, empty data ("",', or,) is not considered as bad records. If this parameter is set to **true**, empty data is considered as bad records.
BAD_RECORD_PATH	-	HDFS path where bad records are stored. The default value is **Null**. If bad records logging or bad records operation redirection is enabled, the path must be configured by the user.

Example:

LOAD DATA INPATH *'filepath.csv'* **INTO TABLE** *tablename OPTIONS('BAD_RECORDS_LOGGER_ENABLE'='true', 'BAD_RECORD_PATH'='hdfs://hacluster/tmp/carbon', 'BAD_RECORDS_ACTION'='REDIRECT', 'IS_EMPTY_DATA_BAD_RECORD'='false');*

NOTE

If **REDIRECT** is used, CarbonData will add all bad records into a separate CSV file. However, this file must not be used for subsequent data loading because the content may not exactly match the source record. You must clean up the source record for further data ingestion. This option is used to remind you which records are bad.

- **MAXCOLUMNS**: (Optional) Specifies the maximum number of columns parsed by a CSV parser in a line.

OPTIONS('MAXCOLUMNS'='400')

Table 12-38 MAXCOLUMNS

Name of the Optional Parameter	Default Value	Maximum Value
MAXCOLUMNS	2000	20000

Table 12-39 Behavior chart of MAXCOLUMNS

MAXCOLUMNS Value	Number of Columns in the File Header	Final Value Considered
Not specified in Load options	5	2000
Not specified in Load options	6000	6000
40	7	Max (column count of file header, MAXCOLUMNS value)
22000	40	20000
60	Not specified in Load options	Max (Number of columns in the first line of the CSV file, MAXCOLUMNS value)

NOTE

There must be sufficient executor memory for setting the maximum value of **MAXCOLUMNS Option**. Otherwise, data loading will fail.

- If **SORT_SCOPE** is set to **GLOBAL_SORT** during table creation, you can specify the number of partitions to be used when sorting data. If this parameter is not set or is set to a value less than **1**, the number of map tasks is used as the number of reduce tasks. It is recommended that each reduce task process 512 MB to 1 GB data.

  OPTIONS('GLOBAL_SORT_PARTITIONS'='2')

  NOTE

  To increase the number of partitions, you may need to increase the value of **spark.driver.maxResultSize**, as the sampling data collected in the driver increases with the number of partitions.

- **DATEFORMAT**: Specifies the date format of the table.

  OPTIONS('DATEFORMAT'='dateFormat')

NOTE

Date formats are specified by date pattern strings. The date pattern letters in Carbon are same as in JAVA.

- **TIMESTAMPFORMAT**: Specifies the timestamp of a table.
- *OPTIONS('TIMESTAMPFORMAT'='timestampFormat')*
- **SKIP_EMPTY_LINE**: Ignores empty rows in the CSV file during data loading.

  OPTIONS('SKIP_EMPTY_LINE'='TRUE/FALSE')
- **Optional: SCALE_FACTOR**: Used to control the number of partitions for **RANGE_COLUMN**, **SCALE_FACTOR**. The formula is as follows:

  ```
  splitSize = max(blocklet_size, (block_size - blocklet_size)) * scale_factor
  numPartitions = total size of input data / splitSize
  ```

  The default value is **3**. The value ranges from **1** to **300**.

  OPTIONS('SCALE_FACTOR'='10')

  NOTE

  - If **GLOBAL_SORT_PARTITIONS** and **SCALE_FACTOR** are used at the same time, only **GLOBAL_SORT_PARTITIONS** is valid.
  - The compaction on **RANGE_COLUMN** will use **LOCAL_SORT** by default.

Scenarios

To load a CSV file to a CarbonData table, run the following statement:

LOAD DATA *INPATH 'folder path' INTO TABLE tablename OPTIONS(property_name=property_value, ...);*

Examples

The data in the **data.csv** file is as follows:

```
ID,date,country,name,phonetype,serialname,salary
4,2014-01-21 00:00:00,xxx,aaa4,phone2435,ASD66902,15003
5,2014-01-22 00:00:00,xxx,aaa5,phone2441,ASD90633,15004
6,2014-03-07 00:00:00,xxx,aaa6,phone294,ASD59961,15005
```

CREATE TABLE carbontable(ID int, date Timestamp, country String, name String, phonetype String, serialname String,salary int) STORED AS carbondata;

LOAD DATA *inpath 'hdfs://hacluster/tmp/data.csv' INTO table carbontable*

options('DELIMITER'=',');

System Response

Success or failure will be recorded in the driver logs.

12.3.6.2.2 UPDATE CARBON TABLE

Function

This command is used to update the CarbonData table based on the column expression and optional filtering conditions.

Syntax

- Syntax 1:

  UPDATE <CARBON TABLE> SET (column_name1, column_name2, ... column_name n) = (column1_expression , column2_expression , column3_expression ... column n_expression) [WHERE { <filter_condition> }];

- Syntax 2:

  UPDATE <CARBON TABLE> SET (column_name1, column_name2,) = (select sourceColumn1, sourceColumn2 from sourceTable [WHERE { <filter_condition> }]) [WHERE { <filter_condition> }];

Parameter Description

Table 12-40 UPDATE parameters

Parameter	Description
CARBON TABLE	Name of the CarbonData table to be updated
column_name	Target column to be updated
sourceColumn	Column value of the source table that needs to be updated in the target table
sourceTable	Table from which the records are updated to the target table

Precautions

Note the following before running this command:

- The UPDATE command fails if multiple input rows in the source table are matched with a single row in the target table.
- If the source table generates empty records, the UPDATE operation completes without updating the table.
- If rows in the source table do not match any existing rows in the target table, the UPDATE operation completes without updating the table.
- UPDATE is not allowed in the table with secondary index.
- In a subquery, if the source table and target table are the same, the UPDATE operation fails.
- The UPDATE operation fails if the subquery used in the UPDATE command contains an aggregate function or a GROUP BY clause.

  For example, **update t_carbn01 a set (a.item_type_code, a.profit) = (select b.item_type_cd, sum(b.profit) from t_carbn01b b where item_type_cd =2 group by item_type_code);**.

  In the preceding example, aggregate function **sum(b.profit)** and GROUP BY clause are used in the subquery. As a result, the UPDATE operation will fail.

- If the **carbon.input.segments** property has been set for the queried table, the UPDATE operation fails. To solve this problem, run the following statement before the query:

Syntax:

SET carbon.input.segments. <database_name>. <table_name>=*;

Examples

- Example 1:

  update carbonTable1 d set (d.column3,d.column5) = (select s.c33 ,s.c55 from sourceTable1 s where d.column1 = s.c11) where d.column1 = 'country' exists(select * from table3 o where o.c2 > 1);

- Example 2:

  update carbonTable1 d set (c3) = (select s.c33 from sourceTable1 s where d.column1 = s.c11) where exists(select * from iud.other o where o.c2 > 1);

- Example 3:

  update carbonTable1 set (c2, c5) = (c2 + 1, concat(c5 , "y"));

- Example 4:

  update carbonTable1 d set (c2, c5) = (c2 + 1, "xyx") where d.column1 = 'india';

- Example 5:

  update carbonTable1 d set (c2, c5) = (c2 + 1, "xyx") where d.column1 = 'india' and exists(select * from table3 o where o.column2 > 1);

System Response

Success or failure will be recorded in the driver log and on the client.

12.3.6.2.3 DELETE RECORDS from CARBON TABLE

Function

This command is used to delete records from a CarbonData table.

Syntax

DELETE FROM CARBON_TABLE [WHERE expression];

Parameter Description

Table 12-41 DELETE RECORDS parameters

Parameter	Description
CARBON TABLE	Name of the CarbonData table in which the DELETE operation is performed

Precautions

- If a segment is deleted, all secondary indexes associated with the segment are deleted as well.

- If the **carbon.input.segments** property has been set for the queried table, the DELETE operation fails. To solve this problem, run the following statement before the query:

  Syntax:

  SET carbon.input.segments. <database_name>.<table_name>=*;

Examples

- Example 1:

  delete from columncarbonTable1 d where d.column1 = 'country';

- Example 2:

  delete from dest where column1 IN ('country1', 'country2');

- Example 3:

  delete from columncarbonTable1 where column1 IN (select column11 from sourceTable2);

- Example 4:

  delete from columncarbonTable1 where column1 IN (select column11 from sourceTable2 where column1 = '*');**

- Example 5:

  delete from columncarbonTable1 where column2 >= 4;

System Response

Success or failure will be recorded in the driver log and on the client.

12.3.6.2.4 INSERT INTO CARBON TABLE

Function

This command is used to add the output of the SELECT command to a Carbon table.

Syntax

INSERT INTO [CARBON TABLE] [select query];

Parameter Description

Table 12-42 INSERT INTO parameters

Parameter	Description
CARBON TABLE	Name of the CarbonData table to be inserted
select query	SELECT query on the source table (CarbonData, Hive, and Parquet tables are supported)

Precautions

- A table has been created.
- You must belong to the data loading group in order to perform data loading operations. By default, the data loading group is named **ficommon**.
- CarbonData tables cannot be overwritten.
- The data type of the source table and the target table must be the same. Otherwise, data in the source table will be regarded as bad records.
- The **INSERT INTO** command does not support partial success. If bad records exist, the command fails.
- When you insert data of the source table to the target table, you cannot upload or update data of the source table.

  To enable data loading or updating during the INSERT operation, set the following parameter to **true**.

  carbon.insert.persist.enable=**true**

  By default, the preceding parameters are set to **false**.

  NOTE

  Enabling this property will reduce the performance of the INSERT operation.

Example

create table carbon01(a int,b string,c string) stored as carbondata;

insert into table carbon01 values(1,'a','aa'),(2,'b','bb'),(3,'c','cc');

create table carbon02(a int,b string,c string) stored as carbondata;

INSERT INTO carbon02 select * from carbon01 where a > 1;

System Response

Success or failure will be recorded in the driver logs.

12.3.6.2.5 DELETE SEGMENT by ID

Function

This command is used to delete segments by the ID.

Syntax

DELETE FROM TABLE db_name.table_name WHERE SEGMENT.ID IN (segment_id1,segment_id2);

Parameter Description

Table 12-43 DELETE SEGMENT parameters

Parameter	Description
segment_id	ID of the segment to be deleted.
db_name	Database name. If the parameter is not specified, the current database is used.
table_name	The name of the table in a specific database.

Usage Guidelines

Segments cannot be deleted from the stream table.

Examples

DELETE FROM TABLE CarbonDatabase.CarbonTable WHERE SEGMENT.ID IN (0);

DELETE FROM TABLE CarbonDatabase.CarbonTable WHERE SEGMENT.ID IN (0,5,8);

System Response

Success or failure will be recorded in the CarbonData log.

12.3.6.2.6 DELETE SEGMENT by DATE

Function

This command is used to delete segments by loading date. Segments created before a specific date will be deleted.

Syntax

DELETE FROM TABLE db_name.table_name WHERE SEGMENT.STARTTIME BEFORE date_value;

Parameter Description

Table 12-44 DELETE SEGMENT by DATE parameters

Parameter	Description
db_name	Database name. If this parameter is not specified, the current database is used.
table_name	Name of a table in the specified database

Parameter	Description
date_value	Valid date when segments are started to be loaded. Segments before the date will be deleted.

Precautions

Segments cannot be deleted from the stream table.

Example

DELETE FROM TABLE db_name.table_name WHERE SEGMENT.STARTTIME BEFORE '2017-07-01 12:07:20';

STARTTIME indicates the loading start time of different loads.

System Response

Success or failure will be recorded in CarbonData logs.

12.3.6.2.7 SHOW SEGMENTS

Function

This command is used to list the segments of a CarbonData table.

Syntax

SHOW SEGMENTS FOR TABLE *[db_name.]table_name* **LIMIT** *number_of_loads;*

Parameter Description

Table 12-45 SHOW SEGMENTS FOR TABLE parameters

Parameter	Description
db_name	Database name. If this parameter is not specified, the current database is used.
table_name	Name of a table in the specified database
number_of_loads	Threshold of records to be listed

Precautions

None

Examples

create table carbon01(a int,b string,c string) stored as carbondata;

insert into table carbon01 select 1,'a','aa';

insert into table carbon01 select 2,'b','bb';

insert into table carbon01 select 3,'c','cc';

SHOW SEGMENTS FOR TABLE carbon01 LIMIT 2;

System Response

```
+-----+----------+--------------------------+------------------+------------+------------+-------------+--------------+--
+
| ID  |  Status  |     Load Start Time      | Load Time Taken  | Partition  | Data Size  | Index Size  | File Format  |
+-----+----------+--------------------------+------------------+------------+------------+-------------+--------------+--
+
| 3   | Success  | 2020-09-28 22:53:26.336  | 3.726S           | {}         | 6.47KB     | 3.30KB      | columnar_v3  |
| 2   | Success  | 2020-09-28 22:53:01.702  | 6.688S           | {}         | 6.47KB     | 3.30KB      | columnar_v3  |
+-----+----------+--------------------------+------------------+------------+------------+-------------+--------------+--
+
```

12.3.6.2.8 CREATE SECONDARY INDEX

Function

This command is used to create secondary indexes in the CarbonData tables.

Syntax

CREATE INDEX *index_name*

ON TABLE *[db_name.]table_name (col_name1, col_name2)*

AS *'carbondata'*

PROPERTIES *('table_blocksize'='256')*;

Parameter Description

Table 12-46 CREATE SECONDARY INDEX parameters

Parameter	Description
index_name	Index table name. It consists of letters, digits, and special characters (_).
db_name	Database name. It consists of letters, digits, and special characters (_).
table_name	Name of the database table. It consists of letters, digits, and special characters (_).
col_name	Name of a column in a table. Multiple columns are supported. It consists of letters, digits, and special characters (_).
table_blocksize	Block size of a data file. For details, see **•Block Size**.

Precautions

db_name is optional.

Examples

create table productdb.productSalesTable(id int,price int,productName string,city string) stored as carbondata;

CREATE INDEX productNameIndexTable on table productdb.productSalesTable (productName,city) as 'carbondata' ;

In this example, a secondary table named **productdb.productNameIndexTable** is created and index information of the provided column is loaded.

System Response

A secondary index table will be created. Index information related to the provided column will be loaded into the secondary index table. The success message will be recorded in system logs.

12.3.6.2.9 SHOW SECONDARY INDEXES

Function

This command is used to list all secondary index tables in the CarbonData table.

Syntax

SHOW INDEXES ON db_name.table_name;

Parameter Description

Table 12-47 SHOW SECONDARY INDEXES parameters

Parameter	Description
db_name	Database name. It consists of letters, digits, and special characters (_).
table_name	Name of the database table. It consists of letters, digits, and special characters (_).

Precautions

db_name is optional.

Examples

create table productdb.productSalesTable(id int,price int,productName string,city string) stored as carbondata;

CREATE INDEX productNameIndexTable on table productdb.productSalesTable (productName,city) as 'carbondata' ;

SHOW INDEXES ON productdb.productSalesTable;

System Response

All index tables and corresponding index columns in a given CarbonData table will be listed.

12.3.6.2.10 DROP SECONDARY INDEX

Function

This command is used to delete the existing secondary index table in a specific table.

Syntax

DROP INDEX *[IF EXISTS] index_name* **ON** *[db_name.]table_name*;

Parameter Description

Table 12-48 DROP SECONDARY INDEX parameters

Parameter	Description
index_name	Name of the index table. Table name contains letters, digits, and underscores (_).
db_Name	Name of the database. If the parameter is not specified, the current database is used.
table_name	Name of the table to be deleted.

Usage Guidelines

In this command, **IF EXISTS** and **db_name** are optional.

Examples

DROP INDEX *if exists productNameIndexTable* **ON** *productdb.productSalesTable*;

System Response

Secondary Index Table will be deleted. Index information will be cleared in CarbonData table and the success message will be recorded in system logs.

12.3.6.2.11 CLEAN FILES

Function

After the **DELETE SEGMENT** command is executed, the deleted segments are marked as the **delete** state. After the segments are merged, the status of the original segments changes to **compacted**. The data files of these segments are not physically deleted. If you want to forcibly delete these files, run the **CLEAN FILES** command.

However, running this command may result in a query command execution failure.

Syntax

CLEAN FILES FOR TABLE *[db_name.]table_name* ;

Parameter Description

Table 12-49 CLEAN FILES FOR TABLE parameters

Parameter	Description
db_name	Database name. It consists of letters, digits, and underscores (_).
table_name	Name of the database table. It consists of letters, digits, and underscores (_).

Precautions

None

Examples

Add Carbon configuration parameters.

```
carbon.clean.file.force.allowed = true
```

create table carbon01(a int,b string,c string) stored as carbondata;

insert into table carbon01 select 1,'a','aa';

insert into table carbon01 select 2,'b','bb';

delete from table carbon01 where segment.id in (0);

show segments for table carbon01;

CLEAN FILES FOR TABLE carbon01 options('force'='true');

show segments for table carbon01;

In this example, all the segments marked as **deleted** and **compacted** are physically deleted.

System Response

Success or failure will be recorded in the driver logs.

12.3.6.2.12 SET/RESET

Function

This command is used to dynamically add, update, display, or reset the CarbonData properties without restarting the driver.

Syntax

- Add or Update parameter value:

  SET *parameter_name=parameter_value*

  This command is used to add or update the value of **parameter_name**.
- Display property value:

  SET *parameter_name*

  This command is used to display the value of **parameter_name**.
- Display session parameter:

  SET

  This command is used to display all supported session parameters.
- Display session parameters along with usage details:

  SET -v

  This command is used to display all supported session parameters and their usage details.
- Reset parameter value:

  RESET

  This command is used to clear all session parameters.

Parameter Description

Table 12-50 SET parameters

Parameter	Description
parameter_name	Name of the parameter whose value needs to be dynamically added, updated, or displayed
parameter_value	New value of **parameter_name** to be set

Precautions

The following table lists the properties which you can set or clear using the SET or RESET command.

Table 12-51 Properties

Property	Description
carbon.options.bad.records.logger.enable	Whether to enable bad record logger.
carbon.options.bad.records.action	Operations on bad records, for example, force, redirect, fail, or ignore. For more information, see **•Bad record handling**.
carbon.options.is.empty.data.bad.record	Whether the empty data is considered as a bad record. For more information, see **Bad record handling**.
carbon.options.sort.scope	Scope of the sort during data loading.
carbon.options.bad.record.path	HDFS path where bad records are stored.
carbon.custom.block.distribution	Whether to enable Spark or CarbonData block distribution.
enable.unsafe.sort	Whether to use unsafe sort during data loading. Unsafe sort reduces the garbage collection during data loading, thereby achieving better performance.
carbon.si.lookup.partialstring	If this is set to **TRUE**, the secondary index uses the starts-with, ends-with, contains, and LIKE partition condition strings. If this is set to **FALSE**, the secondary index uses only the starts-with partition condition string.

Property	Description
carbon.input.segments	Segment ID to be queried. This property allows you to query a specified segment of a specified table. CarbonScan reads data only from the specified segment ID. Syntax: **carbon.input.segments.<database_name>.<table_name> = <list of segment ids >** If you want to query a specified segment in multi-thread mode, you can use **CarbonSession.threadSet** instead of the **SET** statement. Syntax: **CarbonSession.threadSet ("carbon.input.segments.<database_name>.<table_name>","<list of segment ids >");** **NOTE** You are advised not to set this property in the **carbon.properties** file because all sessions contain the segment list unless session-level or thread-level overwriting occurs.

Examples

- Add or Update:

  SET *enable.unsafe.sort=true*

- Display property value:

  SET *enable.unsafe.sort*

- Show the segment ID list, segment status, and other required details, and specify the segment list to be read:

  SHOW SEGMENTS FOR *TABLE carbontable1;*

  SET *carbon.input.segments.db.carbontable1 = 1, 3, 9;*

- Query a specified segment in multi-thread mode:

  CarbonSession.threadSet (*"carbon.input.segments.default.carbon_table_MulTI_THread", "1,3"*);

- Use **CarbonSession.threadSet** to query segments in a multi-thread environment (Scala code is used as an example):

```
def main(args: Array[String]) {
 Future
{             CarbonSession.threadSet("carbon.input.segments.default.carbon_table_MulTI_THread", "1")
    spark.sql("select count(empno) from carbon_table_MulTI_THread").show()
  }
}
```

- Reset:
  RESET

System Response

- Success will be recorded in the driver log.
- Failure will be displayed on the UI.

12.3.6.3 Operation Concurrent Execution

Before performing **DDL** and **DML** operations, you need to obtain the corresponding locks. See **Table 12-52** for details about the locks that need to be obtained for each operation. The check mark (√) indicates that the lock is required. An operation can be performed only after all required locks are obtained.

You can check whether any two operations can be executed concurrently by using the following method: The first two lines in **Table 12-52** indicate two operations. If no column in the two lines is marked with the check mark (√), the two operations can be executed concurrently. That is, if the columns with check marks (√) in the two lines do not exist, the two operations can be executed concurrently.

Table 12-52 List of obtaining locks for operations

Operation	METADATA_LOCK	COMPACTION_LOCK	DROP_TABLE_LOCK	DELETE_SEGMENT_LOCK	CLEAN_FILES_LOCK	ALTER_PARTITION_LOCK	UPDATE_LOCK	STREAMING_LOCK	CONCURRENT_LOAD_LOCK	SEGMENT_LOCK

12.3.6.4 API

This section describes the APIs and usage methods of Segment. All methods are in the org.apache.spark.util.CarbonSegmentUtil class.

The following methods have been abandoned:

```
/**
* Returns the valid segments for the query based on the filter condition
* present in carbonScanRdd.
*
* @param carbonScanRdd
* @return Array of valid segments
*/
@deprecated def getFilteredSegments(carbonScanRdd: CarbonScanRDD[InternalRow]): Array[String];
```

Usage Method

Use the following methods to obtain CarbonScanRDD from the query statement:

```
val df=carbon.sql("select * from table where age='12'")
val myscan=df.queryExecution.sparkPlan.collect {
case scan: CarbonDataSourceScan if scan.rdd.isInstanceOf[CarbonScanRDD[InternalRow]] => scan.rdd
case scan: RowDataSourceScanExec if scan.rdd.isInstanceOf[CarbonScanRDD[InternalRow]] => scan.rdd
}.head
val carbonrdd=myscan.asInstanceOf[CarbonScanRDD[InternalRow]]
```

Example:

```
CarbonSegmentUtil.getFilteredSegments(carbonrdd)
```

The filtered segment can be obtained by importing SQL statements.

```
/**
* Returns an array of valid segment numbers based on the filter condition provided in the sql
* NOTE: This API is supported only for SELECT Sql (insert into,ctas,.., is not supported)
*
* @param sql
* @param sparkSession
* @return Array of valid segments
* @throws UnsupportedOperationException because Get Filter Segments API supports if and only
* if only one carbon main table is present in query.
*/
def getFilteredSegments(sql: String, sparkSession: SparkSession): Array[String];
```

Example:

```
CarbonSegmentUtil.getFilteredSegments("select * from table where age='12'", sparkSession)
```

Import the database name and table name to obtain the list of segments to be merged. The obtained segments can be used as parameters of the getMergedLoadName function.

```
/**
* Identifies all segments which can be merged with MAJOR compaction type.
* NOTE: This result can be passed to getMergedLoadName API to get the merged load name.
*
* @param sparkSession
* @param tableName
* @param dbName
* @return list of LoadMetadataDetails
*/
def identifySegmentsToBeMerged(sparkSession: SparkSession,
tableName: String,
dbName: String) : util.List[LoadMetadataDetails];
```

Example:

```
CarbonSegmentUtil.identifySegmentsToBeMerged(sparkSession, "table_test","default")
```

Import the database name, table name, and obtain all segments which can be merged with CUSTOM compaction type. The obtained segments can be transferred as the parameter of the getMergedLoadName function.

```
/**
* Identifies all segments which can be merged with CUSTOM compaction type.
*  NOTE: This result can be passed to getMergedLoadName API to get the merged load name.
*
* @param sparkSession
* @param tableName
* @param dbName
* @param customSegments
* @return list of LoadMetadataDetails
* @throws UnsupportedOperationException if customSegments is null or empty.
* @throws MalformedCarbonCommandException if segment does not exist or is not valid
*/
def identifySegmentsToBeMergedCustom(sparkSession: SparkSession,
tableName: String,
dbName: String,
customSegments: util.List[String]): util.List[LoadMetadataDetails];
```

Example:

```
val customSegments = new util.ArrayList[String]()
customSegments.add("1")
customSegments.add("2")
CarbonSegmentUtil.identifySegmentsToBeMergedCustom(sparkSession, "table_test","default",
customSegments)
```

If a segment list is specified, the merged load name is returned.

```
/**
* Returns the Merged Load Name for given list of segments
*
* @param list of segments
* @return Merged Load Name
* @throws UnsupportedOperationException if list of segments is less than 1
*/
def getMergedLoadName(list: util.List[LoadMetadataDetails]): String;
```

Example:

```
val carbonTable = CarbonEnv.getCarbonTable(Option(databaseName), tableName)(sparkSession)
val loadMetadataDetails = SegmentStatusManager.readLoadMetadata(carbonTable.getMetadataPath)
CarbonSegmentUtil.getMergedLoadName(loadMetadataDetails.toList.asJava)
```

12.3.6.5 Spatial Indexes

Quick Example

```
create table IF NOT EXISTS carbonTable
(
COLUMN1    BIGINT,
LONGITUDE    BIGINT,
LATITUDE    BIGINT,
COLUMN2    BIGINT,
COLUMN3    BIGINT
)
STORED AS carbondata
TBLPROPERTIES
('SPATIAL_INDEX.mygeohash.type'='geohash','SPATIAL_INDEX.mygeohash.sourcecolumns'='longitude,
latitude','SPATIAL_INDEX.mygeohash.originLatitude'='39.850713','SPATIAL_INDEX.mygeohash.gridSize'='50','S
PATIAL_INDEX.mygeohash.minLongitude'='115.828503','SPATIAL_INDEX.mygeohash.maxLongitude'='720.000
000','SPATIAL_INDEX.mygeohash.minLatitude'='39.850713','SPATIAL_INDEX.mygeohash.maxLatitude'='720.0
00000','SPATIAL_INDEX'='mygeohash','SPATIAL_INDEX.mygeohash.conversionRatio'='1000000','SORT_COLU
MNS'='column1,column2,column3,latitude,longitude');
```

Introduction to Spatial Indexes

Spatial data includes multidimensional points, lines, rectangles, cubes, polygons, and other geometric objects. A spatial data object occupies a certain region of

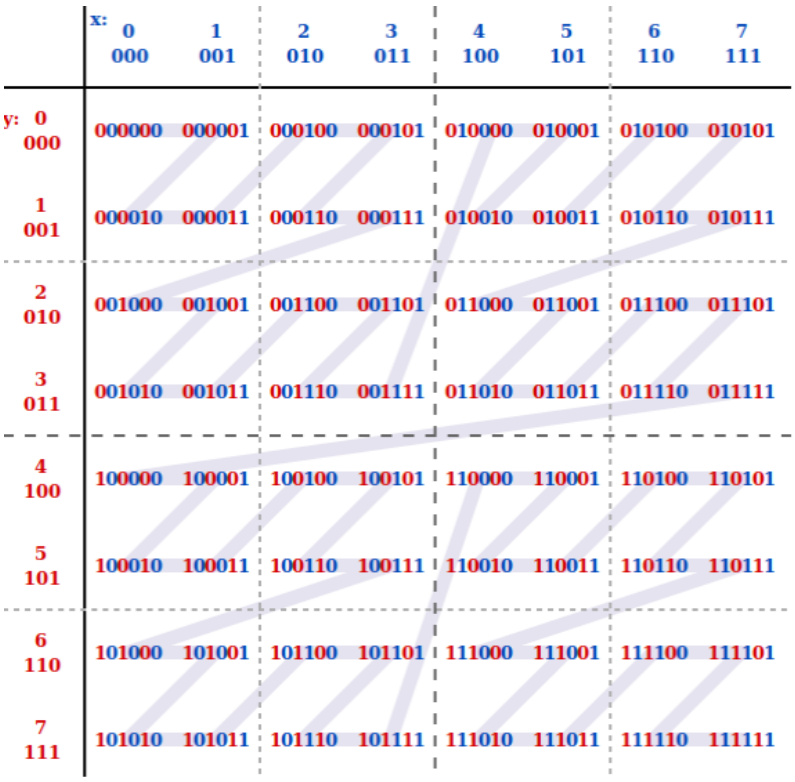
space, called spatial scope, characterized by its location and boundary. The spatial data can be either point data or region data.

- Point data: A point has a spatial extent characterized completely by its location. It does not occupy space and has no associated boundary. Point data consists of a collection of points in a two-dimensional space. Points can be stored as a pair of longitude and latitude.
- Region data: A region has a spatial extent with a location, and boundary. The location can be considered as the position of a fixed point in the region, such as its centroid. In two dimensions, the boundary can be visualized as a line (for finite regions, a closed loop). Region data contains a collection of regions.

Currently, only point data is supported, and it can be stored.

Longitude and latitude can be encoded as a unique GeoID. Geohash is a public-domain geocoding system invented by Gustavo Niemeyer. It encodes geographical locations into a short string of letters and digits. It is a hierarchical spatial data structure which subdivides the space into buckets of grid shape, which is one of the many applications of what is known as the Z-order curve, and generally the space-filling curve.

The Z value of a point in multiple dimensions is calculated by interleaving the binary representation of its coordinate value, as shown in the following figure. When Geohash is used to create a GeoID, data is sorted by GeoID instead of longitude and latitude. Data is stored by spatial proximity.



Creating a Table

GeoHash encoding:

```
create table IF NOT EXISTS carbonTable
(
```

```
...
`LONGITUDE`     BIGINT,
`LATITUDE`      BIGINT,
...
)
STORED AS carbondata
TBLPROPERTIES
('SPATIAL_INDEX.mygeohash.type'='geohash','SPATIAL_INDEX.mygeohash.sourcecolumns'='longitude,
latitude','SPATIAL_INDEX.mygeohash.originLatitude'='xx.xxxxxx','SPATIAL_INDEX.mygeohash.gridSize'='xx','SP
ATIAL_INDEX.mygeohash.minLongitude'='xxx.xxxxxx','SPATIAL_INDEX.mygeohash.maxLongitude'='xxx.xxxxxx'
,'SPATIAL_INDEX.mygeohash.minLatitude'='xx.xxxxxx','SPATIAL_INDEX.mygeohash.maxLatitude'='xxx.xxxxxx','
SPATIAL_INDEX'='mygeohash','SPATIAL_INDEX.mygeohash.conversionRatio'='1000000','SORT_COLUMNS'='co
lumn1,column2,column3,latitude,longitude');
```

SPATIAL_INDEX is a user-defined index handler. This handler allows users to create new columns from the table-structure column set. The new column name is the same as that of the handler name. The **type** and **sourcecolumns** properties of the handler are mandatory. Currently, the value of **type** supports only **geohash**. Carbon provides a default implementation class that can be easily used. You can extend the default implementation class to mount the customized implementation class of **geohash**. The default handler also needs to provide the following table properties:

- **SPATIAL_INDEX.*xxx*.originLatitude**: specifies the origin latitude. (**Double** type.)
- **SPATIAL_INDEX.*xxx*.gridSize**: specifies the grid length in meters. (**Int** type.)
- **SPATIAL_INDEX.*xxx*.minLongitude**: specifies the minimum longitude. (**Double** type.)
- **SPATIAL_INDEX.*xxx*.maxLongitude**: specifies the maximum longitude. (**Double** type.)
- **SPATIAL_INDEX.*xxx*.minLatitude**: specifies the minimum latitude. (**Double** type.)
- **SPATIAL_INDEX.*xxx*.maxLatitude**: specifies the maximum latitude. (**Double** type.)
- **SPATIAL_INDEX.*xxx*.conversionRatio**: used to convert the small value of the longitude and latitude to an integer. (**Int** type.)

You can add your own table properties to the handlers in the above format and access them in your custom implementation class. **originLatitude**, **gridSize**, and **conversionRatio** are mandatory. Other parameters are optional in Carbon. You can use the **SPATIAL_INDEX.*xxx*.class** property to specify their implementation classes.

The default implementation class can generate handler column values for **sourcecolumns** in each row and support query based on the **sourcecolumns** filter criteria. The generated handler column is invisible to users. Except the **SORT_COLUMNS** table properties, no DDL commands or properties are allowed to contain the handler column.

NOTE

- By default, the generated handler column is regarded as the sorting column. If **SORT_COLUMNS** does not contain any **sourcecolumns**, add the handler column to the end of the existing **SORT_COLUMNS**. If the handler column has been specified in **SORT_COLUMNS**, its order in **SORT_COLUMNS** remains unchanged.
- If **SORT_COLUMNS** contains any **sourcecolumns** but does not contain the handler column, the handler column is automatically inserted before **sourcecolumns** in **SORT_COLUMNS**.
- If **SORT_COLUMNS** needs to contain any **sourcecolumns**, ensure that the handler column is listed before the **sourcecolumns** so that the handler column can take effect during sorting.

GeoSOT encoding:

```
CREATE TABLE carbontable(
...
longitude DOUBLE,
latitude DOUBLE,
...)
STORED AS carbondata
TBLPROPERTIES ('SPATIAL_INDEX'='xxx',
'SPATIAL_INDEX.xxx.type'='geosot',
'SPATIAL_INDEX.xxx.sourcecolumns'='longitude, latitude',
'SPATIAL_INDEX.xxx.level'='21',
'SPATIAL_INDEX.xxx.class'='org.apache.carbondata.geo.GeoSOTIndex')
```

Table 12-53 Parameter description

Parameter	Description
SPATIAL_INDEX	Specifies the spatial index. Its value is the same as the column name.
SPATIAL_INDEX.xxx.type	(Mandatory) The value is set to **geosot**.
SPATIAL_INDEX.xxx.source columns	(Mandatory) Specifies the source columns for calculating the spatial index. The value must be two existing columns of the double type.
SPATIAL_INDEX.xxx.level	(Optional) Specifies the columns for calculating the spatial index. The default value is **17**, through which you can obtain an accurate result and improve the computing performance.
SPATIAL_INDEX.xxx.class	(Optional) Specifies the implementation class of GeoSOT. The default value is **org.apache.carbondata.geo.GeoSOTIndex**.

Example:

```
create table geosot(
timevalue bigint,
longitude double,
latitude double)
stored as carbondata
TBLPROPERTIES ('SPATIAL_INDEX'='mygeosot',
'SPATIAL_INDEX.mygeosot.type'='geosot',
'SPATIAL_INDEX.mygeosot.level'='21', 'SPATIAL_INDEX.mygeosot.sourcecolumns'='longitude, latitude');
```

Preparing Data

- Data file 1: **geosotdata.csv**

```
timevalue,longitude,latitude
1575428400000,116.285807,40.084087

Importing Data

The GeoHash default implementation class extends the customized index abstract class. If the handler property is not set to a customized implementation class, the default implementation class is used. You can extend the default implementation class to mount the customized implementation class of **geohash**. The methods of the customized index abstract class are as follows:

- **Init** method: Used to extract, verify, and store the handler property. If the operation fails, the system throws an exception and displays the error information.

- **Generate** method: Used to generate indexes. It generates an index for each row of data.
- **Query** method: Used to generate an index value range list for given input.

The commands for importing data are the same as those for importing common Carbon tables.

LOAD DATA inpath '/tmp/*geosotdata.csv*' INTO TABLE geosot OPTIONS ('DELIMITER'= ',');

LOAD DATA inpath '/tmp/*geosotdata2.csv*' INTO TABLE geosot OPTIONS ('DELIMITER'= ',');

NOTE

For details about **geosotdata.csv** and **geosotdata2.csv**, see **Preparing Data**.

Aggregate Query of Irregular Spatial Sets

Query statements and filter UDFs

- Filtering data based on polygon

  IN_POLYGON(pointList)

  UDF input parameter

Parameter	Type	Description
pointList	String	Enter multiple points as a string. Each point is presented as **longitude latitude**. Longitude and latitude are separated by a space. Each pair of longitude and latitude is separated by a comma (,). The longitude and latitude values at the start and end of the string must be the same.

  UDF output parameter

Parameter	Type	Description
inOrNot	Boolean	Checks whether data is in the specified **polygon_list**.

  Example:

```
select longitude, latitude from geosot where IN_POLYGON('116.321011 40.123503, 116.137676 39.947911, 116.560993 39.935276, 116.321011 40.123503');
```

- Filtering data based on the polygon list

  IN_POLYGON_LIST(polygonList, opType)

  UDF input parameters

Parameter	Type	Description
polygonList	String	Inputs multiple polygons as a string. Each polygon is presented as **POLYGON ((longitude1 latitude1, longitude2 latitude2, ...))**. Note that there is a space after **POLYGON**. Longitudes and latitudes are separated by spaces. Each pair of longitude and latitude is separated by a comma (,). The longitudes and latitudes at the start and end of a polygon must be the same. **IN_POLYGON_LIST** requires at least two polygons. Example: POLYGON ((116.137676 40.163503, 116.137676 39.935276, 116.560993 39.935276, 116.137676 40.163503))
opType	String	Performs union, intersection, and subtraction on multiple polygons. Currently, the following operation types are supported: ● OR: A U B U C (Assume that three polygons A, B, and C are input.) ● AND: A ∩ B ∩ C

UDF output parameter

Parameter	Type	Description
inOrNot	Boolean	Checks whether data is in the specified **polygon_list**.

Example:

```
select longitude, latitude from geosot where IN_POLYGON_LIST('POLYGON ((120.176433 30.327431,120.171283 30.322245,120.181411 30.314540, 120.190509 30.321653,120.185188 30.329358,120.176433 30.327431)), POLYGON ((120.191603 30.328946,120.184179 30.327465,120.181819 30.321464, 120.190359 30.315388,120.199242 30.324464,120.191603 30.328946))', 'OR');
```

- Filtering data based on the polyline list

  IN_POLYLINE_LIST(polylineList, bufferInMeter)

  UDF input parameters

Parameter	Type	Description
polylineList	String	Inputs multiple polylines as a string. Each polyline is presented as **LINESTRING (longitude1 latitude1, longitude2 latitude2, ...)**. Note that there is a space after **LINESTRING**. Longitudes and latitudes are separated by spaces. Each pair of longitude and latitude is separated by a comma (,). A union will be output based on the data in multiple polylines. Example: `LINESTRING (116.137676 40.163503, 116.137676 39.935276, 116.260993 39.935276)`
bufferInMeter	Float	Polyline buffer distance, in meters. Right angles are used at the end to create a buffer.

UDF output parameter

Parameter	Type	Description
inOrNot	Boolean	Checks whether data is in the specified **polyline_list**.

Example:

```
select longitude, latitude from geosot where IN_POLYLINE_LIST('LINESTRING (120.184179 30.327465, 120.191603 30.328946, 120.199242 30.324464, 120.190359 30.315388)', 65);
```

- Filtering data based on the GeoID range list

  IN_POLYGON_RANGE_LIST(polygonRangeList, opType)

  UDF input parameters

Parameter	Type	Description
polygonRangeList	String	Inputs multiple rangeLists as a string. Each rangeList is presented as **RANGELIST (startGeoId1 endGeoId1, startGeoId2 endGeoId2, ...)**. Note that there is a space after **RANGELIST**. Start GeoIDs and end GeoIDs are separated by spaces. Each group of GeoID ranges is separated by a comma (,). Example: RANGELIST (855279368848 855279368850, 855280799610 855280799612, 855282156300 855282157400)
opType	String	Performs union, intersection, and subtraction on multiple rangeLists. Currently, the following operation types are supported: ● OR: A U B U C (Assume that three rangeLists A, B, and C are input.) ● AND: A ∩ B ∩ C

UDF output parameter

Parameter	Type	Description
inOrNot	Boolean	Checks whether data is in the specified **polyRange_list**.

Example:

```
select mygeosot, longitude, latitude from geosot where IN_POLYGON_RANGE_LIST('RANGELIST (526549722865860608 526549722865860618, 532555655580483584 532555655580483594)', 'OR');
```

- Performing polygon query

  IN_POLYGON_JOIN(GEO_HASH_INDEX_COLUMN, POLYGON_COLUMN)

  Perform join query on two tables. One is a spatial data table containing the longitude, latitude, and GeoHashIndex columns, and the other is a dimension table that saves polygon data.

  During query, **IN_POLYGON_JOIN UDF**, **GEO_HASH_INDEX_COLUMN**, and **POLYGON_COLUMN** of the polygon table are used. **Polygon_column** specifies the column containing multiple points (longitude and latitude pairs). The first and last points in each row of the Polygon table must be the same. All points in each row form a closed geometric shape.

  UDF input parameters

Parameter	Type	Description
GEO_HASH_INDEX_COLUMN	Long	GeoHashIndex column of the spatial data table.
POLYGON_COLUMN	String	Polygon column of the polygon table, the value of which is represented by the string of polygon, for example, **POLYGON ((longitude1 latitude1, longitude2 latitude2, ...))**.

Example:

```
CREATE TABLE polygonTable(
polygon string,
poiType string,
poiId String)
STORED AS carbondata;

insert into polygonTable select 'POLYGON ((120.176433 30.327431,120.171283 30.322245,
120.181411 30.314540,120.190509 30.321653,120.185188 30.329358,120.176433 30.327431))','abc','1';

insert into polygonTable select 'POLYGON ((120.191603 30.328946,120.184179 30.327465,
120.181819 30.321464,120.190359 30.315388,120.199242 30.324464,120.191603 30.328946))','abc','2';

select t1.longitude,t1.latitude from geosot t1
inner join
(select polygon,poiId from polygonTable where poitype='abc') t2
on in_polygon_join(t1.mygeosot,t2.polygon) group by t1.longitude,t1.latitude;
```

- Performing range_list query

  IN_POLYGON_JOIN_RANGE_LIST(GEO_HASH_INDEX_COLUMN, POLYGON_COLUMN)

  Use the **IN_POLYGON_JOIN_RANGE_LIST** UDF to associate the spatial data table with the polygon dimension table based on **Polygon_RangeList**. By using a range list, you can skip the conversion between a polygon and a range list.

  UDF input parameters

Parameter	Type	Description
GEO_HASH_INDEX_COLUMN	Long	GeoHashIndex column of the spatial data table.
POLYGON_COLUMN	String	Rangelist column of the Polygon table, the value of which is represented by the string of rangeList, for example, **RANGELIST (startGeoId1 endGeoId1, startGeoId2 endGeoId2, ...)**.

Example:

```
CREATE TABLE polygonTable(
polygon string,
```

```
poiType string,
poiId String)
STORED AS carbondata;

insert into polygonTable select 'RANGELIST (526546455897309184 526546455897309284,
526549831217315840 526549831217315850, 532555655580483534 532555655580483584)','xyz','2';

select t1.*
from geosot t1
inner join
(select polygon,poiId from polygonTable where poitype='xyz') t2
on in_polygon_join_range_list(t1.mygeosot,t2.polygon);
```

UDFs of spacial index tools

- Obtaining row number and column number of a grid converted from GeoID

  GeoIdToGridXy(geoId)

  UDF input parameter

Parameter	Type	Description
geoId	Long	Calculates the row number and column number of the grid based on GeoID.

  UDF output parameter

Parameter	Type	Description
gridArray	Array[Int]	Returns the grid row and column numbers contained in GeoID in array. The first digit indicates the row number, and the second digit indicates the column number.

  Example:

```
select longitude, latitude, mygeohash, GeoIdToGridXy(mygeohash) as GridXY from geoTable;
```

- Converting longitude and latitude to GeoID

  LatLngToGeoId(latitude, longitude oriLatitude, gridSize)

  UDF input parameters

Parameter	Type	Description
longitude	Long	Longitude. Note: The value is an integer after conversion.
latitude	Long	Latitude. Note: The value is an integer after conversion.
oriLatitude	Double	Origin latitude, required for calculating GeoID.

Parameter	Type	Description
gridSize	Int	Grid size, required for calculating GeoID.

UDF output parameter

Parameter	Type	Description
geoId	Long	Returns a number that indicates the longitude and latitude after coding.

Example:

```
select longitude, latitude, mygeohash, LatLngToGeoId(latitude, longitude, 39.832277, 50) as geoId from geoTable;
```

- Converting GeoID to longitude and latitude

  GeoIdToLatLng(geoId, oriLatitude, gridSize)

  UDF input parameters

Parameter	Type	Description
geoId	Long	Calculates the longitude and latitude based on GeoID.
oriLatitude	Double	Origin latitude, required for calculating the longitude and latitude.
gridSize	Int	Grid size, required for calculating the longitude and latitude.

  NOTE

  GeoID is generated based on the grid coordinates, which are the grid center. Therefore, the calculated longitude and latitude are the longitude and latitude of the grid center. There may be an error ranging from 0 degree to half of the grid size between the calculated longitude and latitude and the longitude and latitude of the generated GeoID.

  UDF output parameter

Parameter	Type	Description
latitudeAndLongitude	Array[Double]	Returns the longitude and latitude coordinates of the grid center that represent the GeoID in array. The first digit indicates the latitude, and the second digit indicates the longitude.

Example:

```
select longitude, latitude, mygeohash, GeoIdToLatLng(mygeohash, 39.832277, 50) as
LatitudeAndLongitude from geoTable;
```

- Calculating the upper-layer GeoID of the pyramid model

  ToUpperLayerGeoId(geoId)

  UDF input parameter

Parameter	Type	Description
geoId	Long	Calculates the upper-layer GeoID of the pyramid model based on the input GeoID.

  UDF output parameter

Parameter	Type	Description
geoId	Long	Returns the upper-layer GeoID of the pyramid model.

  Example:

```
select longitude, latitude, mygeohash, ToUpperLayerGeoId(mygeohash) as upperLayerGeoId from
geoTable;
```

- Obtaining the GeoID range list using the input polygon

  ToRangeList(polygon, oriLatitude, gridSize)

  UDF input parameters

Parameter	Type	Description
polygon	String	Input polygon string, which is a pair of longitude and latitude. Longitude and latitude are separated by a space. Each pair of longitude and latitude is separated by a comma (,). The longitude and latitude at the start and end must be the same.
oriLatitude	Double	Origin latitude, required for calculating GeoID.
gridSize	Int	Grid size, required for calculating GeoID.

  UDF output parameter

Parameter	Type	Description
geoIdList	Buffer[Array[Long]]	Converts polygons into GeoID range lists.

Example:

```
select ToRangeList('116.321011 40.123503, 116.137676 39.947911, 116.560993 39.935276, 116.321011 40.123503', 39.832277, 50) as rangeList from geoTable;
```

- Calculating the upper-layer longitude of the pyramid model

  ToUpperLongitude (longitude, gridSize, oriLat)

  UDF input parameters

Parameter	Type	Description
longitude	Long	Input longitude, which is a long integer.
gridSize	Int	Grid size, required for calculating longitude.
oriLatitude	Double	Origin latitude, required for calculating longitude.

  UDF output parameter

Parameter	Type	Description
longitude	Long	Returns the upper-layer longitude.

  Example:

```
select ToUpperLongitude (-23575161504L, 50, 39.832277) as upperLongitude from geoTable;
```

- Calculating the upper-layer latitude of the pyramid model

  ToUpperLatitude(Latitude, gridSize, oriLat)

  UDF input parameters

Parameter	Type	Description
latitude	Long	Input latitude, which is a long integer.
gridSize	Int	Grid size, required for calculating latitude.
oriLatitude	Double	Origin latitude, required for calculating latitude.

UDF output parameter

Parameter	Type	Description
Latitude	Long	Returns the upper-layer latitude.

Example:

```
select ToUpperLatitude (-23575161504L, 50, 39.832277) as upperLatitude from geoTable;
```

- Converting longitude and latitude to GeoSOT

  LatLngToGridCode(latitude, longitude, level)

  UDF input parameters

Parameter	Type	Description
latitude	Double	Latitude.
longitude	Double	Longitude.
level	Int	Level. The value range is [0, 32].

UDF output parameter

Parameter	Type	Description
geoId	Long	A number that indicates the longitude and latitude after GeoSOT encoding.

Example:

```
select LatLngToGridCode(39.930753, 116.302895, 21) as geoId;
```

12.3.7 CarbonData Troubleshooting

12.3.7.1 Filter Result Is not Consistent with Hive when a Big Double Type Value Is Used in Filter

Symptom

When double data type values with higher precision are used in filters, incorrect values are returned by filtering results.

Possible Causes

When double data type values with higher precision are used in filters, values are rounded off before comparison. Therefore, values of double data type with different fraction part are considered same.

Troubleshooting Method

NA.

Procedure

To avoid this problem, use decimal data type when high precision data comparisons are required, such as financial applications, equality and inequality checks, and rounding operations.

Reference Information

NA.

12.3.7.2 Query Performance Deterioration

Symptom

The query performance fluctuates when the query is executed in different query periods.

Possible Causes

During data loading, the memory configured for each executor program instance may be insufficient, resulting in more Java GCs. When GC occurs, the query performance deteriorates.

Troubleshooting Method

On the Spark UI, the GC time of some executors is obviously higher than that of other executors, or all executors have high GC time.

Procedure

Log in to Manager and choose **Cluster** > **Services** > **Spark2x**. On the displayed page, click the **Configurations** tab and then **All Configurations**, search for **spark.executor.memory** in the search box, and set its value to a larger value.

Reference

None

12.3.8 CarbonData FAQ

12.3.8.1 Why Is Incorrect Output Displayed When I Perform Query with Filter on Decimal Data Type Values?

Question

Why is incorrect output displayed when I perform query with filter on decimal data type values?

For example:

select * from carbon_table where num = 1234567890123456.22;

Output:

```
+------+---------------------+--+
| name |        num          |
+------+---------------------+--+
| IAA  | 1234567890123456.22 |
| IAA  | 1234567890123456.21 |
+------+---------------------+--+
```

Answer

To obtain accurate output, append BD to the number.

For example:

select * from carbon_table where num = 1234567890123456.22BD;

Output:

```
+------+---------------------+--+
| name |        num          |
+------+---------------------+--+
| IAA  | 1234567890123456.22 |
+------+---------------------+--+
```

12.3.8.2 How to Avoid Minor Compaction for Historical Data?

Question

How to avoid minor compaction for historical data?

Answer

If you want to load historical data first and then the incremental data, perform following steps to avoid minor compaction of historical data:

1. Load all historical data.
2. Configure the major compaction size to a value smaller than the segment size of historical data.
3. Run the major compaction once on historical data so that these segments will not be considered later for minor compaction.
4. Load the incremental data.
5. You can configure the minor compaction threshold as required.

For example:

1. Assume that you have loaded all historical data to CarbonData and the size of each segment is 500 GB.
2. Set the threshold of major compaction property to **carbon.major.compaction.size** = **491520** (480 GB x 1024).
3. Run major compaction. All segments will be compacted because the size of each segment is more than configured size.
4. Perform incremental loading.
5. Configure the minor compaction threshold to **carbon.compaction.level.threshold** = **6,6**.
6. Run minor compaction. As a result, only incremental data is compacted.

12.3.8.3 How to Change the Default Group Name for CarbonData Data Loading?

Question

How to change the default group name for CarbonData data loading?

Answer

By default, the group name for CarbonData data loading is **ficommon**. You can perform the following operation to change the default group name:

1. Edit the **carbon.properties** file.
2. Change the value of the key **carbon.dataload.group.name** as required. The default value is **ficommon**.

12.3.8.4 Why Does INSERT INTO CARBON TABLE Command Fail?

Question

Why does the ***INSERT INTO CARBON TABLE*** command fail and the following error message is displayed?

```
Data load failed due to bad record
```

Answer

The ***INSERT INTO CARBON TABLE*** command fails in the following scenarios:

- If the data type of source and target table columns are not the same, the data from the source table will be treated as bad records and the ***INSERT INTO*** command fails.
- If the result of aggregation function on a source column exceeds the maximum range of the target column, then the ***INSERT INTO*** command fails.

  Solution:

  You can use the cast function on corresponding columns when inserting records.

  For example:

a. Run the ***DESCRIBE*** command to query the target and source table.

DESCRIBE *newcarbontable*;

Result:

```
col1 int
col2 bigint
```

DESCRIBE *sourcetable*;

Result:

```
col1 int
col2 int
```

b. Add the cast function to convert bigint value to integer.

INSERT INTO *newcarbontable select col1, cast(col2 as integer) from sourcetable;*

12.3.8.5 Why Is the Data Logged in Bad Records Different from the Original Input Data with Escape Characters?

Question

Why is the data logged in bad records different from the original input data with escaped characters?

Answer

An escape character is a backslash (\) followed by one or more characters. If the input records contain escape characters such as \t, \b, \n, \r, \f, \', \", \\ , java will process the escape character '\' and the following characters together to obtain the escaped meaning.

For example, if the CSV data type **2010\\10,test** is inserted to String,int type, the value is treated as bad records, because **tes**t cannot be converted to int. The value logged in the bad records is **2010\10** because java processes **** as ****.

12.3.8.6 Why Data Load Performance Decreases due to Bad Records?

Question

Why data load performance decreases due to bad records?

Answer

If bad records are present in the data and **BAD_RECORDS_LOGGER_ENABLE** is **true** or **BAD_RECORDS_ACTION** is **redirect** then load performance will decrease due to extra I/O for writing failure reason in log file or redirecting the records to raw CSV.

12.3.8.7 Why INSERT INTO/LOAD DATA Task Distribution Is Incorrect and the Opened Tasks Are Less Than the Available Executors when the Number of Initial Executors Is Zero?

Question

Why **INSERT INTO or LOAD DATA** task distribution is incorrect, and the openedtasks are less than the available executors when the number of initial executors is zero**?**

Answer

In case of INSERT INTO or LOAD DATA, CarbonData distributes one task per node. If the executors are not allocated from the distinct nodes then CarbonData will launch fewer tasks.

Solution:

Configure higher value for the executor memory and core so that the yarn can launch only one executor per node.

1. Configure the number of the Executor cores.
   - Configure the **spark.executor.cores** in **spark-defaults.conf** or the **SPARK_EXECUTOR_CORES** in **spark-env.sh** appropriately.
   - Add **--executor-cores NUM** parameter to configure the cores during use the spark-submit command.
2. Configure the Executor memory.
   - Configure the **spark.executor.memory** in **spark-defaults.conf** or the **SPARK_EXECUTOR_MEMORY** in **spark-env.sh** appropriately.
   - Add **--executor-memory MEM** parameter to configure the memory during use the spark-submit command.

12.3.8.8 Why Does CarbonData Require Additional Executors Even Though the Parallelism Is Greater Than the Number of Blocks to Be Processed?

Question

Why does CarbonData require additional executors even though the parallelism is greater than the number of blocks to be processed?

Answer

CarbonData block distribution optimizes data processing as follows:

1. Optimize data processing parallelism.
2. Optimize parallel reading of block data.

To optimize parallel processing and parallel read, CarbonData requests executors based on the locality of blocks so that it can obtain executors on all nodes.

If you are using dynamic allocation, you need to configure the following properties:

1. Set **spark.dynamicAllocation.executorIdleTimeout** to 15 minutes (or the average query time).
2. Set **spark.dynamicAllocation.maxExecutors** correctly. The default value **2048** is not recommended. Otherwise, CarbonData will request the maximum number of executors.
3. For a bigger cluster, set **carbon.dynamicAllocation.schedulerTimeout** to a value ranging from 10 to 15 seconds. The default value is 5 seconds.
4. Set **carbon.scheduler.minRegisteredResourcesRatio** to a value ranging from 0.1 to 1.0. The default value is **0.8**. Block distribution can be started as long as the value of **carbon.scheduler.minRegisteredResourcesRatio** is within the range.

12.3.8.9 Why Data loading Fails During off heap?

Question

Why Data Loading fails during off heap?

Answer

YARN Resource Manager will consider (Java heap memory + **spark.yarn.am.memoryOverhead**) as memory limit, so during the off heap, the memory can exceed this limit. So you need to increase the memory by increasing the value of the parameter **spark.yarn.am.memoryOverhead**.

12.3.8.10 Why Do I Fail to Create a Hive Table?

Question

Why do I fail to create a hive table?

Answer

Creating a Hive table fails, when source table or sub query has more number of partitions. The implementation of the query requires a lot of tasks, then the number of files will be output a lot, resulting OOM in Driver.

It can be solved by using ***distribute by*** on suitable cardinality(distinct values) column in the statement of Hive table creation.

distribute by clause limits number of hive table partitions. It considers cardinality of given column or **spark.sql.shuffle.partitions** which ever is minimal. For example, if **spark.sql.shuffle.partitions** is 200, but cardinality of column is 100, out files is 200, but the other 100 files are empty. So using very low cardinality column like 1 will cause data skew and will effect later query distribution.

So we suggest using the column with cardinality greater than **spark.sql.shuffle.partitions**. It can be greater than 2 to 3 times.

Example:

create table hivetable1 as select * from sourcetable1 distribute by col_age;

12.3.8.11 Why CarbonData tables created in V100R002C50RC1 not reflecting the privileges provided in Hive Privileges for non-owner?

Question

Why CarbonData tables created in V100R002C50RC1 not reflecting the privileges provided in Hive Privileges for non-owner?

Answer

The Hive ACL is implemented after the version V100R002C50RC1, hence the Hive ACL Privileges are not reflecting.

To support HIVE ACL Privileges for CarbonData tables created in V100R002C50RC1, following two ALTER TABLE commands must be executed by owner of the table.

ALTER TABLE *$dbname.$tablename SET LOCATION '$carbon.store/$dbname/$tablename';*

ALTER TABLE *$dbname.$tablename SET SERDEPROPERTIES ('path'='$carbon.store/$dbname/$tablename');*

Example:

Assume database name is 'carbondb', table name is 'carbontable', and CarbonData store location is 'hdfs://hacluster/user/hive/warehouse/carbon.store', then the commands should be executed is as follows:

ALTER TABLE *carbondb.carbontable SET LOCATION 'hdfs://hacluster/user/hive/warehouse/carbon.store/carbondb/carbontable';*

ALTER TABLE *carbondb.carbontable SET SERDEPROPERTIES ('path'='hdfs://hacluster/user/hive/warehouse/carbon.store/carbondb/carbontable');*

12.3.8.12 How Do I Logically Split Data Across Different Namespaces?

Question

How do I logically split data across different namespaces?

Answer

- Configuration:

  To logically split data across different namespaces, you must update the following configuration in the **core-site.xml** file of HDFS, Hive, and Spark.

  NOTE

  Changing the Hive component will change the locations of carbonstore and warehouse.

  – Configuration in HDFS

- **fs.defaultFS**: Name of the default file system. The URI mode must be set to **viewfs**. When **viewfs** is used, the permission part must be **ClusterX**.
- **fs.viewfs.mountable.ClusterX.homedir**: Home directory base path. You can use the getHomeDirectory() method defined in **FileSystem/FileContext** to access the home directory.
- fs.viewfs.mountable.default.link.<dir_name>: ViewFS mount table.

Example:

```
<property>
<name>fs.defaultFS</name>
<value>viewfs://ClusterX/</value>
</property>
<property>
<name>fs.viewfs.mounttable.ClusterX.link./folder1</name>
<value>hdfs://NS1/folder1</value>
</property>
<property>
<name>fs.viewfs.mounttable.ClusterX.link./folder2</name>
<value>hdfs://NS2/folder2</value>
</property>
```

– Configurations in Hive and Spark

fs.defaultFS: Name of the default file system. The URI mode must be set to **viewfs**. When **viewfs** is used, the permission part must be **ClusterX**.

- Syntax:

LOAD DATA INPATH *'path to data' INTO TABLE table_name OPTIONS ('...');*

NOTE

When Spark is configured with the viewFS file system and attempts to load data from HDFS, users must specify a path such as **viewfs://** or a relative path as the file path in the **LOAD** statement.

- Example:
  – Sample viewFS path:

  LOAD DATA INPATH *'viewfs://ClusterX/dir/data.csv' INTO TABLE table_name OPTIONS ('...');*

  – Sample relative path:

  LOAD DATA INPATH *'/apps/input_data1.txt'* ***INTO TABLE*** *table_name*;

12.3.8.13 Why Missing Privileges Exception is Reported When I Perform Drop Operation on Databases?

Question

Why drop database cascade is throwing the following exception?

```
Error: org.apache.spark.sql.AnalysisException: Missing Privileges;(State=,code=0)
```

Answer

This error is thrown when the owner of the database performs ***drop database <database_name> cascade*** which contains tables created by other users.

12.3.8.14 Why the UPDATE Command Cannot Be Executed in Spark Shell?

Question

Why the UPDATE command cannot be executed in Spark Shell?

Answer

The syntax and examples provided in this document are about Beeline commands instead of Spark Shell commands.

To run the UPDATE command in Spark Shell, use the following syntax:

- Syntax 1

  <carbon_context>.sql("UPDATE <CARBON TABLE> SET (column_name1, column_name2, ... column_name n) = (column1_expression , column2_expression , column3_expression ... column n_expression) [WHERE { <filter_condition> }];").show

- Syntax 2

  <carbon_context>.sql("UPDATE <CARBON TABLE> SET (column_name1, column_name2,) = (select sourceColumn1, sourceColumn2 from sourceTable [WHERE { <filter_condition> }]) [WHERE { <filter_condition> }];").show

Example:

If the context of CarbonData is **carbon**, run the following command:

carbon.sql("update carbonTable1 d set (d.column3,d.column5) = (select s.c33 ,s.c55 from sourceTable1 s where d.column1 = s.c11) where d.column1 = 'country' exists(select * from table3 o where o.c2 > 1);").show

12.3.8.15 How Do I Configure Unsafe Memory in CarbonData?

Question

How do I configure unsafe memory in CarbonData?

Answer

In the Spark configuration, the value of **spark.yarn.executor.memoryOverhead** must be greater than the sum of (**sort.inmemory.size.inmb** + **Netty offheapmemory required**), or the sum of (**carbon.unsafe.working.memory.in.mb** + **carbon.sort.inememory.storage.size.in.mb** + **Netty offheapmemory required**). Otherwise, if off-heap access exceeds the configured executor memory, Yarn may stop the executor.

If **spark.shuffle.io.preferDirectBufs** is set to **true**, the netty transfer service in Spark takes off some heap memory (around 384 MB or 0.1 x executor memory) from **spark.yarn.executor.memoryOverhead**.

For details, see **Configuring Executor Off-Heap Memory**.

12.3.8.16 Why Exception Occurs in CarbonData When Disk Space Quota is Set for Storage Directory in HDFS?

Question

Why exception occurs in CarbonData when Disk Space Quota is set for the storage directory in HDFS?

Answer

The data will be written to HDFS when you during create table, load table, update table, and so on. If the configured HDFS directory does not have sufficient disk space quota, then the operation will fail and throw following exception.

```
org.apache.hadoop.hdfs.protocol.DSQuotaExceededException:
The DiskSpace quota of /user/tenant is exceeded:
quota = 314572800 B = 300 MB but diskspace consumed = 402653184 B = 384 MB at
org.apache.hadoop.hdfs.server.namenode.DirectoryWithQuotaFeature.verifyStoragespaceQuota(DirectoryWithQuotaFeature.java:211) at
org.apache.hadoop.hdfs.server.namenode.DirectoryWithQuotaFeature.verifyQuota(DirectoryWithQuotaFeature.java:239) at
org.apache.hadoop.hdfs.server.namenode.FSDirectory.verifyQuota(FSDirectory.java:941) at
org.apache.hadoop.hdfs.server.namenode.FSDirectory.updateCount(FSDirectory.java:745)
```

If such exception occurs, configure a sufficient disk space quota for the tenant.

For example:

If the HDFS replication factor is 3 and HDFS default block size is 128 MB, then at least 384 MB (no. of block x block_size x replication_factor of the schema file = 1 x 128 x 3 = 384 MB) disk space quota is required to write a table schema file to HDFS.

NOTE

In case of fact files, as the default block size is 1024 MB, the minimum space required is 3072 MB per fact file for data load.

12.3.8.17 Why Does Data Query or Loading Fail and "org.apache.carbondata.core.memory.MemoryException: Not enough memory" Is Displayed?

Question

Why does data query or loading fail and "org.apache.carbondata.core.memory.MemoryException: Not enough memory" is displayed?

Answer

This exception is thrown when the out-of-heap memory required for data query and loading in the executor is insufficient.

In this case, increase the values of **carbon.unsafe.working.memory.in.mb** and **spark.yarn.executor.memoryOverhead**.

For details, see **How Do I Configure Unsafe Memory in CarbonData?**.

The memory is shared by data query and loading. Therefore, if the loading and query operations need to be performed at the same time, you are advised to set **carbon.unsafe.working.memory.in.mb** and **spark.yarn.executor.memoryOverhead** to a value greater than 2,048 MB.

The following formula can be used for estimation:

Memory required for data loading:

carbon.number.of.cores.while.loading [default value is 6] x Number of tables to load in parallel x offheap.sort.chunk.size.inmb [default value is 64 MB] + carbon.blockletgroup.size.in.mb [default value is 64 MB] + Current compaction ratio [64 MB/3.5])

= Around 900 MB per table

Memory required for data query:

(SPARK_EXECUTOR_INSTANCES. [default value is 2] x (carbon.blockletgroup.size.in.mb [default value: 64 MB] + carbon.blockletgroup.size.in.mb [default value = 64 MB x 3.5) x Number of cores per executor [default value: 1])

= ~ 600 MB

12.3.8.18 Why Do Files of a Carbon Table Exist in the Recycle Bin Even If the drop table Command Is Not Executed When Mis-deletion Prevention Is Enabled?

Question

Why do files of a Carbon table exist in the recycle bin even if the **drop table** command is not executed when mis-deletion prevention is enabled?

Answer

After the the mis-deletion prevention is enabled for a Carbon table, calling a file deletion command will move the deleted files to the recycle bin. The intermediate file **.carbonindex** is deleted durtion the execution of the **insert** or **load** command. Therefore, the table files may exist in the recycle bin even through the **drop table** command is not executed. If you run the **drop table** command, a table directory with a timestamp is generated. The files in the directory are complete.

12.4 Using ClickHouse

12.4.1 Using ClickHouse from Scratch

ClickHouse is a column-based database oriented to online analysis and processing. It supports SQL query and provides good query performance. The aggregation analysis and query performance based on large and wide tables is excellent, which is one order of magnitude faster than other analytical databases.

Prerequisites

You have installed the client, for example, in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory. Before using the client, download and update the client configuration file, and ensure that the active management node of Manager is available.

Procedure

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create ClickHouse tables. For details about how to bind a role to the user, see **ClickHouse User and Permission Management**. If Kerberos authentication is disabled for the current cluster, skip this step.

1. Run the following command if it is an MRS 3.1.0 cluster:

   export CLICKHOUSE_SECURITY_ENABLED=true

2. **kinit** *Component service user*

   Example: **kinit clickhouseuser**

Step 5 Run the client command of the ClickHouse component.

Run the **clickhouse -h** command to view the command help of ClickHouse.

The command output is as follows:

```
Use one of the following commands:
clickhouse local [args]
clickhouse client [args]
clickhouse benchmark [args]
clickhouse server [args]
clickhouse performance-test [args]
clickhouse extract-from-config [args]
clickhouse compressor [args]
clickhouse format [args]
clickhouse copier [args]
clickhouse obfuscator [args]
...
```

Run the **clickhouse client** command to connect to the ClickHouse serverif MRS 3.1.0 or later.

- Using SSL for login when Kerberos authentication is disabled for the current cluster:

  clickhouse client --host *IP address of the ClickHouse instance* **--user** *Username* **--password** *Password* **--port** 9440 **--secure**

- Using SSL for login when Kerberos authentication is enabled for the current cluster:

You must create a user on Manager because there is no default user. For details, see **ClickHouse User and Permission Management**.

After the user authentication is successful, you do not need to carry the **--user** and **--password** parameters when logging in to the client as the authenticated user.

clickhouse client --host *IP address of the ClickHouse instance* **--port** 9440 **--secure**

The following table describes the parameters of the **clickhouse client** command.

Table 12-54 Parameters of the **clickhouse client** command

Parameter	Description
--host	Host name of the server. The default value is **localhost**. You can use the host name or IP address of the node where the ClickHouse instance is located. **NOTE** You can log in to FusionInsight Manager and choose **Cluster** > **Services** > **ClickHouse** > **Instance** to obtain the service IP address of the ClickHouseServer instance.
--port	Port for connection. • If the SSL security connection is used, the default port number is **9440**, the parameter **--secure** must be carried. For details about the port number, search for the **tcp_port_secure** parameter in the ClickHouseServer instance configuration. • If non-SSL security connection is used, the default port number is **9000**, the parameter **--secure** does not need to be carried. For details about the port number, search for the **tcp_port** parameter in the ClickHouseServer instance configuration.
--user	Username. You can create the user on Manager and bind a role to the user. For details, see **ClickHouse User and Permission Management**. • If Kerberos authentication is enabled for the current cluster and the user authentication is successful, you do not need to carry the **--user** and **--password** parameters when logging in to the client as the authenticated user. You must create a user with this name on Manager because there is no default user in the Kerberos cluster scenario. • If Kerberos authentication is not enabled for the current cluster, you can specify a user and its password created on Manager when logging in to the client. If the user and password parameters are not carried, user **default** is used for login by default.
--password	Password. The default password is an empty string. This parameter is used together with the **--user** parameter. You can set a password when creating a user on Manager.
--query	Query to process when using non-interactive mode.

Parameter	Description
--database	Current default database. The default value is **default**, which is the default configuration on the server.
--multiline	If this parameter is specified, multiline queries are allowed. (**Enter** only indicates line feed and does not indicate that the query statement is complete.)
--multiquery	If this parameter is specified, multiple queries separated with semicolons (;) can be processed. This parameter is valid only in non-interactive mode.
--format	Specified default format used to output the result.
--vertical	If this parameter is specified, the result is output in vertical format by default. In this format, each value is printed on a separate line, which helps to display a wide table.
--time	If this parameter is specified, the query execution time is printed to **stderr** in non-interactive mode.
--stacktrace	If this parameter is specified, stack trace information will be printed when an exception occurs.
--config-file	Name of the configuration file.
--secure	If this parameter is specified, the server will be connected in SSL mode.
--history_file	Path of files that record command history.
--param_<name>	Query with parameters. Pass values from the client to the server. For details, see **https://clickhouse.tech/docs/en/interfaces/cli/#cli-queries-with-parameters**.

----End

12.4.2 ClickHouse Table Engine Overview

Background

Table engines play a key role in ClickHouse to determine:

- Where to write and read data
- Supported query modes
- Whether concurrent data access is supported
- Whether indexes can be used
- Whether multi-thread requests can be executed
- Parameters used for data replication

This section describes MergeTree and Distributed engines, which are the most important and frequently used ClickHouse table engines.

For details about other table engines, visit **https://clickhouse.tech/docs/en/engines/table-engines**.

MergeTree Family

Engines of the MergeTree family are the most universal and functional table engines for high-load tasks. They have the following key features:

- Data is stored by partition and block based on partitioning keys.
- Data index is sorted based on primary keys and the **ORDER BY** sorting keys.
- Data replication is supported by table engines prefixed with Replicated.
- Data sampling is supported.

When data is written, a table with this type of engine divides data into different folders based on the partitioning key. Each column of data in the folder is an independent file. A file that records serialized index sorting is created. This structure reduces the volume of data to be retrieved during data reading, greatly improving query efficiency.

- MergeTree

  Syntax for creating a table:

```
CREATE TABLE [IF NOT EXISTS] [db.]table_name [ON CLUSTER cluster]
(
    name1 [type1] [DEFAULT|MATERIALIZED|ALIAS expr1] [TTL expr1],
    name2 [type2] [DEFAULT|MATERIALIZED|ALIAS expr2] [TTL expr2],
    ...
    INDEX index_name1 expr1 TYPE type1(...) GRANULARITY value1,
    INDEX index_name2 expr2 TYPE type2(...) GRANULARITY value2
) ENGINE = MergeTree()
ORDER BY expr
[PARTITION BY expr]
[PRIMARY KEY expr]
[SAMPLE BY expr]
[TTL expr [DELETE|TO DISK 'xxx'|TO VOLUME 'xxx'], ...]
[SETTINGS name=value, ...]
```

  Example:

```
CREATE TABLE default.test (
  name1 DateTime,
  name2 String,
  name3 String,
  name4 String,
  name5 Date,
  ...
) ENGINE = MergeTree()
PARTITION BY toYYYYMM(name5)
ORDER BY (name1, name2)
SETTINGS index_granularity = 8192
```

  Parameters in the example are described as follows:

  - **ENGINE = MergeTree()**: specifies the MergeTree engine.
  - **PARTITION BY toYYYYMM(name4)**: specifies the partition. The sample data is partitioned by month, and a folder is created for each month.
  - **ORDER BY**: specifies the sorting field. A multi-field index can be sorted. If the first field is the same, the second field is used for sorting, and so on.
  - **index_granularity = 8192**: specifies the index granularity. One index value is recorded for every 8,192 data records.

  If the data to be queried exists in a partition or sorting field, the data query time can be greatly reduced.

- ReplacingMergeTree

  Different from MergeTree, ReplacingMergeTree deletes duplicate entries with the same sorting key. ReplacingMergeTree is suitable for clearing duplicate data to save space, but it does not guarantee the absence of duplicate data. Generally, it is not recommended.

  Syntax for creating a table:

```
CREATE TABLE [IF NOT EXISTS] [db.]table_name [ON CLUSTER cluster]
(
    name1 [type1] [DEFAULT|MATERIALIZED|ALIAS expr1],
    name2 [type2] [DEFAULT|MATERIALIZED|ALIAS expr2],
    ...
) ENGINE = ReplacingMergeTree([ver])
[PARTITION BY expr]
[ORDER BY expr]
[SAMPLE BY expr]
[SETTINGS name=value, ...]
```

- SummingMergeTree

  When merging data parts in SummingMergeTree tables, ClickHouse merges all rows with the same primary key into one row that contains summed values for the columns with the numeric data type. If the primary key is composed in a way that a single key value corresponds to large number of rows, storage volume can be significantly reduced and the data query speed can be accelerated.

  Syntax for creating a table:

```
CREATE TABLE [IF NOT EXISTS] [db.]table_name [ON CLUSTER cluster]
(
    name1 [type1] [DEFAULT|MATERIALIZED|ALIAS expr1],
    name2 [type2] [DEFAULT|MATERIALIZED|ALIAS expr2],
    ...
) ENGINE = SummingMergeTree([columns])
[PARTITION BY expr]
[ORDER BY expr]
[SAMPLE BY expr]
[SETTINGS name=value, ...]
```

  Example:

  Create a SummingMergeTree table named **testTable**.

```
CREATE TABLE testTable
(
    id UInt32,
    value UInt32
)
ENGINE = SummingMergeTree()
ORDER BY id
```

  Insert data into the table.

```
INSERT INTO testTable Values(5,9),(5,3),(4,6),(1,2),(2,5),(1,4),(3,8);
INSERT INTO testTable Values(88,5),(5,5),(3,7),(3,5),(1,6),(2,6),(4,7),(4,6),(43,5),(5,9),(3,6);
```

  Query all data in unmerged parts.

```
SELECT * FROM testTable
┌─id─┬─value─┐
│  1 │     6 │
│  2 │     5 │
│  3 │     8 │
│  4 │     6 │
│  5 │    12 │
└────┴───────┘

┌─id─┬─value─┐
│  1 │     6 │
│  2 │     6 │
│  3 │    18 │
```

```
┌─id─┬─value─┐
│  4 │    13 │
│  5 │    14 │
│ 43 │     5 │
│ 88 │     5 │
└────┴───────┘
```

If ClickHouse has not summed up all rows and you need to aggregate data by ID, use the **sum** function and **GROUP BY** statement.

```
SELECT id, sum(value) FROM testTable GROUP BY id
┌─id─┬─sum(value)─┐
│  4 │         19 │
│  3 │         26 │
│ 88 │          5 │
│  2 │         11 │
│  5 │         26 │
│  1 │         12 │
│ 43 │          5 │
└────┴────────────┘
```

Merge rows manually.

```
OPTIMIZE TABLE testTable
```

Query data in the **testTable** table again.

```
SELECT * FROM testTable
┌─id─┬─value─┐
│  1 │    12 │
│  2 │    11 │
│  3 │    26 │
│  4 │    19 │
│  5 │    26 │
│ 43 │     5 │
│ 88 │     5 │
└────┴───────┘
```

SummingMergeTree uses the **ORDER BY** sorting keys as the condition keys to aggregate data. That is, if sorting keys are the same, data records are merged into one and the specified merged fields are aggregated.

Data is pre-aggregated only when merging is executed in the background, and the merging execution time cannot be predicted. Therefore, it is possible that some data has been pre-aggregated and some data has not been aggregated. Therefore, the **GROUP BY** statement must be used during aggregation.

- AggregatingMergeTree

  AggregatingMergeTree is a pre-aggregation engine used to improve aggregation performance. When merging partitions, the AggregatingMergeTree engine aggregates data based on predefined conditions, calculates data based on predefined aggregate functions, and saves the data in binary format to tables.

  Syntax for creating a table:

  ```
  CREATE TABLE [IF NOT EXISTS] [db.]table_name [ON CLUSTER cluster]
  (
      name1 [type1] [DEFAULT|MATERIALIZED|ALIAS expr1],
      name2 [type2] [DEFAULT|MATERIALIZED|ALIAS expr2],
      ...
  ) ENGINE = AggregatingMergeTree()
  [PARTITION BY expr]
  [ORDER BY expr]
  [SAMPLE BY expr]
  [TTL expr]
  [SETTINGS name=value, ...]
  ```

  Example:

You do not need to set the AggregatingMergeTree parameter separately. When partitions are merged, data in each partition is aggregated based on the **ORDER BY** sorting key. You can set the aggregate functions to be used and column fields to be calculated by defining the AggregateFunction type, as shown in the following example:

```
create table test_table (
name1 String,
name2 String,
name3 AggregateFunction(uniq,String),
name4 AggregateFunction(sum,Int),
name5 DateTime
) ENGINE = AggregatingMergeTree()
PARTITION BY toYYYYMM(name5)
ORDER BY (name1,name2)
PRIMARY KEY name1;
```

When data of the AggregateFunction type is written or queried, the ***state** and ***merge** functions need to be called. The asterisk (*) indicates the aggregate functions used for defining the field type. For example, the **uniq** and **sum** functions are specified for the **name3** and **name4** fields defined in the **test_table**, respectively. Therefore, you need to call the **uniqState** and **sumState** functions and run the **INSERT** and **SELECT** statements when writing data into the table.

```
insert into test_table select '8','test1',uniqState('name1'),sumState(toInt32(100)),'2021-04-30 17:18:00';
insert into test_table select '8','test1',uniqState('name1'),sumState(toInt32(200)),'2021-04-30 17:18:00';
```

When querying data, you need to call the corresponding functions **uniqMerge** and **sumMerge**.

```
select name1,name2,uniqMerge(name3),sumMerge(name4) from test_table group by name1,name2;
┌─name1─┬─name2─┬─uniqMerge(name3)─┬─sumMerge(name4)─┐
│ 8     │ test1 │                1 │             300 │
└───────┴───────┴──────────────────┴─────────────────┘
```

AggregatingMergeTree is more commonly used with materialized views, which are query views of other data tables at the upper layer. For details, visit **https://clickhouse.tech/docs/en/engines/table-engines/mergetree-family/aggregatingmergetree/**

- CollapsingMergeTree

  CollapsingMergeTree defines a **Sign** field to record status of data rows. If **Sign** is **1**, the data in this row is valid. If **Sign** is **-1**, the data in this row needs to be deleted.

  Syntax for creating a table:

  ```
  CREATE TABLE [IF NOT EXISTS] [db.]table_name [ON CLUSTER cluster]
  (
    name1 [type1] [DEFAULT|MATERIALIZED|ALIAS expr1],
    name2 [type2] [DEFAULT|MATERIALIZED|ALIAS expr2],
    ...
  ) ENGINE = CollapsingMergeTree(sign)
  [PARTITION BY expr]
  [ORDER BY expr]
  [SAMPLE BY expr]
  [SETTINGS name=value, ...]
  ```

  Example:

  For details about the example, visit **https://clickhouse.tech/docs/en/engines/table-engines/mergetree-family/collapsingmergetree/**.

- VersionedCollapsingMergeTree

The VersionedCollapsingMergeTree engine adds **Version** to the table creation statement to record the mapping between a **state** row and a **cancel** row in case that rows are out of order. The rows with the same primary key, same **Version**, and opposite **Sign** will be deleted during compaction.

Syntax for creating a table:

```
CREATE TABLE [IF NOT EXISTS] [db.]table_name [ON CLUSTER cluster]
(
    name1 [type1] [DEFAULT|MATERIALIZED|ALIAS expr1],
    name2 [type2] [DEFAULT|MATERIALIZED|ALIAS expr2],
    ...
) ENGINE = VersionedCollapsingMergeTree(sign, version)
[PARTITION BY expr]
[ORDER BY expr]
[SAMPLE BY expr]
[SETTINGS name=value, ...]
```

Example:

For details about the example, visit **https://clickhouse.tech/docs/en/engines/table-engines/mergetree-family/versionedcollapsingmergetree/**.

- GraphiteMergeTree

  The GraphiteMergeTree engine is used to store data in the time series database Graphite.

  Syntax for creating a table:

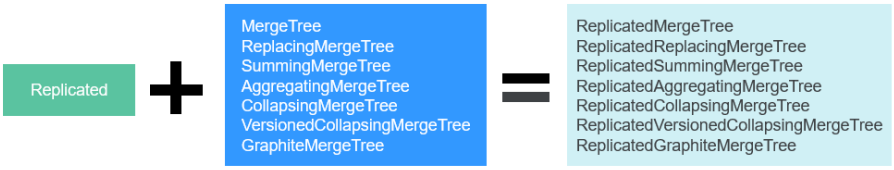
  ```
  CREATE TABLE [IF NOT EXISTS] [db.]table_name [ON CLUSTER cluster]
  (
      Path String,
      Time DateTime,
      Value <Numeric_type>,
      Version <Numeric_type>
      ...
  ) ENGINE = GraphiteMergeTree(config_section)
  [PARTITION BY expr]
  [ORDER BY expr]
  [SAMPLE BY expr]
  [SETTINGS name=value, ...]
  ```

  Example:

  For details about the example, visit **https://clickhouse.tech/docs/en/engines/table-engines/mergetree-family/graphitemergetree/**.

Replicated*MergeTree Engines

All engines of the MergeTree family in ClickHouse prefixed with Replicated become MergeTree engines that support replicas.



Replicated series engines use ZooKeeper to synchronize data. When a replicated table is created, all replicas of the same shard are synchronized based on the information registered with ZooKeeper.

Template for creating a Replicated engine:

```
ENGINE = Replicated*MergeTree('Storage path in ZooKeeper','Replica name', ...)
```

Two parameters need to be specified for a Replicated engine:

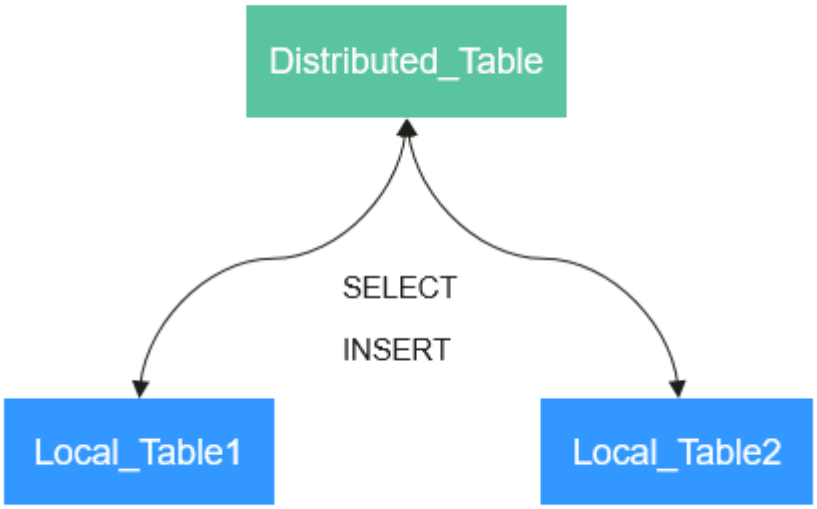
- *Storage path in ZooKeeper*: specifies the path for storing table data in ZooKeeper. The path format is ***/clickhouse/tables/{shard}|Database name/Table name***.
- *Replica name*: Generally, **{replica}** is used.

For details about the example, see **Creating a ClickHouse Table**.

Distributed Engine

The Distributed engine does not store any data. It serves as a transparent proxy for data shards and can automatically transmit data to each node in the cluster. Distributed tables need to work with other local data tables. Distributed tables distribute received read and write tasks to each local table where data is stored.

Figure 12-5 Working principle of the Distributed engine



Template for creating a Distributed engine:

```
ENGINE = Distributed(cluster_name, database_name, table_name, [sharding_key])
```

Parameters of a distributed table are described as follows:

- **cluster_name**: specifies the cluster name. When a distributed table is read or written, the cluster configuration information is used to search for the corresponding ClickHouse instance node.
- **database_name**: specifies the database name.
- **table_name**: specifies the name of a local table in the database. It is used to map a distributed table to a local table.
- **sharding_key** (optional): specifies the sharding key, based on which a distributed table distributes data to each local table.

Example:

```
-- Create a ReplicatedMergeTree local table named test.
CREATE TABLE default.test ON CLUSTER default_cluster_1
(
    `EventDate` DateTime,
    `id` UInt64
)
ENGINE = ReplicatedMergeTree('/clickhouse/tables/{shard}/default/test', '{replica}')
PARTITION BY toYYYYMM(EventDate)
ORDER BY id

-- Create a distributed table named test_all based on the local table test.
CREATE TABLE default.test_all ON CLUSTER default_cluster_1
(
    `EventDate` DateTime,
    `id` UInt64
)
ENGINE = Distributed(default_cluster_1, default, test, rand())
```

Rules for creating a distributed table:

- When creating a distributed table, add **ON CLUSTER** *cluster_name* to the table creation statement so that the statement can be executed once on a ClickHouse instance and then distributed to all instances in the cluster for execution.
- Generally, a distributed table is named in the following format: *Local table name*_all. It forms a one-to-many mapping with local tables. Then, multiple local tables can be operated using the distributed table proxy.
- Ensure that the structure of a distributed table is the same as that of local tables. If they are inconsistent, no error is reported during table creation, but an exception may be reported during data query or insertion.

12.4.3 Creating a ClickHouse Table

ClickHouse implements the replicated table mechanism based on the ReplicatedMergeTree engine and ZooKeeper. When creating a table, you can specify an engine to determine whether the table is highly available. Shards and replicas of each table are independent of each other.

ClickHouse also implements the distributed table mechanism based on the Distributed engine. Views are created on all shards (local tables) for distributed query, which is easy to use. ClickHouse has the concept of data sharding, which is one of the features of distributed storage. That is, parallel read and write are used to improve efficiency.

The ClickHouse cluster table engine that uses Kunpeng as the CPU architecture does not support HDFS and Kafka.

Viewing cluster and Other Environment Parameters of ClickHouse

Step 1 Use the ClickHouse client to connect to the ClickHouse server by referring to **Using ClickHouse from Scratch**.

Step 2 Query the cluster identifier and other information about the environment parameters.

select cluster,shard_num,replica_num,host_name from system.clusters;

```
SELECT
    cluster,
```

```
    shard_num,
    replica_num,
    host_name
FROM system.clusters

┌─cluster─────────────┬─shard_num─┬─replica_num─┬─host_name──────────┐
│ default_cluster_1   │         1 │           1 │ node-master1dOnG   │
│ default_cluster_1   │         1 │           2 │ node-group-1tXED0001 │
│ default_cluster_1   │         2 │           1 │ node-master2OXQS   │
│ default_cluster_1   │         2 │           2 │ node-group-1tXED0002 │
│ default_cluster_1   │         3 │           1 │ node-master3QsRI   │
│ default_cluster_1   │         3 │           2 │ node-group-1tXED0003 │
└─────────────────────┴───────────┴─────────────┴────────────────────┘

6 rows in set. Elapsed: 0.001 sec.
```

Step 3 Query the shard and replica identifiers.

select * from system.macros;

```
SELECT *
FROM system.macros

┌─macro───┬─substitution──────┐
│ id      │ 76                │
│ replica │ node-master3QsRI  │
│ shard   │ 3                 │
└─────────┴───────────────────┘

3 rows in set. Elapsed: 0.001 sec.
```

----End

Creating a Local Replicated Table and a distributed Table

Step 1 Log in to the ClickHouse node using the client, for example, **clickhouse client --host** *node-master3QsRI* **--multiline --port 9440 --secure;**

NOTE

node-master3QsRI is the value of **host_name** obtained in **Step 2** in **Viewing cluster and Other Environment Parameters of ClickHouse**.

Step 2 Create a replicated table using the ReplicatedMergeTree engine.

For details about the syntax, see **https://clickhouse.tech/docs/en/engines/table-engines/mergetree-family/replication/#creating-replicated-tables**.

For example, run the following commands to create a ReplicatedMergeTree table named **test** on the **default_cluster_1** node and in the **default** database:

CREATE TABLE *default.test* **ON CLUSTER** *default_cluster_1*

(

`EventDate` DateTime,

`id` UInt64

)

ENGINE = ReplicatedMergeTree('*/clickhouse/tables/{shard}/default/test***', '***{replica}***')**

PARTITION BY toYYYYMM(EventDate)

ORDER BY id;

The parameters are described as follows:

- The **ON CLUSTER** syntax indicates the distributed DDL, that is, the same local table can be created on all instances in the cluster after the statement is executed once.
- **default_cluster_1** is the cluster identifier obtained in **Step 2** in **Viewing cluster and Other Environment Parameters of ClickHouse**.

> **CAUTION**
>
> **ReplicatedMergeTree** engine receives the following two parameters:
>
> – Storage path of the table data in ZooKeeper
>
> The path must be in the **/clickhouse** directory. Otherwise, data insertion may fail due to insufficient ZooKeeper quota.
>
> To avoid data conflict between different tables in ZooKeeper, the directory must be in the following format:
>
> */clickhouse/tables/{shard}/default/test*, in which **/clickhouse/tables/{shard}** is fixed, *default* indicates the database name, and *text* indicates the name of the created table.
>
> – Replica name: Generally, **{replica}** is used.

```
CREATE TABLE default.test ON CLUSTER default_cluster_1
(
   `EventDate` DateTime,
   `id` UInt64
)
ENGINE = ReplicatedMergeTree('/clickhouse/tables/{shard}/default/test', '{replica}')
PARTITION BY toYYYYMM(EventDate)
ORDER BY id

┌─host──────────────────────┬─port─┬─status─┬─error─┬─num_hosts_remaining─┬─num_hosts_activ
e─┐
│ node-group-1tXED0002      │ 9000 │      0 │       │                   5 │           3 │
│ node-group-1tXED0003      │ 9000 │      0 │       │                   4 │           3 │
│ node-master1dOnG          │ 9000 │      0 │       │                   3 │           3 │
└───────────────────────────┴──────┴────────┴───────┴─────────────────────┴───────────────┘
┌─host──────────────────────┬─port─┬─status─┬─error─┬─num_hosts_remaining─┬─num_hosts_activ
e─┐
│ node-master3QsRI          │ 9000 │      0 │       │                   2 │           0 │
│ node-group-1tXED0001      │ 9000 │      0 │       │                   1 │           0 │
│ node-master2OXQS          │ 9000 │      0 │       │                   0 │           0 │
└───────────────────────────┴──────┴────────┴───────┴─────────────────────┴───────────────┘

6 rows in set. Elapsed: 0.189 sec.
```

Step 3 Create a distributed table using the Distributed engine.

For example, run the following commands to create a distributed table named **test_all** on the **default_cluster_1** node and in the **default** database:

CREATE TABLE *default.test_all* **ON CLUSTER** *default_cluster_1*

(

`EventDate` DateTime,

`id` UInt64

)

ENGINE = Distributed(*default_cluster_1, default, test, rand()***);**

```
CREATE TABLE default.test_all ON CLUSTER default_cluster_1
(
   `EventDate` DateTime,
   `id` UInt64
)
ENGINE = Distributed(default_cluster_1, default, test, rand())

┌─host──────────────────────┬─port─┬─status─┬─error─┬─num_hosts_remaining─┬─num_hosts_active─┐
│ node-group-1tXED0002      │ 9000 │      0 │       │                   5 │                0 │
│ node-master3QsRI          │ 9000 │      0 │       │                   4 │                0 │
│ node-group-1tXED0003      │ 9000 │      0 │       │                   3 │                0 │
│ node-group-1tXED0001      │ 9000 │      0 │       │                   2 │                0 │
│ node-master1dOnG          │ 9000 │      0 │       │                   1 │                0 │
│ node-master2OXQS          │ 9000 │      0 │       │                   0 │                0 │
└───────────────────────────┴──────┴────────┴───────┴─────────────────────┴──────────────────┘

6 rows in set. Elapsed: 0.115 sec.
```

NOTE

Distributed requires the following parameters:

- **default_cluster_1** is the cluster identifier obtained in **Step 2** in **Viewing cluster and Other Environment Parameters of ClickHouse**.
- **default** indicates the name of the database where the local table is located.
- **test** indicates the name of the local table. In this example, it is the name of the table created in **Step 2**.
- (Optional) Sharding key

  This key and the weight configured in the **config.xml** file determine the route for writing data to the distributed table, that is, the physical table to which the data is written. It can be the original data (for example, **site_id**) of a column in the table or the result of the function call, for example, **rand()** is used in the preceding SQL statement. Note that data must be evenly distributed in this key. Another common operation is to use the hash value of a column with a large difference, for example, **intHash64(user_id)**.

----End

ClickHouse Table Data Operations

Step 1 Log in to the ClickHouse node on the client. Example:

clickhouse client --host *node-master3QsRI* **--multiline --port 9440 --secure;**

NOTE

node-master3QsRI is the value of **host_name** obtained in **Step 2** in **Viewing cluster and Other Environment Parameters of ClickHouse**.

Step 2 After creating a table by referring to **Creating a Local Replicated Table and a distributed Table**, you can insert data to the local table.

For example, run the following command to insert data to the local table **test**:

insert into test values(toDateTime(now()), rand());

Step 3 Query the local table information.

For example, run the following command to query data information of the table **test** in **Step 2**:

select * from test;

```
SELECT *
FROM test

┌─────────────EventDate─┬──────────id─┐
│ 2020-11-05 21:10:42   │ 1596238076  │
└───────────────────────┴─────────────┘

1 rows in set. Elapsed: 0.002 sec.
```

Step 4 Query the distributed table.

For example, the distributed table **test_all** is created based on table **test** in **Step 3**. Therefore, the same data in table **test** can also be queried in table **test_all**.

select * from test_all;

```
SELECT *
FROM test_all

┌─────────────EventDate─┬──────────id─┐
│ 2020-11-05 21:10:42   │ 1596238076  │
└───────────────────────┴─────────────┘

1 rows in set. Elapsed: 0.004 sec.
```

Step 5 Switch to the shard node with the same **shard_num** and query the information about the current table. The same table data can be queried.

For example, run the **exit;** command to exit the original node.

Run the following command to switch to the **node-group-1tXED0003** node:

clickhouse client --host *node-group-1tXED0003* **--multiline --port 9440 --secure;**

NOTE

The **shard_num** values of **node-group-1tXED0003** and **node-master3QsRI** are the same by performing **Step 2**.

show tables;

```
SHOW TABLES

┌─name─────┐
│ test     │
│ test_all │
└──────────┘
```

Step 6 Query the local table data. For example, run the following command to query data in table **test** on the **node-group-1tXED0003** node:

select * from test;

```
SELECT *
FROM test

┌─────────────EventDate─┬──────────id─┐
│ 2020-11-05 21:10:42   │ 1596238076  │
└───────────────────────┴─────────────┘
```

```
1 rows in set. Elapsed: 0.005 sec.
```

Step 7 Switch to the shard node with different **shard_num** value and query the data of the created table.

For example, run the following command to exit the **node-group-1tXED0003** node:

exit;

Switch to the **node-group-1tXED0001** node. The **shard_num** values of **node-group-1tXED0001** and **node-master3QsRI** are different by performing **Step 2**.

clickhouse client --host *node-group-1tXED0001* **--multiline --port 9440 --secure;**

Query the local table **test**. Data cannot be queried on the different shard node because table **test** is a local table.

select * from test;

```
SELECT *
FROM test

Ok.
```

Query data in the distributed table **test_all**. The data can be queried properly.

select * from test_all;

```
SELECT *
FROM test

┌─────────────EventDate─┬──────────id─┐
│ 2020-11-05 21:12:19   │ 3686805070  │
└───────────────────────┴─────────────┘

1 rows in set. Elapsed: 0.002 sec.
```

----End

12.4.4 Common ClickHouse SQL Syntax

12.4.4.1 CREATE DATABASE: Creating a Database

This section describes the basic syntax and usage of the SQL statement for creating a ClickHouse database.

Basic Syntax

CREATE DATABASE [IF NOT EXISTS] *Database_name* **[ON CLUSTER** *ClickHouse cluster name***]**

NOTE

The syntax **ON CLUSTER** *ClickHouse cluster name* enables the Data Definition Language (DDL) statement to be executed on all instances in the cluster at a time. You can run the following statement to obtain the cluster name from the **cluster** field:

select cluster,shard_num,replica_num,host_name from system.clusters;

Example

```
-- Create a database named test.
CREATE DATABASE test ON CLUSTER default_cluster;
-- After the creation is successful, run the query command for verification.
show databases;
┌─name────┐
│ default │
│ system  │
│ test    │
└─────────┘
```

12.4.4.2 CREATE TABLE: Creating a Table

This section describes the basic syntax and usage of the SQL statement for creating a ClickHouse table.

Basic Syntax

- Method 1: Creating a table named **table_name** in the specified **database_name** database.

  If the table creation statement does not contain **database_name**, the name of the database selected during client login is used by default.

  CREATE TABLE [IF NOT EXISTS] *[database_name.]table_name* **[ON CLUSTER** *ClickHouse cluster name***]**

  (

  name1 **[***type1***] [DEFAULT|MATERIALIZED|ALIAS** *expr1***],**

  name2 **[***type2***] [DEFAULT|MATERIALIZED|ALIAS** *expr2***],**

  ...

) *ENGINE = engine_name()*

  [**PARTITION BY** *expr_list*]

  [**ORDER BY** *expr_list*]

  CAUTION

  You are advised to use **PARTITION BY** to create table partitions when creating a ClickHouse table. The ClickHouse data migration tool migrates data based on table partitions. If you do not use **PARTITION BY** to create table partitions during table creation, the table data cannot be migrated on the GUI in **Using the ClickHouse Data Migration Tool**.

- Method 2: Creating a table with the same structure as **database_name2.table_name2** and specifying a different table engine for the table

If no table engine is specified, the created table uses the same table engine as **database_name2.table_name2**.

CREATE TABLE [IF NOT EXISTS] *[database_name.]table_name* **AS** [*database_name2*.]*table_name*2 [ENGINE = *engine_name*]

- Method 3: Using the specified engine to create a table with the same structure as the result of the **SELECT** clause and filling it with the result of the **SELECT** clause

  CREATE TABLE [IF NOT EXISTS] *[database_name.]table_name ENGINE = engine_name* **AS SELECT** ...

Example

```
-- Create a table named test in the default database and default_cluster cluster.
CREATE TABLE default.test ON CLUSTER default_cluster
(
    `EventDate` DateTime,
    `id` UInt64
)
ENGINE = ReplicatedMergeTree('/clickhouse/tables/{shard}/default/test', '{replica}')
PARTITION BY toYYYYMM(EventDate)
ORDER BY id
```

12.4.4.3 INSERT INTO: Inserting Data into a Table

This section describes the basic syntax and usage of the SQL statement for inserting data to a table in ClickHouse.

Basic Syntax

- Method 1: Inserting data in standard format

  INSERT INTO *[database_name.]table* [(*c1, c2, c3*)] **VALUES** (*v11, v12, v13*), (*v21, v22, v23*), ...

- Method 2: Using the **SELECT** result to insert data

  INSERT INTO *[database_name.]table* [(c1, c2, c3)] **SELECT** ...

Example

```
-- Insert data into the test2 table.
insert into test2 (id, name) values (1, 'abc'), (2, 'bbbb');
-- Query data in the test2 table.
select * from test2;
┌─id─┬─name─┐
│  1 │ abc  │
│  2 │ bbbb │
└────┴──────┘
```

12.4.4.4 SELECT: Querying Table Data

This section describes the basic syntax and usage of the SQL statement for querying table data in ClickHouse.

Basic Syntax

SELECT [**DISTINCT**] expr_list

[**FROM** [*database_name*.]*table* | (subquery) | table_function] [**FINAL**]

[SAMPLE sample_coeff]

[ARRAY **JOIN** ...]

[**GLOBAL**] [**ANY**|**ALL**|**ASOF**] [**INNER**|**LEFT**|**RIGHT**|**FULL**|**CROSS**] [**OUTER**|SEMI|ANTI] **JOIN** (subquery)|**table** (**ON** <expr_list>)|(**USING** <column_list>)

[PREWHERE expr]

[**WHERE** expr]

[**GROUP BY** expr_list] [**WITH** TOTALS]

[**HAVING** expr]

[**ORDER BY** expr_list] [**WITH** FILL] [**FROM** expr] [**TO** expr] [STEP expr]

[**LIMIT** [offset_value,]n **BY** columns]

[**LIMIT** [n,]m] [**WITH** TIES]

[**UNION ALL** ...]

[**INTO** OUTFILE filename]

[FORMAT format]

Example

```
-- View ClickHouse cluster information.
select * from system.clusters;
-- View the macros set for the current node.
select * from system.macros;
-- Check the database capacity.
select
sum(rows) as "Total number of rows",
formatReadableSize(sum(data_uncompressed_bytes)) as "Original size",
formatReadableSize(sum(data_compressed_bytes)) as "Compression size",
round(sum(data_compressed_bytes) / sum(data_uncompressed_bytes) * 100,
0) "Compression rate"
from system.parts;
-- Query the capacity of the test table. Add or modify the where clause based on the site requirements.
select
sum(rows) as "Total number of rows",
formatReadableSize(sum(data_uncompressed_bytes)) as "Original size",
formatReadableSize(sum(data_compressed_bytes)) as "Compression size",
round(sum(data_compressed_bytes) / sum(data_uncompressed_bytes) * 100,
0) "Compression rate"
from system.parts
where table in ('test')
and partition like '2020-11-%'
group by table;
```

12.4.4.5 ALTER TABLE: Modifying a Table Structure

This section describes the basic syntax and usage of the SQL statement for modifying a table structure in ClickHouse.

Basic Syntax

ALTER TABLE [*database_name*].*name* [**ON CLUSTER** *cluster*] **ADD**|**DROP**|**CLEAR**|**COMMENT**|**MODIFY COLUMN** ...

NOTE

ALTER supports only *MergeTree, Merge, and Distributed engine tables.

Example

```
-- Add the test01 column to the t1 table.
ALTER TABLE t1 ADD COLUMN test01 String DEFAULT 'defaultvalue';
-- Query the modified table t1.
desc t1
┌─name────┬─type───┬─default_type─┬─default_expression─┬─comment─┬─codec_expression─┬─ttl_expression─┐
│ id      │ UInt8  │              │                    │         │                  │                │
│ name    │ String │              │                    │         │                  │                │
│ address │ String │              │                    │         │                  │                │
│ test01  │ String │ DEFAULT      │ 'defaultvalue'     │         │                  │                │
└─────────┴────────┴──────────────┴────────────────────┴─────────┴──────────────────┴────────────────┘
-- Change the type of the name column in the t1 table to UInt8.
ALTER TABLE t1 MODIFY COLUMN name UInt8;
-- Query the modified table t1.
desc t1
┌─name────┬─type───┬─default_type─┬─default_expression─┬─comment─┬─codec_expression─┬─ttl_expression─┐
│ id      │ UInt8  │              │                    │         │                  │                │
│ name    │ UInt8  │              │                    │         │                  │                │
│ address │ String │              │                    │         │                  │                │
│ test01  │ String │ DEFAULT      │ 'defaultvalue'     │         │                  │                │
└─────────┴────────┴──────────────┴────────────────────┴─────────┴──────────────────┴────────────────┘
-- Delete the test01 column from the t1 table.
ALTER TABLE t1 DROP COLUMN test01;
-- Query the modified table t1.
desc t1
┌─name────┬─type───┬─default_type─┬─default_expression─┬─comment─┬─codec_expression─┬─ttl_expression─┐
│ id      │ UInt8  │              │                    │         │                  │                │
│ name    │ UInt8  │              │                    │         │                  │                │
│ address │ String │              │                    │         │                  │                │
└─────────┴────────┴──────────────┴────────────────────┴─────────┴──────────────────┴────────────────┘
```

12.4.4.6 DESC: Querying a Table Structure

This section describes the basic syntax and usage of the SQL statement for querying a table structure in ClickHouse.

Basic Syntax

DESC|**DESCRIBE TABLE** [*database_name*.]*table* [**INTO** OUTFILE filename] [FORMAT format]

Example

```
-- Query the t1 table structure.
desc t1;
┌─name────┬─type───┬─default_type─┬─default_expression─┬─comment─┬─codec_expression─┬─ttl_expression─┐

```

12.4.4.7 DROP: Deleting a Table

This section describes the basic syntax and usage of the SQL statement for deleting a ClickHouse table.

Basic Syntax

DROP [**TEMPORARY**] **TABLE** [**IF EXISTS**] [*database_name*.]*name* [**ON CLUSTER** *cluster*]

Example

```
-- Delete the t1 table.
drop table t1;
```

12.4.4.8 SHOW: Displaying Information About Databases and Tables

This section describes the basic syntax and usage of the SQL statement for displaying information about databases and tables in ClickHouse.

Basic Syntax

show databases

show tables

Example

```
-- Query database information.
show databases;
┌─name───┐
│ default │
│ system │
│ test │
└────────┘
-- Query table information.
show tables;
┌─name──┐
│ t1 │
│ test │
│ test2 │
│ test5 │
└───────┘
```

12.4.5 Migrating ClickHouse Data

12.4.5.1 Using ClickHouse to Import and Export Data

Using ClickHouse to Import and Export Data

This section describes the basic syntax and usage of the SQL statements for importing and exporting file data using ClickHouse.

- Importing data in CSV format

  clickhouse client --host *Host name or IP address of the ClickHouse instance* **--database** *Database name* **--port** *Port number* **--secure --format_csv_delimiter="***CSV file delimiter***" --query="INSERT INTO** *Table name* **FORMAT CSV" <** *Host path where the CSV file is stored*

  Example

  ```
  clickhouse client --host 10.5.208.5 --database testdb --port 21427 --secure --format_csv_delimiter="," --query="INSERT INTO testdb.csv_table FORMAT CSV" < /opt/data.csv
  ```

  You need to create a table in advance.

- Exporting data in CSV format

  CAUTION

  Exporting data files in CSV format may cause CSV injection. Exercise caution when performing this operation.

  clickhouse client --host *Host name or IP address of the ClickHouse instance* **--database** *Database name* **--port** *Port number* **-m --secure --query=**"SELECT * **FROM** *Table name*" > *CSV file export path*

  Example

  ```
  clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="SELECT * FROM test_table" > /opt/test.csv
  ```

- Importing data in Parquet format

  cat *Parquet file* **| clickhouse client --host** *Host name or IP address of the ClickHouse instance* **--database** *Database name* **--port** *Port number* **-m --secure --query="INSERT INTO** *Table name* **FORMAT Parquet"**

  Example

  ```
  cat /opt/student.parquet | clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="INSERT INTO parquet_tab001 FORMAT Parquet"
  ```

- Exporting data in Parquet format

  clickhouse client --host *Host name or IP address of the ClickHouse instance* **--database** *Database name* **--port** *Port number* **-m --secure --query="select * from** *Table name* **FORMAT Parquet**" > *Parquet file export path*

  Example

  ```
  clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="select * from test_table FORMAT Parquet" > /opt/student.parquet
  ```

- Importing data in ORC format

  cat *ORC file path* **| clickhouse client --host** *Host name or IP address of the ClickHouse instance* **--database** *Database name* **--port** *Port number* **-m --secure --query="INSERT INTO** *Table name* **FORMAT ORC"**

  Example

  ```
  cat /opt/student.orc | clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="INSERT INTO orc_tab001 FORMAT ORC"
  # Data in the ORC file can be exported from HDFS. For example:
  hdfs dfs -cat /user/hive/warehouse/hivedb.db/emp_orc/000000_0_copy_1 | clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="INSERT INTO orc_tab001 FORMAT ORC"
  ```

- Exporting data in ORC format

  clickhouse client --host *Host name or IP address of the ClickHouse instance* **--database** *Database name* **--port** *Port number* **-m --secure --query="select * from** *Table name* **FORMAT ORC**" > *ORC file export path*

  Example

  ```
  clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="select * from csv_tab001 FORMAT ORC" > /opt/student.orc
  ```

- Importing data in JSON format

  INSERT INTO *Table name* **FORMAT JSONEachRow** *JSON string 1 JSON string 2*

  Example

```
INSERT INTO test_table001 FORMAT JSONEachRow {"PageViews":5,
"UserID":"4324182021466249494", "Duration":146,"Sign":-1}
{"UserID":"4324182021466249494","PageViews":6,"Duration":185,"Sign":1}
```

- Exporting data in JSON format

  clickhouse client --host *Host name or IP address of the ClickHouse instance* **--database** *Database name* **--port** *Port number* **-m --secure --query="SELECT** * **FROM** *Table name* **FORMAT JSON|JSONEachRow|JSONCompact|...**" > *JSON file export path*

  Example

```
# Export JSON file.
clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="SELECT *
FROM test_table FORMAT JSON" > /opt/test.json

# Export json(JSONEachRow).
clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="SELECT *
FROM test_table FORMAT JSONEachRow" > /opt/test_jsoneachrow.json

# Export json(JSONCompact).
clickhouse client --host 10.5.208.5 --database testdb --port 21427 -m --secure --query="SELECT *
FROM test_table FORMAT JSONCompact" > /opt/test_jsoncompact.json
```

12.4.5.2 Synchronizing Kafka Data to ClickHouse

This section describes how to create a Kafka table to automatically synchronize Kafka data to the ClickHouse cluster.

Prerequisites

- You have created a Kafka cluster. The Kafka client has been installed.
- A ClickHouse cluster has been created. It is in the same VPC as the Kafka cluster and can communicate with each other.
- The ClickHouse client has been installed.

Syntax of the Kafka Table

- **Syntax**

```
CREATE TABLE [IF NOT EXISTS] [db.]table_name [ON CLUSTER cluster]
(
    name1 [type1] [DEFAULT|MATERIALIZED|ALIAS expr1],
    name2 [type2] [DEFAULT|MATERIALIZED|ALIAS expr2],
    ...
) ENGINE = Kafka()
SETTINGS
    kafka_broker_list = 'host1:port1,host2:port2',
    kafka_topic_list = 'topic1,topic2,...',
    kafka_group_name = 'group_name',
    kafka_format = 'data_format';
    [kafka_row_delimiter = 'delimiter_symbol',]
    [kafka_schema = '',]
    [kafka_num_consumers = N]
```

- **Parameter description**

Table 12-55 Kafka table parameters

Parameter	Mandatory	Description
kafka_broker_list	Yes	A list of Kafka broker instances, separated by comma (,). For example, *IP address 1 of the Kafka broker instance*:**9092**,*IP address 2 of the Kafka broker instance*:**9092**,*IP address 3 of the Kafka broker instance*:**9092**. To obtain the IP address of the Kafka broker instance, perform the following steps: • For versions earlier than MRS 3.x, click the cluster name to go to the cluster details page and choose **Components** > **Kafka**. Click **Instances** to query the IP addresses of the Kafka instances. **NOTE** If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.) • For MRS 3.*x* or later, log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka**. Click **Instances** to query the IP addresses of the Kafka instances.
kafka_topic_list	Yes	A list of Kafka topics.
kafka_group_name	Yes	A group of Kafka consumers, which can be customized.
kafka_format	Yes	Kafka message format, for example, JSONEachRow, CSV, and XML.
kafka_row_delimiter	No	Delimiter character, which ends a message.
kafka_schema	No	Parameter that must be used if the format requires a schema definition.
kafka_num_consumers	No	Number of consumers in per table. The default value is **1**. If the throughput of a consumer is insufficient, more consumers are required. The total number of consumers cannot exceed the number of partitions in a topic because only one consumer can be allocated to each partition.

How to Synchronize Kafka Data to ClickHouse

Step 1 Switch to the Kafka client installation directory. For details, see **Using the Kafka Client**.

1. Log in to the node where the Kafka client is installed as the Kafka client installation user.
2. Run the following command to go to the client installation directory:

   cd /opt/client
3. Run the following command to configure environment variables:

   source bigdata_env
4. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. If Kerberos authentication is disabled for the current cluster, skip this step.
   a. Run the following command first for an MRS 3.1.0 cluster:

      export CLICKHOUSE_SECURITY_ENABLED=true
   b. **kinit** *Component service user*

Step 2 Run the following command to create a Kafka topic. For details, see **Managing Kafka Topics**.

kafka-topics.sh --topic *kafkacktest2* **--create --zookeeper** *IP address of the Zookeeper role instance:2181*/**kafka --partitions** *2* **--replication-factor** *1*

NOTE

- **--topic** is the name of the topic to be created, for example, **kafkacktest2**.
- **--zookeeper** is the IP address of the node where the ZooKeeper role instances are located, which can be the IP address of any of the three role instances. You can obtain the IP address of the node by performing the following steps:
  - For versions earlier than MRS 3.x, click the cluster name to go to the cluster details page and choose **Components** > **ZooKeeper** > **Instances**. View the IP addresses of the ZooKeeper role instances.
  - For MRS 3.*x* or later, log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Instance**. View the IP addresses of the ZooKeeper role instances.
- **--partitions** and **--replication-factor** are the topic partitions and topic backup replicas, respectively. The number of the two parameters cannot exceed the number of Kafka role instances.

Step 3 Log in to the ClickHouse client by referring to **Using ClickHouse from Scratch**.

1. Run the following command to go to the client installation directory:

   cd /opt/Bigdata/client
2. Run the following command to configure environment variables:

   source bigdata_env
3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The user must have the permission to create ClickHouse tables. Therefore, you need to bind the corresponding role to the user. For details, see **ClickHouse User and Permission Management**. If Kerberos authentication is disabled for the current cluster, skip this step.

   kinit *Component service user*

   Example: **kinit clickhouseuser**
4. Run the following command to connect to the ClickHouse instance node to which data is to be imported:

clickhouse client --host *IP address of the ClickHouse instance* **--user** *Login username* **--password** *User password* **--port** *Port number of the ClickHouse instance* **--database** *Database name* **--multiline**

Step 4 Create a Kafka table in ClickHouse by referring to **Syntax of the Kafka Table**. For example, the following table creation statement is used to create a Kafka table whose name is **kafka_src_tbl3**, topic name is **kafkacktest2**, and message format is **JSONEachRow** in the default database.

```
create table kafka_src_tbl3 on cluster default_cluster
(id UInt32, age UInt32, msg String)
ENGINE=Kafka()
SETTINGS
 kafka_broker_list='IP address 1 of the Kafka broker instance:9092,IP address 2 of the Kafka broker instance:9092,IP address 3 of the Kafka broker instance:9092',
 kafka_topic_list='kafkacktest2',
 kafka_group_name='cg12',
 kafka_format='JSONEachRow';
```

Step 5 Create a ClickHouse replicated table, for example, the ReplicatedMergeTree table named **kafka_dest_tbl3**.

```
create table kafka_dest_tbl3 on cluster default_cluster
( id UInt32, age UInt32, msg String )
engine = ReplicatedMergeTree('/clickhouse/tables/{shard}/default/kafka_dest_tbl3', '{replica}')
partition by age
order by id;
```

Step 6 Create a materialized view, which converts data in Kafka in the background and saves the data to the created ClickHouse table.

```
create materialized view consumer3 on cluster default_cluster to kafka_dest_tbl3 as select * from
kafka_src_tbl3;
```

Step 7 Perform **Step 1** again to go to the Kafka client installation directory.

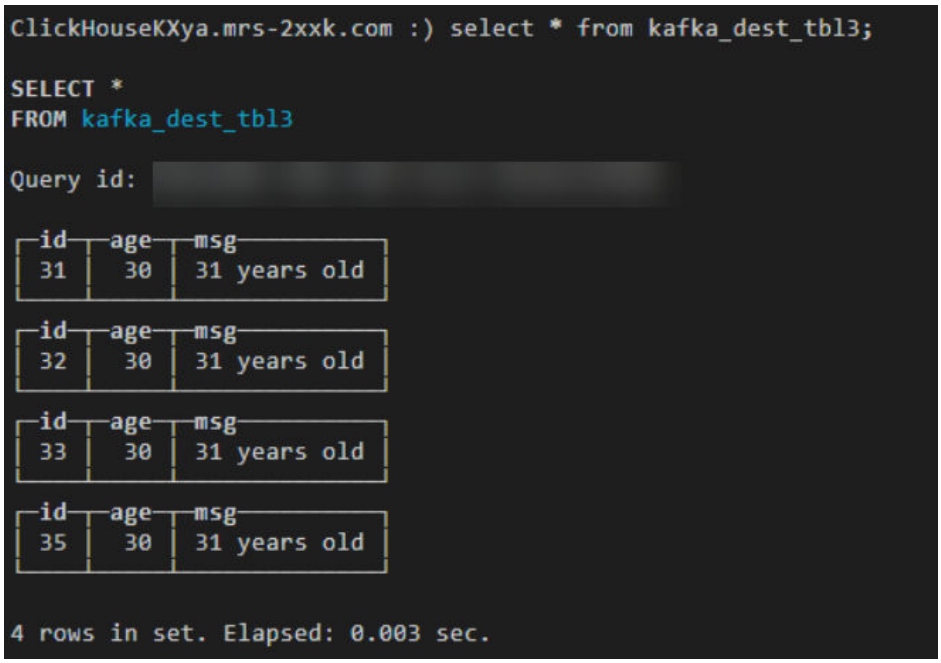
Step 8 Run the following command to send a message to the topic created in **Step 2**:

kafka-console-producer.sh --broker-list *IP address 1 of the kafka broker instance*:**9092,***IP address 2 of the kafka broker instance*:**9092,***IP address 3 of the kafka broker instance*:**9092 --topic** *kafkacktest2*

```
>{"id":31, "age":30, "msg":"31 years old"}
>{"id":32, "age":30, "msg":"31 years old"}
>{"id":33, "age":30, "msg":"31 years old"}
>{"id":35, "age":30, "msg":"31 years old"}
```

Step 9 Use the ClickHouse client to log in to the ClickHouse instance node in **Step 3** and query the ClickHouse table data, for example, to query the replicated table **kafka_dest_tbl3**. It shows that the data in the Kafka message has been synchronized to this table.

```
select * from kafka_dest_tbl3;
```



----End

12.4.5.3 Using the ClickHouse Data Migration Tool

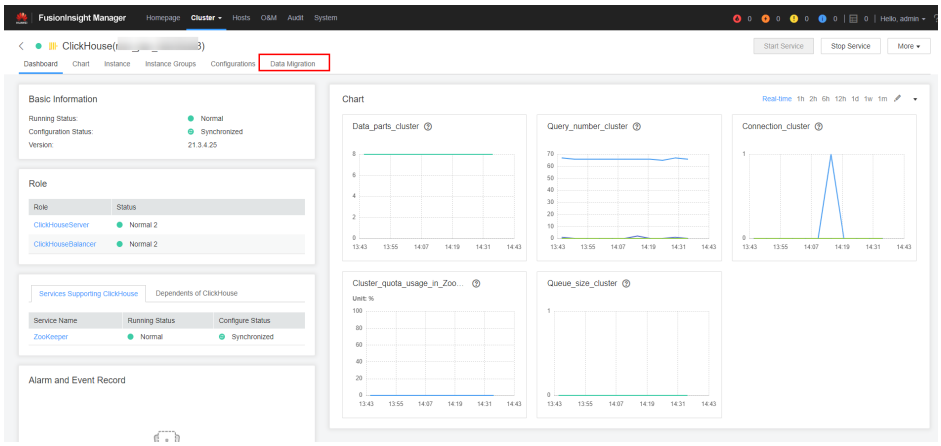
The ClickHouse data migration tool can migrate some partitions of one or more partitioned MergeTree tables on several ClickHouseServer nodes to the same tables on other ClickHouseServer nodes. In the capacity expansion scenario, you can use this tool to migrate data from an original node to a new node to balance data after capacity expansion.

Prerequisites

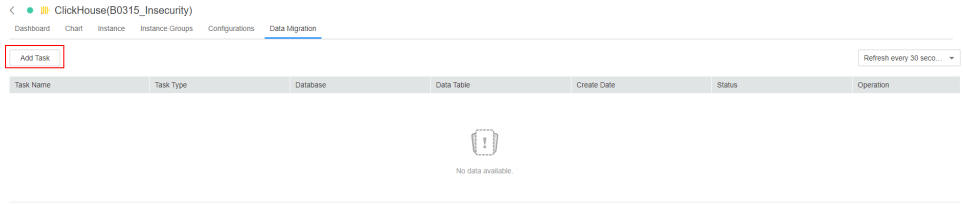
- The ClickHouse and Zookeeper services are running properly. The ClickHouseServer instances on the source and destination nodes are normal.
- The destination node has the data table to be migrated and the table is a partitioned MergeTree table.
- Before creating a migration task, ensure that all tasks for writing data to a table to be migrated have been stopped. After the task is started, you can only query the table to be migrated and cannot write data to or delete data from the table. Otherwise, data may be inconsistent before and after the migration.
- The ClickHouse data directory on the destination node has sufficient space.

Procedure

Step 1 Log in to Manager and choose **Cluster** > **Services** > **ClickHouse**. On the ClickHouse service page, click the **Data Migration** tab.



Step 2 Click **Add Task**.



Step 3 On the page for creating a migration task, set the migration task parameters. For details, see **Table 12-56**.

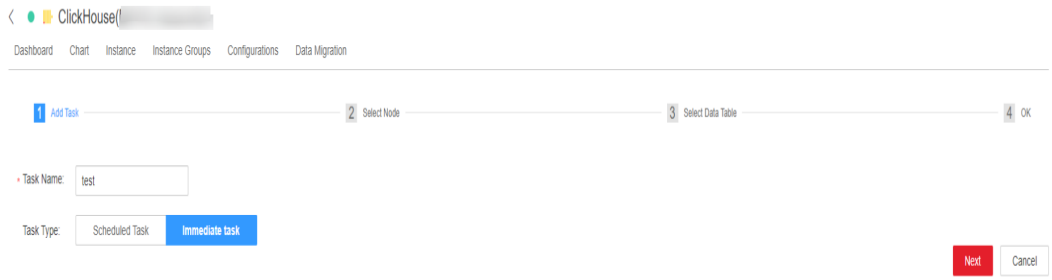


Table 12-56 Migration task parameters

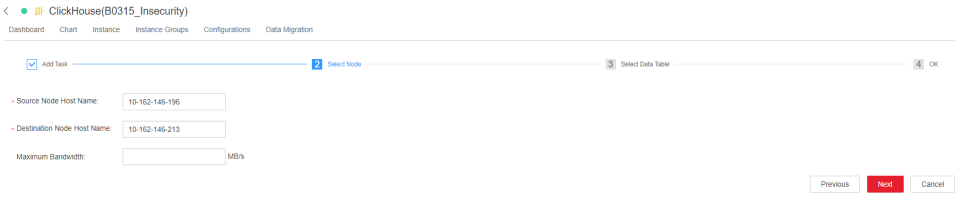
Parameter	Description
Task Name	Enter a specific task name. The value can contain 1 to 50 characters, including letters, arrays, and underscores (_), and cannot be the same as that of an existing migration task.
Task Type	• **Scheduled Task**: When the scheduled task is selected, you can set **Started** to specify a time point later than the current time to execute the task. • **Immediate task**: The task is executed immediately after it is started.
Started	Set this parameter when **Task Type** is set to **Scheduled Task**. The valid value is a time point within 90 days from now.

Step 4 On the **Select Node** page, specify **Source Node Host Name** and **Destination Node Host Name**, and click **Next**.

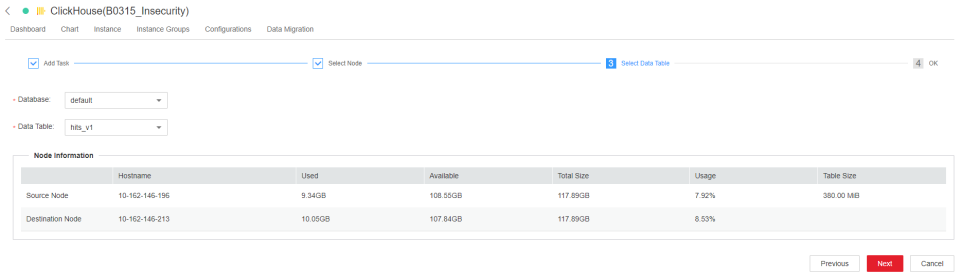


NOTE

- Only one host name can be entered in **Source Node Host Name** and **Destination Node Host Name**, respectively. Multi-node migration is not supported.

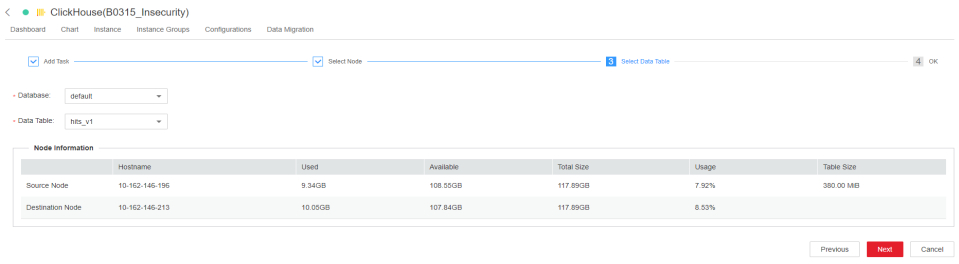
  To obtain the parameter values, click the **Instance** tab on the ClickHouse service page and view the **Host Name** column of the current ClickHouseServer instance.
- **Maximum Bandwidth** is optional. If it is not specified, there is no upper limit. The maximum bandwidth can be set to **10000** MB/s.

Step 5 On the **Select Data Table** page, click next to **Database**, select the database to be migrated on the source node, and select the data table to be migrated for **Data Table**. The data table drop-down list displays the partitioned MergeTree tables in the selected database. In the **Node Information** area, the space usage of the ClickHouse service data directory on the current source and destination nodes is displayed. Click **Next**.



Step 6 Confirm the task information and click **Submit**.

The data migration tool automatically calculates the partitions to be migrated based on the size of the data table. The amount of data to be migrated is the total size of the partitions to be migrated.



Step 7 After the migration task is submitted, click **Start** in the **Operation** column. If the task is an immediate task, the task starts to be executed. If the task is a scheduled task, the countdown starts.

Step 8 During the migration task execution, you can click **Cancel** to cancel the migration task that is being executed. If you cancel the task, the migrated data on the destination node will be rolled back.

You can choose **More** > **Details** to view the log information during the migration.

Step 9 After the migration is complete, choose **More** > **Results** to view the migration result and choose **More** > **Delete** to delete the directories related to the migration task on ZooKeeper and the source node.

----End

12.4.6 User Management and Authentication

12.4.6.1 ClickHouse User and Permission Management

User Permission Model

ClickHouse user permission management enables unified management of users, roles, and permissions on each ClickHouse instance in the cluster. You can use the permission management module of the Manager UI to create users, create roles, and bind the ClickHouse access permissions. User permissions are controlled by binding roles to users.

Resource management: **Table 12-57** lists the resources supported by ClickHouse permission management.

Resource permissions: **Table 12-58** lists the resource permissions supported by ClickHouse.

Table 12-57 Permission management objects supported by ClickHouse

Resource	Integration	Remarks
Database	Yes (level 1)	-
Table	Yes (level 2)	-
View	Yes (level 2)	Same as tables

Table 12-58 Resource permission list

Resource	Available Permission	Remarks
Database	CREATE	CREATE DATABASE/TABLE/VIEW/ DICTIONARY

Resource	Available Permission	Remarks
Table/View	SELECT/INSERT	-

Prerequisites

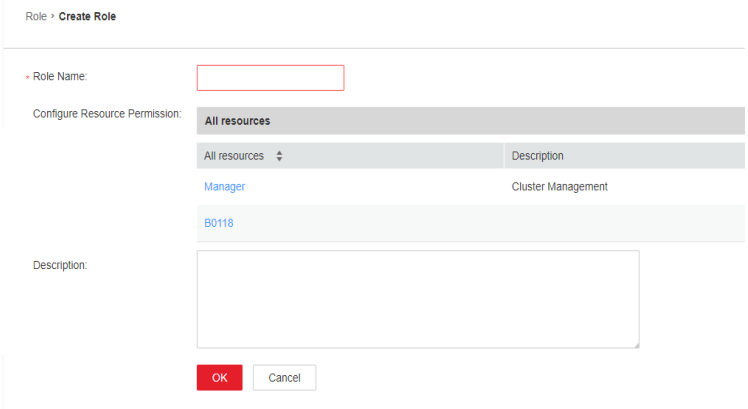
- The ClickHouse and Zookeeper services are running properly.
- When creating a database or table in the cluster, the **ON CLUSTER** statement is used to ensure that the metadata of the database and table on each ClickHouse node is the same.

NOTE

After the permission is granted, it takes about 1 minute for the permission to take effect.

Adding the ClickHouse Role

Step 1 Log in to Manager and choose **System** > **Permission** > **Role**. On the **Role** page, click **Create Role**.



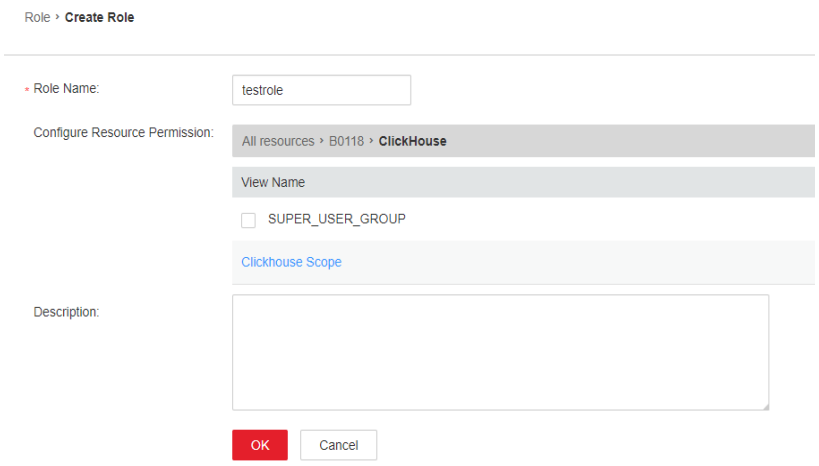
Step 2 On the **Create Role** page, specify **Role Name**. In the **Configure Resource Permission** area, click the cluster name. On the service list page that is displayed, click the ClickHouse service.

Determine whether to create a role with administrator permission based on service requirements.

NOTE

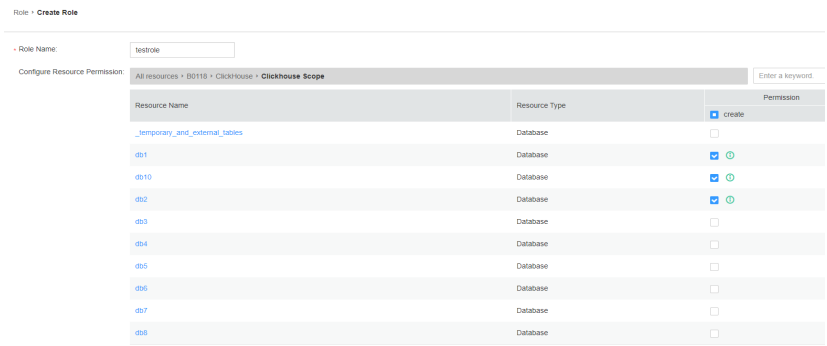
- The ClickHouse administrator has all the database operation permissions except the permissions to create, delete, and modify users and roles.
- Only the built-in user **clickhouse** of ClickHouse has the permission to manage users and roles.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.



Step 3 Select **SUPER_USER_GROUP** and click **OK**.

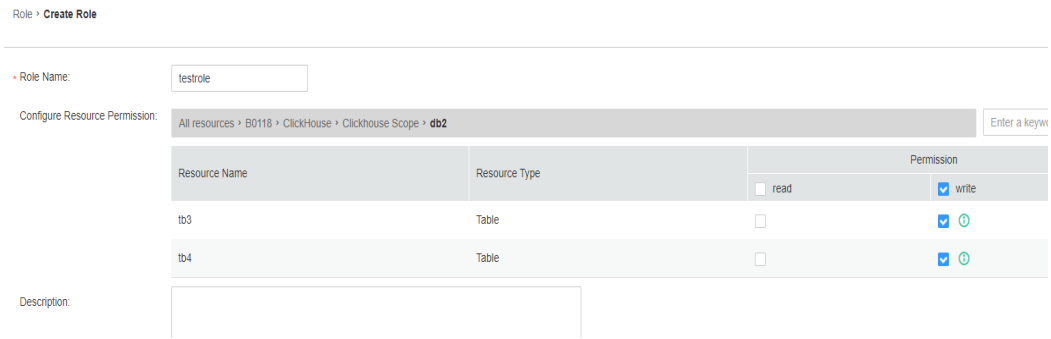
Step 4 Click **ClickHouse Scope**. The ClickHouse database resource list is displayed. If you select **create**, the role has the create permission on the database.



Determine whether to grant the permission based on the service requirements.

- If yes, click **OK**.
- If no, go to **Step 5**.

Step 5 Click the resource name and select the *Database resource name to be operated*. On the displayed page, select **READ** (SELECT permission) or **WRITE** (INSERT permission) based on service requirements, and click **OK**.



----End

Adding a User and Binding the ClickHouse Role to the User

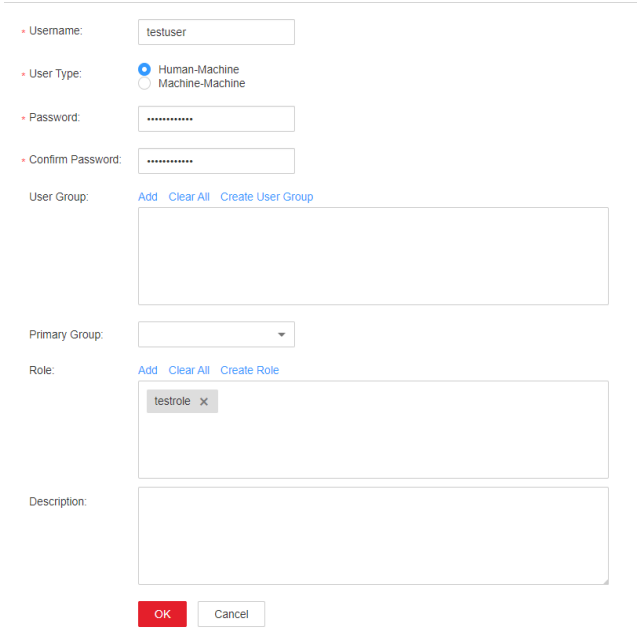
Step 1 Log in to Manager and choose **System** > **Permission** > **User** and click **Create**.

Step 2 Select **Human-Machine** for **User Type** and set **Password** and **Confirm Password** to the password of the user.

NOTE

- Username: The username cannot contain hyphens (-). Otherwise, the authentication will fail.
- Password: The password cannot contain special characters $, ., and #. Otherwise, the authentication will fail.

Step 3 In the **Role** area, click **Add**. In the displayed dialog box, select a role with the ClickHouse permission and click **OK** to add the role. Then, click **OK**.



Step 4 Log in to the node where the ClickHouse client is installed and use the new username and password to connect to the ClickHouse service.

- Run the following command to go to the client installation directory:

  cd /opt/*Client installation directory*

- Run the following command to configure environment variables:

  source bigdata_env

- If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The user must have the permission to create ClickHouse tables. Therefore, you need to bind the corresponding role to the user. For details, see **Adding the ClickHouse Role**. If Kerberos authentication is disabled for the current cluster, skip this step.

  a. Run the following command if it is an MRS 3.1.0 cluster:

  export CLICKHOUSE_SECURITY_ENABLED=true

  b. **kinit** *Component service user*

- Log in to the system as the new user.

  clickhouse client --host *ClickHouse instance IP* **--multiple --user** *User added in* ***Step 1*** **--password** *User password set in* ***Step 2*** **--port** *ClickHouse port number* **--secure**

----End

Granting Permissions Using the Client in Abnormal Scenarios

By default, the table metadata on each node of the ClickHouse cluster is the same. Therefore, the table information on a random ClickHouse node is collected on the permission management page of Manager. If the **ON CLUSTER** statement is not used when databases or tables are created on some nodes, the resource may fail to be displayed during permission management, and permissions may not be granted to the resource. To grant permissions on the local table on a single ClickHouse node, perform the following steps on the background client.

NOTE

The following operations are performed based on the obtained roles, database or table names, and IP addresses of the node where the corresponding ClickHouseServer instance is located.

- You can log in to FusionInsight Manager and choose **Cluster** > **Services** > **ClickHouse** > **Instance** to obtain the service IP address of the ClickHouseServer instance.
- The default system domain name is **hadoop.com**. Log in to FusionInsight Manager and choose **System** > **Permission** > **Domain and Mutual Trust**. The value of **Local Domain** is the system domain name. Change the letters to lowercase letters when running a command.

Step 1 Log in to the node where the ClickHouseServer instance is located as user **root**.

Step 2 Run the following command to obtain the path of the **clickhouse.keytab** file:

ls ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/install/FusionInsight-ClickHouse-*/clickhouse/keytab/clickhouse.keytab

Step 3 Log in to the node where the client is installed as the client installation user.

Step 4 Run the following command to go to the client installation directory:

cd /opt/client

Step 5 Run the following command to configure environment variables:

source bigdata_env

Run the following command if it is an MRS 3.1.0 cluster with Kerberos authentication enabled:

export CLICKHOUSE_SECURITY_ENABLED=true

Step 6 Run the following command to connect to the ClickHouseServer instance:

If Kerberos authentication is enabled for the current cluster, run the following command:

clickhouse client --host *IP address of the node where the ClickHouseServer instance is located* **--user clickhouse/hadoop.**<*System domain name*> **--password** *clickhouse.keytab path obtained in* ***Step 2*** **--port** *ClickHouse port number* **--secure**

If Kerberos authentication is disabled for the current cluster, run the following command:

clickhouse client --host *IP address of the node where the ClickHouseServer instance is located* **--user clickhouse --port** *ClickHouse port number*

Step 7 Run the following statement to grant permissions to a database:

In the syntax for granting permissions, *DATABASE* indicates the name of the target database, and *role* indicates the target role.

GRANT [ON CLUSTER *cluster_name***]** *privilege* **ON** *{DATABASE|TABLE}* **TO** *{user | role]*

For example, grant user **testuser** the CREATE permission on database **t2**:

GRANT CREATE ON *m2* **to** *testuser***;**

Step 8 Run the following commands to grant permissions on the table or view. In the following command, *TABLE* indicates the name of the table or view to be operated, and *user* indicates the role to be operated.

Run the following command to grant the query permission on tables in a database:

GRANT SELECT ON *TABLE* **TO** *user;*

Run the following command to grant the write permission on tables in a database:

GRANT INSERT ON *TABLE* **TO** *user***;**

NOTE

For details about ClickHouse **GRANT** operations and permission description, visit **https://clickhouse.tech/docs/en/sql-reference/statements/grant/**.

Step 9 Run the following command to exit the client:

quit;

----End

12.4.6.2 Interconnecting ClickHouse With OpenLDAP for Authentication

ClickHouse can be interconnected with OpenLDAP. You can manage accounts and permissions in a centralized manner by adding the OpenLDAP server configuration and creating users on ClickHouse. You can use this method to import users from the OpenLDAP server to ClickHouse in batches.

This section applies only to MRS 3.1.0 or later.

Prerequisites

- The MRS cluster and ClickHouse instances are running properly, and the ClickHouse client has been installed.
- OpenLDAP has been installed and is running properly.

Creating a ClickHouse User for Interconnecting with the OpenLDAP Server

Step 1 Log in to Manager and choose **Cluster** > **Services** > **ClickHouse**. Click the **Configurations** tab and then **All Configurations**.

Step 2 Choose **ClickHouseServer(Role)** > **Customization**, and add the following OpenLDAP configuration parameters to the **clickhouse-config-customize** configuration item.

Table 12-59 OpenLDAP parameters

Parameter	Description	Example Value
ldap_servers.ldap_server_name.host	OpenLDAP server host name or IP address. This parameter cannot be empty.	localhost
ldap_servers.ldap_server_name.port	OpenLDAP server port number. If **enable_tls** is set to **true**, the default port number is **636**. Otherwise, the default port number is **389**.	636
ldap_servers.ldap_server_name.auth_dn_prefix	Prefix and suffix used to construct the DN to bind to. The generated DN will be constructed as a string in the following format: **auth_dn_prefix** + **escape(user_name)** + **auth_dn_suffix**. Use a comma (,) as the first non-space character of **auth_dn_suffix**.	uid=
ldap_servers.ldap_server_name.auth_dn_suffix		,ou=Group,dc=node1,dc=com
ldap_servers.ldap_server_name.enable_tls	A tag to trigger the use of the secure connection to the OpenLDAP server. • Set it to **no** for the plaintext (ldap://) protocol (not recommended). • Set it to **yes** for the LDAP over SSL/TLS (ldaps://) protocol.	yes
ldap_servers.ldap_server_name.tls_require_cert	SSL/TLS peer certificate verification behavior. The value can be **never**, **allow**, **try**, or **require**.	allow

NOTE

For details about other parameters, see **<ldap_servers> Parameters**.

Step 3 After the configuration is complete, click **Save**. In the displayed dialog box, click **OK**. After the configuration is saved, click **Finish**.

Step 4 On Manager, click **Instance**, select a ClickHouseServer instance, and choose **More** > **Restart Instance**. In the displayed dialog box, enter the password and click **OK**. In the displayed **Restart instance** dialog box, click **OK**. Confirm that the instance is restarted successfully as prompted and click **Finish**.

Step 5 Log in to the ClickHouseServer instance node and go to the **${BIGDATA_HOME}/FusionInsight_ClickHouse_***Version number*/*x_x*_**ClickHouseServer/etc** directory.

cd ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*x_x*_ClickHouseServer/etc

Step 6 Run the following command to view the **config.xml** configuration file and check whether the OpenLDAP parameters are configured successfully:

cat config.xml

```
[root@k                3 etc]# cat config.xml
<yandex>
  <ldap_servers>
    <ldap_server_name>
      <auth_dn_prefix>uid=</auth_dn_prefix>
      <port>636</port>
      <host>localhost</host>
      <enable_tls>yes</enable_tls>
      <tls_require_cert>allow</tls_require_cert>
      <auth_dn_suffix>,ou=Group,dc=node1,dc=com</auth_dn_suffix>
    </ldap_server_name>
  </ldap_servers>
  <zookeeper>
```

Step 7 Log in to the node where the ClickHouseServer instance is located as user **root**.

Step 8 Run the following command to obtain the path of the **clickhouse.keytab** file:

ls ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/install/FusionInsight-ClickHouse-*/clickhouse/keytab/clickhouse.keytab

Step 9 Log in to the node where the client is installed as the client installation user.

Step 10 Run the following command to go to the ClickHouse client installation directory:

cd /opt/client

Step 11 Run the following command to configure environment variables:

source bigdata_env

Step 12 Run the following command to connect to the ClickHouseServer instance:

- If Kerberos authentication is enabled for the current cluster, use **clickhouse.keytab** to connect to the ClickHouseServer instance.

  clickhouse client --host *IP address of the node where the ClickHouseServer instance is located* **--user clickhouse/hadoop.***<System domain name>* **--password** *clickhouse.keytab path obtained in* ***Step 8*** **--port** *ClickHouse port number*

NOTE

The default system domain name is **hadoop.com**. Log in to FusionInsight Manager and choose **System** > **Permission** > **Domain and Mutual Trust**. The value of **Local Domain** is the system domain name. Change the letters to lowercase letters when running a command.

- If Kerberos authentication is disabled for the current cluster, connect to the ClickHouseServer instance as the **clickhouse** administrator.

  clickhouse client --host *IP address of the node where the ClickHouseServer instance is located* **--user clickhouse --port** *ClickHouse port number*

Step 13 Create a common user of OpenLDAP.

Run the following statement to create user **testUser** in cluster **default_cluster** and set **ldap_server** to the OpenLDAP server name in the **<ldap_servers>** tag in **Step 6**. In this example, the name is **ldap_server_name**.

CREATE USER *testUser* **ON CLUSTER** *default_cluster* **IDENTIFIED WITH ldap_server BY** 'ldap_server_name'**;**

testUser indicates an existing username in OpenLDAP. Change it based on the site requirements.

Step 14 Log out of the client, and then log in to the client as the new user to check whether the configuration is successful.

exit;

clickhouse client --host *ClickHouseServer IP address* **--user** *testUser* **--password** *testUser password* **--port** *ClickHouse port number*

----End

<ldap_servers> Parameters

- **host**

  OpenLDAP server host name or IP address. This parameter is mandatory and cannot be empty.

- **port**

  Port number of the OpenLDAP server. If **enable_tls** is set to **true**, the default value is **636**. Otherwise, the value is **389**.

- **auth_dn_prefix, auth_dn_suffix**

  Prefix and suffix used to construct the DN to bind to.

  The generated DN will be constructed as a string in the following format: **auth_dn_prefix** + **escape(user_name)** + **auth_dn_suffix**.

  Note that you should use a comma (,) as the first non-space character of **auth_dn_suffix**.

- **enable_tls**

  A tag to trigger the use of the secure connection to the OpenLDAP server.

  Set it to **no** for the plaintext (ldap://) protocol (not recommended).

  Set it to **yes** for LDAP over SSL/TLS (ldaps://) protocol (recommended and default).

- **tls_minimum_protocol_version**
  Minimum protocol version of SSL/TLS.
  The value can be **ssl2**, **ssl3**, **tls1.0**, **tls1.1**, or **tls1.2** (default).
- **tls_require_cert**
  SSL/TLS peer certificate verification behavior.
  The value can be **never**, **allow**, **try**, or **require** (default).
- **tls_cert_file**
  Certificate file.
- **tls_key_file**
  Certificate key file.
- **tls_ca_cert_file**
  CA certificate file.
- **tls_ca_cert_dir**
  Directory where the CA certificate is stored.
- **tls_cipher_suite**
  Allowed encryption suite.

12.4.7 Backing Up and Restoring ClickHouse Data Using a Data File

Scenario

This section describes how to back up data by exporting ClickHouse data to a CSV file and restore data using the CSV file.

Prerequisites

- You have installed the ClickHouse client.
- You have created a user with related permissions on ClickHouse tables on Manager.
- You have prepared a server for backup.

Backing Up Data

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create ClickHouse tables. If Kerberos authentication is disabled for the current cluster, skip this step.

1. Run the following command if it is an MRS 3.1.0 cluster:

   export CLICKHOUSE_SECURITY_ENABLED=true

2. **kinit** *Component service user*

   Example: **kinit clickhouseuser**

Step 5 Run the ClickHouse client command to export the ClickHouse table data to be backed up to a specified directory.

clickhouse client --host *Host name or instance IP address* **--secure --port 21427 --query=**"*Table query statement*" > *Path of the exported CSV file*

The following shows an example of backing up data in the **test** table to the **default_test.csv** file on the ClickHouse instance **10.244.225.167**.

clickhouse client --host 10.244.225.167 --secure --port 21427 --query="select * from default.test FORMAT CSV" > /opt/clickhouse/default_test.csv

Step 6 Upload the exported CSV file to the backup server.

----End

Restoring Data

Step 1 Upload the backup data file on the backup server to the directory where the ClickHouse client is located.

For example, upload the **default_test.csv** backup file to the **/opt/clickhouse** directory.

Step 2 Log in to the node where the client is installed as the client installation user.

Step 3 Run the following command to go to the client installation directory:

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create ClickHouse tables. If Kerberos authentication is disabled for the current cluster, skip this step.

1. Run the following command if it is an MRS 3.1.0 cluster:

   export CLICKHOUSE_SECURITY_ENABLED=true

2. **kinit** *Component service user*

   Example: **kinit clickhouseuser**

Step 6 Run the ClickHouse client command to log in to the ClickHouse cluster.

clickhouse client --host *Host name or instance IP address* **--secure --port 21427**

Step 7 Create a table with the format corresponding to the CSV file.

CREATE TABLE [IF NOT EXISTS] *[database_name.]table_name* **[ON CLUSTER** *Cluster name***]**

(

name1 **[***type1***] [DEFAULT|***materialized***|ALIAS** *expr1***],**

name2 **[***type2***] [DEFAULT|***materialized***|ALIAS** *expr2***],**

...

) *ENGINE = engine*

Step 8 Import the content in the backup file to the table created in **Step 7** to restore data.

clickhouse client --host *Host name or instance IP address* **--secure --port 21427 --query="insert into** *Table name* **FORMAT CSV" <** *CSV file path*

The following shows an example of restoring data from the **default_test.csv** backup file to the **test_cpy** table on the ClickHouse instance **10.244.225.167**.

clickhouse client --host 10.244.225.167 --secure --port 21427 --query="insert into default.test_cpy FORMAT CSV" < /opt/clickhouse/default_test.csv

----End

12.4.8 ClickHouse Log Overview

Log Description

Log path: The default storage path of ClickHouse log files is as follows: **${BIGDATA_LOG_HOME}/clickhouse**

Log archive rule: The automatic ClickHouse log compression function is enabled. By default, when the size of logs exceeds 100 MB, logs are automatically compressed into a log file named in the following format: *<Original log name>***.***[ID]***.gz**. A maximum of 10 latest compressed files are reserved by default. The number of compressed files can be configured on Manager.

Table 12-60 ClickHouse log list

Log Type	Log File Name	Description
Run logs	/var/log/Bigdata/clickhouse/clickhouseServer/clickhouse-server.err.log	Path of ClickHouseServer error log files.
	/var/log/Bigdata/clickhouse/clickhouseServer/checkService.log	Path of key ClickHouseServer run log files.
	/var/log/Bigdata/clickhouse/clickhouseServer/clickhouse-server.log	
	/var/log/Bigdata/clickhouse/balance/start.log	Path of ClickHouseBalancer startup log files.
	/var/log/Bigdata/clickhouse/balance/error.log	Path of ClickHouseBalancer error log files.
	/var/log/Bigdata/clickhouse/balance/access_http.log	Path of ClickHouseBalancer run log files.

Log Type	Log File Name	Description
Data migration logs	/var/log/Bigdata/clickhouse/migration/*Data migration task name*/clickhouse-copier_{timestamp}_{processId}/copier.log	Run logs generated when you use the migration tool by referring to **Using the ClickHouse Data Migration Tool**.
	/var/log/Bigdata/clickhouse/migration/*Data migration task name*/clickhouse-copier_{timestamp}_{processId}/copier.err.log	Error logs generated when you use the migration tool by referring to **Using the ClickHouse Data Migration Tool**.

Log Level

Table 12-61 describes the log levels supported by ClickHouse.

Levels of run logs are error, warning, trace, information, and debug from the highest to the lowest priority. Run logs of equal or higher levels are recorded. The higher the specified log level, the fewer the logs recorded.

Table 12-61 Log levels

Log Type	Level	Description
Run log	error	Logs of this level record error information about system running.
	warning	Logs of this level record exception information about the current event processing.
	trace	Logs of this level record trace information about the current event processing.
	information	Logs of this level record normal running status information about the system and events.
	debug	Logs of this level record system running and debugging information.

To modify log levels, perform the following operations:

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > **Services** > **ClickHouse** > **Configurations**.

Step 3 Select **All Configurations**.

Step 4 On the menu bar on the left, select the log menu of the target role.

Step 5 Select a desired log level.

Step 6 Click **Save**. Then, click **OK**.

----End

NOTE

The configurations take effect immediately without the need to restart the service.

Log Format

The following table lists the ClickHouse log format:

Table 12-62 Log formats

Log Type	Format	Example
Run log	*<yyyy-MM-dd HH:mm:ss,SSS>*|*<Log level>*|*<Name of the thread that generates the log>*|*<Message in the log>*|*<Location where the log event occurs>*	2021.02.23 15:26:30.691301 [6085] {} <Error> DynamicQueryHandler: Code: 516, e.displayText() = DB::Exception: default: Authentication failed: password is incorrect or there is no user with such name, Stack trace (when copying this message, always include the lines below): 0. Poco::Exception::Exception(std::__1::basic_string<char, std::__1::char_traits<char>, std::__1::allocator<char> > const&, int) @ 0x1250e59c

12.5 Using DBService

12.5.1 DBService Log Overview

Log Description

Log path: The default storage path of DBService log files is **/var/log/Bigdata/dbservice**.

- GaussDB: **/var/log/Bigdata/dbservice/DB** (GaussDB run log directory), **/var/log/Bigdata/dbservice/scriptlog/gaussdbinstall.log** (GaussDB installation log), and **/var/log/gaussdbuninstall.log** (GaussDB uninstallation log).
- HA: **/var/log/Bigdata/dbservice/ha/runlog** (HA run log directory) and **/var/log/Bigdata/dbservice/ha/scriptlog** (HA script log directory)
- DBServer: **/var/log/Bigdata/dbservice/healthCheck** (Directory of service and process health check logs)

  /var/log/Bigdata/dbservice/scriptlog (run log directory), **/var/log/Bigdata/audit/dbservice/** (audit log directory)

Log archive rule: The automatic DBService log compression function is enabled. By default, when the size of logs exceeds 1 MB, logs are automatically compressed into a log file named in the following format: *<Original log file name>-[No.]*.**gz**. A maximum of 20 latest compressed files are reserved.

NOTE

Log archive rules cannot be modified.

Table 12-63 DBService log list

Type	Log File Name	Description
DBServer run log	dbservice_serviceCheck.log	Run log file of the service check script
	dbservice_processCheck.log	Run log file of the process check script
	backup.log	Run logs of backup and restoration operations (The DBService backup and restoration operations need to be performed.)
	checkHaStatus.log	Log file of HA check records
	cleanupDBService.log	Uninstallation log file (You need to uninstall DBService logs.)

Type	Log File Name	Description
	componentUserManager.log	Log file that records the adding and deleting operations on the database by users (Services that depend on DBService need to be added.)
	install.log	Installation log file
	preStartDBService.log	Pre-startup log file
	start_dbserver.log	DBServer startup operation log file (DBService needs to be started.)
	stop_dbserver.log	DBServer stop operation log file (DBService needs to be stopped.)
	status_dbserver.log	Log file of the DBServer status check (You need to execute the **$DBSERVICE_HOME/sbin/status-dbserver.sh** script.)
	modifyPassword.log	Run log file of changing the DBService password script. (You need to execute the **$DBSERVICE_HOME/sbin/modifyDBPwd.sh** script.)
	modifyDBPwd_yyyy-mm-dd.log	Run log file that records the DBService password change tool (You need to execute the **$DBSERVICE_HOME/sbin/modifyDBPwd.sh** script.)
	dbserver_switchover.log	Log for DBServer to execute the active/standby switchover script (the active/standby switchover needs to be performed)

Type	Log File Name	Description
GaussDB run log	gaussdb.log	Log file that records database running information
	gs_ctl-current.log	Log file that records operations performed by using the **gs_ctl** tool
	gs_guc-current.log	Log file that records operations, mainly parameter modification performed by using the **gs_guc** tool
	gaussdbinstall.log	GaussDB installation log file
	gaussdbuninstall.log	GaussDB uninstallation log file
HA script run log	floatip_ha.log	Log file that records the script of floating IP addresses
	gaussDB_ha.log	Log file that records the script of GaussDB resources
	ha_monitor.log	Log file that records the HA process monitoring information
	send_alarm.log	Alarm sending log file
	ha.log	HA run log file
DBService audit log	dbservice_audit.log	Audit log file that records DBService operations, such as backup and restoration operations

Log Format

The following table lists the DBService log formats.

Table 12-64 Log format

Type	Format	Example
Run log	[<*yyyy-MM-dd HH:mm:ss*>] <*Log level*>: [< *Name of the script that generates the log*: *Line number* >]: < *Message in the log*>	[2020-12-19 15:56:42] INFO [postinstall.sh:653] Is cloud flag is false. (main)
Audit log	[<*yyyy-MM-dd HH:mm:ss,SSS*>] UserName:<*Username*> UserIP:<*User IP address*> Operation:<*Operation content*> Result:<*Operation results*> Detail:<*Detailed information*>	[2020-05-26 22:00:23] UserName:omm UserIP:192.168.10.21 Operation:DBService data backup Result: SUCCESS Detail: DBService data backup is successful.

12.6 Using Flink

12.6.1 Using Flink from Scratch

This section describes how to use Flink to run wordcount jobs.

Prerequisites

- Flink has been installed in an MRS cluster.
- The cluster runs properly and the client has been correctly installed, for example, in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

Using the Flink Client (Versions Earlier Than MRS 3.x)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to initialize environment variables:

source /opt/hadoopclient/bigdata_env

Step 4 If Kerberos authentication is enabled for the cluster, perform the following steps. If not, skip this whole step.

1. Prepare a user for submitting Flink jobs..
2. Log in to Manager and download the authentication credential.

   Log in to Manager of the cluster. For details, see **Accessing MRS Manager (Versions Earlier Than MRS 3.x)**. Choose **System Settings** > **User**

Management. In the **Operation** column of the row that contains the added user, choose **More** > **Download Authentication Credential**.

3. Decompress the downloaded authentication credential package and copy the **user.keytab** file to the client node, for example, to the **/opt/hadoopclient/Flink/flink/conf** directory on the client node. If the client is installed on a node outside the cluster, copy the **krb5.conf** file to the **/etc/** directory on this node.
4. Configure security authentication by adding the **keytab** path and username in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** configuration file.

   security.kerberos.login.keytab: *<user.keytab file path>*

   security.kerberos.login.principal: *<Username>*

   Example:

   security.kerberos.login.keytab: /opt/hadoopclient/Flink/flink/conf/user.keytab

   security.kerberos.login.principal: test
5. In the **bin** directory of the Flink client, run the following command to perform security hardening and set password to a new one for submitting jobs. For details, see "Using Flink" > "Security Hardening" > "Authentication and Encryption" in *MapReduce Service Component Operation Guide*.

   sh generate_keystore.sh <*password*>

   The script automatically replaces the SSL value in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file. For an MRS 2.*x* or earlier security cluster, external SSL is disabled by default. To enable external SSL, configure the parameter and run the script again. For details, see "Using Flink" > "Security Hardening" in *MapReduce Service Component Operation Guide*.

   NOTE

   - You do not need to manually generate the **generate_keystore.sh** script.
   - After authentication and encryption, the generated **flink.keystore**, **flink.truststore**, and **security.cookie** items are automatically filled in the corresponding configuration items in **flink-conf.yaml**.
6. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.
   - Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **/opt/hadoopclient/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
   - Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
     i. Create a directory, for example, **ssl**, in **/opt/hadoopclient/Flink/flink/conf/**.

        cd /opt/hadoopclient/Flink/flink/conf/

        mkdir ssl

     ii. Move the **flink.keystore** and **flink.truststore** files to the **/opt/hadoopclient/Flink/flink/conf/ssl/** directory.

        mv flink.keystore ssl/

mv flink.truststore ssl/

iii. Change the values of the following parameters to relative paths in the **flink-conf.yaml** file:

```
security.ssl.internal.keystore: ssl/flink.keystore
security.ssl.internal.truststore: ssl/flink.truststore
```

Step 5 Run a wordcount job.

NOTICE

To submit or run jobs on Flink, the user must have the following permissions:

- If Ranger authentication is enabled, the current user must belong to the **hadoop** group or the user has been granted the **/flink** read and write permissions in Ranger.
- If Ranger authentication is disabled, the current user must belong to the **hadoop** group.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:

    yarn-session.sh -nm "*session-name***"**

    flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
  - Run the following command to submit a single job on Yarn:

    flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
- Security cluster (Kerberos authentication enabled)
  - If the **flink.keystore** and **flink.truststore** file are stored in the absolute path:
    - Run the following commands to start a session and submit a job in the session:

      yarn-session.sh -nm "*session-name***"**

      flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
    - Run the following command to submit a single job on Yarn:

      flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
  - If the **flink.keystore** and **flink.truststore** files are stored in the relative path:
    - In the same directory of SSL, run the following commands to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/hadoopclient/Flink/flink/conf/**, then run the following commands in this directory:

      yarn-session.sh -t ssl/ -nm "*session-name***"**

      flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar

- Run the following command to submit a single job on Yarn:

  flink run -m yarn-cluster -yt ssl/ /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar

Step 6 After the job has been successfully submitted, the following information is displayed on the client:

Figure 12-6 Job submitted successfully on Yarn

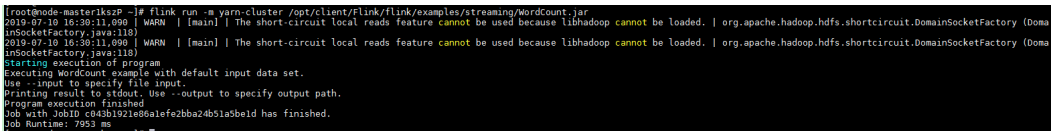


Figure 12-7 Session started successfully

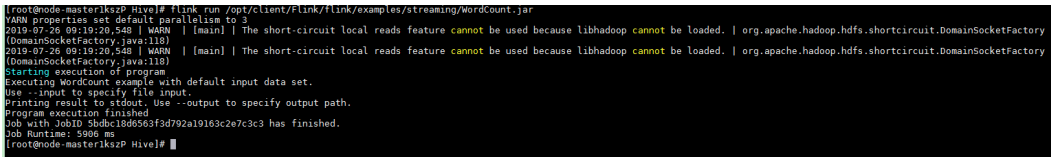
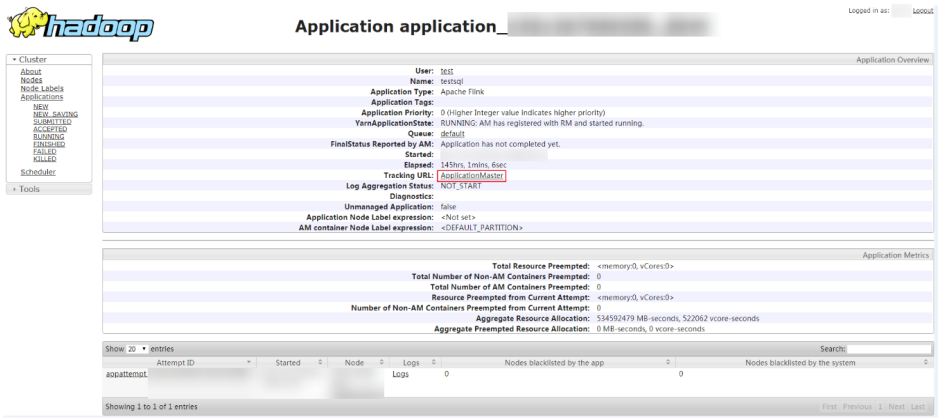
Figure 12-8 Job submitted successfully in the session



Step 7 Go to the native YARN service page, find the application of the job, and click the application name to go to the job details page. For details, see "Using Flink" > "Viewing Flink Job Information" in *MapReduce Service Component Operation Guide*.

- If the job is not completed, click **Tracking URL** to go to the native Flink page and view the job running information.
- If the job submitted in a session has been completed, you can click **Tracking URL** to log in to the native Flink service page to view job information.

Figure 12-9 Application



----End

Using the Flink Client (MRS 3.x or Later)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client installation directory:

cd /opt/hadoopclient

Step 3 Run the following command to initialize environment variables:

source /opt/hadoopclient/bigdata_env

Step 4 If Kerberos authentication is enabled for the cluster, perform the following steps. If not, skip this whole step.

1. Prepare a user for submitting Flink jobs.
2. Log in to Manager and download the authentication credential.

   Log in to Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **System** > **Permission** > **Manage User**. On the displayed page, locate the row that contains the added user, click **More** in the **Operation** column, and select **Download authentication credential**.
3. Decompress the downloaded authentication credential package and copy the **user.keytab** file to the client node, for example, to the **/opt/hadoopclient/Flink/flink/conf** directory on the client node. If the client is installed on a node outside the cluster, copy the **krb5.conf** file to the **/etc/** directory on this node.
4. Append the service IP address of the node where the client is installed, floating IP address of Manager, and IP address of the master node to the **jobmanager.web.access-control-allow-origin** and **jobmanager.web.allow-access-address** configuration item in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file. Use commas (,) to separate IP addresses.

   jobmanager.web.access-control-allow-origin: *xx.xx.xxx.xxx,xx.xx.xxx.xxx,xx.xx.xxx.xxx*
   jobmanager.web.allow-access-address: *xx.xx.xxx.xxx,xx.xx.xxx.xxx,xx.xx.xxx.xxx*

NOTE

- To obtain the service IP address of the node where the client is installed, perform the following operations:
  - Node inside the cluster:

    In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a cluster, and click its name to switch to the cluster details page.

    On the **Nodes** tab page, view the IP address of the node where the client is installed.
  - Node outside the cluster: IP address of the ECS where the client is installed.
- To obtain the floating IP address of Manager, perform the following operations:
  - In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a cluster, and click its name to switch to the cluster details page.

    On the **Nodes** tab page, view the **Name**. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node.
  - Log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of MRS Manager. Record the value of **inet**. If the floating IP address of MRS Manager cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.

5. Configure security authentication by adding the **keytab** path and username in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** configuration file.

   security.kerberos.login.keytab: *<user.keytab file path>*

   security.kerberos.login.principal: *<Username>*

   Example:

   security.kerberos.login.keytab: /opt/hadoopclient/Flink/flink/conf/user.keytab

   security.kerberos.login.principal: test

6. In the **bin** directory of the Flink client, run the following command to perform security hardening and set password to a new one for submitting jobs. For details, see "Using Flink" > "Security Hardening" > "Authentication and Encryption" in *MapReduce Service Component Operation Guide*.

   sh generate_keystore.sh <*password*>

   The script automatically replaces the SSL value in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file.

   sh generate_keystore.sh <*password*>

NOTE

After authentication and encryption, the **flink.keystore** and **flink.truststore** files are generated in the **conf** directory on the Flink client and the following configuration items are set to the default values in the **flink-conf.yaml** file:

- Set **security.ssl.keystore** to the absolute path of the **flink.keystore** file.
- Set **security.ssl.truststore** to the absolute path of the **flink.truststore** file.
- Set **security.cookie** to a random password automatically generated by the **generate_keystore.sh** script.
- By default, **security.ssl.encrypt.enabled** is set to **false** in the **flink-conf.yaml** file by default. The **generate_keystore.sh** script sets **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password** to the password entered when the **generate_keystore.sh** script is called.
- For MRS 3.1.0 or later, if ciphertext is required and **security.ssl.encrypt.enabled** is set to **true** in the **flink-conf.yaml** file, the **generate_keystore.sh** script does not set **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password**. To obtain the values, use the Manager plaintext encryption API by running the following command: **curl -k -i -u** *Username*:*Password* **-X POST -HContent-type:application/json -d '{"plainText":"***Password***"}' 'https://***x.x.x.x***:28443/web/api/v2/tools/encrypt'**

  In the preceding command, *Username*:*Password* indicates the user name and password for logging in to the system. The password of **"plainText"** indicates the one used to call the **generate_keystore.sh** script. *x.x.x.x* indicates the floating IP address of Manager.

7. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.
   - Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **/opt/hadoopclient/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
   - Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
     i. Create a directory, for example, **ssl**, in **/opt/hadoopclient/Flink/flink/conf/**.

        cd /opt/hadoopclient/Flink/flink/conf/

        mkdir ssl

     ii. Move the **flink.keystore** and **flink.truststore** files to the **/opt/hadoopclient/Flink/flink/conf/ssl/** directory.

        mv flink.keystore ssl/

        mv flink.truststore ssl/

     iii. Change the values of the following parameters to relative paths in the **flink-conf.yaml** file:

```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```

Step 5 Run a wordcount job.

NOTICE

To submit or run jobs on Flink, the user must have the following permissions:

- If Ranger authentication is enabled, the current user must belong to the **hadoop** group or the user has been granted the **/flink** read and write permissions in Ranger.
- If Ranger authentication is disabled, the current user must belong to the **hadoop** group.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:

    yarn-session.sh -nm "*session-name***"**

    flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
  - Run the following command to submit a single job on Yarn:

    flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
- Security cluster (Kerberos authentication enabled)
  - If the **flink.keystore** and **flink.truststore** files are stored in the absolute path:
    - Run the following commands to start a session and submit a job in the session:

      yarn-session.sh -nm "*session-name***"**

      flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
    - Run the following command to submit a single job on Yarn:

      flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
  - If the **flink.keystore** and **flink.truststore** file are stored in the relative path:
    - In the same directory of SSL, run the following commands to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/hadoopclient/Flink/flink/conf/**, then run the following commands in this directory:

      yarn-session.sh -t ssl/ -nm "*session-name***"**

      flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
    - Run the following command to submit a single job on Yarn:

      flink run -m yarn-cluster -yt ssl/ /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar

Step 6 After the job has been successfully submitted, the following information is displayed on the client:

Figure 12-10 Job submitted successfully on Yarn

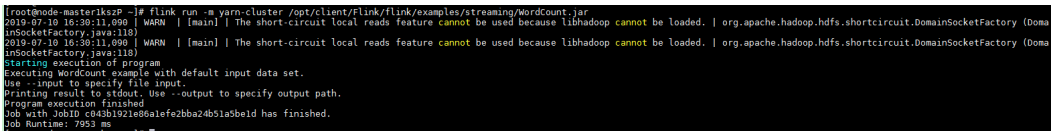


Figure 12-11 Session started successfully

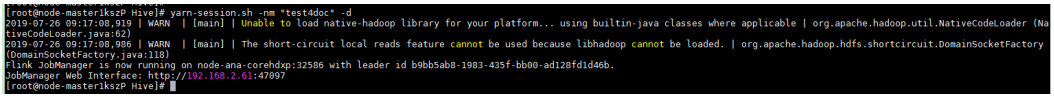

Figure 12-12 Job submitted successfully in the session

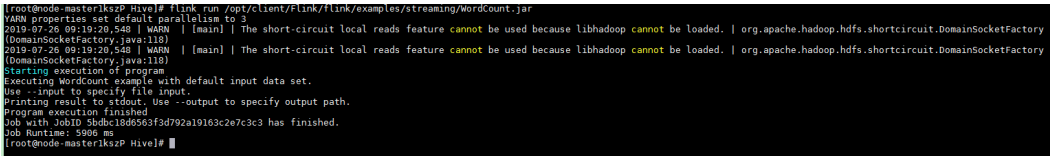
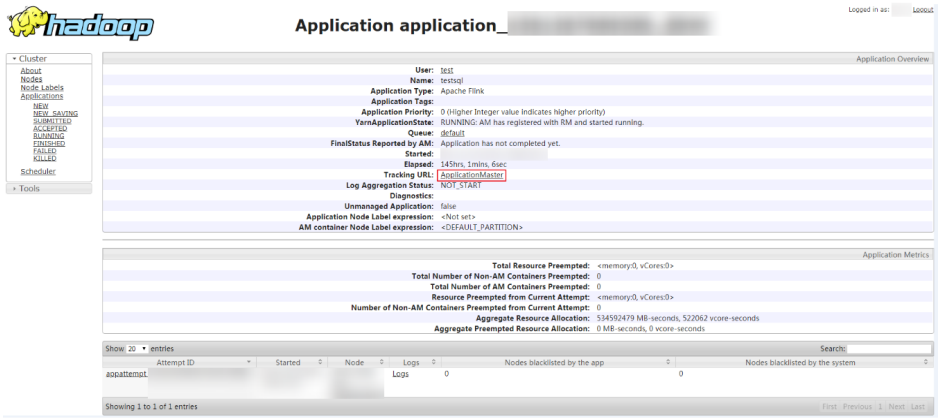


Step 7 Go to the native YARN service page, find the application of the job, and click the application name to go to the job details page. For details, see "Using Flink" > "Viewing Flink Job Information" in *MapReduce Service Component Operation Guide*.

- If the job is not completed, click **Tracking URL** to go to the native Flink page and view the job running information.
- If the job submitted in a session has been completed, you can click **Tracking URL** to log in to the native Flink service page to view job information.

Figure 12-13 Application



----End

12.6.2 Viewing Flink Job Information

You can view Flink job information on the Yarn web UI.

Prerequisites

The Flink service has been installed in a cluster.

Accessing the Yarn Web UI

Step 1 Go to the Yarn service page.

- For versions earlier than MRS 3.x, click the cluster name to go to the cluster details page and choose **Components** > **Yarn** > **Yarn Summary**.

  NOTE

  If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

- For MRS 3.*x* or later, log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Instance** > **Dashboard**.

Step 2 Click the link next to **ResourceManager WebUI** to go to the Yarn web UI page.

----End

12.6.3 Flink Configuration Management

12.6.3.1 Configuring Parameter Paths

All parameters of Flink must be set on a client. The path of a configuration file is as follows: *Client installation path*/**Flink/flink/conf/flink-conf.yaml**.

NOTE

- You are advised to set the parameters in the format of *Key*: *Value* in the **flink-conf.yaml** configuration file on the client.

  Example: **taskmanager.heap.size: 1024mb**

  A space is required between *Key*: and *Value*.
- If parameters are modified in the Flink service configuration, you need to download and install the client again after the configuration is complete.

12.6.3.2 JobManager & TaskManager

Scenarios

JobManager and TaskManager are main components of Flink. You can configure the parameters for different security and performance scenarios on the client.

Configuration Description

Main configuration items include communication port, memory management, connection retry, and so on.

For versions earlier than MRS 3.x, see **Table 12-65**.

Table 12-65 Parameters

Parameter	Mandatory	Default Value	Description
taskmanager.rpc.port	No	32326-32390	IPC port range of TaskManager
taskmanager.data.port	No	32391-32455	Data exchange port range of TaskManager
taskmanager.data.ssl.enabled	No	false	Whether to enable secure sockets layer (SSL) encryption for data transfer between TaskManagers. This parameter is valid only when the global switch **security.ssl** is enabled.
taskmanager.numberOfTaskSlots	No	3	Number of slots occupied by TaskManager. Generally, the value is configured as the number of cores of the physical machine. In **yarn-session** mode, the value can be transmitted by only the **-s** parameter. In **yarn-cluster** mode, the value can be transmitted by only the **-ys** parameter.
parallelism.default	No	1	Number of concurrent job operators.
taskmanager.memory.size	No	0	Amount of heap memory of the Java virtual machine (JVM) that TaskManager reserves for sorting, hash tables, and caching of intermediate results. If unspecified, the memory manager will take a fixed ratio with respect to the size of JVM as specified by **taskmanager.memory.fraction**. The unit is MB.
taskmanager.memory.fraction	No	0.7	Ratio of JVM heap memory that TaskManager reserves for sorting, hash tables, and caching of intermediate results.
taskmanager.memory.off-heap	Yes	false	Whether TaskManager uses off-heap memory for sorting, hash tables and intermediate status. You are advised to enable this item for large memory needs to improve memory operation efficiency.

Parameter	Mandatory	Default Value	Description
taskmanager.memory.segment-size	No	32768	Size of memory segment on TaskManager. Memory segment is the basic unit of the reserved memory space and is used to configure network buffer stacks. The unit is bytes.
taskmanager.memory.preallocate	No	false	Whether TaskManager allocates reserved memory space upon startup. You are advised to enable this item when off-heap memory is used.
taskmanager.registration.initial-backoff	No	500 ms	Initial interval between two consecutive registration attempts. The unit is ms/s/m/h/d. **NOTE** The time value and unit are separated by half-width spaces. ms/s/m/h/d indicates millisecond, second, minute, hour, and day, respectively.
taskmanager.registration.refused-backoff	No	5 min	Retry interval when a registration connection is rejected by JobManager.
task.cancellation.interval	No	30000	Interval between two successive task cancellation attempts.

For configuration items for MRS 3.x or later, see **Table 12-66**.

Table 12-66 Parameters

Parameter	Description	Default Value	Mandatory
taskmanager.rpc.port	IPC port range of TaskManager	32326-32390	No
client.rpc.port	Akka system listening port on the Flink client.	32651-32720	No
taskmanager.data.port	Data exchange port range of TaskManager	32391-32455	No

Parameter	Description	Default Value	Mandatory
taskmanager.data.ssl.enabled	Whether to enable secure sockets layer (SSL) encryption for data transfer between TaskManagers. This parameter is valid only when the global switch **security.ssl** is enabled.	false	No
jobmanager.heap.size	Size of the heap memory of JobManager. In **yarn-session** mode, the value can be transmitted by only the **-jm** parameter. In **yarn-cluster** mode, the value can be transmitted by only the **-yjm** parameter. If the value is smaller than **yarn.scheduler.minimum-allocation-mb** in the Yarn configuration file, the Yarn configuration value is used. Unit: B/KB/MB/GB/TB.	1024mb	No
taskmanager.heap.size	Size of the heap memory of TaskManager. In **yarn-session** mode, the value can be transmitted by only the **-tm** parameter. In **yarn-cluster** mode, the value can be transmitted by only the **-ytm** parameter. If the value is smaller than **yarn.scheduler.minimum-allocation-mb** in the Yarn configuration file, the Yarn configuration value is used. The unit is B/KB/MB/GB/TB.	1024mb	No
taskmanager.numberOfTaskSlots	Number of slots occupied by TaskManager. Generally, the value is configured as the number of cores of the physical machine. In **yarn-session** mode, the value can be transmitted by only the **-s** parameter. In **yarn-cluster** mode, the value can be transmitted by only the **-ys** parameter.	1	No
parallelism.default	Default degree of parallelism, which is used for jobs for which the degree of parallelism is not specified	1	No
taskmanager.network.numberOfBuffers	Number of TaskManager network transmission buffer stacks. If an error indicates insufficient system buffer, increase the parameter value.	2048	No
taskmanager.memory.fraction	Ratio of JVM heap memory that TaskManager reserves for sorting, hash tables, and caching of intermediate results.	0.7	No

Parameter	Description	Default Value	Mandatory
taskmanager.memory.off-heap	Whether TaskManager uses off-heap memory for sorting, hash tables and intermediate status. You are advised to enable this item for large memory needs to improve memory operation efficiency.	false	Yes
taskmanager.memory.segment-size	Size of the memory buffer used by the memory manager and network stack The unit is bytes.	32768	No
taskmanager.memory.preallocate	Whether TaskManager allocates reserved memory space upon startup. You are advised to enable this item when off-heap memory is used.	false	No
taskmanager.debug.memory.startLogThread	Enable this item for debugging Flink memory and garbage collection (GC)-related problems. TaskManager periodically collects memory and GC statistics, including the current utilization of heap and off-heap memory pools and GC time.	false	No
taskmanager.debug.memory.logIntervalMs	Interval at which TaskManager periodically collects memory and GC statistics.	0	No
taskmanager.maxRegistrationDuration	Maximum duration of TaskManager registration on JobManager. If the actual duration exceeds the value, TaskManager is disabled.	5 min	No
taskmanager.initial-registration-pause	Initial interval between two consecutive registration attempts. The value must contain a time unit (ms/s/min/h/d), for example, 5 seconds.	500ms **NOTE** The time value and unit are separated by half-width spaces. ms/s/m/h/d indicates millisecond, second, minute, hour, and day, respectively.	No

Parameter	Description	Default Value	Mandatory
taskmanager.max-registration-pause	Maximum registration retry interval in case of TaskManager registration failures. The unit is ms/s/m/h/d.	30s	No
taskmanager.refused-registration-pause	Retry interval when a TaskManager registration connection is rejected by JobManager. The unit is ms/s/m/h/d.	10s	No
task.cancellation.interval	Interval between two successive task cancellation attempts. The unit is millisecond.	30000	No
classloader.resolve-order	Class resolution policies defined when classes are loaded from user codes, which means whether to first check the user code JAR file (**child-first**) or the application class path (**parent-first**). The default setting indicates that the class is first loaded from the user code JAR file, which means that the user code JAR file can contain and load dependencies that are different from those used by Flink.	child-first	No
slot.idle.timeout	Timeout for an idle slot in Slot Pool, in milliseconds.	50000	No
slot.request.timeout	Timeout for requesting a slot from Slot Pool, in milliseconds.	300000	No
task.cancellation.timeout	Timeout of task cancellation, in milliseconds. If a task cancellation times out, a fatal TaskManager error may occur. If this parameter is set to **0**, no error is reported when a task cancellation times out.	180000	No
taskmanager.network.detailed-metrics	Indicates whether to enable the detailed metrics monitoring of network queue lengths.	false	No

Parameter	Description	Default Value	Mandatory
taskmanager.network.memory.buffers-per-channel	Maximum number of network buffers used by each output/input channel (sub-partition/incoming channel). In credit-based flow control mode, this indicates how much credit is in each input channel. It should be configured with at least 2 buffers to deliver good performance. One buffer is used to receive in-flight data in the sub-partition, and the other for parallel serialization.	2	No
taskmanager.network.memory.floating-buffers-per-gate	Number of extra network buffers used by each output gate (result partition) or input gate, indicating the amount of floating credit shared among all input channels in credit-based flow control mode. Floating buffers are distributed based on the backlog feedback (real-time output buffers in sub-partitions) and can help mitigate back pressure caused by unbalanced data distribution among sub-partitions. Increase this value if the round-trip time between nodes is long and/or the number of machines in the cluster is large.	8	No
taskmanager.network.memory.fraction	Ratio of JVM memory used for network buffers, which determines how many streaming data exchange channels a TaskManager can have at the same time and the extent of channel buffering. Increase this value or the values of **taskmanager.network.memory.min** and **taskmanager.network.memory.max** if the job is rejected or a warning indicating that the system does not have enough buffers is received. Note that the values of **taskmanager.network.memory.min** and **taskmanager.network.memory.max** may overwrite this value.	0.1	No
taskmanager.network.memory.max	Maximum memory size of the network buffer. The value must contain a unit (B/KB/MB/GB/TB).	1 GB	No
taskmanager.network.memory.min	Minimum memory size of the network buffer. The value must contain a unit (B/KB/MB/GB/TB).	64 MB	No

Parameter	Description	Default Value	Mandatory
taskmanager.network.request-backoff.initial	Minimum backoff for partition requests of input channels.	100	No
taskmanager.network.request-backoff.max	Maximum backoff for partition requests of input channels.	10000	No
taskmanager.registration.timeout	Timeout for TaskManager registration. TaskManager will be terminated if it is not successfully registered within the specified time. The value must contain a time unit (ms/s/min/h/d).	5 min	No
resourcemanager.taskmanager-timeout	Timeout interval for releasing an idle TaskManager, in milliseconds.	30000	No

12.6.3.3 Blob

Scenarios

The Blob server on the JobManager node is used to receive JAR files uploaded by users on the client, send JAR files to TaskManager, and transfer log files. Flink provides some items for configuring the Blob server. You can configure them in the **flink-conf.yaml** configuration file.

Configuration Description

Users can configure the port, SSL, retry times, and concurrency.

Table 12-67 Parameters

Parameter	Description	Default Value	Mandatory
blob.server.port	Blob server port	32456 to 32520	No
blob.service.ssl.enabled	Indicates whether to enable the encryption for the blob transmission channel. This parameter is valid only when the global switch **security.ssl** is enabled.	true	Yes

Parameter	Description	Default Value	Mandatory
blob.fetch.retries	Number of times that TaskManager tries to download blob files from JobManager.	50	No
blob.fetch.num-concurrent	Number of concurrent tasks for downloading blob files supported by JobManager.	50	No
blob.fetch.backlog	Number of blob files, such as **.jar** files, to be downloaded in the queue supported by JobManager. The unit is count.	1000	No
library-cache-manager.cleanup.interval	Interval at which JobManager deletes the JAR files stored on the HDFS when the user cancels the Flink job. The unit is second.	3600	No

NOTE

For versions earlier than MRS 3.x, **library-cache-manager.cleanup.interval** cannot be configured.

12.6.3.4 Distributed Coordination (via Akka)

Scenarios

The Akka actor model is the basis of communications between the Flink client and JobManager, JobManager and TaskManager, as well as TaskManager and TaskManager. Flink enables you to configure the Akka connection parameters in the **flink-conf.yaml** file based on the network environment or optimization policy.

Configuration Description

You can configure timeout settings of message sending and waiting, and the Akka listening mechanism Deathwatch.

For versions earlier than MRS 3.x, see **Table 12-68**.

Table 12-68 Parameters

Parameter	Mandatory	Default Value	Description
akka.ask.timeout	No	10 s	Timeout duration of Akka asynchronous and block requests. If a Flink timeout failure occurs, this value can be increased. Timeout occurs when the machine processing speed is slow or the network is blocked. The unit is ms/s/m/h/d.
akka.lookup.timeout	No	10 s	Timeout duration for JobManager actor object searching. The unit is ms/s/m/h/d.
akka.framesize	No	10485760b	Maximum size of the message transmitted between JobManager and TaskManager. If a Flink error occurs because the message exceeds this limit, the value can be increased. The unit is b/B/KB/MB.
akka.watch.heartbeat.interval	No	10 s	Heartbeat interval at which the Akka DeathWatch mechanism detects disconnected TaskManager. If TaskManager is frequently and incorrectly marked as disconnected due to heartbeat loss or delay, the value can be increased. The unit is ms/s/m/h/d. **NOTE** For detailed description of Akka DeathWatch, see the Akka official website: **http://doc.akka.io/docs/akka/snapshot/scala/remoting.html#failure-detector**.
akka.watch.heartbeat.pause	No	60 s	Acceptable heartbeat pause for Akka DeathWatch mechanism. A small value indicates that irregular heartbeat is not accepted. The unit is ms/s/m/h/d. **NOTE** For detailed description of Akka DeathWatch, see the Akka official website: **http://doc.akka.io/docs/akka/snapshot/scala/remoting.html#failure-detector**.
akka.watch.threshold	No	12	DeathWatch failure detection threshold. A small value is prone to mark normal TaskManager as failed and a large value increases failure detection time. **NOTE** For detailed description of Akka DeathWatch, see the Akka official website: **http://doc.akka.io/docs/akka/snapshot/scala/remoting.html#failure-detector**.

Parameter	Mandatory	Default Value	Description
akka.tcp.timeout	No	20 s	Timeout duration of Transmission Control Protocol (TCP) connection request. If TaskManager connection timeout occurs frequently due to the network congestion, the value can be increased. The unit is ms/s/m/h/d.
akka.throughput	No	15	Number of messages processed by Akka in batches. After an operation, the processing thread is returned to the thread pool. A small value indicates the fair scheduling for actor message processing. A large value indicates improved overall performance but lowered scheduling fairness.
akka.log.lifecycle.events	No	false	Switch of Akka remote time logging, which can be enabled for debugging.
akka.startup-timeout	No	The default value is the same as the value of **akka.ask.timeout**.	Timeout duration of remote component started by Akka. The unit is ms/s/m/h/d.
akka.ssl.enabled	Yes	true	Switch of Akka communication SSL. This parameter is valid only when the global switch **security.ssl** is enabled.

For configuration items for MRS 3.x or later, see **Table 12-69**.

Table 12-69 Parameters

Parameter	Description	Default Value	Mandatory
akka.ask.timeout	Timeout duration of Akka asynchronous and block requests. If a Flink timeout failure occurs, this value can be increased. Timeout occurs when the machine processing speed is slow or the network is blocked. The unit is ms/s/m/h/d.	10s	No

Parameter	Description	Default Value	Mandatory
akka.lookup.timeout	Timeout duration for JobManager actor object searching. The unit is ms/s/m/h/d.	10s	No
akka.framesize	Maximum size of the message transmitted between JobManager and TaskManager. If a Flink error occurs because the message exceeds this limit, the value can be increased. The unit is b/B/KB/MB.	10485760b	No
akka.watch.heartbeat.interval	Heartbeat interval at which the Akka DeathWatch mechanism detects disconnected TaskManager. If TaskManager is frequently and incorrectly marked as disconnected due to heartbeat loss or delay, the value can be increased. The unit is ms/s/m/h/d. **NOTE** For detailed explanation of DeathWatch, see the Akka official website: **http://doc.akka.io/docs/akka/snapshot/scala/remoting.html#failure-detector**.	10s	No
akka.watch.heartbeat.pause	Acceptable heartbeat pause for Akka DeathWatch mechanism. A small value indicates that irregular heartbeat is not accepted. The unit is ms/s/m/h/d. **NOTE** For detailed explanation of DeathWatch, see the Akka official website: **http://doc.akka.io/docs/akka/snapshot/scala/remoting.html#failure-detector**.	60s	No
akka.watch.threshold	DeathWatch failure detection threshold. A small value may mark normal TaskManager as failed and a large value increases failure detection time. **NOTE** For detailed explanation of DeathWatch, see the Akka official website: **http://doc.akka.io/docs/akka/snapshot/scala/remoting.html#failure-detector**.	12	No

Parameter	Description	Default Value	Mandatory
akka.tcp.timeout	Timeout duration of Transmission Control Protocol (TCP) connection request. If TaskManager connection timeout occurs frequently due to the network congestion, the value can be increased. The unit is ms/s/m/h/d.	20s	No
akka.throughput	Number of messages processed by Akka in batches. After an operation, the processing thread is returned to the thread pool. A small value indicates the fair scheduling for actor message processing. A large value indicates improved overall performance but lowered scheduling fairness.	15	No
akka.log.lifecycle.events	Switch of Akka remote time logging, which can be enabled for debugging.	false	No
akka.startup-timeout	Timeout interval before a remote component fails to be started. The value must contain a time unit (ms/s/min/h/d).	The default value is the same as the value of **akka.ask.timeout**.	No
akka.ssl.enabled	Switch of Akka communication SSL. This parameter is valid only when the global switch **security.ssl** is enabled.	true	Yes
akka.client-socket-worker-pool.pool-size-factor	Factor that is used to determine the thread pool size. The pool size is calculated based on the following formula: ceil (available processors * factor). The size is bounded by the **pool-size-min** and **pool-size-max** values.	1.0	No
akka.client-socket-worker-pool.pool-size-max	Maximum number of threads calculated based on the factor.	2	No
akka.client-socket-worker-pool.pool-size-min	Minimum number of threads calculated based on the factor.	1	No

Parameter	Description	Default Value	Mandatory
akka.client.timeout	Timeout duration of the client. The value must contain a time unit (ms/s/min/h/d).	60s	No
akka.server-socket-worker-pool.pool-size-factor	Factor that is used to determine the thread pool size. The pool size is calculated based on the following formula: ceil (available processors * factor). The size is bounded by the **pool-size-min** and **pool-size-max** values.	1.0	No
akka.server-socket-worker-pool.pool-size-max	Maximum number of threads calculated based on the factor.	2	No
akka.server-socket-worker-pool.pool-size-min	Minimum number of threads calculated based on the factor.	1	No

12.6.3.5 SSL

Scenarios

When the secure Flink cluster is required, SSL-related configuration items must be set.

Configuration Description

Configuration items include the SSL switch, certificate, password, and encryption algorithm.

For versions earlier than MRS 3.x, see **Table 12-70**.

Table 12-70 Parameters

Parameter	Mandatory	Default Value	Description
security.ssl.internal.enabled	Yes	The value is automatically configured according to the cluster installation mode. • Security mode: The default value is **true**. • Normal mode: The default value is **false**.	Main switch of internal communication SSL.
security.ssl.internal.keystore	Yes	-	Java keystore file.
security.ssl.internal.keystore-password	Yes	-	Password used to decrypt the keystore file.
security.ssl.internal.key-password	Yes	-	Password used to decrypt the server key in the keystore file.
security.ssl.internal.truststore	Yes	-	**truststore** file containing the public CA certificates.
security.ssl.internal.truststore-password	Yes	-	Password used to decrypt the truststore file.
security.ssl.protocol	Yes	TLSv1.2	SSL transmission protocol version
security.ssl.algorithms	Yes	The default value is **TLS_RSA_WITH_AES_128_CBC_SHA256,TLS_DHE_RSA_WITH_AES_128_CBC_SHA256,TLS_DHE_DSS_WITH_AES_128_CBC_SHA256**.	Supported SSL standard algorithm. For details, see the Java official website: **http://docs.oracle.com/javase/8/docs/technotes/guides/security/StandardNames.html#ciphersuites**.

Parameter	Mandatory	Default Value	Description
security.ssl.rest.enabled	Yes	The value is automatically configured according to the cluster installation mode. • Security mode: The default value is **true**. • Normal mode: The default value is **false**.	Main switch of external communication SSL.
security.ssl.rest.keystore	Yes	-	Java keystore file.
security.ssl.rest.keystore-password	Yes	-	Password used to decrypt the keystore file.
security.ssl.rest.key-password	Yes	-	Password used to decrypt the server key in the keystore file.
security.ssl.rest.truststore	Yes	-	**truststore** file containing the public CA certificates.
security.ssl.rest.truststore-password	Yes	-	Password used to decrypt the truststore file.

For configuration items for MRS 3.x or later, see **Table 12-71**.

Table 12-71 Parameters

Parameter	Description	Default Value	Mandatory
security.ssl.enabled	Main switch of internal communication SSL.	The value is automatically configured according to the cluster installation mode. • Security mode: The default value is **true**. • Non-security mode: The default value is **false**.	Yes
security.ssl.keystore	Java keystore file.	-	Yes

Parameter	Description	Default Value	Mandatory
security.ssl.keystore-password	Password used to decrypt the keystore file.	-	Yes
security.ssl.key-password	Password used to decrypt the server key in the keystore file.	-	Yes
security.ssl.truststore	**truststore** file containing the public CA certificates.	-	Yes
security.ssl.truststore-password	Password used to decrypt the truststore file.	-	Yes
security.ssl.protocol	SSL transmission protocol version.	TLSv1.2	Yes
security.ssl.algorithms	Supported SSL standard algorithm. For details, see the Java official website: **http://docs.oracle.com/javase/8/docs/technotes/guides/security/StandardNames.html#ciphersuites**.	The default value: "TLS_DHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_DHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384"	Yes

12.6.3.6 Network communication (via Netty)

Scenario

When Flink runs a job, data transmission and reverse pressure detection between tasks depend on Netty. In certain environments, **Netty** parameters should be configured.

Configuration Description

For advanced optimization, you can modify the following Netty configuration items. The default configuration can meet the requirements of tasks of large-scale clusters with high concurrent throughput. For details about the parameters, visit the Netty official website at **http://netty.io/**.

Table 12-72 Parameter description

Parameter	Description	Default Value	Mandatory
taskmanager.network.netty.num-arenas	Number of Netty memory blocks.	1	No
taskmanager.network.netty.server.numThreads	Number of Netty server threads	1	No
taskmanager.network.netty.client.numThreads	Number of Netty client threads	1	No
taskmanager.network.netty.client.connectTimeoutSec	Netty client connection timeout duration. Unit: second	120	No
taskmanager.network.netty.sendReceiveBufferSize	Size of Netty sending and receiving buffers. This defaults to the system buffer size (**cat /proc/sys/net/ipv4/tcp_[rw]mem**) and is 4 MB in modern Linux. Unit: byte	4096	No
taskmanager.network.netty.transport	Netty transport type, either **nio** or **epoll**	nio	No

12.6.3.7 JobManager Web Frontend

Scenarios

When JobManager is started, the web server in the same process is also started.

- You can access the web server to obtain information about the current Flink cluster, including information about JobManager, TaskManager, and running jobs in the cluster.
- You can configure parameters of the web server.

Configuration Description

Configuration items include the port, temporary directory, display items, error redirection, and security-related items.

For versions earlier than MRS 3.x, see **Table 12-73**.

Table 12-73 Parameters

Parameter	Mandatory	Default Value	Description
jobmanager.web.port	No	32261-32325	Web port. Value range: 32261-32325.
jobmanager.web.allow-access-address	Yes	*	Web access whitelist. IP addresses are separated by commas (,). Only IP addresses in the whitelist can access the web.

For details about configuration items of MRS 3.*x* or later, see **Table 12-74**.

Table 12-74 Parameters

Parameter	Description	Default Value	Mandatory
flink.security.enable	When installing a Flink cluster, you are required to select **security mode** or **normal mode**. • If **security mode** is selected, the value of **flink.security.enable** is automatically set to **true**. • If **normal mode** is selected, the value of **flink.security.enable** is automatically set to **false**. If you want to checker whether Flink cluster is in security mode or normal mode, view the value of **flink.security.enable**.	The value is automatically configured based on the cluster installation mode.	No
rest.bind-port	Web port. Value range: 32261-32325.	32261-32325	No
jobmanager.web.history	Number of recent jobs to be displayed.	5	No
jobmanager.web.checkpoints.disable	Indicates whether to disable checkpoint statistics.	false	No
jobmanager.web.checkpoints.history	Number of checkpoint statistical records.	10	No
jobmanager.web.backpressure.cleanup-interval	Interval for clearing unaccessed backpressure records. The unit is millisecond.	600000	No

Parameter	Description	Default Value	Mandatory
jobmanager.web.backpressure.refresh-interval	Interval for updating backpressure records. The unit is millisecond.	60000	No
jobmanager.web.backpressure.num-samples	Number of stack tracing records for reverse pressure calculation.	100	No
jobmanager.web.backpressure.delay-between-samples	Sampling interval for reverse pressure calculation. The unit is millisecond.	50	No
jobmanager.web.ssl.enabled	Whether SSL encryption is enabled for web transmission. This parameter is valid only when the global switch **security.ssl** is enabled.	false	Yes
jobmanager.web.accesslog.enable	Switch to enable or disable web operation logs. The log is stored in **webaccess.log**.	true	Yes
jobmanager.web.x-frame-options	Value of the HTTP security header **X-Frame-Options**. The value can be **SAMEORIGIN**, **DENY**, or **ALLOW-FROM uri**.	DENY	Yes
jobmanager.web.cache-directive	Whether the web page can be cached.	no-store	Yes
jobmanager.web.expires-time	Expiration duration of web page cache. The unit is millisecond.	0	Yes
jobmanager.web.allow-access-address	Web access whitelist. IP addresses are separated by commas (,). Only IP addresses in the whitelist can access the web.	*	Yes
jobmanager.web.access-control-allow-origin	Web page same-origin policy that prevents cross-domain attacks.	*	Yes
jobmanager.web.refresh-interval	Web page refresh interval. The unit is millisecond.	3000	Yes
jobmanager.web.logout-timer	Automatic logout interval when no operation is performed. The unit is millisecond.	600000	Yes
jobmanager.web.403-redirect-url	Web page access error 403. If 403 error occurs, the page switch to a specified page.	Automatic configuration	Yes

Parameter	Description	Default Value	Mandatory
jobmanager.web.404-redirect-url	Web page access error 404. If 404 error occurs, the page switch to a specified page.	Automatic configuration	Yes
jobmanager.web.415-redirect-url	Web page access error 415. If 415 error occurs, the page switch to a specified page.	Automatic configuration	Yes
jobmanager.web.500-redirect-url	Web page access error 500. If 500 error occurs, the page switch to a specified page.	Automatic configuration	Yes
rest.await-leader-timeout	Time of the client waiting for the leader address. The unit is millisecond.	30000	No
rest.client.max-content-length	Maximum content length that the client handles (unit: bytes).	104857600	No
rest.connection-timeout	Maximum time for the client to establish a TCP connection (unit: ms).	15000	No
rest.idleness-timeout	Maximum time for a connection to stay idle before failing (unit: ms).	300000	No
rest.retry.delay	The time that the client waits between retries (unit: ms).	3000	No
rest.retry.max-attempts	The number of retry times if a retrievable operator fails.	20	No
rest.server.max-content-length	Maximum content length that the server handles (unit: bytes).	104857600	No
rest.server.numThreads	Maximum number of threads for the asynchronous processing of requests.	4	No
web.timeout	Timeout for web monitor (unit: ms).	10000	No

12.6.3.8 File Systems

Scenario

Result files are created when tasks are running. Flink enables you to configure parameters for file creation.

Configuration Description

Configuration items include overwriting policy and directory creation.

Table 12-75 Parameter description

Parameter	Description	Default Value	Mandatory
fs.overwrite-files	Whether to overwrite the existing file by default when the file is written.	false	No
fs.output.always-create-directory	When the degree of parallelism (DOP) of file writing programs is greater than 1, a directory is created under the output file path and different result files (one for each parallel writing program) are stored in the directory. • If this parameter is set to **true**, a directory is created for the writing program whose DOP is 1 and a result file is stored in the directory. • If this parameter is set to **false**, the file of the writing program whose DOP is 1 is created directly in the output path and no directory is created.	false	No

12.6.3.9 State Backend

Scenarios

Flink enables HA and job exception, as well as job pause and recovery during version upgrade. Flink depends on state backend to store job states and on the restart strategy to restart a job. You can configure state backend and the restart strategy.

Configuration Description

Configuration items include the state backend type, storage path, and restart strategy.

Table 12-76 Parameters

Parameter	Description	Default Value	Mandatory
state.backend.fs.checkpointdir	Path when the backend is set to **filesystem**. The path must be accessible by JobManager. Only the local mode is supported. In the cluster mode, use an HDFS path.	hdfs:///flink/checkpoints	No
state.savepoints.dir	Savepoint storage directory used by Flink to restore and update jobs. When a savepoint is triggered, the metadata of the savepoint is saved to this directory.	hdfs:///flink/savepoint	Mandatory in security mode
restart-strategy	Default restart policy, which is used for jobs for which no restart policy is specified. The options are as follows: • fixed-delay • failure-rate • none	none	No
restart-strategy.fixed-delay.attempts	Number of retry times when the fixed-delay restart strategy is used. For details, see **https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/task_failure_recovery.html**.	• If the checkpoint is enabled, the default value is the value of **Integer.MAX_VALUE**. • If the checkpoint is disabled, the default value is 3.	No

Parameter	Description	Default Value	Mandatory
restart-strategy.fixed-delay.delay	Retry interval when the fixed-delay strategy is used. The unit is ms/s/m/h/d.	• If the checkpoint is enabled, the default value is 10s. • If the checkpoint is disabled, the default value is the value of **akka.ask.timeout**.	No
restart-strategy.failure-rate.max-failures-per-interval	Maximum number of restart times in a specified period before a job fails when the fault rate policy is used. For details about the policies, see **https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/task_failure_recovery.html**.	1	No
restart-strategy.failure-rate.failure-rate-interval	Retry interval when the failure-rate strategy is used. The unit is ms/s/m/h/d.	60 s	No
restart-strategy.failure-rate.delay	Retry interval when the failure-rate strategy is used. The unit is ms/s/m/h/d.	The default value is the same as the value of **akka.ask.timeout**. For details, see **Distributed Coordination (via Akka)**.	No

12.6.3.10 Kerberos-based Security

Scenarios

Flink Kerberos configuration items must be configured in security mode.

Configuration Description

The configuration items include **keytab**, **principal**, and **cookie** of Kerberos.

NOTE

For versions earlier than MRS 3.x, the configuration item does not contain cookie.

Table 12-77 Parameters

Parameter	Description	Default Value	Mandatory
security.kerberos.login.keytab	Keytab file path. This parameter is a client parameter.	Configure the parameter based on actual service requirements.	Yes
security.kerberos.login.principal	A parameter on the client. If **security.kerberos.login.keytab** and **security.kerberos.login.principal** are both set, keytab certificate is used by default.	Configure the parameter based on actual service requirements.	No
security.kerberos.login.contexts	Contexts of the jass file generated by Flink. This parameter is a server parameter.	Client, KafkaClient	Yes
security.enable	Certificate enabling switch of the Flink internal module. This parameter is a client parameter.	This parameter is configured automatically according to the cluster installation mode. • Security mode: The default value is **true**. • Non-security mode: The default value is **false**.	Yes
security.cookie	Module certificate token. This parameter is a client parameter. It must be configured and cannot be left empty when **security.enable** is enabled.	Configure the parameter based on actual service requirements.	Yes

NOTE

For versions earlier than MRS 3.x, the configuration parameters do not include **security.enable** and **security.cookie**.

12.6.3.11 HA

Scenarios

The Flink HA mode depends on ZooKeeper. Therefore, ZooKeeper-related configuration items must be set.

Configuration Description

Configuration items include the ZooKeeper address, path, and security certificate.

Table 12-78 Parameters

Parameter	Description	Default Value	Mandatory
high-availability	Whether HA is enabled. Only the following two modes are supported currently: 1. none: Only a single JobManager is running. The checkpoint is disabled for JobManager. 2. ZooKeeper: • In non-Yarn mode, multiple JobManagers are supported and the leader JobManager is elected. • In Yarn mode, only one JobManager exists.	zookeeper	No
high-availability.zookeeper.quorum	ZooKeeper quorum address.	Automatic configuration	No
high-availability.zookeeper.path.root	Root directory that Flink creates on ZooKeeper, storing metadata required in HA mode.	/flink	No
high-availability.storageDir	Directory for storing JobManager metadata of state backend. ZooKeeper stores only pointers to actual data.	hdfs:///flink/recovery	No

Parameter	Description	Default Value	Mandatory
high-availability.zookeeper.client.session-timeout	Session timeout duration on the ZooKeeper client. The unit is millisecond.	60000	No
high-availability.zookeeper.client.connection-timeout	Connection timeout duration on the ZooKeeper client. The unit is millisecond.	15000	No
high-availability.zookeeper.client.retry-wait	Retry waiting time on the ZooKeeper client. The unit is millisecond.	5000	No
high-availability.zookeeper.client.max-retry-attempts	Maximum retry times on the ZooKeeper client.	3	No
high-availability.job.delay	Delay of job restart when JobManager recovers.	The default value is the same as the value of **akka.ask.timeout**.	No
high-availability.zookeeper.client.acl	ACL (open creator) of the ZooKeeper node. For ACL options, see **https://zookeeper.apache.org/doc/r3.5.1-alpha/zookeeperProgrammers.html#sc_BuiltinACLSchemes**.	This parameter is configured automatically according to the cluster installation mode. • Security mode: The default value is **creator**. • Non-security mode: The default value is **open**.	Yes

Parameter	Description	Default Value	Mandatory
zookeeper.sasl.disable	Simple authentication and security layer (SASL)-based certificate enable switch.	This parameter is configured automatically according to the cluster installation mode. • Security mode: The default value is **false**. • Non-security mode: The default value is **true**.	Yes
zookeeper.sasl.service-name	• If the ZooKeeper server configures a service whose name is different from **ZooKeeper**, this configuration item can be set. • If service names on the client and server are inconsistent, authentication fails.	zookeeper	Yes

NOTE

For versions earlier than MRS 3.x, the **high-availability.job.delay** parameter is not supported.

12.6.3.12 Environment

Scenario

In scenarios raising special requirements on JVM configuration, users can use configuration items to transfer JVM parameters to the client, JobManager, and TaskManager.

Configuration

Configuration items include JVM parameters.

Table 12-79 Parameter description

Parameter	Description	Default Value	Mandatory
env.java.opts	JVM parameter, which is transferred to the startup script, JobManager, TaskManager, and Yarn client. For example, transfer remote debugging parameters.	-Xloggc:<LOG_DIR>/gc.log -XX:+PrintGCDetails -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=20 -XX:GCLogFileSize=20M -Djdk.tls.ephemeralDHKeySize=2048 -Djava.library.path=${HADOOP_COMMON_HOME}/lib/native -Djava.net.preferIPv4Stack=true -Djava.net.preferIPv6Addresses=false -Dbeetle.application.home.path=/opt/*xxx*/Bigdata/common/runtime/security/config	No

12.6.3.13 Yarn

Scenario

Flink runs on a Yarn cluster and JobManager runs on ApplicationMaster. Certain configuration parameters of JobManager depend on Yarn. By setting Yarn-related configuration items, Flink is enabled to run better on Yarn.

Configuration Description

The configuration items include the memory, virtual kernel, and port of the Yarn container.

Table 12-80 Parameter description

Parameter	Description	Default Value	Mandatory
yarn.maximum-failed-containers	Maximum number of containers the system is going to reallocate in case of a container failure of TaskManager The default value is the number of TaskManagers when the Flink cluster is started.	5	No

Parameter	Description	Default Value	Mandatory
yarn.application-attempts	Number of ApplicationMaster restarts. The value is the maximum value in the validity interval that is set to Akka's timeout in Flink. After the restart, the IP address and port number of ApplicationMaster will change and you will need to connect to the client manually.	2	No
yarn.heartbeat-delay	Time between heartbeats with the ApplicationMaster and Yarn ResourceManager in seconds. Unit: second	5	No
yarn.containers.vcores	Number of virtual cores of each Yarn container	The default value is the number of TaskManager slots.	No
yarn.application-master.port	ApplicationMaster port number setting. A port number range is supported.	32586-32650	No

12.6.3.14 Pipeline

Scenarios

The Netty connection is used among multiple jobs to reduce latency. In this case, NettySink is used on the server and NettySource is used on the client for data transmission.

This section applies to MRS 3.x or later.

Configuration Description

Configuration items include NettySink information storing path, range of NettySink listening port, whether to enable SSL encryption, domain of the network used for NettySink monitoring.

Table 12-81 Parameters

Parameter	Description	Default Value	Mandatory
nettyconnector.registerserver.topic.storage	Path (on a third-party server) to information about IP address, port numbers, and concurrency of NettySink. ZooKeeper is recommended for storage.	/flink/nettyconnector	No. However, if pipeline is enabled, the feature is mandatory.
nettyconnector.sinkserver.port.range	Port range of NettySink.	If MRS cluster is used, the default value is 28444-28843.	No. However, if pipeline is enabled, the feature is mandatory.
nettyconnector.ssl.enabled	Whether SSL encryption for the communication between NettySink and NettySource is enabled. For details about the encryption key and protocol, see **SSL**.	false	No. However, if pipeline is enabled, the feature is mandatory.
nettyconnector.message.delimiter	Delimiter used to configure the message sent by NettySink to the NettySource, which is 2-4 bytes long, and cannot contain **\n**, **#**, or space.	The default value is **$_**.	No. However, if pipeline is enabled, the feature is mandatory.

12.6.4 Security Configuration

12.6.4.1 Security Features

Security Features of Flink

- All Flink cluster components support authentication.
  - The Kerberos authentication is supported between Flink cluster components and external components, such as Yarn, HDFS, and ZooKeeper.
  - The security cookie authentication between Flink cluster components, for example, Flink client and JobManager, JobManager and TaskManager, and TaskManager and TaskManager, are supported.
- SSL encrypted transmission is supported by Flink cluster components.
- SSL encrypted transmission between Flink cluster components, for example, Flink client and JobManager, JobManager and TaskManager, and TaskManager and TaskManager, are supported.
- Following security hardening approaches for Flink web are supported:

  - Whitelist filtering. Flink web can only be accessed through Yarn proxy.
  - Security header enhancement.
- In Flink clusters, ranges of listening ports of components can be configured.
- In HA mode, ACL control is supported.

12.6.4.2 Configuring Kafka

Sample project data of Flink is stored in Kafka. A user with Kafka permission can send data to Kafka and receive data from it.

Step 1 Ensure that clusters, including HDFS, Yarn, Flink, and Kafka are installed.

Step 2 Create a topic.

- Run Linux command line to create a topic. Before running commands, ensure that the kinit command, for example, **kinit flinkuser**, is run for authentication.

  NOTE

  To create a Flink user, you need to have the permission to create Kafka topics.

  The format of the command is shown as follows, in which **{zkQuorum}** indicates ZooKeeper cluster information and the format is *IP.port*, and **{Topic}** indicates the topic name.

  bin/kafka-topics.sh --create --zookeeper {zkQuorum}/kafka --replication-factor 1 --partitions 5 --topic {Topic}

  Assume the topic name is **topic 1**. The command for creating this topic is displayed as follows:

  ```
  /opt/client/Kafka/kafka/bin/kafka-topics.sh --create --zookeeper 10.96.101.32:2181,10.96.101.251:2181,10.96.101.177:2181,10.91.8.160:2181/kafka --replication-factor 1 --partitions 5 --topic topic1
  ```

- Configure the permission of the topic on the server.

  Set the **allow.everyone.if.no.acl.found** parameter of Kafka Broker to **true**.

Step 3 Perform the security authentication.

The Kerberos authentication, SSL encryption authentication, or Kerberos + SSL authentication mode can be used.

NOTE

For versions earlier than MRS 3.x, only Kerberos authentication is supported.

- **Kerberos authentication**
  - Client configuration

    In the Flink configuration file **flink-conf.yaml**, add configurations about Kerberos authentication. For example, add **KafkaClient** in **contexts** as follows:

    ```
    security.kerberos.login.keytab: /home/demo//keytab/flinkuser.keytab
    security.kerberos.login.principal: flinkuser
    security.kerberos.login.contexts: Client,KafkaClient
    security.kerberos.login.use-ticket-cache: false
    ```

    NOTE

    For versions earlier than MRS 3.x, set **security.kerberos.login.keytab** to **/home/demo/flink/release/keytab/flinkuser.keytab**.

  - Running parameter

    Running parameters about the **SASL_PLAINTEXT** protocol are as follows:

    ```
    --topic topic1 --bootstrap.servers 10.96.101.32:21007 --security.protocol SASL_PLAINTEXT  --sasl.kerberos.service.name kafka //10.96.101.32:21007 indicates the IP.port of the Kafka server.
    ```

- **SSL encryption**
  - Configure the server.

    Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Kafka** > **Configurations**, and set **Type** to **All**. Search for **ssl.mode.enable** and set it to **true**.

  - Configure the client.

    i. Log in to FusionInsight Manager, choose **Cluster > *Name of the desired cluster* > Services > Kafka > More > Download Client** to download Kafka client.

    ii. Use the **ca.crt** certificate file in the client root directory to generate the **truststore** file for the client.

    Run the following command:

    ```
    keytool -noprompt -import -alias myservercert -file ca.crt -keystore truststore.jks
    ```

    The command execution result is similar to the following:

    ```
    drwx------.  5 zgd  users     4096 Feb  4 16:22 .
    drwxr-xr-x. 10 zgd  users     4096 Jan 22 17:38 ..
    -rwx------.  1 zgd  users      135 Jan 22 17:31 application.properties
    -rwx------.  1 zgd  users      790 Jan 22 17:31 bigdata_env.sample
    -rw-------.  1 zgd  users     1322 Jan 22 17:31 ca.crt
    -rwx------.  1 zgd  users     4508 Jan 22 17:31 conf.py
    -rw-------.  1 zgd  users      120 Jan 22 17:31 hosts
    -rwx------.  1 zgd  users      745 Jan 22 17:31 install.bat
    -rwx------.  1 zgd  users    15082 Jan 22 17:31 install.sh
    drwx------.  2 zgd  users     4096 Jan 22 17:38 JDK
    -rwx------.  1 zgd  users 37021723 Jan 22 17:31 jython-standalone-2.7.0.jar
    drwx------.  5 zgd  users     4096 Jan 22 17:38 Kafka
    drwx------.  3 zgd  users     4096 Jan 22 17:38 KrbClient
    -rwx------.  1 zgd  users      473 Jan 22 17:31 log4j.properties
    -rwx------.  1 zgd  users     2107 Jan 22 17:31 README
    -rwx------.  1 zgd  users     6949 Jan 22 17:31 refreshConfig.sh
    -rwx------.  1 zgd  users     1736 Jan 22 17:31 switchuser.py
    -rw-r--r--   1 root root      1004 Feb  4 16:22 truststore.jks
    ```

    iii. Run parameters.

    The value of **ssl.truststore.password** must be the same as the password you entered when creating **truststore**. Run the following command to run parameters:

    ```
    --topic topic1 --bootstrap.servers 10.96.101.32:9093 --security.protocol SSL --ssl.truststore.location /home/zgd/software/FusionInsight_Kafka_ClientConfig/truststore.jks --ssl.truststore.password XXX
    ```

- **Kerberos+SSL encryption**

  After completing preceding configurations of the client and server of Kerberos and SSL, modify the port number and protocol type in running parameters to enable the Kerberos+SSL encryption mode.

  ```
  --topic topic1 --bootstrap.servers 10.96.101.32:21009 --security.protocol SASL_SSL  --sasl.kerberos.service.name kafka --ssl.truststore.location /home/zgd/software/FusionInsight_Kafka_ClientConfig/truststore.jks --ssl.truststore.password XXX
  ```

----End

12.6.4.3 Configuring Pipeline

This section applies to MRS 3.x or later.

1. Configure files.
   - **nettyconnector.registerserver.topic.storage**: (Mandatory) Configures the path (on a third-party server) to information about IP address, port numbers, and concurrency of NettySink. For example:
     ```
     nettyconnector.registerserver.topic.storage: /flink/nettyconnector
     ```
   - **nettyconnector.sinkserver.port.range**: (Mandatory) Configures the range of port numbers of NettySink. For example:
     ```
     nettyconnector.sinkserver.port.range: 28444-28843
     ```
   - **nettyconnector.ssl.enabled**: Configures whether to enable SSL encryption between NettySink and NettySource. The default value is **false**. For example:
     ```
     nettyconnector.ssl.enabled: true
     ```
2. Configure security authentication.
   - SASL authentication of ZooKeeper depends on the HA configuration in the **flink-conf.yaml** file.
   - SSL configurations such as keystore, truststore, keystore password, truststore password, and password inherit from **flink-conf.yaml**. For details, see **Encrypted Transmission**.

12.6.5 Security Hardening

12.6.5.1 Authentication and Encryption

Security Authentication

Flink uses the following three authentication modes:

- Kerberos authentication: It is used between the Flink Yarn client and Yarn ResourceManager, JobManager and ZooKeeper, JobManager and HDFS, TaskManager and HDFS, Kafka and TaskManager, as well as TaskManager and ZooKeeper.
- Security cookie authentication: Security cookie authentication is used between Flink Yarn client and JobManager, JobManager and TaskManager, as well as TaskManager and TaskManager.
- Internal authentication of Yarn: The Internal authentication mechanism of Yarn is used between Yarn ResourceManager and ApplicationMaster (AM).

  NOTE

  - Flink JobManager and Yarn ApplicationMaster are in the same process.
  - If Kerberos authentication is enabled for the user's cluster, Kerberos authentication is required.
  - For versions earlier than MRS 3.*x*, Flink does not support security cookie authentication.

Table 12-82 Authentication modes

Authentication Mode	Description	Configuration Method

Kerberos authentication	Currently, only keytab authentication mode is supported.	1. Download the user keytab from the KDC server, and place the keytab to a directory on the host of the Flink client.
		2. Configure the following parameters in the **flink-conf.yaml** file:
		a. Keytab path
		`security.kerberos.login.keytab: /home/flinkuser/keytab/abc222.keytab`
		Note:
		/home/flinkuser/keytab/abc222.keytab indicates the user directory.
		b. Principal name
		`security.kerberos.login.principal: abc222`
		c. In HA mode, if ZooKeeper is configured, the Kerberos authentication configuration items must be configured as follows:
		`zookeeper.sasl.disable: false`
		`security.kerberos.login.contexts: Client`
		d. If you want to perform Kerberos authentication between Kafka client and Kafka broker, set the value as follows:
		`security.kerberos.login.contexts: Client,KafkaClient`

Authentication Mode	Description	Configuration Method
Security cookie authentication	-	1. In the **bin** directory of the Flink client, run the **generate_keystore.sh** script to generate security cookie, **flink.keystore**, and **flink.truststore**. Run the **sh generate_keystore.sh** command and enter the user-defined password. The password cannot contain **#**. **NOTE** After the script is executed, the **flink.keystore** and **flink.truststore** files are generated in the **conf** directory on the Flink client. In the **flink-conf.yaml** file, default values are specified for following parameters: ● Set **security.ssl.keystore** to the absolute path of the **flink.keystore** file. ● Set **security.ssl.truststore** to the absolute path of the **flink.truststore** file. ● Set **security.cookie** to a random password automatically generated by the **generate_keystore.sh** script. ● By default, **security.ssl.encrypt.enabled: false** is set in the **flink-conf.yaml** file by default. The **generate_keystore.sh** script sets **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password** to the password entered when the **generate_keystore.sh** script is called. ● For MRS 3.1.0 or later, if ciphertext is required and **security.ssl.encrypt.enabled** is set to **true** in the **flink-conf.yaml** file, the **generate_keystore.sh** script does not set **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password**. To obtain the values, use the Manager plaintext encryption API by running the following command: **curl -k -i -u** *Username*:*Password* **-X POST -HContent-type:application/json -d '{"plainText":"***Password***"}' 'https://***x.x.x.x***:28443/web/api/v2/tools/encrypt'** In the preceding command, *Username*:*Password* indicates the user name and password for logging in to the system. The password of **"plainText"** indicates the one used to call the **generate_keystore.sh** script. *x.x.x.x* indicates the floating IP address of Manager. 2. Set **security.enable: true** in the **flink-conf.yaml** file and check whether **security cookie** is configured successfully. Example: security.cookie: ae70acc9-9795-4c48-ad35-8b5adc8071744f605d1d-2726-432e-88ae-dd39bfec40a9

Authentication Mode	Description	Configuration Method
Internal authentication of Yarn	This authentication mode does not need to be configured by the user.	-

NOTE

One Flink cluster supports only one user. One user can create multiple Flink clusters.

Encrypted Transmission

Flink uses following encrypted transmission modes:

- Encrypted transmission inside Yarn: It is used between the Flink Yarn client and Yarn ResourceManager, as well as Yarn ResourceManager and JobManager.
- SSL transmission: SSL transmission is used between Flink Yarn client and JobManager, JobManager and TaskManager, as well as TaskManager and TaskManager.
- Encrypted transmission inside Hadoop: The internal encrypted transmission mode of Hadoop used between JobManager and HDFS, TaskManager and HDFS, JobManager and ZooKeeper, as well as TaskManager and ZooKeeper.

NOTE

Configuration about SSL encrypted transmission is mandatory while configuration about encryption of Yarn and Hadoop is not required.

To configure SSL encrypted transmission, configure the following parameters in the **flink-conf.yaml** file on the client:

1. Enable SSL and configure the SSL encryption algorithm. For MRS 3.x or later, see **Table 12-83**. Modify the parameters as required.

Table 12-83 Parameter description

Parameter	Example Value	Description
security.ssl.enabled	true	Enable SSL.

Parameter	Example Value	Description
akka.ssl.enabled	true	Enable Akka SSL.
blob.service.ssl.enabled	true	Enable SSL for the Blob channel.
taskmanager.data.ssl.enabled	true	Enable SSL transmissions between TaskManagers.
security.ssl.algorithms	TLS_DHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_DHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	Configure the SSL encryption algorithm.

For versions earlier than MRS 3.x, see **Table 12-84**.

Table 12-84 Parameter description

Parameter	Example Value	Description
security.ssl.internal.enabled	true	Enable internal SSL.
akka.ssl.enabled	true	Enable Akka SSL.
blob.service.ssl.enabled	true	Enable SSL for the Blob channel.
taskmanager.data.ssl.enabled	true	Enable SSL transmissions between TaskManagers.
security.ssl.algorithms	TLS_RSA_WITH_AES128 CBC_SHA256	Configure the SSL encryption algorithm.

For versions earlier than MRS 3.x, the following parameters in **Table 12-85** do not exist in the default Flink configuration of MRS. If you want to enable SSL for external connections, add the following parameters. After SSL for external connection is enabled, the native Flink page cannot be accessed using a Yarn proxy, because the Yarn open-source version cannot process HTTPS requests using a proxy. However, you can create a Windows VM in the same VPC of the cluster and access the native Flink page from the VM.

Table 12-85 Parameter description

Parameter	Example Value	Description
security.ssl.rest.enabled	true	Enable external SSL. If this parameter is set to **true**, set the related parameters by referring to **Table 12-85**.
security.ssl.rest.keystore	${path}/flink.keystore	Path for storing the **keystore**.
security.ssl.rest.keystore-password	-	A user-defined password of **keystore**.
security.ssl.rest.key-password	-	A user-defined password of the SSL key.
security.ssl.rest.truststore	${path}/flink.truststore	Path for storing the **truststore**.
security.ssl.rest.truststore-password	-	A user-defined password of **truststore**.

NOTE

Enabling SSL for data transmission between TaskManagers may pose great impact on the system performance.

2. In the **bin** directory of the Flink client, run the ***sh generate_keystore.sh*** *<password>* command. For details, see **Authentication and Encryption**. The configuration items in **Table 12-86** are set by default for MRS 3.*x* or later. You can also configure them manually.

Table 12-86 Parameter description

Parameter	Example Value	Description
security.ssl.keystore	${path}/flink.keystore	Path for storing the **keystore**. **flink.keystore** indicates the name of the **keystore** file generated by the **generate_keystore.sh*** tool.
security.ssl.keystore-password	-	A user-defined password of **keystore**.
security.ssl.key-password	-	A user-defined password of the SSL key.
security.ssl.truststore	${path}/flink.truststore	Path for storing the **truststore**. **flink.truststore** indicates the name of the **truststore** file generated by the **generate_keystore.sh*** tool.

Parameter	Example Value	Description
security.ssl.truststore-password	-	A user-defined password of **truststore**.

For versions earlier than MRS 3.x, the ***generate_keystore.sh*** command is generated automatically, and the configuration items in **Table 12-87** are set by default. You can also configure them manually.

Table 12-87 Parameter description

Parameter	Example Value	Description
security.ssl.internal.keystore	${path}/flink.keystore	Path for storing the **keystore**. **flink.keystore** indicates the name of the **keystore** file generated by the **generate_keystore.sh*** tool.
security.ssl.internal.keystore-password	-	A user-defined password of **keystore**.
security.ssl.internal.key-password	-	A user-defined password of the SSL key.
security.ssl.internal.truststore	${path}/flink.truststore	Path for storing the **truststore**. **flink.truststore** indicates the name of the **truststore** file generated by the **generate_keystore.sh*** tool.
security.ssl.internal.truststore-password	-	A user-defined password of **truststore**.

For versions earlier than MRS 3.x, if SSL for external connections is enabled, that is, **security.ssl.rest.enabled** is set to **true**, you need to configure the parameters listed in **Table 12-88**.

Table 12-88 Parameters

Parameter	Example Value	Description
security.ssl.rest.enabled	true	Enable external SSL. If this parameter is set to **true**, set the related parameters by referring to **Table 12-88**.
security.ssl.rest.keystore	${path}/flink.keystore	Path for storing the **keystore**.

Parameter	Example Value	Description
security.ssl.rest.keystore-password	-	A user-defined password of **keystore**.
security.ssl.rest.key-password	-	A user-defined password of the SSL key.
security.ssl.rest.truststore	${path}/flink.truststore	Path for storing the **truststore**.
security.ssl.rest.truststore-password	-	A user-defined password of **truststore**.

NOTE

The **path** directory is a user-defined directory for storing configuration files of the SSL keystore and truststore. The commands vary according to the relative path and absolute path. For details, see 3 and 4.

3. If the **keystore** or **truststore** file path is a relative path, the Flink client directory where the command is executed needs to access this relative path directly. Either of the following method can be used to transmit the keystore and truststore file:
   - Add **-t** option to the **CLI yarn-session.sh** command to transfer the **keystore** and **truststore** file to execution nodes. Example:
     ```
     ./bin/yarn-session.sh -t ssl/
     ```
   - Add **-yt** option to the **flink run** command to transfer the **keystore** and **truststore** file to execution nodes. Example:
     ```
     ./bin/flink run -yt ssl/ -ys 3  -m yarn-cluster -c
     org.apache.flink.examples.java.wordcount.WordCount /opt/client/Flink/flink/examples/batch/
     WordCount.jar
     ```

     NOTE

     - In the preceding example, **ssl/** is the sub-directory of the Flink client directory. It is used to store configuration files of the SSL keystore and truststore.
     - The relative path of **ssl/** must be accessible from the current path where the Flink client command is run.
4. If the keystore or truststore file path is an absolute path, the keystore and truststore files must exist in the absolute path on Flink Client and all nodes.

   NOTE

   For versions earlier than MRS 3.x, the user who submits the job must have the permission to read the keystore and truststore files.

   Either of the following methods can be used to execute applications. The **-t** or **-yt** option does not need to be added to transmit the **keystore** and **truststore** files.
   - Run the **CLI yarn-session.sh** command of Flink to execute applications. Example:
     ```
     ./bin/yarn-session.sh
     ```
   - Run the **Flink run** command to execute applications. Example:

```
./bin/flink run  -ys 3 -m yarn-cluster -c
org.apache.flink.examples.java.wordcount.WordCount /opt/client/Flink/flink/examples/batch/
WordCount.jar
```

12.6.5.2 ACL Control

In HA mode of Flink, ZooKeeper can be used to manage clusters and discover services. Zookeeper supports SASL ACL control. Only users who have passed the SASL (Kerberos) authentication have the permission to operate files on ZooKeeper. To enable SASL ACL control, perform following configurations in the Flink configuration file.

```
high-availability.zookeeper.client.acl: creator
zookeeper.sasl.disable: false
```

For details about configuration items, see **Table 12-78**.

12.6.5.3 Web Security

Coding Specifications

Note: The same coding mode is used on the web service client and server to prevent garbled characters and to enable input verification.

Security hardening: apply UTF-8 to response messages of web server.

Whitelist-based Filter of IP Addresses

Note: IP filter must be added to the web server to filter unauthorized requests from the source IP address and prevent unauthorized login.

Security: Add **jobmanager.web.allow-access-address** to enable the IP filter. By default, only Yarn users are supported.

NOTE

After the client is installed, you need to add the IP address of the client node to the **jobmanager.web.allow-access-address** configuration item.

Preventing Sending the Absolute Paths to the Client

Note: If an absolute path is sent to a client, the directory structure of the server is exposed, increasing the risk that attackers know and attack the system.

Security hardening: If the Flink configuration file contains a parameter starting with a slash (/), the first-level directory is deleted.

Same-origin Policy

The same-source policy applies to MRS 3.x or later.

If two URL protocols have same hosts and ports, they are of the same origin. Protocols of different origins cannot access each other, unless the source of the visitor is specified on the host of the service to be visited.

Security hardening: The default value of the header of the response header **Access-Control-Allow-Origin** is the IP address of ResourceManager on Yarn clusters. If the IP address is not from Yarn, mutual access is not allowed.

Defense Against XSS

Defense Against XSS applies to MRS 3.x or later.

Disabling XSS filter incurs the following risks:

- Leakage of sensitive information, for example, **sessionid**.
- Tampering of pages.
- Redirection to malicious websites.
- DoS attacks from other websites to Flink web.

Security hardening: Add the **X-XSS-Protection** security header to enable XSS filter. The default value configuration is **X-XSS-Protection: 1; mode=block**. If XSS attack is detected, rendering of the page is stopped. For example, if XSS attacks are detected in Internet Explorer 8, all contents of the page is replaced by **#**.

Preventing Sensitive Information Disclosure

Sensitive information disclosure prevention is applicable to MRS 3.x or later.

Web pages containing sensitive data must not be cached, to avoid leakage of sensitive information or data crosstalk among users who visit the internet through the proxy server.

Security hardening: Add **Cache-control**, **Pragma**, **Expires** security header. The default value is **Cache-Control: no-store**, **Pragma: no-cache**, and **Expires: 0**.

The security hardening stops contents interacted between Flink and web server from being cached.

Anti-Hijacking

Anti-hijacking applies to MRS 3.x or later.

Since hotlinking and clickjacking use framing technologies, security hardening is required to prevent attacks.

Security hardening: Add **X-Frame-Options** security header to specify whether the browser will load the pages from **iframe**, **frame** or **object**. The default value is **X-Frame-Options: DENY**, indicating that no pages can be nested to **iframe**, **frame** or **object**.

Logging calls of the Web Service APIs

This function applies to MRS 3.x or later.

Calls of the **Flink webmonitor restful** APIs are logged.

The **jobmanager.web.accesslog.enable** can be added in the **access log**. The default value is **true**. Logs are stored in a separate **webaccess.log** file.

Cross-Site Request Forgery Prevention

Cross-site request forgery (CSRF) prevention applies to MRS 3.x or later.

In **Browser/Server** applications, CSRF must be prevented for operations involving server data modification, such as adding, modifying, and deleting. The CSRF forces end users to execute non-intended operations on the current web application.

Security hardening: Only two post APIs, one delete API, and get interfaces are reserve for modification requests. All other APIs are deleted.

Troubleshooting

This function applies to MRS 3.x or later.

When the application is abnormal, exception information is filtered, logged, and returned to the client.

Security hardening

- A default error message page to filter information and log detailed error information.
- Four configuration parameters are added to ensure that the error page is switched to a specified URL provided by FusionInsight, preventing exposure of unnecessary information.

Table 12-89 Parameter description

Parameter	Description	Default Value	Mandatory
jobmanager.web.403-redirect-url	Web page access error 403. If 403 error occurs, the page switch to a specified page.	-	Yes
jobmanager.web.404-redirect-url	Web page access error 404. If 404 error occurs, the page switch to a specified page.	-	Yes
jobmanager.web.415-redirect-url	Web page access error 415. If 415 error occurs, the page switch to a specified page.	-	Yes
jobmanager.web.500-redirect-url	Web page access error 500. If 500 error occurs, the page switch to a specified page.	-	Yes

HTML5 Security

HTML5 security applies to MRS 3.x or later.

HTML5 is a next generation web development specification that provides new functions and extend the labels for developers. These new labels and functions increase the attack surface and pose attack risks (such as cross-domain resource sharing, client storage, WebWorker, WebRTC, and WebSocket).

Security hardening: Add the **Access-Control-Allow-Origin** parameter. For example, if you want to enable the cross-domain resource sharing, configure the **Access-Control-Allow-Origin** parameter of the HTTP response header.

NOTE

Flink does not involve security risks of functions such as storage on the client, WebWorker, WebRTC, and WebSocket.

12.6.6 Security Statement

- All security functions of Flink are provided by the open source community or self-developed. Security features that need to be configured by users, such as authentication and SSL encrypted transmission, may affect performance.
- As a big data computing and analysis platform, Flink does not detect sensitive information. Therefore, you need to ensure that the input data is not sensitive.
- You can evaluate whether configurations are secure as required.
- For any security-related problems, contact O&M support.

12.6.7 Using the Flink Web UI

12.6.7.1 Overview

12.6.7.1.1 Introduction to Flink Web UI

Flink web UI provides a web-based visual development platform. You only need to compile SQL statements to develop jobs, slashing the job development threshold. In addition, the exposure of platform capabilities allows service personnel to compile SQL statements for job development to quickly respond to requirements, greatly reducing the Flink job development workload.

NOTE

This section applies to only MRS 3.1.0 or later.

Flink Web UI Features

The Flink web UI has the following features:

- Enterprise-class visual O&M: GUI-based O&M management, job monitoring, and standardization of Flink SQL statements for job development.
- Quick cluster connection: After configuring the client and user credential key file, you can quickly access a cluster using the cluster connection function.

- Quick data connection: You can access a component by configuring the data connection function. If **Data Connection Type** is set to **HDFS**, you need to create a cluster connection. If **Authentication Mode** is set to **KERBEROS** for other data connection types, you need to create a cluster connection. If **Authentication Mode** is set to **SIMPLE**, you do not need to create a cluster connection.

  NOTE

  If **Data Connection Type** is set to **Kafka**, **Authentication Type** cannot be set to **KERBEROS**.
- Visual development platform: The input/output mapping table can be customized to meet the requirements of different input sources and output destinations.
- Easy to use GUI-based job management

Key Web UI Capabilities

Table 12-90 shows the key capabilities provided by Flink web UI.

Table 12-90 Key web UI capabilities

Item	Description
Batch-Stream convergence	• Batch jobs and stream jobs can be processed with a unified set of Flink SQL statements.
Flink SQL kernel capabilities	• Flink SQL supports customized window size, stream compute within 24 hours, and batch processing beyond 24 hours. • Flink SQL supports Kafka and HDFS reading. Data can be written to Kafka, Redis, and HDFS. The Redis dimension table can be joined. • A job can define multiple Flink SQL jobs, and multiple metrics can be combined into one job for computing. If a job contains same primary keys as well as same inputs and outputs, the job supports the computing of multiple windows. • The AVG, SUM, COUNT, MAX, and MIN statistical methods are supported.
Flink SQL functions on the console	• Cluster connection management allows you to configure clusters where services such as Kafka, Redis, and HDFS reside. • Data connection management allows you to configure services such as Kafka, Redis, and HDFS. • Data table management allows you to define data tables accessed by SQL statements and generate DDL statements. • Flink SQL job definition allows you to verify, parse, optimize, convert a job into a Flink job, and submit the job for running based on the entered SQL statements.

Item	Description
Flink job visual management	• Stream jobs and batch jobs can be defined in a visual manner. • Job resources, fault recovery policies, and checkpoint policies can be configured in a visual manner. • Status monitoring of stream and batch jobs are supported. • The Flink job O&M is enhanced, including redirection of the native monitoring page.
Performance and reliability	• Stream processing supports 24-hour window aggregation computing and millisecond-level performance. • Batch processing supports 90-day window aggregation computing, which can be completed in minutes. • Invalid data of stream processing and batch processing can be filtered out. • When HDFS data is read, the data can be filtered based on the calculation period in advance. • Data in Flink jobs comes from Redis. If fault recovery policies have been set for Flink jobs, data is read from Redis during calculation and no data is lost when a job is faulty. • If the job definition platform is faulty or the service is degraded, jobs cannot be redefined, but the computing of existing jobs is not affected. • The automatic restart mechanism is provided for job failures. You can configure restart policies.

12.6.7.1.2 Flink Web UI Application Process

The Flink web UI application process is shown as follows:

Figure 12-14 Application process

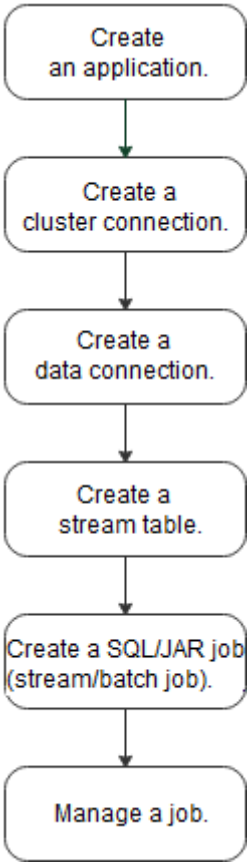


Table 12-91 Description of the Flink web UI application process

Phase	Description	Reference Section
Creating an application	Applications can be used to isolate different upper-layer services.	**Creating an Application on the Flink Web UI**
Creating a cluster connection	Different clusters can be accessed by configuring the cluster connection.	**Creating a Cluster Connection on the Flink Web UI**
Creating a data connection	Different data services can be accessed, such as HDFS, Kafka, and Redis, through the data connection.	**Creating a Data Connection on the Flink Web UI**
Creating a stream table	Data tables can be used to define basic attributes and parameters of source tables, dimension tables, and output tables.	**Managing Tables on the Flink Web UI**
Creating a SQL/JAR job (stream/batch job)	APIs can be used to define Flink jobs, including Flink SQL and Flink Jar jobs.	**Managing Jobs on the Flink Web UI**

Phase	Description	Reference Section
Managing a job	A created job can be managed, including starting, developing, stopping, deleting, and editing the job.	**Managing Jobs on the Flink Web UI**

12.6.7.2 FlinkServer Permissions Management

12.6.7.2.1 Overview

User **admin** of Manager does not have the FlinkServer service operation permission. To perform FlinkServer service operations, you need to grant related permission to the user.

Applications (tenants) in FlinkServer are the maximum management scope, including cluster connection management, data connection management, application management, stream table management, and job management.

There are three types of resource permissions for FlinkServer, as shown in **Table 12-92**.

Table 12-92 FlinkServer resource permissions

Name	Description	Remarks
Administrator permission	Users who have the permission can edit and view all applications.	This is the highest-level permission of FlinkServer. If you have the administrator permission, you have the permission on all applications by default.
Application edit permission	Users who have the permission can create, edit, and delete cluster connections and data connections. They can also create stream tables as well as create and run jobs.	In addition, users who have the permission can view current applications.
Application view permission	Users who have the permission can view applications.	-

12.6.7.2.2 Authentication Based on Users and Roles

This section describes how to create and configure a FlinkServer role on Manager as the system administrator. A FlinkServer role can be configured with administrator permission and the permissions to edit and view applications.

You need to set permissions for the specified user in FlinkServer so that they can update, query, and delete data.

Prerequisites

The administrator has planned permissions based on business needs.

Procedure

Step 1 Log in to Manager.

Step 2 Choose **System** > **Permission** > **Role**.

Step 3 On the displayed page, click **Create Role** and specify **Role Name** and **Description**.

Step 4 Set **Configure Resource Permission**.

FlinkServer permissions are as follows:

- **FlinkServer Admin Privilege**: highest-level permission. Users with the permission can perform service operations on all FlinkServer applications.
- **FlinkServer Application**: Users can set **application view** and **applications management** permissions on applications.

Table 12-93 Setting a role

Scenario	Role Authorization
Setting the administrator operation permission	In **Configure Resource Permission**, choose *Name of the desired cluster* > **Flink** and select **FlinkServer Admin Privilege**.
Setting a specified permission on applications	1. In the **Configure Resource Permission** table, choose *Name of the desired cluster* > **Flink** > **FlinkServer Application**. 2. In the **Permission** column, select **application view** or **applications management**.

Step 5 Click **OK**. Return to role management page.

NOTE

After the FlinkServer is created, create a FlinkServer user and bind the user to the role and user group. For details, see .

----End

12.6.7.3 Accessing the Flink Web UI

Scenario

After Flink is installed in an MRS cluster, you can connect to clusters and data as well as manage stream tables and jobs using the Flink web UI.

This section describes how to access the Flink web UI in an MRS cluster.

NOTE

You are advised to use Google Chrome 50 or later to access the Flink web UI. The Internet Explorer may be incompatible with the Flink web UI.

Impact on the System

Site trust must be added to the browser when you access Manager and the Flink web UI for the first time. Otherwise, the Flink web UI cannot be accessed.

Procedure

Step 1 Log in to FusionInsight Manager as a user with **FlinkServer Admin Privilege**. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster** > **Services** > **Flink**.

Step 2 On the right of **Flink WebUI**, click the link to access the Flink web UI.

The Flink web UI provides the following functions:

- System management:
  - Cluster connection management allows you to create, view, edit, test, and delete a cluster connection.
  - Data connection management allows you to create, view, edit, test, and delete a data connection. Data connection types include HDFS, Kafka, and Redis.
  - Application management allows you to create, view, and delete an application.
- Stream table management allows you to create, view, edit, and delete a stream table.
- Job management allows you to create, view, start, develop, edit, stop, and delete a job.

----End

12.6.7.4 Creating an Application on the Flink Web UI

Scenario

Applications can be used to isolate different upper-layer services.

Creating an Application

Step 1 Access the Flink web UI as a user with **FlinkServer Admin Privilege**. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Application Management**.

Step 3 Click **Create Application**. On the displayed page, set parameters by referring to **Table 12-94** and click **OK**.

Table 12-94 Parameters for creating an application

Parameter	Description
Application	Name of the application to be created. The name can contain a maximum of 32 characters. Only letters, digits, and underscores (_) are allowed.
Description	Description of the application to be created. The value can contain a maximum of 85 characters.

After the application is created, you can switch to the application to be operated in the upper left corner of the Flink web UI and develop jobs.

----End

12.6.7.5 Creating a Cluster Connection on the Flink Web UI

Scenario

Different clusters can be accessed by configuring the cluster connection.

Creating a Cluster Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Cluster Connection Management**. The **Cluster Connection Management** page is displayed.

Step 3 Click **Create Cluster Connection**. On the displayed page, set parameters by referring to **Table 12-95** and click **OK**.

Table 12-95 Parameters for creating a cluster connection

Parameter	Description
Cluster Connection Name	Name of the cluster connection, which can contain a maximum of 100 characters. Only letters, digits, and underscores (_) are allowed.
Description	Description of the cluster connection name.
FusionInsight HD Version	Set a cluster version.
Secure Version	• If the secure version is used, select **Yes** for a security cluster. Enter the username and upload the user credential. • If not, select **No**.

Parameter	Description
Username	The user must have the minimum permissions for accessing services in the cluster. The name can contain a maximum of 100 characters. Only letters, digits, and underscores (_) are allowed. This parameter is available only when **Secure Version** is set to **Yes**.
Client Profile	Client profile of the cluster, in TAR format.
User Credential	User authentication credential in FusionInsight Manager in TAR format. This parameter is available only when **Secure Version** is set to **Yes**. Files can be uploaded only after the username is entered.

NOTE

To obtain the cluster client configuration files, perform the following steps:

1. Log in to FusionInsight Manager and choose **Cluster** > **Dashboard**.
2. Choose **More** > **Download Client** > **Configuration Files Only**, select a platform type, and click **OK**.

To obtain the user credential, perform the following steps:

1. Log in to FusionInsight Manager and click **System**.
2. In the **Operation** column of the user, choose **More** > **Download Authentication Credential**, select a cluster, and click **OK**.

----End

Editing a Cluster Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Cluster Connection Management**. The **Cluster Connection Management** page is displayed.

Step 3 In the **Operation** column of the item to be modified, click **Edit**. On the displayed page, modify the connection information by referring to **Table 12-95** and click **OK**.

----End

Testing a Cluster Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Cluster Connection Management**. The **Cluster Connection Management** page is displayed.

Step 3 In the **Operation** column of the item to be tested, click **Test**.

----End

Searching for a Cluster Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Cluster Connection Management**. The **Cluster Connection Management** page is displayed.

Step 3 In the upper right corner of the page, you can enter a search criterion to search for and view the cluster connection based on **Cluster Connection Name**.

----End

Deleting a Cluster Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Cluster Connection Management**. The **Cluster Connection Management** page is displayed.

Step 3 In the **Operation** column of the item to be deleted, click **Delete**, and click **OK** in the displayed page.

----End

12.6.7.6 Creating a Data Connection on the Flink Web UI

Scenario

Different data services can be accessed through data connections. Currently, FlinkServer supports HDFS, Kafka, and Redis data connections.

Creating a Data Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Data Connection Management**. The **Data Connection Management** page is displayed.

Step 3 Click **Create Data Connection**. On the displayed page, select a data connection type, enter information by referring to **Table 12-96**, and click **OK**.

Table 12-96 Parameters for creating a data connection

Parameter	Description	Example Value
Data Connection Type	Type of the data connection, which can be **HDFS**, **Kafka**, or **Redis**.	-
Data Connection Name	Name of the data connection, which can contain a maximum of 100 characters. Only letters, digits, and underscores (_) are allowed.	-

Parameter	Description	Example Value
Cluster Connection	Cluster connection name in configuration management. This parameter is mandatory for HDFS data connections and Redis data connections whose authentication type is **KERBEROS**.	-
Kafka broker	Connection information about Kafka broker instances. The format is *IP address*:*Port number*. Use commas (,) to separate multiple instances. This parameter is mandatory for Kafka data connections.	192.168.0.1:21005,192.168.0.2:21005
Redis Deployment Method	Redis deployment mode. Currently, only **Cluster** is supported. This parameter is mandatory for Redis data connections.	Cluster
Redis Server List	Connection information about Redis instances. The format is *IP address*:*Port number*. Use commas (,) to separate multiple instances. This parameter is mandatory for Redis data connections.	192.168.0.1:22400,192.168.0.2:22400
Authentication Mode	• **SIMPLE**: indicates that the connected service is in non-security mode and does not need to be authenticated. • **KERBEROS**: indicates that the connected service is in security mode and the Kerberos protocol for security authentication is used for authentication. This parameter is mandatory for Redis data connections.	-

----End

Editing a Data Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Data Connection Management**. The **Data Connection Management** page is displayed.

Step 3 In the **Operation** column of the item to be modified, click **Edit**. On the displayed page, modify the connection information by referring to **Table 12-96** and click **OK**.

----End

Testing a Data Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Data Connection Management**. The **Data Connection Management** page is displayed.

Step 3 In the **Operation** column of the item to be tested, click **Test**.

----End

Searching for a Data Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Data Connection Management**. The **Data Connection Management** page is displayed.

Step 3 In the upper right corner of the page, you can search for a data connection by name.

----End

Deleting a Data Connection

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Choose **System Management** > **Data Connection Management**. The **Data Connection Management** page is displayed.

Step 3 In the **Operation** column of the item to be deleted, click **Delete**, and click **OK** in the displayed page.

----End

12.6.7.7 Managing Tables on the Flink Web UI

Scenario

Data tables can be used to define basic attributes and parameters of source tables, dimension tables, and output tables.

Creating a Stream Table

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Table Management**. The table management page is displayed.

Step 3 Click **Create Stream Table**. On the stream table creation page, set parameters by referring to **Table 12-97** and click **OK**.

Table 12-97 Parameters for creating a stream table

Parameter	Description	Remarks
Stream/Table Name	Stream/Table name, which can contain 1 to 64 characters. Only letters, digits, and underscores (_) are allowed.	Example: **flink_sink**
Description	Stream/Table description information, which can contain 1 to 1024 characters.	-
Mapping Table Type	Flink SQL does not provide the data storage function. Table creation is actually the creation of mapping for external data tables or storage. The value can be **Kafka**, **HDFS**, or **Redis**.	-
Type	Includes the data source table **Source**, data result table **Sink**, and data dimension table **Table**. Tables included in different mapping table types are as follows: ● Kafka: **Source** and **Sink** ● HDFS: **Source** and **Sink** ● Redis: **Sink** and **Table**	-
Data Connection	Name of the data connection.	-
Topic	Kafka topic to be read. Multiple Kafka topics can be read. Use separators to separate topics. This parameter is available when **Mapping Table Type** is set to **Kafka**.	-
File Path	HDFS directory or a single file path to be transferred. This parameter is available when **Mapping Table Type** is set to **HDFS**.	Example: **/user/sqoop/** or **/user/sqoop/example.csv**
Code	Codes corresponding to different mapping table types are as follows: ● Kafka: **CSV** and **JSON** ● HDFS: **CSV** ● Redis: – If **Type** is set to **Sink**, the value can be **String**, **List**, **Set**, **Zset**, or **Hash**. – If **Type** is set to **Table**, the value can be **String** or **Zset**.	-

Parameter	Description	Remarks
Prefix	When **Mapping Table Type** is set to **Kafka**, **Type** is set to **Source**, and **Code** is set to **JSON**, this parameter indicates the hierarchical prefixes of multi-layer nested JSON, which are separated by commas (,).	For example, **data,info** indicates that the content under **data** and **info** in the nested JSON file is used as the data input in JSON format.
	If **Mapping Table Type** is set to **Redis**, prefixes will be automatically added to the key or you can manually enter prefixes.	For example, if the key value is **key1** and the prefix is **test**, the key written to Redis is **test:key1**.
Separator	Meanings of this parameter corresponding to different mapping table types are as follows: ● Kafka: This parameter is used to specify the separator between CSV fields. This parameter is available when **Code** is set to **CSV**. ● Redis: This parameter is used to specify the field separator.	Example: comma (**,**)
Row Separator	Line break in the file, including **\r**, **\n**, and **\r\n**. This parameter is available when **Mapping Table Type** is set to **HDFS**.	-
Column Separator	Field separator in the file. This parameter is available when **Mapping Table Type** is set to **HDFS**.	Example: comma (**,**)
Data Validity Period	Data validity period, which can be **Permanent**, **Effective Duration**, or **Deadline**. This parameter is available when **Mapping Table Type** is set to **Redis** and **Type** is set to **Sink**.	-
Stream Table Structure	Stream/Table structure, including **Name** and **Type**.	-
Proctime	System time, which is irrelevant to the data timestamp. That is, the time when the calculation is complete in Flink operators. This parameter is available when **Type** is set to **Source**.	-

Parameter	Description	Remarks
Event Time	Time when an event is generated, that is, the timestamp generated during data generation. This parameter is available when **Type** is set to **Source**.	-

----End

Editing a Stream Table

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Table Management**. The table management page is displayed.

Step 3 In the **Operation** column of the item to be modified, click **Edit**. On the displayed page, modify the stream table information by referring to **Table 12-97** and click **OK**.

----End

Searching for a stream table

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Table Management**. The table management page is displayed.

Step 3 In the upper right corner of the page, you can enter a keyword to search for stream table information.

----End

Deleting a Stream Table

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Table Management**. The table management page is displayed.

Step 3 In the **Operation** column of the item to be deleted, click **Delete**, and click **OK** in the displayed page.

----End

12.6.7.8 Managing Jobs on the Flink Web UI

Scenario

Define Flink jobs, including Flink SQL and Flink JAR jobs.

Creating a Stream Table

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 Click **Create Job**. On the displayed job creation page, set parameters by referring to **Table 12-98** and click **OK**. The job development page is displayed.

Table 12-98 Parameters for creating a job

Parameter	Description
Type	Job type, which can be **Flink SQL** or **Flink Jar**.
Name	Job name, which can contain a maximum of 64 characters. Only letters, digits, and underscores (_) are allowed.
Task Type	Type of the job data source, which can be a stream job or a batch job.
Description	Job description, which can contain a maximum of 100 characters.

Step 4 (Optional) If you need to develop a job immediately, configure the job on the job development page.

- Creating a Flink SQL job
  a. Develop the job on the job development page.
  b. Click **Check Semantic** to check the input content and click **Format SQL** to format SQL statements.
  c. After the job SQL statements are developed, set basic and customized parameters as required by referring to **Table 12-99** and click **Save**.

Table 12-99 Basic parameters

Parameter	Description
Parallelism	Number of concurrent jobs. The value must be a positive integer containing a maximum of 64 characters.
Maximum Operator Parallelism	Maximum parallelism of operators. The value must be a positive integer containing a maximum of 64 characters.
JobManager Memory (MB)	Memory of JobManager The minimum value is **512** and the value can contain a maximum of 64 characters.
Submit Queue	Queue to which a job is submitted. If this parameter is not set, the **default** queue is used. The queue name can contain a maximum of 30 characters. Only letters, digits, and underscores (_) are allowed.

Parameter	Description
taskManager	taskManager running parameters include: ■ **Slots**: If this parameter is left blank, the default value **1** is used. ■ **Memory (MB)**: The minimum value is **512**.
Enable CheckPoint	Whether to enable CheckPoint. After CheckPoint is enabled, you need to configure the following information: ■ **Time Interval (ms)**: This parameter is mandatory. ■ **Mode**: This parameter is mandatory. The options are **EXACTLY_ONCE** and **AT_LEAST_ONCE**. ■ **Minimum Interval (ms)**: The minimum value is **10**. ■ **Timeout Duration**: The minimum value is **10**. ■ **Maximum Parallelism**: The value must be a positive integer containing a maximum of 64 characters. ■ **Whether to clean up**: This parameter can be set to **Yes** or **No**. ■ **Whether to enable incremental checkpoints**: This parameter can be set to **Yes** or **No**.
Failure Recovery Policy	Failure recovery policy of a job. The options are as follows: ■ **fixed-delay**: You need to configure **Retry Times** and **Retry Interval (s)**. ■ **failure-rate**: You need to configure **Max Retry Times**, **Interval (min)**, and **Retry Interval (s)**. ■ **none**

d. Click **Submit** in the upper left corner to submit the job.

- Creating a Flink JAR job
  a. Click **Select** to upload a local JAR file and set parameters by referring to **Table 12-100** or add customized parameters.

Table 12-100 Parameter configuration

Parameter	Description
Local .jar File	Upload a local JAR file. The size of the file cannot exceed 10 MB.
Main Class	Main-Class type. ■ **Default**: By default, the class name is specified based on the **Mainfest** file in the JAR file. ■ **Specify**: Manually specify the class name.
Type	Class name. This parameter is available when **Main Class** is set to **Specify**.
Class Parameter	Class parameters of Main-Class (parameters are separated by spaces).
Parallelism	Number of concurrent jobs. The value must be a positive integer containing a maximum of 64 characters.
JobManager Memory (MB)	Memory of JobManager The minimum value is **512** and the value can contain a maximum of 64 characters.
Submit Queue	Queue to which a job is submitted. If this parameter is not set, the **default** queue is used. The queue name can contain a maximum of 30 characters. Only letters, digits, and underscores (_) are allowed.
taskManager	taskManager running parameters include: ■ **Slots**: If this parameter is left blank, the default value **1** is used. ■ **Memory (MB)**: The minimum value is **512**.

b. Click **Save** to save the configuration and click **Submit** to submit the job.

Step 5 Return to the job management page. You can view information about the created job, including job name, type, status, kind, and description.

----End

Starting a Job

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 In the **Operation** column of the job to be started, click **Start** to run the job. Jobs in the **Draft**, **Saved**, **Submission failed**, **Running succeeded**, **Running failed**, or **Stop** state can be started.

----End

Developing a Job

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 In the **Operation** column of the job to be developed, click **Develop** to go to the job development page. Develop a job by referring to **Step 4**. You can view created stream tables and fields in the list on the left.

----End

Editing the Job Name and Description

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 In the **Operation** column of the item to be modified, click **Edit**, modify **Description**, and click **OK** to save the modification.

----End

Viewing Job Details

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 In the **Operation** column of the item to be viewed, choose **More** > **Job Monitoring** to view the job running details.

NOTE

You can only view details about jobs in the **Running** state.

----End

Checkpoint Failure Recovery

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 In the Operation column of the item to be restored, click **More** > **Checkpoint Failure Recovery**. You can perform checkpoint failure recovery for jobs in the **Running failed**, **Running Succeeded**, or **Stop** state.

----End

Filtering/Searching for Jobs

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 In the upper right corner of the page, you can obtain job information by selecting the job name, or enter a keyword to search for a job.

----End

Stopping a Job

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 In the **Operation** column of the item to be stopped, click **Stop**. Jobs in the **Submitting**, **Submission succeeded**, or **Running** state can be stopped.

----End

Deleting a Job

Step 1 Access the Flink web UI. For details, see **Accessing the Flink Web UI**.

Step 2 Click **Job Management**. The job management page is displayed.

Step 3 In the **Operation** column of the item to be deleted, click **Delete**, and click **OK** in the displayed page. Jobs in the **Draft**, **Saved**, **Submission failed**, **Running succeeded**, **Running failed**, or **Stop** state can be deleted.

----End

12.6.8 Flink Log Overview

Log Description

Log path:

- Run logs of a Flink job: **${BIGDATA_DATA_HOME}/hadoop/data${i}/nm/containerlogs/application_${appid}/container_{$contid}**

  NOTE

  The logs of executing tasks are stored in the preceding path. After the execution is complete, the Yarn configuration determines whether these logs are gathered to the HDFS directory.

- FlinkResource run logs: **/var/log/Bigdata/flink/flinkResource**

Log archive rules:

1. FlinkResource run logs:
   - By default, service logs are backed up each time when the log size reaches 20 MB. A maximum of 20 logs can be reserved without being compressed.

NOTE

For versions earlier than MRS 3.x, The executor logs are backed up each time when the log size reaches 30 MB. A maximum of 20 logs can be reserved without being compressed.

- You can set the log size and number of compressed logs on the Manager page or modify the corresponding configuration items in **log4j-cli.properties**, **log4j.properties**, and **log4j-session.properties** in **/opt/client/Flink/flink/conf/** on the client. **/opt/client** is the client installation directory.

Table 12-101 FlinkResource log list

Type	Name	Description
FlinkResource run logs	checkService.log	Health check log
	kinit.log	Initialization log
	postinstall.log	Service installation log
	prestart.log	Prestart script log
	start.log	Startup log

Log Level

Table 12-102 describes the log levels supported by Flink. The priorities of log levels are ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the specified level are printed. The number of printed logs decreases as the specified log level increases.

Table 12-102 Log levels

Level	Description
ERROR	Error information about the current event processing
WARN	Exception information about the current event processing
INFO	Normal running status information about the system and events
DEBUG	System information and system debugging information

To modify log levels, perform the following steps:

Step 1 Go to the **All Configurations** page of Flink by referring to **Modifying Cluster Service Configuration Parameters**.

Step 2 On the menu bar on the left, select the log menu of the target role.

Step 3 Select a desired log level.

Step 4 Save the configuration. In the displayed dialog box, click **OK** to make the configurations take effect.

----End

NOTE

- After the configuration is complete, you do not need to restart the service. Download the client again for the configuration to take effect.
- You can also change the configuration items corresponding to the log level in **log4j-cli.properties**, **log4j.properties**, and **log4j-session.properties** in **/opt/client/Flink/flink/conf/** on the client. **/opt/client** is the client installation directory.
- When a job is submitted using a client, a log file is generated in the **log** folder on the client. The default umask value is **0022**. Therefore, the default log permission is **644**. To change the file permission, you need to change the umask value. For example, to change the umask value of user **omm**:
  - Add **umask 0026** to the end of the **/home/omm/.baskrc** file.
  - Run the **source /home/omm/.baskrc** command to make the file permission take effect.

Log Format

Table 12-103 Log formats

Type	Format	Example
Run log	<*yyyy-MM-dd HH:mm:ss,SSS*>|<*Log level*>|<*Name of the thread that generates the log*>|<*Message in the log*>|<*Location where the log event occurs*>	2019-06-27 21:30:31,778 | INFO | [flink-akka.actor.default-dispatcher-3] | TaskManager container_e10_1498290698388_0004_02_000007 has started. | org.apache.flink.yarn.YarnFlinkResourceManager (FlinkResourceManager.java:368)

12.6.9 Flink Performance Tuning

12.6.9.1 Optimization DataStream

12.6.9.1.1 Memory Configuration Optimization

Scenarios

The computing of Flink depends on memory. If the memory is insufficient, the performance of Flink will be greatly deteriorated. One solution is to monitor garbage collection (GC) to evaluate the memory usage. If the memory becomes the performance bottleneck, optimize the memory usage according to the actual situation.

If **Full GC** is frequently reported in the Container GC on the Yarn that monitors the node processes, the GC needs to be optimized.

NOTE

In the **env.java.opts** configuration item of the **conf/flink-conf.yaml** file on the client, add the **-Xloggc:<LOG_DIR>/gc.log -XX:+PrintGCDetails -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=20 -XX:GCLogFileSize=20M** parameter. The GC log is configured by default.

Procedure

- Optimize GC.

  Adjust the ratio of tenured generation memory to young generation memory. In the **conf/flink-conf.yaml** configuration file on the client, add the **-XX:NewRatio** parameter to the **env.java.opts** configuration item. For example, **-XX:NewRatio=2** indicates that ratio of tenured generation memory to young generation memory is 2:1, that is, the young generation memory occupies one third and tenured generation memory occupies two thirds.
- When developing Flink applications, optimize the partitioning or grouping operation of DataStream.
  - If partitioning causes data skew, partitions need to be optimized.
  - Do not perform concurrent operations, because some operations, WindowAll for example, to DataStream do not support parallelism.
  - Do not use set keyBy to string type.

12.6.9.1.2 Configuring DOP

Scenario

The degree of parallelism (DOP) indicates the number of tasks to be executed concurrently. It determines the number of data blocks after the operation. Configuring the DOP will optimize the number of tasks, data volume of each task, and the host processing capability.

Query the CPU and memory usage. If data and tasks are not evenly distributed among nodes, increase the DOP for even distribution.

Procedure

Configure the DOP at one of the following layers (the priorities of which are in the descending order) based on the actual memory, CPU, data, and application logic conditions:

- Operator

  Call the **setParallelism()** method to specify the DOP of an operator, data source, and sink. For example:

```
final StreamExecutionEnvironment env = StreamExecutionEnvironment.getExecutionEnvironment();

DataStream<String> text = [...]
DataStream<Tuple2<String, Integer>> wordCounts = text
    .flatMap(new LineSplitter())
    .keyBy(0)
    .timeWindow(Time.seconds(5))
```

```
    .sum(1).setParallelism(5);

wordCounts.print();

env.execute("Word Count Example");
```

- Execution environment

  Flink runs in the execution environment which defines a default DOP for operators, data source and data sink.

  Call the **setParallelism()** method to specify the default DOP of the execution environment. Example:

```
final StreamExecutionEnvironment env = StreamExecutionEnvironment.getExecutionEnvironment();
env.setParallelism(3);
DataStream<String> text = [...]
DataStream<Tuple2<String, Integer>> wordCounts = [...]
wordCounts.print();
env.execute("Word Count Example");
```

- Client

  Specify the DOP when submitting jobs to Flink on the client. If you use the CLI client, specify the DOP using the **-p** parameter. Example:

```
./bin/flink run -p 10 ../examples/*WordCount-java*.jar
```

- System

  On the Flink client, modify the **parallelism.default** parameter in the **flink-conf.yaml** file under the conf to specify the DOP for all execution environments.

12.6.9.1.3 Configuring Process Parameters

Scenario

In Flink on Yarn mode, there are JobManagers and TaskManagers. JobManagers and TaskManagers schedule and run tasks.

Therefore, configuring parameters of JobManagers and TaskManagers can optimize the execution performance of a Flink application. Perform the following steps to optimize the Flink cluster performance.

Procedure

Step 1 Configure JobManager memory.

JobManagers are responsible for task scheduling and message communications between TaskManagers and ResourceManagers. JobManager memory needs to be increased as the number of tasks and the DOP increases.

JobManager memory needs to be configured based on the number of tasks.

- When running the **yarn-session** command, add the **-jm MEM** parameter to configure the memory.
- When running the **yarn-cluster** command, add the **-yjm MEM** parameter to configure the memory.

Step 2 Configure the number of TaskManagers.

Each core of a TaskManager can run a task at the same time. Increasing the number of TaskManagers has the same effect as increasing the DOP. Therefore,

you can increase the number of TaskManagers to improve efficiency when there are sufficient resources.

Step 3 Configure the number of TaskManager slots.

Multiple cores of a TaskManager can process multiple tasks at the same time. This has the same effect as increasing the DOP. However, the balance between the number of cores and the memory must be maintained, because all cores of a TaskManager share the memory.

- When running the **yarn-session** command, add the **-s NUM** parameter to configure the number of slots.
- When running the **yarn-cluster** command, add the **-ys NUM** parameter to configure the number of slots.

Step 4 Configure TaskManager memory.

TaskManager memory is used for task execution and communication. A large-size task requires more resources. In this case, you can increase the memory.

- When running the **yarn-session** command, add the **-tm MEM** parameter to configure the memory.
- When running the **yarn-cluster** command, add the **-ytm MEM** parameter to configure the memory.

----End

12.6.9.1.4 Optimizing the Design of Partitioning Method

Scenarios

The divide of tasks can be optimized by optimizing the partitioning method. If data skew occurs in a certain task, the whole execution process is delayed. Therefore, when designing the partitioning method, ensure that partitions are evenly assigned.

Procedure

Partitioning methods are as follows:

- **Random partitioning**: randomly partitions data.
  ```
  dataStream.shuffle();
  ```
- **Rebalancing (round-robin partitioning)**: evenly partitions data based on round-robin. The partitioning method is useful to optimize data with data skew.
  ```
  dataStream.rebalance();
  ```
- **Rescaling**: assign data to downstream subsets in the form of round-robin. The partitioning method is useful if you want to deliver data from each parallel instance of a data source to subsets of some mappers without the using rebalance (), that is, the complete rebalance operation.
  ```
  dataStream.rescale();
  ```
- **Broadcast**: broadcast data to all partitions.
  ```
  dataStream.broadcast();
  ```

- **User-defined partitioning**: use a user-defined partitioner to select a target task for each element. The user-defined partitioning allows user to partition data based on a certain feature to achieve optimized task execution.

  The following is an example:

```
// fromElements builds simple Tuple2 stream
DataStream<Tuple2<String, Integer>> dataStream = env.fromElements(Tuple2.of("hello",1),
Tuple2.of("test",2), Tuple2.of("world",100));

// Defines the key value used for partitioning. Adding one to the value equals to the id.
Partitioner<Tuple2<String, Integer>> strPartitioner = new Partitioner<Tuple2<String, Integer>>() {
    @Override
    public int partition(Tuple2<String, Integer> key, int numPartitions) {
        return (key.f0.length() + key.f1) % numPartitions;
    }
};

// The Tuple2 data is used as the basis for partitioning.

dataStream.partitionCustom(strPartitioner, new KeySelector<Tuple2<String, Integer>, Tuple2<String,
Integer>>() {
    @Override
    public Tuple2<String, Integer> getKey(Tuple2<String, Integer> value) throws Exception {
        return value;
    }
}).print();
```

12.6.9.1.5 Configuring the Netty Network Communication

Scenarios

The communication of Flink is based on Netty network. The network performance determines the data switching speed and task execution efficiency. Therefore, the performance of Flink can be optimized by optimizing the Netty network.

Procedure

In the **conf/flink-conf.yaml** file on the client, change configurations as required. Exercise caution when changing default values, because default values are optimal.

- **taskmanager.network.netty.num-arenas**: Specifies the number of arenas of Netty. The default value is **taskmanager.numberOfTaskSlots**.
- **taskmanager.network.netty.server.numThreads** and **taskmanager.network.netty.client.numThreads**: specify the number of threads on the client and server. The default value is **taskmanager.numberOfTaskSlots**.
- **taskmanager.network.netty.client.connectTimeoutSec**: specifies the timeout interval for connection of TaskManager client. The default value is **120s**.
- **taskmanager.network.netty.sendReceiveBufferSize**: specifies the buffer size of the Netty network. The default value is the buffer size (cat /proc/sys/net/ipv4/tcp_[rw]mem) of the system and the value is usually 4 MB.
- **taskmanager.network.netty.transport**: specifies the transmission method of the Netty network. The default value is **nio**. The value can only be **nio** and **epoll**.

12.6.9.1.6 Experience Summary

Avoiding Data Skew

If data skew occurs (certain data volume is extremely large), the execution time of tasks is inconsistent even though no GC is performed.

- Redefine keys. Use keys of smaller granularity to optimize the task size.
- Modify the DOP.
- Call the rebalance operation to balance data partitions.

Setting Timeout Interval for the Buffer

- During the execution of tasks, data is exchanged through network. You can set the **setBufferTimeout** parameter to specify a buffer timeout interval for data exchanging among different servers.
- If **setBufferTimeout** is set to **-1**, the refreshing operation is performed when the buffer is full to maximize the throughput. If **setBufferTimeout** is set to **0**, the refreshing operation is performed each time data is received to minimize the delay. If **setBufferTimeout** is set to a value greater than **0**, the refreshing operation is performed after the buffer times out.

  The following is an example:

```
env.setBufferTimeout(timeoutMillis);

env.generateSequence(1,10).map(new MyMapper()).setBufferTimeout(timeoutMillis);
```

12.6.10 Common Flink Shell Commands

This section applies to MRS 3.x or later.

Before running the Flink shell commands, perform the following steps:

Step 1 Install the Flink client in a directory, for example, **/opt/client**.

Step 2 Run the following command to initialize environment variables:

source /opt/client/bigdata_env

Step 3 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled, skip this step.

kinit *Service user*

Step 4 Run the related commands according to **Table 12-104**.

Table 12-104 Flink Shell commands

Command	Description	Description
yarn-session.sh	**-at,--applicationType <arg>**: Defines the Yarn application type. **-D <property=value>**: Configures dynamic parameter. **-d,--detached**: Disables the interactive mode and starts a separate Flink Yarn session. **-h,--help**: Displays the help information about the Yarn session CLI. **-id,--applicationId <arg>**: Binds to a running Yarn session. **-j,--jar <arg>**: Sets the path of the user's JAR file. **-jm,--jobManagerMemory <arg>**: Sets the JobManager memory. **-m,--jobmanager <arg>**: Address of the JobManager (master) to which to connect. Use this parameter to connect to a specified JobManager. **-nl,--nodeLabel <arg>**: Specifies the nodeLabel of the Yarn application. **-nm,--name <arg>**: Customizes a name for the application on Yarn. **-q,--query**: Queries available Yarn resources. **-qu,--queue <arg>**: Specifies a Yarn queue. **-s,--slots <arg>**: Sets the number of slots for each TaskManager. **-t,--ship <arg>**: specifies the directory of the file to be sent. **-tm,--taskManagerMemory <arg>**: sets the TaskManager memory. **-yd,--yarndetached**: starts Yarn in the detached mode. **-z,--zookeeperNamespace <args>**: specifies the namespace of ZooKeeper. **-h**: Gets help information.	Start a resident Flink cluster to receive tasks from the Flink client.

Command	Description	Description
flink run	**-c,--class <classname>**: Specifies a class as the entry for running programs. **-C,--classpath <url>**: Specifies **classpath**. **-d,--detached**: Runs a job in the detached mode. **-files,--dependencyFiles <arg>**: File on which the Flink program depends. **-n,--allowNonRestoredState**: A state that cannot be restored can be skipped during restoration from a snapshot point in time. For example, if an operator in the program is deleted, you need to add this parameter when restoring the snapshot point. **-m,--jobmanager <host:port>**: Specifies the JobManager. **-p,--parallelism <parallelism>**: Specifies the job DOP, which will overwrite the DOP parameter in the configuration file. **-q,--sysoutLogging**: Disables the function of outputting Flink logs to the console. **-s,--fromSavepoint <savepointPath>**: Specifies a savepoint path for recovering jobs. **-z,--zookeeperNamespace <zookeeperNamespace>**: specifies the namespace of ZooKeeper. **-yat,--yarnapplicationType <arg>**: Defines the Yarn application type. **-yD <arg>**: Dynamic parameter configuration. **-yd,--yarndetached**: Starts Yarn in the detached mode. **-yh,--yarnhelp**: Obtains the Yarn help. **-yid,--yarnapplicationId <arg>**: Binds a job to a Yarn session. **-yj,--yarnjar <arg>**: Sets the path to Flink jar file. **-yjm,--yarnjobManagerMemory <arg>**: Sets the JobManager memory (MB). **-ynm,--yarnname <arg>**: Customizes a name for the application on Yarn. **-yq,--yarnquery**: Queries available Yarn resources (memory and CPUs).	Submit a Flink job. 1. The **-y*** parameter is used in the **yarn-cluster** mode. 2. If the parameter is not **-y***, you need to run the **yarn-session** command to start the Flink cluster before running this command to submit a task.

Command	Description	Description
	-yqu,--yarnqueue <arg>: Specifies a Yarn queue. **-ys,--yarnslots**: Sets the number of slots for each TaskManager. **-yt,--yarnship <arg>**: Specifies the path of the file to be sent. **-ytm,--yarntaskManagerMemory <arg>**: Sets the TaskManager memory (MB). **-yz,--yarnzookeeperNamespace <arg>**: Specifies the namespace of ZooKeeper. The value must be the same as the value of **yarn-session.sh -z**. **-h**: Gets help information.	
flink info	**-c,--class <classname>**: Specifies a class as the entry for running programs. **-p,--parallelism <parallelism>**: Specifies the DOP for running programs. **-h**: Gets help information.	Display the execution plan (JSON) of the running program.
flink list	**-a,--all**: displays all jobs. **-m,--jobmanager <host:port>**: specifies the JobManager. **-r,--running:** displays only jobs in the running state. **-s,--scheduled**: displays only jobs in the scheduled state. **-z,--zookeeperNamespace <zookeeperNamespace>**: specifies the namespace of ZooKeeper. **-yid,--yarnapplicationId <arg>**: binds a job to a Yarn session. **-h**: gets help information.	Query running programs in the cluster.

Command	Description	Description
flink stop	**-d,--drain**: sends MAX_WATERMARK before the savepoint is triggered and the job is stopped. **-p,--savepointPath <savepointPath>**: path for storing savepoints. The default value is **state.savepoints.dir**. **-m,--jobmanager <host:port>**: specifies the JobManager. **-z,--zookeeperNamespace <zookeeperNamespace>**: specifies the namespace of ZooKeeper. **-yid,--yarnapplicationId <arg>**: binds a job to a Yarn session. **-h**: gets help information.	Forcibly stop a running job (only streaming jobs are supported. **StoppableFunction** needs to be implemented on the source side in service code).
flink cancel	**-m,--jobmanager <host:port>**: specifies the JobManager. **-s,--withSavepoint <targetDirectory>**: triggers a savepoint when a job is canceled. The default directory is **state.savepoints.dir**. **-z,--zookeeperNamespace <zookeeperNamespace>**: specifies the namespace of ZooKeeper. **-yid,--yarnapplicationId <arg>**: binds a job to a Yarn session. **-h**: gets help information.	Cancel a running job.
flink savepoint	**-d,--dispose <arg>**: specifies a directory for storing the savepoint. **-m,--jobmanager <host:port>**: specifies the JobManager. **-z,--zookeeperNamespace <zookeeperNamespace>**: specifies the namespace of ZooKeeper. **-yid,--yarnapplicationId <arg>**: binds a job to a Yarn session. **-h**: gets help information.	Trigger a savepoint.

Command	Description	Description
source *Client installation directory*/**bigdata_env**	None	Import client environment variables. Restriction: If the user uses a custom script (for example, **A.sh**) and runs this command in the script, variables cannot be imported to the **A.sh** script. If variables need to be imported to the custom script **A.sh**, the user needs to use the secondary calling method. For example, first call the **B.sh** script in the **A.sh** script, and then run this command in the **B.sh** script. Parameters can be imported to the **A.sh** script but cannot be imported to the **B.sh** script.
start-scala-shell.sh	local | remote <host> <port> | yarn: running mode	Start the scala shell.
sh generate_keystore.sh	-	Run the **generate_keystore.sh** script to generate security cookie, **flink.keystore**, and **flink.truststore**. You need to enter a user-defined password that does not contain number signs (#).

----End

12.6.11 Reference

12.6.11.1 Example of Issuing a Certificate

Generate the **generate_keystore.sh** script based on the sample code and save the script to the **bin** directory on the Flink client.

```
#!/bin/bash

KEYTOOL=${JAVA_HOME}/bin/keytool
KEYSTOREPATH="$FLINK_HOME/conf/"
CA_ALIAS="ca"
CA_KEYSTORE_NAME="ca.keystore"
CA_DNAME="CN=Flink_CA"
CA_KEYALG="RSA"
CLIENT_CONF_YAML="$FLINK_HOME/conf/flink-conf.yaml"
KEYTABPRINCEPAL=""

        exit 1
    fi

    return 0;
}

#the start main
main "$@"

exit 0
```

NOTE

Run the **sh generate_keystore.sh** *<password>* command. *<password>* is user-defined.

- If *<password>* contains the special character **$**, use the following method to avoid the password being escaped: **sh generate_keystore.sh 'Bigdata_2013'**.
- The password cannot contain **#**.
- Before using the **generate_keystore.sh** script, run the **source bigdata_env** command in the client directory.
- When the **generate_keystore.sh** script is used, the absolute paths of **security.ssl.keystore** and **security.ssl.truststore** are automatically filled in **flink-conf.yaml**. Therefore, you need to manually change the paths to relative paths as required. Example:
  - Change **/opt/client/Flink/flink/conf//flink.keystore** to **security.ssl.keystore: ssl/flink.keystore**.
  - Change **/opt/client/Flink/flink/conf//flink.truststore** to **security.ssl.truststore: ssl/flink.truststore**.
  - Create the **ssl** folder in any directory on the Flink client. For example, create the **ssl** folder in the **/opt/client/Flink/flink/conf/** directory and save the **flink.keystore** and **flink.truststore** files to the **ssl** folder.
  - When running the **yarn-session** or **flink run -m yarn-cluster** command, run the **yarn-session -t ssl -d** or **flink run -m yarn-cluster -yt ssl -d WordCount.jar** command in the same directory as the **ssl** folder.

12.7 Using Flume

12.7.1 Using Flume from Scratch

Scenario

You can use Flume to import collected log information to Kafka.

Prerequisites

- A streaming cluster with Kerberos authentication enabled has been created.
- The Flume client has been installed in a directory, for example, **/opt/Flumeclient**, on the node where logs are generated. For details about how to install the Flume client, see "Using Flume" > "Installing the Flume Client" in *MapReduce Service Component Operation Guide*. The client directory in the following operations is only an example. Change it to the actual installation directory.
- The streaming cluster can properly communicate with the node where logs are generated.

Using the Flume Client (Versions Earlier Than MRS 3.x)

NOTE

You do not need to perform **Step 2** to **Step 6** for a normal cluster.

Step 1 Install the client.

Step 2 Copy the configuration file of the authentication server from the Master1 node to the *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf** directory on the node where the Flume client resides.

The full file path is **${BIGDATA_HOME}/MRS_Current/1_X_KerberosClient/etc/kdc.conf**.

In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 3 Check the service IP address of any node where the Flume role is deployed.

Log in to the cluster details page, choose *Name of the desired cluster* > **Components** > **Flume** > **Instances**, and check the service IP address of any node where the Flume role is deployed.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 4 Copy the user authentication file from this node to the *Flume client installation directory*/**fusioninsight-flume-Flume component version number/conf** directory on the Flume client node.

The full file path is **${BIGDATA_HOME}/MRS_XXX/install/FusionInsight-Flume-Flume component version number/flume/conf/flume.keytab**.

In the preceding paths, **XXX** indicates the product version number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 5 Copy the **jaas.conf** file from this node to the **conf** directory on the Flume client node.

The full file path is **${BIGDATA_HOME}/MRS_Current/1_X_Flume/etc/jaas.conf**.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 6 Log in to the Flume client node and go to the client installation directory. Run the following command to modify the file:

vi conf/jaas.conf

Change the full path of the user authentication file defined by **keyTab** to the **Flume client installation directory/fusioninsight-flume-*Flume component version number*/conf** saved in **Step 4**, and save the modification and exit.

Step 7 Run the following command to modify the **flume-env.sh** configuration file of the Flume client:

vi *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf/flume-env.sh**

Add the following information after **-XX:+UseCMSCompactAtFullCollection**:

```
-Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-1.9.0/conf/kdc.conf -
Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-1.9.0/conf/jaas.conf -
Dzookeeper.request.timeout=120000
```

For example, **"-XX:+UseCMSCompactAtFullCollection -Djava.security.krb5.conf=*Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/kdc.conf -Djava.security.auth.login.config=***Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/jaas.conf -Dzookeeper.request.timeout=120000"**

Change *Flume client installation directory* to the actual installation directory. Then save and exit.

Step 8 Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following command to restart the Flume client:

cd /opt/FlumeClient/fusioninsight-flume-*Flume component version number***/bin**

./flume-manage.sh restart

Step 9 Run the following command to modify the **properties.properties** configuration file of the Flume client:

vi *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf/properties.properties**

Add the following information to the file:

```
################################################################################
################
client.sources = static_log_source
client.channels = static_log_channel
client.sinks = kafka_sink
################################################################################
################
#LOG_TO_HDFS_ONLINE_1

client.sources.static_log_source.type = spooldir
client.sources.static_log_source.spoolDir = PATH
client.sources.static_log_source.fileSuffix = .COMPLETED
client.sources.static_log_source.ignorePattern = ^$
client.sources.static_log_source.trackerDir = PATH
client.sources.static_log_source.maxBlobLength = 16384
client.sources.static_log_source.batchSize = 51200
client.sources.static_log_source.inputCharset = UTF-8
client.sources.static_log_source.deserializer = LINE
client.sources.static_log_source.selector.type = replicating
client.sources.static_log_source.fileHeaderKey = file
client.sources.static_log_source.fileHeader = false
client.sources.static_log_source.basenameHeader = true
client.sources.static_log_source.basenameHeaderKey = basename
client.sources.static_log_source.deletePolicy = never

client.channels.static_log_channel.type = file
client.channels.static_log_channel.dataDirs = PATH
client.channels.static_log_channel.checkpointDir = PATH
client.channels.static_log_channel.maxFileSize = 2146435071
client.channels.static_log_channel.capacity = 1000000
client.channels.static_log_channel.transactionCapacity = 612000
client.channels.static_log_channel.minimumRequiredSpace = 524288000

client.sinks.kafka_sink.type = org.apache.flume.sink.kafka.KafkaSink
client.sinks.kafka_sink.kafka.topic = flume_test
client.sinks.kafka_sink.kafka.bootstrap.servers = XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka port number
```

```
client.sinks.kafka_sink.flumeBatchSize = 1000
client.sinks.kafka_sink.kafka.producer.type = sync
client.sinks.kafka_sink.kafka.security.protocol  = SASL_PLAINTEXT
client.sinks.kafka_sink.kafka.kerberos.domain.name = hadoop.XXX.com
client.sinks.kafka_sink.requiredAcks = 0

client.sources.static_log_source.channels = static_log_channel
client.sinks.kafka_sink.channel = static_log_channel
```

Modify the following parameters as required. Then save and exit the file.

- spoolDir
- trackerDir
- dataDirs
- checkpointDir
- topic

  If the topic does not exist in Kafka, the topic is automatically created by default.
- kafka.bootstrap.servers

  By default, the port for a security cluster is port 21007 and that for a normal cluster is port 9092.
- kafka.security.protocol

  Set this parameter to **SASL_PLAINTEXT** for a security cluster and **PLAINTEXT** for a normal cluster.
- **kafka.kerberos.domain.name**

  You do not need to set this parameter for a normal cluster. For a security cluster, the value of this parameter is the value of **kerberos.domain.name** in the Kafka cluster.

  You can check **${BIGDATA_HOME}/MRS_Current/1_X_Broker/etc/server.properties** on the node where the broker instance resides.

  In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 10 The Flume client automatically loads the information in the **properties.properties** file.

After new log files are generated in the directory specified by **spoolDir**, the logs will be sent to Kafka producers and can be consumed by Kafka consumers.

----End

Using the Flume Client (MRS 3.x or Later)

NOTE

You do not need to perform **Step 2** to **Step 6** for a normal cluster.

Step 1 Install the client.

Step 2 Copy the configuration file of the authentication server from the Master1 node to the *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf** directory on the node where the Flume client resides.

The full file path is **${BIGDATA_HOME}/FusionInsight_Current/1_X_KerberosClient/etc/kdc.conf**. In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 3 Check the service IP address of any node where the Flume role is deployed.

Log in to FusionInsight Manager. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster > Services > Flume > Instance**. Check the service IP address of any node where the Flume role is deployed.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 4 Copy the user authentication file from this node to the *Flume client installation directory*/**fusioninsight-flume-Flume component version number/conf** directory on the Flume client node.

The full file path is **${BIGDATA_HOME}/FusionInsight_Porter_XXX/install/FusionInsight-Flume-Flume component version number/flume/conf/flume.keytab**.

In the preceding paths, **XXX** indicates the product version number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 5 Copy the **jaas.conf** file from this node to the **conf** directory on the Flume client node.

The full file path is **${BIGDATA_HOME}/FusionInsight_Current/1_X_Flume/etc/jaas.conf**.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 6 Log in to the Flume client node and go to the client installation directory. Run the following command to modify the file:

vi conf/jaas.conf

Change the full path of the user authentication file defined by **keyTab** to the **Flume client installation directory/fusioninsight-flume-*Flume component version number*/conf** saved in **Step 4**, and save the modification and exit.

Step 7 Run the following command to modify the **flume-env.sh** configuration file of the Flume client:

vi *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf/flume-env.sh**

Add the following information after **-XX:+UseCMSCompactAtFullCollection**:

```
-Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-1.9.0/conf/kdc.conf -Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-1.9.0/conf/jaas.conf -Dzookeeper.request.timeout=120000
```

For example, **"-XX:+UseCMSCompactAtFullCollection -Djava.security.krb5.conf=*Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/kdc.conf -Djava.security.auth.login.config=***Flume client installation directory***/fusioninsight-flume-***Flume component version number***/conf/jaas.conf -Dzookeeper.request.timeout=120000"**

Change *Flume client installation directory* to the actual installation directory. Then save and exit.

Step 8 Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following command to restart the Flume client:

cd /opt/FlumeClient/fusioninsight-flume-*Flume component version number***/bin**

./flume-manage.sh restart

Step 9 Run the following command to modify the **properties.properties** configuration file of the Flume client:

vi *Flume client installation directory*/**fusioninsight-flume-***Flume component version number*/**conf/properties.properties**

Add the following information to the file:

```
################################################################################################
client.sources = static_log_source
client.channels = static_log_channel
client.sinks = kafka_sink
################################################################################################
#LOG_TO_HDFS_ONLINE_1

client.sources.static_log_source.type = spooldir
client.sources.static_log_source.spoolDir = PATH
client.sources.static_log_source.fileSuffix = .COMPLETED
client.sources.static_log_source.ignorePattern = ^$
client.sources.static_log_source.trackerDir = PATH
client.sources.static_log_source.maxBlobLength = 16384
client.sources.static_log_source.batchSize = 51200
client.sources.static_log_source.inputCharset = UTF-8
client.sources.static_log_source.deserializer = LINE
client.sources.static_log_source.selector.type = replicating
client.sources.static_log_source.fileHeaderKey = file
client.sources.static_log_source.fileHeader = false
client.sources.static_log_source.basenameHeader = true
client.sources.static_log_source.basenameHeaderKey = basename
client.sources.static_log_source.deletePolicy = never

client.channels.static_log_channel.type = file
client.channels.static_log_channel.dataDirs = PATH
client.channels.static_log_channel.checkpointDir = PATH
client.channels.static_log_channel.maxFileSize = 2146435071
client.channels.static_log_channel.capacity = 1000000
client.channels.static_log_channel.transactionCapacity = 612000
client.channels.static_log_channel.minimumRequiredSpace = 524288000

client.sinks.kafka_sink.type = org.apache.flume.sink.kafka.KafkaSink
client.sinks.kafka_sink.kafka.topic = flume_test
client.sinks.kafka_sink.kafka.bootstrap.servers = XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka port number,XXX.XXX.XXX.XXX:Kafka port number
client.sinks.kafka_sink.flumeBatchSize = 1000
client.sinks.kafka_sink.kafka.producer.type = sync
client.sinks.kafka_sink.kafka.security.protocol  = SASL_PLAINTEXT
client.sinks.kafka_sink.kafka.kerberos.domain.name = hadoop.XXX.com
```

```
client.sinks.kafka_sink.requiredAcks = 0

client.sources.static_log_source.channels = static_log_channel
client.sinks.kafka_sink.channel = static_log_channel
```

Modify the following parameters as required. Then save and exit the file.

- spoolDir
- trackerDir
- dataDirs
- checkpointDir
- topic

  If the topic does not exist in Kafka, the topic is automatically created by default.
- kafka.bootstrap.servers

  By default, the port for a security cluster is port 21007 and that for a normal cluster is port 9092.
- kafka.security.protocol

  Set this parameter to **SASL_PLAINTEXT** for a security cluster and **PLAINTEXT** for a normal cluster.
- **kafka.kerberos.domain.name**

  You do not need to set this parameter for a normal cluster. For a security cluster, the value of this parameter is the value of **kerberos.domain.name** in the Kafka cluster.

  For details, check **${BIGDATA_HOME}/FusionInsight_Current/1_X_Broker/etc/server.properties** on the node where the broker instance resides.

  In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

Step 10 The Flume client automatically loads the information in the **properties.properties** file.

After new log files are generated in the directory specified by **spoolDir**, the logs will be sent to Kafka producers and can be consumed by Kafka consumers.

----End

12.7.2 Overview

Flume is a distributed, reliable, and highly available system for aggregating massive logs, which can efficiently collect, aggregate, and move massive log data from different data sources and store the data in a centralized data storage system. Various data senders can be customized in the system to collect data. Additionally, Flume provides simple data processes capabilities and writes data to data receivers (which is customizable).

Flume consists of the client and server, both of which are FlumeAgents. The server corresponds to the FlumeServer instance and is directly deployed in a cluster. The client can be deployed inside or outside the cluster. he client-side and service-side FlumeAgents work independently and provide the same functions.

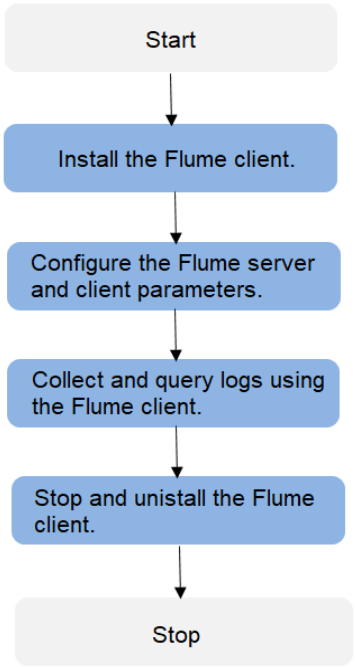
The client-side FlumeAgent needs to be independently installed. Data can be directly imported to components such as HDFS and Kafka. Additionally, the client-side and service-side FlumeAgents can also work together to provide services.

Process

The process for collecting logs using Flume is as follows:

1. Installing the flume client
2. Configuring the Flume server and client parameters
3. Collecting and querying logs using the Flume client
4. Stopping and uninstalling the Flume client

Figure 12-15 Log collection process



Flume Client

A Flume client consists of the source, channel, and sink. The source sends the data to the channel, and then the sink transmits the data from the channel to the external device. **Table 12-105** describes Flume modules.

Table 12-105 Module description

Name	Description
Source	A source receives or generates data and sends the data to one or multiple channels. The source can work in either data-driven or polling mode. Typical sources include: ● Sources that are integrated with the system and receives data, such as Syslog and Netcat ● Sources that automatically generate event data, such as Exec and SEQ ● IPC sources that are used for communication between agents, such as Avro A Source must associate with at least one channel.
Channel	A channel is used to buffer data between a source and a sink. After the sink transmits the data to the next channel or the destination, the cache is deleted automatically. The persistency of the channels varies with the channel types: ● Memory channel: non-persistency ● File channel: persistency implemented based on write-ahead logging (WAL) ● JDBC channel: persistency implemented based on the embedded database Channels support the transaction feature to ensure simple sequential operations. A channel can work with sources and sinks of any quantity.
Sink	Sink is responsible for sending data to the next hop or final destination and removing the data from the channel after successfully sending the data. Typical sinks include: ● Sinks that send storage data to the final destination, such as HDFS and Kafka ● Sinks that are consumed automatically, such as Null Sink ● IPC sinks that are used for communication between agents, such as Avro A sink must associate with at least one channel.

A Flume client can have multiple sources, channels, and sinks. A source can send data to multiple channels, and then multiple sinks send the data out of the client.

Multiple Flume clients can be cascaded. That is, a sink can send data to the source of another client.

Supplementary Information

1. Flume provides the following reliability measures:
   - The transaction mechanism is implemented between sources and channels, and between channels and sinks.
   - The sink processor supports the failover and load balancing (load_balance) mechanisms.

     The following is an example of the load balancing (load_balance) configuration:

     ```
     server.sinkgroups=g1
     server.sinkgroups.g1.sinks=k1 k2
     server.sinkgroups.g1.processor.type=load_balance
     server.sinkgroups.g1.processor.backoff=true
     server.sinkgroups.g1.processor.selector=random
     ```
2. The following are precautions for the aggregation and cascading of multiple Flume clients:
   - Avro or Thrift protocol can be used for cascading.
   - When the aggregation end contains multiple nodes, evenly distribute the clients to these nodes. Do not connect all the clients to a single node.
3. The Flume client can contain multiple independent data flows. That is, multiple sources, channels, and sinks can be configured in the **properties.properties** configuration file. These components can be linked to form multiple flows.

   For example, to configure two data flows in a configuration, run the following commands:

   ```
   server.sources = source1 source2
   server.sinks = sink1 sink2
   server.channels = channel1 channel2

   #dataflow1
   server.sources.source1.channels = channel1
   server.sinks.sink1.channel = channel1

   #dataflow2
   server.sources.source2.channels = channel2
   server.sinks.sink2.channel = channel2
   ```

12.7.3 Installing the Flume Client

12.7.3.1 Installing the Flume Client on Clusters of Versions Earlier Than MRS 3.x

Scenario

To use Flume to collect logs, you must install the Flume client on a log host. You can create an ECS and install the Flume client on it.

This section applies to versions earlier than MRS 3.x.

Prerequisites

- A streaming cluster with the Flume component has been created.
- The log host is in the same VPC and subnet with the MRS cluster.

- You have obtained the username and password for logging in to the log host.

Procedure

Step 1 Create an ECS that meets the requirements.

Step 2 Go to the cluster details page and choose **Components**.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 3 Click **Download Client**.

1. In **Client Type**, select **All client files**.
2. In **Download to**, select **Remote host**.
3. Set **Host IP Address** to the IP address of the ECS, **Host Port** to **22**, and **Save Path** to **/tmp**.
   - If the default port **22** for logging in to an ECS through SSH has been changed, set **Host Port** to a new port.
   - The value of **Save Path** contains a maximum of 256 characters.
4. Set **Login User** to **root**.

   If another user is used, ensure that the user has permissions to read, write, and execute the save path.
5. Select **Password** or **SSH Private Key** for **Login Mode**.
   - **Password**: Enter the password of user **root** set during cluster creation.
   - **SSH Private Key**: Select and upload the key file used for creating the cluster.
6. Click **OK** to generate a client file.

   If the following information is displayed, the client package is saved.

   ```
   Client files downloaded to the remote host successfully.
   ```

   If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to **Step 3** to download the client again.

   ```
   Failed to connect to the server. Please check the network connection or parameter settings.
   ```

Step 4 Choose **Flume** > **Instance**. Query the **Business IP Address** of any Flume instance and any two MonitorServer instances.

Step 5 Log in to the ECS using VNC. See section "Login Using VNC" in the *Elastic Cloud Service User Guide* (**Instances** > **Logging In to a Linux ECS** > **Login Using VNC**.

All images support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation. You are advised to change the password upon the first login.

Step 6 On the ECS, switch to user **root** and copy the installation package to the **/opt** directory.

sudo su - root

cp /tmp/MRS_Flume_Client.tar /opt

Step 7 Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

tar -xvf MRS_Flume_Client.tar

Step 8 Run the following command to verify the configuration package of the client:

sha256sum -c MRS_Flume_ClientConfig.tar.sha256

If the following information is displayed, the file package is successfully verified:

```
MRS_Flume_ClientConfig.tar: OK
```

Step 9 Run the following command to decompress **MRS_Flume_ClientConfig.tar**:

tar -xvf MRS_Flume_ClientConfig.tar

Step 10 Run the following command to install the client running environment to a new directory, for example, **/opt/Flumeenv**. A directory is automatically generated during the client installation.

sh /opt/MRS_Flume_ClientConfig/install.sh /opt/Flumeenv

If the following information is displayed, the client running environment is successfully installed:

```
Components client installation is complete.
```

Step 11 Run the following command to configure environment variables:

source /opt/Flumeenv/bigdata_env

Step 12 Run the following commands to decompress the Flume client package:

cd /opt/MRS_Flume_ClientConfig/Flume

tar -xvf FusionInsight-Flume-1.6.0.tar.gz

Step 13 Run the following command to check whether the password of the current user has expired:

chage -l root

If the value of **Password expires** is earlier than the current time, the password has expired. Run the **chage -M -1 root** command to validate the password.

Step 14 Run the following command to install the Flume client to a new directory, for example, **/opt/FlumeClient**. A directory is automatically generated during the client installation.

sh /opt/MRS_Flume_ClientConfig/Flume/install.sh -d /opt/FlumeClient -f *service IP address of the MonitorServer instance* **-c** *path of the Flume configuration file* **-l /var/log/ -e** *service IP address of Flume* **-n** *name of the Flume client*

The parameters are described as follows:

- **-d**: indicates the installation path of the Flume client.

- (Optional) **-f**: indicates the service IP addresses of the two MonitorServer instances, separated by a comma (,). If the IP addresses are not configured, the Flume client will not send alarm information to MonitorServer, and the client information will not be displayed on MRS Manager.
- (Optional) **-c**: indicates the **properties.properties** configuration file that the Flume client loads after installation. If this parameter is not specified, the **fusioninsight-flume-1.6.0/conf/properties.properties** file in the client installation directory is used by default. The configuration file of the client is empty. You can modify the configuration file as required and the Flume client will load it automatically.
- (Optional) **-l**: indicates the log directory. The default value is **/var/log/Bigdata**.
- (Optional) **-e**: indicates the service IP address of the Flume instance. It is used to receive the monitoring indicators reported by the client.
- (Optional) **-n**: indicates the name of the Flume client.
- IBM JDK does not support **-Xloggc**. You must change **-Xloggc** to **-Xverbosegclog** in **flume/conf/flume-env.sh**. For 32-bit JDK, the value of **-Xmx** must not exceed 3.25 GB.
- In **flume/conf/flume-env.sh**, the default value of **-Xmx** is 4 GB. If the client memory is too small, you can change it to 512 MB or even 1 GB.

For example, run **sh install.sh -d /opt/FlumeClient**.

If the following information is displayed, the client is successfully installed:

```
install flume client successfully.
```

----End

12.7.3.2 Installing the Flume Client on Clusters of MRS 3.*x* or a Later Version

Scenario

To use Flume to collect logs, you must install the Flume client on a log host. You can create an ECS and install the Flume client on it.

This section applies to MRS 3.*x* and later versions.

Prerequisites

- A cluster with the Flume component has been created.
- The log host is in the same VPC and subnet with the MRS cluster.
- You have obtained the username and password for logging in to the log host.
- The installation directory is automatically created if it does not exist. If it exists, the directory must be left blank. The directory path cannot contain any space.

Procedure

Step 1 Obtain the software package.

Log in to the FusionInsight Manager. Choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the Flume service page that is displayed, choose **More** >

Download Client in the upper right corner and set **Select Client Type** to **Complete Client** to download the Flume service client file.

The file name of the client is **FusionInsight_Cluster**_<*Cluster ID*>**_Flume_Client.tar**. This section takes the client file **FusionInsight_Cluster_1_Flume_Client.tar** as an example.

Step 2 Upload the software package.

Upload the software package to a directory, for example, **/opt/client** on the node where the Flume service client will be installed as user **user**.

NOTE

user is the user who installs and runs the Flume client.

Step 3 Decompress the software package.

Log in to the node where the Flume service client is to be installed as user **user**. Go to the directory where the installation package is installed, for example, **/opt/client**, and run the following command to decompress the installation package to the current directory:

cd /opt/client

tar -xvf FusionInsight_Cluster_1_Flume_Client.tar

Step 4 Verify the software package.

Run the **sha256sum -c** command to verify the decompressed file. If **OK** is returned, the verification is successful. Example:

sha256sum -c FusionInsight_Cluster_1_Flume_ClientConfig.tar.sha256

```
FusionInsight_Cluster_1_Flume_ClientConfig.tar: OK
```

Step 5 Decompress the package.

tar -xvf FusionInsight_Cluster_1_Flume_ClientConfig.tar

Step 6 Run the following command in the Flume client installation directory to install the client to a specified directory (for example, **opt/FlumeClient**): After the client is installed successfully, the installation is complete.

cd /opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/Flume/FlumeClient

./install.sh -d */opt/FlumeClient* **-f** *MonitorServerService IP address or host name of the role* **-c** *User service configuration filePath for storing properties.properties* **-s** *CPU threshold* **-l /var/log/Bigdata -e** *FlumeServer service IP address or host name* **-n** *Flume*

NOTE

- **-d**: Flume client installation path
- (Optional) **-f**: IP addresses or host names of two MonitorServer roles. The IP addresses or host names are separated by commas (,). If this parameter is not configured, the Flume client does not send alarm information to MonitorServer and information about the client cannot be viewed on the FusionInsight Manager GUI.
- (Optional) **-c**: Service configuration file, which needs to be generated by the user based on the service. For details about how to generate the file on the configuration tool page of the Flume server, see **Flume Service Configuration Guide**. Upload the file to any directory on the node where the client is to be installed. If this parameter is not specified during the installation, you can upload the generated service configuration file **properties.properties** to the **/opt/FlumeClient/fusioninsight-flume-1.9.0/conf** directory after the installation.
- (Optional) **-s**: cgroup threshold. The value is an integer ranging from 1 to 100 x *N*. *N* indicates the number of CPU cores. The default threshold is **-1**, indicating that the processes added to the cgroup are not restricted by the CPU usage.
- (Optional) **-l**: Log path. The default value is **/var/log/Bigdata**. The user **user** must have the write permission on the directory. When the client is installed for the first time, a subdirectory named **flume-client** is generated. After the installation, subdirectories named **flume-client-***n* will be generated in sequence. The letter *n* indicates a sequence number, which starts from 1 in ascending order. In the **/conf/** directory of the Flume client installation directory, modify the **ENV_VARS** file and search for the **FLUME_LOG_DIR** attribute to view the client log path.
- (Optional) **-e**: Service IP address or host name of FlumeServer, which is used to receive statistics for the monitoring indicator reported by the client.
- (Optional) **-n**: Name of the Flume client. You can choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Flume Management** on FusionInsight Manager to view the client name on the corresponding node.
- If the following error message is displayed, run the **export JAVA_HOME=*JDK path*** command.
  JAVA_HOME is null in current user,please install the JDK and set the JAVA_HOME
- IBM JDK does not support **-Xloggc**. You must change **-Xloggc** to **-Xverbosegclog** in **flume/conf/flume-env.sh**. For 32-bit JDK, the value of **-Xmx** must not exceed 3.25 GB.
- When installing a cross-platform client in a cluster, go to the **/opt/client/FusionInsight_Cluster_1_Flume_ClientConfig/Flume/FusionInsight-Flume-1.9.0.tar.gz** directory to install the Flume client.

----End

12.7.4 Viewing Flume Client Logs

Scenario

You can view logs to locate faults.

Prerequisites

The Flume client has been installed.

Procedure

Step 1 Go to the Flume client log directory (**/var/log/Bigdata** by default).

Step 2 Run the following command to view the log file:

ls -lR flume-client-*

A log file is shown as follows:

```
flume-client-1/flume:
total 7672
-rw-------. 1 root root       0 Sep  8 19:43 Flume-audit.log
-rw-------. 1 root root 1562037 Sep 11 06:05 FlumeClient.2017-09-11_04-05-09.[1].log.zip
-rw-------. 1 root root 6127274 Sep 11 14:47 FlumeClient.log
-rw-------. 1 root root    2935 Sep  8 22:20 flume-root-20170908202009-pid72456-gc.log.0.current
-rw-------. 1 root root    2935 Sep  8 22:27 flume-root-20170908202634-pid78789-gc.log.0.current
-rw-------. 1 root root    4382 Sep  8 22:47 flume-root-20170908203137-pid84925-gc.log.0.current
-rw-------. 1 root root    4390 Sep  8 23:46 flume-root-20170908204918-pid103920-gc.log.0.current
-rw-------. 1 root root    3196 Sep  9 10:12 flume-root-20170908215351-pid44372-gc.log.0.current

-rw-------. 1 root root   92896 Sep 11 13:24 flume-root-20170909111126-pid120689-gc.log.0.current
-rw-------. 1 root root    5588 Sep 11 14:46 flume-root-20170911132445-pid42259-gc.log.0.current
-rw-------. 1 root root    2576 Sep 11 13:24 prestartDetail.log
-rw-------. 1 root root    3303 Sep 11 13:24 startDetail.log
-rw-------. 1 root root    1253 Sep 11 13:24 stopDetail.log

flume-client-1/monitor:
total 8
-rw-------. 1 root root  141 Sep  8 19:43 flumeMonitorChecker.log
-rw-------. 1 root root 2946 Sep 11 13:24 flumeMonitor.log
```

In the log file, **FlumeClient.log** is the run log of the Flume client.

----End

12.7.5 Stopping or Uninstalling the Flume Client

Scenario

You can stop and start the Flume client or uninstall the Flume client when the Flume data ingestion channel is not required.

Procedure

- Stop the Flume client of the Flume role.

  Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following command to stop the Flume client:

  cd /opt/FlumeClient/fusioninsight-flume-*Flume component version number***/bin**

  ./flume-manage.sh stop

  If the following information is displayed after the command execution, the Flume client is successfully stopped.

  ```
  Stop Flume PID=120689 successful..
  ```

  NOTE

  The Flume client will be automatically restarted after being stopped. If you do not need automatic restart, run the following command:

  ./flume-manage.sh stop force

  If you want to restart the Flume client, run the following command:

  ./flume-manage.sh start force

- Uninstall the Flume client of the Flume role.

  Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following command to uninstall the Flume client:

  cd /opt/FlumeClient/fusioninsight-flume-*Flume component version number***/inst**

  ./uninstall.sh

12.7.6 Using the Encryption Tool of the Flume Client

Scenario

You can use the encryption tool provided by the Flume client to encrypt some parameter values in the configuration file.

Prerequisites

The Flume client has been installed.

Procedure

Step 1 Log in to the Flume client node and go to the client installation directory, for example, **/opt/FlumeClient**.

Step 2 Run the following command to switch the directory:

cd fusioninsight-flume-*Flume component version number***/bin**

Step 3 Run the following command to encrypt information:

./genPwFile.sh

Input the information that you want to encrypt twice.

Step 4 Run the following command to query the encrypted information:

cat password.property

NOTE

If the encryption parameter is used for the Flume server, you need to perform encryption on the corresponding Flume server node. You need to run the encryption script as user **omm** for encryption.

- For versions earlier than MRS 3.x, the encryption path is **/opt/Bigdata/MRS_XXX/install/FusionInsight-Flume-*Flume component version number*/flume/bin/genPwFile.sh**.
- For MRS 3.*x* or later, the encryption path is **/opt/Bigdata/FusionInsight_Porter_XXX/install/FusionInsight-Flume-*Flume component version number*/flume/bin/genPwFile.sh**. *XXX* indicates the product version number.

----End

12.7.7 Flume Service Configuration Guide

This section applies to MRS 3.*x* and later versions.

This configuration guide describes how to configure common Flume services. For non-common Source, Channel, and Sink configuration, see the user manual

provided by the Flume community. You can obtain the user manual at **http://flume.apache.org/releases/1.9.0.html**.

NOTE

- Parameters in bold in the following tables are mandatory.
- The value of **BatchSize** of the Sink must be less than that of **transactionCapacity** of the Channel.
- Only some parameters of Source, Channel, and Sink are displayed on the Flume configuration tool page. For details, see the following configurations.
- The Customer Source, Customer Channel, and Customer Sink displayed on the Flume configuration tool page need to be configured based on self-developed code. The following common configurations are not displayed.

Common Source Configurations

- **Avro Source**

  An Avro source listens to the Avro port, receives data from the external Avro client, and places data into configured channels. Common configurations are as follows:

  Table 12-106 Common configurations of an Avro source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured.
type	avro	Specifies the type of the avro source, which must be **avro**.
bind	-	Specifies the listening host name/IP address.
port	-	Specifies the bound listening port. Ensure that this port is not occupied.
threads	-	Specifies the maximum number of source threads.
compression-type	none	Specifies the message compression format, which can be set to **none** or **deflate**. **none** indicates that data is not compressed, while **deflate** indicates that data is compressed.

Parameter	Default Value	Description
compression-level	6	Specifies the data compression level, which ranges from **1** to **9**. The larger the value is, the higher the compression rate is.
ssl	false	Specifies whether to use SSL encryption. If this parameter is set to **true**, the values of **keystore** and **keystore-password** must be specified.
truststore-type	JKS	Specifies the Java trust store type, which can be set to **JKS** or **PKCS12**. **NOTE** Different passwords are used to protect the key store and private key of **JKS**, while the same password is used to protect the key store and private key of **PKCS12**.
truststore	-	Specifies the Java trust store file.
truststore-password	-	Specifies the Java trust store password.
keystore-type	JKS	Specifies the keystore type set after SSL is enabled, which can be set to **JKS** or **PKCS12**. **NOTE** Different passwords are used to protect the key store and private key of **JKS**, while the same password is used to protect the key store and private key of **PKCS12**.
keystore	-	Specifies the keystore file path set after SSL is enabled. This parameter is mandatory if SSL is enabled.

Parameter	Default Value	Description
keystore-password	-	Specifies the keystore password set after SSL is enabled. This parameter is mandatory if SSL is enabled.
trust-all-certs	false	Specifies whether to disable the check for the SSL server certificate. If this parameter is set to **true**, the SSL server certificate of the remote source is not checked. You are not advised to perform this operation during the production.
exclude-protocols	SSLv3	Specifies the excluded protocols. The entered protocols must be separated by spaces. The default value is **SSLv3**.
ipFilter	false	Specifies whether to enable the IP address filtering.
ipFilter.rules	-	Specifies the rules of *N* network **ipFilters**. Host names or IP addresses must be separated by commas (,). If this parameter is set to **true**, there are two configuration rules: allow and forbidden. The configuration format is as follows: ipFilterRules=allow:ip:127.*, allow:name:localhost, deny:ip:*

- **SpoolDir Source**

  SpoolDir Source monitors and transmits new files that have been added to directories in real-time mode. Common configurations are as follows:

Table 12-107 Common configurations of a Spooling Directory source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured.
type	spooldir	Specifies the type of the spooling source, which must be set to **spooldir**.
spoolDir	-	Specifies the monitoring directory of the Spooldir source. A Flume running user must have the read, write, and execution permissions on the directory.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the source is restarted. Unit: second
fileSuffix	.COMPLETED	Specifies the suffix added after file transmission is complete.
deletePolicy	never	Specifies the source file deletion policy after file transmission is complete. The value can be either **never** or **immediate**. **never** indicates that the source file is not deleted after file transmission is complete, while **immediate** indicates that the source file is immediately deleted after file transmission is complete.
ignorePattern	^$	Specifies the regular expression of a file to be ignored. The default value is ^$, indicating that spaces are ignored.
includePattern	^.*$	Specifies the regular expression that contains a file. This parameter can be used together with **ignorePattern**. If a file meets both **ignorePattern** and **includePattern**, the file is ignored. In addition, when a file starts with a period (.), the file will not be filtered.
trackerDir	.flumespool	Specifies the metadata storage path during data transmission.
batchSize	1000	Specifies the number of events written to the channel in batches.
decodeErrorPolicy	FAIL	Specifies the code error policy. **NOTE** If a code error occurs in the file, set **decodeErrorPolicy** to **REPLACE** or **IGNORE**. Flume will skip the code error and continue to collect subsequent logs.

Parameter	Default Value	Description
deserializer	LINE	Specifies the file parser. The value can be either **LINE** or **BufferedLine**. • When the value is set to **LINE**, characters read from the file are transcoded one by one. • When the value is set to **BufferedLine**, one line or multiple lines of characters read from the file are transcoded in batches, which delivers better performance.
deserializer.maxLineLength	2048	Specifies the maximum length for resolution by line.
deserializer.maxBatchLine	1	Specifies the maximum number of lines for resolution by line. If multiple lines are set, **maxLineLength** must be set to a corresponding multiplier. **NOTE** When configuring the Interceptor, take the multi-line combination into consideration to avoid data loss. If the Interceptor cannot process combined lines, set this parameter to **1**.
selector.type	replicating	Specifies the selector type. The value can be either **replicating** or **multiplexing**. **replicating** indicates that data is replicated and then transferred to each channel so that each channel receives the same data, while **multiplexing** indicates that a channel is selected based on the value of the header in the event and each channel has different data.
interceptors	-	Specifies the interceptor. Multiple interceptors are separated by spaces.
inputCharset	UTF-8	Specifies the encoding format of a read file. The encoding format must be the same as that of the data source file that has been read. Otherwise, an error may occur during character parsing.
fileHeader	false	Specifies whether to add the file name (including the file path) to the event header.

Parameter	Default Value	Description
fileHeaderKey	-	Specifies that the data storage structure in header is set in the <key,value> mode. Parameters **fileHeaderKey** and **fileHeader** must be used together. Following is an example if **fileHeader** is set to true: Define **fileHeaderKey** as **file**. When the **/root/a.txt** file is read, **fileHeaderKey** exists in the header in the **file=/root/a.txt** format.
basenameHeader	false	Specifies whether to add the file name (excluding the file path) to the event header.
basenameHeaderKey	-	Specifies that the data storage structure in header is set in the <key,value> mode. Parameters **basenameHeaderKey** and **basenameHeader** must be used together. Following is an example if **basenameHeader** is set to **true**: Define **basenameHeaderKey** as **file**. When the **a.txt** file is read, **fileHeaderKey** exists in the header in the **file=a.txt** format.
pollDelay	500	Specifies the delay for polling new files in the monitoring directory. Unit: milliseconds
recursiveDirectorySearch	false	Specifies whether to monitor new files in the subdirectory of the configured directory.
consumeOrder	oldest	Specifies the consumption order of files in a directory. If this parameter is set to **oldest** or **youngest**, the sequence of files to be read is determined by the last modification time of files in the monitored directory. If there are a large number of files in the directory, it takes a long time to search for **oldest** or **youngest** files. If this parameter is set to **random**, an earlier created file may not be read for a long time. If this parameter is set to **oldest** or **youngest**, it takes a long time to find the latest and the earliest file. The options are as follows: **random**, **youngest**, and **oldest**.

Parameter	Default Value	Description
maxBackoff	4000	Specifies the maximum time to wait between consecutive attempts to write to a channel if the channel is full. If the time exceeds the threshold, an exception is thrown. The corresponding source starts to write at a smaller time value. Each time the source attempts, the digital exponent increases until the current specified value is reached. If data cannot be written, the data write fails. Unit: second
emptyFileEvent	true	Specifies whether to collect empty file information and send it to the sink end. The default value is **true**, indicating that empty file information is sent to the sink end. This parameter is valid only for HDFS Sink. Taking HDFS Sink as an example, if this parameter is set to **true** and an empty file exists in the **spoolDir** directory, an empty file with the same name will be created in the **hdfs.path** directory of HDFS.

NOTE

SpoolDir Source ignores the last line feed character of each event when data is reading by row. Therefore, Flume does not calculate the data volume counters used by the last line feed character.

- **Kafka Source**

  A Kafka source consumes data from Kafka topics. Multiple sources can consume data of the same topic, and the sources consume different partitions of the topic. Common configurations are as follows:

  Table 12-108 Common configurations of a Kafka source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured.
type	org.apache.flume.source.kafka.KafkaSource	Specifies the type of the Kafka source, which must be set to **org.apache.flume.source.kafka.KafkaSource**.

Parameter	Default Value	Description
kafka.bootstrap.servers	-	Specifies the bootstrap address port list of Kafka. If Kafka has been installed in the cluster and the configuration has been synchronized to the server, you do not need to set this parameter on the server. The default value is the list of all brokers in the Kafka cluster. This parameter must be configured on the client. Use commas (,) to separate multiple values of *IP address:Port number*. The rules for matching ports and security protocols must be as follows: port 21007 matches the security mode (SASL_PLAINTEXT), and port 9092 matches the common mode (PLAINTEXT).
kafka.topics	-	Specifies the list of subscribed Kafka topics, which are separated by commas (,).
kafka.topics.regex	-	Specifies the subscribed topics that comply with regular expressions. **kafka.topics.regex** has a higher priority than **kafka.topics** and will overwrite **kafka.topics**.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the source is restarted. Unit: second
nodatatime	0 (Disabled)	Specifies the alarm threshold. An alarm is triggered when the duration that Kafka does not release data to subscribers exceeds the threshold. Unit: second This parameter can be configured in the **properties.properties** file.
batchSize	1000	Specifies the number of events written to the channel in batches.
batchDurationMillis	1000	Specifies the maximum duration of topic data consumption at a time, expressed in milliseconds.
keepTopicInHeader	false	Specifies whether to save topics in the event header. If the parameter value is **true**, topics configured in Kafka Sink become invalid.

Parameter	Default Value	Description
setTopicHeader	true	If this parameter is set to **true**, the topic name defined in **topicHeader** is stored in the header.
topicHeader	topic	When **setTopicHeader** is set to **true**, this parameter specifies the name of the topic received by the storage device. If the property is used with that of Kafka Sink **topicHeader**, be careful not to send messages to the same topic cyclically.
useFlumeEventFormat	false	By default, an event is transferred from a Kafka topic to the body of the event in the form of bytes. If this parameter is set to **true**, the Avro binary format of Flume is used to read events. When used together with the **parseAsFlumeEvent** parameter with the same name in KafkaSink or KakfaChannel, any set **header** generated from the data source is retained.
keepPartitionInHeader	false	Specifies whether to save partition IDs in the event header. If the parameter value is **true**, Kafka Sink writes data to the corresponding partition.
kafka.consumer.group.id	flume	Specifies the Kafka consumer group ID. Sources or proxies having the same ID are in the same consumer group.
kafka.security.protocol	SASL_PLAINTEXT	Specifies the Kafka security protocol. The parameter value must be set to PLAINTEXT in a common cluster. The rules for matching ports and security protocols must be as follows: port 21007 matches the security mode (SASL_PLAINTEXT), and port 9092 matches the common mode (PLAINTEXT).

Parameter	Default Value	Description
Other Kafka Consumer Properties	-	Specifies other Kafka configurations. This parameter can be set to any consumption configuration supported by Kafka, and the **.kafka** prefix must be added to the configuration.

- **Taildir Source**

  A Taildir source monitors file changes in a directory and automatically reads the file content. In addition, it can transmit data in real time. Common configurations are as follows:

  Table 12-109 Common configurations of a Taildir source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured.
type	TAILDIR	Specifies the type of the taildir source, which must be set to TAILDIR.
filegroups	-	Specifies the group name of a collection file directory. Group names are separated by spaces.
filegroups.<filegroupName>.parentDir	-	Specifies the parent directory. The value must be an absolute path.
filegroups.<filegroupName>.filePattern	-	Specifies the relative file path of the file group's parent directory. Directories can be included and regular expressions are supported. It must be used together with **parentDir**.
positionFile	-	Specifies the metadata storage path during data transmission.
headers.<filegroupName>.<headerKey>	-	Specifies the key-value of an event when data of a group is being collected.
byteOffsetHeader	false	Specifies whether each event header contains the event location information in the source file. If the parameter value is true, the location information is saved in the byteoffset variable.

Parameter	Default Value	Description
maxBatchCount	Long.MAX_VALUE	Specifies the maximum number of batches that can be consecutively read from a file. If the monitored directory reads multiple files consecutively and one of the files is written at a rapid rate, other files may fail to be processed. This is because the file that is written at a high speed will be in an infinite read loop. In this case, set this parameter to a smaller value.
skipToEnd	false	Specifies whether Flume can locate the latest location of a file and read the latest data after restart. If the parameter value is true, Flume locates and reads the latest file data after restart.
idleTimeout	120000	Specifies the idle duration during file reading, expressed in milliseconds. If file content is not changed in the preset time duration, close the file. If data is written to this file after the file is closed, open the file and read data.
writePosInterval	3000	Specifies the interval for writing metadata to a file, expressed in milliseconds.
batchSize	1000	Specifies the number of events written to the channel in batches.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the source is restarted. Unit: second
fileHeader	false	Specifies whether to add the file name (including the file path) to the event header.
fileHeaderKey	file	Specifies that the data storage structure in header is set in the <key,value> mode. Parameters **fileHeaderKey** and **fileHeader** must be used together. Following is an example if **fileHeader** is set to true: Define **fileHeaderKey** as **file**. When the **/root/a.txt** file is read, **fileHeaderKey** exists in the header in the **file=/root/a.txt** format.

- **Http Source**

  An HTTP source receives data from an external HTTP client and sends the data to the configured channels. Common configurations are as follows:

  Table 12-110 Common configurations of an HTTP source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured.
type	http	Specifies the type of the http source, which must be set to http.
bind	-	Specifies the listening host name/IP address.
port	-	Specifies the bound listening port. Ensure that this port is not occupied.
handler	org.apache.flume.source.http.JSONHandler	Specifies the message parsing method of an HTTP request. Two formats are supported: JSON (org.apache.flume.source.http.JSONHandler) and BLOB (org.apache.flume.sink.solr.morphline.BlobHandler).
handler.*	-	Specifies handler parameters.
exclude-protocols	SSLv3	Specifies the excluded protocols. The entered protocols must be separated by spaces. The default value is **SSLv3**.
include-cipher-suites	-	Specifies the included protocols. The entered protocols must be separated by spaces. If this parameter is left empty, all protocols are supported by default.
enableSSL	false	Specifies whether SSL is enabled in HTTP. If this parameter is set to **true**, the values of **keystore** and **keystore-password** must be specified.
keystore-type	JKS	Specifies the keystore type, which can be **JKS** or **PKCS12**.

Parameter	Default Value	Description
keystore	-	Specifies the keystore path set after SSL is enabled in HTTP.
keystorePassword	-	Specifies the keystore password set after SSL is enabled in HTTP.

- **Thrift Source**

  Thrift Source monitors the thrift port, receives data from the external Thrift clients, and puts the data into the configured channel. Common configurations are as follows:

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured.
type	thrift	Specifies the type of the thrift source, which must be set to **thrift**.
bind	-	Specifies the listening host name/IP address.
port	-	Specifies the bound listening port. Ensure that this port is not occupied.
threads	-	Specifies the maximum number of worker threads that can be run.
kerberos	false	Specifies whether Kerberos authentication is enabled.
agent-keytab	-	Specifies the address of the keytab file used by the server. The machine-machine account must be used. You are advised to use **flume/conf/flume_server.keytab** in the Flume service installation directory.
agent-principal	-	Specifies the principal of the security user used by the server. The principal must be a machine-machine account. You are advised to use the default user of Flume: flume_server/hadoop.*<system domain name>*@*<system domain name>* **NOTE** **flume_server/hadoop.**<*system domain name*> is the username. All letters in the system domain name contained in the username are lowercase letters. For example, **Local Domain** is set to **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**, and the username is **flume_server/hadoop.9427068f-6efa-4833-b43e-60cb641e5b6c.com**.

Parameter	Default Value	Description
compression-type	none	Specifies the message compression format, which can be set to **none** or **deflate**. **none** indicates that data is not compressed, while **deflate** indicates that data is compressed.
ssl	false	Specifies whether to use SSL encryption. If this parameter is set to **true**, the values of **keystore** and **keystore-password** must be specified.
keystore-type	JKS	Specifies the keystore type set after SSL is enabled.
keystore	-	Specifies the keystore file path set after SSL is enabled. This parameter is mandatory if SSL is enabled.
keystore-password	-	Specifies the keystore password set after SSL is enabled. This parameter is mandatory if SSL is enabled.

Common Channel Configurations

- **Memory Channel**

  A memory channel uses memory as the cache. Events are stored in memory queues. Common configurations are as follows:

  Table 12-111 Common configurations of a memory channel

Parameter	Default Value	Description
type	-	Specifies the type of the memory channel, which must be set to **memory**.
capacity	10000	Specifies the maximum number of events cached in a channel.

Parameter	Default Value	Description
transactionCapacity	1000	Specifies the maximum number of events accessed each time. **NOTE** • The parameter value must be greater than the batchSize of the source and sink. • The value of **transactionCapacity** must be less than or equal to that of **capacity**.
channelfullcount	10	Specifies the channel full count. When the count reaches the threshold, an alarm is reported.
keep-alive	3	Specifies the waiting time of the Put and Take threads when the transaction or channel cache is full. Unit: second
byteCapacity	80% of the maximum JVM memory	Specifies the total bytes of all event bodies in a channel. The default value is the 80% of the maximum JVM memory (indicated by **-Xmx**). Unit: bytes
byteCapacityBufferPercentage	20	Specifies the percentage of bytes in a channel (%).

- **File Channel**

  A file channel uses local disks as the cache. Events are stored in the folder specified by **dataDirs**. Common configurations are as follows:

  Table 12-112 Common configurations of a file channel

Parameter	Default Value	Description
type	-	Specifies the type of the file channel, which must be set to **file**.

Parameter	Default Value	Description
checkpointDir	${BIGDATA_DATA_HOME}/hadoop/data1~N/flume/checkpoint **NOTE** This path is changed with the custom data path.	Specifies the checkpoint storage directory.
dataDirs	${BIGDATA_DATA_HOME}/hadoop/data1~N/flume/data **NOTE** This path is changed with the custom data path.	Specifies the data cache directory. Multiple directories can be configured to improve performance. The directories are separated by commas (,).
maxFileSize	2146435071	Specifies the maximum size of a single cache file, expressed in bytes.
minimumRequiredSpace	524288000	Specifies the minimum idle space in the cache, expressed in bytes.
capacity	1000000	Specifies the maximum number of events cached in a channel.
transactionCapacity	10000	Specifies the maximum number of events accessed each time. **NOTE** • The parameter value must be greater than the batchSize of the source and sink. • The value of **transactionCapacity** must be less than or equal to that of **capacity**.
channelfullcount	10	Specifies the channel full count. When the count reaches the threshold, an alarm is reported.

Parameter	Default Value	Description
useDualCheckpoints	false	Specifies the backup checkpoint. If this parameter is set to **true**, the **backupCheckpointDir** parameter value must be set.
backupCheckpointDir	-	Specifies the path of the backup checkpoint.
checkpointInterval	30000	Specifies the check interval, expressed in seconds.
keep-alive	3	Specifies the waiting time of the Put and Take threads when the transaction or channel cache is full. Unit: second
use-log-replay-v1	false	Specifies whether to enable the old reply logic.
use-fast-replay	false	Specifies whether to enable the queue reply.
checkpointOnClose	true	Specifies that whether a checkpoint is created when a channel is disabled.

- **Memory File Channel**

  A memory file channel uses both memory and local disks as its cache and supports message persistence. It provides similar performance as a memory channel and better performance than a file channel. This channel is currently experimental and not recommended for use in production. The following table describes common configuration items: Common configurations are as follows:

  Table 12-113 Common configurations of a memory file channel

Parameter	Default Value	Description
type	org.apache.flume.channel.MemoryFileChannel	Specifies the type of the memory file channel, which must be set to **org.apache.flume.channel.MemoryFileChannel**.

Parameter	Default Value	Description
capacity	50000	Specifies the maximum number of events cached in a channel.
transactionCapacity	5000	Specifies the maximum number of events processed by a transaction. **NOTE** • The parameter value must be greater than the batchSize of the source and sink. • The value of **transactionCapacity** must be less than or equal to that of **capacity**.
subqueueByteCapacity	20971520	Specifies the maximum size of events that can be stored in a subqueue, expressed in bytes. A memory file channel uses both queues and subqueues to cache data. Events are stored in a subqueue, and subqueues are stored in a queue. **subqueueCapacity** and **subqueueInterval** determine the size of events that can be stored in a subqueue. **subqueueCapacity** specifies the capacity of a subqueue, and **subqueueInterval** specifies the duration that a subqueue can store events. Events in a subqueue are sent to the destination only after the subqueue reaches the upper limit of **subqueueCapacity** or **subqueueInterval**. **NOTE** The value of **subqueueByteCapacity** must be greater than the number of events specified by **batchSize**.
subqueueInterval	2000	Specifies the maximum duration that a subqueue can store events, expressed in milliseconds.
keep-alive	3	Specifies the waiting time of the Put and Take threads when the transaction or channel cache is full. Unit: second
dataDir	-	Specifies the cache directory for local files.
byteCapacity	80% of the maximum JVM memory	Specifies the channel cache capacity. Unit: bytes

Parameter	Default Value	Description
compression-type	None	Specifies the message compression format, which can be set to **none** or **deflate**. **none** indicates that data is not compressed, while **deflate** indicates that data is compressed.
channelfullcount	10	Specifies the channel full count. When the count reaches the threshold, an alarm is reported.

The following is a configuration example of a memory file channel:

```
server.channels.c1.type = org.apache.flume.channel.MemoryFileChannel
server.channels.c1.dataDir = /opt/flume/mfdata
server.channels.c1.subqueueByteCapacity = 20971520
server.channels.c1.subqueueInterval=2000
server.channels.c1.capacity = 500000
server.channels.c1.transactionCapacity = 40000
```

- **Kafka Channel**

  A Kafka channel uses a Kafka cluster as the cache. Kafka provides high availability and multiple copies to prevent data from being immediately consumed by sinks when Flume or Kafka Broker crashes.

  Table 12-114 Common configurations of a Kafka channel

Parameter	Default Value	Description
type	-	Specifies the type of the Kafka channel, which must be set to **org.apache.flume.channel.kafka.KafkaChannel**.

Parameter	Default Value	Description
kafka.bootstrap.servers	-	Specifies the bootstrap address port list of Kafka. If Kafka has been installed in the cluster and the configuration has been synchronized to the server, you do not need to set this parameter on the server. The default value is the list of all brokers in the Kafka cluster. This parameter must be configured on the client. Use commas (,) to separate multiple values of *IP address:Port number*. The rules for matching ports and security protocols must be as follows: port 21007 matches the security mode (SASL_PLAINTEXT), and port 9092 matches the common mode (PLAINTEXT).
kafka.topic	flume-channel	Specifies the Kafka topic used by the channel to cache data.
kafka.consumer.group.id	flume	Specifies the data group ID obtained from Kafka. This parameter cannot be left blank.
parseAsFlumeEvent	true	Specifies whether data is parsed into Flume events.
migrateZookeeperOffsets	true	Specifies whether to search for offsets in ZooKeeper and submit them to Kafka when there is no offset in Kafka.

Parameter	Default Value	Description
kafka.consumer.auto.offset.reset	latest	Specifies where to consume if there is no offset record, which can be set to **earliest**, **latest**, or **none**. **earliest** indicates that the offset is reset to the initial point, **latest** indicates that the offset is set to the latest position, and **none** indicates that an exception is thrown if there is no offset.
kafka.producer.security.protocol	SASL_PLAINTEXT	Specifies the Kafka producer security protocol. The rules for matching ports and security protocols must be as follows: port 21007 matches the security mode (SASL_PLAINTEXT), and port 9092 matches the common mode (PLAINTEXT). **NOTE** If the parameter is not displayed, click **+** in the lower left corner of the dialog box to display all parameters.
kafka.consumer.security.protocol	SASL_PLAINTEXT	Specifies the Kafka consumer security protocol. The rules for matching ports and security protocols must be as follows: port 21007 matches the security mode (SASL_PLAINTEXT), and port 9092 matches the common mode (PLAINTEXT).
pollTimeout	500	Specifies the maximum timeout interval for the consumer to invoke the poll function. Unit: milliseconds

Parameter	Default Value	Description
ignoreLongMessage	false	Specifies whether to discard oversized messages.
messageMaxLength	1000012	Specifies the maximum length of a message written by Flume to Kafka.

Common Sink Configurations

- **HDFS Sink**

  An HDFS sink writes data into HDFS. Common configurations are as follows:

  Table 12-115 Common configurations of an HDFS sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink.
type	hdfs	Specifies the type of the hdfs sink, which must be set to **hdfs**.
hdfs.path	-	Specifies the data storage path in HDFS. The value must start with **hdfs://hacluster/**.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the sink is restarted. Unit: second
hdfs.inUseSuffix	.tmp	Specifies the suffix of the HDFS file to which data is being written.
hdfs.rollInterval	30	Specifies the interval for file rolling, expressed in seconds.
hdfs.rollSize	1024	Specifies the size for file rolling, expressed in bytes.
hdfs.rollCount	10	Specifies the number of events for file rolling. **NOTE** Parameters **rollInterval**, **rollSize**, and **rollCount** can be configured at the same time. The parameter meeting the requirements takes precedence for compression.

Parameter	Default Value	Description
hdfs.idleTimeout	0	Specifies the timeout interval for closing idle files automatically, expressed in seconds.
hdfs.batchSize	1000	Specifies the number of events written into HDFS in batches.
hdfs.kerberosPrincipal	-	Specifies the Kerberos principal of HDFS authentication. This parameter is mandatory in a secure mode, but not required in a common mode.
hdfs.kerberosKeytab	-	Specifies the Kerberos keytab of HDFS authentication. This parameter is not required in a common mode, but in a secure mode, the Flume running user must have the permission to access **keyTab** path in the **jaas.cof** file.
hdfs.fileCloseByEndEvent	true	Specifies whether to close the HDFS file when the last event of the source file is received.
hdfs.batchCallTimeout	-	Specifies the timeout control duration when events are written into HDFS in batches. Unit: milliseconds If this parameter is not specified, the timeout duration is controlled when each event is written into HDFS. When the value of **hdfs.batchSize** is greater than 0, configure this parameter to improve the performance of writing data into HDFS. **NOTE** The value of **hdfs.batchCallTimeout** depends on **hdfs.batchSize**. A greater **hdfs.batchSize** requires a larger **hdfs.batchCallTimeout**. If the value of **hdfs.batchCallTimeout** is too small, writing events to HDFS may fail.
serializer.appendNewline	true	Specifies whether to add a line feed character (**\n**) after an event is written to HDFS. If a line feed character is added, the data volume counters used by the line feed character will not be calculated by HDFS sinks.

Parameter	Default Value	Description
hdfs.filePrefix	over_%{basename}	Specifies the file name prefix after data is written to HDFS.
hdfs.fileSuffix	-	Specifies the file name suffix after data is written to HDFS.
hdfs.inUsePrefix	-	Specifies the prefix of the HDFS file to which data is being written.
hdfs.fileType	DataStream	Specifies the HDFS file format, which can be set to **SequenceFile**, **DataStream**, or **CompressedStream**. **NOTE** If the parameter is set to **SequenceFile** or **DataStream**, output files are not compressed, and the **codeC** parameter cannot be configured. However, if the parameter is set to **CompressedStream**, the output files are compressed, and the **codeC** parameter must be configured together.
hdfs.codeC	-	Specifies the file compression format, which can be set to **gzip**, **bzip2**, **lzo**, **lzop**, or **snappy**.
hdfs.maxOpenFiles	5000	Specifies the maximum number of HDFS files that can be opened. If the number of opened files reaches this value, the earliest opened files are closed.
hdfs.writeFormat	Writable	Specifies the file write format, which can be set to **Writable** or **Text**.
hdfs.callTimeout	10000	Specifies the timeout control duration each time events are written into HDFS, expressed in milliseconds.
hdfs.threadsPoolSize	-	Specifies the number of threads used by each HDFS sink for HDFS I/O operations.
hdfs.rollTimerPoolSize	-	Specifies the number of threads used by each HDFS sink to schedule the scheduled file rolling.
hdfs.round	false	Specifies whether to round off the timestamp value. If this parameter is set to true, all time-based escape sequences (except %t) are affected.

Parameter	Default Value	Description
hdfs.roundUnit	second	Specifies the unit of the timestamp value that has been rounded off, which can be set to **second**, **minute**, or **hour**.
hdfs.useLocalTimeStamp	true	Specifies whether to enable the local timestamp. The recommended parameter value is **true**.
hdfs.closeTries	0	Specifies the maximum attempts for the **hdfs sink** to stop renaming a file. If the parameter is set to the default value **0**, the sink does not stop renaming the file until the file is successfully renamed.
hdfs.retryInterval	180	Specifies the interval of request for closing the HDFS file, expressed in seconds. **NOTE** For each closing request, there are multiple RPCs working on the NameNode back and forth, which may make the NameNode overloaded if the parameter value is too small. Also, when the parameter is set to **0**, the Sink will not attempt to close the file, but opens the file or uses **.tmp** as the file name extension, if the first closing attempt fails.
hdfs.failcount	10	Specifies the number of times that data fails to be written to HDFS. If the number of times that the sink fails to write data to HDFS exceeds the parameter value, an alarm indicating abnormal data transmission is reported.

- **Avro Sink**

  An Avro sink converts events into Avro events and sends them to the monitoring ports of the hosts. Common configurations are as follows:

  Table 12-116 Common configurations of an Avro sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink.
type	-	Specifies the type of the avro sink, which must be set to **avro**.

Parameter	Default Value	Description
hostname	-	Specifies the bound host name or IP address.
port	-	Specifies the bound listening port. Ensure that this port is not occupied.
batch-size	1000	Specifies the number of events sent in a batch.
client.type	DEFAULT	Specifies the client instance type. Set this parameter based on the communication protocol used by the configured model. The options are as follows: • **DEFAULT**: The client instance of the AvroRPC type is returned. • **OTHER**: NULL is returned. • **THRIFT**: The client instance of the Thrift RPC type is returned. • **DEFAULT_LOADBALANCING**: The client instance of the LoadBalancing RPC type is returned. • **DEFAULT_FAILOVER**: The client instance of the Failover RPC type is returned.
ssl	false	Specifies whether to use SSL encryption. If this parameter is set to **true**, the values of **keystore** and **keystore-password** must be specified.

Parameter	Default Value	Description
truststore-type	JKS	Specifies the Java trust store type, which can be set to **JKS** or **PKCS12**. **NOTE** Different passwords are used to protect the key store and private key of **JKS**, while the same password is used to protect the key store and private key of **PKCS12**.
truststore	-	Specifies the Java trust store file.
truststore-password	-	Specifies the Java trust store password.
keystore-type	JKS	Specifies the keystore type set after SSL is enabled.
keystore	-	Specifies the keystore file path set after SSL is enabled. This parameter is mandatory if SSL is enabled.
keystore-password	-	Specifies the keystore password after SSL is enabled. This parameter is mandatory if SSL is enabled.
connect-timeout	20000	Specifies the timeout for the first connection, expressed in milliseconds.
request-timeout	20000	Specifies the maximum timeout for a request after the first request, expressed in milliseconds.

Parameter	Default Value	Description
reset-connection-interval	0	Specifies the interval between a connection failure and a second connection, expressed in seconds. If the parameter is set to **0**, the system continuously attempts to perform a connection.
compression-type	none	Specifies the compression type of the batch data, which can be set to **none** or **deflate**. **none** indicates that data is not compressed, while **deflate** indicates that data is compressed. This parameter value must be the same as that of the AvroSource compression-type.
compression-level	6	Specifies the compression level of batch data, which can be set to **1** to **9**. A larger value indicates a higher compression rate.
exclude-protocols	SSLv3	Specifies the excluded protocols. The entered protocols must be separated by spaces. The default value is **SSLv3**.

- **HBase Sink**

  An HBase sink writes data into HBase. Common configurations are as follows:

  Table 12-117 Common configurations of an HBase sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink.

Parameter	Default Value	Description
type	-	Specifies the type of the HBase sink, which must be set to **hbase**.
table	-	Specifies the HBase table name.
columnFamily	-	Specifies the HBase column family.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the sink is restarted. Unit: second
batchSize	1000	Specifies the number of events written into HBase in batches.
kerberosPrincipal	-	Specifies the Kerberos principal of HBase authentication. This parameter is mandatory in a secure mode, but not required in a common mode.
kerberosKeytab	-	Specifies the Kerberos keytab of HBase authentication. This parameter is not required in a common mode, but in a secure mode, the Flume running user must have the permission to access **keyTab** path in the **jaas.cof** file.
coalesceIncrements	true	Specifies whether to perform multiple operations on the same hbase cell in a same processing batch. Setting this parameter to **true** improves performance.

- **Kafka Sink**

  A Kafka sink writes data into Kafka. Common configurations are as follows:

  Table 12-118 Common configurations of a Kafka sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink.
type	-	Specifies the type of the kafka sink, which must be set to **org.apache.flume.sink.kafka.KafkaSink**.

Parameter	Default Value	Description
kafka.bootstrap.servers	-	Specifies the bootstrap address port list of Kafka. If Kafka has been installed in the cluster and the configuration has been synchronized to the server, you do not need to set this parameter on the server. The default value is the list of all brokers in the Kafka cluster. The client must be configured with this parameter. If there are multiple values, use commas (,) to separate the values. The rules for matching ports and security protocols must be as follows: port 21007 matches the security mode (SASL_PLAINTEXT), and port 9092 matches the common mode (PLAINTEXT).
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the sink is restarted. Unit: second
kafka.producer.acks	1	Successful write is determined by the number of received acknowledgement messages about replicas. The value **0** indicates that no confirm message needs to be received, the value **1** indicates that the system is only waiting for only the acknowledgement information from a leader, and the value **-1** indicates that the system is waiting for the acknowledgement messages of all replicas. If this parameter is set to **-1**, data loss can be avoided in some leader failure scenarios.
kafka.topic	-	Specifies the topic to which data is written. This parameter is mandatory.
flumeBatchSize	1000	Specifies the number of events written into Kafka in batches.
kafka.security.protocol	SASL_PLAINTEXT	Specifies the Kafka security protocol. The parameter value must be set to PLAINTEXT in a common cluster. The rules for matching ports and security protocols must be as follows: port 21007 matches the security mode (SASL_PLAINTEXT), and port 9092 matches the common mode (PLAINTEXT).

Parameter	Default Value	Description
ignoreLongMessage	false	Specifies whether to discard oversized messages.
messageMaxLength	1000012	Specifies the maximum length of a message written by Flume to Kafka.
defaultPartitionId	-	Specifies the Kafka partition ID to which the events of a channel is transferred. The **partitionIdHeader** value overwrites this parameter value. By default, if this parameter is left blank, events will be distributed by the Kafka Producer's partitioner (by a specified key or a partitioner customized by **kafka.partitioner.class**).
partitionIdHeader	-	When you set this parameter, the sink will take the value of the field named using the value of this property from the event header and send the message to the specified partition of the topic. If the value does not have a valid partition, **EventDeliveryException** is thrown. If the header value already exists, this setting overwrites the **defaultPartitionId** parameter.
Other Kafka Producer Properties	-	Specifies other Kafka configurations. This parameter can be set to any production configuration supported by Kafka, and the **.kafka** prefix must be added to the configuration.

- **Thrift Sink**

  A Thrift sink converts events to Thrift events and sends them to the monitoring port of the configured host. Common configurations are as follows:

  Table 12-119 Common configurations of a Thrift sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink.
type	thrift	Specifies the type of the thrift sink, which must be set to **thrift**.

Parameter	Default Value	Description
hostname	-	Specifies the bound host name or IP address.
port	-	Specifies the bound listening port. Ensure that this port is not occupied.
batch-size	1000	Specifies the number of events sent in a batch.
connect-timeout	20000	Specifies the timeout for the first connection, expressed in milliseconds.
request-timeout	20000	Specifies the maximum timeout for a request after the first request, expressed in milliseconds.
kerberos	false	Specifies whether Kerberos authentication is enabled.
client-keytab	-	Specifies the path of the client **keytab** file. The Flume running user must have the access permission on the authentication file.
client-principal	-	Specifies the principal of the security user used by the client.
server-principal	-	Specifies the principal of the security user used by the server.
compression-type	none	Specifies the compression type of data sent by Flume, which can be set to **none** or **deflate**. **none** indicates that data is not compressed, while **deflate** indicates that data is compressed.

Parameter	Default Value	Description
maxConnections	5	Specifies the maximum size of the connection pool for Flume to send data.
ssl	false	Specifies whether to use SSL encryption.
truststore-type	JKS	Specifies the Java trust store type.
truststore	-	Specifies the Java trust store file.
truststore-password	-	Specifies the Java trust store password.
reset-connection-interval	0	Specifies the interval between a connection failure and a second connection, expressed in seconds. If the parameter is set to **0**, the system continuously attempts to perform a connection.

Precautions

- What are the reliability measures of Flume?
  - Use the transaction mechanisms between Source and Channel as well as between Channel and Sink.
  - Configure the failover and load_balance mechanisms for Sink Processor. The following shows a load balancing example. For details, see **http://flume.apache.org/releases/1.9.0.html**.

```
server.sinkgroups=g1
server.sinkgroups.g1.sinks=k1 k2
server.sinkgroups.g1.processor.type=load_balance
server.sinkgroups.g1.processor.backoff=true
server.sinkgroups.g1.processor.selector=random
```

- What are the precautions for the aggregation and cascading of multiple Flume agents?
  - Avro or Thrift protocol can be used for cascading.
  - When the aggregation end contains multiple nodes, evenly distribute the agents and do not aggregate all agents on a single node.

12.7.8 Flume Configuration Parameter Description

For versions earlier than MRS 3.x, configure Flume parameters in the **properties.properties** file.

For MRS 3.x or later, some parameters can be configured on Manager.

Overview

This section describes how to configure the sources, channels, and sinks of Flume, and modify the configuration items of each module.

For MRS 3.x or later, log in to FusionInsight Manager and choose **Cluster** > **Services** > **Flume**. On the displayed page, click the **Configuration Tool** tab, select and drag the source, channel, and sink to be used to the GUI on the right, and double-click them to configure corresponding parameters. Parameters such as **channels** and **type** are configured only in the client configuration file **properties.properties**, the path of which is *Flume client installation directory*/**fusioninsight-flume-***Flume version*/**conf/properties.properties**.

NOTE

You must input encrypted information for some configurations. For details on how to encrypt information, see **Using the Encryption Tool of the Flume Client**.

Common Source Configurations

- **Avro Source**

  An Avro source listens to the Avro port, receives data from the external Avro client, and places data into configured channels. **Table 12-120** lists common configurations.

  Table 12-120 Common configurations of an Avro source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured. Use spaces to separate them. In a single proxy process, sources and sinks are connected through channels. A source instance corresponds to multiple channels, but a sink instance corresponds only to one channel. The format is as follows: **<Agent >.sources.<Source>.channels = <channel1> <channel2> <channel3>...** **<Agent >.sinks.<Sink>.channels = <channel1>** This parameter can be configured only in the **properties.properties** file.

Parameter	Default Value	Description
type	avro	Specifies the type, which is set to **avro**. The type of each source is a fixed value. This parameter can be configured only in the **properties.properties** file.
bind	-	Specifies the host name or IP address associated with the source.
port	-	Specifies the bound port number.
ssl	false	Specifies whether to use SSL encryption. ● true ● false
truststore-type	JKS	Specifies the Java trust store type. Set this parameter to **JKS** or other truststore types supported by Java.
truststore	-	Specifies the Java trust store file.
truststore-password	-	Specifies the Java trust store password.
keystore-type	JKS	Specifies the key storage type. Set this parameter to **JKS** or other truststore types supported by Java.
keystore	-	Specifies the key storage file.
keystore-password	-	Specifies the key storage password.

- **SpoolDir Source**

  A SpoolDir source monitors and transmits new files that have been added to directories in quasi-real-time mode. Common configurations are as follows:

  Table 12-121 Common configurations of a SpoolDir source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured. This parameter can be configured only in the **properties.properties** file.

Parameter	Default Value	Description
type	spooldir	Type, which is set to **spooldir**. This parameter can be configured only in the **properties.properties** file.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the source is restarted. Unit: second
spoolDir	-	Specifies the monitoring directory.
fileSuffix	.COMPLETED	Specifies the suffix added after file transmission is complete.
deletePolicy	never	Specifies the source file deletion policy after file transmission is complete. The value can be either **never** or **immediate**.
ignorePattern	^$	Specifies the regular expression of a file to be ignored.
trackerDir	.flumespool	Specifies the metadata storage path during data transmission.
batchSize	1000	Specifies the source transmission granularity.
decodeErrorPolicy	FAIL	Specifies the code error policy. This parameter can be configured only in the **properties.properties** file. The value can be **FAIL**, **REPLACE**, or **IGNORE**. **FAIL**: Generate an exception and fail the parsing. **REPLACE**: Replace the characters that cannot be identified with other characters, such as U+FFFD. **IGNORE**: Discard character strings that cannot be parsed. **NOTE** If a code error occurs in the file, set **decodeErrorPolicy** to **REPLACE** or **IGNORE**. Flume will skip the code error and continue to collect subsequent logs.

Parameter	Default Value	Description
deserializer	LINE	Specifies the file parser. The value can be either **LINE** or **BufferedLine**. • When the value is set to **LINE**, characters read from the file are transcoded one by one. • When the value is set to **BufferedLine**, one line or multiple lines of characters read from the file are transcoded in batches, which delivers better performance.
deserializer.maxLineLength	2048	Specifies the maximum length for resolution by line, ranging from 0 to 2,147,483,647.
deserializer.maxBatchLine	1	Specifies the maximum number of lines for resolution by line. If multiple lines are set, **maxLineLength** must be set to a corresponding multiplier. For example, if **maxBatchLine** is set to **2**, **maxLineLength** is set to **4096** (2048 x 2).
selector.type	replicating	Specifies the selector type. The value can be either **replicating** or **multiplexing**. • **replicating** indicates that the same content is sent to each channel. • **multiplexing** indicates that the content is sent only to certain channels according to the distribution rule.
interceptors	-	Specifies the interceptor. For details, see the **Flume official document**. This parameter can be configured only in the **properties.properties** file.

NOTE

The Spooling source ignores the last line feed character of each event when data is read by line. Therefore, Flume does not calculate the data volume counters used by the last line feed character.

- **Kafka Source**

  A Kafka source consumes data from Kafka topics. Multiple sources can consume data of the same topic, and the sources consume different partitions of the topic. Common configurations are as follows:

  Table 12-122 Common configurations of a Kafka source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured. This parameter can be configured only in the **properties.properties** file.
type	org.apache.flume.source.kafka.KafkaSource	Specifies the type, which is set to **org.apache.flume.source.kafka.KafkaSource**. This parameter can be configured only in the **properties.properties** file.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the source is restarted. Unit: second
nodatatime	0 (Disabled)	Specifies the alarm threshold. An alarm is triggered when the duration that Kafka does not release data to subscribers exceeds the threshold. Unit: second
batchSize	1000	Specifies the number of events written into a channel at a time.
batchDurationMillis	1000	Specifies the maximum duration of topic data consumption at a time, expressed in milliseconds.
keepTopicInHeader	false	Specifies whether to save topics in the event header. If topics are saved, topics configured in Kafka sinks become invalid. ● true ● false This parameter can be configured only in the **properties.properties** file.

Parameter	Default Value	Description
keepPartitionIn-Header	false	Specifies whether to save partition IDs in the event header. If partition IDs are saved, Kafka sinks write data to the corresponding partitions. ● true ● false This parameter can be set only in the properties.properties file.
kafka.bootstrap.servers	-	Specifies the list of Broker addresses, which are separated by commas.
kafka.consumer.group.id	-	Specifies the Kafka consumer group ID.
kafka.topics	-	Specifies the list of subscribed Kafka topics, which are separated by commas (,).
kafka.topics.regex	-	Specifies the subscribed topics that comply with regular expressions. **kafka.topics.regex** has a higher priority than **kafka.topics** and will overwrite **kafka.topics**.
kafka.security.protocol	SASL_PLAINTEXT	Specifies the security protocol of Kafka. The value must be set to **PLAINTEXT** for clusters in which Kerberos authentication is disabled.
kafka.kerberos.domain.name	-	Specifies the value of **default_realm** of Kerberos in the Kafka cluster, which should be configured only for security clusters. This parameter can be set only in the properties.properties file.
Other Kafka Consumer Properties	-	Specifies other Kafka configurations. This parameter can be set to any consumption configuration supported by Kafka, and the **.kafka** prefix must be added to the configuration. This parameter can be set only in the properties.properties file.

- **Taildir Source**

A Taildir source monitors file changes in a directory and automatically reads the file content. In addition, it can transmit data in real time. **Table 12-123** lists common configurations.

Table 12-123 Common configurations of a Taildir source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured. This parameter can be set only in the properties.properties file.
type	taildir	Specifies the type, which is set to **taildir**. This parameter can be set only in the properties.properties file.
filegroups	-	Specifies the group name of a collection file directory. Group names are separated by spaces.
filegroups.<filegroupName>.parentDir	-	Specifies the parent directory. The value must be an absolute path. This parameter can be set only in the properties.properties file.
filegroups.<filegroupName>.filePattern	-	Specifies the relative file path of the file group's parent directory. Directories can be included and regular expressions are supported. It must be used together with **parentDir**. This parameter can be set only in the properties.properties file.
positionFile	-	Specifies the metadata storage path during data transmission.
headers.<filegroupName>.<headerKey>	-	Specifies the key-value of an event when data of a group is being collected. This parameter can be set only in the properties.properties file.
byteOffsetHeader	false	Specifies whether each event header should contain the location information about the event in the source file. The location information is saved in the **byteoffset** variable.

Parameter	Default Value	Description
skipToEnd	false	Specifies whether Flume can locate the latest location of a file and read the latest data after restart.
idleTimeout	120000	Specifies the idle duration during file reading, expressed in milliseconds. If the file data is not changed in this idle period, the source closes the file. If data is written into this file after it is closed, the source opens the file and reads data.
writePosInterval	3000	Specifies the interval for writing metadata to a file, expressed in milliseconds.
batchSize	1000	Specifies the number of events written to the channel in batches.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the source is restarted. Unit: second

- **Http Source**

  An HTTP source receives data from an external HTTP client and sends the data to the configured channels. **Table 12-124** lists common configurations.

  Table 12-124 Common configurations of an HTTP source

Parameter	Default Value	Description
channels	-	Specifies the channel connected to the source. Multiple channels can be configured. This parameter can be set only in the properties.properties file.
type	http	Specifies the type, which is set to **http**. This parameter can be set only in the properties.properties file.
bind	-	Specifies the name or IP address of the bound host.
port	-	Specifies the bound port.

Parameter	Default Value	Description
handler	org.apache.flume.source.http.JSONHandler	Specifies the message parsing method of an HTTP request. The following methods are supported: • **org.apache.flume.source.http.JSONHandler**: JSON • **org.apache.flume.sink.solr.morphline.BlobHandler**: BLOB
handler.*	-	Specifies handler parameters.
enableSSL	false	Specifies whether SSL is enabled in HTTP.
keystore	-	Specifies the keystore path set after SSL is enabled in HTTP.
keystorePassword	-	Specifies the keystore password set after SSL is enabled in HTTP.

Common Channel Configurations

- **Memory Channel**

  A memory channel uses memory as the cache. Events are stored in memory queues. **Table 12-125** lists common configurations.

  Table 12-125 Common configurations of a memory channel

Parameter	Default Value	Description
type	-	Specifies the type, which is set to **memory**. This parameter can be set only in the properties.properties file.
capacity	10000	Specifies the maximum number of events cached in a channel.
transactionCapacity	1000	Specifies the maximum number of events accessed each time.
channelfullcount	10	Specifies the channel full count. When the count reaches the threshold, an alarm is reported.

- **File Channel**

  A file channel uses local disks as the cache. Events are stored in the folder specified by **dataDirs**. **Table 12-126** lists common configurations.

Table 12-126 Common configurations of a file channel

Parameter	Default Value	Description
type	-	Specifies the type, which is set to **file**. This parameter can be set only in the properties.properties file.
checkpointDir	${BIGDATA_DATA_HOME}/flume/checkpoint	Specifies the checkpoint storage directory.
dataDirs	${BIGDATA_DATA_HOME}/flume/data	Specifies the data cache directory. Multiple directories can be configured to improve performance. The directories are separated by commas (,).
maxFileSize	2146435071	Specifies the maximum size of a single cache file, expressed in bytes.
minimumRequired-Space	524288000	Specifies the minimum idle space in the cache, expressed in bytes.
capacity	1000000	Specifies the maximum number of events cached in a channel.
transactionCapacity	10000	Specifies the maximum number of events accessed each time.
channelfullcount	10	Specifies the channel full count. When the count reaches the threshold, an alarm is reported.

- **Kafka Channel**

  A Kafka channel uses a Kafka cluster as the cache. Kafka provides high availability and multiple copies to prevent data from being immediately consumed by sinks when Flume or Kafka Broker crashes. **Table 10 Common configurations of a Kafka channel** lists common configurations.

  Table 12-127 Common configurations of a Kafka channel

Parameter	Default Value	Description
type	-	Specifies the type, which is set to **org.apache.flume.channel.kafka.KafkaChannel**. This parameter can be set only in the properties.properties file.

Parameter	Default Value	Description
kafka.bootstrap.servers	-	Specifies the list of Brokers in the Kafka cluster.
kafka.topic	flume-channel	Specifies the Kafka topic used by the channel to cache data.
kafka.consumer.group.id	flume	Specifies the Kafka consumer group ID.
parseAsFlumeEvent	true	Specifies whether data is parsed into Flume events.
migrateZookeeper-Offsets	true	Specifies whether to search for offsets in ZooKeeper and submit them to Kafka when there is no offset in Kafka.
kafka.consumer.auto.offset.reset	latest	Consumes data from the specified location when there is no offset.
kafka.producer.security.protocol	SASL_PLAINTEXT	Specifies the Kafka producer security protocol.
kafka.consumer.security.protocol	SASL_PLAINTEXT	Specifies the Kafka consumer security protocol.

Common Sink Configurations

- **HDFS Sink**

  An HDFS sink writes data into HDFS. **Table 12-128** lists common configurations.

  Table 12-128 Common configurations of an HDFS sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink. This parameter can be set only in the properties.properties file.
type	hdfs	Specifies the type, which is set to **hdfs**. This parameter can be set only in the properties.properties file.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the sink is restarted. Unit: second
hdfs.path	-	Specifies the HDFS path.

Parameter	Default Value	Description
hdfs.inUseSuffix	.tmp	Specifies the suffix of the HDFS file to which data is being written.
hdfs.rollInterval	30	Specifies the interval for file rolling, expressed in seconds.
hdfs.rollSize	1024	Specifies the size for file rolling, expressed in bytes.
hdfs.rollCount	10	Specifies the number of events for file rolling.
hdfs.idleTimeout	0	Specifies the timeout interval for closing idle files automatically, expressed in seconds.
hdfs.batchSize	1000	Specifies the number of events written into HDFS at a time.
hdfs.kerberosPrincipal	-	Specifies the Kerberos username for HDFS authentication. This parameter is not required for a cluster in which Kerberos authentication is disabled.
hdfs.kerberosKeytab	-	Specifies the Kerberos keytab of HDFS authentication. This parameter is not required for a cluster in which Kerberos authentication is disabled.
hdfs.fileCloseByEndEvent	true	Specifies whether to close the file when the last event is received.
hdfs.batchCallTimeout	-	Specifies the timeout control duration each time events are written into HDFS, expressed in milliseconds. If this parameter is not specified, the timeout duration is controlled when each event is written into HDFS. When the value of **hdfs.batchSize** is greater than 0, configure this parameter to improve the performance of writing data into HDFS. **NOTE** The value of **hdfs.batchCallTimeout** depends on **hdfs.batchSize**. A greater **hdfs.batchSize** requires a larger **hdfs.batchCallTimeout**. If the value of **hdfs.batchCallTimeout** is too small, writing events to HDFS may fail.

Parameter	Default Value	Description
serializer.appendNewline	true	Specifies whether to add a line feed character (**\n**) after an event is written to HDFS. If a line feed character is added, the data volume counters used by the line feed character will not be calculated by HDFS sinks.

- **Avro Sink**

  An Avro sink converts events into Avro events and sends them to the monitoring ports of the hosts. **Table 12-129** lists common configurations.

  Table 12-129 Common configurations of an Avro sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink. This parameter can be set only in the properties.properties file.
type	-	Specifies the type, which is set to **avro**. This parameter can be set only in the properties.properties file.
hostname	-	Specifies the name or IP address of the bound host.
port	-	Specifies the monitoring port.
batch-size	1000	Specifies the number of events sent in a batch.
ssl	false	Specifies whether to use SSL encryption.
truststore-type	JKS	Specifies the Java trust store type.
truststore	-	Specifies the Java trust store file.
truststore-password	-	Specifies the Java trust store password.
keystore-type	JKS	Specifies the key storage type.
keystore	-	Specifies the key storage file.
keystore-password	-	Specifies the key storage password.

- **HBase Sink**

  An HBase sink writes data into HBase. **Table 12-130** lists common configurations.

Table 12-130 Common configurations of an HBase sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink. This parameter can be set only in the properties.properties file.
type	-	Specifies the type, which is set to **hbase**. This parameter can be set only in the properties.properties file.
table	-	Specifies the HBase table name.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the sink is restarted. Unit: second
columnFamily	-	Specifies the HBase column family.
batchSize	1000	Specifies the number of events written into HBase at a time.
kerberosPrincipal	-	Specifies the Kerberos username for HBase authentication. This parameter is not required for a cluster in which Kerberos authentication is disabled.
kerberosKeytab	-	Specifies the Kerberos keytab of HBase authentication. This parameter is not required for a cluster in which Kerberos authentication is disabled.

- **Kafka Sink**

  A Kafka sink writes data into Kafka. **Table 12-131** lists common configurations.

  Table 12-131 Common configurations of a Kafka sink

Parameter	Default Value	Description
channel	-	Specifies the channel connected to the sink. This parameter can be set only in the properties.properties file.

Parameter	Default Value	Description
type	-	Specifies the type, which is set to **org.apache.flume.sink.kafka.KafkaSink**. This parameter can be set only in the properties.properties file.
kafka.bootstrap.servers	-	Specifies the list of Kafka Brokers, which are separated by commas.
monTime	0 (Disabled)	Specifies the thread monitoring threshold. When the update time exceeds the threshold, the sink is restarted. Unit: second
kafka.topic	default-flume-topic	Specifies the topic where data is written.
flumeBatchSize	1000	Specifies the number of events written into Kafka at a time.
kafka.security.protocol	SASL_PLAINTEXT	Specifies the security protocol of Kafka. The value must be set to **PLAINTEXT** for clusters in which Kerberos authentication is disabled.
kafka.kerberos.domain.name	-	Specifies the Kafka domain name. This parameter is mandatory for a security cluster. This parameter can be set only in the properties.properties file.
Other Kafka Producer Properties	-	Specifies other Kafka configurations. This parameter can be set to any production configuration supported by Kafka, and the **.kafka** prefix must be added to the configuration. This parameter can be set only in the properties.properties file.

12.7.9 Using Environment Variables in the properties.properties File

Scenario

This section describes how to use environment variables in the **properties.properties** configuration file.

This section applies to MRS 3.*x* and later versions.

Prerequisites

You have installed Flume service or client.

Procedure

Step 1 Add variables to the *Flume client installation directory*/fusioninsight-flume-*Flume Version*/**conf/flume-env.sh** file.

Add variables:

export *Variable name* **=** *Variable value*

Example:

JAVA_OPTS="-Xms2G -Xmx4G -XX:CMSFullGCsBeforeCompaction=1 -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:+UseCMSCompactAtFullCollection -DpropertiesImplementation=org.apache.flume.node.EnvVarResolverProperties "

export TAILDIR_PATH=/tmp/flumetest/201907/20190703/1/.*log.*

Step 2 Restart the Flume instance process.

1. Log in to FusionInsight Manager.
2. Choose **Cluster** > *Name of the target cluster* > **Services** > **Flume** > **Instance**, select all Flume instances, choose **More** > **Restart Instance**, enter the password, and click **OK**.

NOTICE

- Do not restart the Flume process by restarting the Flume service on the Manager page, after **flume-env.sh** takes effect in the flume server. Otherwise, user-defined environment variables are lost.
- Ensure that **flume-env.sh** takes effect before configuring the **properties.properties** as instructed in **Step 3** and uploading the file on the GUI. If the operation sequence is not standard, user-defined environment variables may be lost.

Step 3 In the **properties.properties** configuration file, use the **$**{variable name} format to reference the variable, taking the client as an example.

Example:

```
client.sources.s1.type = TAILDIR
client.sources.s1.filegroups = f1
client.sources.s1.filegroups.f1 = ${TAILDIR_PATH}
client.sources.s1.positionFile = /tmp/flumetest/201907/20190703/1/taildir_position.json
client.sources.s1.channels = c1
```

----End

12.7.10 Non-Encrypted Transmission

12.7.10.1 Configuring Non-encrypted Transmission

Scenario

This section describes how to configure Flume server and client parameters after the cluster and the Flume service are installed to ensure proper running of the service.

This section applies to MRS 3.*x* and later versions.

NOTE

By default, the cluster network environment is secure and the SSL authentication is not enabled during the data transmission process. For details about how to use the encryption mode, see **Configuring the Encrypted Transmission**.

Prerequisites

- The cluster and Flume service have been installed.
- The network environment of the cluster is secure.

Procedure

Step 1 Configure the client parameters of the Flume role.

1. Use the Flume configuration tool on FusionInsight Manager to configure the Flume role client parameters and generate a configuration file.
   a. Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **client**. Select and drag the source, channel, and sink to be used to the GUI on the right, and connect them.

      For example, use SpoolDir Source, File Channel, and Avro Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by referring to **Table 12-132** based on the actual environment.

      NOTE

      - If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Flume** > **Configuration** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
      - It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
   d. Click **Export** to save the **properties.properties** configuration file to the local server.

Table 12-132 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the function is not enabled.	false

2. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.

Step 2 Configure the server parameters of the Flume role and upload the configuration file to the cluster.

1. Use the Flume configuration tool on the FusionInsight Manager portal to configure the server parameters and generate the configuration file.
   a. Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **server**. Select and drag the source, channel, and sink to be used to the GUI on the right, and connect them.
      For example, use Avro Source, File Channel, and HDFS Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by referring to **Table 12-133** based on the actual environment.

      NOTE

      ■ If the server parameters of the Flume role have been configured, you can choose **Cluster** > **Services** > **Flume** > **Instance** on FusionInsight Manager. Then select the corresponding Flume role instance and click the **Download** button behind the **flume.config.file** parameter on the **Instance Configurations** page to obtain the existing server parameter configuration file. Choose **Cluster** > **Service** > **Flume** > **Configurations** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.

      ■ It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.

      ■ A unique checkpoint directory needs to be configured for each File Channel.
   d. Click **Export** to save the **properties.properties** configuration file to the local server.

Table 12-133 Parameters to be modified of the Flume role server

Parameter	Description	Example Value
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the function is not enabled.	false

2. Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Flume**. On the **Instances** tab page, click **Flume**.
3. Select the Flume role of the node where the configuration file is to be uploaded, choose **Instance Configurations** > **Import** beside the **flume.config.file**, and select the **properties.properties** file.

   NOTE

   - An independent server configuration file can be uploaded to each Flume instance.
   - This step is required for updating the configuration file. Modifying the configuration file on the background is an improper operation because the modification will be overwritten after configuration synchronization.
4. Click **Save**, and then click **OK**.
5. Click **Finish**.

----End

12.7.10.2 Typical Scenario: Collecting Local Static Logs and Uploading Them to Kafka

Scenario

This section describes how to use Flume to collect static logs from a local host (service IP address: 192.168.108.11) and save them to the topic list (test1) of Kafka.

This section applies to MRS 3.*x* and later versions.

NOTE

By default, the cluster network environment is secure and the SSL authentication is not enabled during the data transmission process. For details about how to use the encryption mode, see **Configuring the Encrypted Transmission**. The configuration can apply to scenarios where only the server is configured, for example, Server:Spooldir Source+File Channel+Kafka Sink.

Prerequisites

- The cluster, Kafka, and Flume service have been installed.
- The network environment of the cluster is secure.
- The system administrator has understood service requirements and prepared Kafka administrator **flume_kafka**.

Procedure

Step 1 Configure the client parameters of the Flume role.

1. Use the Flume configuration tool on Manager to configure the Flume role client parameters and generate a configuration file.
   a. Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **client**. Select and drag the source, channel, and sink to be used to the GUI on the right, and connect them.

      Use SpoolDir Source, File Channel, and Avro Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by referring to **Table 12-134** based on the actual environment.

      NOTE

      - If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to Manager, choose **Cluster** > **Services** > **Flume** > **Configurations** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
      - It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
   d. Click **Export** to save the **properties.properties** configuration file to the local server.

Table 12-134 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test

Parameter	Description	Example Value
spoolDir	Specifies the directory where the file to be collected resides. This parameter cannot be left blank. The directory needs to exist and have the write, read, and execute permissions on the flume running user.	/srv/BigData/hadoop/data1/zb
trackerDir	Specifies the path for storing the metadata of files collected by Flume.	/srv/BigData/hadoop/data1/tracker
batchSize	Specifies the number of events that Flume sends in a batch (number of data pieces). A larger value indicates higher performance and lower timeliness.	61200
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/data

Parameter	Description	Example Value
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/checkpoint
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hostname	Specifies the name or IP address of the host whose data is to be sent. This parameter cannot be left blank. The parameter must be configured to be the name or IP address of the host where the connected Avro Source resides.	192.168.108.11

Parameter	Description	Example Value
port	Specifies the port that sends the data. This parameter cannot be left blank. It must be configured to be the port that is listened to by the connected Avro Source.	21154
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the function is not enabled.	false

2. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.

Step 2 Configure the server parameters of the Flume role and upload the configuration file to the cluster.

1. Use the Flume configuration tool on the FusionInsight Manager portal to configure the server parameters and generate the configuration file.
   a. Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **server**. Select and drag the source, channel, and sink to be used to the GUI on the right, and connect them.
      Avro Source, File Channel, and Kafka Sink are used.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by referring to **Table 12-135** based on the actual environment.

NOTE

- If the server parameters of the Flume role have been configured, you can choose **Cluster** > **Services** > **Flume** > **Instance** on Manager. Then select the corresponding Flume role instance and click the **Download** button behind the **flume.config.file** parameter on the **Instance Configurations** page to obtain the existing server parameter configuration file. Choose **Cluster** > **Services** > **Flume** > **Configurations** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
- It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
- A unique checkpoint directory needs to be configured for each File Channel.

d. Click **Export** to save the **properties.properties** configuration file to the local server.

Table 12-135 Parameters to be modified of the Flume role server

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
bind	Specifies the IP address to which Avro Source is bound. This parameter cannot be left blank. It must be configured as the IP address that the server configuration file will upload.	192.168.108.11
port	Specifies the port that Avro Source listens to. This parameter cannot be left blank. It must be configured as an unused port.	21154
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the function is not enabled.	false

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/checkpoint
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
kafka.topics	Specifies the list of subscribed Kafka topics, which are separated by commas (,). This parameter cannot be left blank.	test1

Parameter	Description	Example Value
kafka.bootstrap.servers	Specifies the bootstrap IP address and port list of Kafka. The default value is all Kafka lists in a Kafka cluster. If Kafka has been installed in the cluster and its configurations have been synchronized, this parameter can be left blank.	192.168.101.10:21007

2. Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Flume**. On the **Instance** tab page, click the **Flume** role.
3. Select the Flume role of the node where the configuration file is to be uploaded, choose **Instance Configurations** > **Import** beside the **flume.config.file**, and select the **properties.properties** file.

   NOTE

   - An independent server configuration file can be uploaded to each Flume instance.
   - This step is required for updating the configuration file. Modifying the configuration file on the background is an improper operation because the modification will be overwritten after configuration synchronization.
4. Click **Save**, and then click **OK**.
5. Click **Finish**.

Step 3 Verify log transmission.

1. Log in to the Kafka client.

   cd /*Client installation directory***/Kafka/kafka**

   kinit flume_kafka (Enter the password.)
2. Read data from a Kafka topic.

   bin/kafka-console-consumer.sh --topic *topic name* **--bootstrap-server** *Kafka service IP address of the node where the role instance is located*:**21007 --consumer.config config/consumer.properties --from-beginning**

   The system displays the contents of the file to be collected.

   ```
   [root@host1 kafka]# bin/kafka-console-consumer.sh --topic test1 --bootstrap-server 192.168.101.10:21007 --consumer.config config/consumer.properties --from-beginning
   Welcome to flume
   ```

----End

12.7.10.3 Typical Scenario: Collecting Local Static Logs and Uploading Them to HDFS

Scenario

This section describes how to use Flume to collect static logs from a local PC (for example, the service IP address is 192.168.108.11) and save them to the **/flume/test** directory on HDFS.

This section applies to MRS 3.*x* or later.

NOTE

By default, the cluster network environment is secure and the SSL authentication is not enabled during the data transmission process. For details about how to use the encryption mode, see **Configuring the Encrypted Transmission**. This configuration can use only one Flume scenario, for example, Server:Spooldir Source+File Channel+HDFS Sink.

Prerequisites

- The cluster, HDFS, and Flume service have been installed.
- The network environment of the cluster is secure.
- User **flume_hdfs** has been created, and the HDFS directory and data used for log verification have been authorized to the user.

Procedure

Step 1 On FusionInsight Manager, choose **System** > **Permission > User**, select user **flume_hdfs**, and choose **More** > **Download Authentication Credential** to download the Kerberos certificate file of user **flume_hdfs** and save it to the local host.

Step 2 Configure the client parameters of the Flume role.

1. Use Flume on FusionInsight Manager to configure the Flume role client parameters and generate a configuration file.
   a. Log in to FusionInsight Manager. Choose **Cluster** > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **client**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

      Use SpoolDir Source, File Channel, and Avro Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by referring to **Table 12-136** based on the actual environment.

      NOTE

      - If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
      - It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
   d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-136 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
spoolDir	Specifies the directory where the file to be collected resides. This parameter cannot be left blank. The directory needs to exist and have the write, read, and execute permissions on the flume running user.	/srv/BigData/hadoop/data1/zb
trackerDir	Specifies the path for storing the metadata of files collected by Flume.	/srv/BigData/hadoop/data1/tracker
batch-size	Specifies the number of events that Flume sends in a batch.	61200
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/data

Parameter	Description	Example Value
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/checkpoint
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hostname	Specifies the name or IP address of the host whose data is to be sent. This parameter cannot be left blank. Name or IP address must be configured to be the name or IP address that the Avro source associated with it.	192.168.108.11

Parameter	Description	Example Value
port	Specifies the IP address to which Avro Sink is bound. This parameter cannot be left blank. It must be consistent with the port that is monitored by the connected Avro Source.	21154
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	false

2. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.

Step 3 Configure the server parameters of the Flume role and upload the configuration file to the cluster.

1. Use the Flume configuration tool on the FusionInsight Manager portal to configure the server parameters and generate the configuration file.
   a. Log in to FusionInsight Manager. Choose **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **server**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.
      For example, use Avro Source, File Channel, and HDFS Sink.
   c. Double-click the source, channel, and sink. Refer to **Table 12-137** to set corresponding configuration parameters based on the actual environment.

NOTE

- If the server parameters of the Flume role have been configured, you can choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance** on FusionInsight Manager. Then select the corresponding Flume role instance and click the **Download** button behind the **flume.config.file** parameter on the **Instance Configurations** page to obtain the existing server parameter configuration file. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
- It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
- A unique checkpoint directory needs to be configured for each File Channel.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-137 Parameters to be modified of the Flume role server

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
bind	Specifies the IP address to which Avro Source is bound. This parameter cannot be left blank. It must be configured as the IP address that the server configuration file will upload.	192.168.108.11
port	Specifies the ID of the port that the Avro Source monitors. This parameter cannot be left blank. It must be configured as an unused port.	21154
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	false

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/checkpoint
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hdfs.path	Specifies the HDFS data write directory. This parameter cannot be left blank.	hdfs://hacluster/flume/test
hdfs.inUsePrefix	Specifies the prefix of the file that is being written to HDFS.	TMP_
hdfs.batchSize	Specifies the maximum number of events that can be written to HDFS once.	61200

Parameter	Description	Example Value
hdfs.kerberosPrincipal	Specifies the Kerberos authentication user, which is mandatory in security versions. This configuration is required only in security clusters.	flume_hdfs
hdfs.kerberosKeytab	Specifies the keytab file path for Kerberos authentication, which is mandatory in security versions. This configuration is required only in security clusters.	/opt/test/conf/user.keytab **NOTE** Obtain the **user.keytab** file from the Kerberos certificate file of the user **flume_hdfs**. In addition, ensure that the user who installs and runs the Flume client has the read and write permissions on the **user.keytab** file.
hdfs.useLocalTimeStamp	Specifies whether to use the local time. Possible values are **true** and **false**.	true

2. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume**. On the displayed page, click the **Flume** role under **Role**.
3. Select the Flume role of the node where the configuration file is to be uploaded, choose **Instance Configurations** > **Import** beside the **flume.config.file**, and select the **properties.properties** file.

   NOTE

   - An independent server configuration file can be uploaded to each Flume instance.
   - This step is required for updating the configuration file. Modifying the configuration file on the background is an improper operation because the modification will be overwritten after configuration synchronization.
4. Click **Save**, and then click **OK**.
5. Click **Finish**.

Step 4 Verify log transmission.

1. Log in to FusionInsight Manager as a user who has the management permission on HDFS. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster >** *Name of the desired cluster* > **Services** > **HDFS**, click the HDFS WebUI link next to **NameNode (Active)** to go to the HDFS WebUI, and choose **Utilities** > **Browse the file system**.
2. Check whether the data is generated in the **/flume/test** directory on the HDFS.

----End

12.7.10.4 Typical Scenario: Collecting Local Dynamic Logs and Uploading Them to HDFS

Scenario

This section describes how to use Flume to collect dynamic logs from a local PC (for example, the service IP address is 192.168.108.11) and save them to the **/flume/test** directory on HDFS.

This section applies to MRS 3.*x* or later.

NOTE

By default, the cluster network environment is secure and the SSL authentication is not enabled during the data transmission process. For details about how to use the encryption mode, see **Configuring the Encrypted Transmission**. This configuration can use only one Flume scenario, for example, Server:Taildir Source+File Channel+HDFS Sink.

Prerequisites

- The cluster, HDFS, and Flume service have been installed.
- The network environment of the cluster is secure.
- You have created user **flume_hdfs** and authorized the HDFS directory and data to be operated during log verification.

Procedure

Step 1 On FusionInsight Manager, choose **System > User** and choose **More > Download Authentication Credential** to download the Kerberos certificate file of user **flume_hdfs** and save it to the local host.

Step 2 Configure the client parameters of the Flume role.

1. Use the Flume configuration tool on FusionInsight Manager to configure the Flume role client parameters and generate a configuration file.
   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **client**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

      For example, use Taildir Source, File Channel, and Avro Sink.
   c. Double-click the source, channel, and sink. Refer to **Table 12-138** to set corresponding configuration parameters based on the actual environment.

NOTE

- If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
- It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-138 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
filegroups	Specifies the file group list name. This parameter cannot be left blank. Values are separated by spaces	epgtest
positionFile	Specifies the location where the collected file information (file name and location from which the file collected) is saved. This parameter cannot be left blank. The file does not need to be created manually, but the Flume running user needs to have the write permission on its upper-level directory.	/home/omm/flume/positionfile
batch-size	Specifies the number of events that Flume sends in a batch.	61200

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/checkpoint

Parameter	Description	Example Value
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hostname	Specifies the name or IP address of the host whose data is to be sent. This parameter cannot be left blank. Name or IP address must be configured to be the name or IP address that the Avro source associated with it.	192.168.108.11
port	Specifies the IP address to which Avro Sink is bound. This parameter cannot be left blank. It must be consistent with the port that is monitored by the connected Avro Source.	21154

Parameter	Description	Example Value
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	false

2. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.

Step 3 Configure the server parameters of the Flume role and upload the configuration file to the cluster.

1. Use the Flume configuration tool on the FusionInsight Manager portal to configure the server parameters and generate the configuration file.
   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **server**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.
      For example, use Avro Source, File Channel, and HDFS Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-139** based on the actual environment.

NOTE

- If the server parameters of the Flume role have been configured, you can choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance** on FusionInsight Manager. Then select the corresponding Flume role instance and click the **Download** button behind the **flume.config.file** parameter on the **Instance Configurations** page to obtain the existing server parameter configuration file. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
- It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
- A unique checkpoint directory needs to be configured for each File Channel.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-139 Parameters to be modified of the Flume role server

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
bind	Specifies the IP address to which Avro Source is bound. This parameter cannot be left blank. It must be configured as the IP address that the server configuration file will upload.	192.168.108.11
port	Specifies the ID of the port that the Avro Source monitors. This parameter cannot be left blank. It must be configured as an unused port.	21154
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	false

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/checkpoint
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hdfs.path	Specifies the HDFS data write directory. This parameter cannot be left blank.	hdfs://hacluster/flume/test
hdfs.inUsePrefix	Specifies the prefix of the file that is being written to HDFS.	TMP_
hdfs.batchSize	Specifies the maximum number of events that can be written to HDFS once.	61200

Parameter	Description	Example Value
hdfs.kerberosPrincipal	Specifies the Kerberos authentication user, which is mandatory in security versions. This configuration is required only in security clusters.	flume_hdfs
hdfs.kerberosKeytab	Specifies the keytab file path for Kerberos authentication, which is mandatory in security versions. This configuration is required only in security clusters.	/opt/test/conf/user.keytab **NOTE** Obtain the **user.keytab** file from the Kerberos certificate file of the user **flume_hdfs**. In addition, ensure that the user who installs and runs the Flume client has the read and write permissions on the **user.keytab** file.
hdfs.useLocalTimeStamp	Specifies whether to use the local time. Possible values are **true** and **false**.	true

2. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume**. On the displayed page, click the **Flume** role in the **Role** column.
3. Select the Flume role of the node where the configuration file is to be uploaded, choose **Instance Configurations** > **Import** beside the **flume.config.file**, and select the **properties.properties** file.

   NOTE

   - An independent server configuration file can be uploaded to each Flume instance.
   - This step is required for updating the configuration file. Modifying the configuration file on the background is an improper operation because the modification will be overwritten after configuration synchronization.
4. Click **Save**, and then click **OK**.
5. Click **Finish**.

Step 4 Verify log transmission.

1. Log in to FusionInsight Manager as a user who has the management permission on HDFS. For details, see**Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster >** *Name of the desired cluster* > **Services** > **HDFS**, click the HDFS web UI link of **NameNode**(*Node name*, **Active**) to go to the HDFS web UI, and choose **Utilities** > **Browse the file system**.
2. Check whether the data is generated in the **/flume/test** directory on the HDFS.

----End

12.7.10.5 Typical Scenario: Collecting Logs from Kafka and Uploading Them to HDFS

Scenario

This section describes how to use Flume to collect logs from the Topic list (test1) of Kafka and save them to the **/flume/test** directory on HDFS.

This section applies to MRS 3.*x* or later.

NOTE

By default, the cluster network environment is secure and the SSL authentication is not enabled during the data transmission process. For details about how to use the encryption mode, see **Configuring the Encrypted Transmission**. This configuration can use only one Flume scenario, for example, Server:Kafka Source+File Channel+HDFS Sink.

Prerequisites

- The cluster, HDFS, Kafka, and Flume service have been installed.
- The network environment of the cluster is secure.
- You have created user **flume_hdfs** and authorized the HDFS directory and data to be operated during log verification.

Procedure

Step 1 On FusionInsight Manager, choose **System > User** and choose **More > Download Authentication Credential** to download the Kerberos certificate file of user **flume_hdfs** and save it to the local host.

Step 2 Configure the client parameters of the Flume role.

1. Use the Flume configuration tool on FusionInsight Manager to configure the Flume role client parameters and generate a configuration file.
   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **client**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

      For example, use Kafka Source, File Channel, and Avro Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-140** based on the actual environment.

NOTE

- If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
- It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-140 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
kafka.topics	Specifies the subscribed Kafka topic list, in which topics are separated by commas (,). This parameter cannot be left blank.	test1
kafka.consumer.group.id	Specifies the data group ID obtained from Kafka. This parameter cannot be left blank.	flume
kafka.bootstrap.servers	Specifies the bootstrap IP address and port list of Kafka. The default value is all Kafka lists in a Kafka cluster. If Kafka has been installed in the cluster and its configurations have been synchronized, this parameter can be left blank.	192.168.101.10:9092

Parameter	Description	Example Value
batchSize	Specifies the number of events that Flume sends in a batch (number of data pieces).	61200
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/checkpoint

Parameter	Description	Example Value
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hostname	Specifies the name or IP address of the host whose data is to be sent. This parameter cannot be left blank. Name or IP address must be configured to be the name or IP address that the Avro source associated with it.	192.168.108.11
port	Specifies the IP address to which Avro Sink is bound. This parameter cannot be left blank. It must be consistent with the port that is monitored by the connected Avro Source.	21154

Parameter	Description	Example Value
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	false

2. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.

Step 3 Configure the server parameters of the Flume role and upload the configuration file to the cluster.

1. Use the Flume configuration tool on the FusionInsight Manager portal to configure the server parameters and generate the configuration file.
   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **server**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.
      For example, use Avro Source, File Channel, and HDFS Sink.
   c. Double-click the source, channel, and sink. Refer to **Table 12-141** to set corresponding configuration parameters based on the actual environment.

NOTE

- If the server parameters of the Flume role have been configured, you can choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance** on FusionInsight Manager. Then select the corresponding Flume role instance and click the **Download** button behind the **flume.config.file** parameter on the **Instance Configurations** page to obtain the existing server parameter configuration file. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configurations** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
- It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
- A unique checkpoint directory needs to be configured for each File Channel.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-141 Parameters to be modified of the Flume role server

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
bind	Specifies the IP address to which Avro Source is bound. This parameter cannot be left blank. It must be configured as the IP address that the server configuration file will upload.	192.168.108.11
port	Specifies the ID of the port that the Avro Source monitors. This parameter cannot be left blank. It must be configured as an unused port.	21154
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	false

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/checkpoint
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hdfs.path	Specifies the HDFS data write directory. This parameter cannot be left blank.	hdfs://hacluster/flume/test
hdfs.inUsePrefix	Specifies the prefix of the file that is being written to HDFS.	TMP_
hdfs.batchSize	Specifies the maximum number of events that can be written to HDFS once.	61200

Parameter	Description	Example Value
hdfs.kerberosPrincipal	Specifies the Kerberos authentication user, which is mandatory in security versions. This configuration is required only in security clusters.	flume_hdfs
hdfs.kerberosKeytab	Specifies the keytab file path for Kerberos authentication, which is mandatory in security versions. This configuration is required only in security clusters.	/opt/test/conf/user.keytab **NOTE** Obtain the **user.keytab** file from the Kerberos certificate file of the user **flume_hdfs**. In addition, ensure that the user who installs and runs the Flume client has the read and write permissions on the **user.keytab** file.
hdfs.useLocalTimeStamp	Specifies whether to use the local time. Possible values are **true** and **false**.	true

2. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume**. On the displayed page, click the **Flume** role under **Role**.
3. Select the Flume role of the node where the configuration file is to be uploaded, choose **Instance Configurations** > **Import** beside the **flume.config.file**, and select the **properties.properties** file.

   NOTE

   - An independent server configuration file can be uploaded to each Flume instance.
   - This step is required for updating the configuration file. Modifying the configuration file on the background is an improper operation because the modification will be overwritten after configuration synchronization.
4. Click **Save**, and then click **OK**.
5. Click **Finish**.

Step 4 Verify log transmission.

1. Log in to FusionInsight Manager as a user who has the management permission on HDFS. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster >** *Name of the desired cluster* > **Services** > **HDFS**, click the HDFS web UI link of **NameNode**(*Node name*, **Active**) to go to the HDFS web UI, and choose **Utilities** > **Browse the file system**.
2. Check whether the data is generated in the **/flume/test** directory on the HDFS.

----End

12.7.10.6 Typical Scenario: Collecting Logs from Kafka and Uploading Them to HDFS Through the Flume Client

Scenario

This section describes how to use Flume to collect logs from the Topic list (test1) of Kafka client and save them to the **/flume/test** directory on HDFS.

This section applies to MRS 3.*x* or later.

NOTE

By default, the cluster network environment is secure and the SSL authentication is not enabled during the data transmission process. For details about how to use the encryption mode, see **Configuring the Encrypted Transmission**.

Prerequisites

- The cluster, HDFS, Kafka, and Flume service have been installed.
- You have created user **flume_hdfs** and authorized the HDFS directory and data to be operated during log verification.
- The network environment of the cluster is secure.

Procedure

Step 1 On FusionInsight Manager, choose **System > User** and choose **More > Download Authentication Credential** to download the Kerberos certificate file of user **flume_hdfs** and save it to the local host.

Step 2 Configure the client parameters of the Flume role.

1. Use the Flume configuration tool on FusionInsight Manager to configure the Flume role client parameters and generate a configuration file.
   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **client**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

      For example, use Kafka Source, File Channel, and HDFS Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-142** based on the actual environment.

      NOTE

      - If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
      - It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-142 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
kafka.topics	Specifies the subscribed Kafka topic list, in which topics are separated by commas (,). This parameter cannot be left blank.	test1
kafka.consumer.group.id	Specifies the data group ID obtained from Kafka. This parameter cannot be left blank.	flume
kafka.bootstrap.servers	Specifies the bootstrap IP address and port list of Kafka. The default value is all Kafka lists in a Kafka cluster. If Kafka has been installed in the cluster and its configurations have been synchronized, this parameter can be left blank.	192.168.101.10:21007
batchSize	Specifies the number of events that Flume sends in a batch (number of data pieces).	61200

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/checkpoint

Parameter	Description	Example Value
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hdfs.path	Specifies the HDFS data write directory. This parameter cannot be left blank.	hdfs://hacluster/flume/test
hdfs.inUsePrefix	Specifies the prefix of the file that is being written to HDFS.	TMP_
hdfs.batchSize	Specifies the maximum number of events that can be written to HDFS once.	61200
hdfs.kerberosPrincipal	Specifies the Kerberos authentication user, which is mandatory in security versions. This configuration is required only in security clusters.	flume_hdfs
hdfs.kerberosKeytab	Specifies the keytab file path for Kerberos authentication, which is mandatory in security versions. This configuration is required only in security clusters.	/opt/test/conf/user.keytab **NOTE** Obtain the **user.keytab** file from the Kerberos certificate file of the user **flume_hdfs**. In addition, ensure that the user who installs and runs the Flume client has the read and write permissions on the **user.keytab** file.
hdfs.useLocalTimeStamp	Specifies whether to use the local time. Possible values are **true** and **false**.	true

2. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.
3. To connect the Flume client to the HDFS, you need to add the following configuration:
   a. Download the Kerberos certificate of account **flume_hdfs** and obtain the **krb5.conf** configuration file. Upload the configuration file to the **fusioninsight-flume-1.9.0/conf/** directory on the node where the client is installed.
   b. In **fusioninsight-flume-1.9.0/conf/**, create the **jaas.conf** configuration file.

      vi jaas.conf

      ```
      KafkaClient {
      com.sun.security.auth.module.Krb5LoginModule required
      useKeyTab=true
      keyTab="/opt/test/conf/user.keytab"
      principal="flume_hdfs@<System domain name>"
      useTicketCache=false
      storeKey=true
      debug=true;
      };
      ```

      Values of **keyTab** and **principal** vary depending on the actual situation.
   c. Obtain configuration files **core-site.xml** and **hdfs-site.xml** from **/opt/FusionInsight_Cluster_*<Cluster ID>*_Flume_ClientConfig/Flume/config** and upload them to **fusioninsight-flume-1.9.0/conf/**.
4. Restart the Flume service.

Step 3 Verify log transmission.

1. Log in to FusionInsight Manager as a user who has the management permission on HDFS. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster >** *Name of the desired cluster* > **Services** > **HDFS**, click the HDFS WebUI link of **NameNode** (*Node name*, **Active**) to go to the HDFS WebUI, and choose **Utilities** > **Browse the file system**.
2. Check whether the data is generated in the **/flume/test** directory on the HDFS.

----End

12.7.10.7 Typical Scenario: Collecting Local Static Logs and Uploading Them to HBase

Scenario

This section describes how to use Flume to collect static logs from a local computer (service IP address: 192.168.108.11) and upload them to the **flume_test** table of HBase.

This section applies to MRS 3.*x* or later.

NOTE

By default, the cluster network environment is secure and the SSL authentication is not enabled during the data transmission process. For details about how to use the encryption mode, see **Configuring the Encrypted Transmission**. The configuration can apply to scenarios where only the client or the server is configured, for example, Client/Server:Spooldir Source+File Channel+HBase Sink.

Prerequisites

- The cluster, HBase, and Flume service have been installed.
- The network environment of the cluster is secure.
- An HBase table has been created by running the **create 'flume_test', 'cf'** command.
- The system administrator has understood service requirements and prepared HBase administrator **flume_hbase**.

Procedure

Step 1 On FusionInsight Manager, choose **System > User** and choose **More > Download Authentication Credential** to download the Kerberos certificate file of user **flume_hbase** and save it to the local host.

Step 2 Configure the client parameters of the Flume role.

1. Use the Flume configuration tool on FusionInsight Manager to configure the Flume role client parameters and generate a configuration file.
   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **client**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

      Use SpoolDir Source, File Channel, and Avro Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-143** based on the actual environment.

      NOTE

      - If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
      - It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.

   d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-143 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
spoolDir	Specifies the directory where the file to be collected resides. This parameter cannot be left blank. The directory needs to exist and have the write, read, and execute permissions on the flume running user.	/srv/BigData/hadoop/data1/zb
trackerDir	Specifies the path for storing the metadata of files collected by Flume.	/srv/BigData/hadoop/data1/tracker
batchSize	Specifies the number of events that Flume sends in a batch (number of data pieces). A larger value indicates higher performance and lower timeliness.	61200

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/checkpoint

Parameter	Description	Example Value
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hostname	Specifies the name or IP address of the host whose data is to be sent. This parameter cannot be left blank. Name or IP address must be configured to be the name or IP address that the Avro source associated with it.	192.168.108.11
port	Specifies the port that sends the data. This parameter cannot be left blank. It must be consistent with the port that is monitored by the connected Avro Source.	21154

Parameter	Description	Example Value
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	false

2. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.

Step 3 Configure the server parameters of the Flume role and upload the configuration file to the cluster.

1. Use the Flume configuration tool on the FusionInsight Manager portal to configure the server parameters and generate the configuration file.
   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **server**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.
      For example, use Avro Source, File Channel, and HBase Sink.
   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-144** based on the actual environment.

NOTE

- If the server parameters of the Flume role have been configured, you can choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance** on FusionInsight Manager. Then select the corresponding Flume role instance and click the **Download** button behind the **flume.config.file** parameter on the **Instance Configurations** page to obtain the existing server parameter configuration file. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to non-encrypted transmission.
- It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
- A unique checkpoint directory needs to be configured for each File Channel.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-144 Parameters to be modified of the Flume role server

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
bind	Specifies the IP address to which Avro Source is bound. This parameter cannot be left blank. It must be configured as the IP address that the server configuration file will upload.	192.168.108.11
port	Specifies the ID of the port that the Avro Source monitors. This parameter cannot be left blank. It must be configured as an unused port.	21154
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	false

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/checkpoint
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
table	Specifies the HBase table name. This parameter cannot be left blank.	flume_test
columnFamily	Specifies the HBase column family name. This parameter cannot be left blank.	cf
batchSize	Specifies the maximum number of events written to HBase by Flume in a batch.	61200

Parameter	Description	Example Value
kerberosPrincipal	Specifies the Kerberos authentication user, which is mandatory in security versions. This configuration is required only in security clusters.	flume_hbase
kerberosKeytab	Specifies the file path for Kerberos authentication, which is mandatory in security versions. This configuration is required only in security clusters.	/opt/test/conf/user.keytab **NOTE** Obtain the **user.keytab** file from the Kerberos certificate file of the user **flume_hbase**. In addition, ensure that the user who installs and runs the Flume client has the read and write permissions on the **user.keytab** file.

2. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume**. On the displayed page, click the **Flume** role on the **Instance** tab page.
3. Select the Flume role of the node where the configuration file is to be uploaded, choose **Instance Configurations** > **Import** beside the **flume.config.file**, and select the **properties.properties** file.

   NOTE

   - An independent server configuration file can be uploaded to each Flume instance.
   - This step is required for updating the configuration file. Modifying the configuration file on the background is an improper operation because the modification will be overwritten after configuration synchronization.
4. Click **Save**, and then click **OK**.
5. Click **Finish**.

Step 4 Verify log transmission.

1. Go to the directory where the HBase client is installed.

   cd /*Client installation directory***/ HBase/hbase**

   kinit flume_hbase (Enter the password.)
2. Run the **hbase shell** command to access the HBase client.
3. Run the **scan 'flume_test'** statement. Logs are written in the HBase column family by line.

```
hbase(main):001:0> scan 'flume_test'
ROW                                   COLUMN
+CELL

2017-09-18 16:05:36,394 INFO  [hconnection-0x415a3f6a-shared--pool2-t1] ipc.AbstractRpcClient:

12.7.11 Encrypted Transmission

12.7.11.1 Configuring the Encrypted Transmission

Scenario

This section describes how to configure the server and client parameters of the Flume service (including the Flume and MonitorServer roles) after the cluster is installed to ensure proper running of the service.

This section applies to MRS 3.*x* or later.

Prerequisites

The cluster and Flume service have been installed.

Procedure

Step 1 Generate the certificate trust lists of the server and client of the Flume role respectively.

1. Remotely log in to the node using ECM where the Flume server is to be installed as user **omm**. Go to the **${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin** directory.

   cd ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin

   NOTE

   The version 8.1.0.1 is used as an example. Replace it with the actual version number.

2. Run the following command to generate and export the server and client certificates of the Flume role:

   sh geneJKS.sh -f *xxx* **-g** *xxx*

   The generated certificate is saved in the **${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf** path .

   - **flume_sChat.jks** is the certificate library of the Flume role server. **flume_sChat.crt** is the exported file of the **flume_sChat.jks** certificate. **-f** indicates the password of the certificate and certificate library.
   - **flume_cChat.jks** is the certificate library of the Flume role client. **flume_cChat.crt** is the exported file of the **flume_cChat.jks** certificate. **-g** indicates the password of the certificate and certificate library.

- **flume_sChatt.jks** and **flume_cChatt.jks** are the SSL certificate trust lists of the Flume server and client, respectively.

NOTE

All user-defined passwords involved in this section must meet the following requirements:

- The password must contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- The password must contain 8 to 64 characters.
- It is recommended that the user-defined passwords be changed periodically (for example, every three months), and certificates and trust lists be generated again to ensure security.

Step 2 Configure the server parameters of the Flume role and upload the configuration file to the cluster.

1. Remotely log in to any node where the Flume role is located as user **omm** using ECM. Run the following command to go to the ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin directory:

   cd ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin

2. Run the following command to generate and obtain Flume server keystore password, trust list password, and keystore-password encrypted private key information. Enter the password twice and confirm the password. It is the password of the **flume_sChat.jks** certificate library.

   ./genPwFile.sh

   cat password.property

3. Use the Flume configuration tool on the FusionInsight Manager portal to configure the server parameters and generate the configuration file.

   a. Log in to FusionInsight Manager. Choose **Services** > **Flume** > **Configuration Tool**.

   b. Set **Agent Name** to **server**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

      For example, use Avro Source, File Channel, and HDFS Sink.

   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-145** based on the actual environment.

      NOTE

      - If the server parameters of the Flume role have been configured, you can choose **Services** > **Flume** > **Instance** on FusionInsight Manager. Then select the corresponding Flume role instance and click the **Download** button behind the **flume.config.file** parameter on the **Instance Configurations** page to obtain the existing server parameter configuration file. Choose **Services** > **Flume** > **Import** to change the relevant configuration items of encrypted transmission after the file is imported.
      - It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-145 Parameters to be modified of the Flume role server

Parameter	Description	Example Value
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	true
keystore	Indicates the server certificate.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/flume_sChat.jks
keystore-password	Specifies the password of the key library, which is the password required to obtain the keystore information. Enter the value of password obtained in **Step 2.2**.	-
truststore	Indicates the SSL certificate trust list of the server.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/flume_sChatt.jks
truststore-password	Specifies the trust list password, which is the password required to obtain the truststore information. Enter the value of password obtained in **Step 2.2**.	-

4. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume**. On the displayed page, click the **Flume** role under **Role**.
5. Select the Flume role of the node where the configuration file is to be uploaded, choose **Instance Configurations** > **Import** beside the **flume.config.file**, and select the **properties.properties** file.

NOTE

- An independent server configuration file can be uploaded to each Flume instance.
- This step is required for updating the configuration file. Modifying the configuration file on the background is an improper operation because the modification will be overwritten after configuration synchronization.

6. Click **Save**, and then click **OK**. Click **Finish**.

Step 3 Set the client parameters of the Flume role.

1. Run the following commands to copy the generated client certificate (**flume_cChat.jks**) and client trust list (**flume_cChatt.jks**) to the client directory, for example, **/opt/flume-client/fusionInsight-flume-1.9.0/conf/**. (The Flume client must have been installed.) **10.196.26.1** is the service plane IP address of the node where the client resides.

   scp ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/flume_cChat.jks user@10.196.26.1:/opt/flume-client/fusionInsight-flume-1.9.0/conf/

   scp ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/flume_cChatt.jks user@10.196.26.1:/opt/flume-client/fusionInsight-flume-1.9.0/conf/

   NOTE

   When copying the client certificate, you need to enter the password of user **user** of the host (for example, **10.196.26.1**) where the client resides.

2. Log in to the node where the Flume client is decompressed as user **user**. Run the following command to go to the client directory **opt/flume-client/fusionInsight-flume-1.9.0/bin**.

   cd opt/flume-client/fusionInsight-flume-1.9.0/bin

3. Run the following command to generate and obtain Flume client keystore password, trust list password, and keystore-password encrypted private key information. Enter the password twice and confirm the password. The password is the same as the password of the certificate whose alias is *flumechatclient* and the password of the *flume_cChat.jks* certificate library.

   ./genPwFile.sh

   cat password.property

   NOTE

   If the following error message is displayed, run the export **JAVA_HOME=*JDK path*** command.

   ```
   JAVA_HOME is null in current user,please install the JDK and set the JAVA_HOME
   ```

4. Run the **echo $SCC_PROFILE_DIR** command to check whether the **SCC_PROFILE_DIR** environment variable is empty.
   - If yes, run the **source .sccfile** command.
   - If no, go to **Step 3.5**.

5. Use the Flume configuration tool on FusionInsight Manager to configure the Flume role client parameters and generate a configuration file.

   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.

b. Set **Agent Name** to **client**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

   For example, use SpoolDir Source, File Channel, and Avro Sink.

c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-146** based on the actual environment.

   NOTE

   - If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to encrypted transmission.
   - It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
   - A unique checkpoint directory needs to be configured for each File Channel.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-146 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
ssl	Indicates whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	true
keystore	Specified the client certificate.	/opt/flume-client/fusionInsight-flume-1.9.0/conf/flume_cChat.jks

Parameter	Description	Example Value
keystore-password	Specifies the password of the key library, which is the password required to obtain the keystore information. Enter the value of password obtained in **Step 3.3**.	-
truststore	Indicates the SSL certificate trust list of the client.	/opt/flume-client/fusionInsight-flume-1.9.0/conf/flume_cChatt.jks
truststore-password	Specifies the trust list password, which is the password required to obtain the truststore information. Enter the value of password obtained in **Step 3.3**.	-

6. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.

Step 4 Generate the certificate and trust list of the server and client of the MonitorServer role respectively.

1. Log in to the host using ECM with the MonitorServer role assigned as user **omm**.

   Go to the **${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin** directory.

   cd ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin

2. Run the following command to generate and export the server and client certificates of the MonitorServer role:

   sh geneJKS.sh -m *xxx* **-n** ***xxx***

   The generated certificate is saved in the **${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf** path. Where:

   - **ms_sChat.jks** is the certificate library of the MonitorServer role server. **ms_sChat.crt** is the exported file of the **ms_sChat.jks** certificate. **-m** indicates the password of the certificate and certificate library.
   - **ms_cChat.jks** is the certificate library of the MonitorServer role client. **ms_cChat.crt** is the exported file of the **ms_cChat.jks** certificate. **-n** indicates the password of the certificate and certificate library.

- **ms_sChatt.jks** and **ms_cChatt.jks** are the SSL certificate trust lists of the MonitorServer server and client, respectively.

Step 5 Set the server parameters of the MonitorServer role.

1. Run the following command to generate and obtain MonitorServer server keystore password, trust list password, and keystore-password encrypted private key information. Enter the password twice and confirm the password. The password is the same as the password of the certificate whose alias is *mschatserver* and the password of the *ms_sChat.jks* certificate library.

   ./genPwFile.sh

   cat password.property

2. Run the following command to open the ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/service/application.properties file: Modify related parameters based on the description in **Table 12-147**, save the modification, and exit.

   vi ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1**/install/FusionInsight-Flume-1.9.0/flume/conf/service/application.properties**

   Table 12-147 Parameters to be modified of the MonitorServer role server

Parameter	Description	Example Value
ssl_need_kspasswd_decrypt_key	Specifies whether to enable the user-defined key encryption and decryption function. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true
ssl_server_enable	Indicates whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true
ssl_server_key_store	Set this parameter based on the specific storage location.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_sChat.jks

Parameter	Description	Example Value
ssl_server_trust_key_store	Set this parameter based on the specific storage location.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_sChatt.jks
ssl_server_key_store_password	Indicates the client certificate password. Set this parameter based on the actual situation of certificate creation (the plaintext key used to generate the certificate). Enter the value of password obtained in **Step 5.1**.	-
ssl_server_trust_key_store_password	Specifies the trustkeystore password. Set this parameter based on the actual situation of certificate creation (the plaintext key used to generate the trust list). Enter the value of password obtained in **Step 5.1**.	-
ssl_need_client_auth	Indicates whether to enable the client authentication. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true

3. Restart the MonitorServer instance. Choose **Services** > **Flume** > **Instance** > **MonitorServer**, select the MonitorServer instance, and choose **More** > **Restart Instance**. Enter the administrator password and click **OK**. After the restart is complete, click **Finish**.

Step 6 Set the client parameters of the MonitorServer role.

1. Run the following commands to copy the generated client certificate (**ms_cChat.jks**) and client trust list (**ms_cChatt.jks**) to the **/opt/flume-client/fusionInsight-flume-1.9.0/conf/** client directory. **10.196.26.1** is the service plane IP address of the node where the client resides.

   scp ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_cChat.jks user@10.196.26.1:/opt/flume-client/fusionInsight-flume-1.9.0/conf/

scp ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_cChatt.jks user@10.196.26.1:/opt/flume-client/fusionInsight-flume-1.9.0/conf/

2. Log in to the node where the Flume client is located as **user**. Run the following command to go to the client directory **/opt/flume-client/fusionInsight-flume-1.9.0/bin**.

   cd /opt/flume-client/fusionInsight-flume-1.9.0/bin

3. Run the following command to generate and obtain MonitorServer client keystore password, trust list password, and keystore-password encrypted private key information. Enter the password twice and confirm the password. The password is the same as the password of the certificate whose alias is *mschatclient* and the password of the *ms_cChat.jks* certificate library.

   ./genPwFile.sh

   cat password.property

4. Run the following command to open the **/opt/flume-client/fusionInsight-flume-1.9.0/conf/service/application.properties** file. (**/opt/flume-client/fusionInsight-flume-1.9.0** is the directory where the client software is installed.) Modify related parameters based on the description in **Table 12-148**, save the modification, and exit.

   vi /opt/flume-client/fusionInsight-flume-1.9.0/flume/conf/service/application.properties

Table 12-148 Parameters to be modified of the MonitorServer role client

Parameter	Description	Example Value
ssl_need_kspaswd_decrypt_key	Indicates whether to enable the user-defined key encryption and decryption function. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true
ssl_client_enable	Indicates whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true

Parameter	Description	Example Value
ssl_client_key_store	Set this parameter based on the specific storage location.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_cChat.jks
ssl_client_trust_key_store	Set this parameter based on the specific storage location.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_cChatt.jks
ssl_client_key_store_password	Specifies the keystore password. Set this parameter based on the actual situation of certificate creation (the plaintext key used to generate the certificate). Enter the value of **password** obtained in **Step 6.3**.	-
ssl_client_trust_key_store_password	Specifies the trustkeystore password. Set this parameter based on the actual situation of certificate creation (the plaintext key used to generate the trust list). Enter the value of **password** obtained in **Step 6.3**.	-
ssl_need_client_auth	Indicates whether to enable the client authentication. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true

----End

12.7.11.2 Typical Scenario: Collecting Local Static Logs and Uploading Them to HDFS

Scenario

This section describes how to use Flume to collect static logs from a local PC (service IP address: **192.168.108.11**) and save them to the **/flume/test** directory on HDFS.

This section applies to MRS 3.*x* or later.

Prerequisites

- The cluster, HDFS and Flume services, and Flume client have been installed.
- User **flume_hdfs** has been created, and the HDFS directory and data used for log verification have been authorized to the user.

Procedure

Step 1 Generate the certificate trust lists of the server and client of the Flume role respectively.

1. Log in to the node where the Flume server is located as user **omm**. Go to the **${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin** directory.

   cd ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin

2. Run the following command to generate and export the server and client certificates of the Flume role:

   sh geneJKS.sh -f *Password* **-g** *Password*

   The generated certificate is saved in the **${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf** path .

   - **flume_sChat.jks** is the certificate library of the Flume role server. **flume_sChat.crt** is the exported file of the **flume_sChat.jks** certificate. **-f** indicates the password of the certificate and certificate library.
   - **flume_cChat.jks** is the certificate library of the Flume role client. **flume_cChat.crt** is the exported file of the **flume_cChat.jks** certificate. **-g** indicates the password of the certificate and certificate library.
   - **flume_sChatt.jks** and **flume_cChatt.jks** are the SSL certificate trust lists of the Flume server and client, respectively.

   NOTE

   All user-defined passwords involved in this section must meet the following requirements:

   - Contain at least four types of the following: uppercase letters, lowercase letters, digits, and special characters.
   - Contain at least eight characters and a maximum of 64 characters.
   - It is recommended that the user-defined passwords be changed periodically (for example, every three months), and certificates and trust lists be generated again to ensure security.

Step 2 On FusionInsight Manager, choose **System > User** and choose **More > Download Authentication Credential** to download the Kerberos certificate file of user **flume_hdfs** and save it to the local host.

Step 3 Configure the server parameters of the Flume role and upload the configuration file to the cluster.

1. Log in to any node where the Flume role is located as user **omm**. Run the following command to go to the ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin directory:

   cd ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin

2. Run the following command to generate and obtain Flume server keystore password, trust list password, and keystore-password encrypted private key information. Enter the password twice and confirm the password. It is the password of the **flume_sChat.jks** certificate library.

   ./genPwFile.sh

   cat password.property

3. Use the Flume configuration tool on the FusionInsight Manager portal to configure the server parameters and generate the configuration file.

   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.

   b. Set **Agent Name** to **server**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

      For example, use Avro Source, File Channel, and HDFS Sink.

   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-149** based on the actual environment.

      NOTE

      - If the server parameters of the Flume role have been configured, you can choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance** on FusionInsight Manager. Then select the corresponding Flume role instance and click the **Download** button behind the **flume.config.file** parameter on the **Instance Configurations** page to obtain the existing server parameter configuration file. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to encrypted transmission.
      - It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.
      - A unique checkpoint directory needs to be configured for each File Channel.

   d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-149 Parameters to be modified of the Flume role server

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
bind	Specifies the IP address to which Avro Source is bound. This parameter cannot be left blank. It must be configured as the IP address that the server configuration file will upload.	192.168.108.11
port	Specifies the IP address to which Avro Source is bound. This parameter cannot be left blank. It must be configured as an unused port.	21154
ssl	Indicates whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	true
keystore	Indicates the server certificate.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/flume_sChat.jks
keystore-password	Specifies the password of the key library, which is the password required to obtain the keystore information. Enter the value of **password** obtained in **Step 3.2**.	-
truststore	Indicates the SSL certificate trust list of the server.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/flume_sChatt.jks

Parameter	Description	Example Value
truststore-password	Specifies the trust list password, which is the password required to obtain the truststore information. Enter the value of **password** obtained in **Step 3.2**.	-
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flumeserver/checkpoint
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hdfs.path	Specifies the HDFS data write directory. This parameter cannot be left blank.	hdfs://hacluster/flume/test
hdfs.inUsePrefix	Specifies the prefix of the file that is being written to HDFS.	TMP_

Parameter	Description	Example Value
hdfs.batchSize	Specifies the maximum number of events that can be written to HDFS once.	61200
hdfs.kerberosPrincipal	Specifies the Kerberos authentication user, which is mandatory in security versions. This configuration is required only in security clusters.	flume_hdfs
hdfs.kerberosKeytab	Specifies the keytab file path for Kerberos authentication, which is mandatory in security versions. This configuration is required only in security clusters.	/opt/test/conf/user.keytab **NOTE** Obtain the **user.keytab** file from the Kerberos certificate file of the user **flume_hdfs**. In addition, ensure that the user who installs and runs the Flume client has the read and write permissions on the **user.keytab** file.
hdfs.useLocalTimeStamp	Specifies whether to use the local time. Possible values are **true** and **false**.	true

4. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume**. On the displayed page, click the **Flume** role under **Role**.
5. Select the Flume role of the node where the configuration file is to be uploaded, choose **Instance Configurations** > **Import** beside the **flume.config.file**, and select the **properties.properties** file.

   NOTE

   - An independent server configuration file can be uploaded to each Flume instance.
   - This step is required for updating the configuration file. Modifying the configuration file on the background is an improper operation because the modification will be overwritten after configuration synchronization.
6. Click **Save**, and then click **OK**.
7. Click **Finish**.

Step 4 Configure the client parameters of the Flume role.

1. Run the following commands to copy the generated client certificate (**flume_cChat.jks**) and client trust list (**flume_cChatt.jks**) to the client directory, for example, **/opt/flume-client/fusionInsight-flume-1.9.0/conf/**. (The Flume client must have been installed.) **10.196.26.1** is the service plane IP address of the node where the client resides.

scp ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/flume_cChat.jks user@10.196.26.1:/opt/flume-client/fusionInsight-flume-1.9.0/conf/

scp ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/flume_cChatt.jks user@10.196.26.1:/opt/flume-client/fusionInsight-flume-1.9.0/conf/

NOTE

When copying the client certificate, you need to enter the password of user **user** of the host (for example, **10.196.26.1**) where the client resides.

2. Log in to the node where the Flume client is decompressed as user **user**. Run the following command to go to the client directory **/opt/flume-client/fusionInsight-flume-1.9.0/bin**.

   cd opt/flume-client/fusionInsight-flume-1.9.0/bin

3. Run the following command to generate and obtain Flume client keystore password, trust list password, and keystore-password encrypted private key information. Enter the password twice and confirm the password. The password is the same as the password of the certificate whose alias is *flumechatclient* and the password of the *flume_cChat.jks* certificate library.

   ./genPwFile.sh

   cat password.property

   NOTE

   If the following error message is displayed, run the export **JAVA_HOME=*JDKpath*** command.

   ```
   JAVA_HOME is null in current user,please install the JDK and set the JAVA_HOME
   ```

4. Run the **echo $SCC_PROFILE_DIR** command to check whether the **SCC_PROFILE_DIR** environment variable is empty.
   - If yes, run the **source .sccfile** command.
   - If no, go to **Step 4.5**.

5. Use the Flume configuration tool on FusionInsight Manager to configure the Flume role client parameters and generate a configuration file.
   a. Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool**.
   b. Set **Agent Name** to **client**. Select the source, channel, and sink to be used, drag them to the GUI on the right, and connect them.

      Use SpoolDir Source, File Channel, and Avro Sink.

   c. Double-click the source, channel, and sink. Set corresponding configuration parameters by seeing **Table 12-150** based on the actual environment.

NOTE

- If the client parameters of the Flume role have been configured, you can obtain the existing client parameter configuration file from *client installation directory*/**fusioninsight-flume-1.9.0/conf/properties.properties** to ensure that the configuration is in concordance with the previous. Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Configuration Tool** > **Import**, import the file, and modify the configuration items related to encrypted transmission.
- It is recommended that the numbers of Sources, Channels, and Sinks do not exceed 40 during configuration file import. Otherwise, the response time may be very long.

d. Click **Export** to save the **properties.properties** configuration file to the local.

Table 12-150 Parameters to be modified of the Flume role client

Parameter	Description	Example Value
Name	The value must be unique and cannot be left blank.	test
spoolDir	Specifies the directory where the file to be collected resides. This parameter cannot be left blank. The directory needs to exist and have the write, read, and execute permissions on the flume running user.	/srv/BigData/hadoop/data1/zb
trackerDir	Specifies the path for storing the metadata of files collected by Flume.	/srv/BigData/hadoop/data1/tracker
batch-size	Specifies the number of events that Flume sends in a batch.	61200

Parameter	Description	Example Value
dataDirs	Specifies the directory for storing buffer data. The run directory is used by default. Configuring multiple directories on disks can improve transmission efficiency. Use commas (,) to separate multiple directories. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/data** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/data
checkpointDir	Specifies the directory for storing the checkpoint information, which is under the run directory by default. If the directory is inside the cluster, the **/srv/BigData/hadoop/dataX/flume/checkpoint** directory can be used. **dataX** ranges from data1 to dataN. If the directory is outside the cluster, it needs to be independently planned.	/srv/BigData/hadoop/data1/flume/checkpoint

Parameter	Description	Example Value
transactionCapacity	Specifies the transaction size, that is, the number of events in a transaction that can be processed by the current Channel. The size cannot be smaller than the batchSize of Source. Setting the same size as batchSize is recommended.	61200
hostname	Specifies the name or IP address of the host whose data is to be sent. This parameter cannot be left blank. Name or IP address must be configured to be the name or IP address that the Avro source associated with it.	192.168.108.11
port	Specifies the IP address to which Avro Sink is bound. This parameter cannot be left blank. It must be consistent with the port that is monitored by the connected Avro Source.	21154

Parameter	Description	Example Value
ssl	Specifies whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) Only Sources of the Avro type have this configuration item. ■ **true** indicates that the function is enabled. ■ **false** indicates that the client authentication function is not enabled.	true
keystore	Specifies the **flume_cChat.jks** certificate generated on the server.	/opt/flume-client/fusionInsight-flume-1.9.0/conf/flume_cChat.jks
keystore-password	Specifies the password of the key library, which is the password required to obtain the keystore information. Enter the value of **password** obtained in **Step 4.3**.	-
truststore	Indicates the SSL certificate trust list of the server.	/opt/flume-client/fusionInsight-flume-1.9.0/conf/flume_cChatt.jks
truststore-password	Specifies the trust list password, which is the password required to obtain the truststore information. Enter the value of **password** obtained in **Step 4.3**.	-

6. Upload the **properties.properties** file to **flume/conf/** under the installation directory of the Flume client.

Step 5 Generate the certificate and trust list of the server and client of the MonitorServer role respectively.

1. Log in to the host with the MonitorServer role assigned as user **omm**.

   Go to the **${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin** directory.

   cd ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/bin

2. Run the following command to generate and export the server and client certificates of the MonitorServer role:

   sh geneJKS.sh -m *Password* **-n** *Password*

   The generated certificate is saved in the **${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf** path. Where:

   - **ms_sChat.jks** is the certificate library of the MonitorServer role server. **ms_sChat.crt** is the exported file of the **ms_sChat.jks** certificate. **-m** indicates the password of the certificate and certificate library.
   - **ms_cChat.jks** is the certificate library of the MonitorServer role client. **ms_cChat.crt** is the exported file of the **ms_cChat.jks** certificate. **-n** indicates the password of the certificate and certificate library.
   - **ms_sChatt.jks** and **ms_cChatt.jks** are the SSL certificate trust lists of the MonitorServer server and client, respectively.

Step 6 Set the server parameters of the MonitorServer role.

1. Run the following command to generate and obtain MonitorServer server keystore password, trust list password, and keystore-password encrypted private key information. Enter the password twice and confirm the password. The password is the same as the password of the certificate whose alias is *mschatserver* and the password of the *ms_sChat.jks* certificate library.

   ./genPwFile.sh

   cat password.property

2. Run the following command to open the ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/service/application.properties file: Modify related parameters based on the description in **Table 12-151**, save the modification, and exit.

   vi ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1**/install/FusionInsight-Flume-1.9.0/flume/conf/service/application.properties**

Table 12-151 Parameters to be modified of the MonitorServer role server

Parameter	Description	Example Value
ssl_need_kspasswd_decrypt_key	Indicates whether to enable the user-defined key encryption and decryption function. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true
ssl_server_enable	Indicates whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true
ssl_server_key_store	Set this parameter based on the specific storage location.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_sChat.jks
ssl_server_trust_key_store	Set this parameter based on the specific storage location.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_sChatt.jks
ssl_server_key_store_password	Indicates the client certificate password. Set this parameter based on the actual situation of certificate creation (the plaintext key used to generate the certificate). Enter the value of **password** obtained in **Step 6.1**.	-

Parameter	Description	Example Value
ssl_server_trust_key_store_password	Indicates the client trust list password. Set this parameter based on the actual situation of certificate creation (the plaintext key used to generate the trust list). Enter the value of **password** obtained in **Step 6.1**.	-
ssl_need_client_auth	Indicates whether to enable the client authentication. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true

3. Restart the MonitorServer instance. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance** > **MonitorServer**, select the configured MonitorServer instance, and choose **More** > **Restart Instance**. Enter the administrator password and click **OK**. After the restart is complete, click **Finish**.

Step 7 Set the client parameters of the MonitorServer role.

1. Run the following commands to copy the generated client certificate (**ms_cChat.jks**) and client trust list (**ms_cChatt.jks**) to the **/opt/flume-client/fusionInsight-flume-1.9.0/conf/** client directory. **10.196.26.1** is the service plane IP address of the node where the client resides.

   scp ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_cChat.jks user@10.196.26.1:/opt/flume-client/fusionInsight-flume-1.9.0/conf/

   scp ${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_cChatt.jks user@10.196.26.1:/opt/flume-client/fusionInsight-flume-1.9.0/conf/

2. Log in to the node where the Flume client is located as user **user**. Run the following command to go to the client directory **/opt/flume-client/fusionInsight-flume-1.9.0/bin**.

   cd /opt/flume-client/fusionInsight-flume-1.9.0/bin

3. Run the following command to generate and obtain MonitorServer client keystore password, trust list password, and keystore-password encrypted private key information. Enter the password twice and confirm the password. The password is the same as the password of the certificate whose alias is *mschatclient* and the password of the *ms_cChat.jks* certificate library.

./genPwFile.sh

cat password.property

4. Run the following command to open the **/opt/flume-client/fusionInsight-flume-1.9.0/conf/service/application.properties** file. (**/opt/flume-client/fusionInsight-flume-1.9.0** is the directory where the client is installed.) Modify related parameters based on the description in **Table 12-152**, save the modification, and exit.

   vi /opt/flume-client/fusionInsight-flume-1.9.0/conf/service/application.properties

   Table 12-152 Parameters to be modified of the MonitorServer role client

Parameter	Description	Example Value
ssl_need_kspasswd_decrypt_key	Indicates whether to enable the user-defined key encryption and decryption function. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true
ssl_client_enable	Indicates whether to enable the SSL authentication. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true
ssl_client_key_store	Set this parameter based on the specific storage location.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_cChat.jks
ssl_client_trust_key_store	Set this parameter based on the specific storage location.	${BIGDATA_HOME}/FusionInsight_Porter_8.1.0.1/install/FusionInsight-Flume-1.9.0/flume/conf/ms_cChatt.jks

Parameter	Description	Example Value
ssl_client_key_store_password	Specifies the keystore password. Set this parameter based on the actual situation of certificate creation (the plaintext key used to generate the certificate). Enter the value of **password** obtained in **Step 7.3**.	-
ssl_client_trust_key_store_password	Specifies the trustkeystore password. Set this parameter based on the actual situation of certificate creation (the plaintext key used to generate the trust list). Enter the value of **password** obtained in **Step 7.3**.	-
ssl_need_client_auth	Indicates whether to enable the client authentication. (You are advised to enable this function to ensure security.) – **true** indicates that the function is enabled. – **false** indicates that the client authentication function is not enabled.	true

Step 8 Verify log transmission.

1. Log in to FusionInsight Manager as a user who has the management permission on HDFS. For details, see **Accessing FusionInsight Manager (MRS 3.x or Later)**. Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**, click the HDFS WebUI link to go to the HDFS WebUI, and choose **Utilities** > **Browse the file system**.
2. Check whether the data is generated in the **/flume/test** directory on the HDFS.

----End

12.7.12 Viewing Flume Client Monitoring Information

Scenario

The Flume client outside the FusionInsight cluster is a part of the end-to-end data collection. Both the Flume client outside the cluster and the Flume server in the cluster need to be monitored. Users can use FusionInsight Manager to monitor the Flume client and view the monitoring indicators of the Source, Sink, and Channel of the client as well as the client process status.

This section applies to MRS 3.*x* or later.

Procedure

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Flume Management** to view the current Flume client list and process status.

Step 3 Click the **Instance ID**, and view client monitoring metrics in the **Current** area.

Step 4 Click **History**. The page for querying historical monitoring data is displayed. Select a time range and click **View** to view the monitoring data within the time range.

----End

12.7.13 Connecting Flume to Kafka in Security Mode

Scenario

This section describes how to connect to Kafka using the Flume client in security mode.

This section applies to MRS 3.*x* or later.

Procedure

Step 1 Create a **jaas.conf** file and save it to **${***Flume client installation directory***} /conf**. The content of the **jaas.conf** file is as follows:

```
KafkaClient {
com.sun.security.auth.module.Krb5LoginModule required
useKeyTab=true
keyTab="/opt/test/conf/user.keytab"
principal="flume_hdfs@<System domain name>"
useTicketCache=false
storeKey=true
debug=true;
 };
```

Set **keyTab** and **principal** based on site requirements. The configured **principal** must have certain kafka permissions.

Step 2 Configure services. Set the port number of **kafka.bootstrap.servers** to **21007**, and set **kafka.security.protocol** to **SASL_PLAINTEXT**.

Step 3 If the domain name of the cluster where Kafka is located is changed, change the value of *-Dkerberos.domain.name* in the **flume-env.sh** file in **$**{*Flume client installation directory*} **/conf/** based on the site requirements.

Step 4 Upload the configured **properties.properties** file to **${***Flume client installation directory***} /conf**.

----End

12.7.14 Connecting Flume with Hive in Security Mode

Scenario

This section describes how to use Flume to connect to Hive (version 3.1.0) in the cluster.

This section applies to MRS 3.*x* or later.

Prerequisites

Flume and Hive have been correctly installed in the cluster. The services are running properly, and no alarm is reported.

Procedure

Step 1 Import the following JAR packages to the lib directory (client/server) of the Flume instance to be tested as user **omm**:

- antlr-2.7.7.jar
- antlr-runtime-3.4.jar
- calcite-core-1.16.0.jar
- hadoop-mapreduce-client-core-3.1.1.jar
- hive-beeline-3.1.0.jar
- hive-cli-3.1.0.jar
- hive-common-3.1.0.jar
- hive-exec-3.1.0.jar
- hive-hcatalog-core-3.1.0.jar
- hive-hcatalog-***-adapter-3.1.0.jar
- hive-hcatalog-server-extensions-3.1.0.jar
- hive-hcatalog-streaming-3.1.0.jar
- hive-metastore-3.1.0.jar
- hive-service-3.1.0.jar
- libfb303-0.9.3.jar
- hadoop-plugins-1.0.jar

You can obtain the JAR package from the Hive installation directory and restart the Flume process to ensure that the JAR package is loaded to the running environment.

Step 2 Set Hive configuration items.

On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations** > **HiveServer** > **Customization** > **hive.server.customized.configs**.

Example configurations:

Name	Value
hive.support.concurrency	true
hive.exec.dynamic.partition.mode	nonstrict
hive.txn.manager	org.apache.hadoop.hive.ql.lockmgr.DbTxnManager
hive.compactor.initiator.on	true
hive.compactor.worker.threads	1

Step 3 Prepare the system user **flume_hive** who has the supergroup and Hive permissions, install the client, and create the required Hive table.

Example:

1. The cluster client has been correctly installed. For example, the installation directory is **/opt/client**.
2. Run the following command to authenticate the user:

   cd /opt/client

   source bigdata_env

   kinit flume_hive
3. Run the **beeline** command and run the following table creation statement:

   ```
   create table flume_multi_type_part(id string, msg string)
   partitioned by (country string, year_month string, day string)
   clustered by (id) into 5 buckets
   stored as orc TBLPROPERTIES('transactional'='true');
   ```
4. Run the **select * from** *Table name***;** command to query data in the table.

   In this case, the number of data records in the table is **0**.

Step 4 Prepare related configuration files. Assume that the client installation package is stored in **/opt/FusionInsight_Cluster_1_Services_ClientConfig**.

1. Obtain the following files from the $*Client decompression directory*/**Hive/config** directory:
   - hivemetastore-site.xml
   - hive-site.xml
2. Obtain the following files from the **$***Client decompression directory*/**HDFS/config** directory:

   core-site.xml
3. Create a directory on the host where the Flume instance is started and save the prepared files to the created directory.

   Example: **/opt/hivesink-conf/hive-site.xml**.
4. Copy all property configurations in the **hivemetastore-site.xml** file to the **hive-site.xml** file and ensure that the configurations are placed before the original configurations.

   Data is loaded in sequence in Hive.

NOTE

Ensure that the Flume running user **omm** has the read and write permissions on the directory where the configuration file is stored.

Step 5 Observe the result.

On the Hive client, run the **select * from** *Table name*; command. Check whether the corresponding data has been written to the Hive table.

----End

Examples

Flume configuration example (SpoolDir--Mem--Hive):

```
server.sources = spool_source
server.channels = mem_channel
server.sinks = Hive_Sink

#config the source
server.sources.spool_source.type = spooldir
server.sources.spool_source.spoolDir = /tmp/testflume
server.sources.spool_source.montime =
server.sources.spool_source.fileSuffix =.COMPLETED
server.sources.spool_source.deletePolicy = never
server.sources.spool_source.trackerDir =.flumespool
server.sources.spool_source.ignorePattern = ^$
server.sources.spool_source.batchSize = 20
server.sources.spool_source.inputCharset =UTF-8
server.sources.spool_source.selector.type = replicating
server.sources.spool_source.fileHeader = false
server.sources.spool_source.fileHeaderKey = file
server.sources.spool_source.basenameHeaderKey= basename
server.sources.spool_source.deserializer = LINE
server.sources.spool_source.deserializer.maxBatchLine= 1
server.sources.spool_source.deserializer.maxLineLength= 2048
server.sources.spool_source.channels = mem_channel

#config the channel
server.channels.mem_channel.type = memory
server.channels.mem_channel.capacity =10000
server.channels.mem_channel.transactionCapacity= 2000
server.channels.mem_channel.channelfullcount= 10
server.channels.mem_channel.keep-alive = 3
server.channels.mem_channel.byteCapacity =
server.channels.mem_channel.byteCapacityBufferPercentage= 20

#config the sink
server.sinks.Hive_Sink.type = hive
server.sinks.Hive_Sink.channel = mem_channel
server.sinks.Hive_Sink.hive.metastore = thrift://${any MetaStore service IP address}:21088
server.sinks.Hive_Sink.hive.hiveSite = /opt/hivesink-conf/hive-site.xml
server.sinks.Hive_Sink.hive.coreSite = /opt/hivesink-conf/core-site.xml
server.sinks.Hive_Sink.hive.metastoreSite = /opt/hivesink-conf/hivemeatastore-site.xml
server.sinks.Hive_Sink.hive.database = default
server.sinks.Hive_Sink.hive.table = flume_multi_type_part
server.sinks.Hive_Sink.hive.partition = Tag,%Y-%m,%d
server.sinks.Hive_Sink.hive.txnsPerBatchAsk= 100
server.sinks.Hive_Sink.hive.autoCreatePartitions= true
server.sinks.Hive_Sink.useLocalTimeStamp = true
server.sinks.Hive_Sink.batchSize = 1000
server.sinks.Hive_Sink.hive.kerberosPrincipal= super1
server.sinks.Hive_Sink.hive.kerberosKeytab= /opt/mykeytab/user.keytab
server.sinks.Hive_Sink.round = true
server.sinks.Hive_Sink.roundValue = 10
server.sinks.Hive_Sink.roundUnit = minute
server.sinks.Hive_Sink.serializer = DELIMITED
```

```
server.sinks.Hive_Sink.serializer.delimiter= ";"
server.sinks.Hive_Sink.serializer.serdeSeparator= ';'
server.sinks.Hive_Sink.serializer.fieldnames= id,msg
```

12.7.15 Configuring the Flume Service Model

12.7.15.1 Overview

This section applies to MRS 3.*x* or later.

Guide a reasonable Flume service configuration by providing performance differences between Flume common modules, to avoid a nonstandard overall service performance caused when a frontend Source and a backend Sink do not match in performance.

Only single channels are compared for description.

12.7.15.2 Service Model Configuration Guide

This section applies to MRS 3.*x* or later.

During Flume service configuration and module selection, the ultimate throughput of a sink must be greater than the maximum throughput of a source. Otherwise, in extreme load scenarios, the write speed of the source to a channel is greater than the read speed of sink from channel. Therefore, the channel is fully occupied due to frequent usage, and the performance is affected.

Avro Source and Avro Sink are usually used in pairs to transfer data between multiple Flume Agents. Therefore, Avro Source and Avro Sink do not become a performance bottleneck in general scenarios.

Inter-Module Performance

Based on comparison between the limit performances of modules, Kafka Sink and HDFS Sink can meet the throughput requirements when the front-end is SpoolDir Source. However, HBase Sink could become performance bottlenecks due to the low write performances thereof. As a result, data is stacked in Channel. If you have to use HBase Sink or other sinks that are prone to become performance bottlenecks, you can use **Channel Selector** or **Sink Group** to meet performance requirements.

Channel Selector

A channel selector allows a source to connect to multiple channels. Data of the source can be distributed or copied by selecting different types of selectors. Currently, a channel selector provided by Flume can be a replicating channel selector or a multiplexing channel selector.

Replicating: indicates that the data of the source is synchronized to all channels.

Multiplexing: indicates that based on the value of a specific field of the header of an event, a channel is selected to send the data. In this way, the data is distributed based on a service type.

- Replicating configuration example:

```
client.sources = kafkasource
client.channels = channel1 channel2
client.sources.kafkasource.type = org.apache.flume.source.kafka.KafkaSource
client.sources.kafkasource.kafka.topics = topic1,topic2
client.sources.kafkasource.kafka.consumer.group.id = flume
client.sources.kafkasource.kafka.bootstrap.servers = 10.69.112.108:21007
client.sources.kafkasource.kafka.security.protocol = SASL_PLAINTEXT
client.sources.kafkasource.batchDurationMillis = 1000
client.sources.kafkasource.batchSize = 800
client.sources.kafkasource.channels = channel1 c el2

client.sources.kafkasource.selector.type = replicating
client.sources.kafkasource.selector.optional = channel2
```

Table 12-153 Parameters in the Replicating configuration example

Parameter	Default Value	Description
Selector.type	replicating	Selector type. Set this parameter to **replicating**.
Selector.optional	-	Optional channel. Configure this parameter as a list.

- Multiplexing configuration example:

```
client.sources = kafkasource
client.channels = channel1 channel2
client.sources.kafkasource.type = org.apache.flume.source.kafka.KafkaSource
client.sources.kafkasource.kafka.topics = topic1,topic2
client.sources.kafkasource.kafka.consumer.group.id = flume
client.sources.kafkasource.kafka.bootstrap.servers = 10.69.112.108:21007
client.sources.kafkasource.kafka.security.protocol = SASL_PLAINTEXT
client.sources.kafkasource.batchDurationMillis = 1000
client.sources.kafkasource.batchSize = 800
client.sources.kafkasource.channels = channel1 channel2

client.sources.kafkasource.selector.type = multiplexing
client.sources.kafkasource.selector.header = myheader
client.sources.kafkasource.selector.mapping.topic1 = channel1
client.sources.kafkasource.selector.mapping.topic2 = channel2
client.sources.kafkasource.selector.default = channel1
```

Table 12-154 Parameters in the Multiplexing configuration example

Parameter	Default Value	Description
Selector.type	replicating	Selector type. Set this parameter to **multiplexing**.
Selector.header	Flume.selector.header	-
Selector.default	-	-
Selector.mapping.*	-	-

In a multiplexing selector example, select a field whose name is topic from the header of the event. When the value of the topic field in the header is

topic1, send the event to a channel 1; or when the value of the topic field in the header is topic2, send the event to a channel 2.

Selectors need to use a specific header of an event in a source to select a channel, and need to select a proper header based on a service scenario to distribute data.

SinkGroup

When the performance of a backend single sink is insufficient, and high reliability or heterogeneous output is required, you can use a sink group to connect a specified channel to multiple sinks, thereby meeting use requirements. Currently, Flume provides two types of sink processors to manage sinks in a sink group. The types are load balancing and failover.

Failover: Indicates that there is only one active sink in the sink group each time, and the other sinks are on standby and inactive. When the active sink becomes faulty, one of the inactive sinks is selected based on priorities to take over services, so as to ensure that data is not lost. This is used in high-reliability scenarios.

Load balancing: Indicates that all sinks in the sink group are active. Each sink obtains data from the channel and processes the data. In addition, during running, loads of all sinks in the sink group are balanced. This is used in performance improvement scenarios.

- Load balancing configuration examples:

```
client.sources = source1
client.sinks = sink1 sink2
client.channels = channel1

client.sinkgroups = g1
client.sinkgroups.g1.sinks = sink1 sink2
client.sinkgroups.g1.processor.type = load_balance
client.sinkgroups.g1.processor.backoff = true
client.sinkgroups.g1.processor.selector = random

client.sinks.sink1.type = logger
client.sinks.sink1.channel = channel1

client.sinks.sink2.type = logger
client.sinks.sink2.channel = channel1
```

Table 12-155 Parameters of Load Balancing configuration examples

Parameter	Default Value	Description
sinks	-	Specifies the sink list of the sink group. Multiple sinks are separated by spaces.
processor.type	default	Specifies the type of a processor. Set this parameter to **load_balance**.
processor.backoff	false	Indicates whether to back off failed sinks exponentially.

Parameter	Default Value	Description
processor.selector	round_robin	Specifies the selection mechanism. It must be round_robin, random, or a customized class that inherits AbstractSinkSelector.
processor.selector.maxTimeOut	30000	Specifies the time for masking a faulty sink. The default value is 30,000 ms.

- Failover configuration examples:

```
client.sources = source1
client.sinks = sink1 sink2
client.channels = channel1

client.sinkgroups = g1
client.sinkgroups.g1.sinks = sink1 sink2
client.sinkgroups.g1.processor.type = failover
client.sinkgroups.g1.processor.priority.sink1 = 10
client.sinkgroups.g1.processor.priority.sink2 = 5
client.sinkgroups.g1.processor.maxpenalty = 10000

client.sinks.sink1.type = logger
client.sinks.sink1.channel = channel1

client.sinks.sink2.type = logger
client.sinks.sink2.channel = channel1
```

Table 12-156 Parameters in the **failover** configuration example

Parameter	Default Value	Description
sinks	-	Specifies the sink list of the sink group. Multiple sinks are separated by spaces.
processor.type	default	Specifies the type of a processor. Set this parameter to **failover**.

Parameter	Default Value	Description
processor.priority.<sinkName>	-	Priority. **<sinkName>** must be defined in description of sinks. A sink having a higher priority is activated earlier. A larger value indicates a higher priority. **Note**: If there are multiple sinks, their priorities must be different. Otherwise, only one of them takes effect.
processor.maxpenalty	30000	Specifies the maximum backoff time of failed sinks (unit: ms).

Interceptors

The Flume interceptor supports modification or discarding of basic unit events during data transmission. You can specify the class name list of built-in interceptors in Flume or develop customized interceptors to modify or discard events. The following table lists the built-in interceptors in Flume. A complex example is used in this section. Other users can configure and use interceptions as required. For details, visit the following website:

http://flume.apache.org/releases/content/1.9.0/FlumeUserGuide.html

NOTE

1. The interceptor is used between the sources and channels of Flume. Most sources provide parameters for configuring interceptors. You can set the parameters as required.
2. Flume allows multiple interceptors to be configured for a source. The interceptor names are separated by spaces.
3. The specified interceptor sequence is the order in which they are called.
4. The contents inserted by the interceptor in the header can be read and used in sink.

Table 12-157 Types of built-in interceptors in Flume

Interceptor Type	Description
Timestamp Interceptor	The interceptor inserts a timestamp into the header of an event.
Host Interceptor	The interceptor inserts the IP address or host name of the node where the agent is located into the Header of an event.

Interceptor Type	Description
Remove Header Interceptor	The interceptor discards the corresponding event based on the strings that matches the regular expression contained in the event header.
UUID Interceptor	The interceptor generates a UUID string for the header of each event.
Search and Replace Interceptor	The interceptor provides a simple string-based search and replacement function based on Java regular expressions. The rule is the same as that of Java Matcher.replaceAll().
Regex Filtering Interceptor	The interceptor uses the body of an event as a text file and matches the configured regular expression to filter events. The provided regular expression can be used to exclude or include events.
Regex Extractor Interceptor	The interceptor extracts content from the original events using a regular expression and adds the content to the header of events.

Regex Filtering Interceptor is used as an example to describe how to use the interceptor. (For other types of interceptions, see the configuration provided on the official website.)

Table 12-158 Parameter configuration for **Regex Filtering Interceptor**

Parameter	Default Value	Description
type	-	Specifies the component type name. The value must be **regex_filter**.
regex	-	Specifies the regular expression used to match events.
excludeEvents	false	By default, the matched events are collected. If this parameter is set to **true**, the matched events are deleted and the unmatched events are retained.

Configuration example (netcat tcp is used as the source, and logger is used as the sink). After configuring the preceding parameters, run the **telnet** *Host name or IP address* **44444** command on the host where the Linux operating system is run, and enter a string that complies with the regular expression and another does not

comply with the regular expression. The log shows that only the matched string is transmitted.

```
#define the source, channel, sink
server.sources = r1

server.channels = c1
server.sinks = k1

#config the source
server.sources.r1.type = netcat
server.sources.r1.bind = ${Host IP address}
server.sources.r1.port = 44444
server.sources.r1.interceptors= i1
server.sources.r1.interceptors.i1.type= regex_filter
server.sources.r1.interceptors.i1.regex= (flume)|(myflume)
server.sources.r1.interceptors.i1.excludeEvents= false
server.sources.r1.channels = c1

#config the channel
server.channels.c1.type = memory
server.channels.c1.capacity = 1000
server.channels.c1.transactionCapacity = 100
#config the sink
server.sinks.k1.type = logger
server.sinks.k1.channel = c1
```

12.7.16 Introduction to Flume Logs

Log Description

Log path: The default path of Flume log files is **/var/log/Bigdata/***Role name*.

- FlumeServer: **/var/log/Bigdata/flume/flume**
- FlumeClient: **/var/log/Bigdata/flume-client-n/flume**
- MonitorServer: **/var/log/Bigdata/flume/monitor**

Log archive rule: The automatic Flume log compression function is enabled. By default, when the size of logs exceeds 50 MB , logs are automatically compressed into a log file named in the following format: *<Original log file name>-<yyyy-mm-dd_hh-mm-ss>.[ID]***.log.zip**. A maximum of 20 latest compressed files are reserved. The number of compressed files can be configured on the Manager portal.

Table 12-159 Flume log list

Type	Name	Description
Run logs	/flume/flumeServer.log	Log file that records FlumeServer running environment information.
	/flume/install.log	FlumeServer installation log file
	/flume/flumeServer-gc.log.*<No.>*	GC log file of the FlumeServer process
	/flume/prestartDvietail.log	Work log file before the FlumeServer startup

Type	Name	Description
	/flume/startDetail.log	Startup log file of the Flume process
	/flume/stopDetail.log	Shutdown log file of the Flume process
	/monitor/monitorServer.log	Log file that records MonitorServer running environment information
	/monitor/startDetail.log	Startup log file of the MonitorServer process
	/monitor/stopDetail.log	Shutdown log file of the MonitorServer process
	function.log	External function invoking log file

Log Level

Table 12-160 describes the log levels supported by Flume.

Levels of run logs are FATAL, ERROR, WARN, INFO, and DEBUG from the highest to the lowest priority. Run logs of equal or higher levels are recorded. The higher the specified log level, the fewer the logs recorded.

Table 12-160 Log level

Type	Level	Description
Run log	FATAL	Logs of this level record critical error information about system running.
	ERROR	Logs of this level record error information about system running.
	WARN	Logs of this level record exception information about the current event processing.
	INFO	Logs of this level record normal running status information about the system and events.

Type	Level	Description
	DEBUG	Logs of this level record the system information and system debugging information.

To modify log levels, perform the following operations:

Step 1 Go to the **All Configurations** page of Flume by referring to **Modifying Cluster Service Configuration Parameters**.

Step 2 On the menu bar on the left, select the log menu of the target role.

Step 3 Select a desired log level.

Step 4 Save the configuration. In the displayed dialog box, click **OK** to make the configurations take effect.

----End

NOTE

The configurations take effect immediately without the need to restart the service.

Log Format

The following table lists the Flume log formats.

Table 12-161 Log format

Type	Format	Example
Run logs	*<yyyy-MM-dd HH:mm:ss,SSS>|<Log level>|<Name of the thread that generates the log>|<Message in the log>|<Location where the log event occurs>*	2014-12-12 11:54:57,316 | INFO | [main] | log4j dynamic load is start. | org.apache.flume.tools.LogDynamicLoad.start(LogDynamicLoad.java:59)
	<yyyy-MM-dd HH:mm:ss,SSS><Username><User IP><Time><Operation><Resource><Result><Detail>	2014-12-12 23:04:16,572 | INFO | [SinkRunner-PollingRunner-DefaultSinkProcessor] | SRCIP=null OPERATION=close

12.7.17 Flume Client Cgroup Usage Guide

Scenario

This section describes how to join and log out of a cgroup, query the cgroup status, and change the cgroup CPU threshold.

This section applies to MRS 3.*x* or later.

Procedure

- **Join Cgroup**

  Assume that the Flume client installation path is **/opt/FlumeClient**, and the cgroup CPU threshold is 50%. Run the following command to join a cgroup:

  cd /opt/FlumeClient/fusioninsight-flume-1.9.0/bin

  ./flume-manage.sh cgroup join 50

  NOTE

  - This command can be used to join a cgroup and change the cgroup CPU threshold.
  - The value of the CPU threshold of a cgroup ranges from 1 to 100 x *N*. *N* indicates the number of CPU cores.

- **Check Cgroup status**

  Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following commands to query the cgroup status:

  cd /opt/FlumeClient/fusioninsight-flume-1.9.0/bin

  ./flume-manage.sh cgroup status

- **Exit Cgroup**

  Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following commands to exit cgroup:

  cd /opt/FlumeClient/fusioninsight-flume-1.9.0/bin

  ./flume-manage.sh cgroup exit

  NOTE

  - After the client is installed, the default cgroup is automatically created. If the **-s** parameter is not configured during client installation, the default value **-1** is used. The default value indicates that the agent process is not restricted by the CPU usage.
  - Joining or exiting a cgroup does not affect the agent process. Even if the agent process is not started, the joining or exiting operation can be performed successfully, and the operation will take effect after the next startup of the agent process.
  - After the client is uninstalled, the cgroups created during the client installation are automatically deleted.

12.7.18 Secondary Development Guide for Flume Third-Party Plug-ins

Scenario

This section describes how to perform secondary development for third-party plug-ins.

This section applies to MRS 3.*x* or later.

Prerequisites

- You have obtained the third-party JAR package.
- You have installed Flume server or client.

Procedure

Step 1 Compress the self-developed code into a JAR package.

Step 2 Create a directory for the plug-in.

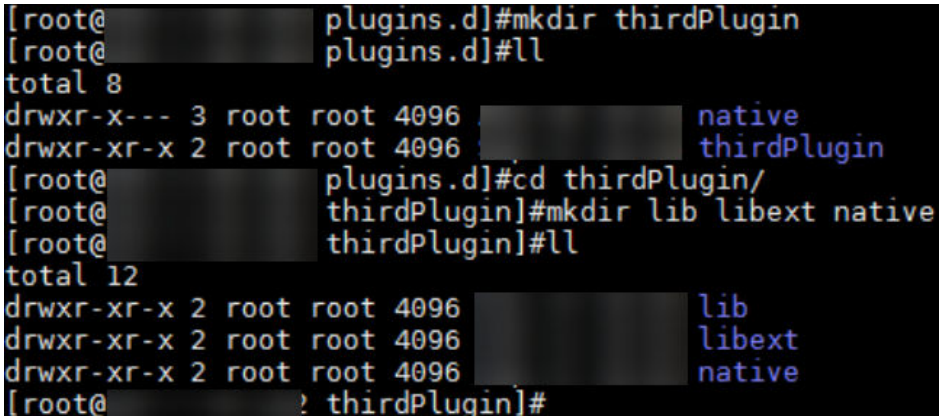
1. Access the **$FLUME_HOME/plugins.d** path and run the following command to create a directory:

   mkdir thirdPlugin

   cd thirdPlugin

   mkdir lib libext native

   The command output is displayed as follows:

2. Place the third-party JAR package in the **$FLUME_HOME/plugins.d/thirdPlugin/lib** directory. If the JAR package depends on other JAR packages, place the depended JAR packages to the **$FLUME_HOME/ plugins.d/thirdPlugin/libext** directory, and place the local library files in **$FLUME_HOME/ plugins.d/ thirdPlugin/native**.

Step 3 Configure the **properties.properties** file in **$FLUME_HOME/conf/**.

For details about how to set parameters in the **properties.properties** file, see the parameter list in the **properties.properties** file in the corresponding typical scenario **Non-Encrypted Transmission** and **Encrypted Transmission**.

NOTE

- **$FLUME_HOME** indicates the Flume installation path. Set this parameter based on the site requirements (server or client) when configuring third-party plug-ins.
- **thirdPlugin** is the name of the third-party plugin.

----End

12.7.19 Common Issues About Flume

Flume logs are stored in **/var/log/Bigdata/flume/flume/flumeServer.log**. Most data transmission exceptions and data transmission failures are recorded in logs. You can run the following command:

tailf /var/log/Bigdata/flume/flume/flumeServer.log

- Problem: After the configuration file is uploaded, an exception occurs. After the configuration file is uploaded again, the scenario requirements are still not met, but no exception is recorded in the log.

  Solution: Restart the Flume process, run the **kill -9** *Process code* to kill the process code, and view the logs.

- Issue: **"java.lang.IllegalArgumentException: Keytab is not a readable file: /opt/test/conf/user.keytab"** is displayed when HDFS is connected.

  Solution: Grant the read and write permissions to the Flume running user.

- Problem: The following error is reported when the Flume client is connected to Kafka:

  ```
  Caused by: java.io.IOException: /opt/FlumeClient/fusioninsight-flume-1.9.0/cof//jaas.conf (No such file or directory)
  ```

  Solution: Add the **jaas.conf** configuration file and save it to the **conf** directory of the Flume client.

  vi jaas.conf

  ```
  KafkaClient {
  com.sun.security.auth.module.Krb5LoginModule required
  useKeyTab=true
  keyTab="/opt/test/conf/user.keytab"
  principal="flume_hdfs@<System domain name>"
  useTicketCache=false
  storeKey=true
  debug=true;
  };
  ```

  Values of **keyTab** and **principal** vary depending on the actual situation.

- Problem: The following error is reported when the Flume client is connected to HBase:

  ```
  Caused by: java.io.IOException: /opt/FlumeClient/fusioninsight-flume-1.9.0/cof//jaas.conf (No such file or directory)
  ```

  Solution: Add the **jaas.conf** configuration file and save it to the **conf** directory of the Flume client.

  vi jaas.conf

  ```
  Client {
  com.sun.security.auth.module.Krb5LoginModule required
  useKeyTab=true
  keyTab="/opt/test/conf/user.keytab"
  principal="flume_hbase@<System domain name>"
  useTicketCache=false
  storeKey=true
  ```

```
debug=true;
};
```

Values of **keyTab** and **principal** vary depending on the actual situation.

- Question: After the configuration file is submitted, the Flume Agent occupies resources. How do I restore the Flume Agent to the state when the configuration file is not uploaded?

  Solution: Submit an empty **properties.properties** file.

12.8 Using HBase

12.8.1 Using HBase from Scratch

HBase is a column-based distributed storage system that features high reliability, performance, and scalability. This section describes how to use HBase from scratch, including how to update the client on the Master node in the cluster, create a table using the client, insert data in the table, modify the table, read data from the table, delete table data, and delete the table.

Background

Suppose a user develops an application to manage users who use service A in an enterprise. The procedure of operating service A on the HBase client is as follows:

- Create the **user_info** table.
- Add users' educational backgrounds and titles to the table.
- Query user names and addresses by user ID.
- Query information by user name.
- Deregister users and delete user data from the user information table.
- Delete the user information table after service A ends.

Table 12-162 User information

ID	Name	Gender	Age	Address
12005000201	A	Male	19	City A
12005000202	B	Female	23	City B
12005000203	C	Male	26	City C
12005000204	D	Male	18	City D
12005000205	E	Female	21	City E
12005000206	F	Male	32	City F
12005000207	G	Female	29	City G
12005000208	H	Female	30	City H
12005000209	I	Male	26	City I

ID	Name	Gender	Age	Address
12005000210	J	Male	25	City J

Prerequisites

The client has been installed. For example, the client is installed in the **/opt/client** directory. The client directory in the following operations is only an example. Change it to the actual installation directory. Before using the client, download and update the client configuration file, and ensure that the active management node of Manager is available.

Procedure

For versions earlier than MRS 3.x, perform the following operations:

Step 1 Download the client configuration file.

1. Log in to MRS Manager. For details, see **Accessing Manager**. Then, choose **Services**.
2. Click **Download Client**.

   Set **Client Type** to **Only configuration files**, **Download To** to **Server**, and click **OK** to generate the client configuration file. The generated file is saved in the **/tmp/MRS-client** directory on the active management node by default. You can customize the file path.

Step 2 Log in to the active management node of MRS Manager.

1. On the **Node** tab page, view the **Name** parameter. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node.

   The active and standby management nodes of MRS Manager are installed on Master nodes by default. Because Master1 and Master2 are switched over in active and standby mode, Master1 is not always the active management node of MRS Manager. Run a command in Master1 to check whether Master1 is active management node of MRS Manager. For details about the command, see **Step 2.4**.
2. Log in to the Master1 node using the password as user **root**.
3. Run the following commands to switch to user **omm**:

   sudo su - root

   su - omm
4. Run the following command to check the active management node of MRS Manager:

   sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh

   In the command output, the node whose **HAActive** is **active** is the active management node, and the node whose **HAActive** is **standby** is the standby management node. In the following example, **mgtomsdat-sh-3-01-1** is the active management node, and **mgtomsdat-sh-3-01-2** is the standby management node.

```
Ha mode
double
NodeName            HostName                HAVersion       StartTime           HAActive
HAAllResOK          HARunPhase
192-168-0-30        mgtomsdat-sh-3-01-1     V100R001C01     2021-11-18 23:43:02
active              normal                  Actived
192-168-0-24        mgtomsdat-sh-3-01-2     V100R001C01     2021-11-21 07:14:02
standby             normal                  Deactived
```

5. Log in to the active management node, for example, **192-168-0-30** of MRS Manager as user **root**, and run the following command to switch to user **omm**:

   sudo su - omm

Step 3 Run the following command to switch to the client installation directory, for example, **/opt/client**:

cd /opt/client

Step 4 Run the following command to update the client configuration for the active management node.

sh refreshConfig.sh /opt/client *Full path of the client configuration file package*

For example, run the following command:

sh refreshConfig.sh /opt/client /tmp/MRS-client/MRS_Services_Client.tar

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.
Succeed to refresh components client config.
```

Step 5 Use the client on a Master node.

1. On the active management node where the client is updated, for example, node **192-168-0-30**, run the following command to go to the client directory:

   cd /opt/client

2. Run the following command to configure environment variables:

   source bigdata_env

3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables. If Kerberos authentication is disabled for the current cluster, skip this step.

   kinit *MRS cluster user*

   For example, **kinit hbaseuser**.

4. Run the following HBase client command:

   hbase shell

Step 6 Run the following commands on the HBase client to implement service A.

1. Create the **user_info** user information table according to **Table 12-162** and add data to it.

   create '*user_info*',{**NAME** => 'i'}

   For example, to add information about the user whose ID is 12005000201, run the following commands:

put '*user_info*','*12005000201*','***i:name***','*A*'

put '*user_info*','*12005000201*','***i:gender***','*Male*'

put '*user_info*','*12005000201*','***i:age***','*19*'

put '*user_info*','*12005000201*','***i:address***','*City A*'

2. Add users' educational backgrounds and titles to the **user_info** table.

   For example, to add educational background and title information about user 12005000201, run the following commands:

   put '*user_info*','*12005000201*','**i:degree**','*master*'

   put '*user_info*','*12005000201*','**i:pose**','*manager*'

3. Query user names and addresses by user ID.

   For example, to query the name and address of user 12005000201, run the following command:

   scan'*user_info*',
   {**STARTROW**=>'*12005000201*',**STOPROW**=>'*12005000201*',**COLUMNS**=>['**i:name**','**i:address**']}

4. Query information by user name.

   For example, to query information about user A, run the following command:

   scan'*user_info*',{**FILTER**=>"SingleColumnValueFilter('i','name',=,'binary:*A*')"}

5. Delete user data from the user information table.

   All user data needs to be deleted. For example, to delete data of user 12005000201, run the following command:

   delete'*user_info*','*12005000201*','i'

6. Delete the user information table.

   disable'*user_info*'

   drop '*user_info*'

----End

For MRS 3.x or later, perform the following operations:

Step 1 Use the client on the active management node.

1. Log in to the node where the client is installed as the client installation user and run the following command to switch to the client directory:

   cd /opt/client

2. Run the following command to configure environment variables:

   source bigdata_env

3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables.. If Kerberos authentication is disabled for the current cluster, skip this step.

   kinit *MRS cluster user*

   For example, **kinit hbaseuser**.

4. Run the following HBase client command:

   hbase shell

Step 2 Run the following commands on the HBase client to implement service A.

1. Create the **user_info** user information table according to **Table 12-162** and add data to it.

   create '*user_info*',{**NAME** => 'i'}

   For example, to add information about the user whose ID is **12005000201**, run the following commands:

   put '*user_info*','*12005000201*','***i:name***','*A*'

   put '*user_info*','*12005000201*','***i:gender***','*Male*'

   put '*user_info*','*12005000201*','***i:age***','*19*'

   put '*user_info*','*12005000201*','***i:address***','*City A*'

2. Add users' educational backgrounds and titles to the **user_info** table.

   For example, to add educational background and title information about user 12005000201, run the following commands:

   put '*user_info*','*12005000201*','**i:degree**','*master*'

   put '*user_info*','*12005000201*','**i:pose**','*manager*'

3. Query user names and addresses by user ID.

   For example, to query the name and address of user 12005000201, run the following command:

   scan'*user_info*',
   {**STARTROW**=>'*12005000201*',**STOPROW**=>'*12005000201*',**COLUMNS**=>['**i:name**','**i:address**']}

4. Query information by user name.

   For example, to query information about user A, run the following command:

   scan'*user_info*',{**FILTER**=>"SingleColumnValueFilter('i','name',=,'binary:*A*')"}

5. Delete user data from the user information table.

   All user data needs to be deleted. For example, to delete data of user 12005000201, run the following command:

   delete'*user_info*','*12005000201*','i'

6. Delete the user information table.

   disable'*user_info*'

   drop '*user_info*'

----End

12.8.2 Using an HBase Client

Scenario

This section describes how to use the HBase client in an O&M scenario or a service scenario.

Prerequisites

- The client has been installed. For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.

- Service component users are created by the administrator as required.

  A machine-machine user needs to download the **keytab** file and a human-machine user needs to change the password upon the first login.
- If a non-**root** user uses the HBase client, ensure that the owner of the HBase client directory is this user. Otherwise, run the following command to change the owner.

  chown user:group -R *Client installation directory*/**HBase**

Using the HBase Client (Versions Earlier Than MRS 3.x)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables.. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *Component service user*

For example, **kinit hbaseuser**.

Step 5 Run the following HBase client command:

hbase shell

----End

Using the HBase Client (MRS 3.x or Later)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to go to the client directory:

cd /opt/hadoopclient

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If you use the client to connect to a specific HBase instance in a scenario where multiple HBase instances are installed, run the following command to load the environment variables of the instance. Otherwise, skip this step. For example, to load the environment variables of the HBase2 instance, run the following command:

source HBase2/component_env

Step 5 If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create HBase tables.. If Kerberos authentication is disabled for the current cluster, skip this step.

kinit *Component service user*

For example, **kinit hbaseuser**.

Step 6 Run the following HBase client command:

hbase shell

----End

Common HBase client commands

The following table lists common HBase client commands. For more commands, see **http://hbase.apache.org/2.2/book.html**.

Table 12-163 HBase client commands

Command	Description
create	Used to create a table, for example, **create 'test', 'f1', 'f2', 'f3'**.
disable	Used to disable a specified table, for example, **disable 'test'**.
enable	Used to enable a specified table, for example, **enable 'test'**.
alter	Used to alter the table structure. You can run the **alter** command to add, modify, or delete column family information and table-related parameter values, for example, **alter 'test', {NAME => 'f3', METHOD => 'delete'}**.
describe	Used to obtain the table description, for example, **describe 'test'**.
drop	Used to delete a specified table, for example, **drop 'test'**. Before deleting a table, you must stop it.
put	Used to write the value of a specified cell, for example, **put 'test','r1','f1:c1','myvalue1'**. The cell location is unique and determined by the table, row, and column.
get	Used to get the value of a row or the value of a specified cell in a row, for example, **get 'test','r1'**.
scan	Used to query table data, for example, **scan 'test'**. The table name and scanner must be specified in the command.

12.8.3 Creating HBase Roles

Scenario

This section guides the system administrator to create and configure an HBase role on Manager. The HBase role can set HBase administrator permissions and read (R), write (W), create (C), execute (X), or manage (A) permissions for HBase tables and column families.

Users can create a table, query/delete/insert/update data, and authorize others to access HBase tables after they set the corresponding permissions for the specified databases or tables on HDFS.

NOTE

- This section applies to MRS 3.*x* or later.
- HBase roles can be created in security mode, but cannot be created in normal mode.
- If the current component uses Ranger for permission control, you need to configure related policies based on Ranger for permission management. For details, see **Adding a Ranger Access Permission Policy for HBase**.

Prerequisites

- The system administrator has understood the service requirements.
- You have logged in to Manager.

Procedure

Step 1 On Manager, choose **System** > **Permission** > **Role**.

Step 2 On the displayed page, click **Create Role** and enter a **Role Name** and **Description**.

Step 3 Set **Permission**. For details, see **Table 12-164**.

HBase permissions:

- HBase Scope: Authorizes HBase tables. The minimum permission is read (R) and write (W) for columns.
- HBase administrator permission: HBase administrator permissions.

NOTE

Users have the read (R), write (W), create (C), execute (X), and administrate (A) permissions for the tables created by themselves.

Table 12-164 Setting a role

Task	Role Authorization
Setting the HBase administrator permission	In **Configure Resource Permission**, choose *Name of the desired cluster* > **HBase** and select **HBase Administrator Permission**.
Setting the permission for users to create tables	1. In **Configure Resource Permission**, choose *Name of the desired cluster* > **HBase** > **HBase Scope**. 2. Click **global**. 3. In the **Permission** column of the specified namespace, select **Create** and **Execute**. For example, select **Create** and **Execute** for the default namespace **default**.

Task	Role Authorization
Setting the permission for users to write data to tables	1. In **Configure Resource Permission**, choose *Name of the desired cluster* > **HBase** > **HBase Scope** > **global**. 2. In the **Permission** column of the specified namespace, select **Write**. For example, select **Write** for the default namespace **default**. By default, HBase sub-objects inherit the permission from the parent object.
Setting the permission for users to read data from tables	1. In **Configure Resource Permission**, choose *Name of the desired cluster* > **HBase** > **HBase Scope** > **global**. 2. In the **Permission** column of the specified namespace, select **Read**. For example, select **Read** for the default namespace **default**. By default, HBase sub-objects inherit the permission from the parent object.
Setting the permission for users to manage namespaces or tables	1. In **Configure Resource Permission**, choose *Name of the desired cluster* > **HBase** > **HBase Scope** > **global**. 2. In the **Permission** column of the specified namespace, select **Manage**. For example, select **Manage** for the default namespace **default**.

Task	Role Authorization
Setting the permission for reading data from or writing data to columns	1. In **Configure Resource Permission**, select *Name of the desired cluster* > **HBase** > **HBase Scope** > **global** and click the specified namespace to display the tables in the namespace. 2. Click a table. 3. Click a column family. 4. Confirm whether you want to create a role? – If yes, enter the column name in the **Resource Name** text box. Use commas (,) to separate multiple columns. Select **Read** or **Write**. If there are no columns with the same name in the HBase table, a newly created column with the same name as the existing column has the same permission as the existing one. The column permission is set successfully. – If no, modify the column permission of the existing HBase role. The columns for which the permission has been separately set are displayed in the table. Go to **Step 3.5**. 5. To add column permissions for a role, enter the column name in the **Resource Name** text box and set the column permissions. To modify column permissions for a role, enter the column name in the **Resource Name** text box and set the column permissions. Alternatively, you can directly modify the column permissions in the table. If the column permissions are modified in the table and column permissions with the same name are added, the settings cannot be saved. You are advised to modify the column permission of a role directly in the table. The search function is supported.

Step 4 Click **OK**, and return to the **Role** page.

----End

12.8.4 Configuring HBase Replication

Scenario

As a key feature to ensure high availability of the HBase cluster system, HBase cluster replication provides HBase with remote data replication in real time. It provides basic O&M tools, including tools for maintaining and re-establishing active/standby relationships, verifying data, and querying data synchronization progress. To achieve real-time data replication, you can replicate data from the HBase cluster to another one.

Prerequisites

- The active and standby clusters have been successfully installed and started (the cluster status is **Running** on the **Active Clusters** page), and you have the administrator rights of the clusters.
- The network between the active and standby clusters is normal and ports can be used properly.
- Cross-cluster mutual trust has been configured.
- If historical data exists in the active cluster and needs to be synchronized to the standby cluster, cross-cluster replication must be configured for the active and standby clusters. For details, see **Enabling Cross-Cluster Copy**.
- Time is consistent between the active and standby clusters and the Network Time Protocol (NTP) service on the active and standby clusters uses the same time source.
- Mapping relationships between the names of all hosts in the active and standby clusters and service IP addresses have been configured in the **/etc/hosts** file by appending **192.***.***.*** **host1** to the **hosts** file.
- The network bandwidth between the active and standby clusters is determined based on service volume, which cannot be less than the possible maximum service volume.

Constraints

- Despite that HBase cluster replication provides the real-time data replication function, the data synchronization progress is determined by several factors, such as the service loads in the active cluster and the health status of processes in the standby cluster. In normal cases, the standby cluster should not take over services. In extreme cases, system maintenance personnel and other decision makers determine whether the standby cluster takes over services according to the current data synchronization indicators.
- Currently, the replication function supports only one active cluster and one standby cluster in HBase.
- Typically, do not perform operations on data synchronization tables in the standby cluster, such as modifying table properties or deleting tables. If any misoperation on the standby cluster occurs, data synchronization between the active and standby clusters will fail and data of the corresponding table in the standby cluster will be lost.
- If the replication function of HBase tables in the active cluster is enabled for data synchronization, after modifying the structure of a table in the active cluster, you need to manually modify the structure of the corresponding table in the standby cluster to ensure table structure consistency.

Procedure

Enable the replication function for the active cluster to synchronize data written by Put.

Step 1 Log in to the MRS console, click a cluster name and choose **Components**.

Step 2 Go to the **All Configurations** page of the HBase service. For details, see **Modifying Cluster Service Configuration Parameters**.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 3 (Optional) Set configuration items listed in **Table 12-165**. You can set the parameters based on the description or use the default values.

Table 12-165 Optional configuration items

Navigation Path	Parameter	Default Value	Description
HMaster > Performance	hbase.master.logcleaner.ttl	600000	Time to live (TTL) of HLog files. If the value is set to **604800000** (unit: millisecond), the retention period of HLog is 7 days.
	hbase.master.cleaner.interval	60000	Interval for the HMaster to delete historical HLog files. The HLog that exceeds the configured period will be automatically deleted. You are advised to set it to the maximum value to save more HLogs.
RegionServer > Replication	replication.source.size.capacity	16777216	Maximum size of edits, in bytes. If the edit size exceeds the value, HLog edits will be sent to the standby cluster.
	replication.source.nb.capacity	25000	Maximum number of edits, which is another condition for triggering HLog edits to be sent to the standby cluster. After data in the active cluster is synchronized to the standby cluster, the active cluster reads and sends data in HLog according to this parameter value. This parameter is used together with **replication.source.size.capacity**.
	replication.source.maxretriesmultiplier	10	Maximum number of retries when an exception occurs during replication.
	replication.source.sleepforretries	1000	Retry interval (unit: ms)

Navigation Path	Parameter	Default Value	Description
	hbase.regionserver.replication.handler.count	6	Number of replication RPC server instances on RegionServer

Enable the replication function for the active cluster to synchronize data written by bulkload.

Step 4 Determine whether to enable bulkload replication.

NOTE

If bulkload import is used and data needs to be synchronized, you need to enable Bulkload replication.

If yes, go to **Step 5**.

If no, go to **Step 9**.

Step 5 Go to the **All Configurations** page of the HBase service parameters by referring to **Modifying Cluster Service Configuration Parameters**.

Step 6 On the HBase configuration interface of the active and standby clusters, search for **hbase.replication.cluster.id** and modify it. It specifies the HBase ID of the active and standby clusters. For example, the HBase ID of the active cluster is set to **replication1** and the HBase ID of the standby cluster is set to **replication2** for connecting the active cluster to the standby cluster. To save data overhead, the parameter value length is not recommended to exceed 30.

Step 7 On the HBase configuration interface of the standby cluster, search for **hbase.replication.conf.dir** and modify it. It specifies the HBase configurations of the active cluster client used by the standby cluster and is used for data replication when the bulkload data replication function is enabled. The parameter value is a path name, for example, **/home**.

NOTE

- In versions earlier than MRS 3.x, you do not need to set this parameter. Skip **Step 7**.
- When bulkload replication is enabled, you need to manually place the HBase client configuration files (**core-site.xml**, **hdfs-site.xml**, and **hbase-site.xml**) in the active cluster on all RegionServer nodes in the standby cluster. The actual path for placing the configuration file is **${hbase.replication.conf.dir}/${hbase.replication.cluster.id}**. For example, if **hbase.replication.conf.dir** of the standby cluster is set to **/home** and **hbase.replication.cluster.id** of the active cluster is set to **replication1**, the actual path for placing the configuration files in the standby cluster is **/home/replication1**. You also need to change the corresponding directory and file permissions by running the **chown -R omm:wheel /home/replication1** command.
- You can obtain the client configuration files from the client in the active cluster, for example, the **/opt/client/HBase/hbase/conf** path.

Step 8 On the HBase configuration page of the active cluster, search for and change the value of **hbase.replication.bulkload.enabled** to **true** to enable bulkload replication.

Restarting the HBase service and install the client

Step 9 Save the configurations and restart HBase.

Step 10 In the active and standby clusters, update the client configuration file.

Synchronize table data of the active cluster. (Skip this step if the active cluster has no data.)

Step 11 Access the HBase shell of the active cluster as user **hbase**.

1. On the active management node where the client has been updated, run the following command to go to the client directory:

   cd /opt/client

2. Run the following command to configure environment variables:

   source bigdata_env

3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. If Kerberos authentication is disabled for the current cluster, skip this step.

   kinit hbase

   NOTE

   The system prompts you to enter the password after you run **kinit hbase**. The default password of user **hbase** is **Hbase@123**.

4. Run the following HBase client command:

   hbase shell

Step 12 Check whether historical data exists in the standby cluster. If historical data exists and data in the active and standby clusters must be consistent, delete data from the standby cluster first.

1. On the HBase shell of the standby cluster, run the **list** command to view the existing tables in the standby cluster.
2. Delete data tables from the standby cluster based on the output list.

   disable '*tableName*'

   drop '*tableName*'

Step 13 After HBase replication is configured and data synchronization is enabled, check whether tables and data exist in the active cluster and whether the historical data needs to be synchronized to the standby cluster.

Run the **list** command to check the existing tables in the active cluster and run the **scan** '*tableName*' command to check whether the tables contain historical data.

- If tables exist and data needs to be synchronized, go to **Step 14**.
- If no, no further action is required.

Step 14 The HBase replication configuration does not support automatic synchronization of historical data in tables. You need to back up the historical data of the active cluster and then manually synchronize the historical data to the standby cluster.

Manual synchronization refers to the synchronization of a single table that is implemented by Export, distcp, and Import.

The process for manually synchronizing data of a single table is as follows:

1. Export table data from the active cluster.

   hbase org.apache.hadoop.hbase.mapreduce.Export -Dhbase.mapreduce.include.deleted.rows=true *Table name Directory where the source data is stored*

   Example: **hbase org.apache.hadoop.hbase.mapreduce.Export -Dhbase.mapreduce.include.deleted.rows=true t1 /user/hbase/t1**

2. Copy the data that has been exported to the standby cluster.

   hadoop distcp *Directory for storing source data in the active cluster* **hdfs://***ActiveNameNodeIP*:**9820/** *Directory for storing source data in the standby cluster*

   ActiveNameNodeIP indicates the IP address of the active NameNode in the standby cluster.

   Example: **hadoop distcp /user/hbase/t1 hdfs://192.168.40.2:9820/user/hbase/t1**

3. Import data to the standby cluster as the HBase table user of the standby cluster.

   hbase org.apache.hadoop.hbase.mapreduce.Import -*Dimport.bulk.output=Directory where the output data is stored in the standby cluster Table name Directory where the source data is stored in the standby cluster*

   hbase org.apache.hadoop.hbase.mapreduce.LoadIncrementalHFiles *Directory where the output data is stored in the standby cluster Table name*

   For example, **hbase org.apache.hadoop.hbase.mapreduce.Import -Dimport.bulk.output=/user/hbase/output_t1 t1 /user/hbase/t1** and

   hbase org.apache.hadoop.hbase.mapreduce.LoadIncrementalHFiles /user/hbase/output_t1 t1

Add the replication relationship between the active and standby clusters.

Step 15 Run the following command on the HBase Shell to create the replication synchronization relationship between the active cluster and the standby cluster:

add_peer '*Standby cluster ID', CLUSTER_KEY => 'ZooKeeper address of the standby cluster*',**{HDFS_CONFS => true}**

- *Standby cluster ID* indicates an ID for the active cluster to recognize the standby cluster. It is recommended that the ID contain letters and digits.
- The ZooKeeper address of the standby cluster includes the service IP address of ZooKeeper, the port for listening to client connections, and the HBase root directory of the standby cluster on ZooKeeper.
- **{HDFS_CONFS => true}** indicates that the default HDFS configuration of the active cluster will be synchronized to the standby cluster. This parameter is used for HBase of the standby cluster to access HDFS of the active cluster. If bulkload replication is disabled, you do not need to use this parameter.

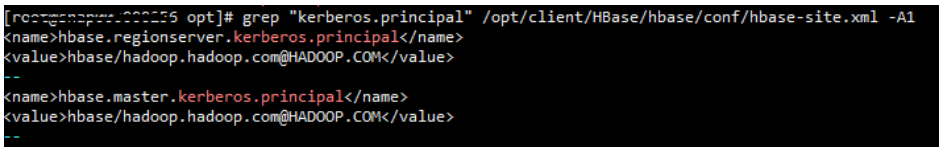
  Suppose the standby cluster ID is replication2 and the ZooKeeper address of the standby cluster is **192.168.40.2,192.168.40.3,192.168.40.4:2181:/hbase**.

  – Run the **add_peer 'replication2',CLUSTER_KEY => '192.168.40.2,192.168.40.3,192.168.40.4:2181:/hbase',CONFIG => { "hbase.regionserver.kerberos.principal" => "<val>", "hbase.master.kerberos.principal" => "<val2>" }** command for a

security cluster and the **add_peer 'replication2',CLUSTER_KEY => '192.168.40.2,192.168.40.3,192.168.40.4:2181:/hbase'** command for a common cluster.

The **hbase.master.kerberos.principal** and **hbase.regionserver.kerberos.principal** parameters are the Kerberos users of HBase in the security cluster. You can search the **hbase-site.xml** file on the client for the parameter values. For example, if the client is installed in the **/opt/client** directory of the Master node, you can run the **grep "kerberos.principal" /opt/client/HBase/hbase/conf/hbase-site.xml -A1** command to obtain the principal of HBase. See the following figure.

Figure 12-16 Obtaining the principal of HBase



NOTE

1. Obtain the ZooKeeper service IP address.

   Log in to the MRS console, click the cluster name, and choose **Components** > **ZooKeeper** > **Instances** to obtain the ZooKeeper service IP address.
2. On the ZooKeeper service parameter configuration page, search for clientPort, which is the port for the client to connect to the server.
3. Run the **list_peers** command to check whether the replication relationship between the active and standby clusters is added. If the following information is displayed, the relationship is successfully added.

```
hbase(main):003:0> list_peers
PEER_ID CLUSTER_KEY ENDPOINT_CLASSNAME STATE REPLICATE_ALL NAMESPACES
TABLE_CFS BANDWIDTH SERIAL
replication2 192.168.0.13,192.168.0.177,192.168.0.25:2181:/hbase ENABLED  true   0 false
```

Specify the data writing status for the active and standby clusters.

Step 16 On the HBase shell of the active cluster, run the following command to retain the data writing status:

set_clusterState_active

The command is run successfully if the following information is displayed:

```
hbase(main):001:0> set_clusterState_active
=> true
```

Step 17 On the HBase shell of the standby cluster, run the following command to retain the data read-only status:

set_clusterState_standby

The command is run successfully if the following information is displayed:

```
hbase(main):001:0> set_clusterState_standby
=> true
```

Enable the HBase replication function to synchronize data.

Step 18 Check whether a namespace exists in the HBase service instance of the standby cluster and the namespace has the same name as the namespace of the HBase table for which the replication function is to be enabled.

On the HBase shell of the standby cluster, run the **list_namespace** command to query the namespace.

- If the same namespace exists, go to **Step 19**.
- If the same namespace does not exist, on the HBase shell of the standby cluster, run the following command to create a namespace with the same name and go to **Step 19**:

  create_namespace'ns1

Step 19 On the HBase shell of the active cluster, run the following command to enable real-time replication for tables in the active cluster. This ensures that modified data in the active cluster can be synchronized to the standby cluster in real time.

You can only synchronize data of one HTable at one time.

enable_table_replication '*Table name***'**

NOTE

- If the standby cluster does not contain a table with the same name as the table for which real-time synchronization is to be enabled, the table is automatically created.
- If a table with the same name as the table for which real-time synchronization is to be enabled exists in the standby cluster, the structures of the two tables must be the same.
- If the encryption algorithm SMS4 or AES is configured for '*Table name*', the function for synchronizing data from the active cluster to the standby cluster cannot be enabled for the HBase table.
- If the standby cluster is offline or has tables with the same name but different structures, the replication function cannot be enabled.

  If the standby cluster is offline, start it.

  If the standby cluster has a table with the same name but different structure, modify the table structure to make it as the same as the table structure of the active cluster. On the HBase shell of the standby cluster, run the ***alter*** command to change the password by referring to the example.

Step 20 On the HBase shell of the active cluster, run the following command to enable the real-time replication function for the active cluster to synchronize the HBase permission table:

enable_table_replication 'hbase:acl'

NOTE

After the permission of the active HBase source data table is modified, to ensure that the standby cluster can properly read data, modify the role permission for the standby cluster.

Check the data synchronization status for the active and standby clusters.

Step 21 Run the following command on the HBase client to check the synchronized data of the active and standby clusters. After the replication function is enabled, you can run this command to check whether the newly synchronized data is consistent.

hbase org.apache.hadoop.hbase.mapreduce.replication.VerifyReplication --starttime=*Start time* **--endtime**=*End time Column family name ID of the standby cluster Table name*

NOTE

- The start time must be earlier than the end time.
- The value of **starttime** and **endtime** must be in the timestamp format. You need to run **date -d "2015-09-30 00:00:00" +%s to** change a common time format to a timestamp format. The command output is a 10-digit number (accurate to second), but HBase identifies a 13-digit number (accurate to millisecond). Therefore, you need to add three zeros (000) to the end of the command output.

Switch over active and standby clusters.

NOTE

1. If the standby cluster needs to be switched over to the active cluster, reconfigure the active/standby relationship by referring to **Step 2** to **Step 10** and **Step 15** to **Step 20**.
2. Do not perform **Step 11** to **Step 14**.

----End

Related Commands

Table 12-166 HBase replication

Operation	Command	Description
Set up the active/standby relationship.	**add_peer** *'Standby cluster ID', 'Standby cluster address'* Examples: **add_peer '1', 'zk1,zk2,zk3:2181:/hbase'** **add_peer '1', 'zk1,zk2,zk3:2181:/hbase1'**	Set up the relationship between the active cluster and the standby cluster. To enable bulkload replication, run the **add_peer** *'Standby cluster ID'*,***CLUSTER_KEY =>*** *'Standby cluster address'* command, configure **hbase.replication.conf.dir**, and manually copy the HBase client configuration file in the active cluster to all RegionServer nodes in the standby cluster. For details, see **Step 4** to **11**.
Remove the active/standby relationship.	**remove_peer** *'Standby cluster ID'* Example: **remove_peer '1'**	Remove standby cluster information from the active cluster.
Query the active/standby relationship.	**list_peers**	Query standby cluster information (mainly Zookeeper information) in the active cluster.

Operation	Command	Description
Enable the real-time user table synchronization function.	**enable_table_replication** *'Table name'* Example: **enable_table_replication 't1'**	Synchronize user tables from the active cluster to the standby cluster.
Disable the real-time user table synchronization function.	**disable_table_replication** *'Table name'* Example: **disable_table_replication 't1'**	Do not synchronize user tables from the active cluster to the standby cluster.
Verify data of the active and standby clusters.	**bin/hbase org.apache.hadoop.hbase.mapreduce.replication.VerifyReplication** *--starttime --endtime Column family name Standby cluster ID Table name*	Verify whether data of the specified table is the same between the active cluster and the standby cluster. The description of the parameters in this command is as follows: ● Start time: If start time is not specified, the default value **0** will be used. ● End time: If end time is not specified, the time when the current operation is submitted will be used by default. ● Table name: If a table name is not entered, all user tables for which the real-time synchronization function is enabled will be verified by default.
Switch the data writing status.	**set_clusterState_active** **set_clusterState_standby**	Specifies whether data can be written to the cluster HBase tables.

Operation	Command	Description
Add or update the active cluster HDFS configurations saved in the peer cluster.	**set_replication_hdfs_confs 'PeerId', {'key1' => 'value1', 'key2' => 'value2'}**	Enable replication for data including bulkload data. When HDFS parameters are modified in the active cluster, the modification cannot be automatically synchronized to the standby cluster. You need to manually run the command to synchronize the changes. The affected parameters are as follows: • fs.defaultFS • dfs.client.failover.proxy.provider.hacluster • dfs.client.failover.connection.retries.on.timeouts • dfs.client.failover.connection.retries For example, if the value of **fs.defaultFS** is changed to **hdfs://hacluster_sale**, run the **set_replication_hdfs_confs '1', {'fs.defaultFS' => 'hdfs://hacluster_sale'}** command to synchronization the HDFS configuration to the standby cluster whose ID is 1.

12.8.5 Configuring HBase Parameters

NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

If the default parameter settings of the MRS service cannot meet your requirements, you can modify the parameter settings as required.

Step 1 Go to the cluster details page and choose **Components**.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 2 Choose **HBase** > **Service Configuration** and switch **Basic** to **All**. On the displayed HBase configuration page, modify parameter settings.

Table 12-167 HBase parameters

Parameter	Description	Value
hbase.regionserver.hfile.durable.sync	Whether to enable the HFile durability to make data persistence on disks. If this parameter is set to **true**, HBase performance is affected because each HFile is synchronized to disks by **hadoop fsync** when being written to HBase. This parameter exists only in MRS 1.9.2 or earlier.	Possible values are as follows: • **true** • **false** The default value is **true**.
hbase.regionserver.wal.durable.sync	Specifies whether to enable WAL file durability to make the WAL data persistence on disks. If this parameter is set to **true**, HBase performance is affected because each edited WAL file is synchronized to disks by **hadoop fsync** when being written to HBase. This parameter exists only in MRS 1.9.2 or earlier.	Possible values are as follows: • **true** • **false** The default value is **true**.

----End

12.8.6 Enabling Cross-Cluster Copy

Scenario

DistCp is used to copy the data stored on HDFS from a cluster to another cluster. DistCp depends on the cross-cluster copy function, which is disabled by default. This function needs to be enabled in both clusters.

This section describes how to enable cross-cluster copy.

Impact on the System

Yarn needs to be restarted to enable the cross-cluster copy function and cannot be accessed during the restart.

Prerequisites

The **hadoop.rpc.protection** parameter of the two HDFS clusters must be set to the same data transmission mode, which can be **privacy** (encryption enabled) or **authentication** (encryption disabled).

NOTE

Go to the **All Configurations** page by referring to **Modifying Cluster Service Configuration Parameters** and search for **hadoop.rpc.protection**.

For versions earlier than MRS 3.x, choose **Components** > **HDFS** > **Service Configuration** on the cluster details page. Switch **Basic** to **All**, and search for **hadoop.rpc.protection**.

Procedure

Step 1 Go to the **All Configurations** page of the Yarn service. For details, see **Modifying Cluster Service Configuration Parameters**.

NOTE

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

Step 2 In the navigation pane, choose **Yarn** > **Distcp**.

Step 3 Set **haclusterX.remotenn1** of **dfs.namenode.rpc-address** to the service IP address and RPC port number of one NameNode instance of the peer cluster, and set **haclusterX.remotenn2** to the service IP address and RPC port number of the other NameNode instance of the peer cluster. Enter a value in the *IP address:port* format.

NOTE

You can log in to FusionInsight Manager in MRS 3.x clusters, and choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** to obtain the service IP address of the NameNode instance.

For versions earlier than MRS 3.x, on the cluster details page, choose **Components** > **HDFS** > **Instances** to obtain the service IP address of the NameNode instance.

dfs.namenode.rpc-address.haclusterX.remotenn1 and **dfs.namenode.rpc-address.haclusterX.remotenn2** do not distinguish active and standby NameNode instances. The default NameNode RPC port is 9820 and cannot be modified on MRS Manager.

For example, **10.1.1.1:9820** and **10.1.1.2:9820**.

Step 4 Save the configuration. On the **Dashboard** tab page, and choose **More** > **Restart Service** to restart the Yarn service.

Operation succeeded is displayed. Click **Finish**. The Yarn service is started successfully.

Step 5 Log in to the other cluster and repeat the preceding operations.

----End

12.8.7 Using the ReplicationSyncUp Tool

Prerequisites

1. Active and standby clusters have been installed and started.
2. Time is consistent between the active and standby clusters and the NTP service on the active and standby clusters uses the same time source.

3. When the HBase service of the active cluster is stopped, the ZooKeeper and HDFS services must be started and run.
4. ReplicationSyncUp must be run by the system user who starts the HBase process.
5. In security mode, ensure that the HBase system user of the standby cluster has the read permission on HDFS of the active cluster. This is because that it will update the ZooKeeper nodes and HDFS files of the HBase system.
6. When HBase of the active cluster is faulty, the ZooKeeper, file system, and network of the active cluster are still available.

Scenarios

The replication mechanism can use WAL to synchronize the state of a cluster with the state of another cluster. After HBase replication is enabled, if the active cluster is faulty, ReplicationSyncUp synchronizes incremental data from the active cluster to the standby cluster using the information from the ZooKeeper node. After data synchronization is complete, the standby cluster can be used as an active cluster.

Parameter Configuration

Parameter	Description	Default Value
hbase.replication.bulkload.enabled	Whether to enable the bulkload data replication function. The parameter value type is Boolean. To enable the bulkload data replication function, set this parameter to **true** for the active cluster.	**false**
hbase.replication.cluster.id	ID of the source HBase cluster. After the bulkload data replication is enabled, this parameter is mandatory and must be defined in the source cluster. The parameter value type is String.	-

Tool Usage

Run the following command on the client of the active cluster:

hbase org.apache.hadoop.hbase.replication.regionserver.ReplicationSyncUp -Dreplication.sleep.before.failover=1

NOTE

replication.sleep.before.failover indicates sleep time required for replication of the remaining data when RegionServer fails to start. You are advised to set this parameter to 1 second to quickly trigger replication.

Precautions

1. When the active cluster is stopped, this tool obtains the WAL processing progress and WAL processing queue from the ZooKeeper Node (RS znode) and copies the queues that are not copied to the standby cluster.
2. RegionServer of each active cluster has its own znode under the replication node of ZooKeeper in the standby cluster. It contains one znode of each peer cluster.
3. If RegionServer is faulty, each RegionServer in the active cluster receives a notification through the watcher and attempts to lock the znode of the faulty RegionServer, including its queues. The successfully created RegionServer transfers all queues to the znode of its own queue. After queues are transferred, they are deleted from the old location.
4. When the active cluster is stopped, ReplicationSyncUp synchronizes data between active and standby clusters using the information from the ZooKeeper node. In addition, WALs of the RegionServer znode will be moved to the standby cluster.

Restrictions and Limitations

If the standby cluster is stopped or the peer relationship is closed, the tool runs normally but the peer relationship cannot be replicated.

12.8.8 Using HIndex

12.8.8.1 Introduction to HIndex

Scenarios

HBase is a distributed storage database of the Key-Value type. Data in tables is sorted by dictionary based on row keys. If you query data by specifying a row key or scan data in a specific row key range, HBase can help you quickly locate the data to be read. In most cases, you need to query data whose column value is *XXX*. HBase provides the filter function to enable you to query data with a specific column value. All data is scanned in the sequence of row keys and is matched with the specific column value until the required data is found. To obtain the required data, the filter will scan some unnecessary data. As a result, the filter function cannot meet the requirements for high-performance, frequent queries.

HBase HIndex is designed to address these issues. HBase HIndex provides HBase with the capability of indexing based on specific column values, making queries faster.

NOTE

- Rolling upgrade is not supported for index data.
- Composite index: You must add or delete all columns that participate in composite indexes. Otherwise, the data may be inconsistent.
- You should not explicitly configure any split policy to a data table where an index has been created.
- The mutation operations are not supported, such as increment and append.
- Index of the column with **maxVersions** greater than 1 is not supported.
- The value size of a column for which an index is added cannot exceed 32 KB.
- When the user data is deleted because TTL of the column family is invalid, the corresponding index data will not be deleted immediately. The index data will be deleted during major compaction.
- After an index is created, the TTL of the user column family must not be changed.
  - If the TTL of the column family is changed to a larger value after an index is created, delete the index and create one again. Otherwise, some generated index data may be deleted before the deletion of user data.
  - If the TTL of the column family is changed to a smaller value after an index is created, the index may be deleted after the deletion of user data.
- After disaster recovery is enabled for HBase tables, a secondary index is created in the active cluster and index table changes are not automatically synchronized to the standby cluster. To implement disaster recovery in this case, perform the following operations:
  1. After the secondary index is created in the active table, create a secondary index with the same schema and name using the same method in the standby cluster.
  2. In the active cluster, manually set **REPLICATION_SCOPE** of the index column family (default value: **d**) to **1**.

Parameter Configuration

1. Log in to the MRS console, click a cluster name and choose **Components**.
2. Go to the **All Configurations** page of the HBase service. For details, see **Modifying Cluster Service Configuration Parameters**.
3. View parameters on the HBase configurations page.

Navigation Path	Parameter	Default Value	Description
HMaster > System	hbase.coprocessor.master.classes	org.apache.hadoop.hbase.hindex.server.master.HIndexMasterCoprocessor,com.xxx.hadoop.hbase.backup.services.RecoveryCoprocessor,org.apache.ranger.authorization.hbase.RangerAuthorizationCoprocessor,org.apache.hadoop.hbase.security.access.ReadOnlyClusterEnabler,org.apache.hadoop.hbase.rsgroup.RSGroupAdminEndpoint	This coprocessor is used to handle Master-level operations after the HIndex function is enabled, for example, creating an index meta table, adding an index, and deleting an index, a table, and index metadata.
RegionServer > RegionServer	hbase.coprocessor.regionserver.classes	org.apache.hadoop.hbase.hindex.server.regionserver.HIndexRegionServerCoprocessor,org.apache.hadoop.hbase.JMXListener,org.apache.ranger.authorization.hbase.RangerAuthorizationCoprocessor	This coprocessor is used to handle the operations that the Master delivers to RegionServer after the HIndex function is enabled.

Navigation Path	Parameter	Default Value	Description
	hbase.coprocessor.region.classes	org.apache.hadoop.hbase.hindex.server.regionserver.HIndexRegionCoprocessor,org.apache.hadoop.hbase.security.token.TokenProvider,com.xxx.hadoop.hbase.backup.services.RecoveryCoprocessor,org.apache.ranger.authorization.hbase.RangerAuthorizationCoprocessor,org.apache.hadoop.hbase.security.access.SecureBulkLoadEndpoint,org.apache.hadoop.hbase.security.access.ReadOnlyClusterEnabler,org.apache.hadoop.hbase.coprocessor.MetaTableMetrics	This coprocessor is used to operate data in the Region after the HIndex function is enabled.

Navigation Path	Parameter	Default Value	Description
	hbase.coprocessor.wal.classes	org.apache.hadoop.hbase.hindex.server.regionserver.HIndexRegionServerCoprocessor,org.apache.hadoop.hbase.JMXListener,org.apache.ranger.authorization.hbase.RangerAuthorizationCoprocessor	This coprocessor is used for Replication, which filters index data to prevent the index data from being sent to the peer cluster. The peer cluster generates index data by itself. This parameter is supported only in versions earlier than MRS 3.x.

NOTE

1. The preceding default values need to be configured after the HBase HIndex function is enabled. In MRS clusters that support the HBase HIndex function, the values have been configured by default.

2. Ensure that the **master** parameter is configured on HMaster and the **region** and **regionserver** parameters are configured on RegionServer.

Related Interfaces

The APIs that use HIndex are in the **org.apache.hadoop.hbase.hindex.client.HIndexAdmin** class. The following table describes the related APIs.

Operation	API	Description	Precautions
Add an index.	addIndices()	Add an index to a table without data. Calling this API will add the specified index to a table but skips index data generation. Therefore, after this operation, the index cannot be used for the scanning and filtering operations. This API applies to scenarios where users want to add indexes in batches to tables that have a large amount of pre-existing user data. The specific operation is to use external tools such as the TableIndexer tool to build index data.	• An index cannot be modified once it is added. To modify the index, you need to delete the old index and then create a new one. • Do not create two indexes on the same column with different index names. Otherwise, storage and processing resources will be wasted. • Indexes cannot be added to a system table. • The append and increment operations are not supported when data is put into the index column. • If any fault occurs on the client except **DoNotRetryIOException**, you need to try again. • An index column family is selected from the following conditions in sequence based on availability: – Typically, the default index column family is **d**. However, if the value of **hindex.default.family.name** is set, the value will be used. – Symbol #, @, $, or %
	addIndicesWithData()	Add an index to a table with data. This API is used to add the specified index to the table and create index data for the existing user data. Alternatively, the API can be called to generate an index and then generate index data when the user data is being stored. Therefore, after this operation, the index can be used for the scanning and filtering operations immediately.	

Operation	API	Description	Precautions
			– #0, @ 0, $ 0, %0, #1, @ 1 ...to #255, @ 255, $ 255, %255 – Throw exceptions. ● You can use the HIndex TableIndexer tool to add indexes without building index data.
Delete an index.	dropIndices()	This API is used to delete an index only. It deletes the specified index from a table but skips the corresponding index data. After this operation, the index cannot be used for the scanning and filtering operations. The cluster automatically deletes old index data during major compaction. This API applies to scenarios where a table contains a large amount of index data and **dropIndicesWithData()** is unavailable. In addition, you can use the TableIndexer tool to delete indexes and index data.	● An index can be disabled when it is in the **ACTIVE**, **INACTIVE**, or **DROPPING** state. ● If you use **dropIndices()** to delete an index, ensure that the index data has been deleted before the index is added to the table with the same index name (that is, major compaction has been completed). ● If you delete an index, the following information will also be deleted: – A column family with an index – Any one of column families in a combination index ● Indexes and index data can be deleted together using the HIndex TableIndexer tool.
	dropIndicesWithData()	Delete index data. This API deletes the specified index and all index data corresponding to the index in a user table. After this operation, the index is completely deleted from the table and is no longer used for the scanning and filtering operations.	

Operation	API	Description	Precautions
Enable/ Disable an index.	disableIndices()	This API disables all indexes specified by a user so that they are no longer used for the scanning and filtering operations.	• An index can be enabled when the index is in the **ACTIVE**, **INACTIVE**, or **BUILDING** state. • An index can be disabled when the index is in the **ACTIVE** or **INACTIVE** state. • Before disabling an index, ensure that the index data is consistent with the user data. If no new data is added to the table when the index is disabled, the index data is consistent with the user data. • When enabling an index, you can use the TableIndexer tool to build index data to ensure data consistency.
	enableIndices()	This API enables all indexes specified by a user so that they can be used for the scanning and filtering operations.	
View the created index.	listIndices()	This API is used to list all indexes of a specified table.	N/A

Querying Data Based on Indexes

You can use a filter to query data in a user table with an index. The query result of a user table with a single or combination index is the same as that of a table without an index, but the table with an index provides higher data query performance than the table without an index.

The index usage rules are as follows:

- Scenario 1: A single index is created for one or more columns.
  - When this column is used for AND or OR query filtering, an index can improve query performance.

    Example: Filter_Condition(IndexCol1)AND / OR Filter_Condition(IndexCol2)
  - When you use **Index Column AND Non-Index Column** for filtering in the query, the index can improve query performance.

Example: Filter_Condition(IndexCol1)AND Filter_Condition(IndexCol2)AND Filter_Condition(NonIndexCol1)

- When you use **Index Column OR Non-Index Column** for filtering in the query but do not use an index, query performance will not be improved.

  Example: Filter_Condition(IndexCol1)AND / OR Filter_Condition(IndexCol2) OR Filter_Condition(NonIndexCol1)

- Scenario 2: A combination index is created for multiple columns.
  - When the columns to be queried are all or part of the combination index and have the same order as the combination index, using the index improves query performance.

    For example, create a combination index for C1, C2, and C3.

    - The index takes effect in the following situations:

      Filter_Condition(IndexCol1)AND Filter_Condition(IndexCol2)AND Filter_Condition(IndexCol3)

      Filter_Condition(IndexCol1)AND Filter_Condition(IndexCol2)

      FILTER_CONDITION(IndexCol1)

    - The index does not take effect in the following situations:

      Filter_Condition(IndexCol2)AND Filter_Condition(IndexCol3)

      Filter_Condition(IndexCol1)AND Filter_Condition(IndexCol3)

      FILTER_CONDITION(IndexCol2)

      FILTER_CONDITION(IndexCol3)

  - When you use **Index Column AND Non-Index Column** for filtering in the query, the index can improve query performance.

    Examples:

    Filter_Condition(IndexCol1)AND Filter_Condition(NonIndexCol1)

    Filter_Condition(IndexCol1)AND Filter_Condition(IndexCol2)AND Filter_Condition(NonIndexCol1)

  - When you use **Index Column OR Non-Index Column** for filtering in the query but do not use an index, query performance will not be improved.

    Examples:

    Filter_Condition(IndexCol1)OR Filter_Condition(NonIndexCol1)

    (Filter_Condition(IndexCol1)AND Filter_Condition(IndexCol2))OR(Filter_Condition(NonIndexCol1))

  - When multiple columns are used for query, you can specify a value range for only the last column in the combination index and set other columns to specified values

    For example, create a combination index for C1, C2, and C3. In a range query, only the value range of C3 can be set. The filter criteria are "C1 = *XXX*, C2 = *XXX*, and C3 = Value range."

Query Policy Selection

Use **SingleColumnValueFilter** or **SingleColumnRangeFilter**. It will provide the definite value **column_family:qualifierpair** (called **col1**) in filter criteria.

If **col1** is the first index column in the table, any index in the table can be a candidate index used during the query. The following provides an example:

If there is an index on **col1**, the index can be used as a candidate index because **col1** is the first and the only column of the index. If there is another index on **col1** and **col2**, you can consider this index as a candidate index because **col1** is the first column in the index list. However, if there is an index on **col2** and **col1**, this index cannot be used as a candidate index because the first column in the index list is not **col1**.

The most suitable method to use the index now is that when there are multiple candidate indexes, select the most suitable index for scanning data.

You can use the following solutions to learn how to select the best index policy.

- It is better to fully match.

  Scenario: There are two indexes available, one for **col1&col2** and the other for **col1**.

  In this scenario, the second index is better than the first one, because it scans less index data.

- If there are multiple candidate multi-column indexes, select an index with fewer index columns.

  Scenario: There are two indexes available, one for **col1&col2** and the other for **col1&col2&col3**.

  In this case, you had better use the index on **col1&col2**, because it scans less index data.

NOTE

- During a query based on an index, the index state must be **ACTIVE**. You can call the **listIndices()** API to view the index state.
- To query the correct data based on the index, ensure the consistency between index data and user data.
- Run the following command to perform a complex query on the HBase shell client (assuming that an index has been created for the specified column):

  scan 'tablename', {FILTER => "SingleColumnValueFilter(family, qualifier, compareOp, comparator, filterIfMissing, latestVersionOnly)"}

  Example: **scan 'test', {FILTER => "SingleColumnValueFilter('info', 'age', =, 'binary:26', true, true)"}**

  In the preceding scenario, if you want to save the row where no column is found in the result, you should not create any index in any such column, because if the column to be queried does not exist, the row will be filtered out when SCVF is used to scan the index columns. When the SCVF whose **filterIfMissingset** is **false** (default value) scans non-index columns, rows where no column is queried will also be returned in the result. Therefore, to avoid inconsistent query results, you are advised to set **filterIfMissing** to **true** after creating SCVF for the index column.
- Run the following command on the HBase shell client to view the index data created for user data:

  scan 'tablename', {ATTRIBUTES => {'FETCH_INDEX_DATA' => 'true'}}

12.8.8.2 Loading Index Data in Batches

Scenarios

HBase provides the ImportTsv&LoadIncremental tool to load user data in batches. HBase also provides the HIndexImportTsv tool to load both the user data and index data in batches. HIndexImportTsv inherits all functions of the HBase batch data loading tool ImportTsv. If a table is not created before the HIndexImportTsv tool is executed, an index will be created when the table is created, and index data is generated when user data is generated.

Procedure

1. Run the following commands to import data to HDFS:

   hdfs dfs -mkdir <*inputdir*>

   hdfs dfs -put <local_data_file> <*inputdir*>

   For example, define the data file **data.txt** as follows:

   ```
   12005000201,Zhang San,Male,19,A City, A Province
   12005000202,Li Wanting,Female,23,B City, B Province
   12005000203,Wang Ming,Male,26,C City, C Province
   12005000204,Li Gang,Male,18,D City, D Province
   12005000205,Zhao Enru,Female,21,E City, E Province
   12005000206,Chen Long,Male,32,F City, F Province
   12005000207,Zhou Wei,Female,29,G City, G Province
   12005000208,Yang Yiwen,Female,30,H City, H Province
   12005000209,Xu Bing,Male,26,I City, I Province
   12005000210,Xiao Kai,Male,25,J City, J Province
   ```

   Run the following commands:

   hdfs dfs -mkdir /datadirImport

   hdfs dfs -put data.txt /datadirImport

2. Go to HBase shell and run the following command to create the **bulkTable** table:

   create 'bulkTable', {NAME => 'info',COMPRESSION => 'SNAPPY', DATA_BLOCK_ENCODING => 'FAST_DIFF'},{NAME=>'address'}

   After the execution is complete, exit the HBase shell.

3. Run the following commands to generate an HFile file (StoreFiles):

   hbase org.apache.hadoop.hbase.hindex.mapreduce.HIndexImportTsv -Dimporttsv.separator=*<separator>*

   -Dimporttsv.bulk.output=*</path/for/output>* **-Dindexspecs.to.add=**<indexspecs> **-Dimporttsv.columns=**<columns> tableName *<inputdir>*

   - **-Dimport.separator**: indicates a separator, for example, **-Dimport.separator=','**.
   - **-Dimport.bulk.output=</path/for/output>**: indicates the output path of the execution result. You need to specify a path that does not exist.
   - **<columns>**: Indicates the mapping of the imported data in a table, for example, **-Dimporttsv.columns=HBASE_ROW_KEY,info:name,info:gender,info:age,address:city,address:province**.
   - **<tablename>**: Indicates the name of a table to be operated.

- **<inputdir>**: Indicates the directory where data is loaded in batches.
- **-Dindexspecs.to.add=<indexspecs>**: Indicates the mapping between an index name and a column, for example, **-Dindexspecs.to.add='index_bulk=>info:[age->String]'**. The index composition can be represented as follows:

  indexNameN=>familyN :[columnQualifierN-> columnQualifierDataType], [columnQualifierM-> columnQualifierDataType];familyM: [columnQualifierO-> columnQualifierDataType]# indexNameN=> familyM: [columnQualifierO-> columnQualifierDataType]

  Column qualifiers are separated by commas (,).

  Example: "index1 => f1:[c1-> String],[c2-> String]"

  Column families are separated by semicolons (;).

  Example: "index1 => f1:[c1-> String],[c2-> String]; f2:[c3-> Long]"

  Multiple indexes are separated by pound keys (#).

  Example: "index1 => f1:[c1-> String],[c2-> String]; f2:[c3-> Long]#index2 => f2:[c3-> Long]"

  The following data types are supported by columns.

  Available data types are as follows: STRING, INTEGER, FLOAT, LONG, DOUBLE, SHORT, BYTE, CHAR

  NOTE

  Data types can also be transferred in lowercase.

For example, run the following command:

hbase org.apache.hadoop.hbase.hindex.mapreduce.HIndexImportTsv -Dimporttsv.separator=',' -Dimporttsv.bulk.output=/dataOutput -Dindexspecs.to.add='index_bulk=>info:[age->String]' -Dimporttsv.columns=HBASE_ROW_KEY,info:name,info:gender,info:age,address:city,address:province bulkTable /datadirImport/data.txt

Command output:

```
[root@shap000000406 opt]# hbase org.apache.hadoop.hbase.hindex.mapreduce.HIndexImportTsv -Dimporttsv.separator=',' -Dimporttsv.bulk.output=/dataOutput -Dindexspecs.to.add='index_bulk=>info:[age->String]' -Dimporttsv.columns=HBASE_ROW_KEY,info:name,info:gender,info:age,address:city,address:province bulkTable /datadirImport/data.txt

12.8.8.3 Using an Index Generation Tool

Scenarios

To quickly create indexes for user data, HBase provides the TableIndexer tool for you to create, add, and delete indexes using MapReduce functions. The application scenarios are as follows:

- You want to add an index for a specified column in a table where a large amount of data exists. However, if you use the **addIndicesWithData()** API to add an index, index data corresponding to the related user data will be generated, which is time-consuming. If you use **addIndices()** to create an index, index data corresponding to user data will not be generated. Therefore, to create index data for user data, you can use the TableIndexer tool to create an index.

- If the index data is inconsistent with the user data, the tool can be used to rebuild index data.

  If you temporarily disable the index, put new data to the disabled index column, and then directly enable the index from the disabled state, index data and user data may be inconsistent. Therefore, you must rebuild all index data before using it again.
- You can use the TableIndexer tool to completely delete a large amount of existing index data from a user table.
- For user tables that do not have indexes, this tool allows you to add and build indexes at the same time.

How to Use

- **Adding a new index to a user table**

  The command is as follows:

  hbase org.apache.hadoop.hbase.hindex.mapreduce.TableIndexer -Dtablename.to.index=tablename -Dindexspecs.to.add='idx_0=>cf_0:[q_0->string],[q_1];cf_1:[q_2],[q_3]#*idx_1*=>cf_1:[q_4]'

  The following parameters are required.

  - **tablename.to.index**: Indicates the name of a table for which an index is created.
  - **indexspecs.to.add**: Indicates the mapping between the index name and the column in the corresponding user table.
  - **scan.caching** (optional): Contains an integer value, indicating the number of cached rows to be transmitted to the scanner during data table scanning.

  The parameters in the preceding command are described as follows:

  - **idx_1**: Indicates an index name.
  - **cf_0**: Indicates the name of a column family.
  - **q_0**: Indicates the name of a column.
  - **string**: Indicates a data type. The parameter value can be STRING, INTEGER, FLOAT, LONG, DOUBLE, SHORT, BYTE, or CHAR.

  NOTE

  - The pound key (#) is used to separate indexes. The semicolon (;) is used to separate column families. The comma (,) is used to separate column qualifiers.
  - The column name and its data type must be included in '[]'.
  - Column names and their data types are separated by '->'.
  - If the data type of a specific column is not specified, the default data type (string) is used.
  - If **scan.caching** is not configured, the default value **1000** is used.
  - The user table must exist.
  - The index specified in the table must not exist.
  - If a column family named **d** exists in the user table, you must use the TableIndexer tool to build index data.

  After the preceding command is executed, the specified index is added to the table and is in INACTIVE state. This behavior is similar to the **addIndices()** API.

- **Creating index data for existing indexes in a user table**

  The command is as follows:

  hbase org.apache.hadoop.hbase.hindex.mapreduce.TableIndexer -Dtablename.to.index=tablename -Dindexnames.to.build ='idx_0#idx_1'

  The following parameters are required.

  - **tablename.to.index**: Indicates the name of a table for which an index is created.
  - **indexspecs.to.build**: Indicates an index name.
  - **scan.caching** (optional): Contains an integer value, indicating the number of cached rows to be transmitted to the scanner during data table scanning.

  The parameters in the preceding command are described as follows:

  - **idx_1**: Indicates an index name.

  NOTE

  - The pound key (#) is used to separate index names.
  - If **scan.caching** is not configured, the default value **1000** is used.
  - The user table must exist.

  After the preceding command is executed, the specified index is set to the ACTIVE state. Users can use them when scanning data.

- **Deleting the existing indexes and their data from a user table**

  The command is as follows:

  hbase org.apache.hadoop.hbase.hindex.mapreduce.TableIndexer -Dtablename.to.index=tablename -Dindexnames.to.drop='idx_0#idx_1'

  The following parameters are required.

  - **tablename.to.index**: Indicates the name of a table for which an index is created.
  - **indexnames.to.drop**: Indicates the name of the index that should be deleted with its data (must exist in the table).
  - **scan.caching** (optional): Contains an integer value, indicating the number of cached rows to be transmitted to the scanner during data table scanning.

  The parameters in the preceding command are described as follows:

  - **idx_1**: Indicates an index name.

  NOTE

  - The pound key (#) is used to separate index names.
  - If **scan.caching** is not configured, the default value **1000** is used.
  - The user table must exist.

  After the preceding command is executed, the specified index is deleted from the table.

- **Adding new indexes to user tables and building data based on existing data**

  The command is as follows:

  hbase org.apache.hadoop.hbase.hindex.mapreduce.TableIndexer -Dtablename.to.index=tablename -Dindexspecs.to.add='idx_0 => cf_0:[q_0-

> string],[q_1];cf_1:[q_2],[q_3]#idx_1 => cf_1:[q_4]' -Dindexnames.to.build='idx_0'

NOTE

- The parameters are the same as the previous ones.
- The user table must exist.
- The indexes specified in **indexspecs.to.add** must not exist in the table.
- The index names specified in **indexnames.to.build** must exist in the table or be part of the value of **indexspecs.to.add**.

After the preceding command is executed, all indexes specified in **indexspecs.to.add** will be added to this table, and index data will be built for all specified indexes using **indexnames.to.build**.

12.8.8.4 Migrating Index Data

Scenario

The indexes used in MRS 1.7 or later are incompatible with secondary indexes used by HBase in earlier MRS versions. Therefore, you need to perform the following operations to migrate index data from an earlier version (MRS 1.5 or earlier) to MRS 1.7 or later.

Prerequisites

1. During data migration, the cluster of the old version must be MRS 1.5 or earlier, and the cluster of the new version must be MRS 1.7 or later.
2. Before data migration, you must have old index data.
3. A cross-cluster mutual trust relationship must be configured and the inter-cluster replication function must be enabled for a security cluster. For a common cluster, only the inter-cluster replication function needs to be enabled

Procedure

Migrate user data from an old cluster to a new cluster. To migrate data, you need to manually synchronize data of the old and new clusters in a single table by export, distcp, and import.

For example, the current old cluster has a user table (**t1**, index name: **idx_t1**) and its corresponding index table (**t1_idx**). Perform the following operations to migrate data.

1. Export table data from the old cluster.
   ```
   hbase org.apache.hadoop.hbase.mapreduce.Export -Dhbase.mapreduce.include.deleted.rows=true <tableName> <path/for/data>
   ```
   - *<tableName>*: Indicates a table name, for example, **t1**.
   - *<path/for/data>*: Indicates the path for storing source data, for example, **/user/hbase/t1**.

   Example: **hbase org.apache.hadoop.hbase.mapreduce.Export -Dhbase.mapreduce.include.deleted.rows=true t1 /user/hbase/t1**
2. Copy the exported data to the new cluster as follows:

hadoop distcp *<path/for/data> hdfs://ActiveNameNodeIP:9820/*<path/for/newData>

- *<path/for/data>*: Indicates the path for storing source data in the old cluster, for example, **/user/hbase/t1**.
- *<path/for/newData>*: Indicates the path for storing source data in the new cluster, for example, **/user/hbase/t1**.

ActiveNameNodeIP indicates the IP address of the active NameNode in the new cluster.

Example: **hadoop distcp /user/hbase/t1 hdfs://192.168.40.2:9820/user/hbase/t1**

NOTE

- Manually copy the exported data to HDFS of the new cluster, for example, **/user/hbase/t1**.

3. Use the HBase table user of the new cluster to generate HFiles in the new cluster.

   hbase org.apache.hadoop.hbase.mapreduce.Import -Dimport.bulk.output=<path/for/hfiles> <tableName><path/for/newData>

   - *<path/for/hfiles>*: Indicates the path of the HFiles generated in the new cluster, for example, **/user/hbase/output_t1**.
   - *<tableName>*: Indicates a table name, for example, **t1**.
   - *<path/for/newData>*: Indicates the path for storing source data in the new cluster, for example, **/user/hbase/t1**.

   Example:

   hbase org.apache.hadoop.hbase.mapreduce.Import -Dimport.bulk.output=/user/hbase/output_t1 t1 /user/hbase/t1

4. Import the generated HFiles to the table in the new cluster.

   The command is as follows:

   hbase org.apache.hadoop.hbase.mapreduce.LoadIncrementalHFiles <path/for/hfiles> <tableName>

   - *<path/for/hfiles>*: Indicates the path of the HFiles generated in the new cluster, for example, **/user/hbase/output_t1**.
   - *<tableName>*: Indicates a table name, for example, **t1**.

   Example:

   hbase org.apache.hadoop.hbase.mapreduce.LoadIncrementalHFiles /user/hbase/output_t1 t1

   NOTE

   1. The preceding shows the process of migrating user data. You only need to perform the first three steps to migrate the index data of the old cluster and change the corresponding table name to an index table name (for example, **t1_idx**).
   2. Skip **4** when migrating index data.

5. Import index data to a table in the new cluster.

   a. Add an index the same as that of the user table of the previous version to the user table of the new cluster (the user table cannot contain a column family named **d**).

      The command is as follows:

      hbase org.apache.hadoop.hbase.hindex.mapreduce.TableIndexer -Dtablename.to.index=<tableName> -Dindexspecs.to.add=<indexspecs>

- *-Dtablename.to.index=<tableName>*: Indicates a table name, for example, **-Dtablename.to.index=t1**.
- **-Dindexspecs.to.add=<indexspecs>**: Indicates the mapping between an index name and a column, for example, **-Dindexspecs.to.add='idx_t1=>info:[name->String]'**.

Example:

hbase org.apache.hadoop.hbase.hindex.mapreduce.TableIndexer -Dtablename.to.index=t1 -Dindexspecs.to.add='idx_t1=>info:[name->String]'

NOTE

If a column family named **d** exists in the user table, you must use the TableIndexer tool to build index data.

b. Run the LoadIncrementalHFiles tool to load the index data of the old cluster to a table in the new cluster.

The command is as follows:

```
hbase org.apache.hadoop.hbase.mapreduce.LoadIncrementalHFiles </path/for/hfiles> <tableName>
```

- *</path/for/hfiles>*: Indicates the path of index data on HDFS. The path is the index generation path specified in **-Dimport.bulk.output**, for example, **/user/hbase/output_t1_idx**.
- *<tableName>*: Indicates a table name of the new cluster, for example, **t1**.

Example:

hbase org.apache.hadoop.hbase.mapreduce.LoadIncrementalHFiles /user/hbase/output_t1_idx t1

12.8.9 Configuring HBase DR

Scenario

HBase disaster recovery (DR), a key feature that is used to ensure high availability (HA) of the HBase cluster system, provides the real-time remote DR function for HBase. HBase DR provides basic O&M tools, including tools for maintaining and re-establishing DR relationships, verifying data, and querying data synchronization progress. To implement real-time DR, back up data of an HBase cluster to another HBase cluster. DR in the HBase table common data writing and BulkLoad batch data writing scenarios is supported.

NOTE

This section applies to MRS 3.*x* or later.

Prerequisites

- The active and standby clusters are successfully installed and started, and you have the administrator permissions on the clusters.
- Ensure that the network connection between the active and standby clusters is normal and ports are available.

- If the active cluster is deployed in security mode and is not managed by one FusionInsight Manager, cross-cluster trust relationship has been configured for the active and standby clusters.. If the active cluster is deployed in normal mode, no cross-cluster mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters.
- Time is consistent between the active and standby clusters and the NTP service on the active and standby clusters uses the same time source.
- Mapping relationships between the names of all hosts in the active and standby clusters and IP addresses have been configured in the hosts files of all the nodes in the active and standby clusters and of the node where the active cluster client resides.
- The network bandwidth between the active and standby clusters is determined based on service volume, which cannot be less than the possible maximum service volume.
- The MRS versions of the active and standby clusters must be the same.
- The scale of the standby cluster must be greater than or equal to that of the active cluster.

Constraints

- Although DR provides the real-time data replication function, the data synchronization progress is affected by many factors, such as the service volume in the active cluster and the health status of the standby cluster. In normal cases, the standby cluster should not take over services. In extreme cases, system maintenance personnel and other decision makers determine whether the standby cluster takes over services according to the current data synchronization indicators.
- HBase clusters must be deployed in active/standby mode.
- Table-level operations on the DR table of the standby cluster are forbidden, such as modifying the table attributes and deleting the table. Misoperations on the standby cluster will cause data synchronization failure of the active cluster. As a result, table data in the standby cluster is lost.
- If the DR data synchronization function is enabled for HBase tables of the active cluster, the DR table structure of the standby cluster needs to be modified to ensure table structure consistency between the active and standby clusters during table structure modification.

Procedure

Configuring the common data writing DR parameters for the active cluster

Step 1 Log in to Manager of the active cluster.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations** and click **All Configurations**. The HBase configuration page is displayed.

Step 3 (Optional) **Table 12-168** describes the optional configuration items during HBase DR. You can set the parameters based on the description or use the default values.

Table 12-168 Optional configuration items

Navigation Path	Parameter	Default Value	Description
HMaster > Performance	hbase.master.logcleaner.ttl	600000	Specifies the retention period of HLog. If the value is set to **604800000** (unit: millisecond), the retention period of HLog is 7 days.
	hbase.master.cleaner.interval	60000	Interval for the HMaster to delete historical HLog files. The HLog that exceeds the configured period will be automatically deleted. You are advised to set it to the maximum value to save more HLogs.
RegionServer > Replication	replication.source.size.capacity	16777216	Maximum size of edits, in bytes. If the edit size exceeds the value, HLog edits will be sent to the standby cluster.
	replication.source.nb.capacity	25000	Maximum number of edits, which is another condition for triggering HLog edits to be sent to the standby cluster. After data in the active cluster is synchronized to the standby cluster, the active cluster reads and sends data in HLog according to this parameter value. This parameter is used together with **replication.source.size.capacity**.
	replication.source.maxretriesmultiplier	10	Maximum number of retries when an exception occurs during replication.
	replication.source.sleepforretries	1000	Retry interval (Unit: ms)
	hbase.regionserver.replication.handler.count	6	Number of replication RPC server instances on RegionServer

Configuring the BulkLoad batch data writing DR parameters for the active cluster

Step 4 Determine whether to enable the BulkLoad batch data writing DR function.

If yes, go to **Step 5**.

If no, go to **Step 8**.

Step 5 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations** and click **All Configurations**. The HBase configuration page is displayed.

Step 6 Search for **hbase.replication.bulkload.enabled** and change its value to **true** to enable the BulkLoad batch data writing DR function.

Step 7 Search for **hbase.replication.cluster.id** and change the HBase ID of the active cluster. The ID is used by the standby cluster to connect to the active cluster. The value can contain uppercase letters, lowercase letters, digits, and underscores (_), and cannot exceed 30 characters.

Restarting the HBase service and install the client

Step 8 Click **Save**. In the displayed dialog box, click **OK**. Restart the HBase service.

Step 9 In the active and standby clusters, choose **Cluster** > ***Name of the desired cluster*** > **Service** > **HBase** > **More** > **Download Client** to download the client and install it.

Adding the DR relationship between the active and standby clusters

Step 10 Log in as user **hbase** to the HBase shell page of the active cluster.

Step 11 Run the following command on HBase Shell to create the DR synchronization relationship between the active cluster HBase and the standby cluster HBase.

add_peer '*Standby cluster ID*', **CLUSTER_KEY => "***ZooKeeper service IP address in the standby cluster* **", CONFIG => {"hbase.regionserver.kerberos.principal" => "***Standby cluster RegionServer principal***", "hbase.master.kerberos.principal" => "***Standby cluster HMaster principal***"}**

- The standby cluster ID indicates the ID for the active cluster to recognize the standby cluster. Enter an ID. The value can be specified randomly. Digits are recommended.
- The ZooKeeper address of the standby cluster includes the service IP address of ZooKeeper, the port for listening to client connections, and the HBase root directory of the standby cluster on ZooKeeper.
- Search for **hbase.master.kerberos.principal** and **hbase.regionserver.kerberos.principal** in the HBase **hbase-site.xml** configuration file of the standby cluster.

For example, to add the DR relationship between the active and standby clusters, run the **add_peer** '*Standby cluster ID*', **CLUSTER_KEY => "*192.168.40.2,192.168.40.3,192.168.40.4:24002:/hbase*", CONFIG => {"hbase.regionserver.kerberos.principal" => "*hbase/hadoop.hadoop.com@HADOOP.COM*", "hbase.master.kerberos.principal" => "*hbase/hadoop.hadoop.com@HADOOP.COM*"}**

Step 12 (Optional) If the BulkLoad batch data write DR function is enabled, the HBase client configuration of the active cluster must be copied to the standby cluster.

- Create the **/hbase/replicationConf/*hbase.replication.cluster.id of the active cluster*** directory in the HDFS of the standby cluster.

- HBase client configuration file, which is copied to the **/hbase/replicationConf/*hbase.replication.cluster.id of the active cluster*** directory of the HDFS of the standby cluster.

  Example: **hdfs dfs -put HBase/hbase/conf/core-site.xml HBase/hbase/conf/hdfs-site.xml HBase/hbase/conf/yarn-site.xml hdfs://*NameNode IP:25000*/hbase/replicationConf/*source_cluster***

Enabling HBase DR to synchronize data

Step 13 Check whether a naming space exists in the HBase service instance of the standby cluster and the naming space has the same name as the naming space of the HBase table for which the DR function is to be enabled.

- If the same namespace exists, go to **Step 14**.
- If no, create a naming space with the same name in the HBase shell of the standby cluster and go to **Step 14**.

Step 14 In the HBase shell of the active cluster, run the following command as user **hbase** to enable the real-time DR function for the table data of the active cluster to ensure that the data modified in the active cluster can be synchronized to the standby cluster in real time.

You can only synchronize the data of one HTable at a time.

enable_table_replication '*table name***'**

NOTE

- If the standby cluster does not contain a table with the same name as the table for which real-time synchronization is to be enabled, the table is automatically created.
- If a table with the same name as the table for which real-time synchronization is to be enabled exists in the standby cluster, the structures of the two tables must be the same.
- If the encryption algorithm SMS4 or AES is configured for '*Table name*', the function for synchronizing data from the active cluster to the standby cluster cannot be enabled for the HBase table.
- If the standby cluster is offline or has tables with the same name but different structures, the DR function cannot be enabled.
- If the DR data synchronization function is enabled for some Phoenix tables in the active cluster, the standby cluster cannot have common HBase tables with the same names as the Phoenix tables in the active cluster. Otherwise, the DR function fails to be enabled or the tables with the names in the standby cluster cannot be used properly.
- If the DR data synchronization function is enabled for Phoenix tables in the active cluster, you need to enable the DR data synchronization function for the metadata tables of the Phoenix tables. The metadata tables include SYSTEM.CATALOG, SYSTEM.FUNCTION, SYSTEM.SEQUENCE, and SYSTEM.STATS.
- If the DR data synchronization function is enabled for HBase tables of the active cluster, after adding new indexes to HBase tables, you need to manually add secondary indexes to DR tables in the standby cluster to ensure secondary index consistency between the active and standby clusters.
- The HBase multi-instance function also supports DR. You need to modify the parameters on the HBase service instance that corresponds to the standby cluster and run the commands on the clients of multiple instances. When adding the DR relationship, you need to select the directory, such as **hbase1**, for ZooKeeper of the standby cluster to store HBase multi-instance data.

Step 15 (Optional) If HBase does not use Ranger, run the following command as user **hbase** in the HBase shell of the active cluster to enable the real-time permission to control data DR function for the HBase tables in the active cluster.

enable_table_replication 'hbase:acl'

Creating Users

Step 16 Log in to FusionInsight Manager of the standby cluster, choose **System** > **Permission** > **Role** > **Create Role** to create a role, and add the same permission for the standby data table to the role based on the permission of the HBase source data table of the active cluster.

Step 17 Choose **System** > **Permission** > **User** > **Create** to create a user. Set the **User Type** to **Human-Machine** or **Machine-Machine** based on service requirements and add the user to the created role. Access the HBase DR data of the standby cluster as the newly created user.

NOTE

- After the permission of the active HBase source data table is modified, to ensure that the standby cluster can properly read data, modify the role permission for the standby cluster.
- If the current component uses Ranger for permission control, you need to configure permission management policies based on Ranger. For details, see **Adding a Ranger Access Permission Policy for HBase**.

Synchronizing the table data of the active cluster

Step 18 After HBase DR is configured and data synchronization is enabled, check whether tables and data exist in the active cluster and whether the historical data needs to be synchronized to the standby cluster.

- If yes, a table exists and data needs to be synchronized. Log in as the HBase table user to the node where the HBase client of the active cluster is installed and run the kinit username to authenticate the identity. The user must have the read and write permissions on tables and the execute permission on the **hbase:meta** table. Then go to **Step 19**.
- If no, no further action is required.

Step 19 The HBase DR configuration does not support automatic synchronization of historical data in tables. You need to back up the historical data of the active cluster and then manually restore the historical data in the standby cluster.

Manual recovery refers to the recovery of a single table, which can be performed through Export, DistCp, or Import.

To manually recover a single table, perform the following steps:

1. Export table data from the active cluster.

   hbase org.apache.hadoop.hbase.mapreduce.Export -Dhbase.mapreduce.include.deleted.rows=true *Table name Directory where the source data is stored*

   Example: **hbase org.apache.hadoop.hbase.mapreduce.Export -Dhbase.mapreduce.include.deleted.rows=true t1 /user/hbase/t1**

2. Copy the data that has been exported to the standby cluster.

   hadoop distcp *directory where the source data is stored on the active cluster* **hdfs://***ActiveNameNodeIP:8020/directory where the source data is stored on the standby cluster*

   ActiveNameNodeIP indicates the IP address of the active NameNode in the standby cluster.

Example: **hadoop distcp /user/hbase/t1 hdfs://192.168.40.2:8020/user/hbase/t1**

3. Import data to the standby cluster as the HBase table user of the standby cluster.

   On the HBase shell screen of the standby cluster, run the following command as user **hbase** to retain the data writing status:

   set_clusterState_active

   The command is run successfully if the following information is displayed:

   ```
   hbase(main):001:0> set_clusterState_active
   => true
   ```

   hbase org.apache.hadoop.hbase.mapreduce.Import -*Dimport.bulk.output=Directory where the output data is stored in the standby cluster Table name Directory where the source data is stored in the standby cluster*

   hbase org.apache.hadoop.hbase.mapreduce.LoadIncrementalHFiles *Directory where the output data is stored in the standby cluster Table name*

   Example:

   ```
   hbase(main):001:0> set_clusterState_active
   => true
   ```

   hbase org.apache.hadoop.hbase.mapreduce.Import -Dimport.bulk.output=/user/hbase/output_t1 t1 /user/hbase/t1

   hbase org.apache.hadoop.hbase.mapreduce.LoadIncrementalHFiles /user/hbase/output_t1 t1

Step 20 Run the following command on the HBase client to check the synchronized data of the active and standby clusters. After the DR data synchronization function is enabled, you can run this command to check whether the newly synchronized data is consistent.

hbase org.apache.hadoop.hbase.mapreduce.replication.VerifyReplication --starttime*=Start time* **--endtime***=End time Column family name ID of the standby cluster Table name*

NOTE

- The start time must be earlier than the end time.
- The values of **starttime** and **endtime** must be in the timestamp format. You need to run **date -d "2015-09-30 00:00:00" +%s to** change a common time format to a timestamp format.

Specify the data writing status for the active and standby clusters.

Step 21 On the HBase shell screen of the active cluster, run the following command as user **hbase** to retain the data writing status:

set_clusterState_active

The command is run successfully if the following information is displayed:

```
hbase(main):001:0> set_clusterState_active
=> true
```

Step 22 On the HBase shell screen of the standby cluster, run the following command as user **hbase** to retain the data read-only status:

set_clusterState_standby

The command is run successfully if the following information is displayed:

```
hbase(main):001:0> set_clusterState_standby
=> true
```

----End

Related Commands

Table 12-169 HBase DR

Operation	Command	Description
Set up a DR relationship.	add_peer'*Standby cluster ID*', CLUSTER_KEY => "*Standby cluster ZooKeeper service IP address*", CONFIG => {"hbase.regionserver.kerberos.principal" => "*Standby cluster RegionServer principal*", "hbase.master.kerberos.principal" => "*Standby cluster HMaster principal*"} **add_peer '1','zk1,zk2,zk3:2181:/hbase1'** **2181**: port number of ZooKeeper in the cluster	Set up the relationship between the active cluster and the standby cluster. If BulkLoad batch data write DR is enabled: • Create the **/hbase/replicationConf/*hbase.replication.cluster.id of the active cluster*** directory in the HDFS of the standby cluster. • HBase client configuration file, which is copied to the **/hbase/replicationConf/*hbase.replication.cluster.id of the active cluster*** directory of the HDFS of the standby cluster.
Remove the DR relationship.	**remove_peer** *'Standby cluster ID'* Example: **remove_peer '1'**	Remove standby cluster information from the active cluster.
Querying the DR Relationship	**list_peers**	Query standby cluster information (mainly Zookeeper information) in the active cluster.
Enable the real-time user table synchronization function.	**enable_table_replication** *'Table name'* Example: **enable_table_replication 't1'**	Synchronize user tables from the active cluster to the standby cluster.

Operation	Command	Description
Disable the real-time user table synchronization function.	**disable_table_replication** *'Table name'* Example: **disable_table_replication 't1'**	Do not synchronize user tables from the active cluster to the standby cluster.
Verify data of the active and standby clusters.	**bin/hbase org.apache.hadoop.hbase.mapreduce.replication.VerifyReplication --starttime=***Start time* **--endtime=***End time Column family name Standby cluster ID Table name*	Verify whether data of the specified table is the same between the active cluster and the standby cluster. The description of the parameters in this command is as follows: ● Start time: If start time is not specified, the default value **0** will be used. ● End time: If end time is not specified, the time when the current operation is submitted will be used by default. ● Table name: If a table name is not entered, all user tables for which the real-time synchronization function is enabled will be verified by default.
Switch the data writing status.	**set_clusterState_active** **set_clusterState_standby**	Specifies whether data can be written to the cluster HBase tables.

Operation	Command	Description
Add or update the active cluster HDFS configurations saved in the peer cluster.	**hdfs dfs -put -f HBase/hbase/conf/core-site.xml HBase/hbase/conf/hdfs-site.xml HBase/hbase/conf/yarn-site.xml hdfs://***Standby cluster* ***NameNode IP:PORT*****/hbase/replicationConf/***Active cluster***hbase.replication.cluster.id***	Enable DR for data including bulkload data. When HDFS parameters are modified in the active cluster, the modification cannot be automatically synchronized from the active cluster to the standby cluster. You need to manually run the command to synchronize configuration. The affected parameters are as follows: • fs.defaultFS • dfs.client.failover.proxy.provider.hacluster • dfs.client.failover.connection.retries.on.timeouts • dfs.client.failover.connection.retries For example, change **fs.defaultFS** to **hdfs://hacluster_sale**, HBase client configuration file, which is copied to the **/hbase/replicationConf/*hbase.replication.cluster.id of the active cluster*** directory of the HDFS of the standby cluster.

12.8.10 Configuring HBase Data Compression and Encoding

Scenario

HBase encodes data blocks in HFiles to reduce duplicate keys in KeyValues, reducing used space. Currently, the following data block encoding modes are supported: NONE, PREFIX, DIFF, FAST_DIFF, and ROW_INDEX_V1. NONE indicates that data blocks are not encoded. HBase also supports compression algorithms for HFile compression. The following algorithms are supported by default: NONE, GZ, SNAPPY, and ZSTD. NONE indicates that HFiles are not compressed.

The two methods are used on the HBase column family. They can be used together or separately.

Prerequisites

- You have installed an HBase client. For example, the client is installed in **opt/client**.

- If authentication has been enabled for HBase, you must have the corresponding operation permissions. For example, you must have the creation (C) or administration (A) permission on the corresponding namespace or higher-level items to create a table, and the creation (C) or administration (A) permission on the created table or higher-level items to modify a table. For details about how to grant permissions, see **Creating HBase Roles**.

Procedure

Setting data block encoding and compression algorithms during creation

- **Method 1: Using hbase shell**
  a. Log in to the node where the client is installed as the client installation user.
  b. Run the following command to go to the client directory:
     cd /opt/client
  c. Run the following command to configure environment variables:
     source bigdata_env
  d. If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step:
     kinit *Component service user*
     For example, **kinit hbaseuser**.
  e. Run the following HBase client command:
     hbase shell
  f. Create a table.
     create '*t1***', {NAME => '***f1***', COMPRESSION => '***SNAPPY***', DATA_BLOCK_ENCODING => '***FAST_DIFF***'}**

     NOTE

     - *t1*: indicates the table name.
     - *f1*: indicates the column family name.
     - *SNAPPY*: indicates the column family uses the SNAPPY compression algorithm.
     - *FAST_DIFF*: indicates FAST_DIFF is used for encoding.
     - The parameter in the braces specifies the column family. You can specify multiple column families using multiple braces and separate them by commas (,). For details about table creation statements, run the **help 'create'** statement in the HBase shell.
- **Method 2: Using Java APIs**
  The following code snippet shows only how to set the encoding and compression modes of a column family when creating a table. For complete code for creating a table and how to use the code to create a table, see "HBase Development Guide" > "Modifying a Table" in .

```
TableDescriptorBuilder htd = TableDescriptorBuilder.newBuilder(TableName.valueOf("t1"));// Create a descriptor for table t1.
ColumnFamilyDescriptorBuilder hcd = ColumnFamilyDescriptorBuilder.newBuilder(Bytes.toBytes("f1"));// Create a builder for column family f1.
```

```
hcd.setDataBlockEncoding(DataBlockEncoding.FAST_DIFF);// Set the encoding mode of column family f1 to FAST_DIFF.
hcd.setCompressionType(Compression.Algorithm.SNAPPY);// Set the compression algorithm of column family f1 to SNAPPY.
htd.setColumnFamily(hcd.build())// Add the column family f1 to the descriptor of table t1.
```

Setting or modifying the data block encoding mode and compression algorithm for an existing table

- **Method 1: Using hbase shell**
  a. Log in to the node where the client is installed as the client installation user.
  b. Run the following command to go to the client directory:
     cd /opt/client
  c. Run the following command to configure environment variables:
     source bigdata_env
  d. If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step:
     kinit *Component service user*
     For example, **kinit hbaseuser**.
  e. Run the following HBase client command:
     hbase shell
  f. Run the following command to modify the table:
     alter '*t1***', {NAME => '***f1***', COMPRESSION => '***SNAPPY***', DATA_BLOCK_ENCODING => '***FAST_DIFF***'}**
- **Method 2: Using Java APIs**
  The following code snippet shows only how to modify the encoding and compression modes of a column family in an existing table. For complete code for modifying a table and how to use the code to modify a table, see "HBase Development Guide".

```
TableDescriptor htd = admin.getDescriptor(TableName.valueOf("t1"));// Obtain the descriptor of table t1.
ColumnFamilyDescriptor originCF = htd.getColumnFamily(Bytes.toBytes("f1"));// Obtain the descriptor of column family f1.
builder.ColumnFamilyDescriptorBuilder hcd = ColumnFamilyDescriptorBuilder.newBuilder(originCF);// Create a builder based on the existing column family attributes.
hcd.setDataBlockEncoding(DataBlockEncoding.FAST_DIFF);// Change the encoding mode of the column family to FAST_DIFF.
hcd.setCompressionType(Compression.Algorithm.SNAPPY);// Change the compression algorithm of the column family to SNAPPY.
admin.modifyColumnFamily(TableName.valueOf("t1"), hcd.build());// Submit to the server to modify the attributes of column family f1.
```

  After the modification, the encoding and compression modes of the existing HFile will take effect after the next compaction.

12.8.11 Performing an HBase DR Service Switchover

Scenario

The system administrator can configure HBase cluster DR to improve system availability. If the active cluster in the DR environment is faulty and the connection

to the HBase upper-layer application is affected, you need to configure the standby cluster information for the HBase upper-layer application so that the application can run in the standby cluster.

NOTE

This section applies to MRS 3.*x* or later.

Impact on the System

After a service switchover, data written to the standby cluster is not synchronized to the active cluster by default. Add the active cluster is recovered, the data newly generated in the standby cluster needs to be synchronized to the active cluster by backup and recovery. If automatic data synchronization is required, you need to switch over the active and standby HBase DR clusters.

Procedure

Step 1 Log in to FusionInsight Manager of the standby cluster.

Step 2 Download and install the HBase client.

Step 3 On the HBase client of the standby cluster, run the following command as user **hbase** to enable the data writing status in the standby cluster.

kinit hbase

hbase shell

set_clusterState_active

The command is run successfully if the following information is displayed:

```
hbase(main):001:0> set_clusterState_active
=> true
```

Step 4 Check whether the original configuration files **hbase-site.xml**, **core-site.xml**, and **hdfs-site.xml** of the HBase upper-layer application are modified to adapt to the application running.

- If yes, update the related content to the new configuration file and replace the old configuration file.
- If no, use the new configuration file to replace the original configuration file of the HBase upper-layer application.

Step 5 Configure the network connection between the host where the HBase upper-layer application is located and the standby cluster.

NOTE

If the host where the client is installed is not a node in the cluster, configure network connections for the client to prevent errors when you run commands on the client.

1. Ensure that the host where the client is installed can communicate with the hosts listed in the **hosts** file in the directory where the client installation package is decompressed.
2. If the host where the client is located is not a node in the cluster, you need to set the mapping between the host name and the IP address (service plan) in

the /etc/hosts file on the host. The host names and IP addresses must be mapped one by one.

Step 6 Set the time of the host where the HBase upper-layer application is located to be the same as that of the standby cluster. The time difference must be less than 5 minutes.

Step 7 Check the authentication mode of the active cluster.

- If the security mode is used, go to **Step 8**.
- If the normal mode is used, no further action is required.

Step 8 Obtain the **keytab** and **krb5.conf** configuration files of the HBase upper-layer application user.

1. On FusionInsight Manager of the standby cluster, choose **System** > **Permission** > **User**.
2. Locate the row that contains the target user, click **More** > **Download Authentication Credential** in the **Operation** column, and download the **keytab** file to the local PC.
3. Decompress the package to obtain **user.keytab** and **krb5.conf**.

Step 9 Use the **user.keytab** and **krb5.conf** files to replace the original files in the HBase upper-layer application.

Step 10 Stop upper-layer applications.

Step 11 Determine whether to switch over the active and standby HBase clusters. If the switchover is not performed, data will not be synchronized.

- If yes, switch over the active and standby HBase DR clusters. For details, see **Performing an HBase DR Active/Standby Cluster Switchover**. Then, go to **Step 12**.
- If no, go to **Step 12**.

Step 12 Start the upper-layer services.

----End

12.8.12 Performing an HBase DR Active/Standby Cluster Switchover

Scenario

The HBase cluster in the current environment is a DR cluster. Due to some reasons, the active and standby clusters need to be switched over. That is, the standby cluster becomes the active cluster, and the active cluster becomes the standby cluster.

NOTE

This section applies to MRS 3.*x* or later.

Impact on the System

After the active and standby clusters are switched over, data cannot be written to the original active cluster, and the original standby cluster becomes the active cluster to take over upper-layer services.

Procedure

Ensuring that upper-layer services are stopped

Step 1 Ensure that the upper-layer services have been stopped. If not, perform operations by referring to **Performing an HBase DR Service Switchover**.

Disabling the write function of the active cluster

Step 2 Download and install the HBase client.

Step 3 On the HBase client of the standby cluster, run the following command as user **hbase** to disable the data write function of the standby cluster:

kinit hbase

hbase shell

set_clusterState_standby

The command is run successfully if the following information is displayed:

```
hbase(main):001:0> set_clusterState_standby
=> true
```

Checking whether the active/standby synchronization is complete

Step 4 Run the following command to ensure that the current data has been synchronized (SizeOfLogQueue=0 and SizeOfLogToReplicate=0 are required). If the values are not 0, wait and run the following command repeatedly until the values are 0.

status 'replication'

Disabling synchronization between the active and standby clusters

Step 5 Query all synchronization clusters and obtain the value of **PEER_ID**.

list_peers

Step 6 Delete all synchronization clusters.

remove_peer *'Standby cluster ID'*

Example:

remove_peer *'1'*

Step 7 Query all synchronized tables.

list_replicated_tables

Step 8 Disable all synchronized tables queried in the preceding step.

disable_table_replication *'Table name'*

Example:

disable_table_replication *'t1'*

Performing an active/standby switchover

Step 9 Reconfigure HBase DR. For details, see **Configuring HBase DR**.

----End

12.8.13 Community BulkLoad Tool

The Apache HBase official website provides the function of importing data in batches. For details, see the description of the **Import** and **ImportTsv** tools at **http://hbase.apache.org/2.2/book.html#tools**.

12.8.14 Configuring the MOB

Scenario

In the actual application scenario, data in various sizes needs to be stored, for example, image data and documents. Data whose size is smaller than 10 MB can be stored in HBase. HBase can yield the best read-and-write performance for data whose size is smaller than 100 KB. If the size of data stored in HBase is greater than 100 KB or even reaches 10 MB and the same number of data files are inserted, the total data amount is large, causing frequent compaction and split, high CPU consumption, high disk I/O frequency, and low performance.

MOB data (100 KB to 10 MB data) is stored in a file system (such as the HDFS) in the HFile format. Files are centrally managed using the expiredMobFileCleaner and Sweeper tools. The addresses and size of files are stored in the HBase store as values. This greatly decreases the compaction and split frequency in HBase and improves performance.

The MOB function of HBase is enabled by default. For details about related configuration items, see **Table 12-170**. To use the MOB function, you need to specify the MOB mode for storing data in the specified column family when creating a table or modifying table attributes.

NOTE

This section applies to MRS 3.*x* or later.

Configuration Description

To enable the HBase MOB function, you need to specify the MOB mode for storing data in the specified column family when creating a table or modifying table attributes.

Use code to declare that the MOB mode for storing data is used:

```
HColumnDescriptor hcd = new HColumnDescriptor("f");
hcd.setMobEnabled(true);
```

Use code to declare that the MOB mode for storing data is used, the unit of MOB_THRESHOLD is byte:

```
hbase(main):009:0> create 't3',{NAME => 'd', MOB_THRESHOLD => '102400', IS_MOB => 'true'}

0 row(s) in 0.3450 seconds

=> Hbase::Table - t3
hbase(main):010:0> describe 't3'
Table t3 is ENABLED

t3

COLUMN FAMILIES DESCRIPTION

{NAME => 'd', MOB_THRESHOLD => '102400', VERSIONS => '1', KEEP_DELETED_CELLS => 'FALSE',
DATA_BLOCK_ENCODING => 'NONE',
TTL => 'FOREVER', MIN_VERSIONS => '0', REPLICATION_SCOPE => '0', BLOOMFILTER => 'ROW',
IN_MEMORY => 'false', IS_MOB => 'true', COMPRESSION => 'NONE', BLOCKCACHE => 'true', BLOCKSIZE =>
'65536'}

1 row(s) in 0.0170 seconds
```

Navigation path for setting parameters:

On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations** > **All Configurations**. Enter a parameter name in the search box.

Table 12-170 Parameter description

Parameter	Description	Default Value
hbase.mob.file.cache.size	Size of the opened file handle cache. If this parameter is set to a large value, more file handles can be cached, reducing the frequency of opening and closing files. However, if this parameter is set to a large value, too many file handles will be opened. The default value is **1000**. This parameter is configured on the ResionServer.	1000
hbase.mob.cache.evict.period	Expiration time of cached MOB files in the MOB cache, in seconds.	3600
hbase.mob.cache.evict.remain.ratio	Ratio of the number of retained files after MOB cache reclamation to the number of cached files. **hbase.mob.cache.evict.remain.ratio** is an algorithm factor. When the number of cached MOB files reaches the product of **hbase.mob.file.cache.size** **hbase.mob.cache.evict.remain.ratio**, cache reclamation is triggered.	0.5

Parameter	Description	Default Value
hbase.master.mob.ttl.cleaner.period	Interval for deleting expired files, in seconds. The default value is one day (86,400 seconds). **NOTE** If the validity period of an MOB file expires, that is, the file has been created for more than 24 hours, the MOB file will be deleted by the tool for deleting expired MOB files.	86400

12.8.15 Configuring Secure HBase Replication

Scenario

This topic provides the procedure to configure the secure HBase replication during cross-realm Kerberos setup in security mode.

Prerequisites

- Mapping for all the FQDNs to their realms should be defined in the Kerberos configuration file.
- The passwords and keytab files of **ONE.COM** and **TWO.COM** must be the same.

Procedure

Step 1 Create krbtgt principals for the two realms.

For example, if you have two realms called **ONE.COM** and **TWO.COM**, you need to add the following principals: **krbtgt/ONE.COM@TWO.COM** and **krbtgt/TWO.COM@ONE.COM**.

Add these two principals at both realms.

```
kadmin: addprinc -e "<enc_type_list>" krbtgt/ONE.COM@TWO.COM
kadmin: addprinc -e "<enc_type_list>" krbtgt/TWO.COM@ONE.COM
```

NOTE

There must be at least one common keytab mode between these two realms.

Step 2 Add rules for creating short names in Zookeeper.

Dzookeeper.security.auth_to_local is a parameter of the ZooKeeper server process. Following is an example rule that illustrates how to add support for the realm called **ONE.COM**. The principal has two members (such as **service/instance@ONE.COM**).

```
Dzookeeper.security.auth_to_local=RULE:[2:\$1@\$0](.*@\\QONE.COM\\E$)s/@\\QONE.COM\\E$//DEFAULT
```

The above code example adds support for the **ONE.COM** realm in a different realm. Therefore, in the case of replication, you must add a rule for the master cluster realm in the slave cluster realm. **DEFAULT** is for defining the default rule.

Step 3 Add rules for creating short names in the Hadoop processes.

The following is the **hadoop.security.auth_to_local** property in the **core-site.xml** file in the slave cluster HBase processes. For example, to add support for the **ONE.COM** realm:

```
<property>
<name>hadoop.security.auth_to_local</name>
<value>RULE:[2:$1@$0](.*@\QONE.COM\E$)s/@\QONE.COM\E$//DEFAULT</value>
</property>
```

NOTE

If replication for bulkload data is enabled, then the same property for supporting the slave realm needs to be added in the **core-site.xml** file in the master cluster HBase processes.

Example:

```
<property>
<name>hadoop.security.auth_to_local</name>
<value>RULE:[2:$1@$0](.*@\QTWO.COM\E$)s/@\QTWO.COM\E$//DEFAULT</value>
</property>
```

----End

12.8.16 Configuring Region In Transition Recovery Chore Service

Scenario

In a faulty environment, there are possibilities that a region may be stuck in transition for longer duration due to various reasons like slow region server response, unstable network, ZooKeeper node version mismatch. During region transition, client operation may not work properly as some regions will not be available.

Configuration

A chore service should be scheduled at HMaster to identify and recover regions that stay in the transition state for a long time.

The following table describes the parameters for enabling this function.

Table 12-171 Parameters

Parameter	Description	Default Value
hbase.region.assignment.auto.recovery.enabled	Configuration parameter used to enable/disable the region assignment recovery thread feature.	true

12.8.17 Using a Secondary Index

Scenario

HIndex enables HBase indexing based on specific column values, making the retrieval of data highly efficient and fast.

Constraints

- Column families are separated by semicolons (;).
- Columns and data types must be contained in square brackets ([]).
- The column data type is specified by using -> after the column name.
- If the column data type is not specified, the default data type (string) is used.
- The number sign (#) is used to separate two index details.
- The following is an optional parameter:
  -Dscan.caching: number of cached rows when the data table is scanned.
  The default value is set to 1000.
- Indexes are created for a single region to repair damaged indexes.
  This function is not used to generate new indexes.

Procedure

Step 1 Install the HBase client. For details, see **Using an HBase Client**.

Step 2 Go to the client installation directory, for example, **/opt/client**.

cd /opt/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

Step 4 If the cluster is in security mode, run the following command to authenticate the user. In normal mode, user authentication is not required.

kinit *Component service user*

Step 5 Run the following command to access HIndex:

hbase org.apache.hadoop.hbase.hindex.mapreduce.TableIndexer

Table 12-172 Common HIndex commands

Description	Command
Add Index	TableIndexer-Dtablename.to.index=table1-Dindexspecs.to.add='IDX1=>cf1:[q1->datatype],[q2],[q3];cf2:[q1->datatype],[q2->datatype]#IDX2=>cf1:[q5]'
Create Index	TableIndexer -Dtablename.to.index=table1 -Dindexnames.to.build='IDX1#IDX2'

Description	Command
Delete Index	TableIndexer -Dtablename.to.index=table1 -Dindexnames.to.drop='IDX1#IDX2'
Disable Index	TableIndexer -Dtablename.to.index=table1 -Dindexnames.to.disable='IDX1#IDX2'
Add and Create Index	TableIndexer -Dtablename.to.index=table1 -Dindexspecs.to.add='IDX1=>cf1:[q1->datatype],[q2],[q3];cf2:[q1->datatype],[q2->datatype]#IDX2=>cf1:[q5]' -Dindexnames.to.build='IDX1'
Create Index for a Single Region	TableIndexer -Dtablename.to.index=table1 -Dregion.to.index=regionEncodedName -Dindexnames.to.build='IDX1#IDX2'

NOTE

- **IDX1**: indicates the index name.
- **cf1**: indicates the column family name.
- **q1**: indicates the column name.
- **datatype**: indicates the data type, including String, Integer, Double, Float, Long, Short, Byte and Char.

----End

12.8.18 HBase Log Overview

Log Description

Log path: The default storage path of HBase logs is **/var/log/Bigdata/hbase/***Role name*.

- HMaster: **/var/log/Bigdata/hbase/hm** (run logs) and **/var/log/Bigdata/audit/hbase/hm** (audit logs)
- RegionServer: **/var/log/Bigdata/hbase/rs** (run logs) and **/var/log/Bigdata/audit/hbase/rs** (audit logs)
- ThriftServer: **/var/log/Bigdata/hbase/ts2** (run logs, **ts2** is the instance name) and **/var/log/Bigdata/audit/hbase/ts2** (audit logs, **ts2** is the instance name)

Log archive rule: The automatic log compression and archiving function of HBase is enabled. By default, when the size of a log file exceeds 30 MB, the log file is automatically compressed. The naming rule of a compressed log file is as follows: <*Original log name*>-<*yyyy-mm-dd_hh-mm-ss*>.[*ID*].**log.zip** A maximum of 20 latest compressed files are reserved. The number of compressed files can be configured on the Manager portal.

Table 12-173 HBase log list

Type	Name	Description
Run logs	hbase-<SSH_USER>-<process_name>-<hostname>.log	HBase system log that records the startup time, startup parameters, and most logs generated when the HBase system is running.
	hbase-<SSH_USER>-<process_name>-<hostname>.out	Log that records the HBase running environment information.
	<process_name>-<SSH_USER>-<DATE>-<PID>-gc.log	Log that records HBase junk collections.
	checkServiceDetail.log	Log that records whether the HBase service starts successfully.
	hbase.log	Log generated when the HBase service health check script and some alarm check scripts are executed.
	sendAlarm.log	Log that records alarms reported after execution of HBase alarm check scripts.
	hbase-haCheck.log	Log that records the active and standby status of HMaster
	stop.log	Log that records the startup and stop processes of HBase.
Audit logs	hbase-audit-<process_name>.log	Log that records HBase security audit.

Log Level

Table 12-174 describes the log levels supported by HBase. The priorities of log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the specified level are printed. The number of printed logs decreases as the specified log level increases.

Table 12-174 Log levels

Level	Description
FATAL	Logs of this level record fatal error information about the current event processing that may result in a system crash.

Level	Description
ERROR	Logs of this level record error information about the current event processing, which indicates that system running is abnormal.
WARN	Logs of this level record abnormal information about the current event processing. These abnormalities will not result in system faults.
INFO	Logs of this level record normal running status information about the system and events.
DEBUG	Logs of this level record the system information and system debugging information.

To modify log levels, perform the following operations:

Step 1 Go to the **All Configurations** page of the HBase service. For details, see **Modifying Cluster Service Configuration Parameters**.

Step 2 On the left menu bar, select the log menu of the target role.

Step 3 Select a desired log level.

Step 4 Save the configuration. In the displayed dialog box, click **OK** to make the configurations take effect.

NOTE

The configurations take effect immediately without the need to restart the service.

----End

Log Formats

The following table lists the HBase log formats.

Table 12-175 Log formats

Type	Component	Format	Example

12.8.19 HBase Performance Tuning

12.8.19.1 Improving the BulkLoad Efficiency

Scenario

BulkLoad uses MapReduce jobs to directly generate files that comply with the internal data format of HBase, and then loads the generated StoreFiles to a running cluster. Compared with HBase APIs, BulkLoad saves more CPU and network resources.

ImportTSV is an HBase table data loading tool.

NOTE

This section applies to MRS 3.*x* and later versions.

Prerequisites

When using BulkLoad, the output path of the file has been specified using the **Dimporttsv.bulk.output** parameter.

Procedure

Add the following parameter to the BulkLoad command when performing a batch loading task:

Table 12-176 Parameter for improving BulkLoad efficiency

Parameter	Description	Value
-Dimporttsv.mapper.class	The construction of key-value pairs is moved from the user-defined mapper to reducer to improve performance. The mapper only needs to send the original text in each row to the reducer. The reducer parses the record in each row and creates a key-value) pair. **NOTE** When this parameter is set to **org.apache.hadoop.hbase.mapreduce.TsvImporterByteMapper**, this parameter is used only when the batch loading command without the *HBASE_CELL_VISIBILITY OR HBASE_CELL_TTL* option is executed. The **org.apache.hadoop.hbase.mapreduce.TsvImporterByteMapper** provides better performance.	org.apache.hadoop.hbase.mapreduce.TsvImporterByteMapper and org.apache.hadoop.hbase.mapreduce.TsvImporterTextMapper

12.8.19.2 Improving Put Performance

Scenario

In the scenario where a large number of requests are continuously put, setting the following two parameters to **false** can greatly improve the Put performance.

- **hbase.regionserver.wal.durable.sync**
- **hbase.regionserver.hfile.durable.sync**

When the performance is improved, there is a low probability that data is lost if three DataNodes are faulty at the same time. Exercise caution when configuring the parameters in scenarios that have high requirements on data reliability.

NOTE

This section applies to MRS 3.*x* and later versions.

Procedure

Navigation path for setting parameters:

On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations** > **All Configurations**. Enter the parameter name in the search box, and change the value.

Table 12-177 Parameters for improving put performance

Parameter	Description	Value
hbase.wal.hsync	Specifies whether to enable WAL file durability to make the WAL data persistence on disks. If this parameter is set to **true**, the performance is affected because each WAL file is synchronized to the disk by the Hadoop fsync.	false
hbase.hfile.hsync	Specifies whether to enable the HFile durability to make data persistence on disks. If this parameter is set to true, the performance is affected because each Hfile file is synchronized to the disk by the Hadoop fsync.	false

12.8.19.3 Optimizing Put and Scan Performance

Scenario

HBase has many configuration parameters related to read and write performance. The configuration parameters need to be adjusted based on the read/write request loads. This section describes how to optimize read and write performance by modifying the RegionServer configurations.

NOTE

This section applies to MRS 3.*x* and later versions.

Procedure

- JVM GC parameters

  Suggestions on setting the RegionServer **GC_OPTS** parameter:

  - Set **-Xms** and **-Xmx** to the same value based on your needs. Increasing the memory can improve the read and write performance. For details, see the description of **hfile.block.cache.size** in **Table 12-179** and **hbase.regionserver.global.memstore.size** in **Table 12-178**.
  - Set **-XX:NewSize** and **-XX:MaxNewSize** to the same value. You are advised to set the value to **512M** in low-load scenarios and **2048M** in high-load scenarios.
  - Set **X-XX:CMSInitiatingOccupancyFraction** to be less than and equal to 90, and it is calculated as follows: **100 x (hfile.block.cache.size + hbase.regionserver.global.memstore.size + 0.05)**.
  - **-XX:MaxDirectMemorySize** indicates the non-heap memory used by the JVM. You are advised to set this parameter to **512M** in low-load scenarios and **2048M** in high-load scenarios.

    NOTE

    The **-XX:MaxDirectMemorySize** parameter is not used by default. If you need to set this parameter, add it to the **GC_OPTS** parameter.

- Put parameters

  RegionServer processes the data of the put request and writes the data to memstore and HLog.

  - When the size of memstore reaches the value of **hbase.hregion.memstore.flush.size**, memstore is updated to HDFS to generate HFiles.
  - Compaction is triggered when the number of HFiles in the column cluster of the current region reaches the value of **hbase.hstore.compaction.min**.
  - If the number of HFiles in the column cluster of the current region reaches the value of **hbase.hstore.blockingStoreFiles**, the operation of refreshing the memstore and generating HFiles is blocked. As a result, the put request is blocked.

Table 12-178 Put parameters

Parameter	Description	Default Value
hbase.wal.hsync	Indicates whether each WAL is persistent to disks. For details, see **Improving Put Performance**.	true
hbase.hfile.hsync	Indicates whether HFile write operations are persistent to disks. For details, see **Improving Put Performance**.	true

Parameter	Description	Default Value
hbase.hregion.memstore.flush.size	If the size of MemStore (unit: Byte) exceeds a specified value, MemStore is flushed to the corresponding disk. The value of this parameter is checked by each thread running **hbase.server.thread.wakefrequency**. It is recommended that you set this parameter to an integer multiple of the HDFS block size. You can increase the value if the memory is sufficient and the put load is heavy.	134217728
hbase.regionserver.global.memstore.size	Updates the size of all MemStores supported by the RegionServer before locking or forcible flush. It is recommended that you set this parameter to **hbase.hregion.memstore.flush.size x Number of regions with active writes/ RegionServer GC -Xmx**. The default value is **0.4**, indicating that 40% of RegionServer GC -Xmx is used.	0.4
hbase.hstore.flusher.count	Indicates the number of memstore flush threads. You can increase the parameter value in heavy-put-load scenarios.	2
hbase.regionserver.thread.compaction.small	Indicates the number of small compaction threads. You can increase the parameter value in heavy-put-load scenarios.	10

Parameter	Description	Default Value
hbase.hstore.blockingStoreFiles	If the number of HStoreFile files in a Store exceeds the specified value, the update of the HRegion will be locked until a compression is completed or the value of **base.hstore.blockingWaitTime** is exceeded. Each time MemStore is flushed, a StoreFile file is written into MemStore. Set this parameter to a larger value in heavy-put-load scenarios.	15

- Scan parameters

  Table 12-179 Scan parameters

Parameter	Description	Default Value
hbase.client.scanner.timeout.period	Client and RegionServer parameters, indicating the lease timeout period of the client executing the scan operation. You are advised to set this parameter to an integer multiple of 60000 ms. You can set this parameter to a larger value when the read load is heavy. The unit is milliseconds.	60000
hfile.block.cache.size	Indicates the data cache percentage in the RegionServer GC –Xmx. You can increase the parameter value in heavy-read-load scenarios, in order to improve cache hit ratio and performance. It indicates the percentage of the maximum heap (-Xmx setting) allocated to the block cache of HFiles or StoreFiles.	When offheap is disabled, the default value is **0.25**. When offheap is enabled, the default value is **0.1**.

- Handler parameters

Table 12-180 Handler parameters

Parameter	Description	Default Value
hbase.regionserver.handler.count	Indicates the number of RPC server instances on RegionServer. The recommended value ranges from 200 to 400.	200
hbase.regionserver.metahandler.count	Indicates the number of program instances for processing prioritized requests. The recommended value ranges from 200 to 400.	200

12.8.19.4 Improving Real-time Data Write Performance

Scenario

Scenarios where data needs to be written to HBase in real time, or large-scale and consecutive put scenarios

NOTE

This section applies to MRS 3.*x* and later versions.

Prerequisites

The HBase put or delete interface can be used to save data to HBase.

Procedure

- **Data writing server tuning**

  Parameter portal:

  Go to the **All Configurations** page of the HBase service. For details, see **Modifying Cluster Service Configuration Parameters**.

Table 12-181 Configuration items that affect real-time data writing

Parameter	Description	Default Value
hbase.wal.hsync	Controls the synchronization degree when HLogs are written to the HDFS. If the value is **true**, HDFS returns only when data is written to the disk. If the value is **false**, HDFS returns when data is written to the OS cache. Set the parameter to **false** to improve write performance.	true
hbase.hfile.hsync	Controls the synchronization degree when HFiles are written to the HDFS. If the value is **true**, HDFS returns only when data is written to the disk. If the value is **false**, HDFS returns when data is written to the OS cache. Set the parameter to **false** to improve write performance.	true

Parameter	Description	Default Value
GC_OPTS	You can increase HBase memory to improve HBase performance because read and write operations are performed in HBase memory. **HeapSize** and **NewSize** need to be adjusted. When you adjust **HeapSize**, set **Xms** and **Xmx** to the same value to avoid performance problems when JVM dynamically adjusts **HeapSize**. Set **NewSize** to 1/8 of **HeapSize**. • **HMaster**: If HBase clusters enlarge and the number of Regions grows, properly increase the **GC_OPTS** parameter value of the HMaster. • **RegionServer**: A RegionServer needs more memory than an HMaster. If sufficient memory is available, increase the **HeapSize** value. **NOTE** When the value of **HeapSize** for the active HMaster is 4 GB, the HBase cluster can support 100,000 regions. Empirically, each time 35,000 regions are added to the cluster, the value of **HeapSize** must be increased by 2 GB. It is recommended that the value of **HeapSize** for the active HMaster not exceed 32 GB.	• HMaster -server -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=512M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M

Parameter	Description	Default Value
		• Region Server -server -Xms6G -Xmx6G -XX:NewSize=1024M -XX:MaxNewSize=1024M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=512M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M

Parameter	Description	Default Value
hbase.regionserver.handler.count	Indicates the number of RPC server instances started on RegionServer. If the parameter is set to an excessively large value, threads will compete fiercely. If the parameter is set to an excessively small value, requests will be waiting for a long time in RegionServer, reducing the processing capability. You can add threads based on resources. It is recommended that the value be set to **100** to **300** based on the CPU usage.	200
hbase.hregion.max.filesize	Indicates the maximum size of an HStoreFile, in bytes. If the size of any HStoreFile exceeds the value of this parameter, the managed Hregion is divided into two parts.	10737418240
hbase.hregion.memstore.flush.size	On the RegionServer, when the size of memstore that exists in memory of write operations exceeds **memstore.flush.size**, MemStoreFlusher performs the Flush operation to write the memstore to the corresponding store in the format of HFile. If RegionServer memory is sufficient and active Regions are few, increase the parameter value and reduce compaction times to improve system performance. The Flush operation may be delayed after it takes place. Write operations continue and memstore keeps increasing during the delay. The maximum size of memstore is: **memstore.flush.size** x **hbase.hregion.memstore.block.multiplier**. When the memstore size exceeds the maximum value, write operations are blocked. Properly increasing the value of **hbase.hregion.memstore.block.multiplier** can reduce the blocks and make performance become more stable. Unit: byte	134217728

Parameter	Description	Default Value
hbase.regionserver.global.memstore.size	Updates the size of all MemStores supported by the RegionServer before locking or forcible flush. On the RegionServer, the MemStoreFlusher thread performs the flush. The thread regularly checks memory occupied by write operations. When the total memory volume occupied by write operations exceeds the threshold, MemStoreFlusher performs the flush. Larger memstore will be flushed first and then smaller ones until the occupied memory is less than the threshold. Threshold = hbase.regionserver.global.memstore.size x hbase.regionserver.global.memstore.size.lower.limit x HBase_HEAPSIZE **NOTE** The sum of the parameter value and the value of **hfile.block.cache.size** cannot exceed 0.8, that is, memory occupied by read and write operations cannot exceed 80% of **HeapSize**, ensuring stable running of other operations.	0.4

Parameter	Description	Default Value
hbase.hstore.blockingStoreFiles	Check whether the number of files is larger than the value of **hbase.hstore.blockingStoreFiles** before you flush regions. If it is larger than the value of **hbase.hstore.blockingStoreFiles**, perform a compaction and configure **hbase.hstore.blockingWaitTime** to 90s to make the flush delay for 90s. During the delay, write operations continue and the memstore size keeps increasing and exceeds the threshold (**memstore.flush.size** x **hbase.hregion.memstore.block.multiplier**), blocking write operations. After compaction is complete, a large number of writes may be generated. As a result, the performance fluctuates sharply. Increase the value of **hbase.hstore.blockingStoreFiles** to reduce block possibilities.	15
hbase.regionserver.thread.compaction.throttle	The compression whose size is greater than the value of this parameter is executed by the large thread pool. The unit is bytes. Indicates a threshold of a total file size for compaction during a Minor Compaction. The total file size affects execution duration of a compaction. If the total file size is large, other compactions or flushes may be blocked.	1610612736
hbase.hstore.compaction.min	Indicates the minimum number of HStoreFiles on which minor compaction is performed each time. When the size of a file in a Store exceeds the value of this parameter, the file is compacted. You can increase the value of this parameter to reduce the number of times that the file is compacted. If there are too many files in the Store, read performance will be affected.	6

Parameter	Description	Default Value
hbase.hstore.compaction.max	Indicates the maximum number of HStoreFiles on which minor compaction is performed each time. The functions of the parameter and **hbase.hstore.compaction.max.size** are similar. Both are used to limit the execution duration of one compaction.	10
hbase.hstore.compaction.max.size	If the size of an HFile is larger than the parameter value, the HFile will not be compacted in a Minor Compaction but can be compacted in a Major Compaction. The parameter is used to prevent HFiles of large sizes from being compacted. After a Major Compaction is forbidden, multiple HFiles can exist in a Store and will not be merged into one HFile, without affecting data access performance. The unit is byte.	9223372036854775807
hbase.hregion.majorcompaction	Main compression interval of all HStoreFile files in a region. The unit is milliseconds. Execution of Major Compactions consumes much system resources and will affect system performance during peak hours. If service updates, deletion, and reclamation of expired data space are infrequent, set the parameter to **0** to disable Major Compactions. If you must perform a Major Compaction to reclaim more space, increase the parameter value and configure the **hbase.offpeak.end.hour** and **hbase.offpeak.start.hour** parameters to make the Major Compaction be triggered in off-peak hours.	604800000

Parameter	Description	Default Value
• hbase.regionserver.maxlogs • hbase.regionserver.hlog.blocksize	• Indicates the threshold for the number of HLog files that are not flushed on a RegionServer. If the number of HLog files is greater than the threshold, the RegionServer forcibly performs flush operations. • Indicates the maximum size of an HLog file. If the size of an HLog file is greater than the value of this parameter, a new HLog file is generated. The old HLog file is disabled and archived. The two parameters determine the number of HLogs that are not flushed in a RegionServer. When the data volume is less than the total size of memstore, the flush operation is forcibly triggered due to excessive HLog files. In this case, you can adjust the values of the two parameters to avoid forcible flush. Unit: byte	• 32 • 134217728

- **Data writing client tuning**

  It is recommended that data is written in Put List mode if necessary, which greatly improves write performance. The length of each put list needs to be set based on the single put size and parameters of the actual environment. You are advised to do some basic tests before configuring parameters.

- **Data table writing design optimization**

  Table 12-182 Parameters affecting real-time data writing

Parameter	Description	Default Value
COMPRESSION	The compression algorithm compresses blocks in HFiles. For compressible data, configure the compression algorithm to efficiently reduce disk I/Os and improve performance. **NOTE** Some data cannot be efficiently compressed. For example, a compressed figure can hardly be compressed again. The common compression algorithm is SNAPPY, because it has a high encoding/decoding speed and acceptable compression rate.	NONE

Parameter	Description	Default Value
BLOCKSIZE	Different block sizes affect HBase data read and write performance. You can configure sizes for blocks in an HFile. Larger blocks have a higher compression rate. However, they have poor performance in random data read, because HBase reads data in a unit of blocks. Set the parameter to 128 KB or 256 KB to improve data write efficiency without greatly affecting random read performance. The unit is byte.	65536
IN_MEMORY	Whether to cache table data in the memory first, which improves data read performance. If you will frequently access some small tables, set the parameter.	false

12.8.19.5 Improving Real-time Data Read Performance

Scenario

HBase data needs to be read.

Prerequisites

The get or scan interface of HBase has been invoked and data is read in real time from HBase.

Procedure

- **Data reading server tuning**

  Parameter portal:

  Go to the **All Configurations** page of the HBase service. For details, see **Modifying Cluster Service Configuration Parameters**.

Table 12-183 Configuration items that affect real-time data reading

Parameter	Description	Default Value
GC_OPTS	You can increase HBase memory to improve HBase performance because read and write operations are performed in HBase memory. **HeapSize** and **NewSize** need to be adjusted. When you adjust **HeapSize**, set **Xms** and **Xmx** to the same value to avoid performance problems when JVM dynamically adjusts **HeapSize**. Set **NewSize** to 1/8 of **HeapSize**. ● **HMaster**: If HBase clusters enlarge and the number of Regions grows, properly increase the **GC_OPTS** parameter value of the HMaster. ● **RegionServer**: A RegionServer needs more memory than an HMaster. If sufficient memory is available, increase the **HeapSize** value. **NOTE** When the value of **HeapSize** for the active HMaster is 4 GB, the HBase cluster can support 100,000 regions. Empirically, each time 35,000 regions are added to the cluster, the value of **HeapSize** must be increased by 2 GB. It is recommended that the value of **HeapSize** for the active HMaster not exceed 32 GB.	For versions earlier than MRS 3.x: ● HMaster: -server -Xms2G -Xmx2G -XX:NewSize=256M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=512M -XX:MaxDirectMemorySize=512M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps

Parameter	Description	Default Value
		-XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M • RegionServer: -server -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=512M -XX:MaxDirectMemorySize=512M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcIn

Parameter	Description	Default Value
		terval=0x7FFFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M For MRS 3.*x* or later: ● HMaster -server -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=512M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -

Parameter	Description	Default Value
		Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M • RegionServer -server -Xms6G -Xmx6G -XX:NewSize=1024M -XX:MaxNewSize=1024M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=512M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSIniti

Parameter	Description	Default Value
		atingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCTimeStamps -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M
hbase.regionserver.handler.count	Indicates the number of requests that RegionServer can process concurrently. If the parameter is set to an excessively large value, threads will compete fiercely. If the parameter is set to an excessively small value, requests will be waiting for a long time in RegionServer, reducing the processing capability. You can add threads based on resources. It is recommended that the value be set to 100 to 300 based on the CPU usage.	200

Parameter	Description	Default Value
hfile.block.cache.size	HBase cache sizes affect query efficiency. Set cache sizes based on query modes and query record distribution. If random query is used to reduce the hit ratio of the buffer, you can reduce the buffer size.	When **offheap** is disabled, the default value is **0.25**. When **offheap** is enabled, the default value is **0.1**.

NOTE

If read and write operations are performed at the same time, the performance of the two operations affects each other. If flush and compaction operations are frequently performed due to data writes, a large number of disk I/O operations are occupied, affecting read performance. If a large number of compaction operations are blocked due to write operations, multiple HFiles exist in the region, affecting read performance. Therefore, if the read performance is unsatisfactory, you need to check whether the write configurations are proper.

- **Data reading client tuning**

  When scanning data, you need to set **caching** (the number of records read from the server at a time. The default value is **1**.). If the default value is used, the read performance will be extremely low.

  If you do not need to read all columns of a piece of data, specify the columns to be read to reduce network I/O.

  If you only need to read the row key, add a filter (FirstKeyOnlyFilter or KeyOnlyFilter) that only reads the row key.

- **Data table reading design optimization**

Table 12-184 Parameters affecting real-time data reading

Parameter	Description	Default Value
COMPRESSION	The compression algorithm compresses blocks in HFiles. For compressible data, configure the compression algorithm to efficiently reduce disk I/Os and improve performance. **NOTE** Some data cannot be efficiently compressed. For example, a compressed figure can hardly be compressed again. The common compression algorithm is SNAPPY, because it has a high encoding/decoding speed and acceptable compression rate.	NONE

Parameter	Description	Default Value
BLOCKSIZE	Different block sizes affect HBase data read and write performance. You can configure sizes for blocks in an HFile. Larger blocks have a higher compression rate. However, they have poor performance in random data read, because HBase reads data in a unit of blocks. Set the parameter to 128 KB or 256 KB to improve data write efficiency without greatly affecting random read performance. The unit is byte.	65536
DATA_BLOCK_ENCODING	Encoding method of the block in an HFile. If a row contains multiple columns, set **FAST_DIFF** to save data storage space and improve performance.	NONE

12.8.19.6 Optimizing JVM Parameters

Scenario

When the number of clusters reaches a certain scale, the default settings of the Java virtual machine (JVM) cannot meet the cluster requirements. In this case, the cluster performance deteriorates or the clusters may be unavailable. Therefore, JVM parameters must be properly configured based on actual service conditions to improve the cluster performance.

Procedure

Navigation path for setting parameters:

The JVM parameters related to the HBase role must be configured in the **hbase-env.sh** file in the **${BIGDATA_HOME}/FusionInsight_HD_*/install/FusionInsight-HBase-2.2.3/hbase/conf/** directory of the node where the HBase service is installed.

Each role has JVM parameter configuration variables, as shown in **Table 12-185**.

Table 12-185 HBase-related JVM parameter configuration variables

Variable	Affected Role
HBASE_OPTS	All roles of HBase
SERVER_GC_OPTS	All roles on the HBase server, such as Master and RegionServer
CLIENT_GC_OPTS	Client process of HBase

Variable	Affected Role
HBASE_MASTER_OPTS	Master of HBase
HBASE_REGIONSERVER_OPTS	RegionServer of HBase
HBASE_THRIFT_OPTS	Thrift of HBase

Configuration example:

```
export HADOOP_NAMENODE_OPTS="-Dhadoop.security.logger=${HADOOP_SECURITY_LOGGER:-INFO,RFAS} -Dhdfs.audit.logger=${HDFS_AUDIT_LOGGER:-INFO,NullAppender} $HADOOP_NAMENODE_OPTS"
```

12.8.20 Common Issues About HBase

12.8.20.1 Why Does a Client Keep Failing to Connect to a Server for a Long Time?

Question

A HBase server is faulty and cannot provide services. In this case, when a table operation is performed on the HBase client, why is the operation suspended and no response is received for a long time?

Answer

Problem Analysis

When the HBase server malfunctions, the table operation request from the HBase client is tried for several times and times out. The default timeout value is **Integer.MAX_VALUE (2147483647 ms)**. The table operation request is retired constantly during such a long period of time and is suspended at last.

Solution

The HBase client provides two configuration items to configure the retry and timeout of the client. **Table 12-186** describes them.

Set the following parameters in the ***Client installation path*/HBase/hbase/conf/hbase-site.xml** configuration file:

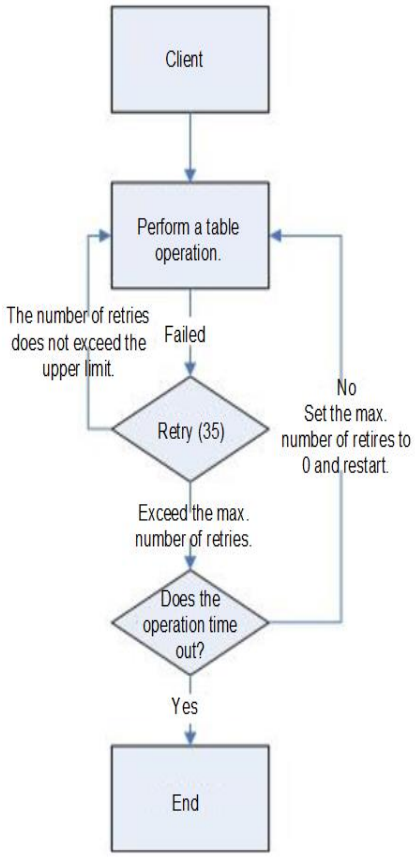
Table 12-186 Configuration parameters of retry and timeout

Parameter	Description	Default Value
hbase.client.operation.timeout	Client operation timeout period You need to manually add the information to the configuration file.	2147483647 ms

Parameter	Description	Default Value
hbase.client.retries.number	Maximum retry times supported by all retryable operations.	35

Figure 12-17 describes the working principles of retry and timeout.

Figure 12-17 Process for HBase client operation retry timeout



The process indicates that a suspension occurs if the preceding parameters are not configured based on site requirements. It is recommended that a proper timeout period be set based on scenarios. If the operation takes a long time, set a long timeout period. If the operation takes a shot time, set a short timeout period. The number of retries can be set to **(hbase.client.retries.number)*60*1000(ms)**. The timeout period can be slightly greater than **hbase.client.operation.timeout**.

12.8.20.2 Operation Failures Occur in Stopping BulkLoad On the Client

Question

Why submitted operations fail by stopping BulkLoad on the client during BulkLoad data importing?

Answer

When BulkLoad is enabled on the client, a partitioner file is generated and used to demarcate the range of Map task data inputting. The file is automatically deleted when BulkLoad exists on the client. In general, if all map tasks are enabled and running, the termination of BulkLoad on the client does not cause the failure of submitted operations. However, due to the retry and speculative execution mechanism of Map tasks, a Map task is performed again if failures of the Reduce task to download the data of the completed Map task exceed the limit. In this case, if BulkLoad already exists on the client, the retry Map task fails and the operation failure occurs because the partitioner file is missing. Therefore, it is recommended not to stop BulkLoad on the client during BulkLoad data importing.

12.8.20.3 Why May a Table Creation Exception Occur When HBase Deletes or Creates the Same Table Consecutively?

Question

When HBase consecutively deletes and creates the same table, why may a table creation exception occur?

Answer

Execution process: Disable Table > Drop Table > Create Table > Disable Table > Drop Table > And more

1. When a table is disabled, HMaster sends an RPC request to RegionServer, and RegionServer brings the region offline. When the time required for closing a region on RegionServer exceeds the timeout period for HBase HMaster to wait for the region to enter the RIT state, HMaster considers that the region is offline by default. Actually, the region may be in the flush memstore phase.
2. After an RPC request is sent to close a region, HMaster checks whether all regions in the table are offline. If the closure times out, HMaster considers that the regions are offline and returns a message indicating that the regions are successfully closed.
3. After the closure is successful, the data directory corresponding to the HBase table is deleted.
4. After the table is deleted, the data directory is recreated by the region that is still in the flush memstore phase.
5. When the table is created again, the **temp** directory is copied to the HBase data directory. However, the HBase data directory is not empty. As a result, when the HDFS rename API is called, the data directory changes to the last layer of the **temp** directory and is appended to the HBase data directory, for example, **$rootDir/data/$nameSpace/$tableName/$tableName**. In this case, the table fails to be created.

Troubleshooting Method

When this problem occurs, check whether the HBase data directory corresponding to the table exists. If it exists, rename the directory.

The HBase data directory consists of **$rootDir/data/$nameSpace/$tableName**, for example, **hdfs://hacluster/hbase/data/default/TestTable**. **$rootDir** is the

HBase root directory, which can be obtained by configuring **hbase.rootdir.perms** in **hbase-site.xml**. The **data** directory is a fixed directory of HBase. **$nameSpace** indicates the nameSpace name. **$tableName** indicates the table name.

12.8.20.4 Why Other Services Become Unstable If HBase Sets up A Large Number of Connections over the Network Port?

Question

Why other services become unstable if HBase sets up a large number of connections over the network port?

Answer

When the OS command ***lsof*** or ***netstat*** is run, it is found that many TCP connections are in the CLOSE_WAIT state and the owner of the connections is HBase RegionServer. This can cause exhaustion of network ports or limit exceeding of HDFS connections, resulting in instability of other services. The HBase CLOSE_WAIT phenomenon is the HBase mechanism.

The reason why HBase CLOSE_WAIT occurs is as follows: HBase data is stored in the HDFS as HFile, which can be called StoreFiles. HBase functions as the client of the HDFS. When HBase creates a StoreFile or starts loading a StoreFile, it creates an HDFS connection. When the StoreFile is created or loaded successfully, the HDFS considers that the task is completed and transfers the connection close permission to HBase. However, HBase may choose not to close the connection to ensure real-time response; that is, HBase may maintain the connection so that it can quickly access the corresponding data file upon request. In this case, the connection is in the CLOSE_WAIT, which indicates that the connection needs to be closed by the client.

When a StoreFile will be created: HBase executes the Flush operation.

When Flush is executed: The data written by HBase is first stored in memstore. The Flush operation is performed only when the usage of memstore reaches the threshold or the ***flush*** command is run to write data into the HDFS.

To resolve the issue, use either of the following methods:

Because of the HBase connection mechanism, the number of StoreFiles must be restricted to reduce the occupation of HBase ports. This can be achieved by triggering HBase's the compaction action, that is, HBase file merging.

Method 1: On HBase shell client, run ***major_compact***.

Method 2: Compile HBase client code to invoke the compact method of the HBaseAdmin class to trigger HBase's compaction action.

If the HBase port occupation issue cannot be resolved through compact, it indicates that the HBase usage has reached the bottleneck. In such a case, you are advised to perform the following:

- Check whether the initial number of Regions configured in the table is appropriate.
- Check whether useless data exists.

If useless data exists, delete the data to reduce the number of storage files for the HBase. If the preceding conditions are not met, then you need to consider a capacity expansion.

12.8.20.5 Why Does the HBase BulkLoad Task (One Table Has 26 TB Data) Consisting of 210,000 Map Tasks and 10,000 Reduce Tasks Fail?

Question

The HBase bulkLoad task (a single table contains 26 TB data) has 210,000 maps and 10,000 reduce tasks (in MRS 3.x or later), and the task fails.

Answer

ZooKeeper I/O bottleneck observation methods:

1. On the monitoring page of Manager, check whether the number of ZooKeeper requests on a single node exceeds the upper limit.
2. View ZooKeeper and HBase logs to check whether a large number of I/O Exception Timeout or SocketTimeout Exception exceptions occur.

Optimization suggestions:

1. Change the number of ZooKeeper instances to 5 or more. You are advised to set **peerType** to **observer** to increase the number of observers.
2. Control the number of concurrent maps of a single task or reduce the memory for running tasks on each node to lighten the node load.
3. Upgrade ZooKeeper data disks, such as SSDs.

12.8.20.6 How Do I Restore a Region in the RIT State for a Long Time?

Question

How do I restore a region in the RIT state for a long time?

Answer

Log in to the HMaster Web UI, choose **Procedure & Locks** in the navigation tree, and check whether any process ID is in the **Waiting** state. If yes, run the following command to release the procedure lock:

hbase hbck -j *Client installation directory*/**HBase/hbase/tools/hbase-hbck2-*.jar bypass -o** *pid*

Check whether the state is in the **Bypass** state. If the procedure on the UI is always in **RUNNABLE(Bypass)** state, perform an active/standby switchover. Run the **assigns** command to bring the region online again.

hbase hbck -j *Client installation directory*/**HBase/hbase/tools/hbase-hbck2-*.jar assigns -o** *regionName*

12.8.20.7 Why Does HMaster Exits Due to Timeout When Waiting for the Namespace Table to Go Online?

Question

Why does HMaster exit due to timeout when waiting for the namespace table to go online?

Answer

During the HMaster active/standby switchover or startup, HMaster performs WAL splitting and region recovery for the RegionServer that failed or was stopped previously.

Multiple threads are running in the background to monitor the HMaster startup process.

- TableNamespaceManager

  This is a help class, which is used to manage the allocation of namespace tables and monitoring table regions during HMaster active/standby switchover or startup. If the namespace table is not online within the specified time (**hbase.master.namespace.init.timeout**, which is 3,600,000 ms by default), the thread terminates HMaster abnormally.

- InitializationMonitor

  This is an initialization thread monitoring class of the primary HMaster, which is used to monitor the initialization of the primary HMaster. If a thread fails to be initialized within the specified time (**hbase.master.initializationmonitor.timeout**, which is 3,600,000 ms by default), the thread terminates HMaster abnormally. If **hbase.master.initializationmonitor.haltontimeout** is started, the default value is **false**.

During the HMaster active/standby switchover or startup, if the **WAL hlog** file exists, the WAL splitting task is initialized. If the WAL hlog splitting task is complete, it initializes the table region allocation task.

HMaster uses ZooKeeper to coordinate log splitting tasks and valid RegionServers and track task development. If the primary HMaster exits during the log splitting task, the new primary HMaster attempts to resend the unfinished task, and RegionServer starts the log splitting task from the beginning.

The initialization of the HMaster is delayed due to the following reasons:

- Network faults occur intermittently.
- Disks run into bottlenecks.
- The log splitting task is overloaded, and RegionServer runs slowly.
- RegionServer (region opening) responds slowly.

In the preceding scenarios, you are advised to add the following configuration parameters to enable HMaster to complete the restoration task earlier. Otherwise, the Master will exit, causing a longer delay of the entire restoration process.

- Increase the online waiting timeout period of the namespace table to ensure that the Master has enough time to coordinate the splitting tasks of the RegionServer worker and avoid repeated tasks.

  hbase.master.namespace.init.timeout (default value: 3,600,000 ms)

- Increase the number of concurrent splitting tasks through RegionServer worker to ensure that RegionServer worker can process splitting tasks in parallel (RegionServers need more cores). Add the following parameters to *Client installation path* **/HBase/hbase/conf/hbase-site.xml**:

  hbase.regionserver.wal.max.splitters (default value: 2)

- If all restoration processes require time, increase the timeout period for initializing the monitoring thread.

  hbase.master.initializationmonitor.timeout (default value: 3,600,000 ms)

12.8.20.8 Why Does SocketTimeoutException Occur When a Client Queries HBase?

Question

Why does the following exception occur on the client when I use the HBase client to operate table data?

```
2015-12-15 02:41:14,054 | WARN  | [task-result-getter-2] | Lost task 2.0 in stage 58.0 (TID 3288, linux-175):

Answer

The memory allocated to RegionServer is too small and the number of Regions is too large. As a result, the memory is insufficient during the running, and the server responds slowly to the client. Modify the following memory allocation parameters in the **hbase-site.xml** configuration file of RegionServer:

Table 12-187 RegionServer memory allocation parameters

Parameter	Description	Default Value
GC_OPTS	Initial memory and maximum memory allocated to RegionServer in startup parameters.	-Xms8G -Xmx8G
hfile.block.cache.size	Percentage of the maximum heap (-Xmx setting) allocated to the block cache of HFiles or StoreFiles.	When **offheap** is disabled, the default value is **0.25**. When **offheap** is enabled, the default value is **0.1**.

12.8.20.9 Why Modified and Deleted Data Can Still Be Queried by Using the Scan Command?

Question

Why modified and deleted data can still be queried by using the **scan** command?

```
scan '<table_name>',{FILTER=>"SingleColumnValueFilter('<column_family>','column',=,'binary:<value>')"}
```

Answer

Because of the scalability of HBase, all values specific to the versions in the queried column are all matched by default, even if the values have been modified or deleted. For a row where column matching has failed (that is, the column does not exist in the row), the HBase also queries the row.

If you want to query only the new values and rows where column matching is successful, you can use the following statement:

```
scan '<table_name>',
{FILTER=>"SingleColumnValueFilter('<column_family>','column',=,'binary:<value>',true,true)"}
```

This command can filter all rows where column query has failed. It queries only the latest values of the current data in the table; that is, it does not query the values before modification or the deleted values.

NOTE

The related parameters of **SingleColumnValueFilter** are described as follows:

SingleColumnValueFilter(final byte[] family, final byte[] qualifier, final CompareOp compareOp, ByteArrayComparable comparator, final boolean filterIfMissing, final boolean latestVersionOnly)

Parameter description:

- family: family of the column to be queried.
- qualifier: column to be queried.
- compareOp: comparison operation, such as = and >.
- comparator: target value to be queried.
- filterIfMissing: whether a row is filtered out if the queried column does not exist. The default value is false.
- latestVersionOnly: whether values of the latest version are queried. The default value is false.

12.8.20.10 Why "java.lang.UnsatisfiedLinkError: Permission denied" exception thrown while starting HBase shell?

Question

Why "java.lang.UnsatisfiedLinkError: Permission denied" exception thrown while starting HBase shell?

Answer

During HBase shell execution JRuby create temporary files under **java.io.tmpdir** path and default value of **java.io.tmpdir** is **/tmp**. If NOEXEC permission is set to /tmp directory then HBase shell start will fail with "java.lang.UnsatisfiedLinkError: Permission denied" exception.

So "java.io.tmpdir" must be set to a different path in HBASE_OPTS/ CLIENT_GC_OPTS if NOEXEC is set to /tmp directory.

12.8.20.11 When does the RegionServers listed under "Dead Region Servers" on HMaster WebUI gets cleared?

Question

When does the RegionServers listed under "Dead Region Servers" on HMaster WebUI gets cleared?

Answer

When an online RegionServer goes down abruptly, it is displayed under "Dead Region Servers" in the HMaster WebUI. When dead RegionServer restarts and reports back to HMaster successfully, the "Dead Region Servers" in the HMaster WebUI gets cleared.

The "Dead Region Servers" is also gets cleared, when the HMaster failover operation is performed successfully.

In cases when an Active HMaster hosting some regions is abruptly killed, Backup HMaster will become the new Active HMater and displays previous Active HMaster as dead RegionServer.

12.8.20.12 Why Are Different Query Results Returned After I Use Same Query Criteria to Query Data Successfully Imported by HBase bulkload?

Question

If the data to be imported by HBase bulkload has identical rowkeys, the data import is successful but identical query criteria produce different query results.

Answer

Data with an identical rowkey is loaded into HBase in the order in which data is read. The data with the latest timestamp is considered to be the latest data. By default, data is not queried by timestamp. Therefore, if you query for data with an identical rowkey, only the latest data is returned.

While data is being loaded by bulkload, the memory processes the data into HFiles quickly, leading to the possibility that data with an identical rowkey has a same timestamp. In this case, identical query criteria may produce different query results.

To avoid this problem, ensure that the same data file does not contain identical rowkeys while you are creating tables or loading data.

12.8.20.13 What Should I Do If I Fail to Create Tables Due to the FAILED_OPEN State of Regions?

Question

What should I do if I fail to create tables due to the FAILED_OPEN state of Regions?

Answer

If a network, HDFS, or Active HMaster fault occurs during the creation of tables, some Regions may fail to go online and therefore enter the FAILED_OPEN state. In this case, tables fail to be created.

The tables that fail to be created due to the preceding mentioned issue cannot be repaired. To solve this problem, perform the following operations to delete and re-create the tables:

1. Run the following command on the cluster client to repair the state of the tables:

   hbase hbck -fixTableStates

2. Enter the HBase shell and run the following commands to delete the tables that fail to be created:

   truncate *'<table_name>'*

disable *'<table_name>'*

drop *'<table_name>'*

3. Create the tables using the recreation command.

12.8.20.14 How Do I Delete Residual Table Names in the /hbase/table-lock Directory of ZooKeeper?

Question

In security mode, names of tables that failed to be created are unnecessarily retained in the table-lock node (default directory is /hbase/table-lock) of ZooKeeper. How do I delete these residual table names?

Answer

Perform the following steps:

1. On the client, run the kinit command as the hbase user to obtain a security certificate.
2. Run the ***hbase zkcli*** command to launch the ZooKeeper Command Line Interface (zkCLI).
3. Run the ***ls /hbase/table*** command on the zkCLI to check whether the table name of the table that fails to be created exists.
   - If the table name exists, no further operation is required.
   - If the table name does not exist, run ***ls /hbase/table-lock*** to check whether the table name of the table fail to be created exist. If the table name exists, run the ***delete /hbase/table-lock/<table>*** command to delete the table name. In the ***delete /hbase/table-lock/<table>*** command, ***<table>*** indicates the residual table name.

12.8.20.15 Why Does HBase Become Faulty When I Set a Quota for the Directory Used by HBase in HDFS?

Question

Why does HBase become faulty when I set quota for the directory used by HBase in HDFS?

Answer

The flush operation of a table is to write memstore data to HDFS.

If the HDFS directory does not have sufficient disk space quota, the flush operation will fail and the region server will stop.

```
Caused by: org.apache.hadoop.hdfs.protocol.DSQuotaExceededException: The DiskSpace quota of /hbase/data/<namespace>/<tableName> is exceeded: quota = 1024 B = 1 KB but diskspace consumed = 402655638 B = 384.00 MB
?at org.apache.hadoop.hdfs.server.namenode.DirectoryWithQuotaFeature.verifyStoragespaceQuota(DirectoryWithQuotaFeature.java:211)
?at org.apache.hadoop.hdfs.server.namenode.DirectoryWithQuotaFeature.verifyQuota(DirectoryWithQuotaFeatu
```

```
re.java:239)
?at org.apache.hadoop.hdfs.server.namenode.FSDirectory.verifyQuota(FSDirectory.java:882)
?at org.apache.hadoop.hdfs.server.namenode.FSDirectory.updateCount(FSDirectory.java:711)
?at org.apache.hadoop.hdfs.server.namenode.FSDirectory.updateCount(FSDirectory.java:670)
?at org.apache.hadoop.hdfs.server.namenode.FSDirectory.addBlock(FSDirectory.java:495)
```

In the preceding exception, the disk space quota of the **/hbase/data/<namespace>/<tableName>** table is 1 KB, but the memstore data is 384.00 MB. Therefore, the flush operation fails and the region server stops.

When the region server is terminated, HMaster replays the WAL file of the terminated region server to restore data. The disk space quota is limited. As a result, the replay operation of the WAL file fails, and the HMaster process exits unexpectedly.

```
2016-07-28 19:11:40,352 | FATAL | MASTER_SERVER_OPERATIONS-10-91-9-131:16000-0 | Caught throwable
while processing event M_SERVER_SHUTDOWN |
org.apache.hadoop.hbase.master.HMaster.abort(HMaster.java:2474)
java.io.IOException: failed log splitting for 10-91-9-131,16020,1469689987884, will retry
?at
org.apache.hadoop.hbase.master.handler.ServerShutdownHandler.resubmit(ServerShutdownHandler.java:365

?at org.apache.hadoop.hbase.master.MasterFileSystem.splitLog(MasterFileSystem.java:402)
?at org.apache.hadoop.hbase.master.MasterFileSystem.splitLog(MasterFileSystem.java:375)
```

Therefore, you cannot set the quota value for the HBase directory in HDFS. If the exception occurs, perform the following operations:

Step 1 Run the **kinit** *Username* command on the client to enable the HBase user to obtain security authentication.

Step 2 Run the **hdfs dfs -count -q** */hbase/data/<namespace>/<tableName>* command to check the allocated disk space quota.

Step 3 Run the following command to cancel the quota limit and restore HBase:

hdfs dfsadmin -clrSpaceQuota */hbase/data/<namespace>/<tableName>*

----End

12.8.20.16 Why HMaster Times Out While Waiting for Namespace Table to be Assigned After Rebuilding Meta Using OfflineMetaRepair Tool and Startups Failed

Question

Why HMaster times out while waiting for namespace table to be assigned after rebuilding meta using OfflineMetaRepair tool and startups failed?

HMaster abort with following FATAL message,

```
2017-06-15 15:11:07,582 FATAL [Hostname:16000.activeMasterManager] master.HMaster: Unhandled
exception. Starting shutdown.
```

```
java.io.IOException: Timedout 120000ms waiting for namespace table to be assigned
    at org.apache.hadoop.hbase.master.TableNamespaceManager.start(TableNamespaceManager.java:98)
    at org.apache.hadoop.hbase.master.HMaster.initNamespace(HMaster.java:1054)
    at org.apache.hadoop.hbase.master.HMaster.finishActiveMasterInitialization(HMaster.java:848)
    at org.apache.hadoop.hbase.master.HMaster.access$600(HMaster.java:199)
    at org.apache.hadoop.hbase.master.HMaster$2.run(HMaster.java:1871)
    at java.lang.Thread.run(Thread.java:745)
```

Answer

When meta is rebuilt by OfflineMetaRepair tool then HMaster wait for all region server's WAL split during start up to avoid the data inconsistency problem. HMaster trigger user regions assignment once WAL split completes. So when the cluster is in the unusual scenario, there are chances WAL splitting may take long time which depends on multiple factors like too many WALs, slow I/O, region servers are not stable etc.

HMaster should be able to finish all region server WAL splitting successfully. Perform the following steps.

1. Make sure cluster is stable, no other problem exist. If any problem occurs, please correct them first.
2. Configure a large value to **hbase.master.initializationmonitor.timeout** parameters, default value is **3600000** milliseconds.
3. Restart HBase service.

12.8.20.17 Why Messages Containing FileNotFoundException and no lease Are Frequently Displayed in the HMaster Logs During the WAL Splitting Process?

Question

Why messages containing FileNotFoundException and no lease are frequently displayed in the HMaster logs during the WAL splitting process?

Answer

During the WAL splitting process, the WAL splitting timeout period is specified by the **hbase.splitlog.manager.timeout** parameter. If the WAL splitting process fails to complete within the timeout period, the task is submitted again. Multiple WAL splitting tasks may be submitted during a specified period. If the **temp** file is deleted when one WAL splitting task completes, other tasks cannot find the file and the FileNotFoudException exception is reported. To avoid the problem, perform the following modifications:

The default value of **hbase.splitlog.manager.timeout** is 600,000 ms. The cluster specification is that each RegionServer has 2,000 to 3,000 regions. When the cluster is normal (HBase is normal and HDFS does not have a large number of read and write operations), you are advised to adjust this parameter based on the cluster specifications. If the actual specifications (the actual average number of regions on each RegionServer) are greater than the default specifications (the default average number of regions on each RegionServer, that is, 2,000), the adjustment solution is (actual specifications/default specifications) x Default time.

Set the **splitlog** parameter in the **hbase-site.xml** file on the server. **Table 12-188** describes the parameter.

Table 12-188 Description of the **splitlog** parameter

Parameter	Description	Default Value
hbase.splitlog.manager.timeout	Timeout period for receiving worker response by the distributed SplitLog management program.	600000

12.8.20.18 Why Does the ImportTsv Tool Display "Permission denied" When the Same Linux User as and a Different Kerberos User from the Region Server Are Used?

Question

When the same Linux user (for example, user **omm**) as and a different Kerberos user (for example, user **admin**) from the Region Server are used, why does the ImportTsv tool fail to be executed and the error message "Permission denied" is displayed?

```
Exception in thread "main" org.apache.hadoop.security.AccessControlException: Permission denied:
user=admin, access=WRITE, inode="/user/omm-bulkload/hbase-staging/
partitions_cab16de5-87c2-4153-9cca-a6f4ed4278a6":hbase:hadoop:drwx--x--x

```

Answer

The ImportTsv tool creates a partition file in the HBase temporary directory specified by **hbase.fs.tmp.dir** in the *Client installation path* **/HBase/hbase/conf/hbase-site.xml file.** Therefore, the client (Kerberos user) must have the **rwx** permission on the specified temporary directory to perform the ImportTsv operation. The default value of **hbase.fs.tmp.dir** is **/user/${user.name}/hbase-staging** (for example, **/user/omm/hbase-staging**). **$ {user.name}** indicates the OS username (user **omm**). The client (Kerberos user, for example, user **admin**) does not have the **rwx** permission on the directory.

To solve the preceding problem, perform the following steps:

1. On the client, set **hbase.fs.tmp.dir** to the directory of the current Kerberos user (for example, **/user/admin/hbase-staging**), or provide the **rwx** permission required by the configured directory for the client (Kerberos user).
2. Perform the ImportTsv operation again.

12.8.20.19 Insufficient Rights When a Tenant Accesses Phoenix

Question

When a tenant accesses Phoenix, a message is displayed indicating that the tenant has insufficient rights.

Answer

You need to associate the HBase service and Yarn queues when creating a tenant.

The tenant must be granted additional rights to perform operations on Phoenix, that is, the RWX permission on the Phoenix system table.

Example:

Tenant **hbase** has been created. Log in to the HBase Shell as user **admin** and run the **scan 'hbase:acl'** command to query the role of the tenant. The role is **hbase_1450761169920** (in the format of tenant name_timestamp).

Run the following commands to grant rights to the tenant (if the Phoenix system table has not been generated, log in to the Phoenix client as user **admin** first and then grant rights on the HBase Shell):

grant '@hbase_1450761169920','RWX','SYSTEM.CATALOG'

grant '@hbase_1450761169920','RWX','SYSTEM.FUNCTION'

grant '@hbase_1450761169920','RWX','SYSTEM.SEQUENCE'

grant '@hbase_1450761169920','RWX','SYSTEM.STATS'

Create user **phoenix** and bind it with tenant **hbase**, so that tenant **hbase** can access the Phoenix client as user **phoenix**.

12.8.20.20 What Can I Do When HBase Fails to Recover a Task and a Message Is Displayed Stating "Rollback recovery failed"?

Question

The system automatically rolls back data after an HBase recovery task fails. If "Rollback recovery failed" is displayed, the rollback fails. After the rollback fails, data stops being processed and the junk data may be generated. How can I resolve this problem?

Answer

You need to manually clear the junk data before performing the backup or recovery task next time.

Step 1 Install the cluster client in **/opt/client**.

Step 2 Run **source /opt/client/bigdata_env** as the client installation user to configure the environment variable.

Step 3 Run **kinit admin** for administrator authentication.

Step 4 Run **zkCli.sh -server** *business IP address of ZooKeeper*:**2181** to connect to the ZooKeeper.

Step 5 Run **deleteall /recovering** to delete the junk data. Run **quit** to disconnect ZooKeeper.

NOTE

Running this command will cause data loss. Exercise caution.

Step 6 Run **hdfs dfs -rm -f -r /user/hbase/backup** to delete temporary data.

Step 7 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Backup and Restoration** > **Restoration Management**. In the task list, locate the row that contains the target task and click **View History** in the **Operation** column. In the displayed dialog box, click ⌄ before a specified execution record to view the snapshot name.

Snapshot [*snapshot name*] is created successfully before recovery.

Step 8 Switch to the client, run **hbase shell**, and then **delete_all_snapshot** '*snapshot name*.*' to delete the temporary snapshot.

----End

12.8.20.21 How Do I Fix Region Overlapping?

Question

When the HBaseFsck tool is used to check the region status in MRS 3.x and later versions, if the log contains **ERROR: (regions region1 and region2) There is an overlap in the region chain** or **ERROR: (region region1) Multiple regions have the same startkey: xxx**, overlapping exists in some regions. How do I solve this problem?

Answer

To rectify the fault, perform the following steps:

Step 1 Run the **hbase hbck -repair** *tableName* command to restore the table that contains overlapping.

Step 2 Run the **hbase hbck** *tableName* command to check whether overlapping exists in the restored table.

- If overlapping does not exist, go to **Step 3**.
- If overlapping exists, go to **Step 1**.

Step 3 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **More** > **Perform HMaster Switchover** to complete the HMaster active/standby switchover.

Step 4 Run the **hbase hbck** *tableName* command to check whether overlapping exists in the restored table.

- If overlapping does not exist, no further action is required.
- If overlapping still exists, start from **Step 1** to perform the recovery again.

----End

12.8.20.22 Why Does RegionServer Fail to Be Started When GC Parameters Xms and Xmx of HBase RegionServer Are Set to 31 GB?

Question

(MRS 3.x and later versions) Check the **hbase-omm-*.out** log of the node where RegionServer fails to be started. It is found that the log contains **An error report file with more information is saved as: /tmp/hs_err_pid*.log**. Check the **/tmp/**

hs_err_pid*.log file. It is found that the log contains **#Internal Error (vtableStubs_aarch64.cpp:213), pid=9456, tid=0x0000ffff97fdd200 and #guarantee(__ pc() <= s->code_end()) failed: overflowed buffer**, indicating that the problem is caused by JDK. How do I solve this problem?

Answer

To rectify the fault, perform the following steps:

Step 1 Run the **su - omm** command on a node where RegionServer fails to be started to switch to user **omm**.

Step 2 Run the **java -XX:+PrintFlagsFinal -version |grep HeapBase** command as user **omm**. Information similar to the following is displayed:

```
uintx HeapBaseMinAddress = 2147483648 {pd product}
```

Step 3 Change the values of **-Xms** and **-Xmx** in **GC_OPTS** to values that are not between **32G-HeapBaseMinAddress** and **32G**, excluding the values of **32G** and **32G-HeapBaseMinAddress**.

Step 4 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance**, select the failed instance, and choose **More** > **Restart Instance** to restart the failed instance.

----End

12.8.20.23 Why Does the LoadIncrementalHFiles Tool Fail to Be Executed and "Permission denied" Is Displayed When Nodes in a Cluster Are Used to Import Data in Batches?

Question

Why does the LoadIncrementalHFiles tool fail to be executed and "Permission denied" is displayed when a Linux user is manually created in a normal cluster and DataNode in the cluster is used to import data in batches?

```
2020-09-20 14:53:53,808 WARN  [main] shortcircuit.DomainSocketFactory: error creating DomainSocket

    at org.apache.hadoop.hbase.tool.LoadIncrementalHFiles.run(LoadIncrementalHFiles.java:1263)
    at org.apache.hadoop.hbase.tool.LoadIncrementalHFiles.run(LoadIncrementalHFiles.java:1276)
    at org.apache.hadoop.hbase.tool.LoadIncrementalHFiles.run(LoadIncrementalHFiles.java:1311)
    at org.apache.hadoop.util.ToolRunner.run(ToolRunner.java:76)
    at org.apache.hadoop.hbase.tool.LoadIncrementalHFiles.main(LoadIncrementalHFiles.java:1333)
```

Answer

If the client that the LoadIncrementalHFiles tool depends on is installed in the cluster and is on the same node as DataNode, HDFS creates short-circuit read during the execution of the tool to improve performance. The short-circuit read depends on the **/var/run/FusionInsight-HDFS** directory (**dfs.domain.socket.path**). The default permission on this directory is **750**. This user does not have the permission to operate the directory.

To solve the preceding problem, perform the following operations:

Method 1: Create a user (recommended).

Step 1 Create a user on Manager. By default, the user group contains the **ficommon** group.

```
[root@xxx-xxx-xxx-xxx ~]# id test
uid=20038(test) gid=9998(ficommon) groups=9998(ficommon)
```

Step 2 Import data again.

----End

Method 2: Change the owner group of the current user.

Step 1 Add the user to the **ficommon** group.

```
[root@xxx-xxx-xxx-xxx ~]# usermod -a -G ficommon test
[root@xxx-xxx-xxx-xxx ~]# id test
uid=2102(test) gid=2102(test) groups=2102(test),9998(ficommon)
```

Step 2 Import data again.

----End

12.8.20.24 Why Is the Error Message "import argparse" Displayed When the Phoenix sqlline Script Is Used?

Question

When the sqlline script is used on the client, the error message "import argparse" is displayed.

Answer

Step 1 Log in to the node where the HBase client is installed as user **root**. Perform security authentication using the **hbase** user.

Step 2 Go to the directory where the sqlline script of the HBase client is stored and run the **python3 sqlline.py** command.

----End

12.8.20.25 How Do I Deal with the Restrictions of the Phoenix BulkLoad Tool?

Question

When the indexed field data is updated, if a batch of data exists in the user table, the BulkLoad tool cannot update the global and partial mutable indexes.

Answer

Problem Analysis

1. Create a table.

```
CREATE TABLE TEST_TABLE(
DATE varchar not null,
NUM integer not null,
SEQ_NUM integer not null,
ACCOUNT1 varchar not null,
ACCOUNTDES varchar,
FLAG varchar,
SALL double,
CONSTRAINT PK PRIMARY KEY (DATE,NUM,SEQ_NUM,ACCOUNT1)
);
```

2. Create a global index.

   CREATE INDEX TEST_TABLE_INDEX ON TEST_TABLE(ACCOUNT1,DATE,NUM,ACCOUNTDES,SEQ_NUM);

3. Insert data.

   UPSERT INTO TEST_TABLE (DATE,NUM,SEQ_NUM,ACCOUNT1,ACCOUNTDES,FLAG,SALL) values ('20201001',30201001,13,'367392332','sffa1','','');

4. Execute the BulkLoad task to update data.

   hbase org.apache.phoenix.mapreduce.CsvBulkLoadTool -t TEST_TABLE -i /tmp/test.csv, where the content of **test.csv** is as follows:

20201001	30201001	13	367392332	sffa888	1231243	23

5. Symptom: The existing index data cannot be directly updated. As a result, two pieces of index data exist.

```
+------------+-----------+-----------+---------------+----------------+
| :ACCOUNT1  |  :DATE    |  :NUM     | 0:ACCOUNTDES  | :SEQ_NUM  |
+------------+-----------+-----------+---------------+----------------+
| 367392332  | 20201001  | 30201001  | sffa1         | 13             |
| 367392332  | 20201001  | 30201001  | sffa888       | 13             |
+------------+-----------+-----------+---------------+----------------+
```

Solution

Step 1 Delete the old index table.

DROP INDEX TEST_TABLE_INDEX ON TEST_TABLE;

Step 2 Create an index table in asynchronous mode.

CREATE INDEX TEST_TABLE_INDEX ON TEST_TABLE(ACCOUNT1,DATE,NUM,ACCOUNTDES,SEQ_NUM) ASYNC;

Step 3 Recreate a index.

hbase org.apache.phoenix.mapreduce.index.IndexTool --data-table TEST_TABLE --index-table TEST_TABLE_INDEX --output-path /user/test_table

----End

12.8.20.26 Why a Message Is Displayed Indicating that the Permission is Insufficient When CTBase Connects to the Ranger Plug-ins?

Question

When CTBase accesses the HBase service with the Ranger plug-ins enabled and you are creating a cluster table, a message is displayed indicating that the permission is insufficient.

```
ERROR: Create ClusterTable failed. Error: org.apache.hadoop.hbase.security.AccessDeniedException:

```

Answer

CTBase users can configure permission policies on the Ranger page and grant the READ, WRITE, CREATE, ADMIN, and EXECUTE permissions to the CTBase metadata table **_ctmeta_**, cluster table, and index table.

12.9 Using HDFS

12.9.1 Using Hadoop from Scratch

You can use Hadoop to submit wordcount jobs. Wordcount is the most classic Hadoop job and is used to count the number of words in massive text.

Procedure

Step 1 Prepare the wordcount program.

Multiple open source Hadoop sample programs are provided, including wordcount. You can download the Hadoop sample program from **https://dist.apache.org/repos/dist/release/hadoop/common/**.

For example, select hadoop-2.10.x, download **hadoop-2.10.x.tar.gz**, decompress it, and obtain **hadoop-2.10.x\share\hadoop\mapreduce** (the Hadoop sample program) from **hadoop-mapreduce-examples-2.10.x.jar**. The **hadoop-mapreduce-examples-2.10.x.jar** sample program contains the wordcount program.

NOTE

hadoop-2.10.x indicates the Hadoop version.

Step 2 Prepare data files.

There is no format requirement for data files. Prepare one or more **.txt** files. The following are examples of the **.txt** file:

```
qwsdfhoedfrffrofhuncckgktpmhutopmma
jjpsffjfjorgjgtyiuyjmhombmbogohoyhm
jhheyeombdhuaqqiquyebchdhmamdhdemmj
doeyhjwedcrfvtgbmojiyhhqssddddddfkf
kjhhjkehdeiyrudjhfhfhffooqweopuyyyy
```

Step 3 Upload data to OBS.

1. Log in to OBS Console.
2. Click **Parallel File System** and choose **Create Parallel File System** to create a file system named **wordcount01**.

   wordcount01 is only an example. The file system name must be globally unique. Otherwise, the parallel file system fails to be created.
3. In the OBS file system list, click **wordcount01** and choose **Files** > **Create Folder** to create the **program** and **input** folders.
   - **program**: stores user programs.
   - **input**: stores user data files.
4. Go to the **program** folder, choose **Upload File** > **add file**, select the program package downloaded in **Step 1** from the local host, and click **Upload**.
5. Go to the **input** folder and upload the data file prepared in **Step 2** to the **input** folder.

Step 4 Log in to the MRS console. In the navigation pane on the left, click **Clusters** and choose **Active Clusters**. Click the cluster name. The cluster must contain Hadoop components.

Step 5 Submit the wordcount job.

On the MRS console, click the **Jobs** tab and click **Create**. The **Create Job** page is displayed.

- Set **Type** to **MapReduce**.
- Set **Name** to **mr_01**.
- Set the path of the executable program to the address of the program stored on the OBS. For example: **obs://wordcount01/program/hadoop-mapreduce-examples-2.10.x.jar**
- Enter **wordcount obs://wordcount01/input/ obs://wordcount01/output/** in the **Parameter** pane.

  NOTE

  - Replace the OBS file system name in **obs://wordcount01/input/** with the actual name of the file system created in the environment.
  - Replace the OBS file system name in **obs://wordcount01/output/** with the actual name of the file system created in the environment. Enter a directory that does not exist in the **output** directory.
- **Service Parameter** can be left blank.

A job can be submitted only when the cluster is in the **Running** state.

After a job is submitted successfully, it is in the **Accepted** state by default. You do not need to manually execute the job.

Step 6 View the job execution result.

1. Go to the **Jobs** tab page and check whether the job is successfully executed.

   It takes some time to run the job. After the job is complete, refresh the job list

   Once a job has succeeded or failed, you cannot execute it again. However, you can add or copy a job, and set job parameters to submit a job again.
2. Log in to the OBS console, go to the OBS path, and view the job output information.

   You can view output files in the **output** directory created in **Step 5**. You need to download the file to the local host and open it in text format.

----End

12.9.2 Configuring Memory Management

Scenario

In HDFS, each file object needs to register corresponding information in the NameNode and occupies certain storage space. As the number of files increases, if the original memory space cannot store the corresponding information, you need to change the memory size.

Configuration Description

Navigation path for setting parameters:

Go to the **All Configurations** page of HDFS by referring to **Modifying Cluster Service Configuration Parameters**.

Table 12-189 Parameter description

Parameter	Description	Default Value
GC_PROFILE	The NameNode memory size depends on the size of FsImage, which can be calculated based on the following formula: FsImage size = Number of files x 900 bytes. You can estimate the memory size of the NameNode of HDFS based on the calculation result. The value range of this parameter is as follows: • **high**: 4 GB • **medium**: 2 GB • **low**: 256 MB • **custom**: The memory size can be set according to the data size in GC_OPTS.	custom
